Department	Department of the person Assigned to this software license.

Financial tab

Field	Description
Vendor	Company that the asset was purchased from.
Invoice number	Invoice that the asset was billed under.
Request line	Request line linked to the asset.

Field	Description
Purchased	The date the entitlement was purchased. This date is considered when reconciliation runs as Microsoft has updated its licensing rules for dedicated hosts on AWS and Microsoft Azure. Note: The purchased date is also visible when importing entitlements.
Opened	Date that the request was opened.
GL account	General ledger account number associated with the asset.
Cost center	Cost center financially responsible for the asset.

Contracts tab

When [importing software entitlements](#), use the **Contract number** column on the downloadable template to link the contracts to the entitlements. Since the **Contract number** is a reference field, the system first searches for matches to existing contracts, so enter existing contract numbers. If no matching contract number is found, entitlement import errors are generated.

You should be able to create the contract from the error, enabling for the creation of the entitlement and the appearance of the contract on the entitlement form in the Contracts related list. You can also skip the contract creation process and still create the entitlement, but without a contract.

Field	Description
Lease contract	Contract that applies to the asset.
Warranty expiration	Expiration date of the warranty.
Support group	Group that supports incidents related to the asset.
Supported by	Individual that supports incidents related to the asset.

User Allocations tab

Note:
 This tab appears only if you're using a user-based license metric, such as Per User or User CAL.

Field	Description
Assigned condition	Condition to account for only user allocations during reconciliation. Only user allocations that meet the specified conditions are included in the reconciliation.
Assigned to	User that the associated rights are allocated to.

Field	Description
	<p>Note: If you're using a client access record to track and manage the users that are accessing your server software, this field displays the name of each user that you assigned the associated client access licenses (CALs) to. See Add a software client access record in Software Asset Management classic for detailed instructions on how to assign CALs to users in the Software Asset Management classic application. See Create a software client access record in workspace for detailed instructions on how to assign CALs to users in the Software Asset Workspace.</p>
Quantity	Number of rights that are allocated to the user.
License key	Unique license key that is allocated to the user.

Device Allocations tab

Note:
This tab appears only if you're using a device-based license metric, such as Per Device or Device CAL.

Field	Description
Allocated condition	Condition to account for only device allocations during reconciliation. Only device allocations that meet the specified conditions are included in reconciliation.
Assigned to	<p>Device that the associated rights are allocated to.</p> <p>Note: If you're using a client access record to track and manage the devices that are accessing your server software, this field displays the name of each device that you assigned the associated client access licenses (CALs) to. See Add a software client access record in Software Asset Management classic for detailed instructions on how to assign CALs to devices in the Software Asset Management classic application. See Create a software client access record in workspace for detailed instructions on how to assign CALs to devices in the Software Asset Workspace.</p>
Quantity	Number of rights that are allocated to the device.
License key	Unique license key that is allocated to the device.

Related Entitlements tab

Note:
This tab appears only if your software entitlement is linked to a related entitlement.

Field	Description
Related Entitlement	Related entitlement that you want to link to your software entitlement.

Field	Description
License type	License type that is associated with the related entitlement.
Active rights	Number of rights that you want to grant to the related entitlement.
Software Entitlement	Software entitlement that you're linking the related entitlement to.
<p>Note: This field appears only in the Software Asset Workspace. This field doesn't appear in the Software Asset Management classic application.</p>	

Upgraded Entitlements tab

Field	Description
From Entitlement	<p>The entitlement from which rights are upgrading. Multiple upgrade entitlements are supported.</p> <p>You can upgrade previously owned rights for a particular version of software to a newer version (for example, Microsoft Office Professional Plus 2013 to Microsoft Office Professional Plus 2016).</p> <p>Note: This field is available when Upgrade is selected from the License type field.</p> <p>The rights from entitlements that you're upgrading from get deactivated when you upgrade because they're moved to the new entitlement.</p>
Number of rights	Number of rights to upgrade.

Activities tab

Field	Description
Work notes	Work notes for the asset.

Downgrade Rights related list

Field	Description
Software entitlement	Software entitlement with which the downgrade is associated.
Software model	Software model corresponding to the downgrade right.
Active	Indicates if the downgrade rights on the software entitlement are active or not. If needed, you can deactivate the downgrade rights. Only the active downgrade

Field	Description
	<p>rights appear in the list. To see all the downgrade rights, remove the Active condition from the filter.</p> <p>If you deactivate a downgrade right on a software model, the change is propagated to the related software entitlement downgrade rights; irrespective of the source of the downgrade right.</p> <p>To deactivate a downgrade right, double-click the field to display the toggle button. Select false and select the Save icon (✔).</p> <ul style="list-style-type: none"> • false: Deactivates the downgrade right on the software model and on the related software entitlements. • true: Deactivates the downgrade right on the software model and on the related software entitlements.
Order	Order of the downgrade. If necessary, you can edit this field.
Start date	Start date of the downgrade.
End date	End date of the downgrade.

Entitlement Consumption Rules

Note:

This tab appears for all publishers except Workday. Additionally, the tab appears for all license metrics except the following:

- Resource Value Unit (RVU)
- Resource Value Unit (RVU) Full Capacity
- Resource Value Unit (RVU) Sub-capacity
- Authorized User Value Unit
- Employee User Value Unit
- External User Value Unit
- Employee

Field	Description
Software entitlement	The software entitlement that the consumption is linked to.
Consumption rule	The consumption rule linked to the entitlement.
License pool	License pool associated with the consumption rule. For details on license pools, see Reconciliation of licenses across global entities .

License Key related list

Field	Description
Is allocated	Option that indicates that the license key has been allocated.
License key	License key value. Must be unique for an entitlement.

Field	Description
Software entitlement	Software entitlement associated with the license key.

Software model results license metric results fields

Software model results License Metric Results form and related list field descriptions. You can access this form through the License Metric Results related list in your software model results.

License Metric Results form

Two license metric results are generated if a software model has two entitlements, one with a perpetual SA license type and the other with a subscription license type. One license metric result where active maintenance is true and the other where the active maintenance is false. In such a scenario, two license position reports are generated, one with active maintenance true and the other one with active maintenance false.

Field	Description
License metric	Name of the license metric that the software license is counted against when reconciliation runs.
Software model result	Software model result associated with the license metric results.
Group	Group on which reconciliation was run.
Subgroup	Subgroup on which reconciliation was run.
Rights owned	Sum of all active rights from entitlements that share a license metric.
Rights used	Sum of rights used during reconciliation (allocated + not allocated and installed).
Rights available	Sum of rights not used during reconciliation (rights owned – rights used).
Over-licensed amount	Estimated cost of unused rights.
Right Allocations	
Allocated in use	Rights that are allocated and are used to license installations.
Not allocated in use	Number of rights that are used to license installations, but not allocated. When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.
Allocated not in use	Rights that are allocated but are not being used to license any installations.

Field	Description
	<p>Note: Allocated not in use reflects rights that are wasted because the user or device for which these rights have been allocated do not have the software installed.</p> <p>When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.</p>
Not allocated	Number of rights that have not been allocated (rights owned – allocated regardless of whether installed or not).
Allocations needed	Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.

Rights Used By related list

Field	Description
Used by	<p>User or device that is using the rights.</p> <p>Note: If your rights are associated with client access records, the Used by field displays the name of each client access record that is using those rights. Select a client access record name to view the corresponding breakdown of users or devices that are using the associated rights. See Add a software client access record in Software Asset Management classic for more information on client access records in the Software Asset Management classic application. See Create a software client access record in workspace for more information on client access records in the Software Asset Workspace.</p>
Rights used	Sum of rights used during reconciliation (allocated + not allocated and installed).
Allocated in use	Rights that are allocated and are used to license installations.
Not allocated in use	<p>Number of rights that are used to license installations, but not allocated.</p> <p>When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.</p>
Allocated not in use	<p>Rights that are allocated but are not being used to license any installations.</p> <p>Note: Allocated not in use reflects rights that are wasted because the user or device for which these rights have been allocated do not have the software installed.</p>

Field	Description
	When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.
Nontransferable rights	Remaining rights from a core pack that cannot be used to license any additional devices. Nontransferable rights are available only for Microsoft Per Core and Microsoft Per Core with (CAL).
Allocations needed	Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.

Rights Needed By related list

Field	Description
Rights needed by	<p>Unlicensed user or device that requires rights.</p> <p>Note: If rights are needed to cover unlicensed users or devices in an associated client access record, the Rights needed field displays the name of the client access record that requires those additional rights. Select the client access record name to view the corresponding breakdown of unlicensed users or devices that require rights. See Add a software client access record in Software Asset Management classic for more information on client access records in the Software Asset Management classic application. See Create a software client access record in workspace for more information on client access records in the Software Asset Workspace.</p>
Rights needed	Number of rights that are required to cover the unlicensed user or device.

Licensed Installs related list

Note:
 This related list is not available for SAP license metrics.

Field	Description
Display name	Name of the software installation.
Publisher	Publisher of the software.
Version	Version of the software.
Discovery model	Software discovery model for the installed software.
Installed on	Hardware on which the software is installed.
Assigned to	User or device to which the software is assigned.

Downgrades/Upgrades related list

Note:
 This related list is not available for SAP license metrics.

Field	Description
Software model	Software model that is available for upgrade or downgrade.
Rights used	Sum of rights used during reconciliation (allocated + not allocated and installed).
Allocated in use	Rights that are allocated and are used to license installations.
Not allocated in use	<p>Number of rights that are used to license installations, but not allocated.</p> <p>When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.</p>
Allocated not in use	<p>Rights that are allocated but are not being used to license any installations.</p> <p>Note: Allocated not in use reflects rights that are wasted because the user or device for which these rights have been allocated do not have the software installed.</p> <p>When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.</p>
Allocations needed	Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.

SAP System Users related list

Note: This related list is available only for SAP named user license metrics.

Field	Description
Display name	Identifier containing the SAP user ID and SAP client.
User	Full name of the SAP user.
SAP user id	Unique identifier for the SAP user.
Email	Email address of the SAP user.
First name	First name of the SAP user.
Last name	Last name of the SAP user.
User type	Type of SAP user.
License type	Named user type value assigned to the SAP user.
Named user type	Normalized named user type of the SAP user.
Optimized named user type	Optimized named user type of the SAP user.

Field	Description
SAP client	Organizational subunit to which the SAP user belongs.

Licensed Subscriptions related list

Field	Description
Display name	Identifier containing the publisher and product of the software subscription.
User	Name of the subscription user.
User principal name	Email address of the subscription user.
Software model	Software model for the subscription software.
Subscription profile	Direct integration profile for the subscription software.
Subscription type	Type of subscription.

Software subscription fields

Software subscription form fields, their descriptions, and the SaaS integrations for which these fields are populated.

Some of the fields in the Software subscription table get populated for specific SaaS integrations while some get populated for all SaaS integrations.

Software subscription form fields

Field	Description	Is pulled from the portal?	SaaS integration
Display name	Name of the subscription downloaded from the SaaS portal.	Yes	All SaaS integrations
Publisher	The publisher for the subscription.	Yes	All SaaS integrations
Product	The software product for the subscription.	Yes	All SaaS integrations
Version	Version of the software product.	Yes	All SaaS integrations
Edition	Edition of the software product.	Yes	All SaaS integrations
Software model	A standardized version of a software product for the subscription. The software model is automatically created for SaaS integrations.	No (Automatically created by ServiceNow)	All SaaS integrations
User	The ServiceNow user record in the User [sys_user] table representing a real person		All SaaS integrations

Software subscription form fields (continued)

Field	Description	Is pulled from the portal?	SaaS integration
	within an organization. In general, the User table is populated through the Active directory integration in the organization.		
User principal name	A unique identifier for a user in the SaaS portal. This is typically the email address of the user in the SaaS portal.	Yes	All SaaS integrations
Last activity	The date when the subscription record was last active. For Microsoft 365 products, this field is populated from the Software Usages [samp_sw_usage] table and Microsoft 365 Apps Usage Reports [samp_m365-apps-usage-report] table. This field determines usage-based optimization recommendation.	Yes	All SaaS integrations except CrowdStrike and DocuSign
Inactive days	Number of days for which a user's subscription has been inactive. This field is visible on the Software Subscriptions form when the Last activity field isn't empty. Inactive days are calculated using the value in the Last activity field.	No (Automatically determined)	All SaaS integrations except CrowdStrike
Subscription profile	Display name of the integration profile.	No (Automatically created by ServiceNow)	All SaaS integrations
Licensable software model	Name of the software model relevant for licensing purposes.	No (Automatically determined)	All SaaS integrations
Subscription identifier	A unique technical identifier provided by the SaaS provider, such as a service plan ID, that indicates the specific product or plan a user is subscribed to. This identifier allows	Yes	All SaaS integrations

Software subscription form fields (continued)

Field	Description	Is pulled from the portal?	SaaS integration
	<p>ServiceNow to correctly map the subscription to the corresponding software model.</p> <p>For example, identifiers like VISIOCLIENT and ENTERPRISEPACK map to specific products such as Microsoft Visio Plan 2 and Office 365 E3, respectively.</p>		
Inferred suite	The inferred suite model that this software subscription belongs to.	No (Automatically determined)	Microsoft 365 integration
Discovered user	The record in the Discovered User [samp_discovered_user] table that represents a user identity discovered from an external system.	No (Automatically determined)	All SaaS integrations
Active	Indicates if the subscription record is active.	No (Automatically determined)	All SaaS integrations
Is reconciled	<p>Indicates whether the SaaS subscription has been reconciled.</p> <p>This field is populated after reconciliation is run.</p>	No (Automatically determined)	All SaaS integrations
License metric result	License metric result of the software product that is populated after reconciliation. For more information on license metric results, see Software reconciliation results .	No (Automatically determined)	All SaaS integrations
Product result	Product result of the software product that is populated after reconciliation. For more information on product results, see Software reconciliation results .	No (Automatically determined)	All SaaS integrations
Software model result	Software model result of the software product that is populated after reconciliation. For more information on software	No (Automatically determined)	All SaaS integrations

Software subscription form fields (continued)

Field	Description	Is pulled from the portal?	SaaS integration
	model results, see Software reconciliation results .		
Unlicensed subscription	Indicates whether the subscription remains unlicensed after reconciliation due to insufficient available licenses. This field is updated with a true or false value to reflect the licensing status.	No (Automatically determined)	All SaaS integrations

Entitlement import error fields

Entitlement Import Error form and related list field descriptions.

Entitlement Import Error form

Field	Description
Error status	Status of the entitlement. An error record can have either of the two statuses: <ul style="list-style-type: none"> Manually fixed: when all the errors in the error record are corrected and the entitlement is successfully created. Needs review: the error record is created and you need to review and correct the errors.
Reason	Reason the imported entitlement couldn't be added to the Entitlement list.
Asset tag	Serial number and the bar code used for tracking the asset.
Publisher part number	<p>Publisher part number from the Software Product Definitions lookup list of predefined software that may have already been purchased.</p> <p>When you select a publisher part number, you may encounter a message: Many underlying software models are being created. These might be part of suite components, downgrade rights or next version. Please validate on completion. The message appears only if there are greater than or equal to 50 suite components for the software model and if any of the following conditions are met:</p> <ul style="list-style-type: none"> A software model does not exist for any suite component A software model does not exist for any downgrade right A software model does not exist for the next version

Field	Description
	<p>Note: If a software model exists for the publisher part number, the Software model field is automatically populated. Otherwise, the software model is automatically created for you directly from this form. If there are multiple software models created with the same discovery map conditions, the software model must be selected manually.</p>
Software model	<p>The software model to match the entitlement.</p> <p>Note: A warning message is shown if the publisher part number is not associated with the publisher and product for the software model. You can either change the software model, or save the entitlement as is.</p>
License type	<p>License type. Whether the rights grant full access to the software or if they are being upgraded from a previous version of the software.</p> <p>When the type is Upgrade, the Upgraded Entitlements related list is shown. The upgrade license type is used to specify the entitlements you are upgrading.</p> <p>This field becomes read-only after the form has been submitted.</p> <p>Note: For SaaS entitlements, keep the default value (Full).</p>
Metric group	<p>This field is automatically populated based on the Software Model field. Each metric group has a set of license metrics that are specific to the software publisher.</p>
License metric	<p>License metric for the license group that the software license is counted against when reconciliation is run. The options for license metric change based on the Metric group field. The default value for SaaS entitlements is User Subscription.</p> <p>For more information, see Software license metrics.</p> <p>Note: Use the Envelopes license metric only for DocuSign entitlements.</p>
Rights per license pack	<p>Rights associated with each pack that is purchased for Microsoft Per Core or Microsoft Per Core with CAL licenses.</p>
Number of packs	<p>Number of packs for Microsoft Per Core or Microsoft Per Core with CAL licenses.</p>
Purchased right	<p>Number of rights that you are purchasing.</p> <p>Note: If you've specified a Microsoft Per Core or Microsoft Per Core with CAL license type, this field is automatically populated. This value is based on the values entered in the Rights per license pack field multiplied by the value in the Number of packs field.</p>

Field	Description
Agreement type	<p>Based on the agreement type that you select, downgrade rights are automatically generated.</p> <p>Note: If the agreement type is Enterprise License Agreement or Unlimited Level Agreement, the Status is Compliant even if there are unlicensed installations.</p> <ul style="list-style-type: none"> • Generic: Downgrade rights are not automatically populated. If you change the agreement type on an existing software entitlement from Generic to any other type (for example CLP), the downgrade rights are automatically populated. • Any agreement type other than Generic: Downgrade rights are automatically populated. If you change the agreement type on an existing software entitlement from an agreement type other than Generic (for example, ELTA) to Generic, the downgrade rights that were already populated are not deleted or deactivated.
Purchased rights	Number of rights that you are purchasing.
Oracle options	Oracle options related to the entitlement.
Contract number	Contract number for the entitlement.

Reference software related list

Field	Description
Publisher	Name of the software publisher.
Product	Name of the product.
Version	Version of the software product.
Edition	Edition of the software product.
Language	Language of the software product to use when searching for the normalized discovery model, which is populated once it has been normalized or added manually.
Platform	Platform of the software product to use when searching for the normalized discovery model.

General related list

Field	Description
Owned by	User or department with financial ownership of the asset. The asset owner can be different than the manager.
PO number	Purchase order number.
Company	Company that this asset belongs to.

Field	Description
Location	Where the license is used. For example, a specific site, country, or region.
Department	Department of the person Assigned to this software license.

Financial related list

Field	Description
Vendor	Company that the asset was purchased from.
Unit cost	Unit cost of the software. Note: Required for total cost and savings calculations on the Software Asset Management dashboard .
GL account	General ledger account number associated with the asset.
Cost center	Cost center financially responsible for the asset.

Entitlement import error actions

Entitlement Import Error form action descriptions.

Entitlement Import Errors actions

Action	Description
Import	<p>Option that saves the Entitlement Import Error record. After you save the record, you remain on the Entitlement Import Error form, so you can easily save the form between actions</p> <p>Upon saving, all values are reevaluated and the form is updated.</p> <p>For example, if both the publisher part number and software model fields are missing, once a known publisher part number is added and the form is saved, the Software model field is filled in automatically.</p> <p>Note: Because the form is reevaluated after each save, changes made to one entitlement may cause an error for another entitlement, such as a Duplicate entry.</p> <p>When all required fields are filled in and the form is saved, an entitlement record is created and the error status is changed to Fixed.</p>
Create PPN	<p>Part number for custom software.</p> <p>If you are importing entitlements using the Software Asset Management workspace application, on selecting Create PPN, you are taken to the Custom Part Numbers list view page. Select New to create a new publisher part number.</p>

Action	Description
	If you are importing entitlements using the Software Asset Management classic application, on selecting Create PPN , the Create Discovery Map for Publisher Part Number dialog box appears. Select a product name in the Product field and select Submit to create a custom discovery map which is automatically associated with the publisher part number.
Create duplicate entitlement	Duplicate entitlement records cause an import error. Select Create duplicate entitlement to override the error and create an entitlement for the duplicate record. Note: This action only appears if there is an entitlement that already exists and a duplicate entitlement is being created.

Impact of different license types on software reconciliation

Each license type has entitlements and conditions outlined on the entitlement form, and more importantly, these license types have a significant impact on the Software Asset Management (SAM) reconciliation process.

License types and their impact on software reconciliation

License type	Description	Publisher applicability	Impact on licensing or reconciliation in SAM
Perpetual	A one-time purchase license that enables indefinite use of the software without any ongoing or recurring payments.	All	This license grants indefinite use but doesn't include maintenance rights, so benefits such as new version access, version upgrades, Bring your own license (BYOL) benefits, and technical support from the software publisher aren't available. To receive maintenance/SA benefits, you must associate maintenance/SA entitlements with the Perpetual license.
Perpetual + Software Assurance	A perpetual license combined with Software Assurance (SA) from Microsoft offers a comprehensive Volume Licensing program with these benefits:	Microsoft	Software Asset Management automatically applies the Software Assurance benefits. For more information, see Software license maintenance .

License types and their impact on software reconciliation (continued)

License type	Description	Publisher applicability	Impact on licensing or reconciliation in SAM
	<ul style="list-style-type: none"> • New version rights: Upgrade eligible Microsoft product licenses to the latest version at no additional cost. • License mobility: Deploy certain server applications on-premises or in the cloud without additional licenses. • Unlimited virtualization: License the physical host for products such as Windows Server Datacenter Edition, enabling an unlimited number of virtual machines. • Virtual layer licensing: License individual virtual machines, reducing overall licensing costs. 		
Subscription	For subscription-based products like Jira, Microsoft 365, and Adobe Creative Cloud, as well as non-subscription products using subscription licenses, such as Windows and SQL Server.	All (subscription products)	License compliance is primarily driven by user subscriptions pulled from the subscription portal, such as Jira and Microsoft 365. It also applies to non-subscription products like Windows Server and SQL Server, which can receive Software Assurance benefits.
Perpetual + Maintenance	Perpetual + Maintenance is similar to Perpetual + Software Assurance, but it includes a maintenance	All	Software Asset Management automatically applies the Software maintenance benefits. For more information,

License types and their impact on software reconciliation (continued)

License type	Description	Publisher applicability	Impact on licensing or reconciliation in SAM
	<p>agreement that provides access to software updates, patches, and sometimes support for a specified duration. This license type applies to non-Microsoft publishers such as Oracle and VMware.</p>		<p>see Software license maintenance.</p>
Upgrade	<p>A licensing option that enables upgrading from a lower-tier edition to a higher-tier edition, such as Standard to Enterprise, without purchasing a new full license.</p>	All	<p>You can upgrade a lower edition of software, such as SQL Server Standard, to a higher edition, such as SQL Server Enterprise. Use the Upgraded Entitlements tab in the Software Entitlement form to link related versions of your software under active maintenance and your upgrades. For more information, see Software entitlement fields.</p>
Software Assurance	<p>Software assurance entitlement that provides Microsoft customers with software assurance benefits. However, it must be linked to a base perpetual license to activate the entitlements.</p>	Microsoft	<p>Software Asset Management doesn't reconcile software assurance entitlements unless they're linked to base perpetual licenses. Confirm that software assurance entitlements are related to base perpetual entitlements for correct reconciliation.</p>
Maintenance	<p>Maintenance entitlement that provides benefits to non-Microsoft customers. However, it must be linked to</p>	All	<p>Software Asset Management doesn't reconcile only maintenance entitlement unless they're linked to</p>

License types and their impact on software reconciliation (continued)

License type	Description	Publisher applicability	Impact on licensing or reconciliation in SAM
	a base perpetual license to activate the entitlements.		base perpetual licenses. Therefore, make sure to relate the maintenance entitlement to base perpetual entitlements for correct reconciliation.
Step-up	A licensing option that enables upgrading from a lower-tier edition of a product to a higher-tier edition, such as Standard to Enterprise, without needing to purchase a full new license.	All	If you're covered under Microsoft Software Assurance, you can upgrade a lower edition of software, such as SQL Server Standard, to a higher edition, like SQL Server Enterprise. Use the Upgraded Entitlements tab in the Software Entitlement form to link related versions of your software under active maintenance and your upgrades. For more information, see Software entitlement fields .
Subscription Step-up	Similar to a step-up license, this license type applies to subscription-based licenses, enabling upgrades to higher-tier editions within the subscription term.	All (subscription products)	Same as step-up licenses, but for subscription software only.
Add on	Add-on USL is a user subscription license that lets you try the features of a cloud-based Microsoft 365 product or service while actively using the perpetual on-premise version. If you have a perpetual license with active SA benefits, this	Microsoft	The add-on license must be associated with a perpetual Office legacy license with active Software Assurance. Therefore, you must link the two licenses for it to work. For more information, see Create Microsoft 365 From SA and Add-on entitlements in

License types and their impact on software reconciliation (continued)

License type	Description	Publisher applicability	Impact on licensing or reconciliation in SAM
	license enables you to test the cloud version without fully transitioning to the cloud.		the Software Asset Workspace.
From SA	A Microsoft 365 From SA USL is a user subscription license that enables you to transition from a perpetual on-premise Microsoft software product to a corresponding cloud-based Microsoft 365 subscription, while maintaining certain SA benefits. This license is available if you have a perpetual license for on-premise Microsoft software products or services with active SA benefits.	Microsoft	The From SA license must be associated with a perpetual Office legacy license with active Software Assurance. Therefore, you must link the two licenses for it to work. For more information, see Create Microsoft 365 From SA and Add-on entitlements in the Software Asset Workspace.

Publisher optimizations for Adobe

View licensing optimizations for Adobe by selecting **Adobe** from the **Publisher** drop-down list.

Important:
To view the recommended licensing optimizations for Adobe, you must activate the **Software Asset Management Professional for Adobe plugin (com.sn_samp_adobe)** on your ServiceNow instance. In addition, you must request and install the **Software Asset Management - SaaS License Management Integrations application** from the **ServiceNow Store**.

Report	Source	Description
Creative Cloud user activity as per subscription	Software Subscriptions [samp_sw_subscription]	Number of user subscriptions per month with meaningful activity. This report displays data for all of your Adobe Creative Cloud All Apps subscriptions for the last 12 months.

Report	Source	Description
		Select any data point to view the last activity date of user subscriptions with meaningful activity for a given subscription type.
Creative Cloud potential savings by type	Removal Candidate [samp_sw_reclamation_candidate]	<p>Potential monthly savings for your Adobe Creative Cloud All Apps licenses that are based on low usage, double licensed users, and consolidated subscriptions. This report displays potential savings for the last 12 months.</p> <ul style="list-style-type: none"> • Low usage: The Adobe Creative Cloud applications not being used for more than 60 days. • Dual licensed users: A user having subscription through both Adobe Creative Cloud All Apps and individual Adobe Creative Cloud applications. • Consolidated subscriptions: A user having multiple individual Adobe applications (greater than 3 by default) and all these subscriptions are consolidated to one Adobe Creative Cloud All Apps subscription.
Inactive user subscriptions	Software Subscriptions [samp_sw_subscription]	Number of inactive user subscriptions in the User [sys_user] table of your ServiceNow instance based on the user status.
Unresolved user subscriptions	Software Subscriptions [samp_sw_subscription]	Number of users not having a record in the User [sys_user] table of your ServiceNow instance.

Microsoft Core License Optimization Reports fields

Field descriptions for the Microsoft Core License Optimization Reports [samp_ms_optimization_report] table.

Microsoft Core License Optimization Reports [samp_ms_optimization_report] table

Field	Description
Product	Microsoft software product that you are optimizing licensing for.
Cluster/Host Type	Indicates whether the recommended licensing optimization applies to a cluster or a standalone physical host.
Virtualization Technology	Virtualization technology that you are using to run virtual machines (VMs) within the cluster or on the standalone physical host.
Cluster/Host Reference	Cluster or standalone physical host that the recommended licensing optimization applies to.
Host Affinity Configured	Indicates if host affinity rules are configured for the cluster. Note: Host affinity rules are applicable to clusters only. If the Cluster/Host Type field is set to Cluster , this field can be set to either true or false . If the Cluster/Host Type field is set to Standalone Host , this field is automatically set to false .
Number of Hosts	Number of physical hosts. If the Cluster/Host Type field is set to Standalone Host , this field is set to 1 . If the Cluster/Host Type field is set to Cluster , this field is set to the total number of physical hosts within the cluster.
Host Cores	Number of cores within each CPU that is assigned to your physical hosts. If the Cluster/Host Type field is set to Standalone Host , this field is set to the number of cores within each CPU that is assigned to the standalone physical host. If the Cluster/Host Type field is set to Cluster , this field is set to the number of cores within each CPU that is assigned to a physical host within the cluster.
Number of VMs	Number of VMs within the cluster or on the standalone physical host.
VM Cores	Number of virtual cores within each virtual CPU (vCPU) that is assigned to your VMs. If the Cluster/Host Type field is set to Standalone Host , this field is set to the number of virtual cores within each vCPU that is assigned to the VMs on the standalone physical host. If the Cluster/Host Type field is set to Cluster , this field is set to the number of virtual cores within each vCPU that is assigned to the VMs within the cluster.
Number of VMs with software installations	Number of VMs that the Microsoft software product is installed on.
Host Core Licenses Required	Number of rights that are required for licensing either the physical hosts within the cluster or the standalone physical host.
VM Core Licenses Required	Number of rights that are required for licensing the VMs within the cluster or on the standalone physical host.
Current License Consumption	Type of license and total number of rights that you are currently consuming.

Microsoft Core License Optimization Reports [samp_ms_optimization_report] table (continued)

Field	Description
Current License Consumption Layer	Layer on which you are currently consuming rights. The options are Physical , Virtual , and Physical/Virtual .
Recommended License Consumption	Type of license and total number of rights that you are recommended to consume.
Recommended License Consumption Layer	Layer on which you are recommended to consume rights. The options are Physical , Virtual , and Physical/Virtual .
Conservative License Consumption	Conservative way to consume rights without applying any licensing optimizations. For example, you can consume rights for your Microsoft Windows Server Data Center or Microsoft SQL Server Enterprise licenses on the host layer.
Conservative License Cost	Total license cost based on the conservative license consumption.
Recommended License Cost	Total license cost based on the recommended license consumption and license consumption layer.
Current License Cost	Total license cost based on the current license consumption and license consumption layer.
Recommended License Applied	Indicates if the recommended licensing optimization has been implemented on the cluster or standalone physical host.
Licensing Status	Licensing status of the cluster or standalone physical host. The options are Licensed and Unlicensed .
Has Allocation	Indicates if you have enough rights to allocate to the cluster or standalone physical host.
Recommendation Details	Summary of the recommended licensing optimization.
Optimization Savings Achieved	Indicates if you have saved money by implementing the recommended licensing optimization.
Optimization Realized Savings	Amount of money that you have saved by implementing the recommended licensing optimization.
Potential Savings	Amount of money that you can save by implementing the recommended licensing optimization.

Maturity item details

Fields on the Maturity item details form help you view and update the state and success goal of the maturity item.

Maturity item details

Field	Description
Name	Name of the maturity item.
Type	Type of the maturity item. <ul style="list-style-type: none"> • Process • End user • SaaS • Data center • Cloud
Short description	A brief summary of the maturity item.
Success goal	Success goal associated to the maturity item. For more information about creating a success goal, see Create success goals for Software Asset Management .
State	Current stage of the maturity item. <ul style="list-style-type: none"> • New • Work in Progress • Closed Complete • Closed Skipped
Maturity level	Current maturity level. <ul style="list-style-type: none"> • Crawl • Walk • Run
Suggested maturity level	Suggested maturity level for improved value return of your SAM application. <ul style="list-style-type: none"> • Crawl • Walk • Run
Start date	The start date of the maturity item.
Completed date	Completed date of the maturity item.
Purpose	Description of the purpose and outcome for the maturity item.
Steps to complete	List of steps of how to accomplish the purpose of the maturity item.
Work notes	Notes about the maturity item, which are visible to all users within your organization.

Maturity stages of your Software Asset Management program

The maturity of your Software Asset Management program is divided into three stages such as Crawl, Walk, and Run.

Maturity stages

Stage	Description
Crawl	Begin your Software Asset Management journey, such as implementing or developing a new Software Asset Management program. At this stage, you can establish a healthy Configuration Management Database (CMDB), identify tools to discover data, and establish processes and roles. You can focus on End-user computing or SaaS integrations for which licensing isn't complex.
Walk	Begin establishing processes, procedures, policies, resources, and tools to execute on the roadmap of the Software Asset Management program. You can automate the manual processes and procedures, which you've established during the Crawl stage. Move to more complex licensing models in datacenter environments, Bring your own license (BYOL) use cases, and additional SaaS publishers. You can consider additional governance and cost control through software metering and reclamation, identify overlapping software, and rightsize software estate through compliance results.
Run	Establish and use mature, standardized, and automated processes and procedures for centralized software assets tracking and system management. You use the standard catalog and onboarding process for new catalog items in the purchasing process. Provide software to end users through automated on-demand mechanisms and rightsize your software spend. You must also be evaluating processes and establishing Software Asset Management goals regularly.

SAM Success Goal Details

Fields on the SAM Success Goal Details help you create success goals for tracking the success of the Software Asset Management application in your instance.

SAM Success Goal Details

Field	Description
Number	A unique identifier of the success goal.
Title	The title for the success goal.

SAM Success Goal Details (continued)

Field	Description
Status	Status of the success goal. By default, the success goal is in draft status.
Category	The category the success goal belongs to.
Vendor	Vendor or publisher associated to the success goal.
Goal Type	Defines the metrics of your goal. <ul style="list-style-type: none"> • Savings • Count
Goal Description	A detailed explanation of the success goal.
Group	The group the goal is to be assigned to.
Owner	The user from the group the goal is assigned to.
Projected Start Date	The projected start date for the success goal.
Projected End Date	The projected end date for the success goal.
Actual Start Date	The actual start date of the success goal.
Actual End Date	The actual end date of the success goal.
Projected Savings	Anticipated savings from the success goal. This field is visible only when you set the Goal Type as Savings .
Actual Savings	The actual savings from the success goal. This field is visible only when you set the Goal Type as Savings .
Projected Count	Anticipated count from the success goal. This field is visible only when you set the Goal Type as Count .
Actual Count	The actual count from the success goal. This field is visible only when you set the Goal Type as Count .
Achievement Description	A description of how the success goal was achieved.

Sample payload for generic software install records

A sample payload that populates the Software Installation [cmdb_sam_sw_install] table in the ServiceNow instance with discovery data collected by third-party discovery sources.

The following is a sample payload for creating software install records for publishers such as Microsoft, IBM. For Oracle, VMware, and Citrix, specialized payloads are used.

In this sample payload, you are passing the information of the installed software, Microsoft Word 2016, and the related CI to inform where it is installed (on a computer CI "SAMILMT8"). You can look up column names in the cmdb_sam_sw_install table and send information by passing the columns, value pairs in the payload. For example, in this payload you are sending the publisher, version and display_name columns. You can also send additional information such as the edition column.

Note:

For more information on CI Identifier rules, see [Identifier Rules](#).

```
{ 'items': [ { 'className': 'cmdb_ci_computer',
               'related': [ {
                             className: 'cmdb_sam_sw_install',
                             values: {
                               'publisher': 'Microsoft',
                               'version': '2016',
                               'display_name': 'Word'
                             }
                           }
               ],
               'values': { 'name': 'SAMILMT8' }
             } ]
}
```

Element	Value	Description
className	cmdb_ci_computer	The class name of the CI.
className	cmdb_sam_sw_install	The name of the related table in the CMDB application where the CI is to be created.
publisher	Microsoft	The name of the publisher for whom this entry is being created in the table.
version	2016	The version of the software for which this entry is created in the table.
display name	Word	The display name for this entry in the table.
name	SAMILMT8	Unique identifier of the CI.

Sample payload for Oracle software install records

A sample payload for Oracle publisher pack that populates the Oracle Instance [cmdb_ci_db_ora_instance] table with software install records from third-party discovery sources.

After you discover Oracle software installs via your discovery source, send a payload that contains the Oracle Instance and the Oracle options associated with the Oracle Instance.

Note:

In the Properties page, make sure to select the Enable scheduled jobs when using third party Datasource Integration Framework [com.snc.samp.ire.datasource.integration] property.

When the schedule job, SAM- Software Asset Connections, runs, it looks for records with null software installs, populates the software install field in the Oracle Instance table and creates the software install record associated to the instance.

The following is a sample payload to create software install records for Oracle in the Oracle Instance [cmdb_ci_db_ora_instance] table. The sample input contains a list of CIs and relationships that exist between these CIs. The payload states that there is an Oracle database server, Dev development 1969 with a standard edition. The Oracle database server has many Oracle options enabled such as Armstrong, Aldrin, Collins and runs on a Linux server.

```
{
  'items': [
    {
      'className': 'cmdb_ci_db_ora_instance',

Element	Value	Description
className	cmdb_ci_db_ora_instance	Name of the related Oracle instance table.
className	samp_oracle_options	Name of the Oracle database option table.
option	Armstrong	Name of the Oracle database option.
currently_used	true	Indicates the Armstrong option is currently enabled.
className	samp_oracle_options	Name of the Oracle database option table.
option	Aldrin	Name of the Oracle database option
currently_used	true	Indicates the Aldrin option is currently enabled.
name	Dev Development 69	Name of the Oracle database server
edition	standard	edition of the Oracle database server
sid	1-2-569	Oracle system ID
version	11.2	Version of the Oracle database server
className	cmdb_ci_linux_server	Name of the related Linux Server table.

Element	Value	Description
mac address	4653XYZAA	MAC address of the interface in the Linux server.

Sample payload for VMware software install records

A sample payload for VMware publisher pack that populates the VMware Discovered License key consumption [samp_vmware_license_key_usage] table with software install records from third-party discovery sources.

After you discover software installs via your discovery source, send a payload via the IRE REST API endpoint to the ServiceNow instance to populate the VMware Discovered License key consumption [samp_vmware_license_key_usage] table with software install records.

Note:

In the Properties page, make sure to select the Enable scheduled jobs when using third party Datasource Integration Framework [com.snc.samp.ire.datasource.integration] property.

1. Send a payload to create a license key in the VMware Discovered License key [samp_vmware_license_key] table.
2. From the response body of the payload, copy the sys ID of the new license key and paste it in a text editor for later use.
3. Use the Enhanced IRE API to query the sys IDs of the CIs that use the new license key.
4. From the response body, copy the sys IDs of the CIs and paste them in a text editor for later use.
5. Send a payload with the sys ID of the license key and the sys ID of the CIs.
6. Run the schedule job, SAM- Update Software Usage to populate the VMware Discovered License key consumption [samp_vmware_license_key_usage] table with the software install records.

```

Element	Value	Description
className	cmdb_ci_vcenter	Name of the table related [samp_vmware_license_key] table
className	samp_vmware_license_key	Name of the table where the license key is created.
className	cmdb_ci_win_server	The name of the Windows server table
name	VirtualMachine-WS2	Name of the Windows server virtual machine.

Sample payload for Citrix software install records

A sample payload for the Citrix publisher pack that populates the Software Installation [cmdb_sam_sw__install] table with software install records from third-party discovery sources.

The Citrix publisher pack supports two products: virtual applications and virtual desktop. For these products, Citrix supports concurrent licensing and user/device licensing.

Note:

For information on license metrics, see [Software License Metrics](#)

The IRE API relies on two CI identifier rules for creating Citrix software install records. The Citrix License server [cmdb_ci_appl_license_server] identifier populates the CAL entries and the Citrix Delivery Controller [cmdb_ci_appl_delivery_controller] identifier creates the software install records.

The CAL entries are used during reconciliation to compare against the purchased rights in entitlements to get the correct license position for Citrix products. The Citrix License server identifier provides information on the samp_concurrent_license_consumption and the samp_user_device_license_consumption tables. Based on your licensing entitlements, you need to populate either of these two tables.

Send a payload to populate the samp_concurrent_license_consumption or the samp_user_device_license_consumption table. Ensure that you mention the key attributes for the tables in the payload:

- samp_concurrent_license_consumption: product_code and number
- samp_user_device_license_consumption: product_code, consumer, and consumer_type

Note:

The two tables are passed in one payload since both are related entries of the parent CI table, cmdb_ci_appl_license_server. In the payload, specify the relationship between the tables and the CI parent table.

Once you send the payload, entries are created in the samp_concurrent_license_consumption and the samp_user_device_license_consumption tables. Now execute the scheduled job, SAM- Create Citrix CAL entries, to update the Client Access [samp_sw_client_access] table. Client access records are created for each product with user/device count.

Note:

Ensure that you configure the schedule job, SAM- Create Citrix CAL entries to execute after processing the payload successfully.

Using the Citrix Delivery Controller [cmdb_ci_appl_delivery_controller] identifier, send a payload to populate all the 7 Citrix tables. Make sure that you mention the key attributes for the 7 tables in the payload.

Note:

Click **Related Entries** in the Citrix Delivery Controller identifier to look up the key attributes (**Criterion attributes**) for the Citrix tables.

Once the entries are created in the tables, execute the scheduled job, SAM- Create Citrix Software installs. The Citrix software install records are created in the Software Installation [cmdb_sam_sw_install] table.

```

Sample payload for BYOL

A sample payload that populates the Software Installation [cmdb_sam_sw_install] table in the ServiceNow instance with discovery data collected by the BYOL licensing model.

Certain entities need to be populated for BYOL to work with software asset connection as a third party discovery source. The relationship between these entities is crucial for BYOL to work smoothly with software asset connections. For example, some values required for populating Cloud Hosts is different for AWS and Azure. Though the object ID and the name of the host is required for both AWS and Azure, for AWS, the CPU core count is required and for Azure, the host type value is required. For details on entities and their relationships, refer to [Entities for BYOL](#) and [Relationships between the entities for BYOL](#).

In this example, Cloud Service Account is the topmost entity. All the other entities listed in the Entities for BYOL table are dependent entities of Cloud Service Account. If an entity is marked as a dependent entity, then the parent entity and the relationship between that entity and it's parent needs to be mentioned in the same payload. For example, if you want to create an AWS data center on Cloud Service Account, you need to include the Cloud Service Account entity in the same payload; even if Cloud Service Account already exists in your instance. Similarly, when you create software installations, you need to include all the dependent entities for software installations all through the hierarchy in the same payload.

Entities for BYOL

Entities	Required fields
Cloud Service Account [cmdb_ci_cloud_service_account]	account_id – Unique identifier
AWS Datacenters [cmdb_ci_aws_datacenter]	object_id – Unique identifier

Entities	Required fields
Azure Datacenters [cmdb_ci_azure_datacenter]	object_id – Unique identifier
Cloud Hosts [cmdb_ci_cloud_host] Note: Not needed for shared VMs.	<ul style="list-style-type: none"> object_id – Unique identifier name - name of the host host_type - host type for Azure. For example, DSv3-Type1 (for Azure hosts only). cpu_core-count - Total CPU core count of the host (for AWS hosts only).
Virtual Machine Instances [cmdb_ci_vm_instance]	object_id – Unique identifier
Computers [cmdb_ci_computer]	<ul style="list-style-type: none"> name - name of the virtual machine cpu_count - CPU count of the virtual machine cpu_core_count - CPU core count of the virtual machine cpu_core_thread - CPU core thread count of the virtual machine virtual – indicates if the computer is a VM (always set to true)
Software Installations [cmdb_sam_sw_install] Note: Software Installations [cmdb_sam_sw_install] is a related entry for Computers [cmdb_ci_computer]	<ul style="list-style-type: none"> publisher version display_name cloud_license_type - license type of the cloud install (BYOL or License Included) cloud_license_type_source - source from where cloud license type gets populated. The value is set to third_party_integration for Software asset connections.

Relationships between the entities for BYOL

Entity relationships	Type	Parent	Child
AWS/Azure Datacenters – Cloud Service Account	Hosted on::Hosts	AWS/Azure Datacenters	Cloud Service Account
AWS/Azure Datacenters – Cloud Hosts	Hosted on::Hosts	Cloud Hosts	AWS/Azure Datacenters

Entity relationships	Type	Parent	Child
AWS/Azure Datacenters – Virtual Machine Instances	Hosted on::Hosts	Virtual Machine Instances	AWS/Azure Datacenters
Cloud Hosts - Virtual Machine Instances	Runs on::Runs	Virtual Machine Instances	Cloud Hosts
Computers - Virtual Machine Instances	Virtualized by::Virtualizes	Computers	Virtual Machine Instances

Sample payload for Computer and Installations for dedicated VM (similar for AWS and Azure)

In this sample payload, a dedicated computer record is being passed. This computer record has a related array that contains all the software installations. A VM instance corresponds to the computer record. Cloud host is the dedicated host on which the virtual machine resides and the AWS datacenter is to be created on the Cloud Service Account. If you have multiple dedicated virtual machines, you can send one REST API for each dedicated virtual machine. For example, if you have 50 dedicated VMs, you need to send 50 REST API calls each having the same payload. All the software installations on a dedicated VM can be sent in a single payload in the related array.

```
var payload = {
  'items': [{
    'className': 'cmdb_ci_computer',
    'values': {
      'name': 'Comp - Dedicated AWS - 1',
      'cpu_count': 1,
      'cpu_core_count': 4,
      'cpu_core_thread': 1,
      'virtual': true
    },
    'related': [{
      'className': 'cmdb_sam_sw_install',
      'values': {
        'publisher': 'Microsoft',
        'display_name': 'SQL Server',
        'version': '2017',
        'cloud_license_type': 'BYOL',
```

```

SAM Success Activity

Fields on the SAM Success Activity form help you create success activities to track the success of your created goals.

SAM Success Activity

Field	Description
Number	A unique identifier of the success activity.
Success Goal	The success goal that the activity is being associated to.
State	The current state of the success activity. Choose from the following options: <ul style="list-style-type: none"> • Pending • Open • Closed Complete • Closed Incomplete • Closed Skipped
Assignment group	The group this activity is assigned to.
Assigned to	A particular person in the assigned group.
Short description	A short description of the success activity.
Description	A detailed description of the success activity.
Work notes	Notes relating to the success activity.

SaaS detection report

Use the SaaS detection report to discover and manage all SaaS applications accessed via a browser and configured within the ServiceNow® Agent Client Collector for Visibility - Content (ACC-VC) product. The SaaS applications that can be managed through this report can be paid or free ones.

i Important:

To view the SaaS detection report, you must do the following:

- Request and install version 15.0.15 or later of the Software Asset Management -SaaS License Management application from the [ServiceNow Store](#) . For more information, see [Request SaaS License Management](#).
- Install the Agent Client Collector for Visibility - Content (ACC-VC) product version 1.3.0 or later.

This report helps you manage your shadow IT spend more effectively by viewing all the users who access these applications, the usage of these applications, and how long each application has been used.

Note:

By default, the SaaS detection report displays data from the past 90 days.

To view this report, navigate to **Software Asset Workspace > License usage > Reports.**

The SaaS detection report includes domain-separated data when Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) and Performance Analytics - Domain Support (com.snc.pa.domain_support) are activated.

SaaS detection

Field	Description
Product	The name of the SaaS application that is being discovered.
Publisher	Publisher of the SaaS application. Publisher is a reference to the Software Publishers [samp_sw_publisher] table.
Is monitored	Indicates whether ACC-VC is monitoring the product or not. <ul style="list-style-type: none"> • If the product is monitored by the ACC-VC application, the Is monitored column value shows as true. • If the product isn't monitored by the ACC-VC application, the Is monitored column value shows as false.
Is managed	Indicates whether the product is managed or unmanaged. <ul style="list-style-type: none"> • If a software model exists for a product, the Is managed column value shows as true. • If a software model doesn't exist for a product, the Is managed column value shows as false.
URL(s)	URL or multiple URLs for your SaaS application.
Total users	Total number of users who have accessed the product. Select the value in this column to view more information about the users in the User Usage Data table.
Last accessed time	The time when the product was last accessed by a user.
Total accessed time	Total duration for which the product has been accessed by its users.

User Usage Data

Field	Description
Discovered user	User referenced from the Discovered Users [samp_discovered_user] table.
User	User accessing the application.
Device	Device or CI from which the user accessed the application.
Cost center	Allotted cost center of the user in an organization.
Department	Department of the user in an organization.
Total accessed time	Total duration for which the application has been accessed by a user.
Last accessed time	Last time when the application was accessed by a user.

Reclamation rules

Reclamation rules define the minimum amount of time for which a subscription must be used. If the subscription doesn't have any activity within a specified time limit, it's added to the list of reclamation candidates.

For each direct integration, the user activity is defined differently. Only one of the listed activities is required to occur within the specified time limit, not all of them.

Direct integration	Activity
Adobe Cloud	Any user activity
Aha!	User login  Note: The analysis period is 60 days.

Reclamation rules for Microsoft 365 integration

Reclamation rules for Microsoft 365 integration sets the minimum usage threshold for a subscription. If a subscription remains inactive for a specified period, Software Asset Management marks the subscription as a potential reclamation candidate.

Reclamation rule	Justification	Description
<ul style="list-style-type: none"> • Power BI • Exchange Online • SharePoint Online • OneDrive for Business • Teams • Project Online • Visio Online • Microsoft 365 Copilot 	Low Usage	If these individual subscriptions show low usage, Software Asset Management recommends reclaiming the low usage subscriptions.
Office 365	<ul style="list-style-type: none"> • Low Usage • Downgrade 	<ul style="list-style-type: none"> • Low usage <p>For example, if Office 365 individual subscriptions or subscriptions suites show low usage, Software Asset Management recommends</p>

Reclamation rule	Justification	Description
		<p>reclaiming the low usage subscriptions.</p> <ul style="list-style-type: none"> • Downgrade <p>For example, if an Office 365 E5 subscription including advanced features and capabilities with Power BI isn't being used, Software Asset Management recommends switching to a downgraded Office 365 E3 subscription.</p>
<p>Microsoft 365</p>	<ul style="list-style-type: none"> • Low Usage • Downgrade • Overlapping • Consolidate <p>i Note: The Overlapping and Consolidate use cases are applicable to all Microsoft 365 integration subscriptions.</p>	<ul style="list-style-type: none"> • Low usage <p>For example, if Microsoft 365 individual subscriptions or subscriptions suites show low usage, Software Asset Management recommends reclaiming the low usage subscriptions.</p> <ul style="list-style-type: none"> • Downgrade <p>For example, if a Microsoft 365 E5 subscription including advanced features and capabilities with Power BI isn't being used, Software Asset Management recommends switching to a downgraded Microsoft 365 E3 subscription.</p> <ul style="list-style-type: none"> • Overlapping <p>For example, both Microsoft 365 E3 and Office 365 E3 subscriptions exist, leading to unnecessary duplicate access to Office applications and additional services already included in Microsoft 365 E3. Software Asset Management recommends reclaiming the Office 365 E3 subscriptions and using the Microsoft 365 E3 subscriptions instead.</p> <ul style="list-style-type: none"> • Consolidate

Reclamation rule	Justification	Description
		For example, if Office 365 Enterprise E5, Windows, and EMS subscriptions exist, Software Asset Management recommends using a single license such as Microsoft 365 Enterprise E5 to cover these multiple products at a lower cost.

Microsoft 365 Apps Usage Reports

Find the last activity date for Microsoft 365 products to determine reclamation candidates.

The values for each field in the Microsoft 365 Apps Usage Reports [samp_m365_apps_usage_report] table are populated using the Microsoft Graph APIs. The **Last Activity Date** helps in determining reclamation candidates more accurately for the supported Microsoft 365 products, including Microsoft Outlook, Word, PowerPoint, Excel, Teams, and OneNote.

Microsoft 365 Apps Usage Reports

Field	Description
User Principal Name	Email address of the user.
Last Activity Date	Date the software product was last used.
Last Activation Date	Date on which the software product license was last activated for the user.
Report Period	Number of days for no meaningful activity before a user account is added to the list of reclamation candidates. The default value is 30 days.
Report Refresh Date	Date of the last refresh of the report.
Windows	Indicates usage of Windows with the value True or False.
Mac	Indicates usage of macOS with the value True or False.
Excel (Mac)	Indicates usage of Microsoft Excel on macOS with the value True or False.
PowerPoint (Mac)	Indicates usage of Microsoft PowerPoint on macOS with the value True or False.

Microsoft 365 Apps Usage Reports (continued)

Field	Description
Outlook (Mac)	Indicates usage of Microsoft Outlook on macOS with the value True or False.
Word (Mac)	Indicates usage of Microsoft Word on macOS with the value True or False.
OneNote (Mac)	Indicates usage of Microsoft OneNote on macOS with the value True or False.
Teams (Mac)	Indicates usage of Microsoft Teams on macOS with the value True or False.
Excel (Windows)	Indicates usage of Microsoft PowerPoint on Windows with the value True or False.
PowerPoint (Windows)	Indicates usage of Microsoft PowerPoint on Windows with the value True or False.
Outlook (Windows)	Indicates usage of Microsoft Outlook on Windows with the value True or False.
Word (Windows)	Indicates usage of Microsoft Word on Windows with the value True or False.
OneNote (Windows)	Indicates usage of Microsoft OneNote on Windows with the value True or False.
Teams (Windows)	Indicates usage of Microsoft Teams on Windows with the value True or False.

Subscription downgrade configuration

Determine various downgrade configurations of SaaS applications and view the downgrade order based on the conditions.

Subscription downgrade configuration

Field	Description
Display name	Name of the supported downgrade configuration.
Source subscription identifier	Subscription identifier of the SaaS application that is currently being used.
Destination subscription identifier	Subscription identifier of SaaS application that can be downgraded to.
Condition	Defined downgrade conditions for the SaaS application.
Active	Shows whether the downgrade configuration is active.

Pricing model for Oracle Java SE Universal

Tier-based monthly subscription price per employee is based on the number of employees directly or indirectly working in an organization.

The Price tier [samp_price_tier] table supports the Employee license metric of the Java SE software model and contains read-only values. This table is shipped with the Software Asset Management Professional for Oracle (com.snc.samp.oracle) plugin.

This table populates the override license cost records for Oracle Java. When you're using a custom tier table, you can update the override license cost records associated with the Oracle Java software model. For details, see [Create or update an override license cost record](#).

Price tier table

Number of employees	Monthly subscription cost per employee
1-999	\$15
1,000-2,999	\$12
3,000-9,999	\$10.50
10,000-19,999	\$8.25
20,000-29,999	\$6.25
30,000-39,999	\$5.70
40,000-49,999	\$5.25

Software EOL request fields

Use the Software EOL request form to create a software end of life (EOL) request for software products in your asset estate that are reaching or have reached EOL.

Software EOL request form

Field	Description
Number	A unique identifier for the EOL request.
Company	Name of the publisher of the software product.
Product	Name of the software product.
Edition	Edition of the software.
Version	Licensable version of the software.
Full version	The granular licensable version of the software.
Justification	Reason for starting the EOL request on the software.
Stage	The stage of the software EOL request. The default stage is Draft . Possible values include: <ul style="list-style-type: none"> • Draft • Open • Analysis • Action initiated

Field	Description
	<ul style="list-style-type: none"> • Completed • Cancelled
Action initiated	<p>The action taken to manage EOL risk. Possible values include:</p> <ul style="list-style-type: none"> • Pending • Remove EOL software • Upgrade • Purchase support • Move to Azure • Accept risk
Version type	<p>Version type values include:</p> <ul style="list-style-type: none"> • Version (build version) • Full version (main version) <p>Note: You can manage EOL risk either for a version or full version of a software product.</p>
Priority	Priority of the software EOL request.
Assignment group	The group from which an individual is selected to complete the software EOL request.
Assignment to	The individual assigned to complete the software EOL request, who is selected from the Assignment group .
Short description	A brief description of the task.
Description	A detailed description of the task.
Work notes	Information about how the EOL workflow task is resolved.

Software EOL tasks tab

Field	Description
Number	A unique identifier for the software EOL task.
Name	Name of the software EOL task.
Software EOL request	The identifier of the software EOL request.
Parent	The identifier of the parent task.
State	The state of the software EOL task. The default state is Open .

Field	Description
Action	<p>Indicates the action that you can take after deciding an IT strategy. Possible values include:</p> <ul style="list-style-type: none"> • Remove EOL software: Remove the EOL software product from the asset inventory. • Upgrade: Upgrade to the latest or the supported software version. • Purchase support: Purchase additional support for maintenance. • Move to Azure: Migrate to Microsoft Azure. This action is available only for Microsoft products. • Accept risk: Accept risks associated with the EOL software. <p>This field appears only when the value selected in the Name field is Decide on IT strategy.</p>
Priority	Priority of the software EOL task.
Assignment group	The group from which an individual is selected to complete the software EOL task.
Assigned to	The individual assigned to complete the software EOL task, who is selected from the Assignment group .
Short description	A brief description of the task.
Description	A detailed description of the task.
Notes	Additional information about the EOL task.
Work notes	Information about how the software EOL task is resolved.

User device license consumption fields

SAM managers can view the client access license (CAL) usage details for Microsoft Windows Server in the User Device License Consumption table and create CAL records.

The User Device License Consumption [samp_user_device_license_consumption] table is populated with the CAL usage logging data for the Windows Server. The data is accessed from ServiceNow Discovery.

To learn more about Microsoft usage access logging for CAL, see [Microsoft User Access Logging](#).

For more information on Microsoft specific license metrics, see [Supported Microsoft 365 license types](#).

The User Device License Consumption table is a child table of the Configuration Item [cmdb_ci] table.

User Device License Consumption form

Field	Description
Domain	Domain to which the data belongs.
Consumer	User ID or IP address of the client device that is used to access a role or a service.
License category	The functional category of the CAL. This field is populated only when the license is of CAL type. For example, Microsoft supports User CAL, Device CAL, and Per Core (with CAL) license metrics.
Publisher	The publisher of the license consumption record.
Consumer type	Type of consumer license: User or Device
Product name	The name of the product for which the license consumption record is created.
Activity count	The number of times a particular user or device accesses a role or service.
Source	The CI record for license consumption.
Discovery source	Discovery source for which license consumption is evaluated.
Product code	The code of the product for which the license consumption record is created.

User resolution rule fields

Fields on the User Resolutions Rules page help you create a rule to map the **User** field in the Software Subscription [samp_sw_subscription] table to an associated user in the User [sys_user] table within the ServiceNow AI Platform.

User Resolution Rules

Field	Description
Display name	Name of the user resolution rule.
Active	Option for enabling the user resolution rule. If this check box is cleared, this rule isn't applied to resolve user subscriptions.
Category	Category of the integration profile that the user resolution rule applies to. <ul style="list-style-type: none"> • SaaS • SSO By default, this field value is set to SaaS .
Source table	Table that contains subscription records.

User Resolution Rules (continued)

Field	Description
	<p>Select Software Subscription [samp_sw_subscription].</p> <p>This field appears only when SaaS is selected from Category.</p>
Look up table	<p>This field is automatically set to User.</p>
Applies to	<p>One or multiple integration profiles to which the user resolution rule applies to.</p> <p>This field appears only when SaaS is selected from Category.</p>
Source field	<p>A field in the Software Subscription [samp_sw_subscription] table used for lookup against the User [sys_user] table, such as User principal name and External user id.</p> <p>As other columns might not contain sufficient data, select either User principal name or External user id.</p> <p>This field appears only when SaaS is selected from Category.</p>
Look up field	<p>The field against which you want to match the Source field value.</p> <p>For example, if you select User principal name in Source field and Email in Look up field, Software Asset Management tries to match these two fields. The match must be exact. If it isn't, you can change the value to User ID in Look up field.</p> <p>Note: User resolution rules created for non-indexed Look up fields in the sys_user table are automatically marked as inactive. This applies to both manually created and AI-generated user resolution rules.</p>
Apply transform on input	<p>Option to apply transformations to the Source field value.</p> <ul style="list-style-type: none"> • None: The Source field value is matched exactly with the Lookup field value. • Remove domain: If you have selected Email in Look up field, the first part of the email address (before the @ symbol), which is the User ID or name, is matched with the Source field value.

User Resolution Rules (continued)

Field	Description
	<ul style="list-style-type: none"> • Replace domain: When you have selected Email in Look up field and you want to replace the domain name, that is, the second part of the email address (after the @ symbol). For example, replace <code>example.com</code> with <code>exampletest.com</code>. • Run script: This option is available only to administrators for updating the script.
New domain	<p>The new domain that you want to add after the @ symbol when Email is selected in Look up field.</p> <p>This field appears only when Replace domain is selected from Apply transform on input.</p>
Script	<div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #cfcfcf;"> <p>i Important: This field is available only to administrators.</p> </div> <p>If the mapping still fails after replacing or removing the domain or the logic is complex, the script can be updated to achieve the desired result.</p>

Domain separation and Software Asset Management

Domain separation is supported in Software Asset Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Enhanced

- Includes all aspects of **Basic** and **Standard** levels of support.
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer cannot affect another.
- Tenants of the instance must be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application's normal function.

Sample use case: Tenant-customers of a shared environment must be able to modify the impact, urgency, or priority matrix to set priority within their domain.

For more information on support levels, see [Application support for domain separation](#) .

Overview

Domain separation support in the product enables service providers to offer managed services for software and hardware asset management to their customers. This feature also caters to large organizations who manage their subsidiaries as independent domains.

How domain separation works in Software Asset Management

In SAM, domain separation occurs in two stages: data separation and process separation. From the Paris release, both data and process are domain-separated.

Any user with `sam_integrator` role has access to create and modify the SaaS integration profiles. Since users with this role can also access the Oauth application registry (currently not domain-separated, so records across all domains are visible), this `sam_integrator` role should be assigned with caution. The user should be in the service provider organization and satisfy high permissions criteria.

To view logs for domain separation, you need to create a system property titled `asset.log_level` and set its value to `debug`, `trace` or `info`. Based on the value that you set, logs are shown when any scheduled job that extends the `AssetManagementBaseJobscheduled` job runs.

In a domain-separated instance, the content data service (CDS) should populate data in the instance with domain set as **global**.

i Note:

The [Recommended practice](#)  is to avoid customizing the base system domain configuration record.

Multi-Tenant Support for IT Asset Management

Manage the entire IT Asset Management lifecycle for your customers in a shared ServiceNow instance

Complete data and process separation | Tenant admin support

now

Service Provider Benefits

- Accelerate into new markets
 - Software Asset Management
 - Hardware Asset Management
- Provide ITAM as a service:
 - ❖ Contract and entitlement management
 - ❖ Discovery and normalization reporting
 - ❖ Software reconciliation, optimization and licensing expertise
 - ❖ Audit response
 - ❖ Software lifecycle and vulnerability reporting

Customer Benefits

- Experts provide best practice services and processes
- No platform or process ownership required

Required plugins

- Domain separation extension (`com.glide.domain.msp_extensions.installer`)
- Performance Analytics – Domain Support (`com.snc.pa.domain_support`)

- SAMP (com.sn_samp_master)
- HAMP (store app)

Other supported plugins

- Service Catalog – Domain Separation (com.glideapp.servicecatalog.domain_separation)
- Procurement (com.snc.procurement)
- Cost Management (com.snc.cost_management)
- Contract Management (com.snc.contract_management)

To learn more, see [Domain separation explained](#), [Contains queries and domain access](#), and [Importance of Default domain](#).

Related topics

[Domain separation for service providers](#)

Domain separation and lifecycle reports

There are certain domain separation aspects to consider when running software lifecycle reports.

Software Asset Management overview

In a domain-separated environment, the software lifecycle report is generated at the level at which the Service Provider (SP) is managing compliance for their customers’ environment. Typically, the level at which reconciliation is run indicates such compliance, and the software lifecycle report is generated at the same level.

The following table shows how the reconciliation should behave. In this example:

- The SP is managing Cisco's software asset management (SAM) program at the Cisco corporate level. That means the lifecycle report must run at the Cisco corporate level.
- The SP is managing Walmart's SAM program for each Walmart division (US and Mexico). That means the lifecycle report must run at the Walmart division level.

Here is the SP hierarchy:

- Cisco Corporate
 - Cisco USA
 - Cisco Mexico
- Walmart Corporate
 - Walmart USA
 - Walmart Mexico

Domain settings (reconciliation/normalization)	Compliance reporting	Lifecycle report level
TOP/Cisco	True	Yes
TOP/Cisco/US	False	
TOP/Cisco/Mexico	False	

Domain settings (reconciliation/normalization)	Compliance reporting	Lifecycle report level
TOP/Cisco/Germany	False	
TOP/Walmart	False	
TOP/Walmart/US	True	Yes
TOP/Walmart/Mexico	True	Yes

If the SP sets up software models for Cisco corporate as well as Cisco Mexico, even though their intent is to manage compliance for Cisco at the Cisco Corporate level, the lifecycle report may show duplicate lifecycle records with the same install count.

Lifecycle report

Model domain		Date		Software Model	Domain
Cisco	SQL Server 2012	2014	10	SQL Server 2012	Cisco
Cisco Mexico	SQL Server 2012	2014	10	SQL Server 2012	Cisco
Walmart USA	SQL Server 2012	2014	5		
Walmart Mexico	SQL Server 2012	2014	20		

To learn more about software lifecycles, see [Create software models in Software Asset Management classic](#). To learn about domain separation path setup, see [Domain separation setup and administration](#) 

Quick start tests for Software Asset Management

Validate that Software Asset Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Software Asset Management quick start tests require activating the Software Asset Management Professional plugin (com.snc.samp). Some quick start tests require activating the following additional plugins.

- Software Asset Management - Spend Detection (com.sn_sam_spend)
- Software Asset Management Professional for Microsoft (com.snc.samp.microsoft)
- Software Asset Management Professional for SAP (com.sn_samp_sap)
- Software Asset Management Professional for Oracle (com.snc.samp.oracle)
- Software Asset Management - SaaS License Management Integrations (sn_sam_saas_int)

Software Asset Management test suite

Test	Description	Release version
SAM - Mapping Custom PPN/ DMAP to newly published PPN and Content	Validates the replacement of a custom publisher part number (PPN) with a new Software Asset Management Content Service PPN.	San Diego
SAM - Oracle PaaS BYOL	<ul style="list-style-type: none"> Validates the addition of the new Serverless Hardware [cmdb_ci_serverless_hardware] table, which stores information about PaaS devices. Validates the license compliance of Oracle Database servers in Amazon Web Services (AWS) PaaS environments. <p>i Note: Requires the Software Asset Management Professional for Oracle (com.snc.samp.oracle) plugin and the CMDB CI Class Models store application.</p>	Rome
SAM - Software Product Lifecycles records on Software Model	Validates that the Software Lifecycle tab on the Software Model form is showing records.	Quebec
SAM - BYOL	<ul style="list-style-type: none"> Validates the purchase date on the Software Entitlement form Validates the addition of newly added column legacy_license on the License Metric Results [samp_license_metric_result] 	Quebec

Software Asset Management test suite (continued)

Test	Description	Release version
	<p>and License Position Report [samp_license_position_report] tables</p> <ul style="list-style-type: none"> Validates the addition of newly added columns, cloud_license_type and cloud_license_type_source in the Software Installations [cmdb_sam_sw_install] table <p>Note: Requires the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin.</p>	
SAM - Validate CIS Suites	<p>Validates reconciliation of Core Infrastructure Server (CIS) suites along with downgrade rights.</p> <p>Note: Requires demo data and the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin.</p>	Paris
SAM - PerCoreForMSCluster	<p>Verifies the reconciliation functionality for Microsoft per core with cluster.</p> <p>Note: Requires the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin.</p>	Paris
SAM - Validate upgrade/downgrade during Reconciliation for Microsoft publisher	<p>Validates upgrade and downgrade rights during reconciliation for Microsoft products.</p>	Paris

Software Asset Management test suite (continued)

Test	Description	Release version
	<p>i Note: Requires demo data and the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin.</p>	
<p>SAM - Generate demand to consolidate SaaS applications</p>	<p>Validates generation and submission of a demand on SaaS applications.</p> <p>i Note: Requires the Software Asset Management - Spend Detection (com.sn_sam_spend) plugin and the PPM standard (com.snc.financial_planning_pmo) plugin.</p>	<p>Paris</p>
<p>SAM - Software Model and Software Entitlement checks for SAP Engines</p>	<p>Verifies that the Software Model and Software Entitlement forms change when the product is an SAP engine.</p> <p>i Note: Requires the Software Asset Management Professional for SAP (com.sn_samp_sap) plugin.</p>	<p>Paris</p>
<p>SAM - Downgrade Rights on Software Model</p>	<p>Validates that the downgrade rights pushed from the content service are correctly populated on the Downgrade Rights related list on the software model form.</p>	<p>Orlando</p>
<p>SAM - Multi-core pack validation on Software Entitlement</p>	<p>Validates the functionality of new fields for a multi-core pack on software entitlements.</p>	<p>Orlando</p>

Software Asset Management test suite (continued)

Test	Description	Release version
	<p>i Note: Requires the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin.</p>	
SAM - Downgrade Rights on Software Entitlement	Validates that the downgrade rights pushed from the content service are correctly populated on the Downgrade Rights related list on the software entitlement form.	Orlando
SAM - Software Spend Transaction	Validates the creation of a Software Spend Transaction. i Note: Requires the Software Asset Management - Spend Detection (com.sn_sam_spend) plugin.	Orlando
SAM - Software Model and Software Entitlement	Tests that a user can create a software model and software entitlement and validates those records.	New York
SAM - Software Installation and Discovery Model	Tests that a user can create a software installation and discovery model and validates those records.	New York
SAM - Software Entitlement Creation Using Custom PPN	Creates a custom software product, a custom DMAP for the custom product, a custom Part Number for the custom DMAP, a software entitlement using the custom Part Number, and verifies that a software model is automatically created.	New York
SAM - Software Model Checks for SAP Named Users	Tests that the software model form changes when the publisher is SAP and the product is Named Users.	New York

Software Asset Management test suite (continued)

Test	Description	Release version
	<p>i Note: Requires the Software Asset Management Professional for SAP (com.sn_samp_sap) plugin.</p>	
SAM - Software Model Checks for SaaS	<p>Tests that the Software Model form changes when a SaaS product is selected.</p> <p>i Note: Requires the Software Asset Management - SaaS License Management (sn_sam_saas_int) plugin.</p>	New York
SAM - Validate Fields on SaaS Software Products	<p>Tests that the Subscription software and Ignore installs fields are present on the Software Product form.</p> <p>i Note: Requires the Software Asset Management - SaaS License Management (sn_sam_saas_int) plugin.</p>	New York

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by [ServiceNow's AI Acceptable Use Policy](#), which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our [CORE Compliance Portal](#).

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about legal request and/or legal matter (including related field information, comments, and work notes). Customers can opt out of future data collection at any time, as described in the [Now Assist Opt-Out page](#).

For more information, see the [Now Assist documentation](#).

Exploring Now Assist for Software Asset Management (SAM)

With the Now Assist for Software Asset Management (SAM) application, Software Asset Management managers can use generative AI capabilities for tasks such as generating compliance summaries, optimization recommendations, and automating SaaS user resolution.

Now Assist for SAM overview

The following generative AI capabilities are available:

- Generate detailed publisher and product summaries to enhance software estate visibility and streamline compliance evaluation.
- Generate recommended actions to manage software license compliance and optimize licensing spend.
- Generate user resolution rules to ensure accurate mapping of incoming subscription data to SAM users.
- Create entitlements by extracting information from software contracts thereby reducing manual effort.

The generative AI skills can be used only by the `sam_user` role and the `sam_admin` role.

Customizations to In-product display roles for accessing generative AI skills are preserved. For example, if you added an alternative role such as the `sam_admin` role instead of the default `sam_user` role, the `sam_admin` role will retain access, while the `sam_user` role will lose access, as per the custom configuration.

The `sam-user` role also contains the Now Assist Admin User (`sn_nowassist_admin.user`) role. This provides the `sam_user` role read-only access to the Now Assist Admin to view the generative AI skills.

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in [AI Control Tower](#) to define which options are available, then set the skill-level preferences in the [Now Assist Admin console](#). For more information, see [Large language models on the ServiceNow AI Platform](#).

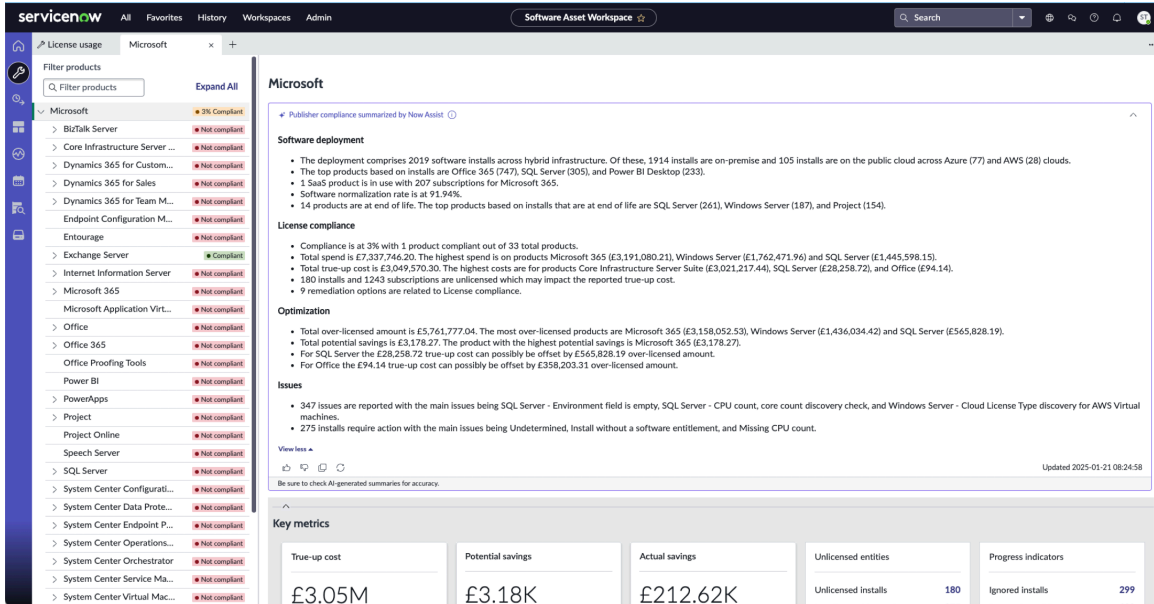

Now Assist for SAM skills

The Now Assist for SAM application includes generative AI that provides your Software Asset Management managers with an AI-based summary of products and publishers within your organization's software estate. Additionally, you also get AI-powered recommended actions that help you to mitigate license compliance risk.

Publisher compliance summarization

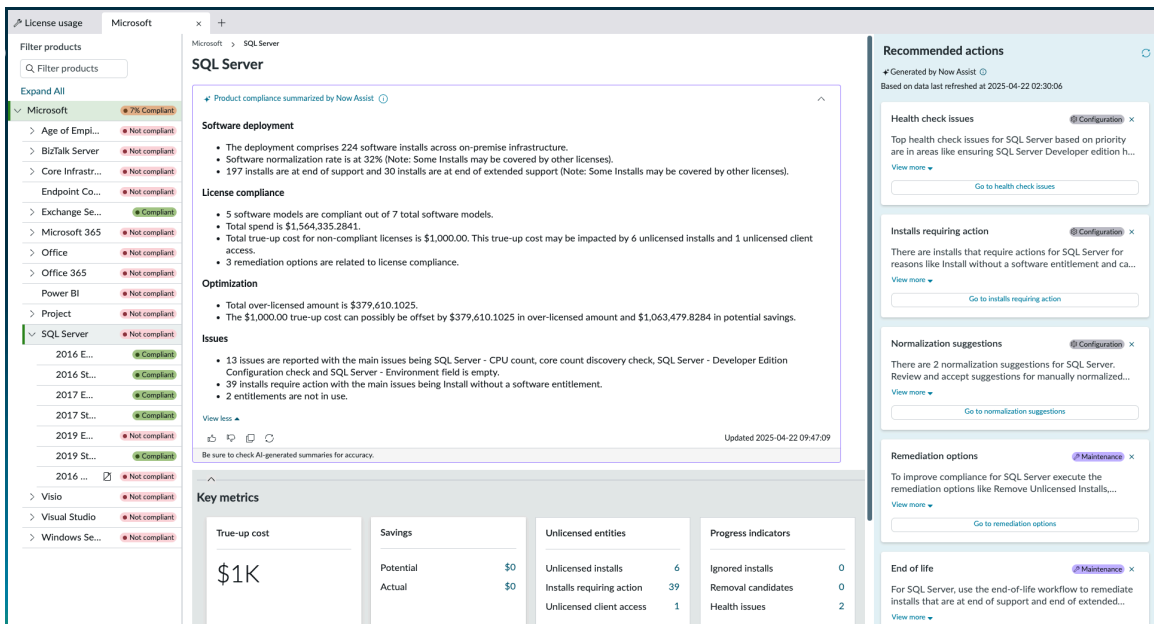

Provides insights into publisher summaries, focusing on software deployment, license compliance, optimizations, and configuration health. The streamlined

process highlights critical information about your software assets, making it easier for you to manage licenses and ensure compliance with publisher contracts.

Product compliance summarization

Provides insights into specific product summaries for publishers, focusing on software deployment, license compliance, optimization, and issues.

Recommended actions

Provides a list of recommended actions that you can perform to fix any configuration, maintenance, and optimization related issues to manage software license compliance and optimize licensing spend.

Recommended actions ↻

SaaS user resolution

Use generative AI to automatically analyze incoming SaaS subscription data and generate user resolution rules to map User Principal Names to corresponding user records within the Software Asset Management application.

i Note:

To effectively use the SaaS user resolution generative skill, ensure that you have the latest compatible versions of both the Software Asset Management plugin and the Software Asset Management - SaaS License Management plugin.

Upon activation of the SaaS user resolution skill, a series of automated processes are triggered. First, the *Downgrade subscriptions* scheduled job is executed on a cadence, daily or weekly, that depends on your SaaS subscription. After the *Downgrade subscriptions* job is successfully executed, the *SAM - Generate user resolution rule* scheduled job is initiated, creating a new user resolution rule for the relevant SaaS integration profile and resolving all associated users.

Contract entitlement data extraction

Use generative AI to provide a streamlined and automated process for extracting licensing data from contracts and generating software entitlements, enhancing productivity and accuracy.

DocIntel, a ServiceNow tool, is used to extract information from contracts. After data has been extracted from Docintel, a synchronous call is made to the prediction server to predict the product, publisher, and edition based on the product description for each entitlement. The Software Asset Management application performs post processing on the fields extracted from DocIntel to map to the supported values for different entitlement fields.

Note:

For more information on DocIntel, see [Document Intelligence documentation](#).

DocIntel is an intuitive and flexible application for dynamic businesses with highly variable document processing needs that change over time. DocIntel processes PDFs and images. Following are the image size and page count limits:

- 10 MB per attachment
- 10 pages for images (JPG, JPEG, or PNG) and 25 pages for PDFs

Note:

DocIntel won't process images or PDFs that exceed the recommended limits. For example, if you upload a PDF consisting of 26 pages, only 25 pages are processed. Similarly, if you upload 11 pages for images, only 10 pages are processed.

Each document is processed as a separate document task tied to a record in the ITAM Contract Import [itam_contract_import] table. The document task can be created from a new file uploaded directly or from an existing attachment on the contract record.

Once the document is uploaded to DocIntel, a flow designer flow is executed to retrieve the values from the document and populate the ITAM Contract Import [itam_contract_import] table.

For extracting entitlements from contracts, you can opt in to participate in the Software Asset Management Content Service. The Software Asset Management Content Service is an IT Asset Management shared service that provides users with continual software recognition improvements. For additional details, see [Software Asset Management Content Service](#).

Supporting information for Now Assist for Software Asset Management (SAM)

Get a quick overview of the important information that is related to the Now Assist for Software Asset Management (SAM) application.

Supported versions

Now Assist for SAM is supported starting with the Yokohama release.

Supported user interfaces

The Now Assist for SAM application includes the skills that are listed in the following table.

Note:

Next Experience must be enabled to use the Now Assist panel. For more information, see [Considerations for activating Next Experience](#).

Now Assist for SAM supported interfaces

Interface	Skill
Software Asset Workspace	<ul style="list-style-type: none"> • Publisher compliance summarization • Product compliance summarization • Recommended actions

Languages supported

The Now Assist for SAM application supports the following languages:

- Arabic
- Czech
- German
- Spanish
- Finnish
- French Canadian
- French
- Hebrew
- Hungarian
- Italian
- Japanese
- Korean
- Norwegian
- Dutch
- Brazilian Portuguese
- Polish
- Portuguese
- Russian
- Swedish
- Thai
- Turkish
- Chinese (Simplified)
- Chinese (Traditional)

Application information

Activate the Now Assist for Software Asset Management (SAM) store app (sn_now_assist_sam) to use the product compliance summarization skill, recommended actions skill, publisher compliance summarization skill.

This store app has the following dependencies:

- Software Asset Management Professional (com.snc.samp)
- Software Asset Workspace (sn_sam_workspace)
- Now Assist for Platform (sn_genai_platform)
- Now Assist AI Agents (sn_aia)
- AI Agents for ITAM (sn_itam_aia)

Activate the applications in the following order:

- Software Asset Management Professional
- Software Asset Workspace
- Now Assist for Platform
- Now Assist for Software Asset Management (SAM)

Configure Now Assist for Software Asset Management (SAM)

If you have the admin role, you can configure the Now Assist for Software Asset Management (SAM) application so that Software Asset Management managers can use the generative AI capabilities in the Software Asset Workspace.

Before you begin

Role required: admin

About this task

Use the Now Assist Admin console to configure Now Assist for SAM. This console contains everything that you need to install the plugins and configure the generative AI skills. For additional information, see [Now Assist Admin console](#).

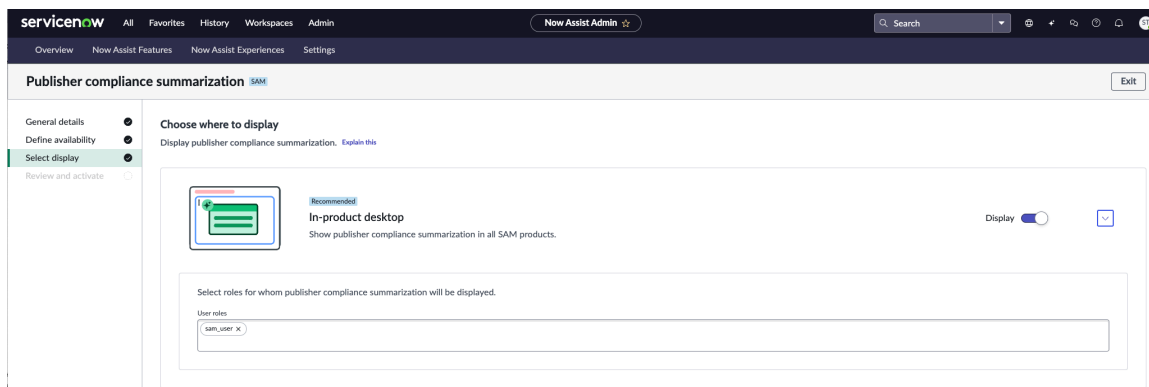

Domain separation is supported in Now Assist for Software Asset Management (SAM). For details, see [Domain separation in the Now Assist Admin console](#).

Starting with the Zurich Patch 4 release, generative AI skills for Now Assist for SAM are automatically activated on your instance by default and require no configuration. However, if you deactivate a skill, you need to manually reactivate that skill by following the specified procedure.

Procedure

1. Install the Now Assist for Software Asset Management (SAM) plugin (sn_now_assist_sam).
2. Navigate to **All > Now Assist Admin > Skills** to access the **Now Assist Skills** tab of the Now Assist Admin console.
3. Select **SAM** under the **Technology** workflow group.
4. On the Now Assist skills for SAM page, select **Activate skill** for the skill that you would like to activate.
The page for the skill that you activated opens with the General details section highlighted.
5. In the General details section, select **Save and continue**.
The settings in the General details section are read-only.

6. In the Select display section, select **Display**.

When selected, the skill is displayed on forms and workspaces.

The sam_user role is the default role for viewing the skill. You can add additional roles if you want to.

7. Select **Save and continue**.

8. In the Review and activate section, review your choices and select **Activate**.

The Successfully activated message box opens and the skill is activated. You're ready to use the skill in the Software Asset Workspace. For details on using the skills, see [Using Now Assist for Software Asset Management \(SAM\)](#).

Skill inputs and triggers for Now Assist for Software Asset Management (SAM)

Get a quick overview of the skill inputs and triggers for Now Assist for Software Asset Management (SAM). By configuring the inputs or triggers for a skill, you can determine how and when a skill is used.

Now Assist for SAM skills and triggers overview

Depending on the selected skill, you can configure the inputs or triggers. These settings determine how and when a skill is used. An input identifies the data that is used for a skill, such as the table and fields that are used to generate a publisher summary. A trigger initiates an action, such as when the system generates a publisher summary.

Publisher compliance summarization skill

For the publisher compliance summarization skill, select the triggers that determine when a publisher compliance summary is generated. You can also select the properties that control how a publisher compliance summary is displayed. To display the publisher compliance summary, you need to select the **Display** toggle button on the Choose where to display page while configuring Now Assist for SAM. For details on the **Display** toggle button, see [Configure Now Assist for Software Asset Management \(SAM\)](#).

The following table lists the triggers that determine when a publisher compliance summary is generated and how a publisher compliance summary is displayed.

Triggers for the publisher compliance summarization skill

Trigger	Description
User triggered	Publisher compliance summary is generated when the agent manually triggers the skill by

Triggers for the publisher compliance summarization skill (continued)

Trigger	Description
	selecting Summarize in the Publisher details page.

The following table lists the inputs for the publisher compliance summarization skill.

Inputs for the publisher compliance summarization skill

Input	Description
Reconciliation results	Compliance status of the software products with regards to the discovery and entitlements.
Software Lifecycle Report [sam_sw_product_lifecycle_report]	Product life-cycle details for all the software products that are installed in your environment.
Dashboards	Dashboards include Discovered inventory, Normalization and content, and Health check.

Product compliance summarization skill

For the product compliance summarization skill, select the triggers that determine when a product compliance summary is generated. You can also select the properties that control how a product compliance summary is displayed. To display the product compliance summary, you need to select the **Display** toggle button on the Choose where to display page while configuring Now Assist for SAM. For details on the **Display** toggle button, see [Configure Now Assist for Software Asset Management \(SAM\)](#).

The following table lists the triggers that determine when a product compliance summary is generated and how a product compliance summary is displayed.

Triggers for product compliance summarization skill

Trigger	Description
User triggered	Product compliance summary is generated when the agent manually triggers the skill by selecting Summarize in the Publisher details page.

The following table lists the inputs for the product compliance summarization skill.

Inputs for the product compliance summarization skill

Input	Description
Reconciliation results	Compliance status of the software products with regards to the discovery and entitlements.
Software Lifecycle Report [sam_sw_product_lifecycle_report]	Contains product life-cycle details for all the software products that are installed in your environment.

Inputs for the product compliance summarization skill (continued)

Input	Description
Dashboards	Dashboards include Discovered inventory, Normalization and content, Health check, and Optimization and Savings dashboard.
SAP related tables	The SAP related tables include: <ul style="list-style-type: none"> • SAP Document Type [samp_sap_document_type] • SAP Digital Access Usage [samp_sap_digital_access_usage] • SAP Engine Usage [samp_sap_sw_client_access] • SAP System User [samp_sap_system_user]
Software Subscription [samp_sw_subscription] table	Contains information pertaining to user software subscriptions.
Purchased Subscription Details [samp_purchased_subscription_details]	Contains the information pulled from the Microsoft Azure portal related to subscriptions purchased and assigned for Microsoft 365.
Software Installation table [cmdb_sam_sw_install]	Contains information on all software installed in your environment.

Recommended actions skill

For the recommended actions skill, select the triggers that determine when a list of recommended actions is generated. You can also select the properties that control how recommended actions is displayed. To display recommended actions, you need to select the **Display** toggle button on the Choose where to display page while configuring Now Assist for SAM. For details on the **Display** toggle button, see [Configure Now Assist for Software Asset Management \(SAM\)](#).

The following table lists the triggers that determine when recommended actions are generated and how the list of recommended actions is displayed.

Triggers for recommended actions skill

Trigger	Description
User triggered	Recommended actions is generated when the user manually triggers the skill by selecting either of the two options in the Publisher details page: <ul style="list-style-type: none"> • Get recommendations icon on Recommended actions sidebar and then select Get recommendations. • Summarize button for a product. When you select Summarize, both the product summary along recommended actions gets generated.

The following table lists the inputs for the recommended actions skill.

Inputs for the recommended actions skill

Inputs	Source
Configuration inputs	
Health check issues	Scan Findings [Scan_finding]
Installs requiring actions	Installs Unlicensed Reasons [samp_install_unlicensed_reason]
Normalization Rate	Software Discovery Models [cmdb_sam_sw_discovery_model]
Normalization suggestions	Normalization Suggestions [samp_normalization_suggestion]
Maintenance inputs	
Remediation options	Remediation Options [samp_remediation_option]
End of Life	Software Lifecycle Report [sam_sw_product_lifecycle_report]
Missing end of life dates	Software Lifecycle Report [sam_sw_product_lifecycle_report]
Expiring entitlements	Software Entitlements [alm_license]
Optimization inputs	
Removal candidates	Removal Candidates [samp_sw_reclamation_candidate]
Optimization (Microsoft): <ul style="list-style-type: none"> Inactive subscriptions Unassigned subscriptions Licensing optimizations 	Software Subscriptions [samp_sw_subscription] Purchased Subscription Details [samp_purchased_subscription_details] Microsoft Core License Optimization Reports [samp_ms_optimization_report]
Optimization (Adobe): <ul style="list-style-type: none"> Inactive users Unresolved subscriptions 	Software Subscriptions [samp_sw_subscription]
Optimization (Red Hat): Licensing optimizations	Potential savings by optimizing licenses [samp_license_optimization_summary]
Optimization (SAP):	SAP System Users [samp_sap_system_user]

Inputs for the recommended actions skill (continued)

Inputs	Source
<ul style="list-style-type: none"> • Inactive users • Named user assignment • Locked out user • Licensed non-dialog users • Role based license optimization • Transaction based license optimization • Unused engines 	License Metric Results [samp_license_metric_result] Removal Candidates [samp_sw_reclamation_candidate]

SaaS user resolution skill

The following table lists the trigger for the SaaS user resolution skill.

Triggers for recommended actions skill

Trigger	Description
Auto triggered	User resolution rules are automatically generated upon the activation of the SaaS user resolution skill.

The following table lists the inputs for the SaaS user resolution skill.

Inputs for the SaaS user resolution skill

Input	Description
List of fields with the String and Email type.	User [sys_user]

Contract entitlement data extraction skill

Triggers for contract entitlement data extraction skill

Trigger	Description
User triggered	An entitlement is automatically generated from a contract when the user manually triggers the skill by selecting Import contract document in the software contract page.

The following table lists the inputs for the Contract entitlement data extraction skill.

Input for the Contract entitlement data extraction skill

Input	Description
The contract document	The contract document that the user uploads that is used for extracting the entitlement information.

Using agentic workflows in Now Assist for SAM

Use the Now Assist for SAM AI agent collection to complete tasks autonomously.

Ensure that you have the following prerequisites for running agentic workflows:

- Your organization has a software asset management system integrated with AI agents. For more details on AI agents, see [Now Assist AI agents](#).
- Access to an AI-driven Now Assist panel. For more details on Now Asset Panel, see [Now Assist panel](#).

Available agentic workflows for Now Assist for SAM AI agent collection

Agentic workflow name	Description	Available AI agents
Help manage software request	Fulfill a software asset request by either allocating the available entitlements, if sufficient rights exist, or generating a purchase order with the necessary line items for the requested software model.	<ul style="list-style-type: none"> • Software entitlement allocation AI agent • Purchase order creation AI agent
Create software reclamation rule	Analyze the license usage of a product and if no reclamation rule exists, prompt the user to create one.	Software reclamation rule creation AI agent
Evaluate software removal candidate	Examine installed or subscription-based removal candidates for a software product by evaluating its software product usage within a specified period and the eligible total number of reclaimable candidates.	Software removal candidate evaluation AI agent

i Important:

By default, all agentic workflows and AI agent records are read-only.

You can run the agentic workflow as is by activating the workflow. Additionally, you can [duplicate](#) the workflow if you want to customize the workflow. If you duplicate the agentic workflow, adjust the settings according to your requirements and then activate the duplicated agentic workflow. You can also [test](#) the duplicated agentic workflow to analyze its performance in the AI Agent Studio, while it executes the instructions that you defined.

When you activate the agentic workflow, activate all agents within the agentic workflow.

Activate the trigger to invoke the agentic workflow automatically. If you prefer to invoke it manually, activating the trigger isn't necessary.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see [Find AI agents](#).
- To find agents that might not be installed on your instance, visit the [AI Agent Marketplace](#) on the ServiceNow Store.

Now Assist for Software Asset Management (SAM) AI agent collection to help manage software asset request agentic workflow

Use the Help manage software request agentic workflow to fulfill a software request by either allocating the available entitlements or generating a purchase order for the software model.

Help manage software request overview

Use the Help manage software request agentic workflow to automate software asset sourcing through auto-allocation or purchase order creation.

The following three scenarios are supported for software requests:

- **User-based allocations:** a user requests a software model with user-based entitlements.
- **Device-based allocations:** a user requests a software model with device-based entitlements.

When a user who has requested the software has multiple devices assigned to them, the agent asks the fulfiller to select one of the user's devices for the allocation process. If the device isn't assigned to the requested item number user during the software fulfillment, then a message appears in the Now Assist panel stating that the user has no devices associated. The user must associate a device and try again. If the device is assigned after this, then the fulfiller user should initiate a new Now Assist panel chat and provide an utterance in the Now Assist panel to fulfill the requested item number, rather than using the existing Now Assist panel chat.

- **Purchase order flow:** if no entitlements are available, a purchase order is created.

The Help manage software request agentic workflow needs the following conditions to execute. Once these conditions are met, the agentic workflow is automatically triggered.

- The requested item is approved.
- The requested item belongs to a software category.
- The requested item isn't sourced.
- The **Assigned to** field in the Requested item [sc-req item] table isn't empty.

The Help manage software request agentic workflow supports both Azure OpenAI Service and Now LLM Service.

Help manage software request agentic workflow

By automating the sourcing of software assets through auto-allocation or purchase order creation, the agentic workflow streamlines request resolution and enhances operational efficiency.

To automatically trigger the Help manage software request workflow for sourcing software requests, follow these steps:

1. Initiate and approve a software asset request:
 - a. A user with any role creates a software asset request in the Service Catalog application.
 - b. If the requested items in the cart amount to a thousand dollars, the request is automatically approved. For amounts more than a thousand dollars, the request must be approved. Auto-approval rules can differ from organization to organization; the default amount for auto-approval is a thousand dollars.
2. Assign the software asset request for sourcing:
 - a. Once the request is approved, the `procurement_user` role navigates to the Procurement module that resides in the Asset Workspace. If the Hardware Asset Management application is installed in the Asset Workspace, the name of the workspace changes to Hardware Asset Workspace.
 - b. The `procurement_user` role selects the Items tab in the Procurement module and selects a value in the **Assigned to** field for the requested item.

Note:

The `itil`, the `procurement_user`, and the `now_assist_panel_user` roles have access to the Now Assist panel. The fulfiller needs the `itil` and `procurement_user` roles if you have the Now Assist for IT Service Management (ITSM) store application installed. If you have the Now Assist for Software Asset Management (SAM) store application but not the Now Assist for IT Service Management (ITSM) store application, then the fulfiller requires the `itil`, `procurement_user`, and `now_assist_panel_user` roles to fulfill the request via the Now Assist panel trigger.

The `procurement_user` role gets notified in the Now Assist panel that the software request is getting fulfilled.

Once the software asset request is assigned, the Help manage software request agentic workflow gets triggered to source the request.

- If entitlements are available for the software request, allocations are automatically made.
- If entitlements aren't available, a purchase order is generated. The AI agents take inputs and confirmation from you when needed.

To view the agentic workflow process, navigate to the Asset Workspace or the Hardware Asset Workspace and select the sparkle icon  on the top-right side of the workspace.

AI agents used in the Help manage software asset requests agentic workflow

The Help manage software request agentic workflow uses the following AI agents to execute instructions.

AI agents and their role in the Help manage software request agentic workflow

AI agent	AI agent role
Software entitlement allocation AI agent	Validates software license requests and allocates licenses from existing inventory when available, using the request item number (RITM).
Purchase order creation AI agent	Sources a request item by creating a purchase order. Asks for inputs sequentially and takes user input in case there are multiple options such as with stockrooms, vendors, metric group, or license metrics.

Now Assist for Software Asset Management (SAM) AI agent collection to create software reclamation rule

Use the Create software reclamation rule agentic workflow to automatically create reclamation rules to aggregate usage records and to identify unused software products that lack reclamation rules but are viable candidates.

Create software reclamation rule overview

Use the Create software reclamation rule agentic workflow to streamline and automate the creation of reclamation rules. Create reclamation rule without having to manually review a product’s utilization and spend thereby improving license utilization, faster turnaround, improved operational efficiency, and enhanced user satisfaction.

Create software reclamation rule agentic workflow

Automating the creation of reclamation rules helps SAM managers to scale their reclamation efforts by automatically identifying and suggesting reclamation rules for overlooked software.

To start the agentic workflow, you must have the sam_admin role.

The Create reclamation rule agentic workflow can be initiated from the following pages:

- Software asset overview page
- Publisher details page
- License operations page

Depending on the page, the sam_admin role is on, follow the steps mentioned in the following table:

Initiating the Create reclamation rule agentic workflow

Software asset overview page	Publisher details page	License operations page
<ol style="list-style-type: none"> 1. Navigate to the Activity center. 2. Select suggestions in the Reclamation rules box in the Activity center. 	<ol style="list-style-type: none"> 1. Select a product for the specific publisher. 2. Select the Removal candidates tab. 	<ol style="list-style-type: none"> 1. Navigate to Administration > Reclamation Rules. 2. Select Create reclamation rule

Initiating the Create reclamation rule agentic workflow (continued)

Software asset overview page	Publisher details page	License operations page
<p>3. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel.</p> <p>If the Now Assist panel is already open, select the hamburger icon.</p> <p>4. Select Create reclamation rule in the Active section the Now Assist panel.</p> <p>5. Select a product from a list of products that need reclamation rules and then select Submit.</p> <p>The agentic workflow is initiated.</p>	<p>3. Select Create reclamation rule.</p> <p>4. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel.</p> <p>If the Now Assist panel is already open, select the hamburger icon.</p> <p>The agentic workflow is initiated.</p>	<p>3. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel.</p> <p>If the Now Assist panel is already open, select the hamburger icon.</p> <p>4. Select a product from a list of products that need reclamation rules and then select Submit.</p> <p>The agentic workflow is initiated.</p>

The AI agent initiates a series of checks assessing factors such as the usage of the product with regard to spend and utilization, among other metrics. After the checks are completed, the AI agent provides you with details such as the name of the reclamation rule name, the assignment group with which the reclamation rules will get created. You're then asked if you would like to create the reclamation rule with the given details or if you want to modify any parameters such as assignment group in the reclamation rule. Mention any modifications that you want; or else confirm that you want to go ahead with the creation of the reclamation rule. After you confirm, the reclamation rule gets created along with the name of the product and a link to the reclamation rule. The Activity tab in the reclamation rule record gets updated with the relevant work notes.

AI agents used in the Create software reclamation rule agentic workflow

AI agent and its role in the Create software reclamation rule agentic workflow

AI agent	AI agent role
Software reclamation rule creation AI agent	Retrieves reclamation rule suggestions, analyzes the license utilization, and generates a reclamation rule for a software product.

Now Assist for Software Asset Management (SAM) AI agent collection to evaluate software removal candidate agentic workflow

Use the Evaluate software removal candidate agentic workflow to assess installed or subscription-based software for potential removal by analyzing their usage over a specified period and determining the total number eligible for removal. After user confirmation, the workflow initiates the eligible removal candidate for reclamation.

Evaluate software removal candidate overview

Use the Evaluate software removal candidate agentic workflow to identify and evaluate genuine software removal candidates and recommend software installations for reclamation, based on a series of intelligent checks that help ensure sufficient context for safe removal actions.

Ensure that you have the following prerequisites for running the Evaluate software removal candidate agentic workflow:

- Your organization has a software asset management system integrated with AI agents.
- Access an AI-driven now-asset panel.
- AI agents have access to reclamation rules, removal candidates, products, and license metric results.

Evaluate software removal candidate agentic workflow

By automatically examining and verifying software removal candidates, the Evaluate software removal candidate agentic workflow helps in reducing manual effort, minimizing compliance risk, and unlocking measurable license cost savings.

Any removal candidates that are in the **Ready** state can be reclaimed.

To start the agentic workflow, you must have the sam_user role or the sam_admin role.

The Evaluate removal candidates agentic workflow can be initiated from the following pages:

- Software asset overview page
- Publisher details page; both from the publisher level as well as from the product level.

Depending on the page you are on, follow the steps mentioned in the following table:

Initiating the Evaluate removal candidates agentic workflow

Software asset overview page	Publisher details page- publisher level	Publisher details page- product level
<ol style="list-style-type: none"> 1. Navigate to the Activity center. 2. Select suggestions in the Removal candidates box in the Activity center. 3. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel. If the Now Assist panel is already open, select the hamburger icon. 4. Select Evaluate removal candidates in the Active section in the Now Assist panel. 5. Select a product from a list of products that need reclamation rules, to initiate the agentic workflow. 	<ol style="list-style-type: none"> 1. Navigate to License usage > Publishers > Removal candidates tab 2. Select Evaluate removal candidates. 3. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel. If the Now Assist panel is already open, select the hamburger icon. The chat window shows your products narrowed down to the specific publisher. 4. Select a product from a list of products that need reclamation rules, to initiate the agentic workflow. 	<ol style="list-style-type: none"> 1. Navigate to License usage > Publishers > Removal candidates tab 2. Select Evaluate removal candidates. 3. Select the sparkle icon on the top-right side of the workspace to open the Now Assist panel. If the Now Assist panel is already open, select the hamburger icon to initiate the agentic workflow.

The AI agent initiates a series of checks using multiple criteria, assessing factors such as the product ID, whether it's installed or subscription-based software, and its last usage, among other metrics. If any check fails, the Now Assist panel displays an error message indicating that the workflow can't continue. If all the checks are successful, a message appears to indicate the number of removal candidates identified for the particular product. You're then asked if you would like to reclaim the software. If you confirm, the reclamation process gets initiated and the state of the removal candidates changes from **Ready** to **Awaiting User**. You can navigate to the Removal candidates tab in the License Usage view to see the removal candidates and their current state. After the process is complete, you're informed about all the removal candidates that were successfully reclaimed for the specific product.

Once a removal candidate has been reclaimed by the agentic workflow, the Activity tab in the removal candidate record is updated with relevant work notes.

AI agents used in the Evaluate software removal candidate agentic workflow

AI agent and its role in the Evaluate software removed candidate agentic workflow

AI agent	AI agent role
Software removal candidate evaluation AI agent	Identifies or proposes users for removal from a software product by assessing their usage within a set time frame and ensuring that the total number of eligible candidates for reclamation is notified to the user, while excluding any VIP users.

Using Now Assist for Software Asset Management (SAM)

If you have a Software Asset Management manager role, you can use generative AI capabilities to streamline your daily Software Asset Management workflow.

Generate publisher compliance summaries by using Now Assist for SAM

Generate a comprehensive summary for a publisher that covers software deployment, license compliance, configuration health, and optimization. The detailed publisher summary helps you to gain insights into the publisher estate.

Before you begin

Role required: sam_user

About this task

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Now Assist for SAM generates the publisher summaries by using reconciliation results, product lifecycle reports, and dashboards such as Discovered inventory, Normalization and content, and Health check.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Select the License usage view.

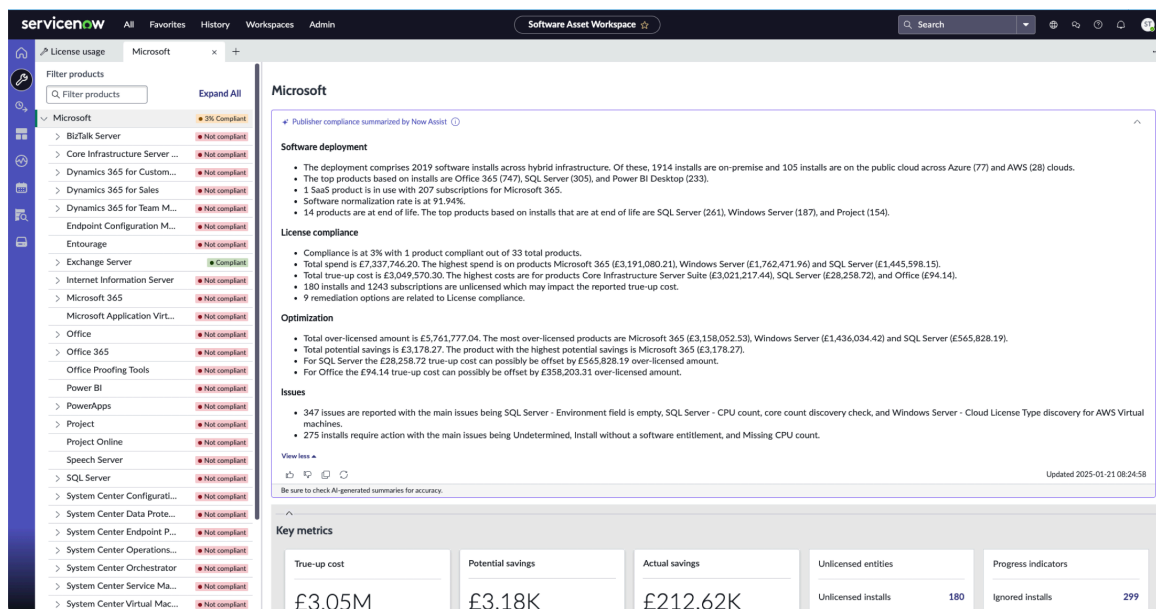

3. Select a publisher to view its summary.
4. On the Publisher details page, select **Summarize**.

Note:

If the property, *com.snc.samp.manage.published.products* is set to true in your ServiceNow instance, to view the **Summarize** button, navigate to the License usage view, open the **Published status** filter in the Publishers tab, and select **Clear** to ensure that both **Published** and **Unpublished** options are not selected. The reconciliation results for all publishers appears on the page.

The Now Assist for SAM application starts generating the summary for the selected publisher. After the summary is compiled, the results of the summary appear under different sections.

After it's generated, the publisher summary is not automatically saved. If you close the **Publisher details** tab where you generated the summary, or if you reload the page, the publisher summary is not available. To regenerate the summary, select **Summarize**.

5. **Optional:** You can perform the following actions on the generated summary.

Generate product compliance summaries by using Now Assist for SAM

Generate a comprehensive summary for a product that covers software deployment, license compliance, optimization, and issues. The detailed product compliance summary helps in gaining insights into your software assets and makes it easier to manage licenses.

Before you begin

Role required: sam_user

About this task

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Now Assist for SAM generates the product summaries by using reconciliation results, product life-cycle reports, and dashboards such as Discovered inventory, Normalization and content, and Health check.

Note:

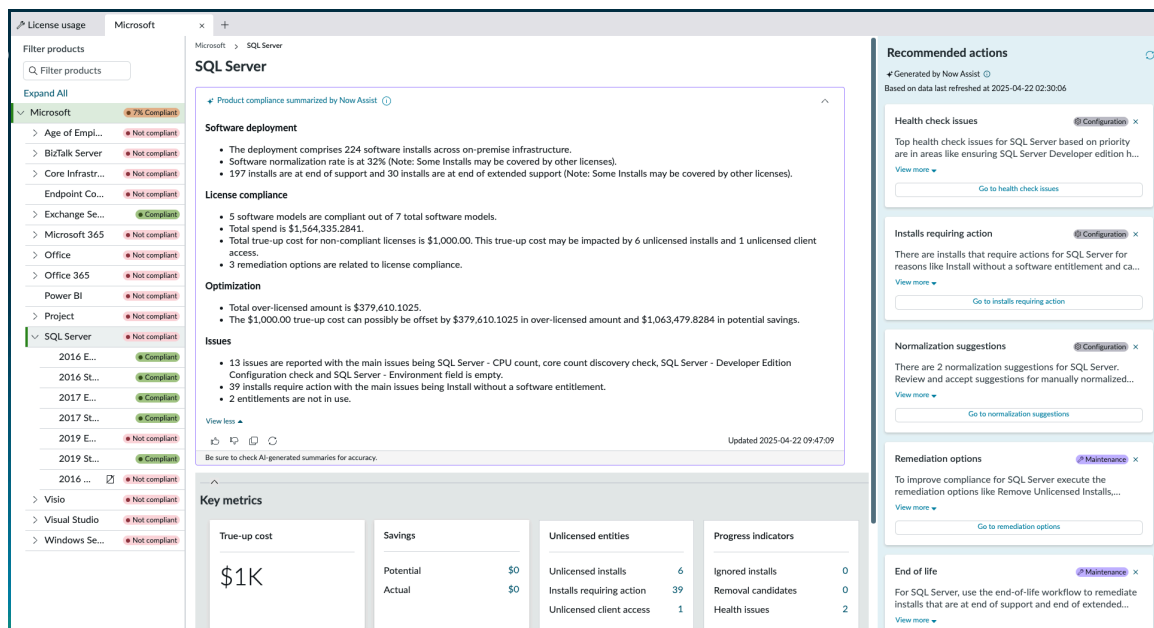

Health check details are shown only for Windows Server, SQL Server, and Oracle Database.

When you run reconciliation with grouping, product summarization and recommended actions are available only for the parent product results, not for the individual child product results.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Select the License usage view.
3. Select a publisher.
4. On the Publisher details page, select a product.
5. Select **Summarize**.

The Now Assist for SAM application starts generating the summary for the selected product. After the summary is compiled, the results of the summary appear under different sections. Additionally, recommended actions are also automatically generated when you select **Summarize**.

After it's generated, the product summary isn't automatically saved. If you close the Publisher details page where you generated the summary, or if you reload the page, the product summary isn't available. To regenerate the summary, select **Summarize**.

6. **Optional:** You can perform the following actions on the generated summary.

Generate recommended actions for products by using Now Assist for SAM

Generate a list of recommended actions to manage software license compliance and optimize licensing spend. The recommended actions help you to take appropriate steps to fix any configuration, maintenance, and optimization issues.

Before you begin

Role required: sam_user

About this task

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Now Assist for SAM generates the recommended actions for products by using reconciliation results, product life-cycle reports, and dashboards such as Discovered inventory, Normalization and content, and Health check.

Note:

Health check details are shown only for Windows Server, SQL Server, and Oracle Database.

When you run reconciliation with grouping, product summarization and recommended actions are available only for the parent product results, not for the individual child product results.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Select the License usage view.
3. Select a publisher.
4. On the Publisher details page, select a product for the publisher.
5. Select **Summarize** or the Recommended actions icon on the right hand side of the page and then select **Get recommendations**.

Now Assist for SAM application starts generating recommended actions for the selected product. After the recommended actions are generated, the results appear as cards under the following three categories:

- Configuration
- Maintenance
- Optimization

Recommended actions

✦ Generated by Now Assist 

Based on data last refreshed at 2025-04-14 02:30:03

Installs requiring action Configuration

There are installs that require actions for Project for reasons like Install without a software entitlement and can be resolved by creating entitlements for those installations using the right publisher part...

[View more ▼](#)

[Go to installs requiring action](#)

End of life Maintenance

For Project, use the end-of-life workflow to remediate installs that are at end of support and end of extended support.

[View more ▼](#)

[Go to end of life report](#)

Missing end of life dates Maintenance

For Project, there are 156 installs that are missing end-of-life dates. Use averages for product lifecycles or work with the content team to add these dates.

[View more ▼](#)

[Go to end of life report](#)

The compiled results can differ from product to product based on the current compliance level of a product.

Recommended actions are generated even if a product is fully compliant. Recommended actions are generated if there are any actions related to health issues, maintenance or optimization.

6. Select a button on a card to view the list view page for that action.
After the recommended actions are generated, the results aren't automatically saved. If you close the Publisher details page where you generated the recommended actions, or if you reload the page, the results aren't available.
7. **Optional:** You can perform the following actions on the generated recommended actions.
8. Select the Dismiss icon to dismiss an action; whether you have resolved the action or decided not to work on the action.
Once you have dismissed all the actions, a message appears mentioning that all recommendations have been dismissed.

Generate troubleshooting guidance for SaaS integrations by using Now Assist for SAM

Generate error messages and detailed guidance to troubleshoot runtime job failures for SaaS integrations. These recommendations enable you to resolve common configuration issues and reduce downtime.

Before you begin

Role required: sam_integrator

About this task

Now Assist for SAM generates the troubleshooting guidance for all SaaS integrations by enabling dynamic debug-level logging for flow actions and validating connections. The troubleshooting guidance is available for both existing and new SaaS integrations.

Procedure

1. Navigate to **Workspace > Software Asset Workspace > License operations**.
2. Select **User subscription** and then select **Direct integration profiles**.
3. Generate troubleshooting guidance.
4. Use the suggested resolutions and select **Validate Connection**.

If the connection validation isn't successful, you can select the **Troubleshoot** button to regenerate the error summary and resolution guidance.

5. After the connection validation is successful, publish the integration profile by selecting **Publish**.

Automate user resolution for SaaS license management using Now Assist for SAM

Automatically generate user resolution rules to ensure accurate mapping of incoming SaaS subscription data to SAM users.

Before you begin

Role required: sam_integrator

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Ensure that you have the latest compatible versions of the Software Asset Management plugin and the Software asset Management- SaaS License Management plugin.

After activation, the SaaS user resolution skill operates automatically generating user resolution rules and resolving users without any manual intervention. To view the resolved users and the corresponding user resolution rules, perform the following steps.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Select the License operations view.
3. Select **User subscription > User subscription**.

In the User subscription page, all the user names are automatically resolved.

Display name	User	User principal name	Software model	Subscription profile	Subscription type
Microsoft Fabric Free	Rohit Makhija	rohit.makhija@premium365.onmicrosoft.com	Microsoft Fabric Free	Microsoft 365 Integration Profile	Software Subscription
Microsoft Microsoft 365 Enterprise E3	Roger Win	M365Test1User@premium365.onmicrosoft.com	Microsoft Microsoft 365 Enterprise E3	Microsoft 365 Integration Profile	Software Subscription
Microsoft Fabric Free	John Williams	sam@premium365.onmicrosoft.com	Microsoft Fabric Free	Microsoft 365 Integration Profile	Software Subscription
Microsoft Office 365 Enterprise E3	John Williams	sam@premium365.onmicrosoft.com	Microsoft Office 365 Enterprise E3	Microsoft 365 Integration Profile	Software Subscription
Microsoft Microsoft 365 Enterprise E5	Robert Hall	M365Test2User@premium365.onmicrosoft.com	Microsoft Microsoft 365 Enterprise E5	Microsoft 365 Integration Profile	Software Subscription
Microsoft Office 365 Enterprise E5	Rajat Jain	rajat.jain@premium365.onmicrosoft.com	Microsoft Office 365 Enterprise E5	Microsoft 365 Integration Profile	Software Subscription
Microsoft Office 365 Enterprise E5	Sreenatha Timmareddy	Sreenatha@premium365.onmicrosoft.com	Microsoft Office 365 Enterprise E5	Microsoft 365 Integration Profile	Software Subscription
Microsoft Microsoft 365 Apps for enterprise	Rohit Makhija	rohit.makhija@premium365.onmicrosoft.com	Microsoft Microsoft 365 Apps for enterprise	Microsoft 365 Integration Profile	Software Subscription
Microsoft Power BI Pro	Sreenatha Timmareddy	Sreenatha@premium365.onmicrosoft.com	Microsoft Power BI Pro	Microsoft 365 Integration Profile	Software Subscription

4. Select **User subscription > User resolution rules** to view the new user resolution rule that got created.

5. Open the user resolution rule to view additional details.

User Resolution via Business Email

Now Assist has created this rule. Check activity for details.

User Resolution Rules

Display name: User Resolution via Business Email

Active:

Category: SaaS

Applies to: Adobe Subscription

Source table: Software Subscription

Source field: user_principal_name

Source: Now Assist

Look up field: u_business_email

Look up table: User

Apply transform on input: -- None --

Work notes:

Justification:

Activity

- priyal.mishra@snc: Field changes • 2025-11-05 03:25:47
Look up field u_business_email was phone
- priyal.mishra@snc: Field changes • 2025-11-05 03:25:35
Look up field phone was u_business_email
- SaaS user resolution: Work notes • 2025-10-23 03:03:56
This user resolution rule was successfully created by Now Assist, but it has been set as inactive because the selected field 'Business Email' is not currently indexed. An unindexed field may cause the subscription data pull jobs to run very slowly due to non-optimal queries. Follow this documentation Link to troubleshoot and index the field before activating the rule.
- System: Field changes • 2025-10-23 03:00:11
Active: false
Applies to: Adobe Subscription
Category: SaaS
Display name: User Resolution via Business Email

The AI indicator next to the **Source** field and the prepopulated value **Now Assist**, signifies that the rule is automatically generated by the SaaS user resolution Now Assist skill.

For details on the rule, refer to the AI Activity log under Activity center that provides a detailed log of the steps involved in creating the rule. For details on all the fields, see [User resolution rule fields](#).

You can also refer to the Activity center in the Software asset overview view for any new rules created. Additionally, if a rule isn't marked **Active**, it shows up as **One marked inactive Review needed** under the SaaS user resolution section. If you go back to the rule and mark it as Active, save the rule, return to the Software asset overview view, and reload the **One marked inactive Review needed** no longer appears.

Extract entitlements from software contracts using Now Assist for SAM

Reduce manual effort by leveraging generative AI to automatically create entitlements by extracting information from software contracts.

Before you begin

Role required: sam_user

About this task

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

With the Contract entitlement data extraction skill being activated by default, you can upload software contracts in the Software Asset Workspace to automatically generate entitlements.

You can extract data related to entitlements from an existing or a new contract and only from contracts where the contract model is a software license.

Procedure

1. Navigate to **Software Asset Workspace > License operations > Contracts > Software contracts**.
2. Open an existing software contract that is in an active state and where the contract model is a software license.
You can also select **New** to create a contract. Only the sam_admin role can create a contract.
3. Select **Import contract document**.
4. **Optional:** Select a publisher from the **Publisher** drop-down.
5. Select **Add file** to attach a PDF or image of a contract.

Note:

The file format should be PDF, JPG, JPEG, or PNG and the file size per attachment shouldn't exceed 4 MB. The maximum page count is 10 pages for images and 25 pages for PDFs.

6. Select **Upload**.
7. Select **Next** to go to the Extract entitlements page.
A message appears informing you that the extracting process is in progress.
8. Select **Next** once the extraction process is complete.

The extract entitlements page opens.

9. Select the Open tables down arrow next to **Tables**.

10. Select **Entitlements**.

Review the generative AI predictions for fields and tables. You can edit any predictions that weren't captured by DocIntel on this page. You can use DocIntel's Draw mode to move or reorder the columns. You can also make edits directly in the table.

11. Select **Submit** after you have reviewed all the predictions on the page. The Confirm field predictions message box opens.

12. Select **Confirm and submit**.

The status changes from **Review** to **Done**. Every time you make changes and select **Submit**, the data extracted from DocIntel changes.

13. Select **Next** to lock in the data and go to the Review entitlements page.

The Review entitlements page opens with the entitlement import error records. For each entitlement extracted from the contract document, an entitlement import record is created. The page also shows the PDF or images you uploaded.

If you selected a publisher in step 4, the system identifies and displays the best matches according to that publisher.

You can perform inline editing in the list view for all records that are in the **Needs review** status.

14. Select one of the following options:

- **Mark as reviewed** for records that have no errors. Additionally, if a record has errors that you don't want to ignore, open that record, rectify the errors, and then select **Mark as reviewed**. If you select **Mark as reviewed**, the status changes to **Reviewed**.
- **Ignore** to ignore the errors for a record. Once you ignore a record, the record becomes read only and the status changes to **Ignored**. You can select **Edit** on the record form to change the status of the record to **Needs review** or **Reviewed**. **Edit** appears only for records that are in the **Ignored** or **Reviewed** status.

Note:

If a record is marked as **Ignored**, an entitlement doesn't get created.

15. Select **Submit** after you have reviewed and corrected the errors in all the records.

The entitlements are successfully created.

Hardware Asset Management

The ServiceNow® Hardware Asset Management (HAM) application is a licensable application that on activation provides advanced workflow, automation, and mobile capabilities to maintain your assets.

Watch this short video for an introduction to the Hardware Asset Management application.

https://player.vimeo.com/video/995199429?badge=0&autoplay=0&player_id=0&app_id=58479

Note:

Beginning with the ServiceNow AI Platform® Washington DC release, limited support is provided for the Hardware Asset Management Core UI interface. While it remains active in your instance, including when you upgrade to a new ServiceNow AI Platform release, the best approach is moving to the new workspace experience. For more information, see [KB1584544](#), [Hardware Asset Workspace](#) and [Next Experience UI](#).

Learn

[What is Hardware Asset Management?](#)

Exploring Hardware Asset Management

Learn more about Hardware Asset Management by reviewing the benefits that it can provide for different users in your organization.

Hardware Asset Management overview

Hardware Asset Management enables you to track and manage the end-to-end life-cycle of all your organizational assets such as hardware and consumables. You can simplify every stage of the asset life-cycle with prescriptive workflows and tasks. Asset tagging, assigning ownership, and location tracking of the asset mitigate the risk of asset loss. Hardware Asset Management can also identify unapproved hardware assets and ensure compliance with established policies and regulations of your organization.

Hardware Asset Management benefits

Benefit	Feature	Users
Manage your asset life-cycle and keep the asset records accurate and up-to-date through an intuitive, centralized, and single-pane view of the hardware asset estate that directs	Hardware Asset Workspace	Executives/ Application owners/ Asset managers/ Inventory users

Benefit	Feature	Users
you to critical Hardware Asset Management priorities and activities.		
Leverage mobile devices to receive assets into stockrooms and conduct on-site audits for accurate inventory checks.	Mobile asset scanning	Asset managers/ Asset administrators/ Inventory administrators
Streamline your asset life-cycle with pre-built and guided workflows of Hardware Asset Management.	Asset life-cycle automation	Asset managers/ Asset administrators
Automate Return Merchandise Automation (RMA) processes for assets to be returned, replaced, or repaired.	Return Merchandise Authorization	Asset managers/ Inventory administrators
Manage a complex group of assets as a single parent record.	Asset bundles	Asset managers/ Asset administrators
Automate the process of reclaiming assets assigned to a departing employee.	Asset reclamation	Employees/Asset managers/ Inventory administrators
Manage asset donation to charity organizations with workflow.	Asset donation	Employees/Asset managers/ Inventory managers
Operate stockrooms with greater precision by linking assets to pallets and tracking assets at the aisle and space level.	Pallets for inventory	Asset managers/ Inventory administrators
Handle all loaner asset requests and make sure of the timely preparation and deployment of loaner assets.	Loaner assets	Employees/ Inventory administrators
Automate the ordering, asset tagging, and delivery of your employees' hardware asset refresh requests.	Zero Touch Refresh	Employees/Asset managers/ Inventory administrators
Track shipments by creating connections to carriers via APIs.	Shipment carrier integration	Administrators/Asset managers/ Inventory administrators
Automate and create hardware asset records before they are received.	Advanced Shipment Notification (ASN)	Administrators
Request hardware products to be used in the organization, onboard the product, and define the TRM life-cycle phases.	Manage onboarding of hardware products using Application Portfolio Management	Enterprise architects/ Application owners
Get defective hardware assets in a stockroom repaired quickly using the Repair flow.	Repair flow	Asset managers
Locate and pick the assets in your stockroom efficiently by using the ServiceNow Mobile Agent application.	Inventory picking for Hardware Asset Management	Inventory users
Track asset movement from the receiving bay of the inventory to the designated space within the stockroom using the Asset put away task.	Managing inventory by putting away assets in the	Inventory users

Benefit	Feature	Users
	stockroom drop-off location	
Enable hardware asset requests to be fulfilled with minimal intervention.	Zero Touch request flow	Employees/ External providers/ Catalog administrators
Perform remote asset audits for the required hardware assets irrespective of their locations by using Asset Attestation.	Asset Attestation	Asset managers/ Inventory users/ Employees

Using Guided Setup to implement Hardware Asset Management

Hardware Asset Management Guided Setup provides a sequence of tasks that help you configure Hardware Asset Management on your ServiceNow instance. To open Hardware Asset Management guided setup, navigate to **App > Guided Setup**. For more information about using the Guided Setup interface, see [Using guided setup](#).

Hardware Asset Management subscription

The ServiceNow platform uses a licensing method where your organization is charged for using the IT Asset Management application- ServiceNow Hardware Asset Management.

Note:

You must install Hardware Asset Management from [ServiceNow Store](#) to help you automate tasks and simplify work.

Get the most out of your asset data to save time and resources with the following prescriptive workflows or features.

- [Hardware Asset Workspace](#)
- [Hardware Asset dashboard](#)
- [Hardware Model Normalization](#)
- [Content lookup portal](#)
- [Asset life-cycle automation](#)
 - [Hardware asset refresh](#)
 - [Hardware disposal](#)

- Asset put away task
- Asset integration - Shipping carrier
- Pallet assets
- Asset Management Executive Dashboard
- Contract management and renewal
- Hardware Asset dashboard
- Content lookup portal
- HAM Guided Setup
- Zebra RFID integration
- Service locations
- Distribution channels support for Stockroom
- Indoor Mapping capability for Hardware Asset
- Hardware Asset Management Maturity
- Asset Total Cost of Ownership
- Asset Warranty integration with Lenovo
- Repair flow
- Inventory picking
- Zero Touch request flow
- Asset Attestation
- Put away assets in the stockroom drop-off location
- Approximated lifecycle and lifecycle code

The following base system features of Core Asset Management are provided with ServiceNow IT Service Management (ITSM) and Customer Service Management (CSM) product.

- Asset and model records
- Stockrooms
- Transfer orders
- Purchase orders
- Contracts
- Mobile asset receiving
- Mobile - My Assets

For more information, see [Asset Management](#) and [Manage Hardware Asset Management subscriptions](#).

Hardware Asset Management licensing

Hardware Asset Management (HAM) licensing enables you to choose the Hardware Asset Management resource categories that you want to use. You can save money by paying only for those categories that you use, and not for categories that you don't use.

Only the resource categories that are opted in are counted toward the Subscription Units.

Note:

By default for a particular resource category, the normalization functions for its associated models and the asset actions for its associated assets don't work. If you want to use the normalization functions and asset actions, you have to opt in that resource category.

For more information about opting in or out of the HAM license resource categories, see [Opt-in or opt-out of HAM license resource categories](#).

Based on the usage of model categories, the ServiceNow HAM license is divided into resource categories. There are different types of resource categories. Different assets fall under different categories as well. Make sure you opt in the correct and required categories. An asset represented in the Asset [alm_asset] table and which meets the criteria for each managed IT resource type such as Server, End User Computers, Network Gear, and Mobile Device, is counted toward a Subscription Unit based on the predefined ratio of number of assets to subscription units.

Note:

Resource categories in HAM are associated with certain entitlements. For example, the Computer resource category is shown only if the computer entitlement is available in the HAM license. On an on-premise ServiceNow instance, the entitlements aren't downloaded. However, you can store your HAM entitlement details by using the `sn_ham_active_entitlements` system property. You can update this system property with a comma separated list of entitlements for which you have access.

The comma separated entitlements should be updated in the following format:

- End User Computers- ham_computer_license
- Mobile Device- ham_mobiledevice_license
- Servers- ham_server_license
- Network Gear- ham_networkgear_license
- Monitors- ham_monitor_license
- Storage- ham_storage_license
- Printer- ham_printer_license
- Telecom Network Inventory- ham_tni_license

HAM license resource categories

The Subscription unit ratio is the ratio of the number of assets to the number of subscription units. For example, the subscription unit ratio of End User Computers is 4:1, where 4 assets require a single unit of license. If 1 license costs \$100, then 4 computer assets cost \$100 and 8 computer assets cost \$200.

Resource category	Subscription unit ratio	Model category
End User Computers	4:1	Computer
Servers	1:1	Any server such as the following: <ul style="list-style-type: none"> • AIX Server • ESX Server

HAM license resource categories

The Subscription unit ratio is the ratio of the number of assets to the number of subscription units. For example, the subscription unit ratio of End User Computers is 4:1, where 4 assets require a single unit of license. If 1 license costs \$100, then 4 computer assets cost \$100 and 8 computer assets cost \$200.

(continued)

Resource category	Subscription unit ratio	Model category
		<ul style="list-style-type: none"> • HPUX Server • Linux server • Netware Server • OS/X Server • Server • Solaris Server • Unix Server • Windows Server
Network Gear	5:1	<ul style="list-style-type: none"> • Network gear • IP Switch • IP Router
Mobile Device	10:1	Mobile Device
Telecom Network Inventory	1:1	<ul style="list-style-type: none"> • Card • Network Interface • Logical connection • Physical connection • Telco equipment
Unclassified hardware	1:1	Hardware
Monitors	15:1	Monitor
Storage	3:1	Storage Device
Printers	10:1	Printer

Note:

Unclassified hardware, Monitors, Storage, and Printers are available with Hardware Asset Management version 10.1.0 and later only when you upgrade to HAM license version 5.0.

To access Hardware Asset Management features for Telecommunications Network Inventory, you should install the Telecommunications Network Inventory application and opt-in to the Telecom Network Inventory resource category. For more information, see [Telecommunications Network Inventory integration with Hardware Asset Management](#).

HAM Licensing for custom model categories

HAM provides some model categories out-of-the-box. Any model category that you create is considered as custom model category. When you upgrade to the Hardware Asset Management license released in Washington DC and later releases, any asset with a custom model category can access the Hardware Asset Management features and workflows only if any of the following conditions hold good:

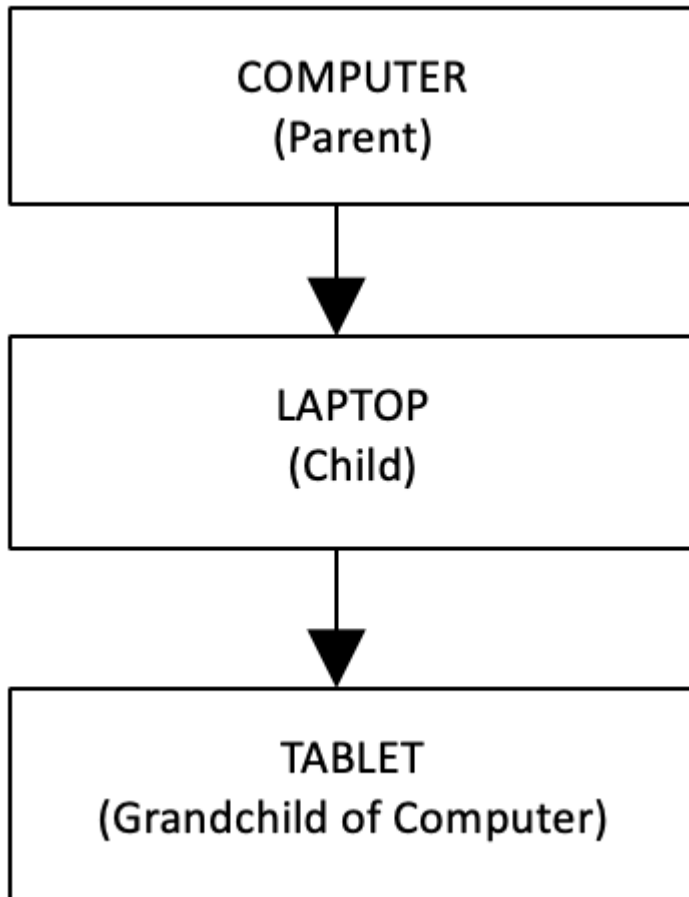

- The custom model category of the asset belongs to the hierarchy of opted-in model categories.
- The parent model category of a custom model category is associated with a licensable and opted-in resource category.

Note:

If you are on any HAM license version released before Hardware Asset Management license version 4, by default, the assets with custom model categories can access Hardware Asset Management features and workflows even if they aren't associated with an opted-in and licensable resource category. Also, the custom model categories aren't counted toward a Subscription Unit.

You can enable HAM licensing for custom model categories by using the `sn_hamp.enable_custom_category_licensing` system property. By default, the value of this system property is set to **false**. When you set the `sn_hamp.enable_custom_category_licensing` system property to **true**, custom model category assets are excluded from HAM workflows unless the parent of the custom model category is an opted-in and licensable category.

Example for hierarchy of model categories

In the example, the Computer model category is associated with the custom model categories Laptop and Tablet. Note the following about the custom model categories:

- When you opt in Computers, both Laptop and Tablet are also counted toward a Subscription Unit under the End User Computers resource category. Also, these custom model categories can access Hardware Asset Management features and workflows.
- When you opt out Computers, both Laptop and Tablet are also opted-out and these custom model categories can't access Hardware Asset Management features and workflows.

Note:

A model category that belongs to a licensable resource category and has a parent model category is licensed only under its associated resource category. For example, the Monitor model category that's associated with the licensable Monitors resource category and that has Computer as its parent, is licensed only under Monitors.

Assets with the following model categories are excluded from accessing Hardware Asset Management features and workflows:

- Any model category that is a child of an opted-out resource category.
- Any model category that is a child of model categories such as printer and storage device. This exclusion is only in Hardware Asset Management version 10.0.0.

Note:

In Hardware Asset Management version 10.0.0 and earlier, assets with model categories such as Printer, Consumables, and Storage Device retain access to Hardware Asset Management features without opting in a resource category.

From Hardware Asset Management version 10.1.0 onward, the resource categories like Printers, Monitors, Storage, and Unclassified hardware are licensed and available only when you upgrade to HAM license version 5.0. You must opt in these resource categories to access the Hardware Asset Management features. When you opt in these resource categories, all their child model categories can also access the HAM features and workflows.

After you upgrade to HAM license version 5.0, the printers, monitors, storage devices, and Unclassified hardware assets that were created in the earlier versions wouldn't be able to access the Hardware Asset Management features by default. You should explicitly opt in these resource categories.

- Any other custom model category without a parent category.

Licensing framework for Hardware Asset Management solutions

Manage the subscription units purchased and consumed by your organization for all the Hardware Asset Management solutions with the improved HAM licensing framework. When more than one Hardware Asset Management solution is activated on a ServiceNow instance, any licensable and opted-in resource category is licensed only under one solution.

The licensed solutions like Hardware Asset Management integration with Zero Touch Mobility and Hardware Asset Management integration with Telecommunications Network Inventory install the Hardware Asset Management on your ServiceNow instance.

Each Hardware Asset Management solution supports some default resource categories that can avail Hardware Asset Management features and workflows.

Resource categories for Hardware Asset Management solutions

Application/Solution	Supported resource categories
Hardware Asset Management integration with Zero Touch Mobility	Mobile Device
Hardware Asset Management integration with Telecommunications Network Inventory	<ul style="list-style-type: none"> • Telecom Network Inventory • Server • Network Gear
Hardware Asset Management	<ul style="list-style-type: none"> • End User Computers • Mobile Device • Server • Network Gear • Printers • Monitors • Storage • Unclassified hardware

HAM licensing is based on the subscription unit ratio defined for each resource category. You can opt in and pay for only those resource categories that you want to use. For more information, see [Hardware Asset Management licensing](#).

License prioritization for Hardware Asset Management solutions

***i* Important:**

The HAM license prioritization feature is available with Hardware Asset Management version 10.1.0 and later.

When you activate all the Hardware Asset Management solutions on your ServiceNow instance and opt-in all resource categories, consider the following:

- A resource category is licensed only under one application based on the application priority that is defined in the HAM licensing framework.
- The application priority is set based on the licensing cost and is in the following order:
 1. Hardware Asset Management integration with Zero Touch Mobility
 2. Hardware Asset Management integration with Telecommunications Network Inventory
 3. Hardware Asset Management
- Mobile Device is licensed under Hardware Asset Management integration with Zero Touch Mobility.
- Telecom Network Inventory, Servers, and Network Gear are licensed under Hardware Asset Management integration with Telecommunications Network Inventory.
- End User Computers is licensed under Hardware Asset Management.

Licensing model for HAM solutions

Resource category	Subscription Unit Ratio	HAM integration with Zero Touch Mobility	HAM integration with Telecommunications Network Inventory	Hardware Asset Management	Licensed under
Mobile	10:1	Installed	Resource category isn't available	Installed	Zero touch Mobility
Server	1:1	Resource category isn't available	Installed	Installed	Telecommunications Network Inventory
Network gear	5:1	Resource category isn't available	Installed	Installed	Telecommunications Network Inventory
Telecom Network Inventory	1:1	Resource category isn't available	Installed	Installed	Telecommunications Network Inventory
End User Computers	4:1	Resource category isn't available	Resource category isn't available	Installed	Hardware Asset Management

You can view the subscription details of your Hardware Asset Management application and solutions using the ITAM License Report. For more details, see [View the license report for the Hardware Asset Management application](#).

Exclusion of Operational Technology (OT) hardware assets from HAM licensing

The licensing model of the OT Asset Management (OTAM) application supports a few default hardware resource categories to license OT hardware assets. For more details on OT hardware assets, see [OT Asset Workspace](#). These OTAM hardware resource categories have equivalent HAM licensing resource categories.

Comparison of resource categories

HAM resource category	Equivalent OTAM hardware resource category
Servers	OT Servers
Network Gear	OT Network Gear
Storage	OT Storage
End User Computers	OT End User Computers
Mobile Devices	OT Mobile Devices
Monitors	OT Monitors
Printers	OT Printers
Unclassified hardware	OT Unclassified Hardware

When you activate all the Hardware Asset Management solutions along with the OT Asset Management application, and opt-in HAM resource categories, consider the following points:

- Non-OT hardware assets, with the **OT entity** flag set to **false**, are licensed only under the resource categories of HAM licensing.
- OT hardware assets, with the **OT entity** flag set to **true**, are licensed only under the hardware resource categories of the OT Asset Management application. For details, see [OT Asset Management licensing](#).
- HAM workflows support both OT hardware assets and non-OT hardware assets.
- OT Asset Management workflows support only OT hardware assets.

[Telecommunications Network Inventory integration with Hardware Asset Management](#) 

Hardware Asset Management license exclusion

Pay only for the assets using licensed Hardware Asset Management features and exclude an asset for which you don't want to use the licensed features.

Hardware asset features are restricted to hardware and consumable asset records. Use the asset level exclusion when you want to use Hardware Asset Management licensed features but want to exclude a few assets. For more information about excluding an asset, see [Exclude assets](#).

Hardware assets belonging to a category that you don't opt in are excluded by default. For example, if you don't opt in for the End User Computer category, all End user computers would be excluded. For more information, see [Opt-in or opt-out of HAM license resource categories](#).

You can't select and use the excluded assets in the following HAM flows and tasks:

- [Loaner](#)
- [Disposal](#)
- [Refresh](#)
- [Lease](#)
- [Bundle](#)
- [Return Merchandise Authorization \(RMA\)](#)
- [Audit](#)
- [RFID](#)
- [Asset lifecycle automation](#)
- [Pallets](#)
- [Donation](#)

Note:

Any workflow once started on an asset is allowed to complete even if the asset is marked excluded midway through.

Hardware Asset Workspace

The Hardware Asset Workspace is the intuitive and streamlined user interface of the Hardware Asset Management application to manage your hardware assets.

Note:

You must activate the Asset Management Workspace (sn_itam_workspace) plugin along with the Hardware Asset Management (sn_hamp) to use the Hardware Asset Workspace.

The Hardware Asset Workspace is a unified medium with multiple views that help you manage your assets efficiently. The views provide you with visibility into all the important aspects of your assets, such as dashboards on Normalization and Stockroom, Asset count by model, life cycle state, model category, and overall performance of assets.

The Hardware Asset Workspace contains the following views:

- **Hardware asset overview:** View important actions and quick links to active tasks. Also, get a 360-degree view of the asset estate for a snapshot of assets by model type, life cycle state, and asset value.
- **Asset analytics:** Manage resources efficiently by tracking the Total Cost of Ownership (TCO) of assets.
- **DaaS provider view:** Manage the assets of the customers of Device as a Service (DaaS) providers.

Note:

Hardware Asset Management for Device as a Service (com.sn_daas_ham) must be installed to access this view.

- **Inventory:** View details of the entire asset inventory and stockrooms that enable you to perform inventory tasks.
- **Asset estate:** View the asset functions and maintain accurate hardware and consumable records.
- **Model management:** View details of different types of models being managed across hardware, software, consumables, and bundles.
- **Content lookup portal for Hardware Asset Management:** View data related to hardware products stored in the Hardware Asset Management Content Service.
- **Procurement view:** View and manage details of all ongoing procurement activities.
- **Contract management:** View and manage all hardware and software contracts.
- **Success portal:** Track the progress of your Hardware Asset Management (HAM) application with success goals, assign activities to track the success of your goals, and mature your HAM program with predefined maturity items.
- **Asset operations:** View asset operations related to inventory, shipment, procurement, hardware asset normalization, contracts, Zero Touch Refresh, and Success goals.

Hardware asset overview

Enhance your Hardware Asset Management experience by using the modernized and user-friendly Hardware asset overview view. The Hardware asset overview is a simplified and intuitive environment that helps you use the application more effectively by reducing complexity.

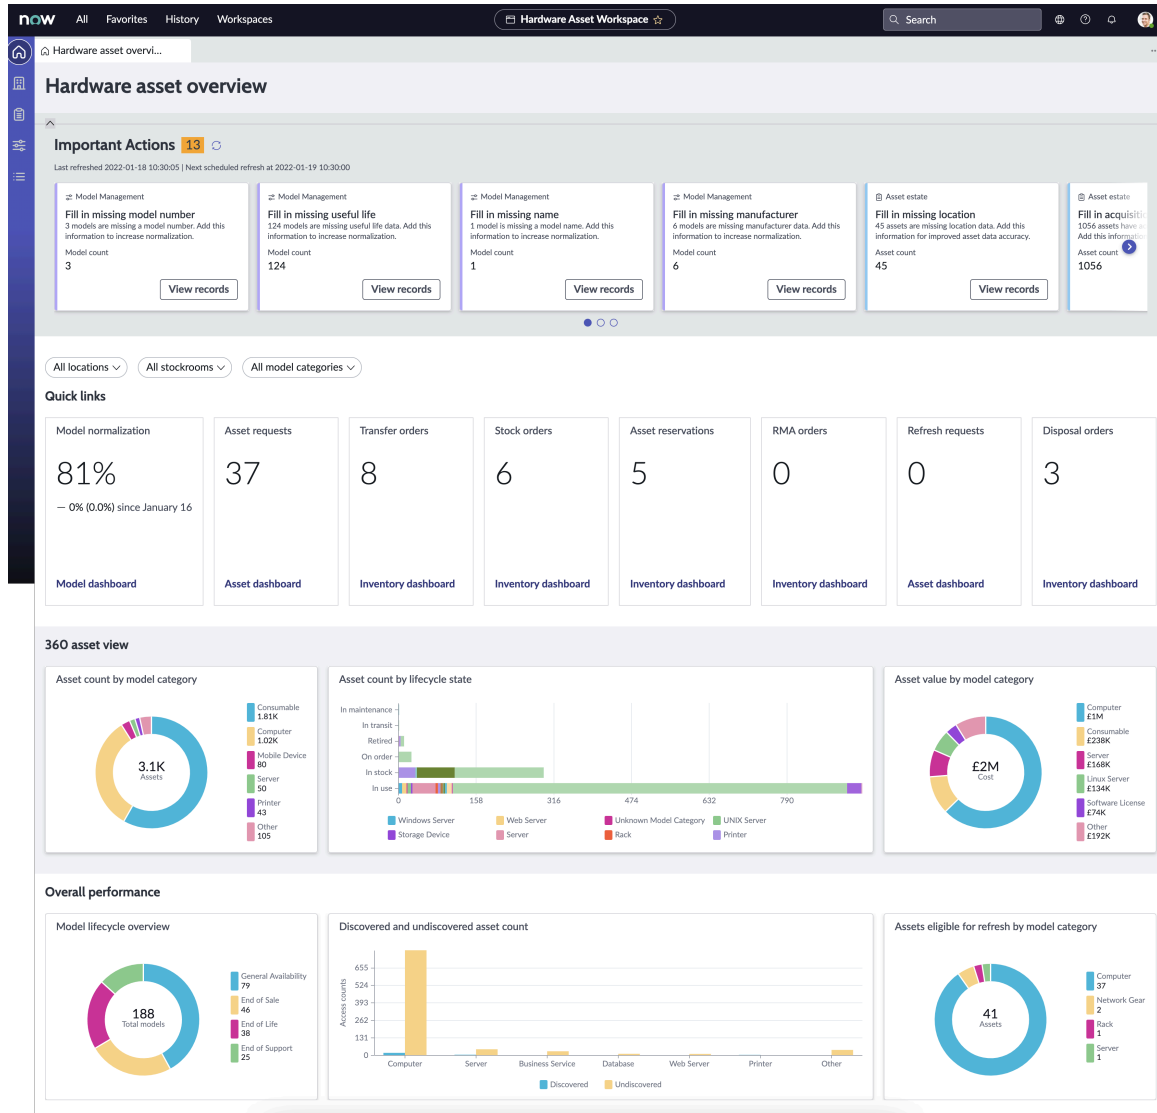

Use the Hardware asset overview view to:

- Act on discrepancies such as when an asset is missing PO number, model number, asset function, or manufacturer.
- Navigate to specific dashboards on asset functions such as Model normalization, Asset requests, Transfer orders, Stock orders, Asset reservations, RMA orders, Refresh requests, and Disposal orders.

- View the 360 asset view section displaying Asset counts by model category and lifecycle state, and asset value by model category.
- View the overall performance section displaying the Model lifecycle overview of all the assets, Discovered and undiscovered asset count, and Assets eligible for refresh by model category.

Select any widget or chart to view detailed information and take appropriate actions. You can also use **Location**, **Stockroom**, and **Model category** lists to filter your results.

Hardware asset overview

Quick links

Widget or chart	Description
Model normalization	Percentage of hardware and consumable models that are normalized.
Asset requests	Number of requested items where the item's model is hardware, consumable, or bundle.
Transfer orders	Number of active transfer orders.

Quick links (continued)

Widget or chart	Description
Stock orders	Number of requested hardware inventory stock order items.
Asset reservations	Number of active loaner asset orders.
RMA orders	Number of open RMA orders.
Refresh requests	Number of open hardware assets refresh order requests.
Disposal orders	Number of open hardware disposal orders.

360 asset view

Widget or chart	Description
Asset count by model category	Number of assets grouped by the model category such as Consumable, Computer, and Mobile Device.
Asset count by lifecycle state	Number of assets grouped by the lifecycle state such as Retired, In use, and In stock.
Asset value by model category	Cost of assets grouped by the model category such as Software License, Consumable, and Server.

Overall performance

Widget or chart	Description
Model lifecycle overview	Overview of model lifecycle grouped by the lifecycle phase such as End of support, End of Life, General Availability, and End of Sale.
Discovered and undiscovered asset count	Comparison of the number of discovered and undiscovered assets grouped by model category. Undiscovered assets are the assets that are not discovered at all or not discovered within one month.
Assets eligible for refresh by model category	Number of assets that have already expired or the current day is the expiry date, and are eligible for a refresh.

Load reports on Hardware asset overview

You can load charts or widgets that fetch a huge set of asset records on demand instead of loading them along with the page. This approach enables you to reduce the loading time for the Hardware asset overview page.

The system property

`sn_itam_workspace.asset_overview_enable_lazy_loading` provides you with an option to either selectively load reports you want to view or load reports concurrently with the page. By default, this system property is set to **False**. When this system property is enabled on your ServiceNow instance, you can view reports by using the **Load report** option.

Load reports on Hardware asset overview

The screenshot displays the ServiceNow Hardware Asset Overview dashboard. At the top, there's a navigation bar with 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and a search bar. Below this, the main header reads 'Hardware asset overview'. A sidebar on the left contains navigation icons. The main content area features an 'Important Actions' section with 21 items, including cards for 'Fill in missing location', 'Fill in acquisition method', 'Fill in PO number', 'Unmatched RFID tags', and 'Fill in missing information'. Below this are filter buttons for 'All locations', 'All stockrooms', and 'All model categories'. A 'Quick links' section contains seven cards with metrics: Model normalization (94%), Asset requests (5), Transfer orders (23), Stock orders (14), Asset reservations (10), RMA orders (2), and Refresh requests (2). The '360 asset view' section includes three report load buttons: 'Asset count by model category', 'Asset count by lifecycle state', and 'Asset value by model category'. The 'Overall performance' section includes three more report load buttons: 'Model lifecycle overview', 'Discovered and undiscovered asset count', and 'Assets eligible for refresh by model category'.

[Analytics and Reporting Solutions for Hardware Asset Management](#)

Asset analytics view

Use the Asset analytics view to get a detailed view of all your hardware assets, the total cost of ownership (TCO) of your assets, and the asset performance.

Total cost of ownership

For more information about the TCO of your assets, see [Asset Total Cost of Ownership for Hardware Asset Management](#).

i Important:

The Asset Analytics view is available with Hardware Asset Management 10.0.0 version or later.

You can filter and narrow down your results by selecting a location, stockroom, and model category.

Note:

TCO reports support domain separation when Domain Extension Installer (com.glide.domain.msp_extensions.installer) and Domain Support (com.snc.pa.domain_support) plugins are activated.

Asset total cost of ownership

Field	Description
Reached benchmark TCO	The number of assets that have their TCO more than or equal to the benchmark cost.
Approaching benchmark TCO	<p>The number of assets that have their TCO more than or equal to the benchmark threshold but less than the benchmark cost.</p> <p>The TCO benchmark threshold percentage is set to 75% of the TCO benchmark cost by default.</p> <p>For example, if you have set the benchmark as \$1000 and the asset cost has reached \$750, the asset is considered to be approaching the benchmark TCO.</p>

Asset total cost of ownership (continued)

Field	Description
	Use the system property <code>sn_itam_common.asset_tco_benchmark_threshold</code> to update the benchmark threshold percentage. For more information about the hardware asset field values, see Asset record fields .
Capital planning	Number of assets for capital planning. The Assets for capital planning are assets that are not retired and their current life cycle phase is true.
Top 10 models with highest average TCO	Top 10 models that have the highest average asset TCO in a 12-month duration.
Asset reached benchmark cost by category	Number of assets whose asset TCO has reached benchmark cost based on model category.
Assets expense distribution	Costs incurred on your assets based on the expense categories such as labor, shipment, and purchase.
Monthly asset expense distribution (last 12 months)	Monthly initial and operational costs of your assets over the last 12 months.

Comparative reports

View the most recently created TCO reports in this section.

You can also create a report by selecting **New** in the Comparative reports section. For more information, [Create a TCO report in Hardware Asset Workspace](#).

Asset performance

i Important:

The Asset performance tab is available with Hardware Asset Management version 13.0.0 and later.

The Asset performance tab provides details on the average values of the following key performance indicators (KPIs):

- Availability
- Mean time between failures (MTBF)
- Mean time to repair (MTTR)

i Note:

For more details on calculation of KPIs, see [Asset performance reports in the Hardware Asset Workspace](#).

By default, the **Model category** filter is applied to the KPI reports. To further narrow down and focus on specific data, you can also select any one of the following filters:

- Domain
- Location
- Classification
- Model

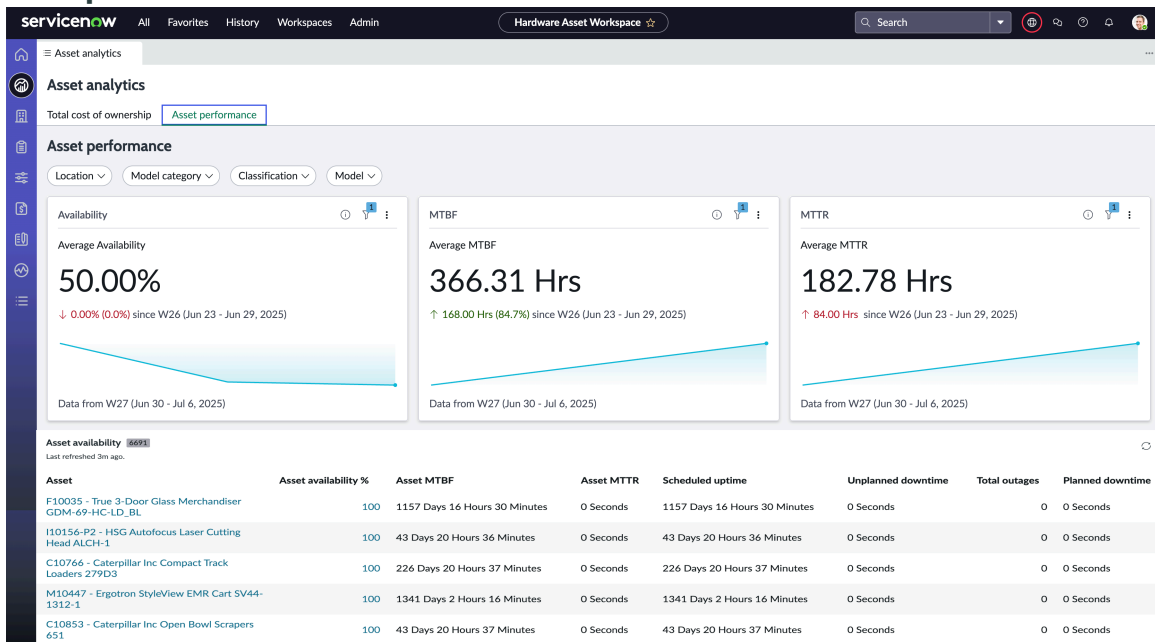

Note:

You can apply a maximum of two filters to any KPI report.

You can see a weekly trend of the average KPI values in the report. The Asset Availability list provides KPI details for all hardware assets that are tracked. The average KPI values are calculated based on the assets in this list.

When you select any KPI report, the **KPI Details** page appears. This page enables you to explore the information within that KPI. You can set targets you want to achieve and also set signals to notify you of any significant changes in the KPI.

Asset performance dashboard

Widget	Description
Availability	Average availability percentage of all hardware assets that are tracked, calculated by dividing the total asset availability percentage by the number of assets listed in the Asset availability report.
MTBF	Average MTBF of all hardware assets that are tracked, calculated by dividing the total Asset MTBF by the number of assets listed in the Asset availability report.
MTTR	Average MTTR of all hardware assets that are tracked, calculated by dividing the total Asset MTTR by the number of assets listed in the Asset availability report.
Asset availability	Report that lists the availability and other related KPIs of all hardware assets that are tracked.

DaaS provider view

The DaaS provider view in the Hardware Asset Workspace is an intuitive interface of the Device as a Service application to manage the assets of the customers of DaaS providers.

Note:

You must activate the following plugins to access the DaaS provider view:

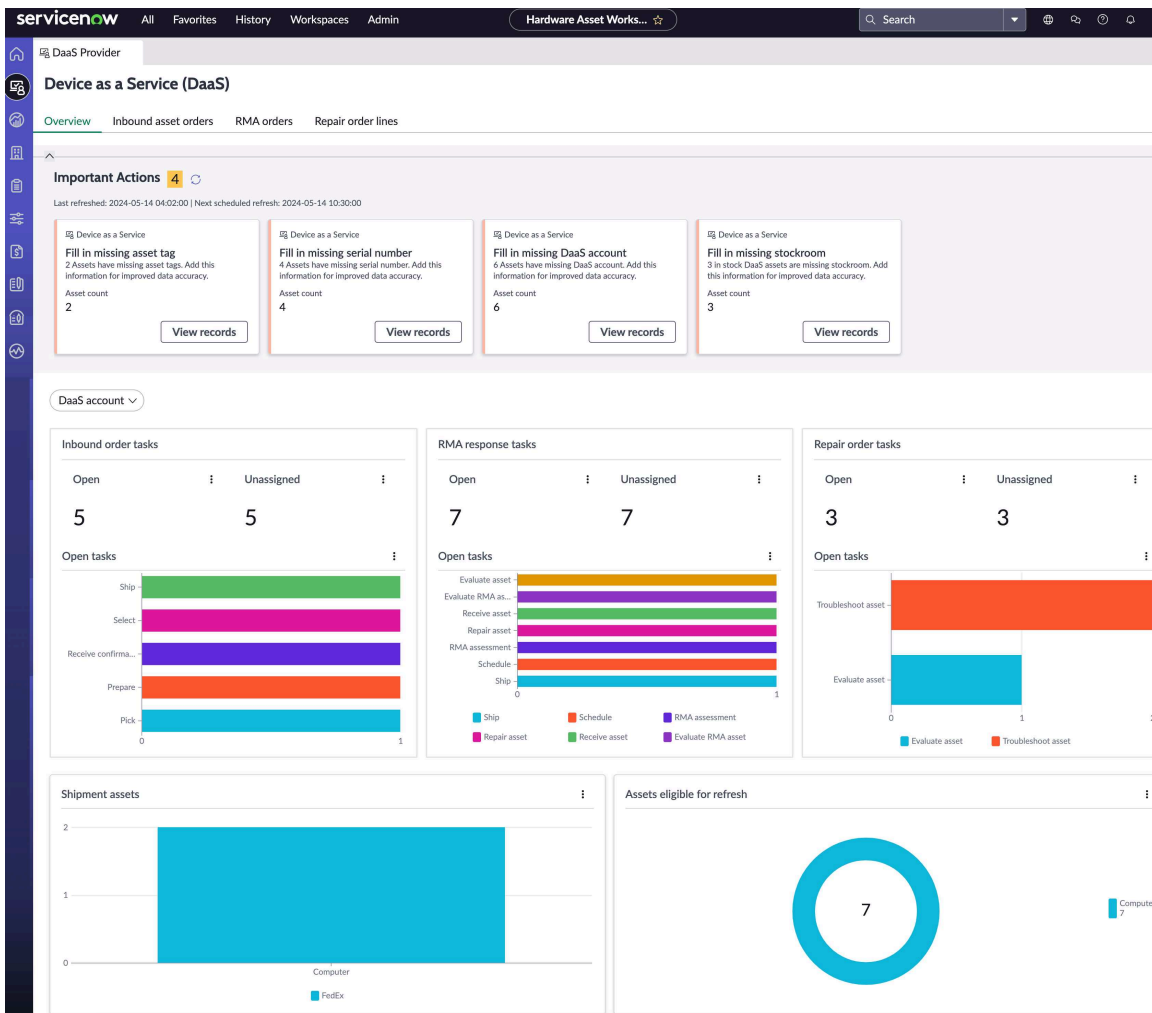

- Hardware Asset Management application (sn_hamp)
- Hardware Asset Workspace (sn_itam_workspace)
- Hardware Asset Management for Device as a Service (com.sn_daas_ham)

For more information about the DaaS feature, see [Device as a Service](#).

Use the DaaS provider view to perform the following:

- Act on discrepancies such as assets missing serial number, stockroom, or DaaS accounts.
- Select a DaaS account for which you want to view the records such as open or unassigned tasks, shipment status, and the number of assets that are eligible for refresh.
- Create and manage [inbound asset orders](#), [RMA response orders](#), and [repair order lines](#) for the DaaS assets of your customers.

Select any widget or chart to view detailed information and take appropriate actions on the assets that are marked as DaaS assets or dedicated to accounts.

Widget/Chart	Description
Important Actions	

Widget/Chart	Description
Fill in missing asset tag	Action to be performed on the assets that have missing asset tag.
Fill in missing serial number	Action to be performed on the assets that have missing serial number.
Fill in missing DaaS account	Action to be performed on the assets that have missing DaaS accounts.
Fill in missing stockroom	Action to be performed on the assets that have missing stockroom information.
DaaS account	Customer of the DaaS provider whose data is being referenced.
Inbound order tasks	<ul style="list-style-type: none"> • Open tasks: Number of open tasks in each stage of the Inbound asset order flow. • Unassigned tasks: Number of unassigned tasks in each stage of the Inbound asset order flow. <p>The Inbound order flow includes the following stages:</p> <ul style="list-style-type: none"> • Select • Pick • Prepare • Ship • Receive confirmation <p>For more information, see Managing inbound asset orders for DaaS assets.</p>
RMA response tasks	<ul style="list-style-type: none"> • Open tasks: Number of open tasks in each stage of the RMA response order flow. • Unassigned tasks: Number of unassigned tasks in each stage of the RMA response order flow. <p>The RMA response order flow includes the following stages:</p> <ul style="list-style-type: none"> • Evaluate asset • Schedule shipment • Receive confirmation • Repair asset • Schedule refresh <p>For more information, see Managing RMA response orders for DaaS assets.</p>

Widget/Chart	Description
Repair order tasks	<ul style="list-style-type: none"> • Open tasks: Number of open tasks in each stage of the repair order flow. • Unassigned tasks: Number of unassigned tasks in each stage of the repair order flow. <p>The repair order flow includes the following stages:</p>
Shipment assets	Open shipment tasks in RMA response order or Inbound asset order flow.
Assets eligible for refresh	Number of assets that are eligible for refresh, which have surpassed the refresh date.

Inventory view

Use the Inventory view in the Hardware Asset Workspace to view the inventory functions such as Asset audits and Disposal orders and to take any inventory-related actions.

Use the following tabs to view the inventory functions and take appropriate actions:

- **Overview:** View various inventory data, such as the number of open hardware requests from stock, RMA request lines, and open transfer orders.
- **All stockrooms:** View, create, and manage stockrooms.
- **Asset audits:** Perform scheduled or blind audits of asset stockrooms and other locations such as offices or data centers.
- **Disposal orders:** Create and manage a disposal order for hardware or consumable assets that have reached their end of life cycle or are no longer functional.
- **Loaner asset orders:** View all the Loaner asset orders and take appropriate actions.
- **RMA orders:** View all the RMA orders and take appropriate actions.
- **RMA line items:** View all the RMA line items and take appropriate actions.
- **Transfer orders:** Create transfer orders, view existing transfer orders, and take appropriate actions.
- **Donation orders:** View the list of asset donation orders.
- **Repair orders:** View the list of repair orders submitted for repair of assets with your stockroom. You can also create repair orders.

To create an asset audit for your inventory, select **New asset audit**. For more details, see [Create an audit record in the Hardware Asset Management application](#).

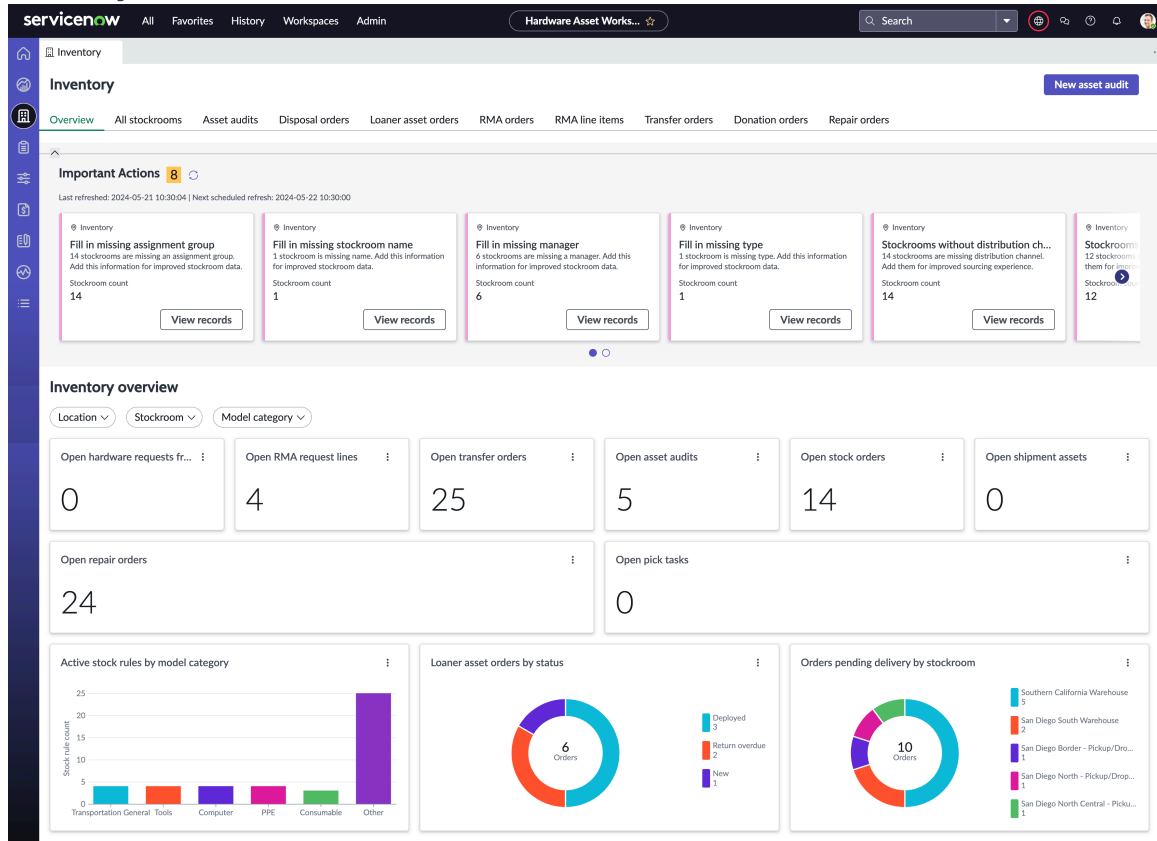

Note:

You need the asset or inventory_admin role to access the Inventory view.

Overview tab

Use the **Overview** tab for a consolidated view of various inventory data as widgets. You can also view notifications about actions with links to act on discrepancies, such as incomplete information on asset audits or disposal orders.

Inventory view

Select any widget or chart to view in detail and take required actions. You can also use **Domain**, **Location**, **Stockroom**, and **Model category** lists to narrow down your results. The **Domain** filter is available only when domain separation is enabled.

Inventory overview

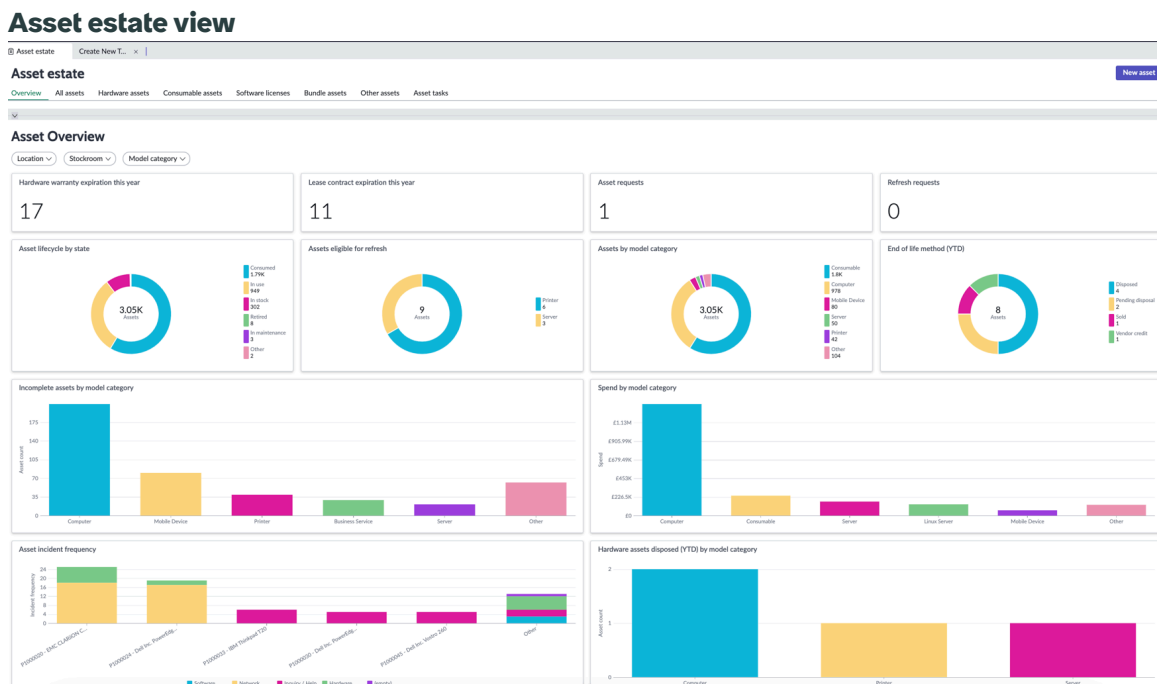

Widget or chart	Description
Open hardware requests from stock (YTD)	Number of transfer orders of Procurement type that are already delivered and created this calendar year.
Open RMA request lines	Number of open RMA request lines.
Open transfer orders	Number of canceled or undelivered transfer orders.
Open asset audits	Number of asset audits that are currently new or in progress.
Open stock orders	Number of incomplete or canceled stock orders.
Orders pending delivery by stockroom	Number of purchase orders that aren't received or canceled.
Active stock rules by model category	All active stock rules grouped by their model category.
Loaner asset orders by status	Number of loaner asset orders grouped by their status, such as Return overdue, Deployed, and New.

You can use the following important action cards related to service locations, distribution channels, and shipments to view the list of items that needs your action:

- Stockrooms missing service locations: List of stockrooms that aren't associated with any service locations. Stockrooms that are excluded from providing support to service locations aren't shown in the list.
- Stockrooms missing distribution channels: List of stockrooms that aren't associated with any distribution channels. Stockrooms that are excluded from having distribution channels aren't shown in the list.
- Stale shipments: List of shipments that weren't updated with the tracking information from the integrated carrier.
- Shipment data discrepancy: List of shipment records with the Carrier status as delivered and the Stage as In Transit.
- Carrier integration failures: List of integration profiles that failed to connect three consecutive times.
- Unmapped carrier profiles: List of integration profiles that aren't associated with a carrier.

Asset estate view

Use the Asset estate view in the Hardware Asset Workspace to view the asset functions and notifications such as expiring assets, expiring lease contracts, and take appropriate actions.

Note: The Software license tab is hidden when Software Asset Management (com.snc.software_asset_management) or Software Asset Management Professional (com.snc.pa.samp) is active. You can view this Software license tab in Software Asset Workspace.

Asset Overview

Widget or chart	Description
Hardware warranty expiration this year	Count of hardware and consumable assets that are expiring this current year.

Asset Overview (continued)

Widget or chart	Description
Lease contract expiration this year	Count of lease contract models expiring this current year.
Asset requests	Count of hardware, consumable, and bundle requests in the catalog.
Refresh requests	Count of assets that are pending refresh.
Asset lifecycle by state	Number of assets grouped by the life cycle state such as Retired, In use, In stock.
Assets eligible for refresh	Assets nearing the end of life and which are eligible for refresh.
Assets by model category	Number of assets grouped by the model category such as Software License, Consumable, Server.
End of life method (YTD)	Assets retired until date in this current year.
Incomplete assets by model category	Asset models without purchase order number, purchase order line, or receiving line.
Spend by model category	Cost of assets grouped by their model category.
Asset incident frequency	Assets that have been reported with frequent incidents.
Hardware assets disposed (YTD) by model category	Assets disposed until the current date in this year and grouped by their model category.

To create hardware, software, consumable, bundle, pallet, mobile, and facility assets, select **New asset**. For more details, see [Create assets](#).

Load reports on Asset estate view

You can load charts or widgets that fetch a huge set of asset records on demand instead of loading them along with the page. This approach enables you to reduce the loading time for the Asset estate view.

The system property `sn_itam_workspace.asset_estate_enable_lazy_loading` provides you with an option to either selectively load reports you want to view or load reports concurrently with the page. By default, this system property is set to **False**. When this system property is enabled on your ServiceNow instance, you can view charts or widgets by using the **Load report** option.

Load reports on Asset estate view

The screenshot displays the ServiceNow interface for the 'Asset estate' view. At the top, there's a navigation bar with 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and a search bar. Below this, the 'Asset estate' section is active, with a 'New asset' button. The main content area is divided into several sections:

- Important Actions:** A section with 7 actions, last refreshed on 2023-12-11 10:30:04. It contains five cards:
 - Fill in missing location:** 65 assets missing location data. Asset count: 65. [View records]
 - Fill in acquisition method:** 1277 assets missing acquisition method. Asset count: 1277. [View records]
 - Fill in PO number:** 693 assets missing PO number. Asset count: 693. [View records]
 - Unmatched RFID tags:** 5 unmatched RFID tags. RFID tag count: 5. [View records]
 - Fill in missing asset information:** 59 assets missing information. Asset count: 59. [View records]
- Asset Overview:** A dashboard with filters for Location, Stockroom, and Model category. It contains several metrics and reports:
 - Hardware warranty expiration this year: 45
 - Lease contract expiration this year: [Load report]
 - Asset requests: 5
 - Refresh requests: 2
 - Asset lifecycle by state: [Load report]
 - Assets eligible for refresh: 84 Assets. Legend: Mobile Device (75), Printer (6), Server (3). [Load report]
 - Asset count by model category: [Load report]
 - End of life method (YTD): [Load report]
 - Incomplete assets by model category: [Load report]
 - Spend by model category: [Load report]
 - Asset incident frequency: [Load report]
 - Hardware assets disposed (YTD) by model category: [Load report]

Model management view

Use the Model management view in the Hardware Asset Workspace to create or edit models, view the asset model-related functions such as hardware and consumable models nearing the end of life, and take appropriate actions.

Model management view

All reports except **Days until next hardware content refresh** under the Model Management view get filtered based on the model category you choose.

Note: Software model tab is hidden when Software Asset Management (com.snc.software_asset_management) or Software Asset Management Professional (com.snc.pa.samp) is active. You can view this Software model tab in Software Asset Workspace.

Model overview

Widget or chart	Description
Hardware models up for end of life this year	Count of hardware models whose start date of the end of life phase is the current year.
Consumable models up for end of life this year	Count of consumable models whose start date of the end of life phase is the current year.
Days until next hardware content refresh	Number of days after which the next hardware content refresh will be performed by Hardware Asset Management.
Missing data	Count of models that have missing model name, manufacturer, and model number.
Normalization metrics	Count of models that were normalized and those models that didn't get normalized.
Model lifecycle overview	Count of models that are present in each life cycle stage such as General Availability, End of Support, End of Life, and End of Sale.
Product model status	Current count of hardware, consumable, and software models based on the status of the models.

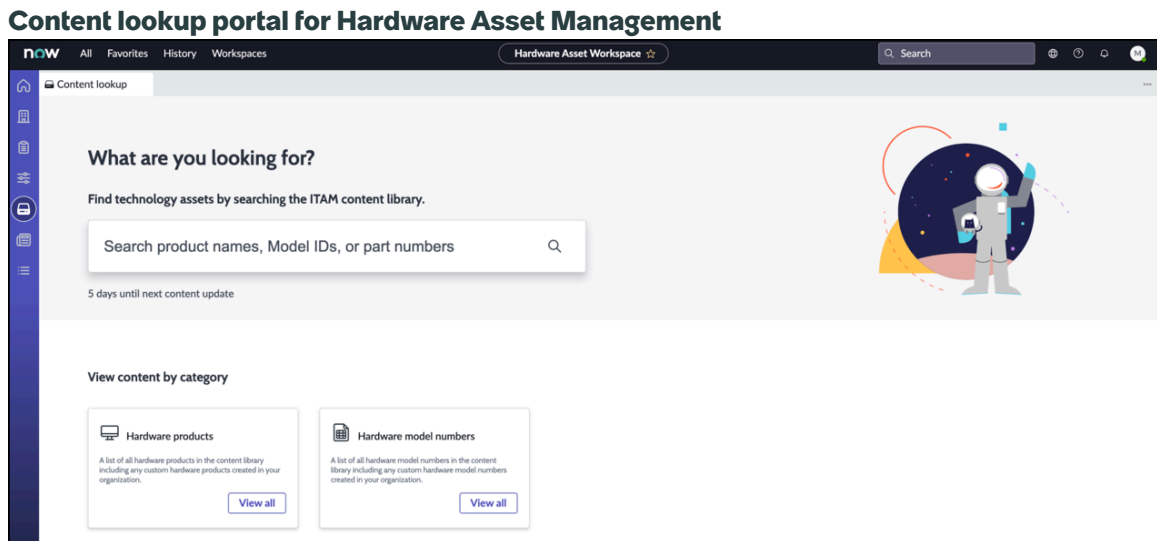

Content lookup portal for Hardware Asset Management

The IT Asset Management Content lookup portal gives you visibility into the data stored in the Hardware Asset Management Content Service via an intuitive user interface.

Once you have installed Hardware Asset Management Professional (sn_hamp), the Content lookup portal enables you to do the following:

- Search for hardware products or model numbers
- View the entire list of hardware products and model numbers in the Content Service
- View the cumulative days remaining for the next content update

For more information about installing Content lookup, [Install Content lookup to view Hardware Asset Management data](#).

After you enter your criteria in the search bar, the search results are listed with the most relevant matches at the top. Filters on the left-hand side of the page assist you in further narrowing down your results.

Based on your search criteria the information in the Content Service is pulled from the following tables.

- Hardware product [sn_hamp_hw_product]
- Hardware Model Library [sn_hamp_hw_product_model]

Select the search result that matches your criteria to display the details of the content record and related lists. The content record page opens in read-only mode.

Install Content lookup to view Hardware Asset Management data

Install the IT Asset Management Content lookup (sn_itam_contlookup) application to view the data stored in the Hardware Asset Management Content Service.

Before you begin

- Install Hardware Asset Management Professional (com.sn_hamp) from [ServiceNow Store](#).
- Activate the AI Search (com.glide.ais) plugin.

Role required: asset

About this task

If you have installed the Software Asset Management Professional (com.sn_samp_master) plugin, you can view data stored in the Software Asset Management Content service. If you have installed both Software Asset Management Professional (com.sn_samp_master) and Hardware Asset Management Professional (com.sn_hamp) plugins, you can view both their content data on the IT Asset Management Content lookup (sn_itam_contlookup) application. You can also filter your search results based on the content type, such as software or hardware. For more

information about installing the Content lookup portal for Software Asset Management, see [Install Content lookup portal for Software Asset Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the IT Asset Management Content lookup (sn_itam_contlookup) application using the filter criteria, search bar, and product tabs.

You can search for the application by its name or ID. If you cannot find the application, request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. In the Application installation dialog box, review the application dependencies.
4. Select **Install**.

Procurement view

Use the Procurement view in the Hardware Asset Workspace to view and manage procurement-related details such as procurement requests, purchase orders, sourcing tasks, and receiving slips.

The Procurement view provides access to actions for managing your open requests, pending purchase orders and transfer orders, and requests that need manager approval.

Procurement view

Select any widget or chart to view the details. You can also use **Location, Stockroom, and Domain** filters to narrow down your results.

Note:

The Domain filter is available only when you've enabled the Domain Extensions Installer (com.glide.domain.msp_extensions.installer) and Domain Separation (plugin com.snc.pa.domain_support) plugins.

Procurement overview

Widget or chart	Description
Purchase order pending delivery	Count of purchase orders that aren't received and aren't canceled. Only purchase orders that have a status of Requested, Ordered, or Pending Delivery are displayed.
Requests pending approval	Count of sourceable and active requests with request state of pending approval.

Procurement overview (continued)

Widget or chart	Description
Expenditure by vendor	Cost that you've paid to each of your vendors for procuring the inventory. Only purchase orders that have a status of Ordered, Pending Delivery, or Received are listed.
Orders by vendor	Purchase orders that have been ordered, are pending delivery, or have been received by the vendor.
Requests by state for last 30 days	Requests created in last 30 days grouped by state.
Requests that require sourcing	List of requests for which a purchase order, local order, or transfer order hasn't been initiated.
Open purchase orders	List of purchase orders that have been requested, ordered, or not delivered.

Success portal view in Hardware Asset Workspace

Use the Success portal view in Hardware Asset Workspace to track the progress of your Hardware Asset Management (HAM) application with success goals, assign activities to track the success of your goals, and mature your HAM program with predefined maturity items.

Success portal helps you perform the following actions:

- **Track the progress of your HAM application through success goals**

Success goals help you analyze the value that you get out of your hardware assets and calculate your projected savings. Create success goals for the assets that you want to track. For more information about creating a success goal, see [Create a success goal for Hardware Asset Management](#).

- **Track the progress of your success goals**

Track the success of your goals by creating success activities for the goals. For more information, see [Create success activities for HAM success goals](#).

- **Mature your HAM program with predefined maturity items**

The program maturity is categorized into Crawl, Walk, and Run stages to help you improve the value return of your HAM application within your organization. You can link these maturity items to success goals and use the HAM application efficiently. For more information, see [View all maturity items for Hardware Asset Management](#).

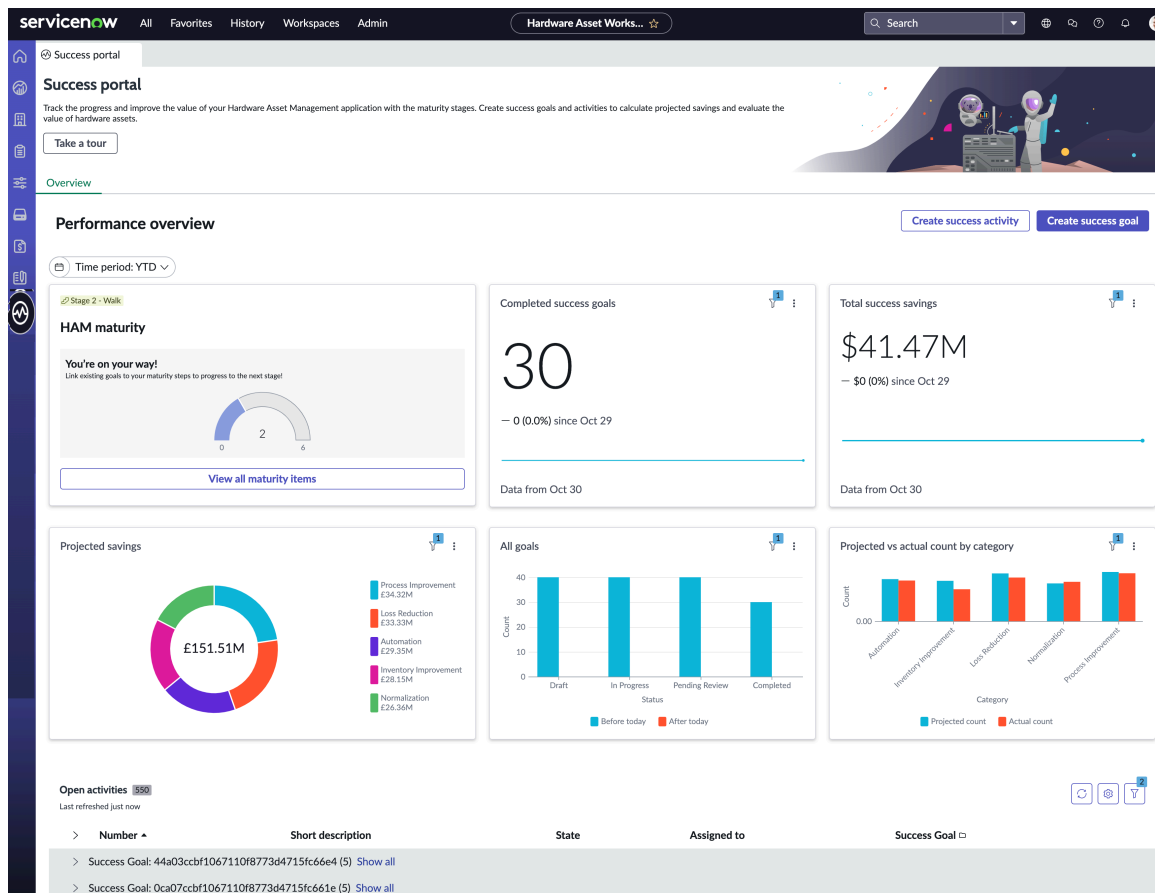

i Important:
The HAM maturity program is available with the Hardware Asset Management 10.0.0 version or later.

Email notifications are sent when the following conditions are met:

- To a group, when a success goal is assigned to that group.
- To an owner, when a success goal is assigned to that owner.
- To an owner, when a success goal is marked as Pending Review.
- To an assigned user or an assignment group, when a success activity is assigned.

Access the Success portal by navigating to **Hardware Asset Workspace > Success portal**.

The Success portal supports domain separation when the Performance Analytics - Domain Support plugin (com.snc.pa.domain_support) is activated. To filter the data by domain, select a domain at the top of the dashboard.

To narrow down your results, you can filter by time period.

Success portal dashboard

Widget	Description
HAM maturity	Current stage of your HAM program maturity such as the Crawl, Walk, or Run stage. View the maturity items of each stage by selecting View all maturity items . For more information, see View all maturity items for Hardware Asset Management .
Completed success goals	Total number of completed success goals.
Total success savings	Actual savings from the completed success goals.
Projected savings	Anticipated savings from the success goals are grouped by the status and category of the goal.
All goals	Complete list of success goals with one of the following statuses: <ul style="list-style-type: none"> • Draft • In Progress • Pending Review
Projected vs actual count by category	Comparison between the projected and actual success goals count with status as Draft, In Progress, or Pending Review .
Open activities	Open success goal activities.

i Important: The **HAM maturity**, **Total success savings**, **Projected savings**, and **All goals** fields are available with the Hardware Asset Management 10.0.0 version or later.

Asset operations view

Use the Asset operations view in the Hardware Asset Workspace to view the asset operations-related functions such as stock rules, stock orders, procurement sourcing requests, all contract renewal requests, contract renewal line items, custom products, custom models, and take appropriate actions.

The Asset operations view includes the following list:

- Inventory
 - Stockroom types: View types of stockrooms. For more information, see [Create a new stockroom type](#).
 - Stock rules: View stock rules associated with the stockroom. For more details, see [Create a stock rule](#).
 - Stock orders: View stock orders associated with the inventory.
- Shipment

- Shipments: View and track the shipments from different sources or flows. For more information, see [View hardware asset shipment details](#).
- Shipment assets: View the list of assets included in the shipments. For more information, see [View hardware asset shipment details](#).
- Shipping carriers: Create and view the list of shipping carriers. For more information, see [Create a shipping carrier record](#).
- Carrier integration profiles: View the list of carrier integration profiles associated with the shipping carriers. For more information, see [View the carrier integration profile details](#).
- Procurement-Requests: View and track procurement requests. For more information, see [Sourcing items in a service catalog request](#).
- Hardware asset normalization
 - Custom products: View details of custom products that aren't represented in the Asset Management Content Service. For more information, see [Add a custom product](#).
 - Custom models: View details of custom models. For more information, see [Create a hardware or consumable model](#).
 - Calculated lifecycle templates: View and create life cycle templates and formulas that can be applied on hardware and consumable models. For more information, see [Manage the lifecycle of hardware models with calculated lifecycle templates](#).
- Contract Renewal
 - All contract renewal requests: View details of all contract renewal requests.
 - Contract renewal line items: View details of all line items associated with contract renewal requests.

For more information, see [Contract renewal workflow](#).

- KPI configuration

i Important:

The KPI configuration options are available in Hardware Asset Management version 13.0.0 and later.

- KPI opt in: Enable the asset performance tracking by opting in to the model categories of the assets. For details, see [Opt in to model categories to track performance KPIs for hardware assets](#).
- Operational schedules: Create and view operational schedules for hardware assets. For details, see [Create an operational schedule for hardware assets](#)
- Asset schedules: Link hardware assets to their respective operational schedules and align KPI records accordingly. For details, see [Map hardware assets to an operational schedule](#)
- TCO configuration
 - Task rate card: Define the type of task and the method of calculating the associated costs, and view the details of the created task rate cards. For more information, see [Create a task rate card in Hardware Asset Workspace](#).
 - Labor rate card: Record the time worked on a task and associate a rate to the task, and view the details of the created labor rate cards. For more information, see [Create a labor rate card in Hardware Asset Workspace](#).
- Zero touch

- Asset requests: View the list of hardware asset requests of your employees submitted through the Zero Touch request flow. For more information, see [Manage hardware asset requests using the Zero Touch request flow](#).
- Provider integration profiles: Create a provider integration profile to transform the Scratchpad updates from your provider into a format required for the Zero Touch request flow. For more information, see [Create a provider integration profile](#).
- Zero touch refresh
 - Requests: View the list of Zero Touch Refresh requests of your employees. For more information, see [Process a Zero Touch Refresh request](#).
 - Refresh models: Create and view the list of refresh models with the configured replacement models. For more information, see [Configure replacement models for a refresh model](#).
- Attestation
 - Attestations: View the list of asset attestation requests. For more information, see [Create an asset attestation in the Inventory view](#).
 - Schedules: View the list of attestation schedules that create recurring attestation requests. For more information, see [Cancel an attestation schedule](#).
- Hardware asset success
 - Success goals: Create success goals and view the list of created success goals for Hardware Asset Management. For more information, see [Create a success goal for Hardware Asset Management](#).
 - Success activities: Create success activities and view the list of created success activities for Hardware Asset Management. For more information, see [Create success activities for HAM success goals](#).
 - Success categories: Create a category for a success goal and view the list of categories. For more information, see [Create a success goal category for hardware assets](#).
 - Hardware maturity: View items that help you drive the success of your hardware assets. For more information, see [View all maturity items for Hardware Asset Management](#).
- Stockroom receiving- Receive assets: View the list of all import records that were performed in any stockroom. For more details, see [Import and receive assets in bulk at your stockroom in the Hardware Asset Workspace](#).
- Asset audits: View deprecated audit records created in the Asset Audits [sn_hamp_asset_audit] table before upgrading to the audit enhancements introduced in Hardware Asset Management version 15.0.0. For more information, see [View deprecated audit records](#).

Important:

If you have enabled the audit enhancements and switched to the common audit table, new asset audit records are now stored in the Asset Audits [sn_itam_common_asset_audit] table. After the switch, you can't view deprecated audit records (created before switching to common table and stored in the Asset Audits [sn_hamp_asset_audit] table) in the **Asset audits** tab from the Inventory view.

You can view the deprecated audit records from the Asset Operations view, when the *migrate_hamaudit* system property to **true**.

- Asset warranty: View the warranty details of Lenovo hardware assets. For more information, see [Track the warranty details of your Lenovo assets](#).

You can also create and easily access your custom list views from the **My Lists** tab.

Asset Management Executive Dashboard

Use the Asset Management Executive Dashboard to gain visibility into critical KPIs for Hardware Asset Management, Software Asset Management, and Cloud Cost Management applications via a single dashboard.

To access the Asset Management Executive dashboard, you must either have Software Asset Management or Hardware Asset Management in your ServiceNow instance.

To view the Asset Management Executive dashboard, navigate to **Asset Executive Workspace > Asset Management Executive Dashboard**. A user with the role of `sn_itam_common.asset_exec` can access the dashboard.

Asset Management Executive Dashboard

You can filter the results in the dashboard by product, domain, or by both product and domain. If you filter by domain, the filter gets applied to all the widgets. If you filter by product, since some widgets are applicable for certain products, the filter isn't applied to all the widgets.

After you select a filter, a blue box gets displayed on the right side of each widget displaying one of the numbers:

- 0: Indicates that no filter is applied to a widget.
- 1: Indicates that only one filter is applied to a widget.
- 2: Indicates that both the filters are applied to a widget.

Note:

To use the domain filter, you must activate the plugins: `com.glide.domain.msp_extensions.installer` and `com.snc.pa.domain_support`.

The schedule job, *Asset Management - Populate KPI aggregate table*, runs daily to update the data on the dashboard. To view the latest data for a widget, select the widget to display the list view page.

The dashboard widgets vary depending on the application plugins that you've activated in your instance. The widgets available with each application are listed in the following table:

Asset Management Executive Dashboard widgets

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
Total spend	Total cost of all entitlements for all products. Source table: License Metric Results [samp_license_metric_result].	Total cost of all hardware assets whose status is either In stock, In use, In maintenance, or In transit Source table: Hardware [alm_hardware].	Total active cost of all cloud resources. Source table: Spend Report Daily Aggregated Cost [sn_cld_spend_core_daily_aggregated_cost].
Actual savings	Total yearly savings for all products. This value is calculated as the total savings from closed complete reclamation candidates. Source table: Removal Candidate [samp_sw_reclamation_candidate].	Not applicable	This value is calculated as the monthly savings on cloud resources. Note: This widget gets displayed only if you have the Software Asset Management application installed on your instance. Source table: Cloud Insights Rightsizing Recommendation Automatics (sn_clin_core_rs_recommendation_automatic) where State = Completed.
Potential savings	Cost saved if removal candidates are reclaimed. Source table: Removal Candidate [samp_sw_reclamation_candidate].	Not applicable	Total of potential savings on a monthly basis on cloud rightsizing, cloud unused machines, cloud reservations, and cloud business hours. Note: This widget appears only if you have the Software Asset Management application installed on your instance. Source tables:

Sustainable IT dashboard

The Sustainable IT dashboard helps you track the environmental impact of your IT assets and displays a variety of information to gauge the sustainability impact of the hardware assets of an organization easily.

You must install the Sustainable IT plugin (sn_esg_sustain) to view the Sustainable IT dashboard. For more information about the activating the Sustainable IT plugin, see [Activate the Sustainable IT plugin](#).

To know more about the Sustainable IT dashboard data for your hardware assets, see [Sustainable IT dashboard](#).

Analytics and Reporting Solutions for Hardware Asset Management

This Platform Analytics Solution contains preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling the Performance Analytics Solution

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

Note:

Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

For unlimited access to all features of this Platform Analytics Solution, purchase a Performance Analytics subscription. For more information, see [Activating your Performance Analytics subscription](#).

To use this Analytics and Reporting Solution, you must be entitled to use Performance Analytics with Hardware Asset Management. For more information about entitlements to Performance Analytics, see [Activating your Performance Analytics subscription](#).

This Out-of-the-box Performance Analytics Solution is available from the ServiceNow Store. To enable this solution, an admin navigates to **System Applications > Search ServiceNow Store**. When the landing page for the ServiceNow Store opens, search for Hardware Asset Management. When you have found the Solution, follow the instructions in the Store. The ServiceNow Store has its own documentation.

Domain separation and 'Run As' user

In some solutions, System Administrator is the **Run As** user for data collection jobs in the Platform Analytics Solutions. In other solutions, the **Run As** user for data collection jobs is left blank. Verify that the **Run As** user exists on the instance, and that this user has the appropriate level of access. An inappropriate **Run As** user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

Performance Analytics dashboards for Hardware Asset Management

Important:

You can access the Core UI Performance Analytics dashboards only if you have upgraded from prior releases to Xanadu. Beginning with the Xanadu release, the Core UI Performance Analytics dashboards aren't available to new users of Hardware Asset Management.

The Performance Analytics dashboards available for Hardware Asset Management are the following:

- Hardware Asset Dashboard
- Hardware Normalization Dashboard
- My Assets
- Procurement Overview
- Asset Contract Overview
- Asset Overview

Beginning with the Xanadu release, note the following points about the Core UI Performance Analytics dashboards:

- The Procurement Overview and Asset Contract overview module links are redirected to [Hardware Asset Workspace](#).
- The following Next Experience Platform Analytics dashboard versions of the Asset Overview and My Assets Core UI Performance Analytics dashboards are available:
 - Analytics Overview: You can access this dashboard by navigating to **Asset > Analytics Overview**.
 - My Assets Analytics: You can access this dashboard by navigating to **Self-Service > My Assets Analytics**.

Note:

After upgrading to Xanadu, you can view both the Core UI Performance Analytics dashboards and the Next Experience Platform Analytics dashboards for Hardware Asset Management. While migrating the Core UI Performance Analytics dashboards to the Next Experience Platform Analytics dashboards, auto-migration is disabled by default to avoid duplicate dashboards.

Hardware Asset dashboard

View the key metrics on your hardware and consumable models and assets for the entire asset life cycle in the Hardware Asset dashboard.

Important:

You can access the Hardware Asset dashboard only if you have upgraded from prior releases to Xanadu. Beginning with the Xanadu release, the Hardware Asset Dashboard isn't available to new users of Hardware Asset Management.

Access the Hardware Asset dashboard by navigating to **Asset > Hardware Asset Dashboard**.

The results in all the tabs in the Hardware Asset dashboard are updated in real time. Only the reports that display data in the **Lifecycle Overview** sections is updated daily based on scheduled jobs. You can save charts in PNG or JPEG formats for sharing or viewing them locally.

End user and roles

End user and goal	Required role	Benefits
Asset Manager must see patterns in the data all through the asset life cycle.	asset	View reports that provide critical insights on assets such as procurement needs, inventory, and end of life status. You can also view the normalization status and life-cycle overview for hardware and consumable models.

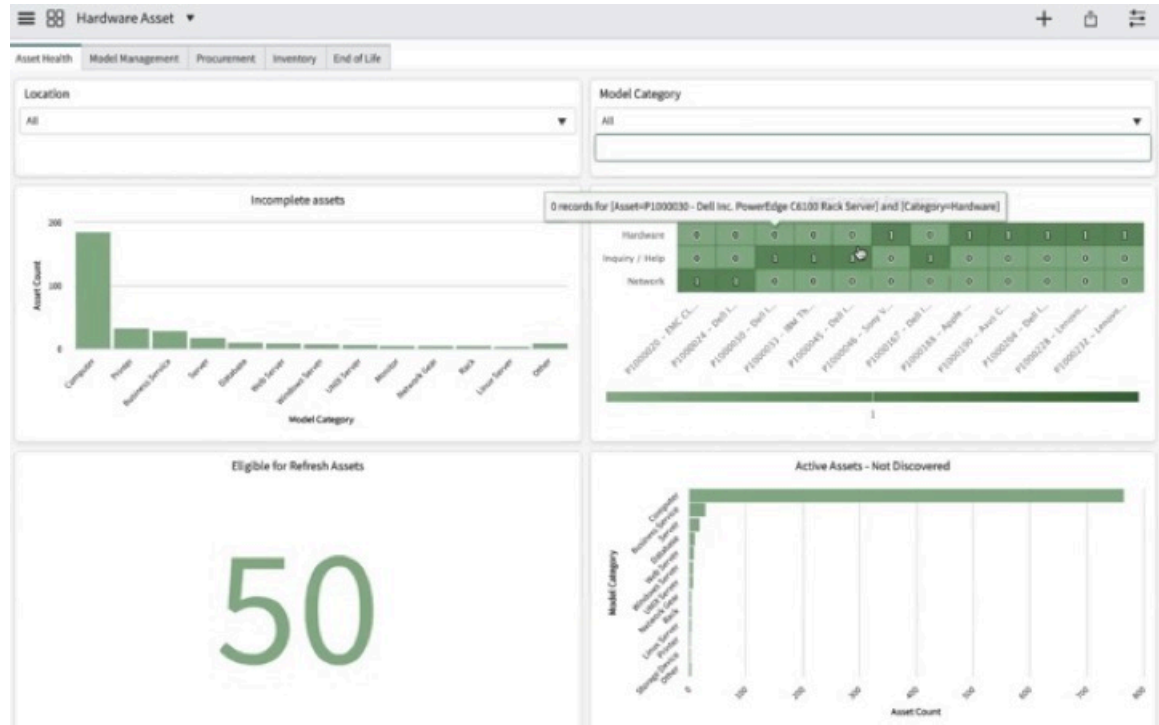

Asset Health tab

This tab gives you an overview of hardware and consumable models that are missing purchase information, undiscovered over a period one month of missing, scheduled for retirement, or reported with most incidents. Use Location and Model Category filters to view asset health reports of particular location and model respectively.

Report	Source table	Description
Incomplete Assets	Asset [alm_asset]	Asset models without purchase order number, purchase order line, or receiving line.
Eligible for Refresh Assets	Hardware [alm_hardware]	Asset nearing end of life and which are eligible for refresh.

Report	Source table	Description
Asset incident Frequency	Incident [incident]	Assets that have been reported with frequent incidents.
Active Assets - Not Discovered	Asset [alm_asset]	Assets that aren't discovered at all or not discovered within one month.

Asset Health tab

Model Management tab

This tab gives you an overview of hardware and consumable models that are reaching their end of life. You can also view the normalization status, life-cycle overview, and information on the content service library. You can effectively manage your models by viewing their end of life status on a monthly, quarterly, or yearly basis.

Report	Source table	Description
Hardware Models up for End of Life	Hardware Model Lifecycle [cmdb_hardware_model_lifecycle]	The beginning phase of the end of life for hardware models. Shows the count of hardware models whose start date of the end of life phase is either the current month, quarter, or year.

Report	Source table	Description
		<p>Note: Only hardware model life cycle records that are active, model status is in production, and life cycle type is Publisher appear in This month, This quarter, or This year.</p>
Normalization Status	Hardware Product Model [cmdb_hardware_product_model]	<p>Normalization status of all the hardware models. View the count of hardware models that were normalized and those models that didn't get normalized.</p> <p>You can further drill down to view the status of the normalized models: Manually Normalized, Manufacturer Normalized, or Partially Normalized.</p> <p>You can drill down to view the status of non-normalized models too: New and Match Not Found.</p>
Lifecycle Overview	Hardware Model Lifecycle [cmdb_hardware_model_lifecycle]	The count of hardware models that are present in each life cycle stage: General availability, end of support, end of extended support, and end of sale.
Consumable Models up for End of Life	Consumable Model Lifecycle [cmdb_consumable_model_lifecycle]	<p>The beginning phase of the end of life for consumable models. Shows the count of hardware models whose start date of the end of life phase is either the current month, quarter, or year.</p> <p>Note: Only consumable model life cycle records that are currently active, model status is in production, and life cycle type is Publisher appear in This month, This quarter, or This year.</p>

Report	Source table	Description
Normalization Status	Consumable Product model [cmdb_consumable_product_model]	<p>Normalization status of all the consumable models. You can view the count of consumable models that were normalized and those that didn't get normalized.</p> <p>You can further drill down to see the status of the normalized models: Manually Normalized, Manufacturer Normalized, or Partially Normalized.</p> <p>You can drill down to view the status of non-normalized models too: New and Match Not Found.</p>
Lifecycle Overview	Consumable Model Lifecycle [cmdb_consumable_model_lifecycle]	The consumable models that are present in each life-cycle stage: General availability, end of support, end of extended support, and end of sale.
Product Model Status	Product Model [cmdb_model]	Current count of hardware, consumable, and software models based on the status of the models. Drill down on a model to view the status of that model. For example, click hardware models on the chart to see the status of all the hardware models: In Production, Retired, or sold.
Hardware Model Content Service Download	CDS table [cde_client_schedule]	The days since the content service library was last downloaded on your instance and the days remaining for the next download to take place.

Model Management tab

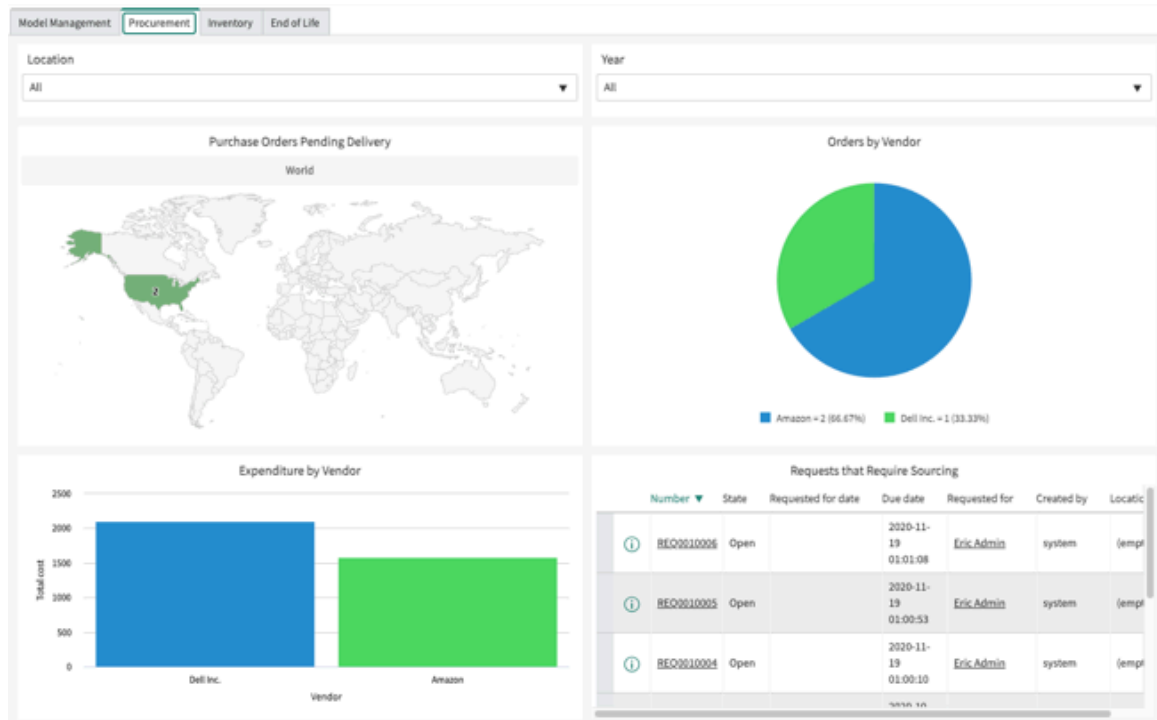

Procurement tab

This tab gives you a view of the purchase orders for hardware assets that are pending delivery worldwide. You can also view purchase orders that haven't yet been sourced and information relating to cost of purchase orders per vendor. You can filter the results in this tab by location and year.

Report	Source table	Description
Purchase orders pending delivery	Purchase Order [proc_po]	Purchase orders which aren't yet received or canceled. Only purchase orders that have a status of ordered or pending delivery are displayed. Note: The asset, procurement_user, inventory_admin, or contract_manager role can only access the Purchase Order [proc_po] reports.
Expenditure by Vendor	Purchase Order [proc_po]	The cost that you've paid to each of your vendors for procuring the inventory. Only purchase orders that have a status of ordered, pending

Report	Source table	Description
		delivery, or received are displayed. Note: The asset, procurement_user, inventory_admin, or contract_manager role can only access the Purchase Order [proc_po] reports.
Orders by Vendor	Purchase Order [proc_po]	Purchase orders that are ordered, pending delivery, or received. Note: The asset, procurement_user, inventory_admin, or contract_manager role can only access the Purchase Order [proc_po] reports.
Requests that Require Sourcing	Request [sc_request]	Requests that haven't yet been addressed. Requests for which either a purchase order or a transfer order hasn't been initiated.

Procurement tab

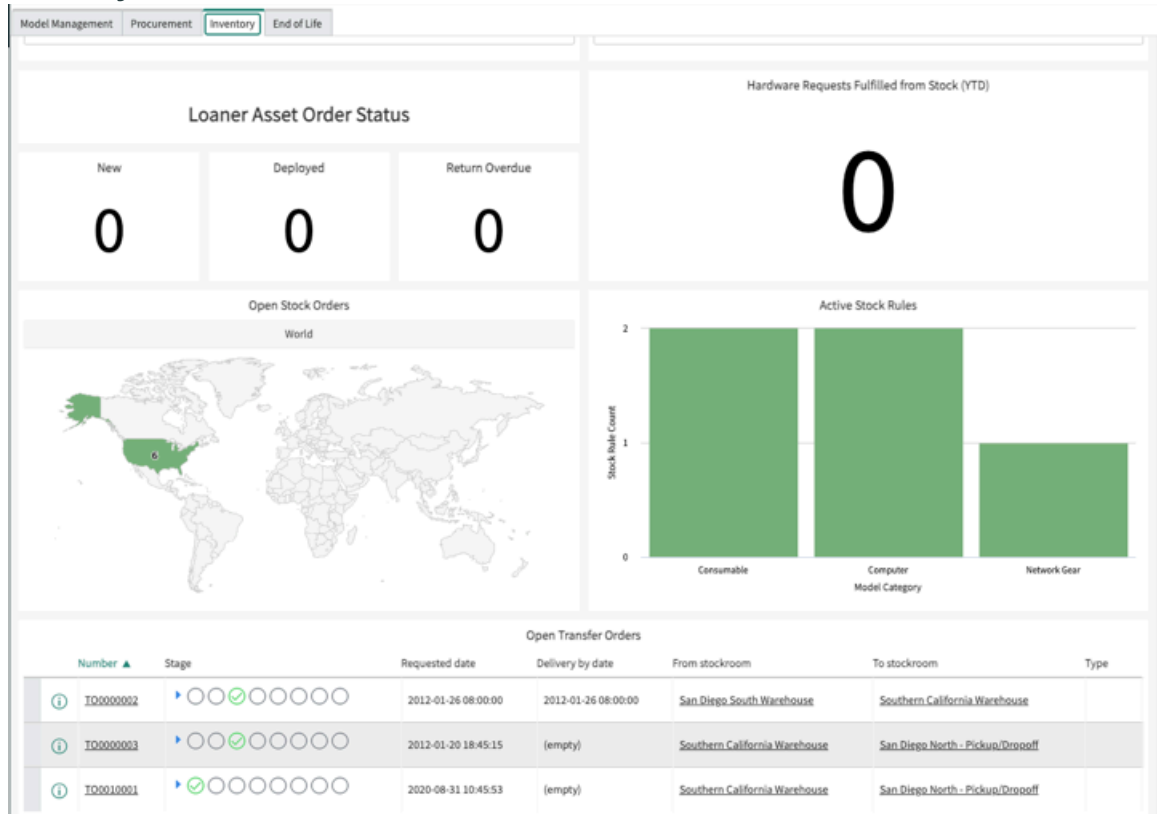

Inventory tab

This tab shows data regarding your open stock orders. You can also view information about active stock rules, open transfer orders, and requests sourced through stock. You can filter the results in this tab by location and stockroom.

Report	Source table	Description
Hardware Requests fulfilled from Stock (YTD)	Transfer Order [alm_transfer_order]	Requests sourced through stock in the current year. Note: The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports.
Open Stock Orders	Requested Item [sc_req_item]	All the stock orders which haven't yet been fulfilled. The open stock orders can be viewed as numerical data geographically.
Active Stock Rules	Stock Rule [alm_stock_rule]	Count of active stock rules grouped by model category. If a model of an item that has an active stock rule falls below the threshold value, a new order is placed.
Open Transfer Orders	Transfer Order [alm_transfer_order]	Transfer orders not yet delivered or canceled. Note: The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports.
Open Audit Assets	Asset Audits [sn_hamp_asset_audit]	Audits that are currently new or in progress. Note: The asset or inventory_user role can only access the Asset Audits [sn_hamp_asset_audit] reports.

Report	Source table	Description
New Hardware Assets Found by Audits	Asset [alm_asset]	The distribution of categories the assets belong to for audits conducted in the last year.
Loaner Asset Order Status	Loaner Asset Order [sn_hamp_loaner_asset_order]	Number of Loaner Asset Orders that are new, deployed, and the ones that are overdue for return.
Open RMA Request Lines	RMA Request Line [sn_hamp_rma_request_line]	List of all the open RMA request lines. Note: The asset, itil, or inventory_user role can only access the RMA Request Line [sn_hamp_rma_request_line] reports.

Inventory tab

End of Life tab

View this tab to monitor your assets that are approaching their end of life stage and the disposal status of your assets. You can filter the results in this tab by location, stockroom, and model category. The Model category filter doesn't apply to **Hardware Asset Disposal Status**.

Report	Source table	Description
Hardware Nearing End of Warranty	Asset [alm_asset]	<p>Hardware and consumable assets whose warranty expiration date falls in the current month, quarter, or year.</p> <p>Note: Only assets that are in the following states appear.</p> <ul style="list-style-type: none"> • in stock • in transit • in use • in maintenance • consumed
Hardware Asset Disposal Status	Hardware Disposal Order [hamp_hardware_disposal]	<p>Status of requests created for hardware assets disposal. The count of new requests appears in New. The count of all hardware disposal requests that are currently in scheduling, transit, and confirmation stages are listed under In progress.Pending Documentation shows all the disposal requests that are in the Documentation stage.</p>
Hardware Assets Disposed (YTD)	Asset [alm_asset]	Hardware and consumable assets, based on model category that have been disposed in the current year.
End of Life Method (YTD)	Asset [alm_asset]	Count of hardware and consumable assets that are retired, based on their substates. A hardware asset in a retired state has many substates (disposed, none, sold, vendor credit, and pending disposal).
Lease Contract Expiration	Contract [ast_contract]	Hardware and consumable assets whose lease expiration date falls in the current month, quarter, or year. It shows only the active contracts.
Hardware Asset Refresh Order	Requested Item [sc_req_item]	A list of Hardware Asset Refresh ordered.

End of Life tab

Hardware Nearing End of Warranty			Lease Contract Expiration		
This month	This quarter	This year	This month	This quarter	This year
25	63	304	2	2	3

Hardware Asset Disposal Status			End of Life Method (YTD)

BITM0010009	Plan and execute the refresh of aged hardware assets																		
BITM0010007	Plan and execute the refresh of aged hardware assets																		

Asset and CI management

Asset and configuration item (CI) management refers to creating assets, setting appropriate states and substates, synchronizing assets and CIs, managing consumables, and retiring assets.

Relationship between asset and CI

It's important to manage the relationship between assets and associated CIs. Assets are tracked with the Asset Management application, which focuses on the financial aspects of owning property. Configuration items are stored in the CMDB, which is used to track items and make them available to users.

When an asset has a corresponding configuration item, the asset record and the configuration item record are kept synchronized with two business rules.

- *Update CI fields on change* (on the Asset [alm_asset] table)
- *Update Asset fields on change* (on the Configuration Item [cmdb_ci] table)

Note:

Assets and CIs can be synchronized only if they're logically mapped.

Asset-CI mapping and synchronization

The State field of asset record and Status field of CI record are synchronized so that changes made on one form trigger the same update on the corresponding form, ensuring consistent reporting.

Note:

The ServiceNow AI Platform synchronizes updates between assets and configuration items only if the asset and configuration item are pointed toward each other.

The following diagram illustrates the concept of Asset-CI mapping and synchronization.

Overview of Asset-CI mapping and synchronization

This synchronization and mapping is based on the following factors:

- Asset state and CI status aren't mapped on one-to-one basis. Rather they're mapped to the most logical counterpart on the other table. For example, for a hardware asset set to state **In Stock - Pending disposal**, the corresponding CI is set to **In Disposition** with no substate.
- This synchronization happens between the asset's State field and the following CI fields:
 - Install Status field: Install Status doesn't have a sub status and must be used for non-hardware CIs.
 - Hardware Status and Sub status field: Hardware Status is visible only for Hardware CI.
- Drive changes by updating the state on the Asset form. The Asset-CI synchronization can be driven in the following ways:
 - Asset to CI synchronization: Change to the asset's status updates the logically mapped CI's Install Status or Hardware Status and sub status.
 - CI to Asset: Change to the CIs Install Status or Hardware Status updates the logically mapped asset's states and sub states.
- For a CMDB hardware CI, if both Hardware Status and Install Status is updated, the Hardware Status change is considered for mapping the corresponding state of the asset.
- CIs Install Status and Hardware Status work independently, so the two fields aren't related. CI's Hardware Status change doesn't change CIs Install Status and vice versa. To avoid confusion, keeping both status for CMDB CI Hardware isn't recommended.

List of the fields that get synced between Asset and CI

When changing any of the following fields on the asset or CI record, the same field on the corresponding record is automatically updated (except for the **Cost** field, which is informational-only on the CI record).

The following is a list of fields that are synchronized.

- Asset tag
- Assigned
- Assigned to
- Checked in
- Checked out
- Company
- Cost (synchronizes in only one direction: asset to CI)
- Cost center
- Delivery date
- Department
- Due in
- Due
- GL account
- Install date
- Invoice number
- Justification
- Lease id
- Location
- MAC address
- Managed by
- Model (model_id in CI)
- Order date
- Order received
- Ordered
- Owned by
- PO number
- Purchase date
- Purchased
- Serial number
- Support group
- Supported by
- Vendor
- Warranty expiration

Asset, CI, and IBI synchronization

Any item that is provided as a service or sold to your customer is tracked as an Install Base Item (IBI). The Model category table associates Asset, CI, and Install Base Item (IBI). The synchronization between the asset and IBI is through the CSDM Life Cycle Stage and Status fields.

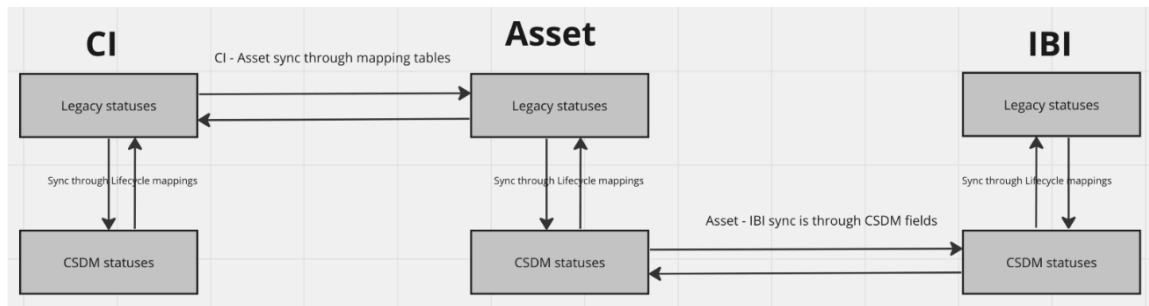

When the CSDM (`csdm.lifecycle.migration.activated`) plugin is activated on your ServiceNow instance, synchronization of the CSDM Lifecycle fields between the asset and CI depends on the `csdm.lifecycle.sync.between.ci.and.asset.activated` system property. If you are upgrading to the Xanadu release, this system property is set to **false** by default. Synchronization between the asset and CI happens in one of the following ways:

- When the system property is set to **false**, synchronization of the CSDM Lifecycle fields is through the legacy State and Substate fields.
- When the system property is set to **true**, the CSDM Life Cycle Stage and Status fields are directly synchronized.

Note:

If you are activating the CSDM (`csdm.lifecycle.migration.activated`) plugin on your ServiceNow instance for the first time, and you have custom States and Substates for the asset or CI, then make sure to configure mapping between the legacy fields and the CSDM Lifecycle fields. For more information, see [Enabling CSDM life-cycle sync between legacy fields and related assets](#).

Asset, CI, and IBI synchronization when the `csdm.lifecycle.sync.between.ci.and.asset.activated` system property is set to false

Synchronization of updates from asset to IBI and CI

Updates made to the State or Substate field of an asset are synchronized with the associated IBI and CI. For example, when the State field of the asset is updated to In use, synchronization happens as follows.

- The Life Cycle Stage and Life Cycle Stage Status of the asset are set to Operational and In use, these field values are then synchronized with Stage and Status fields of IBI asset.
- The Status and Substatus fields of the CI change to Installed and In use.

Synchronization of updates from IBI to asset and CI

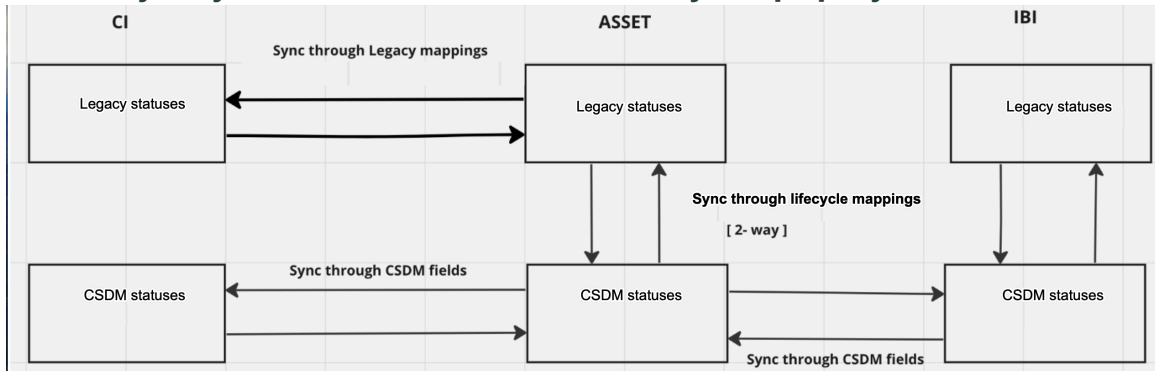

Updates made to the Life Cycle Stage and Life Cycle Stage Status fields of an IBI asset are synchronized with the legacy State and Substate fields of the asset through the CSDM fields. The legacy fields of the asset are then synchronized with the associated CI. For example, when the life Life Cycle Stage and Life Cycle Stage Status fields of an IBI asset are updated to Defective and In Stock, synchronization happens as follows.

1. The Life Cycle Stage and Life Cycle Stage Status of the asset change to In Stock and Defective. These field values are synchronized with the State and Substate fields of the asset.
2. The State and Substate fields of the asset are then synchronized with the corresponding fields of the associated CI.

Synchronization of updates from CI to asset and IBI

Updates made to the Status and Substatus fields of a CI are synchronized with the corresponding fields of the asset. The legacy fields of the asset are then synchronized with the Life Cycle Stage and Life Cycle Stage Status fields of the IBI asset through the CSDM fields. For example, when the Status and Substatus fields of a CI are updated to Retired and Donated, the corresponding fields of the asset change. The changes from the asset are synchronized with the IBI asset and the Life Cycle Stage and Life Cycle Stage Status fields change to End of Life and Retired.

Asset, CI, and IBI synchronization when the `csdm.lifecycle.sync.between.ci.and.asset.activated` system property is set to true

Synchronization of updates from asset to CI and IBI

Updates made to the legacy State and Substate fields of the asset are synchronized between the asset and CI as follows:

- The Life Cycle Stage and Life Cycle Stage Status fields of the asset are updated with values corresponding to the legacy State and Substate fields of the asset.
- The State and Substate fields of the asset are then directly synchronized with the corresponding legacy fields of the associated CI.
- The Life Cycle Stage and Life Cycle Stage Status fields of the asset are then directly synchronized with the corresponding CSDM fields of the associated CI.

However, synchronization of updates from asset to IBI is only through the CSDM Lifecycle fields.

Synchronization of updates from IBI to asset and CI

Updates made to the Life Cycle Stage and Life Cycle Stage Status fields of the IBI are synchronized as follows:

- The legacy State and Substate fields of the asset are synchronized through the CSDM fields.
- The legacy fields of the asset are synchronized with the legacy fields of the associated CI.
- The Life Cycle Stage and Status fields of the asset are directly synchronized with the corresponding CSDM fields of the associated CI.

Synchronization of updates from CI to asset and IBI

Updates made to the Life Cycle Stage and Status fields of a CI are synchronized as follows:

- The Life Cycle Stage and Status fields of the CI are directly synchronized with the corresponding CSDM fields of the asset.
- The legacy fields of the asset are then updated with the values corresponding to the CSDM fields.
- The legacy fields of the asset are then synchronized with the corresponding fields of the CI.
- The legacy fields of IBI are synchronized with the asset through the CSDM Lifecycle fields.

Asset and CI synchronization through MAC address

Synchronization between asset and CI can be achieved using the **MAC address** (mac_addr) field in the Asset [alm_asset] table in addition to the Serial number. A CI can have multiple MAC addresses. The Network Adapter [cmdb_ci_network_adapter] table stores all the MAC addresses and also has a reference field to the CI [cmdb_ci] table. Therefore, the relationship between MAC address and CI is maintained.

Synchronization from asset to CI

When an asset is created with a MAC address, synchronization happens as follows:

1. A CI is created.
2. A record for the corresponding MAC address is created in the Network Adapter [cmdb_ci_network_adapter] table with a reference to the CI.

When the MAC address of an asset is updated, the existing record in the Network Adapter [cmdb_ci_network_adapter] table isn't updated. Instead, a new record is created in the Network Adapter [cmdb_ci_network_adapter] table.

Synchronization from CI to asset

When a CI is created with a MAC address, synchronization happens as follows:

1. An asset is created.
2. The MAC address of the CI is copied to the asset.

If there's an existing CI, then the associated asset is updated with the MAC address only if the asset doesn't have it already.

Rules for generating CI names

A CI name follows a format that's based on the following conditions:

Conditions and CI name

Condition	CI name format
Asset has a Serial number	Concatenation of Serial number and Model name separated by hyphen. For example, SN123 - DemoModel.
Asset has a Serial number and a MAC address	Concatenation of Serial number and Model name separated by hyphen. For example, SN123 - DemoModel.
Asset has no Serial number but has a MAC address	Concatenation of MAC address and Model name separated by hyphen. For example, 88-22-33-66-888-AB - DemoModel.

Conditions and CI name (continued)

Condition	CI name format
Asset has no Serial number and MAC address	Model name

Whenever there are updates to **Serial number** or **MAC address** fields, the CI name is synchronized only under the following conditions:

- CI name isn't updated manually.
- The Discovery source is *SNAssetManagement*, which means that the CI is created from an asset.
- CI name hasn't been modified by CMDB.

Asset and CI creation properties

`glide.create_alm_asset.async`

The system property `glide.create_alm_asset.async` controls whether assets are created immediately when a configuration item (CI) is created, or are created after a delay. A delay in asset creation enables large numbers of CIs to be created quickly. When this property is set to **true**, assets are created by the *Asset - Create asset delayed sync* scheduled job that runs every 15 minutes. View the status of the scheduled job in the Asset Job Log table [asset_job_log]. To view assets waiting to be created and asset creation errors, navigate to **Asset > Administration > Asset Creation Queue**. To reprocess an error, update the state from **Error** to **Ready**. The next time the scheduled job runs, it reattempts to create the asset.

When the `glide.create_alm_asset.async` property is set to **false**, assets are created immediately from CIs.

Note:

If you upgrade to Yokohama from Orlando or earlier, the default value of this property is **false**. Before updating this property, review your processes that depend on an asset value present on a CI and make any necessary changes to account for delayed asset creation.

`glide.asset.create_ci_with_ire`

The system property `glide.asset.create_ci_with_ire` enables CIs to be created from assets using the ServiceNow[®] Configuration Management Database (CMDB) Identification and Reconciliation engine (IRE). This property affects CI classes that have an identification rule on serial number and have no dependent relationships with other CI classes.

Note:

This property is applicable to CI classes that are extended from the hardware CI class [cmdb_ci_hardware].

CIs created with the IRE are named using the format `Serial number - Model name` and the source is `SNAssetManagement`. The **Serial number** field is required on assets with model categories that correspond to these CI classes. Asset creation fails if its serial number is present on an existing CI or asset. The **Serial number** field is also required to receive purchase order line items for model

categories that correspond to these CI classes. The **Serial number** field isn't required to create pre-allocated assets, but the serial number must be provided when the asset is allocated.

The default value of this property is false if you upgrade to Yokohama from Orlando or earlier. Before updating this property, review the customizations on the Serial number field and any integrations or flows that use an existing serial number to create an asset.

Other Asset and CI system properties

sn_itam_enable_cache_for_asset_ci_mapping

The asset and CI fields are synchronized based on the mappings defined in the relevant mapping tables. Fetching these mappings on the update of an asset or CI has an impact on the performance. The *sn_itam_enable_cache_for_asset_ci_mapping* system property enables you to cache the following mappings:

- Asset and CI fields
- Asset state and CI install status
- Asset state and CI hardware status

Unless there isn't any change in the mapping tables, these cached mappings are fetched during the synchronization resulting in the improved system performance.

sn_itam_common.mac_address_sync

The *sn_itam_common.mac_address_sync* system property enables you to synchronize MAC address from the CI (Network Adapter [cmdb_ci_network_adapter] table) to the Asset [alm_asset] table. By default, this system property is set to **false**. To enable synchronization of MAC address, set the value of this system property to **true** in the Asset Property [asset_property] table. After this property is set to true, a scheduled job will run daily to synchronize the MAC addresses for all hardware assets.

Product Instance feature in Hardware Asset Management

You can consistently represent a product along all applications, processes, workflows, and user interactions through the Product Instance feature. Changes made to any of the product representations are synchronized automatically.

The Product Instance feature enables you to have a common representation for any product tracked as an asset in IT Asset Management, an install base item (IBI) in Customer Service Management (CSM), and a configuration item in Configuration Management Database (CMDB). A Product Instance is associated with assets of a particular model category.

Note:

Product Instance is currently enabled only for the Medical device model category.

Product Instance Identifier (PID) configurations for a model category

Product Instance Identifier (PID) is a unique identifier for a Product Instance and links asset, CI, and IBI.

A PID is generated based on the following items defined in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table:

- PID configurations
- Order assigned to each configuration

Note:

PID configurations out-of-the-box can't be edited and are read-only.

Note the following about PID generation:

- If the fields specified in the parameters of PID configurations are empty, a PID isn't generated and the asset isn't created.
- Assets that are in the On order or Pre-allocated state and don't have a serial number won't have a PID generated.
- The PID is recalculated and regenerated whenever changes are made to the fields specified in the PID configuration parameters, for example, updates to the serial number of an asset, CI, or IBI.

Note:

The PID is stored in the `product_instance_id` field of the Asset [alm_asset], Configuration Item [cmdb_CI], and Install Base Item [sn_install_base_item] table.

For the medical device model category, the default parameters of a PID configuration are based on the **Serial number**, **Parent**, and **Model Component ID** fields of the table. The PID configuration based on the item's serial number is given the highest priority when generating a PID. But when the serial number isn't present, the parameters based on the Parent and Model Component ID fields are considered for generating the PID. If you specify an existing serial number, the PID that is generated would be a duplicate of an existing PID, so the asset isn't created. If you have any customizations, such as using a different custom field instead of the Serial Number as a unique identifier, you should deactivate the Serial Number PID configuration and create a new PID configuration for that custom field.

Note:

To enable PID recalculation for child assets when updates are made to the parent asset, set the system property `sn_itam_enable_pid_recalculation_for_child_asset` to true. The default value is false.

PID synchronization between an asset, CI, and IBI

Synchronization of PID between an asset, CI, and IBI happens in the following circumstances:

- Any of the fields of the PID is updated on an asset, CI, or IBI
- An asset, CI, or IBI is with values specified in the fields of the PID configuration parameters.

Create or update assets

When you create an asset by specifying a value for a field included in the PID configuration parameter, based on the PID configuration of the associated model category, the following actions occur:

1. A PID is generated for the asset based on the field value that you specified.
2. The asset is created.
3. The PID of the asset is synchronized with the associated CI.

When you update the field included in the PID configuration parameter of an asset, the PID is recalculated and regenerated based on the new field value. The updated PID of the asset is then synchronized with its associated CI.

Create or update a CI

When you create a CI, a PID is generated only when the asset is created for that CI. The PID of the asset is then synchronized with the CI.

When you update a field included in the PID configuration parameter on a CI, the following actions occur:

1. The field value is copied from CI to the asset.
2. The PID is recalculated and regenerated for the asset.
3. The PID of the asset is synchronized with the associated CI.

Create or update an IBI

When you create an IBI by specifying a field included in the PID configuration parameter, an asset and the associated CI are created. The PID is generated on the install base item and is synchronized with the asset and its associated CI.

A PID is regenerated and synchronized when any updates are made to the fields of the IBI that are part of the PID configuration parameters.

Asset life-cycle automation

Automate the update of your asset records throughout its life cycle and remove the effort of manually maintaining asset accuracy.

Assets must be updated and tracked from the time they're purchased until they're disposed. The automation process starts from the time that you request an asset through determining if the asset is in stock or if it must be purchased. If it's in stock, then the asset is transferred through the transfer order workflow. If the asset must be bought, then the purchase order workflow is triggered. The automated workflows take away the need to update manually each asset record or the associated configuration item (CI). After the workflow is complete, the asset records or CIs are automatically updated.

Note:

The automated workflow isn't triggered for excluded assets. You must manually update your asset records or CIs for the excluded assets.

You can [create bulk stock orders](#) for hardware assets for your stockrooms. You can specify the model and the exact quantity you need. After the item is procured or transferred, the workflow is complete.

You can also [create disposal orders](#) for hardware and consumable assets. This workflow guides you through five asset disposal tasks. These tasks involve the planning, scheduling, verification, departure, and the final confirmation of the disposed assets. Closing a task completes the task and creates the next task in the workflow.

For example, Verify is the first task in the asset disposal workflow. After you complete and close the Verify task, the Schedule pickup task is automatically created. This process continues until you close all the tasks required for disposing the asset. For information, see [Hardware disposal order stages](#).

Asset tasks

Asset tasks are provided for deploy, replace or swap, or retirement operations for your assets. These tasks automatically update the CI/asset record on the completion of these operations.

If an asset is being deployed, replaced, or retired via an incident, change request or a field service work order, the CI/asset record is automatically updated along with the related records for the CI/asset. For example, you have a change ticket to retire a server. After the change is implemented, the Change Management application triggers the retire asset event. The retire task is triggered and updates the following:

- CI
- related asset record
- software allocations
- maintenance contracts

The data accuracy is improved by reducing the need for manual intervention to update records.

When an asset is retired or swapped via an incident, the Stockroom field is populated based on the location of the asset. If there isn't any stockroom in the location of the asset, then the Stockroom field isn't populated. However, if the asset location is supported by multiple stockrooms as part of service locations, then the Stockroom field is automatically populated with details of the supporting stockroom based on the priority. For more details on service locations, see [Associate a stockroom with service locations](#).

This table lists the asset tasks available in each application.

Application	Asset Tasks
Incident Management	<ul style="list-style-type: none"> • Update/Repair • Swap • Retire <p>Note: By default, asset action is required for closing incidents. If you don't want to enforce any asset action for the closure of an incident, you can set the value of the system property <code>sn_hamp.enable_asset_action_validation_i</code> to false. For more details see, the Not able to resolve incident or change request after installing HAMP - mandatory field Asset action [KB1695540] article in the Now Support Knowledge Base.</p>
Change Management	<ul style="list-style-type: none"> • Deploy • Retire

Application	Asset Tasks
	<p>Note: By default, asset action is required for closing change requests. If you don't want to enforce any asset action for the closure of a change request, you can set the value of the system property <code>sn_hamp.enable_asset_action_validation_c</code> to false. For more details see, the Not able to resolve incident or change request after installing HAMP - mandatory field Asset action [KB1695540] article in the Now Support Knowledge Base.</p>
Field Service Management	Deploy

Hardware Model Normalization

Asset Management Hardware Model Normalization enables you to normalize the details, such as manufacturer, product, model, and device type, of your hardware and consumable models. Data from the models is compared against the data in the Hardware Model Normalization Content Service.

The Hardware Model Normalization (com.sn_hwnorm) plugin is activated when you activate the Hardware Asset Management [sn_hamp] plugin.

For more information about the process of normalizing hardware and consumable models, see [Normalize hardware and consumable models](#).

Note:

This documentation is for Hardware Model Normalization. For additional information on Asset Management, see the [Asset Management documentation](#).

Scheduled jobs

To standardize your hardware and consumable models, the asset data must be normalized. You can manually update the model records with the normalization content, or you can compare your data against the Hardware Asset Management Content Service.

The *HAM- Hardware Normalization* scheduled job runs daily. This job doesn't add, remove, or merge models, nor does it modify the original fields like Model Name, Manufacturer, or Model Number. It only updates the normalization-related fields for existing models, such as Normalized Product, Normalized Manufacturer, Normalized Model, and so on.

Content from the Hardware Model Normalization Content Service is pulled into the ServiceNow AI Platform. Use the Asset Job Log (asset_job_log) table to review the status of the scheduled job.

The normalization status of models can be reverted by selecting **Revert Normalization** on the model. Any normalization that occurred on the model gets reverted and the rule gets deactivated. When the scheduled job runs, the models are processed with the active rules and the status is updated. For more information about reverting normalization, see [Revert normalization of hardware and consumable models](#).

Note:

The Domain Asset Process Settings table (`alm_domain_asset_process_setting`) stores configurations for asset processes, including the normalization of hardware models. By default, normalization is performed only for models within the TOP/Default domain. However, if you have the `asset` or `domain_admin` role, you can enable normalization for hardware models in any domain. To enable normalization for a specific domain, follow these steps:

1. Navigate to the Domain Asset Process Settings table (`alm_domain_asset_process_setting`).
2. Locate the specific domain for which you want to enable normalization of models.
3. Set the **Run asset process** field to **true**.

When the scheduled job runs the next time, the hardware models of that domain are normalized.

Important:

By default, hardware models that belong to a model category associated with an opted-out HAM resource category are excluded from HAM workflows. Therefore, such hardware models don't go through Hardware Model Normalization. However, when the OT Asset Management application is activated on your ServiceNow instance, any hardware model of an opted-out HAM resource category with a minimum of one Operational Technology (OT) asset also goes through Hardware Model Normalization. The **OT entity** flag on the asset indicates whether it's an OT asset. For more information on OT assets, see [OT Asset Workspace](#).

You can also revert the normalization status of the hardware models with OT assets.

The scheduled job generates hardware and consumable model reports. These reports identify the overall status of your models and provide a breakdown of the normalization status.

The following reports are included.

- Hardware Product Overall Normalization Status
- Consumable Product Overall Normalization Status
- Hardware Model Normalization Status
- Consumable Model Normalization Status

[Work with hardware normalization](#)

Hardware Asset Management flow customization

Customize the flows in some of the Hardware Asset Management features by using the available decision tables.

You can also create a flow using Workflow Studio that suits your requirement. You can then customize the existing flows by using the newly created flow in the readily available decision tables. For example, in the Hardware Refresh module, you can remove an existing flow, add a new flow or a condition.

Update the associated Decision table entries to trigger the new flow. For more information, see [Update associated Decision tables for HAM flows](#).

For the list of readily available decision tables and the associated Hardware Asset Management features that you can update, see [Decision tables for Hardware Asset Management flows](#).

Return Merchandise Authorization

Return Merchandise Authorization (RMA) is an agreement between a buyer and seller that lets the buyer return or replace a faulty product. The Asset RMA Order catalog item has prescriptive flows to streamline the RMA process.

An RMA request has RMA request lines. When an RMA request is submitted, an RMA request line is created for each asset and consumable that was selected. You can view a list of all the open RMA request lines in the Hardware Asset Dashboard. For details, see [Hardware Asset dashboard](#).

Workflow for Return Merchandise Authorization

The Flow Designer application creates RMA tasks for every RMA request line. The RMA request is completed through the RMA tasks. An Assessment task is created for each RMA request line. The Assessment task is used to assess the faulty asset. When the state of an RMA task is updated, the **Stage** field on the RMA request line form is updated by default.

When you receive a defective product or if a product becomes defective within its warranty period, you can request an Asset RMA Order. Based on your agreement with the vendor, you can decide to repair the faulty asset either on-site or off-site. On the Assessment task form, when you select off-site repair, the flow designer triggers the Asset RMA Off-site flow. The Asset RMA Off-site flow generates the following RMA tasks to complete the RMA process.

- Shipment
- Vendor RMA decision
- Receive

On the Assessment task form, when you select on-site repair, the flow designer triggers the Asset RMA On-site flow. The Asset RMA On-site flow generates the RMA task (On-site repair task) to complete the RMA process.

After attempting an on-site repair, if the faulty asset couldn't be repaired, then you can send the product for an off-site repair. If you want to send the faulty product for an off-site repair, then the Asset RMA Off-site flow is triggered and the RMA process is completed through the Asset RMA Off-site Flow RMA tasks.

You can cancel an RMA request as long none of the assessment tasks are closed for any of the RMA request lines. After an RMA request is canceled, all the associated RMA request lines and RMA tasks are canceled. If you submit RMA for an asset that is part of an existing RMA, the RMA request lines of the existing RMA request are automatically canceled. If an RMA task is canceled, the associated RMA request line is also canceled. If you have the inventory user or itil role, you can cancel an Assessment task, Internal repair task, or a Shipping task.

[Manage RMA requests](#)

Integrating Zebra technology RFID system

Integrating a Zebra technology Radio Frequency Identification (RFID) system with your ServiceNow instance enables you to identify#, track, and manage your hardware asset locations automatically.

After the asset integration with Zebra technology RFID system is successful, you can view the RFID Tag information such as zone group, zone, and locations mapped with your assets. The RFID information is mapped to the Asset [alm_asset] table according to the serial number of the asset. For more information about the Asset management tables, see [Installed with Asset Management](#).

Note:

If the asset is excluded, the RFID information isn't mapped to the Asset [alm_asset] table according to the serial number of the asset. For more information about asset exclusion, see [Hardware Asset Management license exclusion](#).

The data from the Zebra technology RFID system is imported to ServiceNow regularly. Any data change in the RFID system is updated in your ServiceNow instance.

The RFID asset [rfid_asset] table stores the RFID information of assets. For more information about viewing the RFID information, see [View RFID information of assets](#).

Asset bundles

Asset bundles help you bundle a group of assets, already in your inventory, as a single entity.

An asset bundle comprises consumable and hardware assets.

Example of a developer asset bundle

Component	Model category
Apple MacBook W9576XA	hardware asset
Samsung monitor B2156C	hardware asset
Logitech mouse PB567VT	consumable
Apple keyboard MT65021R	consumable

Asset bundles are based on bundled models. A bundled model is a grouping of models. For more information on bundled models, see [Bundled models](#).

Existing assets from stockrooms are used to create an asset bundle. Only assets that are in the **In stock** status and **Available** substatus are added to an asset bundle. If you want to exclude any assets, you must remove the asset from the bundle. For more information about asset exclusion, see [Hardware Asset Management license exclusion](#). Assets that are part of an asset bundle aren't available as individual assets. No CIs are associated with an asset bundle.

An asset bundle goes through the entire asset life cycle. From building an asset bundle, allocating the bundle to a user, moving it to a state of maintenance if assets need repair, and finally retiring the bundle when its purpose is fulfilled.

Asset bundles can be transferred between stockrooms. However, individual assets within a bundle can't be transferred between stockrooms. Assets within a bundle can't be disposed. After an asset bundle is retired, the assets are disassociated from the bundle and can be individually disposed. Deleting an asset bundle moves all assets belonging to the bundle to a stockroom.

You can swap assets belonging to an asset bundle. Assets can be swapped when the state of the bundle is **In maintenance** or **In stock** and substate **Pending repair**.

You can retire an asset bundle and release all the assets belonging to the bundle. The assets that are released are returned to a stockroom and you can delete the bundle.

Assets belonging to a bundle are excluded from sourcing, transfer orders, and disposal orders flows.

For more information on creating asset bundles, see [Manage asset bundles from your inventory](#).

Asset reclamation

Reclaim Asset catalog item integrates Asset Management module with HR module to let you efficiently reclaim assets.

When an employee leaves an organization or moves to a different role, reclaiming the assets assigned to the employee is a troublesome task and needs much coordination between the HR professional and the asset manager. The Reclaim Asset catalog item has prescriptive workflows to efficiently reclaim hardware assets and store them in the inventory, reassign, send it for repair, or dispose of as required.

An HR professional, manager, or employee can submit an asset reclamation request using the Reclaim Asset catalog item. A manager can submit an asset reclamation request for the reporting members. An HR professional can submit an asset reclamation request for any employee in the organization. An employee other than an HR professional and a manager can submit an asset reclamation request for self. For more information, see [Submit an asset reclamation request](#).

Note:

You can't reclaim asset bundles and pallets.

When you create a Reclaim Asset request via Service Catalog, an Asset Reclamation Request is created. For each hardware or consumable assigned to the departing employee, a Hardware Asset Reclamation Line is created for the assets you select in the Reclaim Asset Service Catalog. Each Hardware Asset Reclamation Line is closed through the following Hardware Asset Reclamation Tasks:

- Schedule drop off, Schedule pickup, or Schedule shipment task based on which reclamation method you select in the Reclaim Asset form
- Receive asset
- Evaluate

The Hardware Asset Reclamation Line also has a stage field, which changes when you close a Hardware Asset Reclamation Task as follows:

- Ready
- Pending receive
- Pending evaluation
- Complete

For more information, see [Close an asset reclamation request](#).

The Hardware Asset Reclamation Sub Flow decision table enables you to trigger your custom reclamation sub flow for hardware and consumable assets. Based on the condition related to the asset that you specify in the decision table, the corresponding sub flow is triggered, and the reclamation process completes.

To use Service Catalog Request, you must install SAM Professional or HAM Professional. If you have installed only SAM Professional, you can access the Service Catalog, but only the Software Asset Reclamation flow gets triggered.

Asset donation

You can easily donate hardware and consumable assets in stock in your organization to charity organizations through an Asset Donation Order.

The Asset Donation flow handles the various stages in the asset donation process. After you submit the Asset Donation Order, the asset manager reviews the asset donation order and, if it

is approved, processes the donation. The asset donation process completes when the charity organization acknowledges the delivery of the assets.

Note:

You can't donate excluded assets. For information on excluded assets, see [Hardware Asset Management license exclusion](#).

For more details on asset donation, see [Donate assets to charity organizations](#).

Pre-allocated assets

Pre-allocated assets are often assets that the vendor still owns, but has agreed to store in a customer stockroom for just-in-time procurement.

A pre-allocated asset physically exists, but isn't yet a financial liability. For example, a pre-allocated asset could be a pallet of 100 computers ready to be allocated. Allocating the asset generates a configuration item (if required by the category) and enables you to assign the asset. Pre-allocated assets can be components of another asset that is already in use.

For example, pre-installed, pre-allocated servers can be set up in server racks next to production servers, but the pre-allocated servers only become a financial liability after they're turned on. The pre-allocated option can only be used for assets, not for consumables or licenses. Pre-allocated assets can't be composed of bundles.

Note:

Warranties aren't active until an item is installed. Therefore, until an asset is allocated and assigned, it isn't under warranty.

You can create a pre-allocated asset, allocate the assets from pre-allocated asset records, and also split a pre-allocated asset to create a group that can be moved to a different stockroom. For more information, see [Manage pre-allocated assets](#).

Pallet assets

Use the Pallet asset class to track and manage assets in your inventory as a group. You can easily move a group of assets between locations or dispose of them as a group.

A pallet is an asset with the model category Pallet. Pallets are the parent of the assets contained in them. The predefined pallet types are pallet, bin, box, and container.

Note:

The Pallet asset class with its associated UI options are available only with the Hardware Asset Management Professional plugin (com.sn_hamp).

You can create a pallet asset and add base, hardware, bundle, consumables, and other pallet assets to the pallet in the Asset Estate view.

Pallet assets aren't associated with any expense lines.

The Pallet [alm_pallet] table stores information about pallet assets. The location of a pallet in the stockroom is indicated by the **Aisle** and **Space** columns of the Asset [alm_asset] table.

Note the following when you plan to use pallet assets for inventory management:

- You can't add software, enterprise, and excluded assets to a pallet.

Note:

For information on excluded assets, see [Hardware Asset Management license exclusion](#).

- You can't add an asset that is already associated to a parent asset.
- Pallet assets can't be a part of asset bundles.

For more details on pallet assets, see [Manage your inventory through pallet assets](#).

Loaner assets

Request a loaner asset or consumable when you need it for a short period of time.

A loaner order request is completed through the following stages:

- **Prepare task:** Prepare the loaner asset such as by installing the required software before handing over the loaner asset to the requested user. By default, the Prepare task is created two days before the start day. You can change this setting by modifying the *Number of days required for preparing the loaner asset* variable on the Loaner Asset Request catalog item.

Note:

The *Number of days required for preparing the loaner asset* variable is not shown on the catalog form when you request a loaner asset. To find this variable, go to the Catalog Item module. Only users with the `catalog_admin` role can change the value of this variable.

- **Deploy task:** Hand over the loaner asset to the requested user or install the loaner asset at the user's machine. The Deploy task is created after the Prepare task is closed.
- **Reclaim task:** Reclaim the loaner asset after a period of time. The Reclaim task is created one day before the return day.

Note:

Loaner assets are not counted in the stockroom count when stock rules are being processed.

You can't allocate an excluded loaner asset. For more information, see [Hardware Asset Management license exclusion](#).

Related topics

[Manage loaner assets](#)

Loaner asset reservation

Waitlisted loaner orders give visibility to future demands for loaner asset.

With the available loaner assets, the user who submits a loaner order first gets the loaner asset. Loaner assets are automatically assigned to the users by a daily scheduled job on the Preparation start day. When there is no loaner asset in a stockroom, all the loaner orders become part of a Waitlist. The Waitlisted Orders module under Loaner shows all the wait listed loaner orders. If new loaner assets are added to a stock room or confirmed loaner order are canceled, the wait listed loaner orders are confirmed in a sequence of when they were submitted. A loaner order that was submitted before gets precedence over the order that was submitted later.

As an inventory admin, if you want to confirm a wait listed loaner order, uncheck the **Waitlisted** box in the Loaner Asset Order form and in the **Asset** field, select the asset. If you want to move a confirmed loaner order to wait list, check out the **Waitlisted** box and remove the Asset from the **Asset** field. You can assign a loaner asset from any locations and with any of the following states and substates:

- In stock
- Available
- Pending install
- Reserved
- In use

i Note:

You can't select an excluded loaner asset. For more information, see [Hardware Asset Management license exclusion](#).

Advanced Shipment Notification (ASN)

Advanced Shipment Notification (ASN) automates the creation of asset records in the In transit state when vendors supply both asset and shipment details before delivery.

When a purchase order is created for specific models, vendors can provide detailed asset and shipment information ahead of delivery. ASN uses this information to generate asset records in the In Transit state automatically, reducing manual entry, and enhancing tracking accuracy.

Starting with Hardware Asset Management version 15.0.0, you can initiate the ASN workflow with any of the following roles:

- ham_admin
- ham_user
- procurement_admin
- asset
- admin (existing role)

Starting with Hardware Asset Management version 15.0.0, you can initiate the ASN import process in the Procurement view of the Hardware Asset Workspace.

ASN Workflow

1. Download the standardized ASN template (.xlsx) and share it with the vendor for completion.
2. The vendor completes and returns the template with asset and shipment information.
3. Import the updated ASN template into the system, where:
 - a. A record with a **Pending** status is created in the Shipment Notification Upload [sn_itam_common_asn_upload] table, which initiates the ASN flow.
 - b. Data from the ASN template is populated into an intermediate staging table for field validation.
4. After the validation, the following changes happen:

For rows validated successfully:

- Asset records are created in the **In Transit** state.
- Assets are associated with purchase order line items.
- Purchase order statuses are updated to **Pending Delivery**.

For rows that failed validation:

- Records are either ignored or skipped.
- Asset records aren't created.

ASN import validations

The system validates the data in the ASN import template to verify its accuracy before generating asset records.

Purchase Order (PO) validations

1. Verifies that any PO provided in the template exists and is valid in the system.
2. Requires that valid POs should be in either an **Ordered** or **Pending Delivery** state. Otherwise, the system skips the record.
3. The system creates an asset record and adds the **Shipment details** in the template to the **Comments** field, if a PO isn't found.

Location validations

1. Confirms that the location field in the template isn't empty.
2. If no PO is mentioned in the template, validates the provided location.

Model validations

1. Checks that the model is provided and exists in the system.
2. Ignores software models automatically, as software licenses aren't supported through the ASN import.
3. Evaluates the asset tracking strategy for the model:
 - If the strategy is set to **Don't create asset**, asset record isn't created.
 - If the strategy is set to **Track as Consumable**, unique identifier check isn't performed.
4. Tracks serialized assets belonging to a model category linked to a CI class with defined identification rules:
 - a. Retrieves unique identifier fields.
 - b. Validates that all required unique fields are present.
 - c. Verifies that at least one unique field value in the import data is different from the values in existing asset records.

Quantity validations for non-consumable assets

1. Checks that the quantity doesn't exceed 1.
2. If the provided quantity exceeds 1, logs an error message in the staging table, resets the quantity to **1**, and creates an asset record.

For more details on ASN import process, see [Use Advanced Shipment Notification](#).

Integration with Lenovo for asset warranty details

The Lenovo Asset Warranty Flow enables you to get the warranty information of hardware assets by connecting to the Lenovo Warranty API.

Integration with Lenovo has the following requirements:

- The Hardware Asset Management application (sn_hamp) must be activated.
- The Lenovo Spoke (sn_lenovo_spoke) installed on your ServiceNow instance from the ServiceNow Store. For detailed information, see [Lenovo Spoke](#) .
- The Client ID from Lenovo to connect to the Lenovo Warranty API.

Note:

If you don't have a Client ID, contact your organization's Lenovo sales or service representative.

- A Lenovo connection. If you don't have this connection, it must be created using the Lenovo [sn_lenovo_spoke.Lenovo] connection and credential alias. For more information, see [Connect to the Lenovo Warranty API](#).

Note:

For details on the input and response fields of the Lenovo Warranty API, see the "Warranty" topic in the Lenovo WebAPI documentation.

The process involved in fetching the asset warranty details from Lenovo is as follows:

1. The Download Asset Warranty Information - Lenovo scheduled job that runs every week invokes the Lenovo Asset Warranty Flow that fetches all the hardware assets with the manufacturer as Lenovo.

Note:

The Download Asset Warranty Information - Lenovo scheduled job and the Lenovo Asset Warranty Flow are installed with the Hardware Asset Management (sn_hamp) application.

2. The Lenovo Asset Warranty Flow then invokes the Download Asset Warranty action that resides in the Lenovo Spoke application and passes 1000 serial numbers in a batch.
3. The Download Asset Warranty action connects your ServiceNow instance to the Lenovo Warranty API by passing the serial numbers and the Client ID. This action also downloads the warranty information for all the serial numbers that are passed.
4. The Process Warranty Information action in the Lenovo Asset Warranty Flow creates or updates asset warranty records in the Asset Warranty [sn_itam_common_asset_warranty] table using the response from the Lenovo Warranty API.

The Asset Warranty [sn_itam_common_asset_warranty] table stores the asset warranty details. This table has fields corresponding to the Lenovo API response. Some of the fields of the table are:

- **External warranty ID:** Identifies the warranty records of an asset and update the warranty information.
- **Active:** Boolean field based on the **Warranty** field value of the Lenovo API response.
- **Status:** Indicates whether the warranty is active. This field is populated based on the **Active** field value.
- **Start Date** and **End Date:** Indicate the warranty period.

Note:

Warranty records for excluded assets aren't fetched.

An asset can have multiple warranties associated with it. You can view the warranty information using the Asset Warranties tab on the asset form. You can also view all the asset warranty records from a central location using the Asset warranties list in the Asset operations view. For more information, see [Track the warranty details of your Lenovo assets](#).

[Receive asset warranty details from Lenovo](#)

Zero Touch Refresh

Use the Zero Touch Refresh flow to fulfill employee hardware refresh requests through an external vendor without having to maintain new assets in the local stockroom.

The various stages in the asset refresh process are as follows:

1. An employee of your organization submits a request for refresh of the hardware asset.

The Request confirmation task is created when the Zero Touch Refresh request is approved. The state of this task changes to Closed automatically when the provider confirms the request.

2. Provider ships the new asset to the employee.

Note:

A provider can fulfill a Zero Touch Refresh request by using the Asset Management application.

The following tasks are created:

- a. Request shipment: This task is created when the provider confirms the Zero Touch Refresh request. The state of this task changes to Closed automatically when the provider ships the new asset.

The following happen when the provider ships the asset:

- An asset with the serial number and asset tag specified by the provider is assigned to the employee.
- Based on the refresh method that the employee selected in the Zero Touch Refresh request, email notifications with details of the new replacement asset that is shipped are sent as follows:
 - When the asset is shipped to the employee, an email notification is sent to all users with the asset role.
 - When the asset is shipped to the stockroom, an email notification is sent to all users with the asset role and also the stockroom manager of the selected stockroom from where the employee will pick up the new asset.
- Based on the tracking number and shipping carrier details that the provider specified in the request, unique shipment records are created for the shipments of the replacement asset and the old asset. When the same tracking number is provided for both the shipments, a single shipment record is created. You can view the shipment records with the associated assets in the Assets operations view of the Hardware Asset Workspace. For more details, see [View hardware asset shipment details](#).

- b. Ready for pickup: This task is created only for the Pickup refresh method in which the provider ships the new asset to the stockroom from where the employee picks up the asset.

- c. Receive asset: This task is created as follows:

- For the Ship refresh method, when the provider ships the asset to the employee.
- For the Pickup refresh method, when the Ready for pickup task is closed.

- d. Receive return asset: This task is created when the provider ships the new asset.

3. Employee confirms receipt of the new asset.

4. Employee returns the old asset to the stockroom in the labeled box shipped by the provider.
5. Inventory manager confirms that the old asset was received and evaluates it.

Note:

The Zero Touch Refresh flow requires support from an external provider and is pre-configured to integrate with Insight.

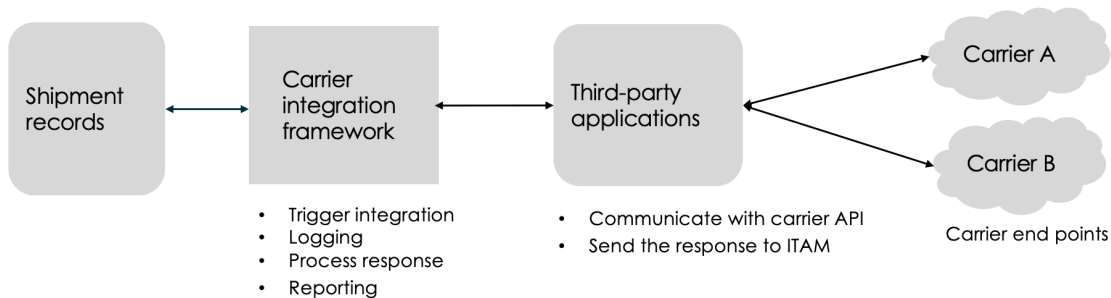

The Zero Touch Refresh flow has the following requirements:

- The employee's organization and the provider must be on the same ServiceNow Cloud.
- The Service Exchange application must be configured on the ServiceNow instance of the provider and the employee's organization.

For more details, see [Manage refresh of assets using Zero Touch Refresh](#).

Managing shipments by integrating with third-party carrier applications

You can check the status of your shipments in real time by integrating your ServiceNow instance with a third-party carrier application using the integration framework provided by the IT Asset Management application.

Requirements for integration with third-party carrier applications

Important:

The IT Asset Management application provides only the integration framework to integrate with your third-party carrier applications. For the integration to work seamlessly, the implementation team must take care of the following requirements.

1. Create a script include that extends from the base class `ITAMShipmentIntegration` script.
 For more details, see [Creating an integration script include for third-party carrier applications](#).
2. If you're using any credentials, then use the Credential table or any table with Password2 fields and provide the KMF access map policy to enable your customers to access your application.
 For more details, see [Password2 encryption with the Key Management Framework \(KMF\)](#).
3. Add the application name, API, and connection details to the Carrier integration profile [sn_itam_carrier_int_profile] table.
 For more details, see [View the carrier integration profile details](#).

Note:

If you are creating the integration as part of an application, complete the following steps before you create a script include:

1. Create an application.
2. Make the application accessible from any application that belongs to a different scope. For more details, see [Creating an integration script include for third-party carrier applications](#).

For more details, see [Track shipments using the integration framework](#).

Asset Total Cost of Ownership for Hardware Asset Management

Assets incur costs throughout their life cycle, including initial capital costs and operational costs. Asset Total Cost of Ownership helps Asset managers to understand, analyze, and track the Total Cost of Ownership (TCO) of assets, where the total cost includes initial capital cost and operation cost.

Important:

You must install Hardware Asset Management 10.0.0 version or later to access the Asset Total Cost of Ownership feature.

TCO benefits

- Track and analyze incurred expenses across the asset hierarchy.
- Benchmark asset costs against assets and asset model to compare performance.
- Create TCO reports and use predefined reports for better financial planning of your assets.

TCO calculation

Costs incurred on the assets are created as expense lines. The expense line shows the history of cost incurred for an asset, which includes the total amount on the expense lines, or the initial capital cost and total expense on all the child assets.

TCO is the sum of all the expenses that occurred on the asset during its lifetime.

- When an asset record is created, the initial cost includes the purchase cost from an expense line that gets created. If you update the cost, the expense line record gets updated.
- For serialized assets, the capital cost is added one time only and the rest is considered as the operational cost. Any expense line created is added to the total cost.
- For a child asset,
 - If any cost is incurred on a child asset, the same cost is added to the TCO of the parent asset.
 - If a child asset is removed, the expense lines of the child asset persist and the TCO of the parent isn't affected.
 - If a child asset is swapped, one expense line is created for operational cost.
- Any expense line created by rate cards is added to the TCO of assets.
- Incidents affecting hardware assets already include task rate cards.

Rate cards, expense lines, and expense categories

Rate cards help you track capital, labor, material, and contract costs and the generated expense lines track these costs. For each task, Hardware Asset Management captures the time worked on that task. After a task is closed, Hardware Asset Management creates expense lines based

on the time worked on the task. These expense lines amounts are added to the total cost of the asset. An expense category is then attributed to the expense line. The expense lines appear in the **Expense Lines** tab on the Hardware Asset Details form.

The Hardware Asset Management application supports the following rate cards:

- [Task rate cards](#)
- [Labor rate cards](#)

Note:

The labor rate card is a part of the created expense line and is valid if you've included the labor rate card information with the task rate card, which is recording the time worked on the task.

Capture time for tasks

Each task has a time capturing capability that creates time worked records for that user.

You can start, start a timer, pause, resume, and save your tasks. A new record entry is created in the Time Worked tab in the following scenarios:

- Select **Start** to begin your work and then select **Save**.
- Select **Start Timer** to begin recording the time for a task.
- Select **Pause** to pause the recording.
- Select **Resume** to resume the recording.

The timer stops only when you close a task. To arrive at the total time spent on a task, all the record entries are added up and then multiplied with the labor rate to arrive at the total cost for a task.

You can select **Record Time** to add time to the tasks manually.

Work with TCO

TCO enables you to perform the following actions:

- Create expense lines to track the initial and operational cost of your hardware assets.
- Track and calculate TCO for the following workflow tasks and the time worked on an individual task in a workflow:
 - Disposal
 - Donation
 - Zero Touch Refresh
 - Contract renewal

Note:

For Contract cost, allocate and distribute amount asset options are used on the contract rate card to distribute the contract cost evenly. You must add assets to the Asset covered for the contract rate card.

- Return Merchandise Authorization (RMA)
- Lease
- Loaner

- Hardware asset refresh
- Asset reclamation

i Note:

Rate cards are included for the Hardware Asset Management workflows. To activate these rate cards, select the **Active** check box on the Task Rate Card form.

- Track the TCO benchmark of a hardware model. After you specify a TCO benchmark cost, the TCO benchmark threshold is calculated by using the following formula:

$$\text{TCO benchmark cost} * \text{TCO benchmark threshold percentage}$$

, where the TCO benchmark threshold percentage is set to 75% of the TCO benchmark cost by default. For more information, see [Hardware model details](#).

- Create a report and compare TCO for a group of assets. For more information on the TCO dashboard and reports, see [Asset analytics view](#).
- For real-time or offline TCO reports, normalize the asset TCO over its useful life and compare the normalized TCO for different models and assets.
 - When the useful life of the asset is equal to or greater than asset life, the Normalized TCO (TCO per month) is calculated by using the following formula:

$$\frac{\text{Purchase cost}}{\text{Useful life}} + \frac{\text{Sum of operational cost}}{\text{Asset life}}$$

- When the useful life of the asset is lower than asset life, Normalized TCO (TCO per month) is calculated by using the following formula:

$$\frac{\text{Purchase cost} + \text{Sum of operational cost}}{\text{Asset life}}$$

i Note:

TCO isn't calculated and tracked for the following assets and consumables:

- Bundle assets
- Pallet assets
- Individual consumables

If you have used consumables as child assets, their expense lines are added to the parent asset.

- Excluded assets
- Assets that are a part of the opted out model categories.

Manage onboarding of hardware products using Application Portfolio Management

Onboard your hardware products and manage the Technology Reference Model (TRM) life-cycle by using Technology Reference Model (TRM) of Application Portfolio Management along with the Hardware Asset Management application.

The Technology Reference Model enables you to maintain a list of hardware products with information on their approval of use within the organization. The TRM library is maintained by enterprise architects and used by application owners. For detailed information on TRM, see [Technology Reference Model](#) . TRM enables application owners to request hardware products to be used in the organization, onboard the product, and define the TRM life-cycle phases.

Each hardware product model is associated with a set of life-cycle phases with a start and end date. The Hardware Asset Management application gives visibility into the TRM life-cycle phases for all hardware models associated with a product.

Synchronizing TRM information with Hardware Asset Management

The HAM - Sync TRM information scheduled job in Hardware Asset Management runs daily to fetch information such as TRM phase and life-cycle for normalized product models from TRM. The job then sends the TRM details to the Hardware Asset Management application. When the scheduled job runs daily, any updates made to the TRM phase are synchronized with Hardware Asset Management.

You can view the following TRM-related information for a hardware product model in the Model Management view of Hardware Asset Workspace:

- The TRM phase using the **TRM product phase** field on the **Details** tab of the hardware product model.
- TRM life-cycle information using the **TRM Product Lifecycles** related tab of the hardware product model.

Repair flow to fix defective hardware assets within a stockroom

Use the Repair flow to get the defective hardware assets in your stockroom fixed so that the repaired assets can be used in different Hardware Asset Management workflows.

By using the Repair flow, your organization can internally fix the assets that are damaged or out of the warranty period. The repaired assets can be put back to use after validation. There's no external vendor involved in the repair of defective assets.

As an asset manager, you can request repair of assets that are either defective or pending repair in your stockroom by submitting repair orders. For more details, see [Request repair of defective hardware assets in your stockroom](#). The repair flow is triggered when you submit a repair order. A repair order has repair order lines that are associated with repair tasks for the assets. The asset technician completes the repair tasks in the Hardware Asset Workspace or by using the Mobile Agent application. The repair flow completes after the repaired asset is evaluated. For details, see [Manage repair of defective assets in your stockroom in the Hardware Asset Workspace](#) and [Manage hardware asset repair tasks using the Mobile Agent application](#).

Stages in the Repair flow

1. Troubleshoot: Stage to evaluate the defective asset and assess the following:

- Issues with the asset
- Parts required
- Steps to repair the defective asset

At this stage, an asset technician confirms if the asset is repairable, redeployable, or unrepairable. The Repair flow proceeds to the next stage only if the asset is repairable. Otherwise the repair order is marked as Complete.

2. Repair: Stage to confirm repair of the defective asset. In this task, the asset is either repaired, redeployed, or marked as unrepairable.

The repair flow proceeds to the next stage only if the asset is repaired. Otherwise the repair order is marked as Complete.

3. Evaluate: Stage to perform a quality control check of the repaired asset. Based on the evaluation results, the asset is either redeployed or disposed of. The Repair flow is completed after asset evaluation.

Inventory picking for Hardware Asset Management

As an inventory user working in large stockrooms, use the Inventory picking feature to pick the assets in the stockroom easily and facilitate the asset pick-up by technicians.

The Inventory picking feature includes adding an Asset pick task in the following Hardware Asset Management workflows:

- [Standard Hardware Asset Request](#)
- [Hardware Refresh Request](#)
- [Sourcing workflow](#)

i Note:

The Asset pick task is available only if it's enabled explicitly for a stockroom that's used to source asset requests, refresh requests, or sourcing requests. For details, see [Enable the Asset pick task for your stockroom in the Hardware Asset Workspace](#).

The Asset pick task enables you to pick the assets from any aisle and space within your stockroom. You can then drop the asset that you picked to a specified place within the stockroom. After you complete the Asset pick task, asset technicians can pick up the assets to fulfill the requests assigned to them.

For more information on the Asset pick task, see [Manage picking hardware assets within your stockroom for Hardware Asset Management workflows](#) and [Manage hardware asset pick tasks using the Mobile Agent application](#).

Managing inventory by putting away assets in the stockroom drop-off location

Use the Asset put away feature to track asset movement efficiently in the inventory.

i Important:

The Asset put away feature is available with Hardware Asset Management version 13.0.0 onwards.

The Asset put away task enables you to track asset movement from the receiving bay of the inventory to the designated space within the stockroom. The Asset put away task confirms that when an asset is received in the inventory, you have filled the aisle-space information for it. An Asset put away task is automatically created in the Hardware Asset Workspace when the following required business rules are met:

- When a hardware asset is created in the Hardware Asset Workspace and the **Aisle-space** field value isn't available, an Asset put away task is created. Open the Asset put away task and updated the **Drop off location** field value, to move the asset to designated aisle-space in the stockroom.

Note:

You can create an Asset put away task manually for the in stock assets in the inventory. For more information about manually creating an Asset put away task in the Hardware Asset Workspace, see [Create an Asset put away task](#).

- When the **Stockroom** field is updated for a hardware asset in the [Hardware Asset Details](#) form, an Asset put away task is created. Open the Asset put away task and update the **Drop off location** field value, to move the asset to the designated aisle-space in the stockroom.

Note:

You can create the Asset put away task for a stockroom only if the stockroom is enabled to perform warehouse tasks. For more information about enabling the feature, see [Enable the asset put away task for your stockroom](#).

In the Hardware Asset Workspace, the inventory users can perform the following actions:

- Create an Asset put away task manually for the in stock assets. For more information, see [Create an Asset put away task](#).
- View the open put away tasks related to the inventory and stockroom. For more information, see [View open put away tasks for your stockroom](#).
- Update the **Drop off location** field for the open task in the Put away form and close it. For more information, see [Close an Asset put away task](#).

Using the ServiceNow Agent application, you can scan the in stock assets in the inventory and put away them in the scanned drop-off location. After the asset is placed in the drop-off location within the stockroom, you can close the Asset put away task. For more information on the mobile experience for Asset put away task, see [Manage asset put away using the ServiceNow Agent application](#).

Zero Touch request flow

Fulfill the hardware requests of your employees through an external provider with minimal intervention by using the Zero Touch request flow.

Zero Touch request flow requirements

The Zero Touch request flow has the following basic requirements:

1. Your organization and the provider must be on the ServiceNow Cloud.
2. The ServiceNow Service Exchange application must be configured on the ServiceNow instance.
3. Your provider must have published the Remote catalog items or Remote record producers.

Zero Touch request workflow

1. An employee of your organization submits a catalog request for a catalog item associated with the Zero Touch request flow.

A catalog request is created with the **Request state** as **Pending Approval**.

2. The approver reviews the catalog request and performs either of the following tasks:

- Rejects the catalog request: The **Request state** changes to **Closed Rejected** and the **Stage** of the requested item changes to **Closed incomplete**.
- Approves the catalog request: The **Request state** changes to **Approved** and the **Stage** of the Requested item changes to **Pending Confirmation**.

Note:

If a requester who doesn't have access to the remote record producer submits a catalog request, the requested item is marked as **Closed incomplete**.

3. After the catalog request is approved, the request goes through the following changes:

- The request is sent to the provider based on the Remote record producer configured in the catalog item mapping.
- The **Stage** of the requested item changes to **Pending confirmation** on the ServiceNow instance of your organization.

4. The provider sends a Scratchpad update confirming the order to your ServiceNow instance. The **Stage** of the requested item changes to **Pending shipment**.

5. The provider ships the asset to your employee and sends a Scratchpad update with the shipment details to your ServiceNow instance.

The following events happen when the provider ships the asset:

- An asset with the serial number and asset tag specified by the provider is assigned to the employee.

Note:

An email notification is sent to the asset managers in the following scenarios to take necessary actions:

- An asset record with the serial number provided by the provider exists on your ServiceNow instance.
 - The model number provided by the provider isn't available on your ServiceNow instance.
 - The asset that is shipped is a consumable.
- Based on the tracking number and shipping carrier details that the provider specified in the Scratchpad update, a unique shipment record is created for the shipment. You can view the shipment records with the associated assets in the Assets operations view of the Hardware Asset Workspace. For more details, see [View hardware asset shipment details](#).

When shipping an asset bundle, the provider can choose to ship the assets fully through a single shipment or partially through multiple shipments. Only when the assets are fully shipped, the **Stage** of the requested item changes to **Pending receive**.

6. The employee acknowledges the receipt of the asset on a mobile device. The Stage of the requested item changes to Complete.

Note:

Receipt of the consumable asset can't be confirmed on a mobile device. The asset manager takes the necessary actions based on the email notifications received and confirms on behalf of the employee.

For more details on creating and fulfilling hardware asset requests through the Zero Touch request flow, see [Manage hardware asset requests using the Zero Touch request flow](#).

Asset Attestation

Use Asset Attestation to maintain accurate details of all the serialized hardware assets that are assigned to your employees.

Asset Attestation has no dependency on the availability of the assets at the office locations. Therefore, organizations that support hybrid and remote work models can audit their assets that are in use even if those assets are dispersed across remote locations. You can achieve asset data accuracy, improve asset utilization, and reduce risk by auditing your assets using Asset Attestation.

As an Asset manager or an Inventory administrator, you can create a one-time asset attestation or create an attestation schedule that creates recurring asset attestations. You can validate whether the serialized hardware asset that's assigned to an employee is still in use by receiving confirmation from the employee directly.

Asset Attestation benefits

- Step-by-step guidance on creating asset attestations and schedules using the playbook. For more details, see [Playbook for asset attestation](#).

i Important:

Starting with Hardware Asset Management version 13.0.0, the playbook is the default option for the creation of asset attestations and schedules. However, if you set the value of the `sn_itam_common.enable_asset_attestation_playbook` system property to **false** with the asset or inventory_admin role, you will be shown forms to complete the attestation process instead of the playbook.

- Ability to perform remote asset audits for the required hardware assets irrespective of their locations. For more details, see [Create an asset attestation in the Inventory view](#).
- Option to set a schedule for creating recurring asset attestations. For more details, see [Create an asset attestation schedule](#).
- Intuitive and user-friendly Now Mobile app and Employee Center portal that enable the employees to confirm the ownership of the assigned hardware assets and also raise issues related to their hardware and consumable assets. For more details, see the following:
 - [Confirm the assigned assets using the Now Mobile app](#)
 - [Confirm the assigned assets on the Employee Center portal](#)
 - [Raise issue related to your asset on the Employee Center portal](#)
- Comprehensive reports that enable Asset managers and Inventory administrators to monitor the status of asset attestations and remediation tasks, and take necessary actions. For more details, see the following:
 - [View open asset attestations in the Hardware Asset Workspace](#)
 - [View open remediation tasks for asset attestations in the Hardware Asset Workspace](#)
 - [View attestations for a serialized hardware asset](#)

Requirements and limitations

Asset Attestation has a dependency on the following ServiceNow Store applications:

- Employee Center (sn_ex_sp)
- Employee Profile (sn_employee)

For more details, see [Employee Center](#)  and [Employee profile](#) .

If you plan to audit your assets by using Asset Attestation, then consider the following points:

- Serialized hardware assets that belong to the opted-in resource categories can only be attested. Excluded hardware assets can't be attested.
- Consumables, bundles, and pallets can't be attested.
- Attestation supports assets that belong to resource categories of HAM solutions only if they're opted-in.
 - Hardware Asset Management integration with Telecommunications Network Inventory- Only assets of Server, Network gear, and Telecom Network Inventory (TNI) resource categories can be attested.
 - Hardware Asset Management integration with Zero Touch Mobility- Only assets of Mobile Device resource category can be attested.

Asset Attestation workflow

1. An Asset manager or an Inventory administrator creates a one-time asset attestation by selecting the employees assigned with the assets and the model categories of the assets.

An attestation record is created in the Asset Attestation [sn_itam_common_asset_attestation] table. Also, the details of the asset to be attested are added to the Attestations for Asset [sn_itam_common_attestation_asset_m2m] table.

2. An email notification is sent to the employees who are responsible for confirming the ownership of the assigned assets.
3. The employees verify the asset details and either accept or deny the ownership of the asset through the Now Mobile app or on the Employee Center portal.

The status of the asset attestation record is updated.

Asset Attestation schedule workflow

1. An Asset manager or an Inventory administrator creates an attestation schedule to create recurring attestations.

An attestation schedule record is created in the Asset Attestation Schedule [sn_itam_common_attestation_schedule] table.

2. The *ITAM Common - Asset attestation* daily job runs daily to check through all the asset attestation schedules. This daily job then creates asset attestations based on the frequency specified in the attestation schedule.

For more details on Asset Attestation, see [Audit your hardware assets by using Asset Attestation](#).

Receiving hardware and consumable assets at stockrooms

As an inventory user, you can receive assets at a stockroom from any workflow using the unified and standardized receiving mechanism.

Important:

The standardized asset receiving mechanism is available with Hardware Asset Management version 13.0.0 and later.

With the standardized receiving process, you don't need to be familiar with the specific workflow to which the assets belong. Therefore, you can receive hardware and consumable assets from different shipments originating from sources, like transfer orders, purchase orders, or any other workflows seamlessly.

Benefits of standardized receiving mechanism

- An intuitive user interface standardizes the receiving process, eliminating unique receiving methods for different workflows.
- A standard and common entry point for the receiving process reduces the time spent to receive assets and enhances the efficiency of inventory users.
- The ability to receive assets in bulk using Excel templates.
- Improved asset data quality by requiring assets to have unique identifiers when they're received at the stockroom.
- Comprehensive validations makes sure that there are no discrepancies in the asset data.

Requirements and limitations

- You can receive enterprise assets in the Hardware Asset Workspace only if the Enterprise Asset Management applications is activated.
- You can receive hardware assets in the Enterprise Asset Workspace only if the Hardware Asset Management application is activated.
- You can only receive complete quantity of consumables.
- You can receive assets from a purchase order line starting from the Zurich release, as well as Yokohama Patch 11 and Xanadu Patch 10 or later.

Asset receiving mechanisms

You can receive a single asset or multiple assets in bulk using any of the following options on the enhanced stockroom form:

- **Receive assets:** You can either search for an asset using its Asset Tag, Serial Number, or MAC address and receive it, or select one or more assets from the list of inbound shipment assets and receive them. For more details, see [Receive a hardware asset at a stockroom in the Hardware Asset Workspace](#) and [Receive assets from inbound shipments at your stockroom in the Hardware Asset Workspace](#).
- **Import assets:** You can download the Excel template, add the asset details that you want to receive, and import the Excel template. During the import process, the system performs validations, and you can view the imported asset records, validation status, and comments in the Import asset row [sn_itam_cmn_import_asset_row] table. Based on the validation status, you can select and receive the assets. If there are any issues with the asset records, you must address those issues before you can receive the assets. For more details, see [Import and receive assets in bulk at your stockroom in the Hardware Asset Workspace](#).

When any asset is received at the stockroom, the following changes happen:

- The State of the asset changes from **In transit** to **In stock**.
- The stockroom field on the asset form is automatically updated.
- The receive tasks in the source workflows associated with the asset that you received are automatically closed.

Asset performance reports in the Hardware Asset Workspace

Gain insights into the overall operational efficiency of your organization's hardware assets by using the asset performance reports available in the Asset analytics view.

i Important:

Asset performance reports are available with Hardware Asset Management version 13.0.0 and later.

Asset performance involves assessing how effectively and efficiently assets fulfill their intended functions within an organization. The evaluation includes measuring and analyzing key performance indicators (KPIs), such as:

- Asset availability to determine when the asset is operational
- Mean time between failures (MTBF) to measure reliability
- Mean time to repair (MTTR) to measure repair efficiency
- Total asset task time summary to measure the total time worked on the related tasks for an asset and its child assets.

Benefits of tracking asset performance

Reduce unplanned downtime

Real-time asset health monitoring can prevent and predict issues before they cause downtime.

Improve maintenance efficiency

Metrics like MTTR and MTBF help you schedule maintenance more effectively, reducing wasted time, and improving technician efficiency.

Maximize asset life and return on investment (ROI)

By detecting early signs of wear and tear and scheduling timely repairs, organizations can make their equipment last longer and delay the need for replacements.

Enhance financial planning

Performance insights help identify models or locations with poor performance or ongoing problems, guiding better investment choices.

Align operations with service levels

Tracking availability ensures that assets achieve the required uptime targets set by service level agreements (SLAs), compliance standards, or production schedules.

Considerations, requirements, and limitations

- To track additional hardware model categories in KPIs, [opt in the relevant HAM resource categories](#). Otherwise, newly added model categories do not appear in performance metrics or dashboards.
- The **First Used** field on HAM assets must contain a valid timestamp for accurate asset performance tracking. Assets with missing or invalid First Used values are excluded from performance calculations, creating gaps in lifecycle and utilization reporting.
- Asset key performance indicators (KPIs) aren't calculated for pallets, consumable, and bundle assets.
- Asset KPIs aren't calculated by default.
- To track asset KPIs including Asset availability, MTBF, and MTTR, complete these configurations:

1. Opt in to the model categories of the assets for which you want to monitor the KPIs.

Note:

If a model category has child categories, selecting the parent category for performance tracking doesn't automatically include the child categories. You need to opt in to the specific child categories you want to track.

2. Define an operation schedule, which is a collection of schedule entries that specify the operational status and total operational duration for any entity that references the schedule. The schedule entries define calendar hours of operation within a schedule.

For details, see [Create an operational schedule for hardware assets](#).

Note:

If an operational schedule isn't defined, the Default operation schedule is applied.

3. Create an Asset schedule to associate the hardware assets with an operational schedule.

Note:

If an asset isn't associated with an operational schedule, the Default asset schedule will be applied.

- The calculation of asset KPIs for hardware assets begins when the asset transitions to the In use state for the first time.
- KPIs are tracked until the state of the asset changes to Retired or Missing.

Calculation of asset KPIs

The KPIs are calculated based on the tasks associated with the asset and the operational schedule of the asset. The KPI values are stored in the Asset availability [sn_ent_asset_availability] table, which extends the Service Availability table.

Performance tracking for assets that belong to a model category opted in for performance tracking begins when the asset's state changes to In use for the first time. A record is then created in the Asset Availability table with **Asset availability %** set to **100**. The Asset availability % value decreases when the asset experiences an outage.

Outage record creation

An outage record is created in the Outages [cmdb_ci_outage] table in the following unplanned outage scenarios:

- The state of an asset changes from In use to any of the following:
 - In stock - Pending repair
 - In stock - Pending disposal
 - In stock - Defective
- An incident is created

The outage record is closed when:

- The status of the asset changes back to In use.
- The incident is closed.

The duration of the outage is calculated when the repair task is closed.

Handling overlapping outages

Outages can overlap due to multiple events being logged within the same time window. To maintain accurate KPI calculations, overlaps between unplanned outages are handled with these rules:

- When multiple unplanned outages, such as an asset moving from In use to In stock - pending repair state and an incident being created on the same asset, occur during overlapping time periods, they are not treated as separate outages. Instead, they are merged into a single outage to avoid overstating downtime.
- The total duration of this combined outage is calculated by merging all overlapping time intervals.
- A sample outage calculation is here:
 1. Outage A: 10:00 AM – 12:00 PM
 2. Outage B: 11:30 AM – 1:00 PM

Result: The resulting outage window is 10:00 AM – 1:00 PM (a single 3-hour outage).

Passing on outages through the asset hierarchy

In an asset hierarchy, outage on assets or their child assets are handled as follows:

- If a child asset with the **Required** field set to **true** experiences an outage, its parent asset will also have the outage.
- If a parent asset has an outage, all its child assets will also have the outage.

Asset KPIs

Asset KPI	Formula
Asset availability (in %)	$\frac{(\text{Operating hours} - \text{Total planned downtime} - \text{Total unplanned downtime})}{(\text{Operating hours} - \text{Total planned downtime})}$
Mean time between failures (MTBF) (in hours)	$\frac{(\text{Operating hours} - \text{Total planned downtime} - \text{Total unplanned downtime})}{(\text{Total unplanned outages})}$
Mean time to repair (MTTR) (in hours)	$\frac{(\text{Total unplanned downtime})}{(\text{Total unplanned outages})}$

Definition of the variables used in the KPI calculations is as follows:

Variable	Definition
Operating hours	The duration from when the asset first transitioned to the In use state until the current date and time within the asset schedule.
Planned downtime	The duration from when the asset transitioned from the Work in progress state to the Closed complete state.
Unplanned downtime	The duration from when the asset transitions from the In use state to any repair state, such as In stock - Pending repair, In stock - Pending disposal, or In stock - Defective, until it returns to the In use state, within the asset schedule.

Variable	Definition
	If there are overlapping durations between the repair state and an incident on the same asset, the combined duration of both is considered. The asset schedule is also considered when determining the outage duration.
Total unplanned outages	The count of total outage records for an asset. Overlapping and concurrent outages are consolidated as one outage.

Accessing asset KPI reports

- Contextual sidebar of the asset Form: You can view the following reports by using the options available in the contextual sidebar of the asset form.
 - [Asset availability and related KPIs report for an individual asset.](#)
 - [Asset task time summary report for all hardware assets.](#)
- Asset performance tab on the Asset analytics view: You can view the average values of the KPIs, including Average availability, Average MTTR, and Average MTBF, for all the assets that are being tracked. Additionally, you can see a list of the assets that contributed to the calculation of these KPIs. For details, see [Asset analytics view in the Hardware Asset Workspace.](#)

Scheduled job for calculation of asset KPIs

- The *Calculate asset performance KPIs* scheduled weekly job runs every Saturday to calculate the KPIs for the assets that belong to the model categories opted in for performance tracking. These KPIs are then reflected in the Asset availability and related KPIs report, which displays the most recent KPI values.

Note:

To track historical KPIs for existing assets in the opted-in model categories, run the *Calculate availability for historical data* job. This job considers the following tasks associated with an asset to calculate the outages and KPIs:

- RMA task
 - Repair task
 - Troubleshoot task
 - Evaluate task
 - Recall task
- The *Asset availability data collection* scheduled weekly job runs every Sunday to calculate the average values of the KPIs that includes Average availability, Average MTTR, and Average MTBF. The job then generates the reports in the Asset performance tab of the Asset analytics view.

Approximated lifecycle and lifecycle code

Leverage the expanded lifecycle coverage for hardware and consumable models available in the ServiceNow® Content library portal when explicit dates from the manufacturer aren't available. Hardware models with approximated lifecycle dates contain a lifecycle code that indicates the dates are approximate.

i Important:

The approximated lifecycle feature is available with Hardware Asset Management version 15.0.0 onwards.

When manufacturers don't publish official life cycle dates for certain hardware models and consumables, the ServiceNow® Content Service generates approximated life cycle dates. The approximated lifecycle dates are derived using data-driven approximation logic to determine the most likely life cycle phase dates for the hardware and consumable models.

The estimated life cycle dates are categorized using specific lifecycle codes. These codes indicate that the lifecycle dates aren't the explicit dates published by the manufacturer. When lifecycle dates are unavailable for any models, codes such as Exception Codes (EXC) and End-of-Phase Codes (END) are assigned to those models. These codes provide clarification regarding the absence of these dates.

The Hardware Lifecycle code [sn_itam_common_lifecycle_code] table stores the approximation codes and its description for the lifecycle records that are curated through approximation logic. For a detailed explanation of lifecycle codes, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB2726382.

The Lifecycle code column in the Hardware Lifecycle Definition [sn_hamp_lifecycle_definition] table indicates the approximate code for a model's lifecycle. This column references the Lifecycle code column in the Hardware Lifecycle Code [sn_hamp_lifecycle_code] table.

Load approximated lifecycle date for hardware and consumable models

The scheduled job *HAM - Hardware Life cycles* retrieves the life cycles date that is published by the ServiceNow Content Service and loads them into the following tables:

- cmdb_hardware_model_lifecycle (for hardware models)
- cmdb_consumable_model_lifecycle (for consumable models)

The system property *approximate_dates_in_hw_lifecycle* determines whether only manufacturer-provided actual dates or both actual and approximated dates are loaded into the hardware and consumable life cycle tables. The default value of the system property *approximate_dates_in_hw_lifecycle* is **True**.

- If this property is set to **False**, only the actual life cycles from the manufacturer are loaded into the hardware and consumable life cycle tables.
- If it is set to **True**, both actual and approximated life cycles are loaded into the hardware and consumable life cycle tables.

Identifying models with approximated lifecycle dates

In both the Hardware Model Lifecycles [cmdb_hardware_model_lifecycle] and Consumable Model Lifecycles [cmdb_consumable_model_lifecycle] tables, as well as in the Model management view within the Hardware Asset Workspace, the Lifecycle code column indicates if the model's lifecycle phase and dates have been approximated.

- If the Lifecycle code column contains a value, the model's lifecycle phase and dates are based on an approximated lifecycle code.
- If the Lifecycle code column is empty, the model's lifecycle dates are confirmed or explicit dates published by the manufacturer.
- If the Lifecycle code column contains a value, and the model's lifecycle phase and dates are empty, the Lifecycle code column indicates the reason for the absence of these dates.

Note:

When manually adding a new lifecycle record, such as a custom lifecycle or calculated lifecycle, you can't add a lifecycle code value. The lifecycle code is only available for lifecycle records that come directly from the ServiceNow Content Service and can't be set for the user created lifecycle records.

Configuring Hardware Asset Management

Configure Hardware Asset Management to have centralized asset data for accurate inventory and insights, automate the IT life cycle with workflows, and reduce the asset costs and risks.

Configuration overview

Here's an overview of the process for configuring Hardware Asset Management.

Configure Hardware Asset Management

Step	Action	Resource
 Install Hardware Asset Management	Get the Hardware Asset Management application from the ServiceNow Store .	Install Hardware Asset Management
 Use Hardware Asset Management	Use Hardware Asset Management to manage your hardware and consumable assets and reduce the asset costs and risks.	Using Hardware Asset Management

Install Hardware Asset Management

You can install the Hardware Asset Management application (sn_hamp) if you have the admin role. The application includes demo data. Install related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

Review the [Hardware Asset Management](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: ham_admin

About this task

The following items are installed with Hardware Asset Management:

- Roles
- Scheduled jobs
- Tables

For more information, see [Installed with Hardware Asset Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Hardware Asset Management application (sn_hamp) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Applying the CSDM guidelines to Hardware Asset Management

Hardware Asset Management manages (contributes data to) CSDM tables. Hardware Asset Management also uses data from CSDM tables that other applications generate. Several ServiceNow products, therefore, benefit from and add value to Hardware Asset Management.

Implementing the CSDM data framework

The CSDM is the data framework that you follow when you set up ServiceNow products and applications. You adhere to the CSDM guidelines when you define the configuration items (CIs) and the relationships between CIs in the CMDB. This process makes sure that your data resides in the appropriate CMDB tables so that you get the maximum value from your ServiceNow AI Platform applications.

Using a CSDM standard and consistent set of terms and definitions helps to track the assets effectively through their life cycle transitions.

Note:

To set up CSDM for Hardware Asset Management, see [Implementing the CSDM framework in stages](#) .

Tables adhering to the CSDM guidelines managed by Hardware Asset Management

1. Product Model table [cmdb_model]: The Asset Management application manages and contributes data to this table.
2. Asset table [alm_asset]: The Asset Management application manages this table containing asset details.

CSDM table used by Hardware Asset Management

Configuration Item table [cmdb_ci]: CMDB manages this table. The Hardware Asset Management application references configuration item (CI) data from this table.

CSDM life cycle mappings for Hardware Asset Management

The base system contains the Life cycle mapping [life_cycle_mapping] table that stores the life cycle mapping values. A mapping record specifies how to map legacy life cycle field values of a class such as asset or product model, to the CSDM **Life cycle stage** and **Life cycle stage status** fields. You can get the mapping details of the Asset [alm_asset] and the Product Model [cmdb_model] tables in the Life cycle mapping table.

Product Model table [cmdb_model] mapping of Hardware Asset Management and CSDM

Product Model Status field	CSDM Life cycle stage and Life cycle stage status fields
Retired	End of Life Retired
Build	Design Build
Sold	End of Life Sold
In Production	Operational In Use

Asset table [alm_asset] mapping of Hardware Asset Management and CSDM

Asset State and Substate fields	CSDM Life cycle stage and Life cycle stage status fields

In stock Pending certificate	End of Operation Pending Certificate
In stock Pending donation	End of Operation Pending Donation

CSDM life-cycle fields on the forms

The synchronization between the legacy fields and the CSDM life-cycle fields is bi-directional for both product model and asset. However, note the following points about the availability of the CSDM fields on the forms:

- On the Model form, both **Life cycle stage** and **Life cycle stage status** fields are shown.
- On the Asset form, the CSDM life-cycle fields aren't shown.

Synchronization of CSDM life-cycle fields between asset and CI

If you have opted-in to CSDM in the releases before Xanadu, synchronization of the CSDM life-cycle fields between the asset and CI happens through the legacy fields. However, when you upgrade to Xanadu, you can also opt in to directly synchronize the CSDM life-cycle fields between the asset and CI.

From the Xanadu release onward, when you opt in to CSDM, the life-cycle fields are directly synchronized between the asset and CI.

For more details on synchronization of life-cycle fields, see [How life-cycle values for Asset, CI, and IBI are synced](#) .

Using Hardware Asset Management

Use the Hardware Asset Management application to manage your hardware and consumable assets.

Work with hardware normalization

Asset Management Hardware Model Normalization enables users to normalize the details, such as manufacturer, product, model, and device type, of your hardware and consumable models. Data from the models is compared against the data in the Hardware Model Normalization Content Service.

The Normalization Data Services Client (`com.glide.data_services_canonicalization.client`) plugin is also activated when you activate the Hardware Model Normalization plugin.

Note:

This documentation is for Hardware Model Normalization. For additional information on Asset Management, see the [Asset Management documentation](#) .

Scheduled jobs

To standardize your hardware and consumable models, the asset data must be normalized. You can manually update the model records with the normalization content, or you can compare your data against the Hardware Asset Management Content Service.

The *HAM- Hardware Normalization* scheduled job runs daily. This job does not add, remove, or merge models, nor does it modify original fields like Model Name, Manufacturer, or Model Number. It only updates the normalization-related fields for existing models, such as Normalized Product, Normalized Manufacturer, Normalized Model, and so on.

Content from the Hardware Model Normalization Content Service is pulled into the ServiceNow AI Platform. Use the Asset Job Log (`asset_job_log`) table to review the status of the scheduled job.

The normalization status of models can be reverted by clicking **Revert Normalization** on the model. Any normalization that occurred on the model gets reverted and the rule gets deactivated. When the scheduled job runs, the models are processed with the active rules and the status is updated.

The scheduled job generates hardware and consumable model reports. These reports identify the overall status of your models and provide a breakdown of the normalization status.

The following reports are included.

- Hardware Product Overall Normalization Status
- Consumable Product Overall Normalization Status
- Hardware Model Normalization Status
- Consumable Model Normalization Status

Opt-in to the Hardware Asset Management Content Service

Opt in to the Hardware Asset Management Content Service to improve the normalization process by sharing hardware and consumable model data from your organization with ServiceNow.

Before you begin

Role required:

- ham_admin: for non domain separated instance
- ham_admin plus domain_admin: for domain separated instance

About this task

By opting in to the Hardware Asset Management Content Service, your data is securely shared with ServiceNow to build the content service repository. Adding to the content service allows more models be normalized automatically. These updates occur weekly.

The content updates are based on data from the hardware and consumable models, lifecycles, and custom hardware product models sent back to the Hardware Asset Management Content Service.

Any data that is retrieved by the content service remains anonymous and secure, following ServiceNow privacy policies. After the data has been reviewed, it is properly disposed of.

Procedure

1. Navigate to **All > Asset > Administration > Hardware Model Normalization > Content Service Setup**.
2. Read the Hardware Asset Management Content Service agreement.
3. Select **Yes, I have read and accept the Opt-In Agreement**.
4. Click **Opt-in**.
5. If there is any hardware model, consumable model, or lifecycle data that you want to exclude, toggle the option on the Content Service Setup form.
6. Click **Save**.

Example: Opt-in to the Hardware Asset Management Content Service

Your organization has decided to enable the Hardware Asset Management Content Service.

Navigate to the Content Service Setup module and review the Hardware Asset Management Content Service agreement.

Hardware Asset Management Content Service agreement

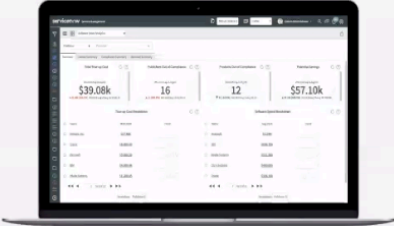

Your company has opted-out of the ServiceNow Hardware Asset Management Content Service program
 Change your mind? Opt-in below ✕

What is the Hardware Asset Management Content Service?

ServiceNow Content Service is an IT Asset Management shared service that provides customers continual data quality improvement.

By anonymously and securely providing ServiceNow the unrecognized details of Hardware/Consumable Models, the Hardware Asset Management Content Service will, in return, supply updates to the Normalization Library. This new content will improve your normalization hit ratios and enable you to better manage your hardware assets.

Note that ServiceNow's privacy policies guide how hardware details remain anonymous and secure, and will be properly disposed of after they are reviewed.

* Yes, I have read and accept the Opt-In Agreement

Select **Yes, I have read and accept the Opt-In Agreement** to display the Content Service Setup page.

You decide that you don't want to send hardware model data to the Hardware Asset Management Content Service. Toggle the button next to Hardware Models to opt out of sending the hardware model asset data.

Content Service Setup

Content Service Setup Save

HARDWARE ASSET DATA

- ▼ **Hardware Models**

Definition: A model created to classify and reduce duplication of hardware models when new models are identified. Only Hardware Models with a status of Match not found, Manufacturer Normalized, Partially Normalized or Manually Normalized will be transferred.

Details transferred: Name, Manufacturer, Model number, Short description, Model category, Status, Normalized name, Normalized manufacturer, Normalized model number, Device type, Normalized status, Normalization rule.
- ▼ **Consumable Models**

Definition: A model created to classify and reduce duplication of consumable models when new models are identified. Only Consumable Models with a status of Match not found, Manufacturer Normalized, Partially Normalized or Manually Normalized will be transferred.

Details transferred: Name, Manufacturer, Model number, Short description, Model category, Status, Normalized name, Normalized manufacturer, Normalized model number, Device type, Normalized status, Normalization rule.
- ▼ **Hardware Lifecycles**

Definition: Hardware Model Lifecycle records representing the external or manufacturer defined lifecycle of the hardware product. Only Hardware Model Lifecycles not created by ServiceNow with a lifecycle type other than internal will be transferred.

Details transferred: Lifecycle type, Lifecycle phase, Source, Phase start date, Phase end date, Risk, Normalized name, Normalized manufacturer, Normalized model number, Device type.
- ▼ **Consumable Lifecycles**

Definition: Consumable Model Lifecycle records representing the external or manufacturer defined lifecycle of the consumable product. Only Consumable Model Lifecycles not created by ServiceNow with a lifecycle type other than internal will be transferred.

Details transferred: Lifecycle type, Lifecycle phase, Source, Phase start date, Phase end date, Risk, Normalized name, Normalized manufacturer, Normalized model number, Device type.
- ▼ **Custom Product Models**

Definition: A model created to classify new models not provided by content service.

Details transferred: Name, Manufacturer, Model number, Device type, Product.

Click **Save**.

Your organization has decided that they don't want to send any of their data and they want to opt-out of the Hardware Asset Management Content Service. To stop sending your data, toggle all the buttons off.

A message appears verifying that you want to opt-out of using the Hardware Asset Management Content Service.

Opting-Out of the ServiceNow Content Service

✕

Opting-Out of the ServiceNow Content Service

Opting-out of the ServiceNow Hardware Asset Management Content Service means that your company will no longer receive content updates specific to your unique Hardware model footprint that exists within your environment and CMDB. You will still receive incremental content updates based on what the Content Service team can create from other sources.

Your company can rejoin the ServiceNow Hardware Asset Management Content Service at anytime through the Content Service Setup module in the Hardware Asset Management application.

Opt-Out

Click **Opt-Out**.

You are returned to the Hardware Asset Management Content Service agreement and you can opt back in at anytime.

Import and export content data

Import and export content data to the ServiceNow Hardware Asset Management content service to improve the normalization process. On-premise users can use the Manage Hardware Library module to import or export data via a zip file.

Before you begin

Role required:

- ham_admin
- domain_admin (if domain separation is enabled)

Procedure

1. Navigate to **Modules** and search for **Manage Hardware Library**.
2. Open the Manage Hardware library form layout and select the **Active** check box to activate the module.
3. Click **Save** and refresh the form layout.
4. Navigate to the Manage Hardware Library module.
5. Import the content data to get the new data into your system.
 - a. Click **Import Hardware Library Content**.
 - b. Click **Attach Content File** and then select the zip file that contains the content.
 - c. Click **Run Import**.
After the data is imported, the content update schedule job, *HAM - Apply latest content changes*, is triggered to process the content updates.
6. Export content to send the custom data or any hardware models that are not fully normalized to the ServiceNow content service team.

- a. Click **Content Service Opt-in: Export Hardware Normalization Content**.
- b. If you already haven't opted in to share the data with ServiceNow content service, click **opt-in** and refresh the Manage Hardware Library page.
- c. Click **Run Export**.
- d. After the status changes to Ready for Download, refresh the page.
A zip file is created and appears at the top of the Manage Hardware Library page. If there is no content to export, an error message appears informing you that no content exists.
- e. Download and send this zip file to the ServiceNow content service team.

Create a hardware or consumable model

To begin tracking your hardware and consumable assets, create a hardware or consumable model. Then, add lifecycle information to keep track of the lifecycle phase of your model.

Before you begin

Role required: admin or asset

Procedure

1. Navigate to one of the following paths.
 - **Product Catalog > Product Models > Hardware Models**
 - **Product Catalog > Product Models > Consumable Models**
2. Click **New**.
3. Complete the following steps if you are adding a hardware model.
 - a. On the Hardware Model form, click the **Consumable Model Fields** section.
 - b. Click **Save**.
 - c. To add additional information on the asset, click the [Hardware model details](#).
 - d. To add unit information, click the [Hardware model details](#).
 - e. To link a compatible model, click the [Compatibles](#) and then click **Add Compatible**.
 - f. To add a model substitution, click the [Substitutes](#) and then click **Add Substitution**.
 - g. To manually normalize your hardware model, click the [Normalization section](#).
 - h. To add a configuration item, click the [Configuration Items](#).
 - i. To add your model to the Product Catalog, click the [Hardware model details](#).
 - j. To publish the model to the Hardware Catalog, click the **Publish to Hardware Catalog** related link.

- k. To add related assets, click the [Hardware model details](#).
- l. To add a model component, click the [Model Components](#).
- m. To add vendor information to your model, click the [Vendor Catalog Items](#) and click **New**.
- n. To add lifecycle information, click the [Hardware Model Lifecycles](#), click **New**.
If a lifecycle with the same source, lifecycle type, lifecycle phase, and source exits, an error message appears.

Note:
While you can delete lifecycles that you've added, you can't delete lifecycles that are created from the Hardware Asset Management Content Service.

4. Complete the following steps if you are adding a consumable model.

- a. On the Consumable Model form, the [fill in the details](#).
- b. Click **Save**.
- c. To add additional information on the consumable asset, click the [Hardware model details](#).
- d. To add your model to the Product Catalog, click the [Hardware model details](#).
- e. To add vendor information to your model, click the [Vendor Items related list](#).
- f. To add lifecycle information, click the [Consumable Model Lifecycle related list](#) and click **New**.
If a lifecycle with the same source, lifecycle type, lifecycle phase, and source exits, an error message appears.

Note:
While you can delete lifecycles that you've added, you can't delete lifecycles that are created from the Hardware Asset Management Content Service

5. Click **Submit**.

Result

The model appears in either the Hardware Model or Consumable Model list.

Note:
If you want to exclude this model from the Hardware Asset Management Content Service, select the **Exclude from content service** option.

Example: Create a hardware model

You've purchased the ThinkPad T43 and you need to begin tracking the asset.

To begin tracking your asset, add the following information to the Hardware form.

Field	Description
Manufacturer	Lenovo

Field	Description
Name	ThinkPad T43

Click **Save**.

The **Display name** field is updated with the name of the manufacturer and the name of the hardware.

Hardware form

Currently, the Lenovo ThinkPad T43 is generally available. Add the lifecycle status to accurately track the phase of the asset.

Click the Hardware Lifecycle Model related list and click **New**. Add the following information to the Hardware Model Lifecycle form.

Field	Description
Lifecycle type	General Availability
Phase start date	2019-10-08
Phase end date	2019-10-31

Click **Submit**.

The lifecycle is added to the record.

Hardware Model Lifecycles

Related Links

[Publish to Hardware Catalog](#)

When the general availability phase is over, the ThinkPad T43 will be discontinued. Add the end of life information to the asset to accurately track the lifecycle.

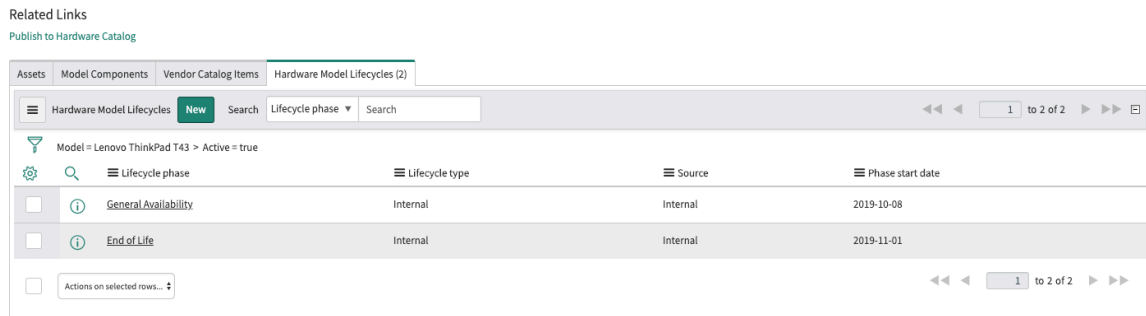

Click the Hardware Lifecycle Model related list and click **New**. Add the following information to the Hardware Model Lifecycle form.

Field	Description
Lifecycle type	End of Life
Phase start date	2019-11-01
Phase end date	2019-11-30

Click **Submit**.

The End of Life lifecycle is added to the record and both lifecycle phases are displayed in the Hardware Model Lifecycle related list.

Lifecycle phases in the Hardware Model Lifecycles list

What to do next

After you've added your hardware or consumable models, you can [normalize the data](#).

Copy a hardware model from the Content lookup portal

Copy a hardware model record from the Content lookup portal to add a new model entry to the Product Model [cmdb_model] table.

Before you begin

Role required: asset and model_manager

About this task

i Important:

Copy a hardware model record from the Content lookup portal feature is available with Hardware Asset Management version 15.0.0 onwards.

You can create a product model record by duplicating an existing model from the Content lookup portal. The duplicated model is normalized and relevant fields are automatically populated from the source record. If a record with the same manufacturer, name, and model number exists in the Product Model [cmdb_model] table, you can't duplicate the model record.

Procedure

1. Navigate to *Hardware Asset Workspace* > **Content lookup**.
2. Search for a hardware model record.
3. Open the Model details form by selecting the model number.
4. Select **Copy model details**.
5. On the form, fill in the fields.

Create model from copied form

Field	Description
Model type	Type of the model.
Model categories	Model categories that the model can be associated with. Model categories are used to create configuration items (CIs) and assets.

6. Select **Create new model**.

A confirmation message is displayed.

Result

The model record is created and you're redirected to the Model record form.

What to do next

- To publish the model to the Hardware Catalog, select **Publish to Hardware Catalog**. For more information about publishing the model to the hardware catalog, see [Publish an item to the hardware catalog](#).
- To revert the normalization of the hardware or consumable model, select **Revert Normalization**. For more information about reverting normalization, see [Revert normalization of hardware and consumable models](#).
- To save the changes made to the model record, select **Save**.

Related topics

Normalize hardware and consumable models

After you have created your hardware and consumable models, normalize the information of the model.

Before you begin

Role required: admin, asset, or model_manager

About this task

Note:

- If you have opted in to the Hardware Asset Management Content Service, you can override any life cycle values that were added from the schedule job, or you can manually add your own life cycles.
- For a model to be fully normalized, you must add manufacturer details and a model number, and optionally a model name.
- If you update the **Device Type** field, the normalization status is updated.

Procedure

1. Create a hardware or consumable model.

If the information is available, the model is compared against the data in the Hardware Normalization Content Service, and the model is normalized.

Note:

If the hardware or consumable model is normalized against the Hardware Asset Management Content Service, a life cycle is added if applicable life cycles exist in the content service.

2. Normalize your model manually if the normalization status of your model is Partially Normalized or Publisher Normalized.

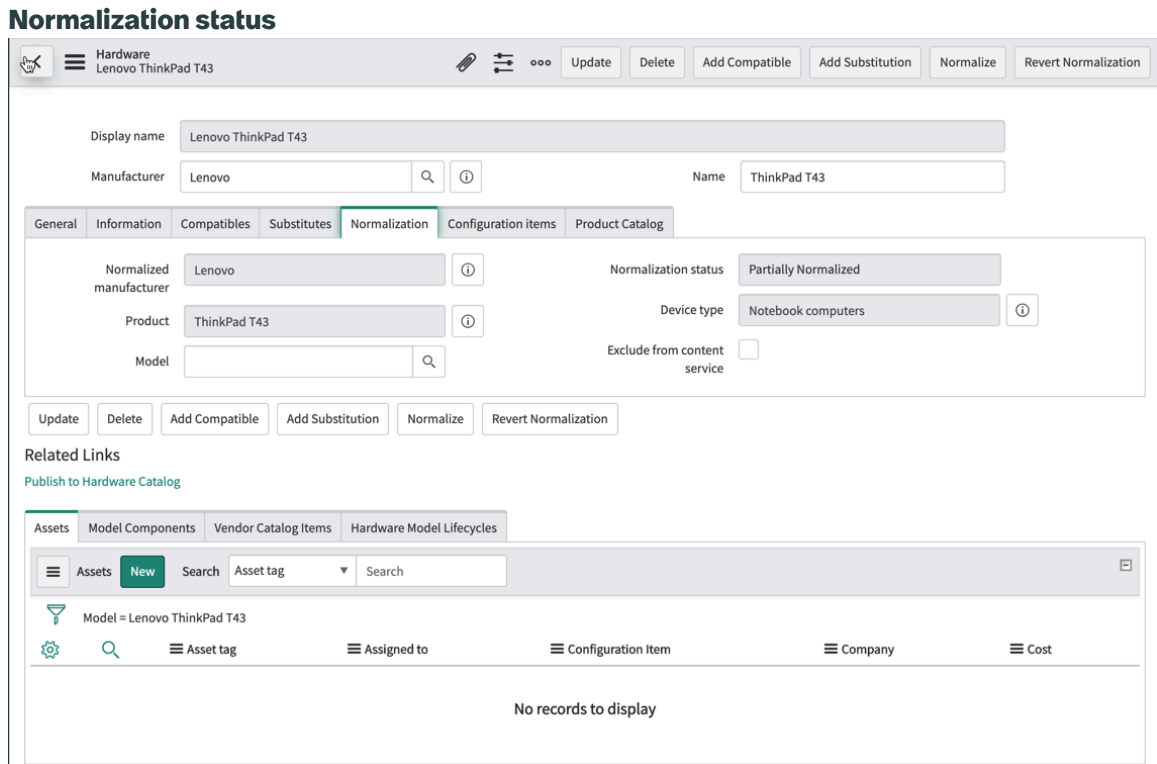

3. Select **Save**.

The **Normalization Status** field is updated.

Example: Normalize a hardware model

You have created a hardware model for the Lenovo ThinkPad T43 and you want your asset information to be consistent across the organization.

Review the normalization status of the model by selecting the **Normalization** section.

The normalization status is set to Partially Normalized because the name of the model is missing.

In the **Model** field, enter 2687DTU.

Select **Save**.

The **Normalization Status** field displays **Manually Normalized**.

Manually Normalized status

Hardware
Lenovo ThinkPad T43 2687DTU

Display name: Lenovo ThinkPad T43 2687DTU

Manufacturer: Lenovo | Name: ThinkPad T43

Normalized manufacturer: Lenovo | Normalization status: Manually Normalized

Product: ThinkPad T43 | Device type: Notebook computers

Model: 2687DTU | Exclude from content service:

Revert normalization of hardware and consumable models

Revert the normalization of hardware and consumable models in the Hardware Asset Workspace.

Before you begin

Role required: Users with asset or model_admin role (without Domain separation), asset or model_admin and domain_admin (with Domain separation).

i Note:

The model_admin role is available only if the OT Asset Management application is activated on your ServiceNow instance. This role enables you to revert the normalization status of OT hardware models. For more details on OT assets, see [OT Asset Workspace](#). The model_admin role includes the mode_manager sub-role.

About this task

Hardware and consumable models with a status of **Fully Normalized**, **Partially Normalized**, **Manufacturer Normalized**, or **Manually Normalized** can be reverted.

Procedure

1. Navigate to a normalized hardware or consumable record.
2. Select a hardware or consumable model record that is already normalized.
3. Select **Revert Normalization** and select one of these options in the confirmation message:
 - To mark your confirmation and proceed with reverting model normalization, select **Proceed**.
 - To dismiss the model normalization revert, select **Cancel**.

i Note:

The revert normalization confirmation feature is available with Hardware Asset Management version 15.0.0 onwards.

Result

After the revert normalization process is complete, the following changes take place:

- All the normalized fields present in the model are reverted and the normalization status changes to **Match not Found**.
- Fields are reset to their original values and any rule associated with the model is deactivated.
- After deactivation of the rule, revert normalization is run on all models that were normalized using that rule before.
- The deactivated rule can no longer normalize any more models. The deactivated rule can't be reactivated. It's a one-time procedure.
- The **Revert Normalization** option on the model record is replaced with the **Normalize** option.

Add a custom product

If you have a product that is not represented in the Asset Management Content Service yet, you can create a custom product.

Before you begin

Role required: ham_admin

Procedure

1. Navigate to **All > Asset > Administration > Custom Products**.
2. Click **New**.

Field	Description
Name	Name of the custom product.
Manufacturer	Name of the manufacturer.
Description	Description of the product.
Device type	Type of device.
Active	Option that indicates the product is active.
Exclude from content service	Option that indicates that the product will be excluded from the content service.

3. Click **Submit**.

What to do next

After you've created the hardware model, [normalize the model](#).

Add a custom hardware model

If you have a hardware model that isn't represented in the Asset Management Content Service yet, you can create a custom model.

Before you begin

Role required: ham_admin

Procedure

1. Navigate to **All > Asset > Administration > Custom Models**.
2. Click **New**.

Custom Hardware Model Library form

Field	Description
Model number	Number associated with the hardware model.
Product	Name of the product.
Description	Description of the hardware model.
Name	Name of the model.
Active	Option that indicates the model is active.
Exclude from content service	Option that indicates the model is excluded from being sent to the content service.

3. Click **Submit**.

What to do next

After you've created the hardware model, [normalize the model](#).

Manage asset bundles from your inventory

Create asset bundles from existing assets in your inventory to track, reserve, or deploy a group of assets as a single entity.

Before you begin

An asset bundle is a grouping of assets and comprises of consumable and hardware assets. Only assets that are in the **In stock** status and **available** substatus are added to an asset bundle. Assets that are part of an asset bundle aren't available as individual assets.

i Note:

For information on asset bundles, see [Asset bundles](#).

Role required: asset

Procedure

1. Navigate to **All > Asset > Bundled Assets**.
2. Select **New**.
The model category defaults to **Bundle** and the state defaults to **Build**. The build state is associated to only the **Bundle** model category. The build state isn't valid for assets.
3. In the Bundle form layout, select a product model from the **Model** list.
4. In the **Stockroom** field, select a stockroom from where the assets are sourced for the bundle.
5. Automatically add assets to your bundle by selecting **Auto-allocate assets** or add specific assets by selecting **Select assets**:
 - o **Auto-select assets**: Automatically adds assets to the asset bundle. The assets are added from the stockroom specified in the asset bundle.

i Note:

Assets are allocated only when all the assets that are part of the bundle are available. Excluded assets aren't considered for auto-selection. For more information about asset exclusion, see [Hardware Asset Management license exclusion](#).

- **Select assets:** Select the assets that you want in your asset bundle and select **Add Assets**.

Note:

You can't select an excluded asset. For more information about asset exclusion, see [Hardware Asset Management license exclusion](#). Assets displayed are confined to the stockroom specified in the asset bundle.

Once the assets are allocated to the bundle, the assets appear in the Assets related list and **Auto-allocate assets** and **Select assets** no longer appear in the Bundle form layout.

Note:

You must include all the assets to the asset bundle that are associated with the bundled model as a model component. If any asset isn't included, the bundle asset is considered incomplete, and the **State** field value of the bundle asset can't be changed.

6. Select Save.

The asset bundle is created. The cost of the bundled model is stamped on the asset bundle and on the expense line of the asset bundle. The cost isn't the cumulative cost of all the model components of the bundled model.

7. You can swap assets from an asset bundle by selecting Replace assets.

Assets belonging to an asset bundle can be swapped when the state of the bundle is **In maintenance** or **In stock** (substate **Pending repair**).

a. In the Replace assets dialog box, select the assets you want to swap.

b. Select the asset that you want to swap the current asset with.

c. Select **Replace**.

The asset that was swapped is returned to the stockroom.

8. You can delete an asset bundle by selecting Delete.

You must disassociate assets from an asset bundle in order to delete the bundle. Once all the assets are released from the bundle, you can delete the bundle.

a. In the **State** field, select **Retired**.

b. Select **Save**.

c. Select the **Release Assets** related link.

d. In the confirmation dialog box, select **Release assets**.

All the assets are disassociated from the asset bundle and are moved to a stockroom.

e. Select **Delete**.

The asset bundle is deleted.

Manage your inventory through pallet assets

Manage your inventory effectively using pallet assets.

Create pallet assets

Create a pallet asset from the Asset estate view in the Hardware Asset Workspace to track and manage assets in the inventory.

Before you begin

You must create a model for a pallet asset. For more information, see [Models](#) .

Role required: asset

About this task

While creating a pallet asset, only the Details, Disposal, Activities, and Audit sections of the asset form appear. Although audit-related fields are shown on the asset form, you can't conduct the audit of pallet assets. You can specify the aisle and space details to give the exact location of the pallet in a stockroom.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset estate**.
2. Select **New Asset**.
3. In the dialog box, select **Pallet** as the asset type and then select **Create**.
4. On the form, fill in the fields.

Pallet Asset Details section

Fields	Description
Display name	Name of the pallet asset based on the values in the Asset Tag and Model fields set when the pallet asset is created. For example, the display name for a pallet with an Asset tag of PAL0000001 whose Model is 3Com Wooden pallet would be PAL0000001 - 3Com Wooden pallet.
Model category	The model grouping of the pallet asset. This field is read-only and is automatically set to Pallet.
Number	Unique, auto-generated number for the pallet asset.
Model	Product model of the pallet asset.
Quantity	Number of items the pallet asset represents. This field is automatically set to 1.
Asset tag	Alphanumeric tracking information from the tag attached to the pallet asset.
Pallet type	Type of pallet. The available values are: <ul style="list-style-type: none"> <input type="radio"/> Pallet <input type="radio"/> Bin <input type="radio"/> Box <input type="radio"/> Container <input type="radio"/> other
State	Current state of the pallet asset. The available values are: <ul style="list-style-type: none"> <input type="radio"/> In stock <input type="radio"/> In transit <input type="radio"/> Retired <input type="radio"/> Missing

Fields	Description
Substate	Current substate of the asset, such as Available or Reserved. The values in the Substate list change based on what you select from the State list.
Stockroom	Name of the stockroom.
Reserved for	Name of the person for whom the pallet is reserved.
Aisle	Aisle details of the pallet within the stockroom. This field appears only when In stock or Build is selected from the State field.
Location	Physical location of the stockroom.
Space	Space details of the pallet within the aisle. This field appears only when In stock or Build is selected from the State field.
Parent	Parent asset of the pallet asset.
Comments	Optional additional information.

Disposal section

Fields	Description
Disposal order number	<p>This field is automatically set to the unique number assigned to the asset disposal order.</p> <p>Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Scheduled retirement	Scheduled date on which the asset retires.
Disposal vendor	<p>The vendor assigned to carry out the asset disposal order.</p> <p>Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Retire date	Actual date on which the asset retires.
Vendor disposal order ID	<p>Order number from the vendor assigned to carry out the asset disposal order.</p> <p>Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Refresh request line	Refresh request line number if the asset has been identified as an aged asset by the Hardware Asset Refresh flow.
Disposal date	<p>Date when the asset disposal process is completed.</p> <p>Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>

Fields	Description
Beneficiary	Organization that will receive the asset when the asset is retired.
Resale price	Value of the asset when it's retired. For example, if the asset is donated, the value used when reporting taxes.

Activities section

Field	Description
Work notes	<p>Any additional information about the asset.</p> <p>Work notes are updated automatically in the following situations:</p> <ul style="list-style-type: none"> ○ Updates to State, Substate, or Reserved for fields of the asset record. Any updates to these fields are automatically recorded in the Work notes field. ○ When the asset is received by a transfer order. These work notes help in tracking the life cycle of an asset.

5. Select **Save**.

Result

The pallet that you created is added to the list shown in the Pallets tab.

Add assets to a pallet

Add base, hardware, bundle, consumable, and other pallet assets to an in-stock pallet to track and manage the assets in a stockroom as a group.

Before you begin

Role required: asset

About this task

You can add assets to a pallet only under the following conditions:

- The asset belongs to the same stockroom as the pallet or has no value set in the **Stockroom** field.
- The pallet **State** field value is In stock.
- The asset **State** field value is one of the following:
 - On order
 - In stock
 - In transit
 - Retired
- The asset isn't associated to another parent asset.

Either remove the existing parent-child association and then add the asset to the pallet or directly add the pallet as parent to the asset.

When an asset that is a parent to other assets is added to a pallet, all its child assets are also added. However, the parent field of the child assets isn't replaced with details of the pallet.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset estate**.
2. Select the **Pallets** tab.
3. Select the pallet to which you want to add assets.
4. Select the **Assets** tab.
5. Add base, hardware, and bundle assets to the pallet.

a. Select **Add assets**.

b. In the Add assets dialog box, select the assets that you want to add.
You can use the filter to narrow the list of available assets.

c. Select **Add**.

The assets that you added to the pallet are added to the list shown in the Assets tab. The state, substate, location, stockroom, aisle, and space details of the assets are synced with the pallet.

Note:

Only the substate of pre-allocated assets isn't synced with the pallet. For more information, see [Create pre-allocated assets](#).

6. Add consumable assets to the pallet.

a. Select **Add consumables**.

b. In the Add consumable to pallet dialog box, select the consumable from the list of available consumables or search for it.

c. In the **Quantity** field, either accept the default field value of the maximum available quantity of the selected consumable or modify the value to the number of consumables you want to add.

d. Select **Add**.

The consumable asset that you added to the pallet is added to the list shown in the Assets tab.

Remove assets from a pallet

Remove the assets contained in a pallet when you don't need to track and manage them using pallets.

Before you begin

Role required: asset

About this task

Removing the assets from a pallet breaks the parent-child association between them.

You can remove assets only from a pallet whose **State** field value is In stock.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset estate**.
2. Select the **Pallets** tab.
3. Select the pallet from which you want to remove assets.

4. In the Pallet Details form, select the **Assets** tab.
5. Select the assets that you want to remove from the pallet and select **Remove**.

Result

The assets that you removed from the pallet are no longer shown under the Assets tab.

Delete pallet assets

Delete a pallet asset when no assets are associated with it.

Before you begin

Role required: asset

About this task

You can delete a pallet only if it's empty. Remove any assets before trying to delete the pallet.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset estate**.
2. Select the **Pallets** tab.
3. Select the pallet that you want to delete.
4. Click the more actions icon () next to the **Save** button and select **Delete**.

Result

The pallet that you deleted is no longer shown under the Pallets tab.

Using pallet assets for managing inventory

You can add a pallet with the assets contained in it to transfer orders and disposal orders to manage your inventory effectively.

Moving pallets from one stockroom to another

Move an in-stock pallet along with the assets contained in it from one stockroom to another by using transfer orders. When you move only the assets contained in a pallet, the assets are removed from the pallet after the Ready for fulfillment task is closed. You can also use a transfer order to move an empty pallet.

Updates that you perform on the pallet as part of the transfer order workflow are applicable to the assets contained in it.

If there's a problem with all or some of the assets you receive as part of a transfer order, you can return the pallet along with its assets. You can't return individual assets contained in the pallet.

For more information, see [Transfer orders for Asset Management](#).

Disposing of pallets

Dispose of a pallet with its assets that are reaching the end of the life cycle or that aren't functional by using a disposal order. When you add a pallet to a disposal order, the assets and child assets in the pallet are also added. However, any asset bundles in the pallet are not included.

The disposal order workflow when disposing of a pallet or its assets is as follows:

- Disposing of the pallet with the assets contained it: The verified pallet and its assets are disposed.
- Disposing of only the assets and retaining the pallet: The assets are removed from the pallet after they're verified.
- Disposing of the pallet with only some of its assets and retaining the remaining assets: The assets that weren't verified or disposed of are removed from the pallet automatically.

For more information, see [Create a disposal order](#).

Consuming assets from a pallet

Note:

When an asset from the pallet is consumed as part of any workflow, the asset is automatically removed from the pallet.

Assets contained in a pallet can also be consumed as part of the following workflows:

- [Return Merchandise Authorization \(RMA\)](#): When an asset from a pallet is added to RMA, the asset is immediately removed from the pallet.

Note:

In an RMA request with an off-site replacement or repair, the assets that are in the pallet aren't shown in the Replacement asset field on the Receive task form.

- [Asset Local Stock](#) : When an asset from the pallet is consumed as part of the local stock, the asset is removed from the pallet after the Confirm assigned asset task is closed.
- [Loaner](#): When an asset from a pallet is consumed as a Loaner asset, the asset is removed from the pallet after the Prepare task of the loaner order is closed.
- [Return leased assets](#): When a leased asset from a pallet is returned, the asset is removed from the pallet after the Shipment task is closed.
- [Swap and deploy tasks from ITSM](#): When deploy asset action is triggered from ITSM, the asset that must be deployed is removed from the pallet. When swap action is triggered from ITSM, the asset in the pallet that is a replacement for a faulty asset is removed from the pallet.

Manage loaner assets

Request a loaner asset or consumable for a short period. You can also prepare the loaner asset or consumable for deployment and reclamation by using loaner asset tasks. Deploy the loaner asset or consumable for a specific period, and reclaim it on the return date.

Request a loaner asset

Request a temporary or loaner asset or consumable and use it for a short period.

Before you begin

Role required: None

While requesting a loaner asset, ensure that the start date is within three months from the date of submission, and the end date is within six months from the start date.

About this task

Request a loaner asset for a specific period. You can request it for yourself, for another employee of your organization, or for a third-party vendor. Before the asset is installed, you can cancel the loaner asset request at any time.

You can submit a loaner order even if the product isn't available at the moment in the location you want to select. In this case, your order is placed in the queue.

Procedure

1. Navigate to **All > Service Catalog > Asset Lifecycle**.

The **Asset Lifecycle** category isn't on the Service Catalog page by default. To add this category, log in with admin credentials, select the add content icon () beside the search catalog bar and then select **Asset Lifecycle**.

2. Select **Loaner Asset Request**.

3. On the form, fill in the fields.

Loaner Asset Request form

Field	Description
Requested for	Person for whom you are requesting the asset. You can make a request for yourself, for another employee of your organization, or for a third-party vendor.
Requested for user	User for whom you requested the asset. This field appears only when For company user is selected in the Requested for field.
Location	Location where the requested asset should be provided. When the location that you specified is a service location of multiple stockrooms, the Model field shows the list of loaner asset models that are available in all those stockrooms in addition to the models available in the stockroom of that location. For more details on service locations, see Associate a stockroom with service locations .
Model	Model of the asset that you're requesting.
Start date	Date when you want to start using the asset.
Return date	Date when you want to return the asset.
Justification	Reason why you need the asset.

After entering the **Start date** and **Return date**, if there are no loaner assets available in the selected location and for the selected time period, a warning appears. If you still submit the loaner order, your loaner order will be in a waitlist.

4. Select **Submit**.

A message appears and shows whether your loaner order was placed successfully or the order was placed in a waitlist.

What to do next

To view your request, navigate to **Self-Service > My Requests**. You can also view your order by using the Now Mobile app.

Before you receive your loaner asset, you can cancel the loaner asset request by selecting **Cancel**. After you receive your loaner asset, the **Cancel** button doesn't appear anymore. You can also return your loaner asset before the specified **Return date**.

Prepare, deploy, and reclaim loaner assets

Select and prepare the loaner asset or consumable for deployment and reclamation by using loaner asset tasks. Deploy the loaner asset or consumable for a specific period, and reclaim it on the return date.

Before you begin

To use an asset as a loaner asset or consumable, go to the asset record and set the **Asset function** field to **Loaner**. These assets are reserved for use as loaner assets. You can't use an asset that has the **Asset function** field set to anything other than **Loaner**. Only hardware, bundle, and consumables can be used as Loaner assets.

The Loaner Asset Orders related list in the Asset form shows all the loaner orders that the asset has served in the past and at present. When the consumable isn't in a stockroom, it shows only the current loaner asset order that it's serving at present.

Role required: inventory_user

About this task

Use the Loaner Asset Orders module to view and complete the loaner asset orders that were requested by the users.

The Hardware Asset dashboard gives a consolidated view of all the loaner asset orders that are in the New, Deployed, or Return Overdue states. For details, see [Hardware Asset dashboard](#).

Note:

There are readily available decision tables that you can use to customize the Loaner Asset Request Flow. For more details, see [Hardware Asset Management flow customization](#).

Procedure

1. Navigate to **All > Inventory > Loaner > Loaner Asset Orders**.
2. Open a loaner asset order record.
3. Under the Loaner Asset Tasks related list, open the Prepare task.
4. On the form, fill in the fields.

Prepare task form

Fields	Descriptions
Asset	<p>Asset that is used to fulfill the loaner asset request.</p> <p>When the Location field value of the Loaner Asset Request form is a service location of multiple stockrooms, the Asset field shows the list of loaner assets that are available in all those stockrooms in addition to the loaner assets available in the stockroom of that location. For more details on service locations, see Associate a stockroom with service locations.</p>

Fields	Descriptions
	<p>Note:</p> <p>The stockroom that is available at the specified location is preferred for fulfilling the loaner asset request. The stockrooms that support the specified location are considered only when there isn't any stockroom in that location.</p>
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Deploy task.

5. After you physically prepare the hardware asset for deployment, select **Close Task** to close the Prepare task.

After the Prepare task is completed, a Deploy task is created under the Loaner Asset Tasks related list. On the Asset record [alm_asset] table, the following changes happen:

- The state of the loaner asset changes to In stock.
- The **Reserved for** field is automatically set to the name of the user who the loaner asset was requested for.
- The substate changes to Pending install.

6. Open the Deploy task.

7. On the form, fill in the fields.

Deploy task form

Fields	Descriptions
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Deploy task.

8. Deploy the hardware asset.

9. Set the **State** field to **Closed Complete**.

10. To close the Deploy task, select **Close Task**.

On the Asset record [alm_asset] table, the following changes happen:

- The state of the loaner asset changes to In use.
- The **Stock room** field changes to Null.
- The **Assigned to** field is automatically set to the name of the user who the asset was requested for.
- If you requested the loaner asset for a third-party vendor, then the **Managed by** field is automatically set to the name of the user who the asset was requested for.

For a consumable, the state changes to Consumed.

Two days before the return date, the users who requested the asset will receive an email notification about the reclaim. One day before the return date, a Reclaim task is created under the Loaner Asset Tasks related list.

11. Open the Reclaim task.
12. On the form, fill in the fields.

Reclaim task form

Field	Description
Stockroom	Stockroom where the returned asset is stored. If you entered a stockroom different from where you received the loaner asset, then a warning message appears which says that the existing loaner orders from the initial stockroom might be affected.
Returned on	Actual date when the asset was returned.
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Reclaim task.
Asset returned	Option to mark the asset as returned. The Reclaim task can't be closed if the asset isn't returned.
Asset functional	Functional status of the loaner asset after it's reclaimed.

If the asset isn't functional, the state of the asset changes to In stock and the substate changes to Pending repair.

13. To close the Reclaim task, select **Close Task**.
14. If a user returns the asset before the return date, do the following:
 - a. Select **Reclaim**.
 - b. On the Reclaim Asset form, update the fields.
 - c. Close the Reclaim task.

On the Asset record [alm_asset] table, the following changes occur:

- The state of the loaner asset changes to In stock.
- The substate changes to Available.
- The **Stockroom** field is automatically set to the value that was selected on the Reclaim task form.
- If the asset is assigned to a future loaner order, the substate changes to Reserved and reflects the details of the loaner order.

Donate assets to charity organizations

Use the Asset Donation flow to donate hardware and consumable assets of your organization to charity organizations.

Create an Asset Donation Order

Create a service catalog request to donate the in-stock hardware and consumable assets in your organization to charity organizations.

Before you begin

Role required: none

Procedure

1. Navigate to **All > Service Catalog > Asset Lifecycle**.

The Asset Lifecycle category isn't on the Service Catalog page by default. To add this category, select the Add content icon () beside the Search catalog bar and then select **Asset Lifecycle**.

Note:

You require admin role to add a category to the Service Catalog.

2. On the Asset Lifecycle page, select **Asset Donation Order**.

3. On the form, fill in the fields.

Request for asset donation form

Field	Description
Charity organization	Name of the charity organization to which you want to donate your assets. You can filter the charity organization list based on Name, City, State/Province, Country, or Phone details.
Description	Name and quantity of the assets that you want to donate. For example, Request to donate two Dell PCs.

4. Select **Submit**.

Your Asset Donation Order is successfully submitted.

5. **Optional:** View the status of your Asset Donation Order by navigating to **All > Self-Service > My Requests**.

Approve or reject an Asset Donation Order

As an asset manager, review and then approve or reject an Asset Donation Order.

Before you begin

Role required: asset

Procedure

1. Navigate to **All > Contract > My Approvals**.

2. Select an Asset Donation Order record that is in the **Requested** state.

3. Approve or reject the Asset Donation Order.

- To approve the order, select **Approve**.

The **State** of the order changes to **Approved**.

- To reject the order, select **Reject** and enter a reason for rejection in the **Comments** field.

The **State** of the order changes to **Rejected**.

Process an Asset Donation Order

Process an Asset Donation Order to prepare and send assets to a charity organization.

Before you begin

Role required: asset

About this task

You can cancel an Asset Donation Order until it reaches the transit stage in the workflow. After your Asset Donation Order reaches the Confirmation stage, you can't cancel it.

Note:

You can process Asset Donation Orders only in Hardware Asset Workspace and not in Hardware Asset Management Core UI.

Procedure

- 1.** Navigate to **All > Hardware Asset Workspace > Inventory**.
- 2.** Open the **Donation orders** tab.
A list of asset donation orders is shown.
- 3.** Select an Asset Donation Order that is in the **Scheduling** stage.
- 4.** Add assets to the Asset Donation Order.
 - a.** Open the **Planned Assets** tab.
 - b.** Select **Add**.
 - c.** In the Add assets pop-up window, select assets that are part of the domain whose state is In stock and substate is Pending donation, and then select **Add**.
Use the filter to search for the desired assets.
The assets that you added are shown under the Planned Assets tab.
- 5.** Prepare the assets for donation and provide a date to pick up the assets.
 - a.** Open the **Asset Donation Tasks** tab.
 - b.** Select the Prepare assets and provide Scheduled date task.
 - c.** In the Planned Assets related list, select the assets that you want to prepare and then select **Prepare**.

 **Note:**

You can configure subflows for asset preparation tasks based on your needs and the type of assets to be donated. For example, you can configure Prepare asset tasks for a data storage asset that needs data wiping or a hardware asset that needs packaging before it's donated.

The stage of the planned assets changes to Prepared.

 - d.** On the Schedule details form, in the **Scheduled date** field, select a date for pick up.
 - e.** Select **Close task**.
The state of the task changes to Closed complete, and the Select the assets departing for donation task is created as an asset donation task.
- 6.** Select the assets to be sent.

- a. Open the Select the assets departing for donation task.
 - b. In the Planned Assets related list, select the assets that you want to send from the stockroom and select **Depart**.
The stage of the planned assets changes from Prepared to In transit. The state of the assets changes to In transit and the Substate changes to Pending donation.
7. Provide the name of the vendor to pick up the assets and the shipment tracking details.
- a. Open the Details tab.
 - b. On the Schedule details form, specify the following:
 - i. In the **Pickup contact name** field, enter the name of the vendor to pick up the assets for donation.
 - ii. (Optional) In the **Shipping carrier** field, select your shipping carrier.
 - iii. (Optional) In the **Tracking number** field, enter the tracking number for the shipment.
- Note:**
The Shipping carrier and Tracking number fields are used to track shipments from the Shipment list in the Asset operations view of the Hardware Asset Workspace. For details, see [View hardware asset shipment details](#).
- c. Select **Close task**.
The State of the task changes to Closed complete. Confirmation from the charity organization task is created under the assets donation tasks.
8. Confirm donation of the assets.
- a. Select the Confirmation from charity organization task.
 - b. In the Planned assets related list, select the assets and then select **Confirm Donation**.
The stage of the assets changes to Completed. The state of the assets changes to Retired and the substate changes to Donated.
9. Attach the donation documentation from the charity organization to the Asset Donation Order record.
- a. Select the Confirmation from charity organization task.
 - b. In the Details related list, select the Attachment icon ()
 - c. Select the document.
 - d. In the Certificate of donation list, select **Yes**.
The state of the Asset Donation Order is set to Completed.
 - e. Select **Close task**.

Result

All the asset donation tasks are in the Closed Complete state and the Asset Donation Order stage changes to Completed.

Add a charity organization for donating assets

Add a charity organization to the Charity Organization [sn_itam_common_charity_org] table to make it available for asset donations.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Inventory > Charity Organization**.
2. Select **New**.
3. Provide the location and contact details of the charity organization.
The **Name** and **Zip/Postal code** fields are required.
4. On the form, fill in the remaining fields.

Charity Organization New Record form

Field	Description
ID	Unique identifier that you assign to the charity organization. The ID field is required.
Active	Option to mark the charity organization record as active.
Domain	Domain of the charity organization record. The charity organization record is set to the global domain automatically when no default domain is available.

5. Select **Submit**.

Result

The charity organization record that you added is added to the Charity Organizations list.

Use Advanced Shipment Notification

Use Advanced Shipment Notification (ASN) to automate and create asset records when your assets are in transit.

Before you begin

- Download the ASN template and share it with the vendor for completion.
- Before importing asset records using the ASN template, validate the following data requirements:
 - The model ID provided in the template is defined in your ServiceNow instance.
 - The shipping address in the template matches the shipping address in the Location [cmn_location] table.
 - The shipping carrier in the template is available in the Shipping carrier [sn_itam_shipping_carrier] table.

Role required:

- Hardware Asset Management version 15.0.0 and later: ham_admin, ham_user, procurement_admin, asset, or admin
- Hardware Asset Management versions prior to 15.0.0: admin

About this task

Note:

If the asset records that you want to create belong to model categories linked to a CI class with identification rules defined for fields like the Asset tag, Serial number, or MAC address, you must provide details for at least one of these fields in the ASN template. Otherwise, the asset record isn't created. For example, if identification rules are defined for the Serial number and MAC address, you should provide a value for either of these fields.

The identification rules for a CI class are defined in the CMDB Identification and Reconciliation engine (IRE). For more details, see [Identification rules](#) and [Create a CI identification rule](#). These rules help to uniquely identify the asset through these required fields and maintain accurate asset records.

Procedure

1. Navigate to ASN import page.

2. Attach or upload the ASN template.

- HAM version 15.0.0 and later:

a. Select **New**.

b. On the Create New Shipment Notification Upload page, enter a unique name in the **Name** field.

c. Select **Attach file** to upload the updated ASN template (.xlsx) that you received from your vendor.

Note:

If you do not have a sample ASN template, select **Download template** and share it with the vendor for completion.

- HAM versions prior to 15.0.0: Select **Browse files** and select the updated template.

Note:

If you don't have a sample ASN template, on the Import Template page, select the **Download Template File (.xlsx)** link to download the template and share it with your vendor for completion.

The ASN template includes fields such as:

- Serial number: Unique identifier for the asset
- Asset tag: Alphanumeric tag assigned by your organization for asset tracking
- Vendor: Vendor from whom the asset was purchased
- PO number: Number associated with the purchase order

Note:

This field isn't the vendor PO number.

- Model id: Model number of the product

- SVC contract end date: Warranty expiration date for the asset
- Carrier: Shipping carrier name
- Tracking number: Number to track the assets that are in transit

3. Start the import.

- HAM version 15.0.0 and later: Select **Import**.

The status of the shipment notification upload transitions as follows:

- Moves from **Draft** to **Pending** after the import is initiated.
- Progresses through the **Extracting Rows** and **Importing** stages as the system processes the data.
- Finalizes the process by updating the status to one of the following based on the outcome:
 - **Completed**: The import finished successfully without issues.

i Note:

Even if some rows fail validation, the overall import status is marked as Completed. Error details for failed records are displayed in the **Comment** field on the **Shipment Notifications Upload Stagings** tab.

- **Failed**: The system couldn't complete the import process.
- The **Shipment Upload Result** section summarizes the import by showing the number of records inserted, ignored, and skipped.

- HAM versions prior to 15.0.0: Select **Upload**.

The upload may take some time as the import process runs asynchronously. Wait for the import process to complete before proceeding.

Check the status of importing the template in one of the following ways.

- Navigate to **Procurement > Orders > Import Status**.
- To open directly the import set record, select the link on the message bar that shows **View import progress here**.

The Import Sets page shows a list of import set records.

4. Review the import results.

- HAM version 15.0.0 and later: Select the **Shipment Notifications Upload Stagings** tab to view the state all rows included in the ASN template. A row can have any of the following states:
 - **Inserted**- Indicates that the row passed all validations and was considered for asset creation.
 - **Ignored**- Indicates that the row failed one or more validations and was excluded from asset creation. Rows containing software licenses are also automatically excluded, as software licenses are not supported through ASN import.

The **Comment** field displays error details.

- HAM versions prior to 15.0.0:
 - a. Select the import set record to view the import status.
 - b. If the import was not successful, select the **Import Set Rows** tab and check the **Comment** field to understand the reason for the failure.

Result

For rows validated successfully:

- Asset records are created in the **In Transit** state.
- Asset records are linked to their corresponding purchase order line items.
- Purchase order statuses are updated to **Pending Delivery**.

What to do next

For rows that were ignored or resulted in a failed import, perform the following steps:

1. Review the **Comment** field to identify errors or details for each row.
2. Resolve the identified issues in the ASN template.
3. HAM version 15.0.0 and later: Create a new **Shipment Notification Upload** record to import the updated template.
4. HAM versions prior to 15.0.0: Import the updated template again.

Manage RMA requests

Initiate a Return Merchandise Authorization (RMA) process by submitting an RMA request to initiate an RMA process with your vendor. You can repair or replace a faulty asset.

After you submit an RMA request for a defective asset, you must go through various tasks to finalize repairing or replacing the asset.

To close an RMA request, you have to close each of its request lines separately. To close a line, you have to complete all the line's RMA tasks, and you must provide any necessary information about the line. You close a line by first closing its Assessment task. Then the defective asset is sent for either off-site or on-site repair. The line is closed after all these tasks are finished.

Submit an RMA request

Submit a Return Merchandise Authorization (RMA) request to initiate an RMA process with your vendor. You can repair or replace a faulty asset.

Before you begin

Role required: asset and inventory user

The asset, inventory_user, or itil role can only access the reports of the RMA request lines.

Procedure

1. Navigate to **All > Service Catalog > Asset Lifecycle > Asset RMA Order**.
2. To initiate an RMA request for a defective asset or consumable, click **Add**.
3. In the **Asset** field on the Add Row form, select the defective asset or consumable for which you want to initiate the RMA request.
You can select multiple rows of assets and consumables. You can't select an excluded asset. For more information about asset exclusion, see [Hardware Asset Management license exclusion](#).
If you select a consumable, a **Quantity** field appears beside the **Asset** field. In the **Quantity** field, enter the number of defective consumables for which you want to initiate the RMA.
4. To add the selected assets or consumables, click **Add**.
5. To submit the RMA request, click **Submit**.

Result

The RMA request is created. A confirmation message appears with the RMA request number.

Closing an RMA request

After you submit an RMA request for a defective asset, you must go through various tasks to finalize repairing or replacing the asset.

To close an RMA request, you have to close each of its request lines separately. To close a line, you have to complete all of the line's RMA tasks, and you must provide any necessary information about the line. You close a line by first closing its Assessment task. Then the defective asset is sent for either off-site or on-site repair. The line is closed after all these tasks are finished.

The following procedures explain how to close a single line by closing its tasks. You must repeat these procedures for all the request lines.

Close the Assessment task for an RMA request

Close the Assessment task for an RMA request so that the defective assets can get repaired or replaced.

Before you begin

Role required: asset, inventory user, or itil

The asset, inventory_user, or itil role can only access the reports of the RMA request lines.

Procedure

1. Navigate to **All > Inventory > Return Merchandise Authorization > All RMA Requests**.
The RMA Request page appears and shows a list of RMA requests.
2. Open the RMA request that you want to close.
3. Under the RMA Request Lines related list, open an RMA request line.
4. Under the Asset RMA Tasks related list, open the Assessment task.
5. On the form, fill in the fields.

Assessment task form

Field	Description
State	State of the task.
Stockroom	Stockroom of the faulty asset or consumable.
Vendor	Vendor from which the asset was purchased.
Vendor RMA number	RMA reference number given by your asset vendor.
Assignment group	Group to which the RMA task is assigned.
Assigned to	User from the assignment group to whom the RMA task is assigned.
RMA action	<p>Action to perform on the RMA. The asset can be repaired either on-site or off-site at the vendor's location. Choices are as follows:</p> <ul style="list-style-type: none"> ○ On-site ○ Off-site <p>Before you close the task, you must update this field.</p>

6. Click Close Task.

In the Asset form, the state of the faulty asset changes to In stock and the substate changes to Pending repair.

If the faulty asset is part of an asset bundle, then after closing the Assessment task, the state of the bundle changes to In stock and Pending repair. If there are multiple RMA requests from a bundle, the state of the bundle remains as In stock, and Pending repair until all the RMA requests are closed.

Result

Based on whether you selected **On-site** or **Off-site** from the **RMA action** field, either the Asset RMA On-site flow or the Asset RMA Off-site flow is triggered to generate the related RMA tasks to complete the RMA process.

Close an RMA request with off-site repair or replacement

Close an RMA request in which a faulty asset is repaired or replaced in the location of the vendor.

Before you begin

Role required: asset, inventory user, or itil

About this task

After you select **Off-site** from the **RMA action** field on the Assessment task form, a Shipment task is generated under the Asset RMA Tasks related list in the RMA request line. Close the Shipment task and the other RMA tasks one by one to complete the RMA process.

You can cancel an RMA request line that was triggered from an Asset RMA Off-site flow if you have the inventory user or itil role. To cancel an RMA request line, you must do it before the Shipment task is closed.

Procedure

1. In the RMA Request Line form, under the Asset RMA Tasks related list, open the Shipment task.
2. On the form, fill in the fields.

Shipment task form

Field	Description
State	State of the Shipment task.
Vendor RMA number	RMA reference number given by your asset vendor.
Assignment group	Group to which the RMA task is assigned.
Assigned to	User from the assignment group to whom the RMA task is assigned.
Shipping carrier	Name of the carrier who ships the asset to the location of the vendor for repair or replacement. This field is a reference to the Shipping carrier [sn_itam_shipping_carrier] table.
Ship date	Date on which the asset is shipped. To close the task, you have to update this field.

Field	Description
Tracking number	Shipment reference number given by the carrier vendor.

3. Select Close task.

In the Asset form, the state of the asset changes to In transit. In the RMA request line form, under the Asset RMA Tasks related list, a Vendor RMA decision task is generated.

4. In the RMA request line form, under the Asset RMA Tasks related list, open the Vendor RMA decision task.

5. On the form, fill in the fields.

Vendor RMA decision task form

Field	Description
State	State of the Vendor RMA decision task.
Assignment group	Group to which the RMA task is assigned.
Assigned to	User from the assignment group to whom the RMA task is assigned.
Vendor action	What the vendor wants to do with the faulty asset. Choices are as follows: <ul style="list-style-type: none"> ○ Repair ○ Replace To close the task, you have to update this field.

6. Based on what the vendor wants to do with the faulty asset, do one of the following:

- If the vendor wants to repair the faulty asset, select **Repair** from the **Vendor action** field.
- If the vendor wants to replace the faulty asset with a new asset, select **Replace** from the **Vendor action** field.

7. Select Close task.

In the RMA request line form, under the Asset RMA Tasks related list, a Receive task is generated.

8. In the RMA request line form, under the Asset RMA Tasks related list, open the Receive task.

9. On the form, fill in the fields.

Receive task form

Field	Description
State	State of the Receive task.
Assignment group	Group to which the RMA task is assigned.
Assigned to	User from the assignment group to whom the RMA task is assigned.
Asset received	Information on whether you received the repaired or new asset. To close the task, you have to update this field.

Field	Description
Replacement asset	The new asset that you received as a replacement for the faulty asset. This option appears only when Replace is selected from the Vendor action field in the Vendor RMA decision task.

10. If you received the repaired asset, do the following:

- a. From the Asset received list, select **Yes**.
- b. Select **Close task**.
In the Asset form, the state of the asset changes to In stock and the substate changes to Available.

11. If you received a new asset as a replacement for the faulty asset, do the following:

- a. From the Asset received list, select **Yes**.
- b. Add the new asset to the Asset [alm_asset] table of the Asset form and return back to the Receive task form.
- c. In the **Replacement asset** field, select the new asset.
- d. Select **Close task**.
In the Asset form, the state of the new asset is In stock and the substate is Available. The **Acquisition method** field under the Financial section in the Asset form shows RMA Replacement.

In the Asset form, the state of the old faulty asset changes to Retired and the substate changes to Vendor credit.

If a vendor replaces an asset that was part of a bundle with a different model, then a warning appears when you select the new asset. The new model can't be added to the bundle. If you close the Receive task, the faulty asset is removed from the bundle. The state of the bundle changes to Build, the state of the new asset changes to In stock, and the substate changes to Available.

Result

The RMA process is complete.

Close an RMA request with on-site repair

Close an RMA request in which the faulty assets are repaired on-site.

Before you begin

Role required: asset, inventory user, or itil

About this task

After you selected **On-site** from the **RMA action** field on the Assessment form, an On-site repair task is generated under the Asset RMA Tasks related list in the RMA request line.

If the asset is successfully repaired on-site, then close the On-site repair task. The RMA process will be complete for the asset that was faulty.

If the asset could not be repaired on-site, you may send the asset for an off-site repair. If you send the faulty asset for an off-site repair, the Asset RMA Off-site flow triggers the required RMA tasks to complete the RMA process.

If you have the inventory user or itil role, then you can cancel an RMA request line that was triggered from an Asset RMA On-site flow until the Repair confirmation task is closed.

Procedure

1. In the RMA request line form, under the Asset RMA Tasks related list, open the On-site repair task.
2. On the form, fill in the fields.

On-site repair task form

Field	Description
Vendor RMA number	RMA reference number given by your asset vendor.
Assignment group	Group to which the RMA task is assigned.
Assigned to	User from the assignment group to whom the RMA task is assigned.
Repair confirmation	Confirmation on whether the asset was successfully repaired on-site or not. To close the task, you have to update this field.
Action change	Option to send the faulty asset for off-site repair because it couldn't be repaired on-site. This option appears only if you selected No from the Repair confirmation field.

3. If the faulty asset was successfully repaired on-site, then do the following:
 - a. From the Repair confirmation list, select **Yes**.
 - b. Click **Close task**.
In the Asset form, the state of the asset changes to In stock and the substate changes to Available. The RMA process is complete.
4. If the faulty asset could not be repaired on-site and you want to send it for an off-site repair, then do the following:
 - a. From the Repair confirmation list, select **No**.
 - b. From the Action change list, select **Off-site**.
 - c. Click **Close task**.
The Asset RMA Off-site flow is triggered and Shipment task is generated. See [Close an RMA request with off-site repair or replacement](#) for details.

In the Asset form, the state of the asset changes to In stock and the substate changes to Pending repair.

Create an inventory stock order request

Create an inventory stock order request so that you can order new hardware in bulk for your stockrooms. After your request is approved, the Hardware Stock Order flow takes you through the process of requesting, sourcing, and receiving your order.

Before you begin

Role required: Inventory user

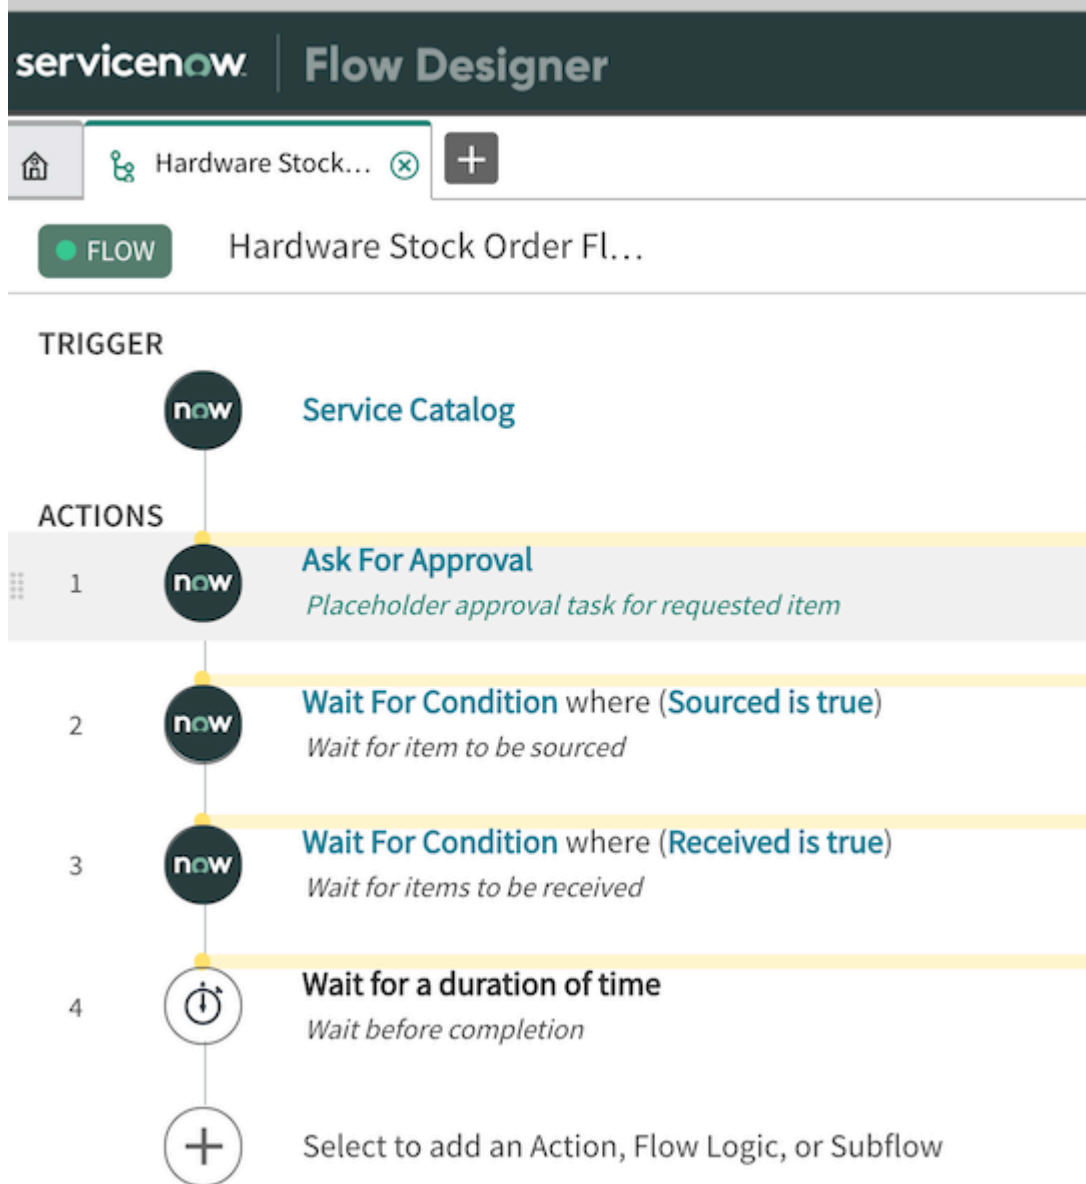

About this task

A stock order is a catalog request to replenish the stock in a stockroom.

You can manually create a hardware inventory stock order request. However, an inventory stock order request is automatically created from a stock rule trigger when the stock rule threshold breaches.

After your stock order request is approved, the Hardware Stock Order flow is triggered. The Workflow Studio application is used to create the Hardware Stock Order flow to take you through the entire process of requesting, sourcing, and receiving your order.

Hardware Stock Order Flow

Role required: inventory_admin

Procedure

1. Navigate to **All > Inventory > Submit Stock Order**.
2. On the form, fill in the fields.

Hardware Inventory Stock Order form

Field	Description
Model	New hardware that you want to order.
Quantity	Amount of the new hardware that you want to order.
Stockroom	Stockroom where you want to stock the new hardware.
Comments	Details that are specific to your order request.

3. Click **Order Now**.

The Order Status form displays all the order details. An existing service catalog request workflow takes care of all the required approvals for the request. You can now source your request.

4. Click the request number to open the request.

The price of the request item is the price of the model. The price of the request is calculated as quantity of the request item multiplied by the price of the request item. The price of the request item that's shown in the Requested Items related list is the price of the model calculated by the quantity.

Price of the Request Item is the Price of the Model and Price of the Request is calculated as Quantity of Request Item * Price of the Request Item.

A catalog task is created after the request is approved.

5. Click **Catalog Tasks** and open the catalog task.

6. Click **Source Request**.

The Source Request form layout lists the model name, the quantity of items to be sourced, and the total quantity of the hardware in stock.

7. Click **Add Transfer Order** or **Add Purchase Order** to source the request via a transfer order or a purchase order.

The quantity mentioned in **Total in Stock** does not include the stock that's available in the destination stockroom.

If the requested item is not available in any stockroom, then **Add Transfer Order** is disabled. If there are no available vendors for the requested item, then **Add Purchase Order** is disabled.

To enable **Add Purchase Order**, do one of the following:

- add a designated vendor by navigating to vendor items.
- add a catalog item for the requested model with vendor details.

Create a disposal order

Create a disposal order for hardware or consumable assets. You can create a disposal order for an asset reaching its end of life cycle or an asset that is no longer functional.

Before you begin

Note:

Install the Hardware Asset Management application from the ServiceNow Store.

Role required: asset

About this task

To add the consumables to a disposal order, select **Mark for disposal**. This will set the Planned for disposal field to **true**. For more details, see [Dispose of consumable assets](#).

Use the Workflow Studio application to create the Hardware Asset Disposal flow to take you through the entire hardware disposal order process.

The hardware disposal order goes through various stages before it's completed. Each stage is associated with a hardware disposal task. To move through the various stages, close each task until you reach the last stage. After you complete the last task, the hardware disposal order is complete. For more information about the hardware disposal order stages, see [Hardware disposal order stages](#).

You can cancel a disposal order until it reaches the transit stage in the workflow. After your disposal order is in the confirmation stage, you can't cancel that order. You can cancel a task that is in a draft, scheduling, or transit stage by selecting **Closed Incomplete** from the **State** list and closing the task.

Starting with Hardware Asset Management 15.0.0 version, the asset resale option is integrated at the final stage of the disposal workflow that is the Documentation stage. When the Disposal order task is in the Documentation stage, you can choose either to dispose of or to resell the assets. For more information about asset resale, see [Resale hardware assets](#).

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory view**.

2. On the form, fill in the fields.

Create New Hardware Disposal Order form

Field	Description
Number	Reference number of the disposal order.
Stockroom	Stockroom where the asset is disposed from.
Vendor	Vendor that you want to dispose the asset to.
Location	<p>Location of the stockroom where the asset gets disposed from. The location automatically appears after you select a stockroom.</p> <p>If you change the location and no location is associated with the selected stockroom, the stockroom field becomes empty. In this scenario, you can select a stockroom from the stockroom list for a specified location.</p>
Assigned to	Person responsible for disposing of the asset.

3. Select **Save**.

The disposal order is created and the hardware asset disposal workflow is triggered.

4. In the Pickup details section of the Hardware Disposal Order Pickup Details form, fill in the fields.

Pickup Details section

Field	Description
Scheduled date	Date when you want to dispose of the asset.
Pickup contact name	Name of the person from the vendor who will pick up the asset to dispose of.
Pickup details	Details of the pickup.
Additional info	Any message if you want to add.

5. Select the **Planned Assets** tab.

6. Select **Add**.

7. From the list of available assets, select the assets that you want to dispose of.

The assets that you selected are shown in the Planned Assets tab. Also, the Verify Asset task is created as a hardware disposal task.

8. Select the Verify Asset task.

9. Select the asset that you want to verify and select **Verify**.

You can't select an excluded asset. For more information, see [Hardware Asset Management license exclusion](#).

The state of the asset changes to retired and the substate changes to pending disposal. The Scheduled Pickup task is created as a hardware disposal task.

10. Update the Schedule Details section with the details of the Vendor, Vendor order ID, Scheduled date, and Pickup contact name and select **Close task**.

The Asset Departure task is created as a hardware disposal task.

11. In the Schedule Details section of the Asset Departure task, specify the details in the Shipped to, Shipping carrier, and Tracking number fields.

12. Select **Save**.

13. In the Asset Departure task, select the **Planned Assets** tab.

14. Select the assets that you want to depart and select **Depart**.

Note:

Planned assets that aren't departed are canceled automatically.

The state of the asset changes to in transit and the substate changes to pending disposal. The Vendor confirmation task is created as a hardware disposal task.

15. Select the Vendor confirmation task and then select **Close task**.

The stage changes to documentation. The Disposal Documentation task is created as a hardware disposal task.

16. Select the Disposal Documentation task and do the following:

a. Select the Attach File icon to attach disposal documentation for the planned assets.

b. In the **Certificate of disposal** list, select **Yes**.

You must attach disposal documentation to the order and set the field to **Yes** to close the Disposal order to Completed.

17. Select **Close Task**.

- All the hardware disposal tasks are complete and the hardware disposal order stage changes to completed.
- The **Disposal date** field in the **Disposal** section of the asset form is populated.
- For any maintenance contracts that are associated with the disposed asset, the **Date removed** field in the **Contracts** tab is populated and the disposed asset is no longer part of the contract.
- Any entitlements that are associated with the disposed asset are also removed.

Resale hardware assets

Enhance asset management by reselling eligible retired hardware assets instead of disposing of them.

Before you begin

Role required: asset

About this task

Important:

The asset resale feature is available with Hardware Asset Management version 15.0.0 onwards.

Asset resale is an extension of the asset disposal workflow that enables you to resell eligible retired assets instead of disposing of them. This approach helps reduce waste and save costs, because you can receive credit for assets that you successfully resell. When the Disposal order is in the Documentation stage, you can choose between disposing of or reselling the assets.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **Disposal orders** tab.
3. Select the **Number** link to open the disposal order record that is in the Documentation stage. The Disposal order form is displayed.
4. Select the **Hardware Disposal Tasks** tab.
5. Select the **Number** link to open the Disposal Documentation task. The Disposal Documentation form is displayed.
6. Select the **Planned Assets** tab. The list of assets planned for disposal or resell is displayed.
7. Select the planned asset records that you want to resell. The **Sell**, **Dispose**, and **Cancel** buttons are activated.
8. Select the **Sell** button. The Add resale value window is displayed.
9. In the Add resale value window, do the following:
 - a. Add the resale value for each asset in the Resold value column.
 - b. From the Currency drop-down, select the currency value.
10. Confirm or cancel the resell.
 - To mark your confirmation and proceed with asset resell, select **Confirm**.
 - To close the Add resale value window, select **Cancel**.

On the Planned Assets list, the State, Substate and Resold value column value is updated for the resold assets.

11. Select the **Details** tab and do the following:

- a. Select the Attach File icon to attach disposal documentation for the planned assets.
- b. In the Certificate of disposal list, select **Yes**.

Note:

You must attach disposal documentation and set the **Certificate of disposal** field to **Yes** to mark the Disposal Documentation task as Completed.

The Disposal Documentation task is marked as **Closed Complete**.

Result

When an asset is sold, on the Asset form, the **State** field value is updated to **Retired**, and the **Substate** field value is updated to **Sold**.

What to do next

When an asset is sold, an expense line is generated for each resold asset. The Amount column value shows the resold value and it's a negative value. To view the expense line created for the resold asset, do the following:

1. On the Disposal Documentation task form, select the **Planned Assets** tab.
2. Select the **Asset display name** link.
3. Select the **Expense Lines** tab.

Related topics

[Create a disposal order](#)

[Perform bulk update of resale value for the assets](#)

Perform bulk update of resale value for the assets

Update the resale values for assets planned for disposal, and indicate that you want to resell them instead of disposing of them, to streamline the asset resale process.

Before you begin

Role required: admin

About this task

Important:

The asset resale feature is available with Hardware Asset Management version 15.0.0 onwards.

Download the list of the planned assets from the Disposal Documentation task and bulk update whether you want to resell or dispose of the assets. For the assets planned for resale, provide the resale value and save it. Import the updated sheet into the Hardware Asset Workspace. After successful import of the resale sheet, on the Disposal Documentation task, in **Planned Asset** tab, the Resold value column data is auto populated. You can proceed with the asset resale for these planned assets.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **Disposal orders** tab.
3. Select the Number link to open the disposal order record that is in the Documentation stage.
The Disposal order form is displayed.

4. Select the **Hardware Disposal Tasks** tab.
5. Select the **Number** link to open the Disposal Documentation task.
The Disposal Documentation form is displayed.
6. Select the **Planned Assets** tab.
7. Select the **Download disposal assets** button.
An Excel sheet is downloaded listing the assets planned for disposal.
8. Open the downloaded Excel sheet.
9. Update the column values in the downloaded planned assets for disposal Excel sheet and save it.
 - a. In the Substate column, enter **Sold** to resell the asset or **Disposed** to dispose of the asset.

Note:

If an invalid value is entered in the Substate column other than **Sold** or **Disposed**, a validation error is triggered when the updated file is imported to the *Hardware Asset Workspace*.

- b. In the Resold value column, enter the amount for reselling the asset.

Note:

- When the Substate column value **Sold**, the Resold value column can't be empty, and the amount must be a positive value. If the resold amount is negative or the Resold value column is empty, a validation error occurs when the updated file is imported into the *Hardware Asset Workspace*.
- When the Substate column value is **Disposed**, the Resold value column must be empty.

10. Disposal Documentation form, select **Import**.
11. In the Create New Imported Vendor Data form, do the following:
 - Enter a name for the import vendor data record in the **Name** field,
 - Select the **Attach File** link to attach the updated planned assets for disposal Excel sheet.
 - Select the **Save** button.
 The Vendor data import form is displayed. On the **Details** tab, review the import information. Select the **Vendor Data Import Rows** tab to check if any validations were triggered during the import.

Note:

The Comment column displays the validations triggered during the import of the updated resell asset record sheet. Make the required changes in the planned assets for disposal Excel sheet, and repeat step 10 to import the updated sheet.

12. Select the **Disposal Documentation** tab to open the Disposal Documentation task.
13. Select the **Planned Assets** tab.
The Resold value and Substate column value show the updated value.

What to do next

On the **Planned Asset** tab, select the assets and proceed with resale. For more information about asset resale, see [Resale hardware assets](#)

Use a hardware asset request flow

Use a hardware asset request flow for requesting, sourcing, and deploying hardware catalog items from the Service Catalog application.

Before you begin

Role required:

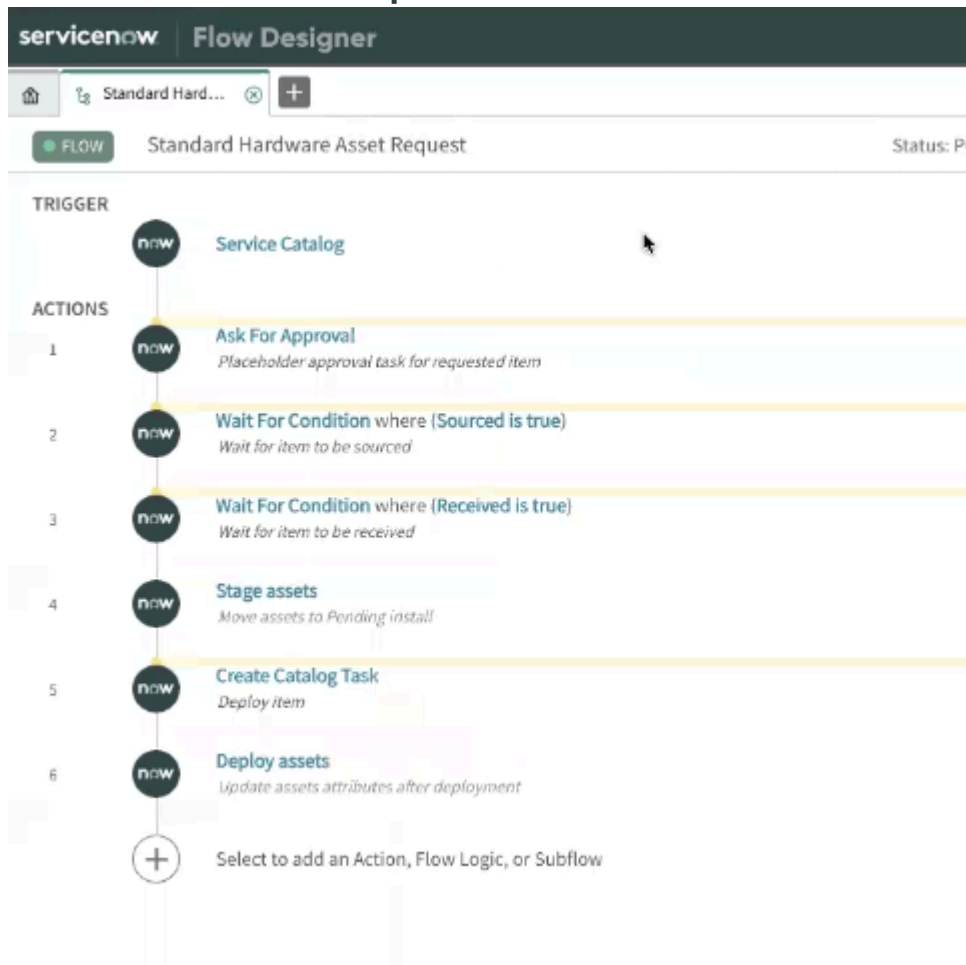

- catalog_admin
- procurement_admin

About this task

Create a request for a hardware catalog item from the Service Catalog application. Associate the catalog item with the Standard Hardware Asset Request flow to trigger the flow.

The Workflow Studio application is used to create the Standard Hardware Asset Request flow to take you through the process of sourcing, procuring, and deploying your hardware catalog items. As the flow takes you through the various stages, the asset details are automatically updated. You can open the Standard Hardware Asset Request flow to view the status of the stages in the flow.

Standard Hardware Asset Request flow

Procedure

1. Log in with credentials for the role of catalog_admin and navigate to **Service Catalog > Maintain Items**.
 2. Open the hardware catalog item and in the **Flow** field, select **Standard Hardware Asset Request**.
If the **Flow** field isn't visible, add it to the form layout by right-clicking the menu icon and navigating to **Configure > Form layout**.
 3. Select **Save**.
The Standard Hardware Asset Request flow is now associated with the hardware catalog item.
 4. Navigate to **Service Catalog** and select **Hardware**.
 5. Select your catalog item from the list.
 6. In the **Location** field, specify the location where the assets should be deployed.
By default, this field is set to the location of the logged-in user. However, you can select a location from the list of available locations.
- Note:**
This field is available only for Hardware catalog items that are published from Hardware models after upgrading to Hardware Asset Management 8.0.0.
7. In the **Quantity** field, specify the quantity of the assets and select **Order Now**.
 8. Log in with credentials for the role of procurement_admin and open the new request.
 9. In the Requested Items related list, select the request item.
 10. In the Requested Item form layout, select the **Flow Context** related link to view the current stage of the Standard Hardware Asset Request flow.
 11. Select the **Catalog Tasks** related list to view the sourcing task for the request.
 12. Open the catalog task and select **Source Request**.
 13. In the Source Request form layout, select **Add Transfer Order** or **Add Purchase Order** to source the request via a transfer order or a purchase order.
After you procure the catalog item, the Asset pick task is created for the Requested item only if the asset is sourced from the stockroom which has the Asset Pick task enabled. Otherwise the Deployment task is created for the Requested item without the Asset pick task. For details, see [Enable the Asset pick task for your stockroom in the Hardware Asset Workspace](#).
 14. Select the Requested items related list and select the requested item.
 15. Select the **Catalog Tasks** related list.
 - If the Pick task is enabled for the source stockroom, complete the Asset pick task first and then complete the Deploy task.
 - If the Pick task isn't enabled, complete the Deploy task.
 16. Complete the Asset pick task using the Mobile Agent application.
For details on completing this step, see [Manage hardware asset pick tasks using the Mobile Agent application](#).
The Deployment task is created for the requested item.
 17. Close the Deployment task.
In the Standard Hardware Asset Request flow, the action that is associated with deploying the assets is complete. The **State**, **Assigned**, **Installed**, **Location**, and **Assigned to** fields of asset are updated. The CI that is associated with the asset is also updated.

Audit hardware asset inventory

Perform scheduled or blind audits of stockrooms and other locations, such as offices or datacenters, to confirm accurate inventory information.

The asset audit process involves verifying and reconciling assets between a physical location or stockroom and the ServiceNow instance. First, assets are identified by scanning their asset tag, serial number, or model barcode. Next, the records in the ServiceNow instance are checked to determine whether they match the scanned assets and the audit result is generated. You can view precise inventory information through detailed lists and reports.

You can create an audit record in the Hardware Asset Management application or the ServiceNow Agent app.

- Use the Hardware Asset Management application to create a scheduled audit record. For more information about creating a scheduled audit record, see [Create an audit record in the Hardware Asset Management application](#).
- Use the ServiceNow Agent app to create a blind or unscheduled audit record. For more information about creating a blind or unscheduled audit record, see [Create an audit record using the ServiceNow Agent app](#).

When an inventory audit record is created, it's saved in the Asset Audits table, depending on the configuration for `sn_hamp_migrate_hamaudit` system property.

- When the `sn_hamp_migrate_hamaudit` system property is set to **true**, the audit record is saved in the Asset Audits [sn_itam_common_asset_audit] table.
- When the `sn_hamp_migrate_hamaudit` system property is set to **false**, the audit record is saved in the Asset Audits [sn_hamp_asset_audit] table.

Note:

Starting with Hardware Asset Management version 15.0.0, the audit inventory has been enhanced to store audit records in the common Asset Audits [sn_itam_common_asset_audit] table. Before enabling audit enhancements and switching to the common Asset Audits table, you must complete all audit records that are in either **In progress** or **New** status.

Using the ServiceNow Agent app, you can scan the assets in the inventory and complete the audit process. The Hardware Asset Management application reconciles scanned assets with ServiceNow records to generate audit results. For more information about scanning assets, see [Complete a single scan inventory audit using the ServiceNow Agent app](#) and [Complete multi scan inventory audit using the ServiceNow Agent app](#).

Create an audit record in the Hardware Asset Management application

Create an audit record to audit your inventory to determine the accuracy of your hardware and consumable assets and to optimize the inventory.

Before you begin

Role required: asset

The asset or inventory_user role can only access the Asset Audits [sn_hamp_asset_audit] reports.

Note:

- When the *sn_hamp_migrate_hamaudit* system property is set to **true**, you're required to have the asset role, along with either the *sn_itam_common.asset_audit_admin* or *sn_itam_common.asset_audit_user* role.
- When the *sn_hamp_migrate_hamaudit* system property is set to **false**, only the asset role is required.

Procedure

1. Create an audit.
2. On the Create New Asset Audits form, fill in the fields.

For a description of the field values, see [Asset audit fields](#).

Note:

The audit result fields, such as **Expected**, and **New**, can't be edited. When the asset is scanned in the inventory using the ServiceNow Agent app, values are automatically updated in these fields. For a detailed description of the audit result field values, see [Audit results](#).

3. Select **Save**.

Result

- The asset audit inventory record is created and appears with the **Expected Assets** and **Scanned Assets** tabs.
- The audit record is saved in the Asset Audits [*sn_itam_common_asset_audit*] table when the *sn_hamp_migrate_hamaudit* system property is set to **true**.
- The audit record is saved in the Asset Audits [*sn_hamp_asset_audit*] table when the *sn_hamp_migrate_hamaudit* system property is set to **false**.

What to do next

Scan the assets in the inventory using the ServiceNow Agent app.

Related topics

- [Complete a single scan inventory audit using the ServiceNow Agent app](#)
- [Complete multi scan inventory audit using the ServiceNow Agent app](#)
- [View audit results](#)

Create an audit record using the ServiceNow Agent app

Create an inventory audit record using the ServiceNow Agent app.

Before you begin

Role required: asset, and *sn_itam_common.asset_audit_admin*, or *sn_itam_common.asset_audit_user*

Note:

- When the *sn_hamp_migrate_hamaudit* system property is set to **true**, you're required to have the asset role, along with either the *sn_itam_common.asset_audit_admin* or *sn_itam_common.asset_audit_user* role.
- When the *sn_hamp_migrate_hamaudit* system property is set to **false**, only the asset role is required.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. Tap **Asset**.
3. Select the audit that you want to perform.
4. On the form, fill in the fields.

New stockroom audit form or New location audit form

Field	Description
Stockroom Note: This field appears if you're creating a stockroom audit.	Stockroom where you want to perform the audit.
Location Note: This field appears if you're creating a location audit.	Location where you want to perform the audit.
Aisle and space Note: This field appears if you're creating a stockroom audit.	Aisle and space for which you want to perform the audit.
Include child locations Note: This field appears if you're creating a location audit.	Option to include child locations in the audit.
Model category	Model category for which you want to perform the audit.
Include consumables Note: This field appears if you're creating a stockroom audit.	Option to include consumable assets in the inventory audit. The available options are: <ul style="list-style-type: none"> ○ Yes ○ No The default populated value for this field is derived using the

Field	Description
	<p><i>sn_itam_common.set_default_include_consumables</i> system property.</p> <ul style="list-style-type: none"> ○ When this system property value is set to yes, the default value for the Include consumables field is set to Yes. ○ When this system property value is set to no, the default value for the Include consumables field is set to No.
Scan method	<p>Scan method to be used to scan the assets. The available options are:</p> <ul style="list-style-type: none"> ○ Single scan ○ Multi scan <ul style="list-style-type: none"> ○ When the Include consumables field is set to Yes, the Scan method field value is automatically set to Single Scan and can't be edited. ○ When the Include consumables field is set to No, the Scan method field becomes editable, enabling you to select the scan type. <p>Depending on the selected scan method for the audit record, you can scan the assets in the inventory using the ServiceNow Agent app.</p> <ul style="list-style-type: none"> ○ To complete asset scanning for the single scan audit record, see Complete a single scan inventory audit using the ServiceNow Agent app. ○ To complete asset scanning for multi scan audit records, see Complete multi scan inventory audit using the ServiceNow Agent app.

5. Tap Submit.

Result

- An audit record is created and listed on the **Open** tab.
- The audit result fields are displayed on the audit **Details** tab.

For a detailed description of the audit result field values, see [Audit results](#).

What to do next

Scan the assets in the inventory using the ServiceNow Agent app.

Complete a single scan inventory audit using the ServiceNow Agent app

Scan your inventory assets by using the ServiceNow Agent app for single scan audit records.

Before you begin

The `sn_hamp_migrate_hamaudit` system property is set to **true** to enable the audit enhancements introduced in the Hardware Asset Management version 15.0.0.

Role required: `asset`, `sn_itam_common.asset_audit_admin` or `sn_itam_common.asset_audit_user`

About this task

Important:

This feature is available with Hardware Asset Management version 15.0.0 onwards.

Procedure

1. From your mobile device, launch the ServiceNow Agent application.
2. Tap **Asset**.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

Note:

This button appears only for the location audit.

5. Select **Scan**.
The Asset scan page is displayed.
6. In the **Asset tag/Serial number/Model barcode** field, enter or scan the asset tag, serial number, or model barcode of the asset.
7. Tap **Next**.
8. **Optional:** Select an **Aisle and space**.
9. Select **Submit**.
The List of assets and models screen is displayed, showing the scanned asset record.

Note:

When the scanned asset record doesn't exist in your ServiceNow instance, the List of assets and models screen is empty. You can create an asset record for the new asset in the inventory. For more information, see [Create an asset from the inventory audit screen](#).

10. On the List of assets and models screen, slide the scanned asset record to the left side.
The Audit option is displayed on the screen.

← List of assets and models  

available	1
Samsung Galaxy A11 - black - 4G - 32 GB	
Category Mobile Device	
Location Primary	

11. Tap Audit.

The **Details** tab screen is displayed. The audit result field values are automatically updated when you scan the stockroom assets.

12. After you're finished scanning assets, mark the audit as complete.

a. Tap the three dots icon in the navigation bar.

b. Tap Complete.

A confirmation message appears on the audits page.

 Note:

You can start a new scan as many times as you need while the audit is in progress. After you mark the audit as **Complete**, you can't scan any more assets.

Result

The audit result field values are updated on the **Details** tab screen. For a detailed field description, see [Audit results](#).

What to do next

- Review the inventory audit result.
- Tap the audit result field values to view the detailed list of the assets.

Related topics

[View audit results](#)

[Create an asset from the inventory audit screen](#)

Complete multi scan inventory audit using the ServiceNow Agent app

Scan your inventory assets by using the ServiceNow Agent app for the multi scan audit records.

Before you begin

Role required: asset, sn_itam_common.asset_audit_admin, or sn_itam_common.asset_audit_user

 Note:

- When the *sn_hamp_migrate_hamaudit* system property is set to **true**, you're required to have the asset role, along with either the sn_itam_common.asset_audit_admin or sn_itam_common.asset_audit_user role.
- When the *sn_hamp_migrate_hamaudit* system property is set to **false**, only the asset role is required.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. Tap **Asset**.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

 Note:

This button appears only for the location audit.

5. Select Scan.

The Asset scan screen is displayed.

6. Scan or enter the asset tag in the **Asset Tag** field.

You can scan or enter the asset tag for one or more assets.

7. Optional: Select the **Review** tab to review the list of scanned assets.

On the review screen, you can delete assets if needed. However, Hardware Asset Management automatically removes duplicates for assets that you accidentally scan twice.

8. Tap **Next**.

9. Optional: Select an Aisle and space.

10. Select **Submit**.

The Stockroom audit **Details** tab screen is displayed.

Note:

If the scanned asset record doesn't exist in your ServiceNow instance, a new asset record is created using the provided Asset tag. The new asset record is created with an unknown product model and an unknown model category value. Additionally, an asset remediation task is also created to notify you that an asset record has been created with an unknown model category and an unknown product model. Open the asset remediation task from the Hardware Asset Workspace and update the **Model category** and **Model** fields value for the asset. For more information, see [Close an asset remediation task](#).

11. After you're finished scanning assets, mark the audit as complete.

a. Tap the three dots icon in the navigation bar.

b. Tap **Complete**.

A confirmation message appears on the audits page.

Note:

You can start a new scan as many times as you need while the audit is in progress. After you mark the audit as **Complete**, you can't scan any more assets.

[Close an asset remediation task](#)

Close an asset remediation task

View the open asset remediation from the **Inventory** view and close the task after updating the **Model category** and **Model** fields value for the asset.

Before you begin

Role required: admin

About this task

Important:

This feature is available with Hardware Asset Management version 15.0.0 onwards.

A new asset record is created when all of the following are true:

- The audit record's **Scan method** is set to **Multi scan**.
- During asset scanning, a new asset is detected that doesn't exist in the ServiceNow[®] instance,

For this new asset record, the application can't automatically determine the **Model category** and **Model** field values. These fields are initially set to **Unknown Model Category** and **Unknown**

Model. An asset remediation task is then generated to notify you that an asset record has been created with an unknown model category and an unknown product model. In the Hardware Asset Workspace, you can access the open remediation task, update the asset record as required, and then close the remediation task.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory view.**
2. Select the **Overview** tab.
3. In the Important Actions section, in the Open asset remediation tasks tile, select **View records.**
The Open asset remediation tasks list is displayed.
4. Select the task Number link.
The Asset remediation form is displayed.
5. In the **Asset** field, select the Open Record icon.
The asset form is displayed. The default value for the **Model category** and **Model** field is displayed in read-only mode.
6. Select the **Update** button.
7. On the form, fill in the details.

To what type of asset would you like to change

Field	Description
Asset type	Type of the asset.
Model category	Model category that the asset can be associated with.
Model	Model that the asset can be associated with.

8. Select **Update.**
The updated Model category and Model value are displayed in the respective fields.
9. Open the **Details** tab.
The Asset remediation task form is displayed.
10. Select the **Close Task** button.
The closed asset remediation task isn't listed on the Open asset remediation tasks list.

Related topics

[Complete multi scan inventory audit using the ServiceNow Agent app](#)

Create an asset from the inventory audit screen

Create an asset record for the scanned asset that doesn't exist in your ServiceNow instance and that is detected when auditing inventory.

Before you begin

Role required: asset, and sn_itam_common.asset_audit_admin, or sn_itam_common.asset_audit_user

About this task

i Important: This feature is available with Hardware Asset Management version 15.0.0 onwards.

When scanning an asset in the inventory, if a new asset is detected that doesn't exist in your ServiceNow® instance, you can create a record for it. You can add the asset directly from the audit screen in the ServiceNow Agent app.

Note:

This procedure applies when you scan assets for a single scan audit record.

Procedure

1. From your mobile device, launch the ServiceNow Agent application.
2. Tap **Asset**.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

Note:

This button appears only for the location audit.

5. Select **Scan**.
The Asset scan page is displayed.
6. In the **Asset tag/Serial number/Model barcode** field, enter or scan the asset tag, serial number, or model barcode of the asset.
7. Tap **Next**.
8. **Optional:** Select an **Aisle and space**.
9. Select **Submit**.
The List of assets and models screen is displayed.

10. Tap the three dots icon.
11. Tap **Create new asset**.

The Create asset from audit screen is displayed.

12. On the form, fill in the following fields.

Create asset from audit screen

Model	The product model of the asset.
Stockroom	The stockroom where the asset is available.
State	The State field value is automatically set to In stock . Change this value as needed.
Substate	The Substate field value is automatically set to Available . Change this value as needed.
Asset Tag	Alphanumeric information assigned by your organization to help track the asset.
Serial Number	Serial number of this asset.
MAC address	MAC address of the mobile device

i Note:

Depending on the IRE rule configured for the selected **Model** field value, either **Asset Tag**, **Serial Number**, or **MAC address** field value is required to save the audit record.

For more details on these field descriptions, see [Asset record fields](#).

13. Tap **Submit**.

A confirmation message is displayed on the screen, and the asset record is created.

Result

In the audit results, the **New** field value is incremented for each new asset scanned in the inventory.

View audit results

View the audit results after you audit your inventory. The Audit Results section is activated and shows the details of the audit result.

Before you begin

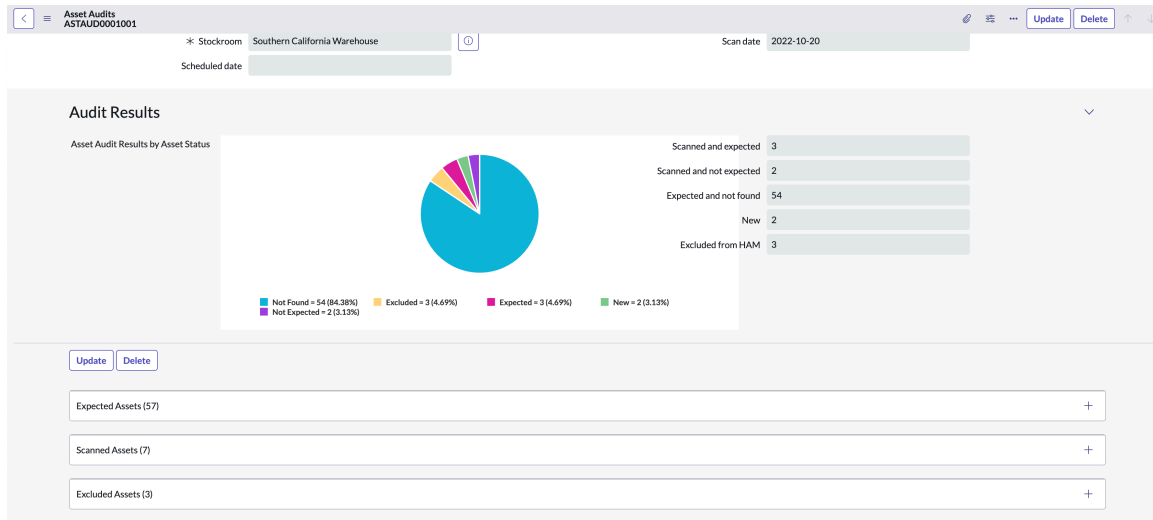

Role required: admin

About this task

The audit results are generated by matching the assets scanned in the stockroom or physical location with the asset records available in the ServiceNow instance.

Procedure

1. Open an asset audit record.
2. Select the stockroom or location audit number.
The Asset audit results are displayed. For more information about audit result fields, see [Audit results](#).

Note: In the Hardware Asset Workspace, on the Asset audits form under the **Details** tab, the audit result-related field values are populated. In the ServiceNow Agent app, you can find audit results on the Asset Audits screen under the **Details** tab.

Related topics

[Audit results](#)

View deprecated audit records

View the deprecated asset audit records that are created before switching to the common Asset Audits [sn_itam_common_asset_audit] table and stored in the Asset Audits [sn_hamp_asset_audit] table.

Before you begin

Role required: asset

Set the *migrate_hamaudit* system property to **true**.

About this task

Important: This feature is available with Hardware Asset Management version 15.0.0 onwards.

You can view deprecated asset audit records in the Audits [Deprecated] list. These records are read only and you can't perform any actions on them or create audit records from this view. Before enabling audit enhancements and migrating to the common audit table, you must complete and close all in-progress and new audit records. Once the *migrate_hamaudit* system property is set to **true**, you can't act on in-progress and new audit records, because they're considered deprecated audits.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. Select **Audits [Deprecated]**.
3. Select an audit number link.

What to do next

View the details of scanned assets within the asset audit form by selecting the relevant tabs.

Request a Hardware Asset Refresh

Use the Hardware Refresh request flow to track the aged hardware assets that are nearing the end of their life cycle. Replace them with new hardware assets.

Before you begin

Role required: Inventory_user

About this task

When hardware assets get old, their maintenance costs and risks of failure increase, while their performance decreases. You can choose to replace all the old hardware assets with the same or different models of new hardware assets. After your Hardware Asset Refresh request is approved, the Hardware Asset Refresh flow takes you through sourcing and it triggers the Hardware Asset Refresh Line flow. The Hardware Asset Refresh Line flow uses Refresh Line tasks to take you through the steps of preparing the new asset, scheduling it for delivery, deploying it, and reclaiming the aged asset.

The Flow Designer application is used to create the Hardware Asset Refresh flow and the Hardware Asset Refresh Line flow. While customizing the Hardware Asset Refresh module, don't remove or customize the **Update Sourcing set Variable** step in the Hardware Asset Refresh flow.

Note:

You can check if a hardware model is eligible for refresh by using the Eligible for refresh field of the Hardware [alm_hardware] table. The SAM - Calculate Asset Refresh Eligibility scheduled job runs weekly and invokes the *Process* method in the *SAMRefreshEligibilityCalculator* Script Include. The Script Include fetches the hardware product model records for the assets for which the useful_life field (in months) is specified. The date on which the asset record was created is compared with the useful_life field to determine if the asset is in the useful life period. The Eligible for refresh flag is set to true for assets that aren't in the useful life period.

Hardware Asset Refresh Flow

While customizing a Hardware Asset Refresh catalog item on the Catalog Item form, don't remove or change the following variables.

Hardware Asset Refresh Catalog Item form

Tabs in the Catalog Item	Variables
Variables	Type of refresh
	Process
Variable Sets	Hardware Asset Management process set
	Hardware Asset Management sourcing set

Note:

There are readily available decision tables that you can use to customize the Hardware Asset Refresh Line Flow. For more details, see [Hardware Asset Management flow customization](#).

Procedure

1. Navigate to All > Service Catalog > Asset Lifecycle.

The **Asset Lifecycle** category isn't on the Service Catalog page by default. To add this category, select the add content icon (+) beside the search catalog bar and then select **Asset Lifecycle**.

2. Open Hardware Asset Refresh Order.

3. If you want to replace all the aged hardware assets with the same model of new hardware assets, do the following:

a. From the **Type of refresh list** field, select **Single model**.

b. On the form, fill in the fields.

Hardware Asset Refresh form

Field	Description
Replacement model	New hardware asset model that you want to replace the aged hardware assets with.
Location	Location where you want to deploy the new asset. By default, this field is set to the location of the logged-in user. However, you can select a location from the list of available locations.
Assets	Aged Hardware assets that you want to replace. You can use a filter to search for hardware assets that you want to replace.

4. If you want to replace the aged hardware assets with different models of new hardware assets, do the following:

a. From the **Type of refresh** field, select **Multi model**.

b. Select **Add**.

c. For each new hardware asset that you want to use, add a row to enter the hardware model.

Note:

You can create 50 rows.

You can't create multiple rows for the same aged hardware asset that you want to replace.

5. Select Order Now.

You can't view an excluded asset. For more information, see [Hardware Asset Management license exclusion](#).

Result

The aged assets are set to get refreshed. In the Hardware table under the Disposal related list of the aged assets, the **Refresh request line** field is populated.

An Order status page appears and it displays the details of the order. A request is created to source the new hardware assets and to replace the aged hardware assets. The Request form shows the total price of all the new hardware asset models.

Use Hardware Asset Refresh Lines tasks to replace the aged assets

Replace aged hardware assets by sourcing new hardware assets.

Before you begin

Role required:

- `proc_user` for sourcing.
- `asset` and `itil` for Refresh Line tasks.

About this task

When refreshing hardware assets, you don't have to update the asset records manually. When closing the hardware asset refresh lines, the asset records and the assets are automatically updated. Close each task to go to the next task, complete the refresh, and reclaim the aged assets.

After sourcing the new assets, the asset refresh is completed through the following stages:

- **Prepare asset task:** Prepare the new asset before you hand it over to the requester. For example, install any software that's required.
- **Schedule refresh task:** Schedule a date to hand over the asset to the requester.
- **Deploy new asset:** Hand over the asset to the requester or install the asset at the requester's location if necessary.
- **Reclaim aged asset:** Collect the aged asset.

Procedure

1. Select the hardware asset refresh request.

After your hardware asset refresh request is approved, the following events happen:

- The Source Request flow is triggered to source new assets.
- In the **Catalog Tasks** tab, a catalog task is created for the procurement of the new hardware asset.

2. Source items in the request.

You can source items in the request by consuming the local stock, through purchase orders, or through transfer orders.

For more details on sourcing items, see [Sourcing items in a service catalog request](#).

After the new asset is received, the following events happens:

- The Hardware Asset Refresh Line flow is triggered for the asset.
- The Hardware Asset Refresh Line tab is displayed next to the Asset Tasks tab on the requested item form.
- The Asset pick task is created under the Refresh Line Tasks only if the requested item is consumed from the local stockroom for which the Asset pick task is enabled. Otherwise the Prepare asset task is created directly without the Pick task. For details, see [Enable the Asset pick task for your stockroom in the Hardware Asset Workspace](#).

3. Select the **Hardware Asset Refresh Line** tab.

4. Select the hardware asset refresh line.

5. Select the **Refresh line tasks** tab.

6. Complete the Asset pick task by using the Mobile Agent application.
For details on completing this step, see [Locate and pick the hardware assets in your stockroom using the Mobile Agent application](#).
7. Prepare the asset.
 - a. Select the **Prepare asset** task.
 - b. In the **Asset** field, select the hardware asset that you want to replace.
 - c. Select **Save**.
 - d. Select **Close Task**.
 - A Schedule refresh task is created under the Refresh Line Tasks.
 - The state of the Replacement asset changes to In stock.
 - The substate changes to Reserved.
 - The **Reserved for** field is populated with the requester details.
8. Complete the Schedule refresh task.
 - a. Select the **Schedule refresh** task.
 - b. In the **Scheduled deployment date** field, select the date on which the new asset will be deployed.
 - c. Select **Close Task**.
 - The Deploy new asset task is created under the Refresh Line Tasks.
 - The state of the Replacement asset changes to In stock and the substate changes to Pending install.
9. Complete the Deploy new asset task.
 - a. Select the **Deploy new asset** task.
 - b. Confirm if you have reclaimed the old asset in the **Is reclaimed** list.
 - If you've collected the aged asset, select **Yes**.
 - If you didn't collect the aged asset, select **No**.

The Location field shows the location where the new asset should be deployed.
 - c. Select **Close task**.
 - Note:**
If you select **Yes** from the Is reclaimed list, then the Reclaim aged asset task is also closed by default.
 - Reclaim aged asset task is created under the Refresh Line Tasks.
 - The state of the replacement asset changes to In use.
 - The allocations are transferred from the aged asset to the replacement asset.
10. Complete reclaiming the aged assets.
 - a. Select the **Reclaim aged asset** task.
 - b. Confirm if you have reclaimed the old asset in the **Is reclaimed** list.

- If you've collected the aged asset, select **Yes**.
- If you didn't collect the aged asset, select **No**.

c. Select **Close task.**

i Note:

You can cancel the hardware asset Refresh Line either by selecting **Cancel** or by changing the **State** field to **Closed Incomplete** in the Refresh Line task.

Result

After the aged hardware asset is reclaimed, the following changes happen on the Hardware form:

- The state of the aged asset changes to In stock.
- The substate changes to Pending disposal.

Manage your expiring contracts for leased hardware assets

Use the lease contract expiration flow and decide on what to do before your leased hardware asset contract expires. Get notifications about the lease contracts that are nearing their expiration dates.

Before you begin

Role required: contract_manager

About this task

When a lease contract is nearing its expiration, contract administrators and business owners are notified 90, 60, and 30 days before the expiration date. Getting these notifications early can help give them enough time to act and to avoid paying a penalty. You can customize the email notifications by navigating to **System Notification > i > Notification > Lease contract threshold breached**.

You can view a consolidated list of asset contracts that are expiring on the Hardware Asset Dashboard in the month, quarter, and year formats. For more information, see [Hardware Asset Dashboard](#).

i Note:

When the Hardware Asset Management license is activated, the **Renew** UI button doesn't appear for active lease contracts that have assets covered.

If an asset is associated with more than one lease contract, then the **Lease contract** field on the asset record reflects the most recently associated contract.

There are readily available decision tables that you can use to customize the Lease Contract Expiration Flow, Leased Asset Buyout Flow, Leased Asset Extension Flow, and Leased Asset Return Flow. For more details, see [Hardware Asset Management flow customization](#).

With the lease contract expiration flow, the possible lease actions are buying out the leased asset, extending the lease agreement, or returning the asset or another like product.

i Note:

For an asset covered, if the **Date removed** field is in the past, then the state of the asset is automatically set to Canceled and you can't take any lease actions.

Procedure

1. Navigate to **Contract > Contracts > Leases**.

The Lease page opens. It shows a list of lease contracts.

2. Open the relevant active lease contract and click the **Begin Lease expiration process** related link.

Note:

The **Begin Lease expiration process** related link is visible only in active contracts that have at least one asset covered.

You can't choose a lease action such as Buy out, return, and extend for an excluded lease asset. For more information, see [Hardware Asset Management license exclusion](#).

The Leased Assets related list shows all the hardware assets that are covered in the lease contract.

In each asset record that is covered under the lease agreement, a Planning task is generated. The Planning task is automatically assigned to the contract administrators.

3. Under the Leased Assets related list, perform any of the following to take a lease action:

- Open a record and then open the Planning task. In the Planning task, select a lease action from the Lease action list.
- Open an asset. From the Asset Covered form, select a wanted lease action from the Lease action list.
- On the list of assets, double-click the **Lease action** field of an asset and select a lease action.

A set of tasks is created. If you select a lease action by a method other than opening the Planning task, then the state of Planning task is automatically moved to Closed.

Note:

By default, the Planning tasks are created only for the first 1000 assets under the contract. If you want to create Planning tasks for more than 1000 assets, then you can change the default value (1000) of the `com.sn.hamp.flow.lease_contract_expiration.max_results` key in the Asset Property (asset_property.list) table. Only users with the asset role can change this property.

Result

Based on your selected action, the corresponding workflow is triggered and the associated Contract Asset tasks are created. Close one task to go to the next task.

What to do next

Based on what lease action you selected, perform any of the following:

- [Return your leased hardware asset](#).
- [Buy out your leased hardware asset](#).
- [Extend your lease contract](#).

Return your leased hardware asset

Return your hardware asset before the contract expires and avoid paying a penalty.

Before you begin

Role required: asset, itil, contract_manager, inventory_admin, or ham_admin

About this task

After you choose to return your leased asset, various Contract Asset tasks are created to take care of the return process for leased assets. Close each task to go to the next and to complete the process.

Procedure

1. Open a lease record.
2. Select the Leased Assets related list.
3. Select an asset.
4. Under the **Contract Asset Tasks** tab, select the Planning task.
5. On the Contract Asset Task form, select **Return** from the Lease action list.
6. Change the **State** to **Closed Complete**.
To take a lease action, you can follow any of the ways mentioned in [Manage your expiring contracts for leased hardware assets](#).
A Collection task is generated under the **Contract Asset Tasks** related list.
7. Select the Collection task.
8. If you successfully collected the asset, then do the following:
 - a. Select the **Asset collection** tab.
 - b. Set the **Asset collected** field to **Yes**.
 - c. In the **Stockroom** field, enter the stockroom where the asset is stored.
On the Hardware form of the leased asset, the asset is moved to the In stock state and to the Pending transfer substate.
9. If you haven't collected the asset from your user, then do the following:
 - a. Update the **Asset collected** field to **No**.
The **Action change** field appears under the **Asset collection** tab.
 - b. If you're unable to collect the leased asset from your user and you want to buy out the leased asset, select **Buyout** from the Action change list.
Further buyout-related tasks are created to take care of the buyout process. See [Buy out your leased hardware asset](#).
 - c. If you're unable to collect the leased asset from your user, and if you want to extend the lease contract, select **Extend** from the Action change list.
Further extension-related tasks are created to take care of the lease extension process. See [Extend your lease contract](#).
 - d. If you're unable to collect the leased asset from your user and the leaser agrees that you return another similar asset, then do the following:
 - i. Select **Like-kind return** from the Action change list.

On the original asset, the **Like-kind exchange** field is populated and the asset moves to the Missing state.

- ii. From the **Like-kind returned asset** field, select the asset that you want to return to the leaser.
- iii. From the **Stockroom** field, select the stockroom that contains the like asset that you want to return.

Further return-related tasks are created for the like asset to take care of the return process.

In the Hardware form, the following changes occur:

- The asset is moved to the Missing state.
- The like asset is moved to the In stock state and to the Pending transfer substate.

10. On the Collection task form, close the task.

During the return confirmation, if there's a need of settlement, you can update the **Settlement** field to **Yes** and update the **Settlement amount** field with the settlement cost. If you do this, a Return Settlement task and a Purchase order are then generated. After the Purchase order is moved to the Received state, the Settlement task is closed automatically.

After the Collection task is closed, a Preparation task is created to remove device allocations of the asset.

11. Under the **Contract Asset Tasks** related list, open the Preparation task.

12. On the form, change the **State** field to **Closed Complete**.

After the Preparation task is closed, a Shipment task is created to update the shipment details.

13. Under the **Contract Asset Tasks** related list, open the Shipment task.

14. Update the **Shipping carrier**, **Ship date**, and **Tracking number** fields.

15. Close the Shipment task.

A Return Confirmation task is created. On the Hardware form, the leased asset is moved to the In transit state and to the None substate.

16. Under the **Contract Asset Tasks** related list, open the Return Confirmation task and do the following:

- a. Set the **State** field to **Closed Complete**.
- b. Set the **Return confirmation** field to **Yes**.

Result

The Return Confirmation task is automatically assigned to the contract administrator. If necessary, you can assign it to any other user.

On the Hardware form of the leased asset, the asset is moved to the Retired state and to the Lease return substate.

Buy out your leased hardware asset

Buy out your leased hardware asset before the contract expires and avoid paying a penalty.

Before you begin

Role required: asset, itil, contract_manager, inventory_admin, or ham_admin

About this task

After you choose to buy out your leased asset, various Contract Asset tasks are created to take care of the purchase process for leased assets. Close each task to go to the next task and to complete the process.

Note:

To close the Buyout tasks, the Purchase order that is created for the leased asset must be approved by the Procurement manager.

Procedure

1. Navigate to **All > Contract > Contracts > Leases**.
2. Click the Leased Assets related list.
3. Open an asset.
4. Under the **Contract Asset Tasks** related list, open the Planning task.
5. On the Contract Asset Task form, select **Buyout** from the Lease action list.
6. Change the **State** to **Closed Complete**.
To take a lease action, you can follow any of the ways mentioned in [Manage your expiring contracts for leased hardware assets](#).

The Purchase order and Purchase order lines are created. In the Purchase order form, the **PO Type** field under the Details section is set to **Lease buyout**. You can order the Purchase orders only after completing all the asset tasks that are associated with the line items of the Purchase order.

After receiving the Purchase orders, Expense lines are created to track the cost of the buyout.

If the lease Buyout Purchase order of your contract is in the Requested state, and if some assets covered under the same contract are updated with the Buyout lease action, then the Purchase order lines of the assets covered are appended to the Purchase order. A new purchase order is created only if an existing Purchase order for a lease buyout is not in the Requested state.

A Buyout task is created to update the buyout information.

7. Under the **Contract Asset Tasks** related list, open the Buyout task.
8. Under the **Buyout details** tab, do the following:
 - a. Update the **Buyout date** field with the date on which you want to purchase the asset.
 - b. Update the **Buyout amount** field with the amount to purchase the asset.
9. Fill in the fields as required.
10. Change the **State** field to **Closed Complete**.

After you update the **Cost** field on the Purchase order line, the **Buyout amount** field is automatically populated with the same amount. You can change the **Cost** field on the Purchase order line until the Buyout task is closed.

A Buyout Confirmation task is created to take care of the confirmation process.

11. Under the **Contract Asset Tasks** related list, open the Buyout Confirmation task and do the following:
 - a. Fill in the required fields.
 - b. Update the **Buyout confirmation field** to **Yes**.
 - c. Change the **State** field to **Closed and Complete**.

If you want to change the **Buyout amount** field from the Buyout Confirmation task form, you can change the amount from the Purchase order.

To close the Buyout Confirmation task, the Purchase order must be in the Received state.

Result

After a buyout is confirmed, the following changes occur in the asset record under the **Financial** tab:

- The **Cost** field is updated to the buyout amount.
- The **Acquisition method** field is changed to Purchase.

Extend your lease contract

Extend your lease contract before the contract expires and avoid paying a penalty.

Before you begin

Role required: itil, contract_manager, inventory_admin, or ham_admin,

About this task

After you choose to extend the lease contract of your asset, various Contract Asset tasks are created to take care of the contract extension process. Close each task to go to the next task and to complete the process.

Note:

To close the Extension tasks, the Purchase order that is created for the leased asset must be approved by the Procurement manager.

Procedure

1. Navigate to **All > Contract > Contracts > Leases**.
 2. Under the Related Links section, click the Leased Assets related list.
 3. Open an asset.
 4. Under the **Contract Asset Tasks** tab, open the Planning task.
 5. Select **Extension** from the Lease action list.
 6. Change the **State** field to **Closed Complete**.
To take a lease action, you can follow any of the ways mentioned in [Manage your expiring contracts for leased hardware assets](#).
- The Purchase order and Purchase order lines are created. The **PO Type** field on the Purchase order line is automatically set to **Extension**. You can order the Purchase orders only after completing all the asset tasks that are associated with the items of the Purchase Order line.
- After the Purchase orders are created, Expense lines are created to track the costs of the contract extension.
- An Extension task is created to take care of the extension process.
7. Under the **Contract Asset Tasks** related list, open the Extension task.
 8. Under the **Extension details** tab, update the **Extension start date** and **Extension end date** fields.
 9. Update the **Extension cost** field with the amount to extend the lease agreement of the asset covered.
The Purchase order line is automatically updated with the same amount.
 10. Change the **State** field to **Closed Complete**.
An Extension Confirmation task is created to take care of the confirmation process.
 11. Under the **Contract Asset Tasks** related list, open the Extension Confirmation task.
If you want to change the Extension amount from the Extension Confirmation task, then you can change the amount from the Purchase order.

Note:

To close the Extension Confirmation task, the Purchase order must be in the Received state.

12. Set the **Extension confirmation** field to **Yes**.

13. Change the **State** field to **Closed Complete**.

Result

A new contract is created with the start and end dates set as the extension start and end dates.

Reclaim hardware assets

Reclaim hardware assets efficiently and store them in the inventory, reassign, send it for repair, or dispose of as required.

Submit an asset reclamation request

Use Reclaim Asset catalog item to efficiently reclaim hardware assets when an employee leaves an organization or moves to a different role.

Before you begin

Role required: Any employee can submit an asset reclamation request.

About this task

Asset bundles and pallets can't be reclaimed.

Note:

To exclude a lost or stolen asset from the Reclamation form, open the asset record, clear the **Assigned to** field, and select **Save**. The asset no longer appears in the Reclamation form.

Procedure

1. Navigate to **All > Service Catalog > Asset Lifecycle > Reclaim Asset**.
2. On the Reclaim Asset form, fill in the fields.

Reclaim Asset form

Fields	Description
Requested by	The role of the person, such as an HR professional, Manager, or Employee, who submits the asset reclamation. <ul style="list-style-type: none"> ○ If Manager is selected, all the employees reporting to the Manager appear in the Requested for field. ○ If Employee is selected, the Requested for becomes read-only.
Requested for	Person for who you are submitting the asset reclamation.
Employee separation	Whether the person for who you are submitting the asset reclamation is leaving the organization or moving to a different role.
Asset	Hardware assets assigned to the person for who you are submitting the asset reclamation.
Reclaim method	The method how you want to collect the hardware assets from the departing

Fields	Description
	employee. You can pick up the assets or the employee can either drop off or ship them to the organization.
Legal hold method	If the hardware assets need to be kept on hold because of any legal reasons.
Notes/Special instructions	Any instructions if you want to mention.

3. Click **Submit.**

An Asset Reclamation Request is created.

Close an asset reclamation request

Efficiently reclaim hardware assets when an employee leaves an organization or moves to a different role.

Before you begin

Role required: inventory_user or inventory_admin

About this task

For each reclaimed asset, a Hardware Asset Reclamation Line is created. For each Hardware Asset Reclamation Line, at most three Hardware Asset Reclamation Tasks are created.

You must close all the tasks of a Hardware Asset Reclamation Line to close the Hardware Asset Reclamation Line. After all Hardware Asset Reclamation Lines are closed, the Asset Reclamation Request is closed.

Procedure

1. Navigate to **All > Inventory > Asset Reclamation > Asset Reclamation Request**.
2. Open the Asset Reclamation Request that you want to close and then open a Hardware Asset Reclamation Line.

i Note:

To search for a specific asset reclamation request, use the search bar or filter options on the Asset Reclamation Request list. You can filter by fields such as Requested for, State, or Request number.

Based the Reclaim method selected while submitting the Asset Reclamation request, a Schedule drop off, Schedule pickup, or Schedule shipment task is created in the Hardware Asset Reclamation Line.

The **Stage** field of the Hardware Asset Reclamation Line form shows **Ready**.

3. Open the Schedule drop off, Schedule pickup, or Schedule shipment task that is present in the Hardware Asset Reclamation Line.
4. On the form, fill in the fields.

Schedule shipment task form

Field names	Description
Assignment group	Group to which the Schedule shipment task is assigned.
Assigned to	User from the assignment group to whom the Schedule shipment task is assigned.

Field names	Description
Stockroom	Location where the reclaimed assets are stored. This field is required.
Shipping carrier	Name of the carrier vendor who ships the asset to the stockroom. This field is required and it is a reference to the Shipment carrier [sn_itam_shipping_carrier] table.
Tracking number	Shipment reference number given by the carrier vendor. This field is required.
Ship date	Date on which the asset is shipped. This field is required.
Work notes	Any additional information that you want to mention.

5. Select Close Task.

The **Stage** field of the Hardware Asset Reclamation Line form changes from **Ready** to **Pending received**.

A Receive asset task is created in the Hardware Asset Reclamation Line.

6. Open the Receive asset task.

7. On the form, fill in the fields.

Receive asset task form

Field names	Description
Assignment group	Group to which the Receive asset task is assigned.
Assigned to	User from the assignment group to whom the Receive asset task is assigned.
Is asset reclaimed?	Select this check box if you've received the assets. This check box is required.
Quantity received	Number of consumables received. This field is required and appears only if the Hardware Asset Reclamation Line is created for a consumable.
Work notes	Any additional information that you want to mention.

8. Select Close Task.

The **Stage** field of the Hardware Asset Reclamation Line form changes from **Pending received** to **Pending evaluation**.

After an asset is received, in the asset form, the following changes occur:

- The **Assigned to** field on the asset record becomes empty.
- State of the asset changes to In stock and Substate changes to Pending repair.

9. On the form, fill in the fields.

Evaluate asset task form

Field names	Description
Assignment group	Group to which the Evaluate asset task is assigned.
Assigned to	User from the assignment group to whom the Evaluate asset task is assigned.
Evaluation status	Status of the reclaimed asset. This drop-down list is required and the available values are: <ul style="list-style-type: none"> ○ Re-deployable ○ Needs repair ○ To be disposed
Work notes	Any additional information that you want to mention.

10. Select Close Task.

Based on what you selected from the **Evaluation status** drop-down list, the State, and Substate of the asset change as follows:

Evaluation status values	Asset state and substate	
	State	Substate
Re-deployable	In stock	Available
Needs repair	In stock	Pending repair
To be disposed	In stock	Pending dispose

The **Stage** field of the Hardware Asset Reclamation Line form changes from **Pending evaluation** to **Complete**.

Note:

When the stage of all Hardware Asset Reclamation Lines has changed to Closed Complete, the state of the Asset Reclamation Request also changes to Complete.

View RFID information of assets

View the Radio Frequency Identification (RFID) information of assets to manage and locate important assets easily.

Before you begin

Role required: asset

Procedure

Navigate to a hardware asset for which you want to view the RFID information.

Note:

The RFID tag field doesn't exist for an excluded asset.

Field	Description
RFID tag	Unique identifier of the RFID tag in the RFID system.
Site name	Name of the site as defined in the RFID system.
Type	Resource type as defined in the RFID system.
Zone group	Zone group as defined in the RFID system.
Serial number	Unique identifier as defined in the RFID system.
Zone group dwell	Length of time the asset has been in the current zone group relative to the timestamp of the data import.
Tag source	The application source of RFID data.
Zone	Zone as defined in the RFID system.
Last blink time	Last time the RFID tag was scanned.
Zone dwell	Duration for which the asset has been in the current zone as compared to the timestamp of the data import.
Last blink elapsed time	Duration for which the asset has been scanned in the RFID system as compared to the timestamp of the data import.
Grid-x, Grid-y, Grid-z	Physical location as defined in the RFID system.
Status	Status of the matching of RFID information to the resource.
Active	Option to map RFID information to the Asset [alm_asset] table. This option is selected by default.

Note:

The activity history is captured only for RFID tag and Zone.

Manage the lifecycle of hardware models with calculated lifecycle templates

Manage the complete lifecycle of hardware models by creating calculated lifecycle templates and associating these templates with the models.

Create Calculated lifecycle templates in the Hardware Asset Workspace

Create Calculated lifecycle templates to manage the complete lifecycle of hardware models efficiently.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset Operations**.
2. From the **Hardware asset normalization** list, select **Calculated lifecycle templates**.

The list of existing Calculated lifecycle templates is displayed.

3. Select **New**.
4. On the form, fill in the fields.

Create New Calculated Lifecycle Template form

Field	Description
Name	Name of the Calculated lifecycle template.
Description	Brief information about the template.
Active	Option to indicate that the Calculated lifecycle template is available for use.

5. Select **Save**.
The **Calculated Lifecycle formulas** tab is displayed with the list of calculated lifecycle formulas for the following lifecycle phases:
 - **End of Extended Support**
 - **End of life**
 - **End of Sale**
 - **End of Support**
 - **End of General Availability**
6. Define the calculated lifecycle formula for a lifecycle phase.
 - a. Select the calculated lifecycle formula.
 - b. In the **Phase start** and **Phase end** fields, enter the number of months for calculating the start date and end date of the lifecycle phase.
 - c. Select **Save**.
The calculated lifecycle formula is updated with the values that you entered in the Phase start and Phase end fields.

What to do next

[Associate a hardware model with a Calculated lifecycle template.](#)

Associate a hardware model with a Calculated lifecycle template

Associate a hardware model with a Calculated lifecycle template to populate the lifecycle details of the model automatically.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Model management**.
2. Select the **All models** tab.
3. Select the model that you want to associate with a Calculated lifecycle template.

4. In the Model Details section of the Model form, enter the template details.
 - a. In the **Calculated lifecycle template** field, select the calculated lifecycle template that you want to apply to the model.
 - b. In the **Calculated lifecycle start date**, select the date from which the Phase start date and Phase end date are calculated for each lifecycle phase defined in the Calculated lifecycle template that you selected.
5. Select **Save**.

Result

The list of lifecycle phases with details such as Phase start date, Phase end date, and Source is displayed in the Model Lifecycles tab.

Receive asset warranty details from Lenovo

Connect to the Lenovo Warranty API and get the warranty details of your hardware assets.

Related topics

[Integration with Lenovo for asset warranty details](#)

Connect to the Lenovo Warranty API

Create a connection and credential to connect to the Lenovo Warranty API and download the warranty information for hardware assets.

Before you begin

You should have the Client ID provided by Lenovo. If you don't have one, contact your organization's Lenovo sales or service representative.

Role required: admin

Procedure

1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases**.
2. Select *Lenovo*.
3. From the **Related Links**, select **Create New Connection and Credential**.
4. **Optional:** Change the default connection name for the connection to the Lenovo Warranty API in the **Connection Name** field.
By default, this field is set to **Lenovo Connection**.

Important:

Don't change the default URL specified in the Connection URL field.

5. In the **Client ID** field, enter the Client ID provided by Lenovo.
6. Select **Create**.

Result

The Lenovo connection is successfully created and listed in the Connections tab.

Track the warranty details of your Lenovo assets

View and track the warranty details of your Lenovo hardware assets from a central location in the Asset operations view of the Hardware Asset Workspace.

Before you begin

Role required: asset

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Asset warranty** list, select **Asset warranties**.
 - To see whether an asset is still in warranty, check the **Status** column.
 - To track warranties that are nearing expiration, check the **End Date** column of the asset record and the asset's status.
3. **Optional:** Select a warranty record to view more details.

Manage stockrooms

Manage the assets in the stockroom by using appropriate stock rules, service locations, and distribution channels.

For details, see [Stockrooms](#) and [Stock rules](#).

Create a stockroom

Create stockrooms to assign places to assets.

Before you begin

Role required: inventory_admin

About this task

Stockrooms are separate, standalone entities in the Asset Management application. When stock is low on a particular asset, stock rules can notify an asset manager, or automatically transfer inventory from one stockroom to another.

Procedure

1. Create a stockroom.
2. On the form, fill in the fields.

Create New Stockroom form

Field	Description
Name	Display name of the stockroom type.
Assignment group	Group that primarily uses the stockroom.
Location	Physical location of the stockroom.
Type	Type of stockroom, such as Field Agent or On site.
Manager	Person in charge of the stockroom. Receives restocking notifications and requests for the stockroom's stock rules.

3. Select **Save**.

Result

The stockroom is added to the list shown in the All stockrooms tab.

Delete a stockroom with assets

You can delete a stockroom. If the stock room has assets, you must remove the assets from the stockroom first.

Before you begin

Role required: inventory_admin

Procedure

1. Navigate to **All > Asset > All Assets**.
2. Personalize the list to add the **Stockroom** column.
3. Filter the list to show only the assets in the stockroom that you want to delete.
4. Change or remove the stockroom for all of the asset records.
5. After removing assets from the stockroom you want to delete, continue with the instructions for [deleting a stockroom with no assets](#).

Delete a stockroom with no assets

You can delete a stockroom that has no assets.

Before you begin

Incomplete transfer orders must be deleted before you delete the stockroom.

Role required: inventory_admin

Procedure

1. Navigate to **All > Inventory > Stock > Stockrooms**.
2. Select the check box beside the stockroom name.
3. In the **Actions** list, select **Delete**.

Note:

Transfer order history is deleted when you delete the stockroom.

Create a new stockroom type

If you need stockroom types that are not included in the base system, you can create a custom stockroom type.

Before you begin

Role required: inventory_admin

About this task

Check the [priority level](#) of the stockroom types provided in the base instance to ensure that you assign the correct priority level to any new stockroom types you create. You can also modify the stockroom types included in the base system.

Procedure

1. Navigate to **All > Inventory > Stock > Stockroom Types** and create a new record (see table for field descriptions).

Field	Description
Name	Display name of the stockroom type.

Field	Description
Description	General information about the stockroom type.
External stockroom	Whether stockrooms of this type are managed internally (check box cleared) or managed externally by a third party (check box selected).
Priority	Level of precedence for this type of stockroom.
Shipment required	Option that determines if stockrooms of this type require shipment by default.
Value	Internal identifier of the stockroom type.

2. Click **Submit**.

View stockroom details

View detailed information about the stockrooms where your hardware, consumables, bundles, pallets, loaner, enterprise, and other assets are located.

Before you begin

Role required: admin or asset

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom.
4. View details about the stockroom on the Details tab.
View the following details about the stockroom:
 - All open tasks associated with the stockroom through the Open stockroom task cards. Selecting a card displays a list of the task records.
 - The active stock rules of your stockroom. The stock rule cards from the contextual sidebar help you know if the stock is less than the threshold and if the model has reached the end of sale.
 - The hours that the stockroom is available are shown in the **Hours of operation** field.
 - The location of the stockroom based on the specified address is shown in the interactive map. To view all service locations and distribution channels associated with the stockroom, select **Toggle full screen view**.
 - Options to enable AI agents in the Help manage hardware asset requests agentic workflow to source hardware assets requests autonomously are available in the Sourcing by AI agents section. The auto-sourcing options include the following:
 - **Auto-consume**
 - **Auto-transfer**
 - **Auto-purchase**
For more details, see [Configure a stockroom for automated sourcing by AI agents and Now Assist for Hardware Asset Management \(HAM\) AI agent collection Help manage hardware asset requests agentic workflow](#).
5. On the Task timeline tab, view the timeline of all scheduled stockroom tasks and the inbound shipments, outbound shipments, and work activities associated with those tasks.
6. **Optional:** On the **Task timeline** tab, adjust the timeline view and timeline duration.

- Set the view to the calendar view with a specified time duration by selecting one of the following values from the **Calendar** drop-down list in the top right:
 - **Day**
 - **Work week**
 - **Week**
 - **Month**
- Set the view to the timeline view with a specified time duration by selecting one of the following values from the **Timeline** drop-down list in the top right:
 - **Day**
 - **Week**
 - **4 Weeks**

7. View the service locations and distribution channels of the stockroom and details of different types of assets in the stockroom by selecting the tabs corresponding to the asset type.

Note:

The tabs related to the enterprise assets appear only if the Enterprise Asset Management application is installed on your ServiceNow® instance. If you select an enterprise asset, you're automatically redirected to the corresponding record in the Enterprise Asset Workspace. If you have access to an enterprise asset, you also have access to the Enterprise Asset Workspace. For more details, see [Enterprise Asset Workspace](#).

Associate a stockroom with service locations

Manage sourcing requests that consume from local stockrooms effectively by associating your stockroom with multiple service locations. Optimize your loaner asset workflow and automated asset tasks by serving multiple locations using a single stockroom.

Before you begin

Role required: inventory_admin

About this task

Note:

You can't add service locations to a stockroom that is excluded from providing location coverage. For more details, see [Exclude a stockroom from service locations](#).

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom that you want to associate with service locations.
4. Select the **Service locations** tab.
5. Select **Add**.
6. In the Add service locations dialog box, select the active locations that you want the stockroom to support and select **Add**.

When you add a parent location, all its child locations are also supported by the stockroom. For example, when you add the city San Francisco, the stockroom supports all the locations within San Francisco.

Note:

If the Active check box isn't selected, the stockroom doesn't support that location, or its child locations so that location can't be added to the stockroom.

Result

The selected locations are added to the list shown in the **Service locations** tab.

Related topics

[Source requests from local stockrooms](#)

Remove service locations

Remove service locations when the associated stockroom doesn't support those locations.

Before you begin

Role required: inventory_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to remove the supported locations.
4. In the **Service locations** tab, select the locations that you want to remove and select **Remove**.

Result

The removed locations are no longer shown in the Service locations list.

Exclude a stockroom from service locations

Exclude a stockroom from service locations so that the stockroom isn't shown in the Stockrooms missing service locations important actions card in the Inventory view.

Before you begin

Role required: inventory_admin

About this task**Note:**

You can't exclude a stockroom that already has associated service locations. You must first remove the associated service locations and then exclude the stockroom from service locations. For more details, see [Remove service locations](#).

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.

3. From the list of available stockrooms, select the stockroom that you want to exclude from service locations.
4. Select the **Exclude from service locations** check box.
5. Select **Save**.

Result

- The stockroom isn't shown in the Stockrooms missing service locations important actions card even if the stockroom doesn't support service locations.
- The **Service location** tab doesn't show the **Add** option for adding service locations to the stockroom.

Link stockrooms into a distribution channel

Link two geographically related stockrooms to create a distribution channel and make the distribution of assets more efficient. You can assign a preference order for each channel to source assets to the stockroom.

Before you begin

Role required: inventory_admin

About this task

A distribution channel is a defined sourcing relationship between two geographically related stockrooms. It determines which stockroom assets are drawn from or transferred to when fulfilling requests, and in what order of preference. Setting up distribution channels helps streamline asset distribution across your organization by automating sourcing decisions rather than handling them manually.

Each distribution channel is created from the perspective of the base stockroom – the stockroom you're configuring. The Function field describes the direction of asset flow relative to the base stockroom:

- Inbound: Assets flow into the base stockroom. The channel stockroom is the source.
- Outbound: Assets flow out of the base stockroom. The channel stockroom is the destination.

When you create a distribution channel, the function is automatically set to Inbound for the base stockroom and Outbound for the channel stockroom.

Note:

You can't create distribution channels for a stockroom that doesn't support sourcing assets through distribution channels. For more details, see [Exclude a stockroom from distribution channels](#).

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to create a distribution channel.
4. Select the **Distribution Channel** tab.
5. Select **New**.
6. On the form, fill in the fields.

Create New Stockroom Distribution Channel form

Field	Description
Base stockroom	Name of the stockroom for which you want to create a distribution channel. This field is automatically populated.
Channel stockroom	Name of the stockroom that you want to link to the base stockroom to create a distribution channel for sourcing assets.
Rank	Numeric order of preference given to the distribution channel for sourcing assets.
Function	Function of the distribution channel. This field is read-only and is automatically set to Inbound.
Active	Option that indicates whether the distribution channel is active for sourcing assets to the base stockroom. Note: When you clear the Active check box, the outbound function of the base stockroom for that channel stockroom also becomes inactive automatically.

7. Select **Save**.

8. Repeat steps 4–7 to create another distribution channel for this base stockroom.

Result

- The distribution channel is added to the list shown in the **Distribution Channel** tab.
- The base stockroom is added as an outbound distribution channel for the channel stockroom. The **Function** field of the base stockroom is set to **Outbound**.

Exclude a stockroom from distribution channels

Exclude a stockroom from distribution channels so that the stockroom isn't shown in the Stockrooms missing distribution channels important actions card in the Inventory view.

Before you begin

Role required: inventory_admin

About this task

Note:

You can't exclude a stockroom that is already linked into any distribution channel.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom that you want to exclude from distribution channels.

4. Select the **Exclude from distribution channels** check box.

5. Select **Save**.

Result

- The stockroom isn't shown in the Stockrooms missing distribution channels important actions card even if the stockroom isn't linked into distribution channels.
- The **Distribution Channel** tab doesn't show the **New** option for creating a distribution channel for the stockroom.

Create a stock rule

Create a stock rule to control what happens when the inventory of a particular asset in a particular stockroom reaches a specified threshold.

Before you begin

Role required: inventory_admin

Procedure

1. Create a stock rule.
2. On the form, fill in the fields.

Create New Stock Rule form

Field	Description
Model	Product model to which the rule applies.
Threshold	Quantity that the stock must reach to trigger restocking. For example, enter a threshold of 10 for a laptop computer that should be restocked when inventory drops below 10 in the specified stockroom. Note: If a stock rule is created for a hardware or software model reaches the threshold limit, a notification is sent to the stockroom manager and a stock order request is automatically created.
Restocking option	Location where additional supplies should come from. If Procurement isn't active, then restocking option is Stockroom only. Otherwise, select one of the following: <ul style="list-style-type: none"> ○ Stockroom: Creates a transfer order to obtain the asset from another stockroom. ○ Vendor: Sends an email to the stockroom manager to order from a vendor. In addition to the email notification, a purchase order and purchase order line item are created. Important: Once a transfer order, purchase order, or purchase order line item is created, it's important to act on it promptly. Any email notifications or reminders won't be sent for these actions.

Field	Description
Active	Option for enabling the stock rule for restocking automatically.
Stockroom	Current physical location of the asset.
Order size	<p>Minimum order quantity for stockroom transfers or vendor purchases. ServiceNow calculates the smallest multiple of the order size needed to restock the item above the threshold.</p> <p>For example, there are 3 laptops in stock with a threshold of 10 and the Stockroom option selected. If the order size is set to 4, the system creates a transfer order for 8 laptops to exceed the threshold and satisfy the rule (3 in stock + 8 ordered = 11). When restocking from a vendor, ServiceNow sends an email to the stockroom manager showing the total number of items to order, as multiples of the order size.</p>

3. Select **Submit or **Save**.**

Result

- The stock rule that you created appears in the **Stock rules** tab.
- If the restocking option was set to **Vendor**, the **Stock orders** tab will be displayed. All the stock orders that are created using this stock rule are listed under the Stock orders tab.

i Important:
The Stock orders tab is available with Hardware Asset Management version 13.0.0 and later.

- If the restocking option was set to **Stockroom**, the **Transfer orders** tab will be displayed. All the transfers orders created using this stock rule are listed under the **Transfer orders** tab.

i Important:
The Transfer orders tab is available with Hardware Asset Management version 13.0.0 and later.

For stock orders created through the restocking by a vendor, the stock order tab shows all stock orders generated by that stock rule. But for transfer orders, the tab only displays transfer orders after the upgrade.

Configure a stockroom for automated sourcing by AI agents

Configure a stockroom to enable AI agents in the Manage hardware asset requests agentic workflow to source hardware assets automatically.

Before you begin

Role required: ham_admin

About this task

i Important:

Configuring the stockroom is necessary for AI agents to source the hardware asset requests from it. However, to automate your hardware asset requests using the Manage hardware asset requests agentic workflow, you must install the Now Assist for Hardware Asset Management (HAM) application. For more details, see [Now Assist for Hardware Asset Management \(HAM\)](#).

Procedure

1. Navigate to **All > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom that you want to set up for automatic sourcing.
4. Select the automatic sourcing options in the **Sourcing by AI agents** section.
 - To enable the AI agent to consume the local stock automatically, select the **Auto-consume** check box.
 - To enable the AI agent to create a transfer order for the stockroom automatically, select the **Auto-transfer** check box.
 - To enable the AI agent to create a purchase order for the stockroom automatically, select the **Auto-purchase** check box.
5. Select **Save**.

Result

The stockroom is configured for the automatic sourcing options that you selected.

Manage the receiving of assets at stockrooms in the Hardware Asset Workspace

Receive hardware and consumable assets at stockrooms from any workflow at a centralized location on the stockroom form in the Hardware Asset Workspace.

i Important:

The options to receive assets at your stockroom through the standardized asset receiving mechanism is available with Hardware Asset Management version 13.0.0 and later.

Depending on the number and type of assets that you want to receive, you can select from the following options to receive assets at your stockroom:

- [Receive a single hardware asset at your stockroom.](#)
- [Receive one or more hardware and consumable assets from the list of shipment assets.](#)
- [Import and receive hardware and consumable assets in bulk through an Excel template.](#)

i Note:

You should have the ham_admin role to import asset records using the Excel template.

For more details, see [Receiving hardware and consumable assets at stockrooms](#).

Receive a hardware asset at a stockroom in the Hardware Asset Workspace

Receive a single hardware asset that has arrived at your stockroom, whether it's part of a workflow or not, in the Hardware Asset Workspace.

Before you begin

i Important:

The option to receive a hardware asset at your stockroom through the standardized asset receiving mechanism is available in Hardware Asset Management version 13.0.0 and later.

Role required: inventory_user or asset

About this task

This task enables you to receive assets in the following scenarios:

Receiving a hardware asset with an existing record

When you're receiving a hardware asset from workflows such as a transfer order or Return Merchandise Authorization (RMA), where a repaired asset has arrived at your stockroom, the asset record exists in your ServiceNow instance. You can search for the existing asset record using the Asset tag or Serial number and then receive the asset, which automatically closes the receive task of the source workflow.

Receiving a new hardware asset at your stockroom

When you're physically receiving a new hardware asset at your stockroom, it's likely that the asset record isn't present in your ServiceNow instance. You can receive new assets through workflows like a purchase order, asset refresh, or RMA with a replacement asset. Through this task, you can create an asset record and associate it with the source workflow, which automatically closes the receive task linked to the source workflow.

Receiving an independent hardware asset

You can receive a hardware asset that isn't part of any workflow and has arrived at your stockroom.

Important:

You can also receive an enterprise asset only if the Enterprise Asset Management application is activated.

Procedure

1. Navigate to **Workspaces** > *Hardware Asset Workspace* > **Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive the hardware asset.
4. Select **Receive assets**.
5. Find the hardware asset that you want to receive.
 - a. In the Receive assets dialog box, enter the Asset tag or Serial number of the asset that you want to receive in the search field.
 - b. Select **Search**.

- If the asset record is found, it appears in the Assets list.

Note:

The following asset details are displayed:

- **Display name**
 - **Model category**
 - **Asset tag**
 - **Quantity**
 - **State**
 - **Stockroom**
 - **Location**
- If the asset record isn't found, a message appears indicating that the asset isn't found, along with an option to create the asset record.

6. Receive the hardware asset in your stockroom.

- If the asset record is found in the Assets list, select the asset record and then select **Receive**.

Result

- The State of the asset changes from **In transit** to **In stock**.
 - The **Stockroom field** on the asset form is automatically updated with the stockroom at which you received the asset.
 - The receive task in the source workflow associated with the asset that you received is automatically closed.
- If the asset record isn't found, create one to receive.
 - Select Create asset.**
 - In the Create asset dialog box, enter the details.**

Create asset dialog box

Field	Description
Model	Specific product model of the asset. This field is required.
Model Category	Model grouping of the asset. This field is required.
Serial Number	Serial number of the asset. Note: Depending on the Model Category that you selected, this field is either required or optional. For instance, Serial number is required for Computer model category.
Asset Tag	Tag to help track the asset.

Field	Description
Mac Address	MAC address of the asset.
Stockroom name	Name of the stockroom that you selected to receive the asset. This field is automatically populated and is read only.
Source type	Source workflow to which the asset that you're receiving belongs. <ul style="list-style-type: none"> ▪ To receive the asset from a purchase order, select PO. ▪ To receive the asset from the RMA flow, select Asset RMA. ▪ To receive the asset through asset refresh workflow, select Refresh.
Source ticket	Request number of the source workflow that's associated with the asset that you want to receive. <ul style="list-style-type: none"> ▪ To receive an asset from a purchase order or asset refresh order, select the associated PO line number. ▪ To receive an asset from an RMA order, select the associated RMA line number. <p>Note: Source tickets are displayed based on the model and source type that you selected.</p>

Important:

Providing the Source type and Source ticket details is optional when creating an asset record. However, including these details links the hardware asset to the source workflow. This link results in the automatic closure of the Receive task in the source workflow when the asset is created. If you don't include these details, the asset record is still created, but you should close the Receive task manually in the source workflow.

Note the following points before you consider creating an asset record:

- If you're receiving an asset from an RMA workflow, you can create an asset record first. Later, you can manually add the details of this asset in the Asset RMA receive task, and then close the task.
- If you're receiving an asset from a purchase order, you can create an asset record for the asset you physically received. However, you can't receive the same asset later through the Receive task on the purchase order.

c. Select Create.

Result

- An asset record is created with State as **In stock** and Substate as **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the asset.
- The receive task in the source workflow is automatically closed only if you provided the Source type and Source ticket details.

Receive assets from inbound shipments at your stockroom in the Hardware Asset Workspace

Receive hardware and consumable assets from one or more shipments that are in transit to your stockroom in the Hardware Asset Workspace. You can receive assets from shipments originating from any workflow.

Before you begin

Important:

The option to receive assets from inbound shipments at your stockroom through the standardized asset receiving mechanism is available in Hardware Asset Management version 13.0.0 and later.

Role required: inventory_user or asset

About this task

If you don't have the details of the assets you want to receive at your stockroom, you can view the list of assets that are on their way and then receive them. You can receive the complete quantity of consumables in the shipments, not a partial quantity.

Assets from an inbound shipment can be received under the following conditions:

- The assets must have a serial number and an asset tag.
- The assets must be in the In-transit state and linked to a shipment record.
- Enterprise assets can be received only if the Enterprise Asset Management application is activated.

Procedure

1. Navigate to **Workspaces** > *Hardware Asset Workspace* > **Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive hardware or consumable assets.
4. Select **Receive assets**.
5. In the Receive assets dialog box, select **View all inbound assets**.
A list of all shipment assets currently on their way to the stockroom is displayed.

The following details of a shipment are displayed:

- **Asset:** Display name of the asset.
- **Stage:** Stage of the shipment.

Note:

Only shipments that are In transit are displayed.

- **Model categories:** Model grouping of the asset.
- **Quantity:** Number of assets to be received.
- **Asset tag:** Tag to track the asset.
- **Serial number:** Serial number of the asset.
- **Tracking number:** Identifier to track the shipment.
- **Source:** Details of the source workflow including the request number through which you're receiving the asset. The source could be a transfer order line, a purchase order line, an RMA order line, or any other workflow through which the asset is received.

6. Select the shipment asset that you want to receive and then select **Receive**.

Result

If the asset details are valid, the following changes occur:

- The assets are received successfully.
- The State of the assets changes from **In transit** to **In stock**, and the Substate of the assets changes from **Reserved** to **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the assets.
- The Status of the shipment tasks associated with the assets changes to **Delivered**.
- The receive tasks in the source workflows are automatically closed.

Note:

If any of the asset details are invalid, an error message is shown in the **Alert** column for the corresponding asset record. You should resolve the error before receiving the assets.

Import and receive assets in bulk at your stockroom in the Hardware Asset Workspace

Receive multiple hardware and consumable assets at your stockroom by importing the asset records using an Excel template in the Hardware Asset Workspace.

Before you begin**Important:**

The option to import and receive assets in bulk through the standardized asset receiving mechanism is available in Hardware Asset Management version 13.0.0 and later.

Role required: ham_admin

About this task

This task enables you to receive assets with existing records, and also new assets, only if you have provided valid asset details in the template.

When you import a template with asset details, extensive validation is performed on each row. The records from the template and the validation results are stored in the Import asset row [sn_itam_cm_n_import_asset_row] table.

Note:

The *sn_itam_common.receive_assets_batch_size* system property determines how many asset records are processed at once when logging imports and receiving jobs. By default, the system handles 1,000 asset records per batch. With the admin role, you can adjust this number to optimize the system performance and handle large volume of assets. This system property supports domain separation by using the application property.

The asset data validation takes care of the following points:

- Child assets can't be received.
- Enterprise assets can only be received if the Enterprise Asset Management application is activated.
- Operational Technology (OT) assets can only be received if the OT Asset Management application is activated.
- Assets can be received only if the following conditions are fulfilled:
 - The required fields are provided.
 - The asset quantity is valid.
 - The Source type and Source ticket details are valid.

- Asset from purchase order lines can be received only in Zurich and later releases.
- Asset bundles can't be received.

Procedure

1. Navigate to **Workspaces** > *Hardware Asset Workspace* > **Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive hardware or consumable assets.
4. Select **Import assets**.
5. Prepare the asset data for import, and then proceed with the import.
 - a. Download, update, and save the asset import template.
 - i. Select **Download Template**.
 - ii. Fill in the template with the details of the assets that you want to import and receive.

The template has the following columns:

- **Asset tag** and **Serial number**: These fields are used to determine whether the asset record exists in your ServiceNow instance or not.
- **Model category**, **Model name**, and **Model number**: The fields required to validate an asset record depend on the model category. For example, a serial number is required for the Computer model category, and you can receive assets of that model category only if the serial number is provided. Additionally, if an asset record isn't found, fields related to the model are required to create one using the Asset tag and Serial number values provided in the template.
- **Quantity**: This field should have a value of 1 for hardware assets, and for consumables, it should reflect the number of assets you're receiving. You can't receive a partial quantity of consumables.
- **Manufacturer**: Asset manufacturer.
- **Source type**: The source type is the workflow through which you're receiving the asset. You should enter values that correspond to the workflows, such as the following:
 - TOL for transfer order line
 - POL for purchase order line
 - RMAL for Return Merchandise Authorization (RMA)

Note:

This field is required for a consumable asset so that the correct asset is identified and received.

- **Source ticket**: The request number of the source workflow that's associated with the asset that you want to receive, such as TO line number, PO line number, or RMA line number.

Note:

This field is required for a consumable asset so that the correct asset is identified and received.

- **Reserved for**

- **Parent asset**
- **MAC address** and **OT entity**: These fields are required to identify and receive OT assets.

iii. Save the template.

b. On the Create New Import asset form, fill in the details.

- i. In the **Name** field, provide a name for the asset import record.
- ii. Select **Attach file** and then select the asset import template that you created in step a.

c. Select **Import**.

- The **Import asset data rows** tab is displayed, showing all the asset record rows that were imported through the Excel template.

Note:

Depending on the number of records being processed, it might take some time for the asset records to appear in the Import Asset Data Rows tab.

- The **Status** column indicates whether the asset is ready to be received. Here are the possible values:
 - **Ready to receive**: This status indicates that the asset data is valid and ready to be received at your stockroom.
 - **Receive error** (Asset not found): This error indicates that no asset records match the details you provided in the template. However, since the details are valid, asset records will be created when you proceed with the Receive action.
 - **Import error**: This error is because of the invalid asset data provided in the asset import template, such as duplicate serial numbers or invalid quantity for hardware assets.
- The **Alert** column provides details about any errors and the steps that you should take to resolve them and successfully receive the asset.

Note:

You can proceed to receive assets with a status of Ready to receive or Receive error.

For assets with a status of Import error, correct the data issues in your template and create a new import record to import the corrected template. You can then receive the assets.

6. Receive assets at your stockroom.

a. Select the import data rows corresponding to the assets that you want to receive.

b. Select **Receive**.

If you received the assets with Status Ready to receive, the following changes happen:

- The State of the assets changes from **In transit** to **In stock**, and the Substate of the assets changes from **Reserved** to **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the assets.
- The receive tasks in the source workflows associated with the assets that you received are automatically closed.

If you received the assets with Status Receive error, the following changes happen:

- Asset records are created with State as **In stock** and Substate as **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the assets.
- The receive task in the source workflow is automatically closed only if you provided the Source type and Source ticket details.

Manage stockrooms with inventory reports in the Hardware Asset Workspace

Track and manage stockrooms efficiently by evaluating the inventory reports in the Hardware Asset Workspace.

i Important:

The inventory reports are available with Hardware Asset Management version 13.0.0 and later.

The inventory reports help you:

- Find replacement options for assets.
- Quickly identify shortages and align current demand in your stockroom with both current and incoming supply.
- Analyze the supply to meet open demand across all stockrooms or locations.

Identify suitable replacement options for assets in the Hardware Asset Workspace

Use the Inventory availability report to determine suitable replacement options for your assets and their child components that are in use, in maintenance, pending repair, or defective. The report also helps you to determine the quantity of available substitute models that can be used locally, moved through the distribution channels, and estimate the lead time for new purchases.

Before you begin

i Important:

The Inventory availability report is available with Hardware Asset Management version 13.0.0 and later.

The Inventory Availability Report is available only for hardware, consumable, and bundle assets that are in use, in maintenance, pending repair, or defective.

Service locations and distribution channels should be configured for the stockroom. If the asset's location is a service location of a stockroom, it automatically becomes the local stockroom. A location can have multiple local stockrooms if it is serviced by more than one stockroom. For more details, see [Associate a stockroom with service locations](#) and [Link stockrooms into a distribution channel](#).

Role required: asset

About this task

The Inventory availability report helps you to identify the best sourcing option when sourcing assets or its components that are in use and nearing the end of their life, defective, or pending repair. Additionally, you can check how much stock is currently available at a stockroom.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset estate**.
2. Select the asset for which you want to view the replacement assets available in the local and remote stockrooms.
3. Select the **Inventory availability** tab.

The list displays the asset and any of its child assets, along with their linked models and any substitute models. The list includes the following details:

Inventory availability report

Field	Description
Asset	Display name of the asset.
Model	Model of the asset. Note: If there are any substitute models for the asset model, they're also displayed.
Asset type	Indicates whether the asset is the original asset or a substitute model asset. This field can have any of the following values: <ul style="list-style-type: none"> ○ Original parent for the actual parent asset. ○ Original child for the child of the original parent asset. ○ Substitute parent for the asset of the substitute model. ○ Substitute child for the child asset of the substitute model.
Local stockroom quantity	Quantity of assets that are in stock and available in the stockrooms that service the asset location. Note: If you select the quantity shown, you can view the full list of assets in your local stockroom that can be used as replacements. There can be multiple local stockrooms if more than one stockroom serves the same location.
Remote stockroom quantity	Quantity of assets that are in stock and available in the distribution channel stockrooms that are marked as inbound stockrooms to the current local stockroom. Note: If you select the quantity shown, you can view the full list of assets in your distribution channel stockrooms that can be used as replacements.
Purchase lead time	Average time in days it has taken from ordering to receiving replacement assets through new purchase orders.

Identify the supply and demand for models within a stockroom in the Hardware Asset Workspace

Use the Supply vs Demand report to evaluate the available and incoming quantity of models in your stockroom and the requests for these models from different service locations. This report helps you determine if you have enough assets to meet the demand.

Before you begin

Important:

The Supply vs Demand report is available with Hardware Asset Management version 13.0.0 and later.

Supply refers to the assets that are currently in stock and those that are incoming at your stockroom. Demand refers to the requests for assets from different service locations that your stockroom services.

Note the following points about the Supply vs Demand report:

- Supply of an asset model to your stockroom includes:
 - In stock assets that are in the Available, Reserved, Pending transfer, and Pending install stage
 - Incoming transfer orders that are partially shipped, fully shipped, in transit, received, and delivered
 - Incoming purchase orders that are ordered
- Demand for an asset model includes:
 - Outgoing transfer orders that are in the Draft, Requested, and Shipment preparation stage
 - Asset requests
 - Refresh requests
 - Work order parts requests

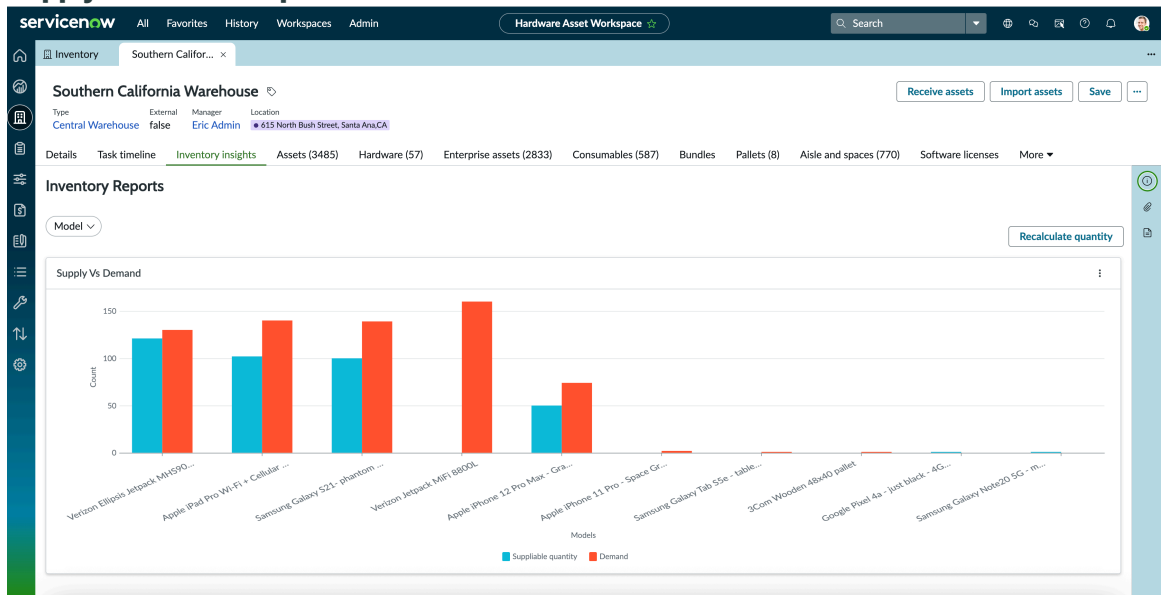

The supply and demand details are stored in the Model and stockrooms [sn_asset_model_and_stockroom] table. The *Populate model and stockroom data* scheduled job runs daily to populate this table.

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of stockrooms, select the one for which you want to view the supply and demand details.
4. Select the **Inventory insights** tab.

Supply vs Demand report

The Supply vs Demand report shows the count on the y-axis and the model on the x-axis, with separate bars for supply and demand for each model. This visual representation helps you to compare the available quantity of each model in the stockroom with the number of requests from different service locations. By looking at the graph, you can determine which models have enough supply to meet demand and which ones need more stock.

Note:

By default, the graph shows details for only 10 models.

5. View the details of the model that isn't shown on the report.
 - a. Select the **Model** filter.
 - b. Enter the model in the search field or select the model from the **Available** list.
 - c. Move the selected model to the **Applied** list.
 - d. Select **Apply**.
6. To further drill down into the supply or demand for a model and view its component-level details, select the corresponding bar.
 - The supply graph shows the count of the following:
 - **In stock assets**
 - **Incoming transfer order**
 - **Incoming purchase order**
 - The demand graph shows the count of the following:
 - **Outgoing transfer order**
 - **Asset requests**
 - **Refresh requests**
 - **Work order parts requests**

By selecting the relevant bars, you can view the list of assets that make up the count.

7. **Optional:** To initiate the calculation of supply and demand for asset models manually, select **Recalculate quantity**.

(Optional) The Supply vs Demand graph updates to show the recently calculated values.

Identify the supply for open demands in the Hardware Asset Workspace

Use the Open demands report to determine available stock within local stockrooms and distribution channels to fulfill sourcing requests that are open.

Before you begin

Important:

The Open demands report is available with Hardware Asset Management version 13.0.0 and later.

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Procurement**.
2. In the Procurement overview, select **Open demands**.

The report displays the list of open demands with the following details:

- Requests and requested items.
 - The quantity of the requested model available in local stockrooms that serve the asset location.
 - The quantity of the requested model available in distribution channel stockrooms that serve the asset location.
 - The purchase lead time, which is the average time in days it has taken from ordering to receiving assets through new purchase orders.
- 3.** To view the current stock availability in the local stockrooms for all open requests for a model and determine if there is sufficient quantity, select the number shown in the **Local stockroom quantity** column.
- The available asset quantity is determined by the current state. If two requests from a service location, which is serviced by two or more stockrooms, are for the same model and the available quantity is 100, the report will show 100 available in the local stockroom for both requests. Once one request is fulfilled, the quantity will update to reflect the remaining amount for the other request.
- 4.** To view the current stock availability in the distribution channel stockrooms for all open requests for a model and determine if there is sufficient quantity, select the number shown in the **Remote stockroom quantity** column.

Track shipments using the integration framework

Track your shipments in real time by integrating your ServiceNow instance with your third-party carrier's application through the integration framework provided by the IT Asset Management application.

Creating an integration script include for third-party carrier applications

In order to integrate with a ServiceNow instance, a third-party carrier application must have a script include that extends the base class `ITAMShipmentIntegration` script on its ServiceNow instance to receive the shipment tracking number from the customer's ServiceNow instance and respond with the carrier-related details.

Consider the following when you create the script include:

- Make sure that the script include is accessible from the Asset Management Common application scope by adjusting the following settings on the application resource record:
 - Set the **Accessible from** field to **All application scopes**.
 - Set the **Caller Access** field to **None** to make sure the caller access isn't restricted.
- The code for communicating with the customer's ServiceNow instance based on the tracking number must be included within the `fetchShipmentInfo` function.
- When the API is invoked in the test mode for validating the connection with the customer's ServiceNow instance, the return response from the `fetchShipmentInfo` method should be a JSON object with the HTTP response code and response message, as follows:

```
{
  httpResponseCode: 200, httpResponseMessage: 'SUCCESS'
}
```

- When not in the test mode, query the shipments and invoke the `processResponse` method with the following response format:

```
[
  {
```

```

trackingNumber: '',
deliveryDate: '',
pickupDate: '',
packageStatus: '',
statusDetail: '',
trackingURL: '',
parcelWeight: '',
deliveryServicesCost: '',
currency: ''
}
]

```

ITAMShipmentIntegration script include sample codes

Sample ITAMShipmentIntegration script include with the default processResponse function provided by the IT Asset Management application

```

Script
1  var DemoFedexAPI = Class.create();
2  DemoFedexAPI.prototype = Object.extend(sn_itam_common.ITAMShipmentIntegration, {
3    initialize: function() {
4      },
5
6    // trackingNumbers: Array of shipment tracking numbers
7    fetchShipmentInfo: function (trackingNumbers, mode) {
8      var returnObj = {
9        httpResponseCode: 0,
10       httpResponseMessage: ''
11      };
12      // Mode = test indicates just check connectivity to API
13      // If mode is test, just check the connection
14      // Else get the status for the input tracking numbers
15      if (mode != 'test') {
16        // Make a call to the carrier API - pass the "trackingNumbers"
17        // If there are no errors, returnObj.httpResponseCode should be 200, else, set it to the returned error code
18        // In case of any error message being returned from API, copy it to returnObj.httpResponseMessage
19        // If call is successful, make sure response is in the format as below:
20        // array of JSON, where each JSON would have below keys with corresponding values
21        // trackingNumber, deliveryDate, pickupDate, packageStatus, statusDetail, trackingURL
22        // Then invoke the default function to update shipments
23        this.processResponse(responseArray);
24      } else {
25        // Check the connection to carrier API and return response
26        // If connection is successful, returnObj.httpResponseCode should be 200, else set it to the returned error code
27      }
28      return returnObj;
29    },
30
31    type: 'DemoFedexAPI'
32  });

```

Sample ITAMShipmentIntegration script include with custom processResponse function

```

Script
1  var DemoUPSAPI = Class.create();
2  DemoUPSAPI.prototype = Object.extend(sn_itam_common.ITAMShipmentIntegration, {
3      initialize: function() {
4          },
5
6          // trackingNumbers: Array of shipment tracking numbers
7          fetchShipmentInfo: function (trackingNumbers, mode) {
8              var returnObj = {
9                  httpResponseCode: 0,
10                 httpResponseMessage: ''
11             };
12             // Mode = test indicates just check connectivity to API
13             // If mode is test, just check the connection
14             // Else get the status for the input tracking numbers
15             if (mode != 'test') {
16                 // Make a call to the carrier API - pass the "trackingNumbers"
17                 // If there are no errors, returnObj.httpResponseCode should be 200, else, set it to the returned error code
18                 // In case of any error message being returned from API, copy it to returnObj.httpResponseMessage
19                 // If call is successful, make sure response is in the format as below:
20                 // array of JSON, where each JSON would have below keys with corresponding values
21                 // trackingNumber, deliveryDate, pickupDate, packageStatus, statusDetail, trackingURL
22                 // Then invoke the default function to update shipments
23                 // In case there is a need for handling shipment updates, implement processResponse function like below
24                 this.processResponse(responseArray);
25             } else {
26                 // Check the connection to carrier API and return response
27                 // If connection is successful, returnObj.httpResponseCode should be 200, else set it to the returned error code
28             }
29             return returnObj;
30         },
31
32         processResponse: function () {
33             // Custom logic for updating shipment records
34             // Query shipment table for each tracking number and then update the values from response onto the corresponding columns
35         },
36
37         type: 'DemoUPSAPI'
38     });

```

fetchShipmentInfo function

The *fetchShipmentInfo* function receives the tracking numbers from the ServiceNow instance of the customer and invokes the carrier API to fetch the shipment details for all the tracking numbers. Within this function, you must define the business logic that enables your customers to communicate with your carrier APIs based on the tracking numbers. This function processes the response that is received from the carrier API and invokes the post-processing function.

processResponse function

The *processResponse* function receives the response from the carrier API and updates the shipment records with the following carrier-related details:

- Carrier link
- Carrier status
- Carrier status detail
- Carrier pick-up date
- Carrier delivered date
- Currency
- Delivery services cost
- Parcel weight

You can either use the default *processResponse* function or define a custom logic to update the shipment records.

Connect your ServiceNow instance with a shipping carrier application

Associate a shipping carrier with an integration profile to connect your ServiceNow instance to the carrier application.

Before you begin

Make sure that the shipping carrier that you want to associate with an integration profile has a shipping carrier record. For more details, see [Create a shipping carrier record](#).

Role required: admin or domain_admin

About this task

A shipping carrier can be associated with only one active integration profile.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Carrier integration profiles**.
3. Select the carrier integration profile that you want to associate with a shipping carrier.

Note:

The third-party carrier application automatically inserts records into the Carrier integration profiles list. If the integration profile associated with your carrier isn't listed, make sure that the prerequisites for the integration with the carrier are fulfilled. For more information, see [Managing shipments by integrating with third-party carrier applications](#).

4. Select the **Shipping Carriers** tab.
5. Associate the shipping carrier with the carrier integration profile.
 - a. Select **Add**.
 - b. In the **Add carriers** dialog box, select the carrier and select **Add**.

Note:

If the carrier you intended to associate is not listed, it likely is already associated with an integration profile.

Result

The shipping carrier is associated with the profile and the carrier details are shown in the **Shipping Carriers** tab.

Remove a shipping carrier from an integration profile

Remove a shipping carrier that you no longer want to associate with an integration profile.

Before you begin

Role required: admin or domain_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Carrier integration profiles**.
3. Select the integration profile for which you want to remove the associated shipping carrier.
4. Select the **Shipping Carriers** tab and select the shipping carrier that you want to remove.
5. Select **Remove**.

Result

The shipping carrier is no longer associated with the integration profile.

Create a carrier integration profile

Create a carrier integration profile for your carrier by specifying the API and connection details that are used to connect your ServiceNow instance to the third-party shipping carrier application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Carrier integration profiles**.
3. Select **New**.
4. On the form, fill in the fields.

Carrier Integration Profile Details form

Field	Description
Name	Name of the integration profile.
Connection details	Reference to the Connection and Credentials Aliases table that stores the credentials of the customer. Note: Your credentials must be updated in the Connection and Credentials Aliases table so that you're authenticated to connect to the carrier API.
API	Name of the script that has the integration business logic.
Job	Name of the scheduled job that invokes the carrier API to fetch the shipment details. This job is automatically created by a job that runs daily, The ITAM: Process integration profiles and stale shipment job.
Active	Option that indicates the status of the integration profile. Note: You can only deactivate the integration profile but can't delete the integration profile. When an integration profile is deactivated, the associated job that invokes the carrier API is deactivated automatically.

5. Select **Save**.

Result

The carrier integration profile is created and added to the Carrier integration profiles list.

View the carrier integration profile details

View the details of the carrier API used to connect your ServiceNow instance to the third-party shipping carrier application.

Before you begin

Role required: admin, domain_admin, asset, or inventory_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations.**
2. From the **Shipment** list, select **Carrier integration profiles.**
The third-party carrier application automatically inserts records into the Carrier integration profiles list. You can also create a carrier integration profile.
3. Select the carrier integration profile of your carrier.

Carrier Integration Profile Details form

Field	Description
Name	Name of the integration profile.
Connection details	Reference to the Connection and Credentials Aliases table that stores the credentials of the customer. Note: Your credentials must be updated in the Connection and Credentials Aliases table so that you're authenticated to connect to the carrier API.
API	Name of the script that has the integration business logic.
Job	Name of the scheduled job that invokes the carrier API to fetch the shipments details. This job is created by a job that runs daily, The ITAM: Process integration profiles and stale shipment job.
Active	Option that indicates the status of the integration profile. Note: Only users with the admin or domain_admin role can deactivate the integration profile but they can't delete the integration profile. When an integration profile is deactivated, the associated job that invokes the carrier API is deactivated automatically.

Test the integration with the carrier API

Check the connection with the carrier API to handle any connection issues such as invalid credentials, incorrect tracking details, and issues with the integration script include.

Before you begin

Role required: admin or domain_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations.**
2. From the **Shipment** list, select **Carrier integration profiles.**
3. Select the carrier integration profile that you want to test.
4. Select **Test connection.**

Result

A message that indicates the success or failure of the connection is displayed.

Create a shipping carrier record

Create a shipping carrier record used to associate the carrier with an integration profile.

Before you begin

Role required: inventory_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations.**
2. From the **Shipment** list, select **Shipping carriers.**
3. Select **New.**
4. Provide the contact details of the carrier.
5. On the form, fill in the remaining fields.

Create New Shipping Carrier form

Field	Description
Name	Name of the shipping carrier. This field is required.
Company	Core company of the shipping carrier.
Integration profile	Profile for integrating with the third-party carrier's application. For more details, see View the carrier integration profile details.
Status	Status of the carrier. This field is set to Active by default.
Max wait days	Maximum days that the carrier takes to deliver a shipment. By default, this field is set to 90. You can change this value. Note: This field isn't shown on the form by default. You can choose to display this field on the form. A shipment record that is not updated by the carrier after the integration profile job has run for the specified maximum wait days is marked as stale shipment by The ITAM: Process integration profiles and stale shipment job.
Notes	Additional information about the carrier.

6. Select **Save.**

Result

The shipping carrier record is created and added to the Shipping carriers list.

View hardware asset shipment details

View all hardware asset shipment details in a single place in the Hardware Asset Workspace.

Before you begin

Role required: inventory_user (read) or inventory_admin

About this task

The Shipment list shows all the shipment records initiated by the shipment tasks of various flows. For details, see [Task closures that create shipment records](#).

A shipment record is created automatically whenever a shipment task of a flow or process is closed.

Note:

The Shipment [sn_itam_common_shipment] table also has the Currency, Delivery services cost, and Parcel weight fields. However, these fields aren't shown on the Shipment form.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Shipments**.
3. Select a shipment record to view the shipment details.

Shipment Details form

Field	Description
Shipment number	Auto-generated and unique identifier for the shipment record.
Tracking number	Unique carrier tracking number for the shipment. Multiple orders or line items can have the same tracking number when they belong to the same shipment. Also, multiple line items that belong to the same order can have different tracking numbers when they're part of different shipments.
Stage	Stage of the shipment record. A shipment can be in one of the following stages: <ul style="list-style-type: none"> ○ Draft ○ On Order ○ Prepare ○ In Transit ○ Delivered ○ Canceled When a shipment has multiple orders, the Stage of the shipment record changes to Delivered when the shipment assets of an order are delivered.
Shipped from	Location from where the assets are shipped. This field is populated with the corresponding field of the order that created this record.
Shipped to	Location to which the assets are shipped.

Field	Description
	This field is populated with the corresponding field of the order that created this record.
Shipped by	Name of the person who shipped the assets. This field is populated with the corresponding field of the order that created this record.
Ship date	Date on which the assets are shipped. This field is populated with the corresponding field of the order that created this record. The date corresponds to the date on which the ship task of the source is closed.
Shipment quantity	Quantity of assets shipped for the shipment record. This field value is automatically populated when the assets are shipped to the destination. The shipment quantity is the sum of the asset quantities shipped for each shipment line. i Important: The Shipment quantity field is available with Hardware Asset Management version 14.0.0 onwards.
Receive date	Date on which the assets are received. This field is populated with the corresponding field of the order that is received first as part of the shipment. The date corresponds to the date on which the receive task of the source is closed.
Received by	Name of the person to whom the assets are sent. This field is populated with the corresponding field of the order that is received first as part of the shipment.
Carrier	Reference to the shipping carrier record.
Carrier status	Status of the shipment. i Note: This field is populated only when you integrate with your third-party carrier applications.
Carrier pick-up date	Date on which the carrier picked up the assets. i Note: This field is populated only when you integrate with your third-party carrier applications.
Carrier delivered	Date on which the carrier delivered the assets.

Field	Description
	<p>Note: This field is populated only when you integrate with your third-party carrier applications.</p>
Carrier link	Link provided by the carrier to track the shipment.
Stale shipment	Option that indicates whether the shipment record is stale. This option is read-only.

Stale shipments

Shipments that are delayed due to various reasons such as an incorrect tracking number, the loss of a shipment package during transit, and invalid connection details are considered stale shipments.

The ITAM: Process integration profiles and stale shipment job runs daily to check for any stale shipments. A shipment record that is not updated by the carrier even after the integration profile job has run for the maximum wait days for a carrier is marked as stale shipment.

The tracking number of the shipment record that is marked stale isn't sent to the carrier for further tracking. If you know the reason that a shipment is late, you can decide to continue tracking it. For more information, see [Continue to track delayed shipments](#).

Note:

You can view the list of shipments that weren't updated with the tracking information from the integrated carrier through the Stale shipments important actions card in the Inventory view. For more information, see [Inventory view](#).

Continue to track delayed shipments

Continue to track a stale hardware asset shipment that is delayed if the reason for the delay is known.

Before you begin

Role required: inventory_user (read) or inventory_admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Shipments**.
3. Select a shipment record that you want to track.
4. On the Shipment details form, select the **Ignore stale check** check box.
5. Select **Save**.

Result

- The **Stale shipment** check box on the Shipment details form is automatically cleared.
- The tracking number of this shipment is sent to the carrier for tracking and this shipment record won't be marked as stale again.

Track a hardware asset shipment

Track the progress of your hardware asset shipment that isn't delivered and that has a carrier associated with an active integration profile.

Before you begin

Role required: `inventory_user` (read) or `inventory_admin`.

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations**.
2. From the **Shipment** list, select **Shipments**.
3. Select a shipment record that you want to track.
4. Select **Track now**.

Result

The following fields on the Shipment details form show the tracking details received from the carrier:

- Carrier status
- Carrier pick-up date
- Carrier delivered date

Track asset location using indoor maps

Locate and track the consumables and hardware, bundle, and pallet assets in your organization by using indoor maps. Indoor maps provide an interactive interface that enables you to visualize the location of your assets within your campuses, buildings, floors, and places.

Before you begin

To be able to use indoor maps in Hardware Asset Workspace, make sure you fulfill the following requirements:

- You should explicitly install Indoor Mapping for Assets (`com.sn_ima`) application from the ServiceNow® Store. When you install this application, Indoor Mapping (`sn_map_core`) and Indoor Mapping component (`sn_map_component`) are also installed.

Note:

To be able to view demo data for indoor maps, you must reinstall demo data after you install the Indoor Mapping for Assets application. For more information, see [Add or repair demo data for applications and plugins](#).

- Set the `com.sn_ham.indoormap.enabled` asset parameter to **true** on your ServiceNow instance.
- Set up your indoor maps: You can design indoor maps using Map Studio. For more information, see [Configure Indoor Mapping](#).

Note:

When you install indoor maps using the entitlement to the Hardware Asset Management license, you can use only the PNG floor map files in the Map Studio. You can't import the files that are in AutoCAD or Raster file format. To use AutoCAD or Raster files, you should have entitlement to Workplace Service Delivery.

- Synchronize location data: The Hardware Asset Management application supports the following indoor mapping location types:
 - Campus: Represents a set of buildings within the same geographic location.
 - Building: Represents a multi-floor building within a specific campus.

- Floor: Represents a floor within a specific building.
- Place: Represents either a polygon or point of interest within a specific floor. Places can represent areas, rooms, desks, printers, assets, and more.

Note:

For indoor map to show assets in Hardware Asset Workspace, assets should be assigned to a location of the type **place** or **room** in the Location [cmn_location] table.

To view the newly created locations within the Hardware Asset Management application, make sure to synchronize the newly created locations from Map Studio to the Location [cmn_location] table.

You can associate the locations created in Map Studio with pre-existing records or new records in the Location [cmn_location] table. For more information, see [Synchronize Indoor Mapping map data with CMN location](#).

Role required: admin or asset

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset estate**.
2. Select the **Asset indoor map** tab.
3. View the assets on a selected floor by using the **Campuses**, **Buildings**, and **Floors** filters.
4. **Optional:** Select a display option at the bottom-right corner of the Indoor map page to view the assets and their location on the selected floor in a particular format.
 - To show the location of the assets on an interactive map, select **Show map only**.
 - To display both the interactive map and a list view of the assets, select **Show map and list**.
 - To display only a list view of the assets, select **Show list only**.
5. **Optional:** If you're viewing the interactive map, view the list of assets in a selected location on the floor by selecting a location on the map.
6. **Optional:** View the location of assets based on a department, user, or model category or a combination of these values.
 - a. Select the Filters Tab icon on the contextual sidebar of the map.
 - b. Select the values for the **Department**, **User**, or **Model category** filters in the Filter by dialog box.

Assess performance of Hardware Asset Management

Track the success of the Hardware Asset Management application in your instance by creating success goals. You can also create a success goal category for a success goal and track the success of your goals by creating success activities.

Create a success goal for Hardware Asset Management

Create a success goal to track the success of the Hardware Asset Management application in your instance.

Before you begin

Role required: ham_admin

Procedure

1. Navigate to one of the following paths.
 - **Hardware Asset Workspace > Success portal**
 - **Hardware Asset Workspace > Asset operations > Success goals**
2. Select **Create success goal** or **New**.
3. On the form, fill in the fields.
For a description of the field values, see [HAM Success Goal Details](#).
4. Select **Save**.
If you want to cancel a success goal, select the success goal number and select **Cancel Goal**.

Result

The success goal that you created gets displayed on the Success goals page in the Asset operations view.

Create success activities for HAM success goals

Create success activities to track the success of your created goals.

Before you begin

Role required: ham_admin, asset (owner of the goal)

Procedure

1. Navigate to one of the following paths.
 - **Hardware Asset Workspace > Success portal**
 - **Hardware Asset Workspace > Asset operations > Success activities**
2. Select **Create success activity** or **New**.
3. On the form, fill in the fields.
For a description of the field values, see [HAM Success Activity](#).
4. Select **Save**.

Result

The success activity that you created gets displayed on the Success activities page in the Asset operations view.

Create a success goal category for hardware assets

Create a success goal category to associate it with the Hardware Asset Management success goal.

Before you begin

Role required: ham_admin

Procedure

1. Navigate to **Hardware Asset Workspace > Asset operations > Success goals > Categories**.
2. Select **New**.
3. On the Success Goal Category form, fill in the category that you want to add and select the **Hardware asset category** check box.
4. Select **Save**.

Result

The category that you add gets listed as an option in the **Category** field while creating a success goal for Hardware Asset Management. For more information, see [Create a success goal for Hardware Asset Management](#).

View all maturity items for Hardware Asset Management

View the maturity of your Hardware Asset Management (HAM) program to analyze the status of each maturity stage, where each stage shows the number of maturity items completed.

Before you begin

Role required: asset

Note:

The asset role can also change the state and success goal of the maturity item.

About this task

The maturity of your HAM program is divided into three stages:

- Crawl
- Walk
- Run

For more information, see [Maturity stages of your Hardware Asset Management program](#).

Note:

The maturity level can't be modified for a required maturity item.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Success portal**.
2. On the Overview page, select **View all maturity items**.
The All maturity items page opens, which lists all the maturity items included in the stage your HAM program is in.
3. Select a maturity item to view its details.
For a description of the field values, see [Maturity item details](#).
4. Select **Save**.

Manage refresh of assets using Zero Touch Refresh

Enable your employees to request hardware refreshes through an external vendor by using the Zero Touch Refresh flow on your ServiceNow instance. This process enables you to eliminate having to maintain a local inventory of new assets.

Service Exchange configuration for Zero Touch Refresh

The Zero Touch Refresh flow uses the Service Exchange application to connect providers with your ServiceNow instance to manage asset refresh requests. Your employees and the provider can work on requests in their own environments.

Service Exchange setup for providers

Providers should perform the following setup tasks to communicate the details of Zero Touch Refresh requests:

1. [Install Service Exchange for Providers](#).
2. [Onboard a new Service Exchange customer](#).
3. Trigger the assignment of a remote task.

Service Exchange setup for employee requests

Perform the following setup to communicate the details of Zero Touch Refresh requests with the provider:

1. [Install Service Exchange for Consumers](#).
2. [Activate the remote task definitions published by the provider.](#)

Trigger the assignment of a remote task

As an asset provider, create remote task definitions that trigger the assignment of a remote task for your customer to communicate the details of Zero Touch Refresh requests.

Before you begin

As a provider, you must have created a provider record. For more details, see [Set up a Service Exchange provider record](#).

Role required: admin

About this task

You receive the details of a Zero Touch Refresh Fulfillment Request from your customer's ServiceNow instance through the inbound fields of the remote task definition. Any updates made to the Zero Touch Refresh Fulfillment Request are sent to your customer's ServiceNow instance through the outbound fields of the remote task definition.

Procedure

1. Navigate to **All > Service Bridge > Provider > Remote Task Definitions**.
2. Select **New**.
3. On the form, fill in the fields.

For the description of field values, see [Remote task definition form](#).

4. Set the **Provider table** and **Customer table** field values to the Zero Touch Refresh Fulfillment Request [sn_itam_ztr_fulfillment_req] table.
5. Select **Submit**.
6. Select this new remote task definition record.
7. Create the inbound fields, which enable you to receive data from the customer's instance when a remote task is created or updated.
 - a. On the **Inbound fields** tab, select **New**.
 - b. For each field you create, fill in the fields and then select **Submit**.
For the required details of the inbound fields that you must create, see [Remote task definition inbound and outbound fields](#).
8. Create the outbound fields, which enable you to send data to the customer's instance when a remote task is created or updated.

- a. On the **Outbound fields** tab, select **New**.
 - b. For each field you create, fill in the fields and then select **Submit**.
For the required details of the outbound fields that you must create, see [Remote task definition inbound and outbound fields](#).
9. Set customer criteria, which specify the customers who can use this remote task definition.
 10. Select **Publish**.

Note:

If you later need to edit this remote task definition, access it and select **Edit**.

Result

A remote task definition record is created on your instance and the **State** field of the record is set to Published. This record is also synchronized with your customer's instance and is pending activation on your customer's instance.

Activate the remote task definitions

Activate the remote task definitions published by the provider on your instance so that your provider can fulfill your Zero Touch Refresh requests.

Before you begin

The Service Exchange application must be installed on your instance. For more information, see [Install Service Bridge for customers](#) .

Before you can activate a remote task definition on your ServiceNow instance, your provider must create and publish it. For more information, see [Trigger the assignment of a remote task](#).

Role required: admin

Procedure

1. Navigate to **All > Service Bridge > Customer > Remote Task Definitions**.
2. Select the remote task definition record.
3. On the Remote Task Definition form, in the Simple Trigger section, set the trigger condition as **Model is not empty**.
Remote tasks are automatically created when records with values in the **Model** field are added to the Zero Touch Refresh Fulfillment Request [sn_itam_ztr_fulfillment_req] table.
4. Select **Save**.
5. Verify the data on the **Inbound fields** tab, the **Outbound fields** tab, and the **Remote task variables** tab.
The provider defines these values. When you create a remote task, the provider receives the remote task data through the inbound fields and responds with the remote task data through the outbound fields.
6. Select **Activate**.
7. In the pop-up window, verify the mappings of the inbound and outbound variables and select **OK**.

Configure replacement models for a refresh model

Configure replacement models for a hardware asset model that is refreshed. When configured, employees can select replacement models for their hardware assets on the Zero Touch Refresh form.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Hardware Asset Workspace > Asset operations.**
2. In the **Zero touch refresh** list, select **Refresh models.**
3. Create the refresh model.
 - a. On the Refresh models page, select **New.**
 - b. On the form, fill in the fields.

Create New Zero Touch Refresh Model form

Field	Description
Model	Model that is being refreshed.
Location	Location for which the replacement models are valid. <div style="border: 1px solid black; padding: 5px;"> <p>Note: Configuring replacement models for a country is the most efficient setup. However, you can configure replacement models for more specific locations such as state or city.</p> </div>
Active	Option that indicates whether the replacement rule is active.

- c. Select **Save.**
4. Add replacement models for the refresh model.
 - a. In the **Replacement models** tab, select **Add.**
 - b. In the **Replacement Model** dialog box, select the models that you want to add as replacement for the refresh asset model and select **Add.**
 - c. Select **Save.**

Result

The refresh model with the assigned replacement models is included in the **Refresh models** list.

Request a hardware asset refresh through Zero Touch Refresh

Request to replace a hardware asset that you own with a new asset directly with the provider through Zero Touch Refresh.

Before you begin

Role required: none

Procedure

1. Navigate to All > Service Catalog > Asset Lifecycle.

If the Asset Lifecycle category isn't available in the service catalog, contact your administrator.

2. On the Asset Lifecycle page, select Zero Touch Refresh.

3. On the form, fill in the fields.

Zero Touch Refresh form

Field	Description
Asset	Hardware asset that you own that you want to refresh. If you select an asset that is not eligible for refresh, a message stating that approvals will be requested is displayed. An approval request is then automatically sent to the asset manager.
Replacement model	Asset model with which you want to replace the hardware asset. The list shows the refresh models based on the model of the hardware asset that you selected and the location of the asset. If the location of the asset isn't specified in the asset record, the location of the requester is considered.

4. Determine where the replacement asset should be sent.

5. Confirm the shipping address choice by selecting the acknowledge check box at the bottom of the Zero Touch Refresh form.

6. Select Submit.

7. Optional: View the status of your Zero Touch Refresh request by navigating to **All > Self-Service > My Requests.**

Result

Your Zero Touch Refresh request is successfully submitted.

Fulfill a Zero Touch Refresh Fulfillment Request

As a provider, ship a replacement asset requested through a Zero Touch Refresh Fulfillment Request to the requester.

Before you begin

The Service Exchange configuration necessary for the Zero Touch Refresh flow must have been set up. For more details, see [Service Exchange configuration for Zero Touch Refresh](#).

Role required: admin, asset, procurement_user, or inventory_user

About this task

When an employee submits a Zero Touch Refresh request on the ServiceNow® instance of your customer, a corresponding Zero Touch Refresh Fulfillment Request is created on your ServiceNow® instance.

Procedure

1. Log in to your ServiceNow® instance.

2. Navigate to All > Zero Touch Refresh Fulfillment Requests.

3. Select a request that is in the Requested state.
4. Review the details on the Zero Touch Refresh Fulfillment Request form.

The Customer request number field shows the corresponding Zero Touch Refresh request number. The fields in the Shipment details tab and the Return shipment details tab are populated with the details specified in the Zero Touch Refresh request.

5. Confirm the Zero Touch Refresh Fulfillment Request.
 - a. In the **State** field, select **Order confirmed**.
 - b. Select **Save**.
6. Ship the replacement asset to the requester or to the stockroom.
 - a. Enter the asset information in the **Asset tag** and **Serial number** fields.
 - b. In the **Shipment details** tab, enter values in the **Tracking number** and **Carrier** fields.
 - c. In the **Return shipment details** tab, enter values in the **Tracking number** and **Carrier** fields.
 - d. In the **State** field, select **Shipped**.
 - e. Select **Save**.
 - f. In the shipment, include a box that the employee can use to return the old asset with an address label made out for the stockroom.
 - g. Ship the new asset to the requester or to the stockroom location where the requester can pick up the asset.

Result

An asset with the serial number and asset tag specified in the Zero Touch Refresh Fulfillment Request is assigned to the employee.

Process a Zero Touch Refresh request

Process a Zero Touch Refresh request to receive the assets from your provider and complete the Zero Touch Refresh flow.

Before you begin

The Service Exchange configuration necessary for the Zero Touch Refresh flow must have been set up. For more details, see [Service Exchange configuration for Zero Touch Refresh](#).

Role required: admin, asset, procurement_user, or inventory_user.

About this task

After the provider ships the assets, the Zero Touch Refresh flow completes when the following actions have occurred:

1. The employee confirms that the replacement asset is received.
2. The inventory manager or the asset manager confirms and evaluates the old asset that was received.

Procedure

1. Log in to your ServiceNow[®] instance.
2. Navigate to **All > Hardware Asset Workspace > Asset operations**.
3. From the **Zero touch refresh list**, select **Requests**.
4. Select the request that you want to process.
5. Select the **Zero Touch Refresh Tasks** tab.

6. As a stockroom manager, notify the employee that the new asset is ready for pickup.
 - a. Select the **Ready for pickup** task.
 - b. Select **Close Task**.
 - An email message is sent to notify the employee that the asset has arrived in the stockroom and is ready for pickup.
 - The Receive asset task is created.

7. Ensure that the Receive asset task is closed.

- If the employee has acknowledged receipt of the replacement asset online, the task is closed automatically.

For more details, see [Acknowledge receipt of an asset on a mobile device](#) or [Acknowledge receipt of an asset through the Core UI](#).

- If the asset has been picked up at the stockroom but the employee has not acknowledged receipt online, users with the admin or asset role can close this task on behalf of the employee by accessing the task and selecting **Close task**.
8. Confirm that the old asset was returned to the stockroom.
 - a. Select the Receive return asset task.
 - b. Select **Close task**.
 - The Receive asset task is closed.
 - The Asset evaluation task is created.
 9. Evaluate the old asset and select the appropriate status.

- a. Select the Asset evaluation task.

- b. In the **Evaluation status**, mark the asset for reuse, repair, or ready for disposal.

- To mark the asset for reuse, select **Re-deployable**.

The state and substate of the asset are set to In stock and Available.

- To mark the asset for repair, select **Needs repair**.

This option initiates the [Return Merchandise Authorization \(RMA\)](#) flow.

The state and substate of the asset are set to In stock and Pending repair.

- To mark the asset as ready for disposal, select **To be disposed**.

The state and substate of the asset are set to In stock and Pending disposal.

- c. Select **Close task**.

Result

The Zero Touch Refresh flow completes. The stage and state of the Zero Touch Refresh request change to Closed complete and Completed.

Acknowledge receipt of an asset on a mobile device

As an employee, acknowledge receipt of the new asset that you received through a Zero Touch Refresh request on a mobile device.

Before you begin

To use your mobile device for this acknowledgment, you must have the ServiceNow mobile app installed on your iOS or Android mobile device.

Role required: none

Procedure

1. Navigate to **My Items > My assets**.
2. Tap the asset.
3. Tap **Scan delivered asset**.
4. Provide the asset tag information.
 - To provide the information through a scan, scan the asset tag of the asset.
 - To provide the information manually, enter a value in the **Asset tag** field.
5. Select **Submit**.

Result

- The state of the asset changes to **In use**.
- The state of the Receive asset task of the Zero Touch Refresh request changes to **Closed**.

Acknowledge receipt of an asset through the Core UI

As an employee, acknowledge receipt of the new asset that you received through a Zero Touch Refresh request through the Core UI on your ServiceNow instance.

Before you begin

Role required: none

Procedure

1. Navigate to **All > Self-Service > My Requests**.
2. Select the Zero Touch Refresh request.
3. In the **Zero Touch Refresh Tasks** tab, select the **Receive asset** task.
4. Select **Close task**.

Result

The state of the Receive asset task of the Zero Touch Refresh request changes to **Closed**.

Configure the Total Cost of Ownership of assets

Configure the Total Cost of Ownership (TCO) of assets by creating rate cards for each task in a Hardware Asset Management workflow.

Rate cards capture costs for a task or on the time consumed on the task.

Related topics

[Asset Total Cost of Ownership for Hardware Asset Management](#)

[Asset analytics view](#)

Create a task rate card in Hardware Asset Workspace

Create a task rate card to define the type of task and the method of calculating the associated costs.

Before you begin

Role required: asset_admin

Activate the ServiceNow® Cost Management (com.snc.cost_management) plugin. For more information, see [Activate Cost Management](#).

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations > TCO configuration > Task rate card.**
2. Select **New.**
3. On the form, fill in the fields.

Create New Task Rate Card

Field	Description
Name	Purpose of the rate card.
Use time worked	Option for forcing the rule to calculate the task cost based on the related task time worked entries. By default, a flat rate for each task is defined in the Task rate field.
Table	The type of tasks the rate card applies to.
Active	Option to determine if the rate card is actively used.
Task rate	Rate of the task, with a currency list. To add a new currency, use the Edit link.
Default labor rate	The default hourly rate to apply to the time worked entries if the worker doesn't have a labor rate card. This field appears only when Use time worked is selected.
Order	Order in which the task rate card applies to the same task. When more than one task rate card applies to the same task, the one with the lowest order is used.
Set conditions	Filter to run on the table selected to determine whether this rate card applies to a given task. This field uses the Condition Count Widget to preview what records would be returned by the conditions.

4. Select **Save.**

Result

After a task rate card is defined for a task, expense lines are created by the **Use time worked** value. When you select the Use time worked field for a task rate card, the time worked records created against users and labor rate are used to calculate expense lines. For more information, see [Process task rate cards](#).

Create a labor rate card in Hardware Asset Workspace

Create a labor rate card to record the time worked on a task and associate a rate to the task.

Before you begin

Role required: asset_admin

Activate the ServiceNow® Cost Management (com.snc.cost_management) plugin. For more information, see [Activate Cost Management](#).

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations > TCO configuration > Labor rate card**.
2. Select **New**.
3. On the form, fill in the fields.

Create New Labor Rate Card

Field	Description
Name	Purpose of the rate card.
Active	Option to determine if the rate card is actively used.
Hourly rate	Identifies the hourly rate to be applied to task time worked entries when the worker meets the condition defined.
Order	Order in which the labor rate card applies to the same task. When more than one labor rate card applies to the same task, the one with the lowest order is used.
Set conditions	Filter to determine whether the Use time worked option applies to this rate card. For more information, see Create a task rate card in Hardware Asset Workspace .

Field	Description
	This field uses the Condition Count widget to preview what records would be returned by the conditions.

4. Select Save.

Result

If you're working on multiple HAM workflows including a labor rate card, the same value is used for all the time recorded tasks. But a labor rate card isn't included, the Default labor rate mentioned in the task rate card is used. For more information, see [Create a task rate card in Hardware Asset Workspace](#).

Create a TCO report in Hardware Asset Workspace

Create your own Total Cost of Ownership (TCO) report to compare the actual or projected TCO of multiple assets or compare the actual or projected asset TCO with the benchmark cost of the hardware model.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset analytics**.
2. In the Comparative reports section, select **New**.
3. On the form, fill in the fields.

TCO report

Field	Description
Name	Name of the TCO report.
Type	Type of the TCO report. <ul style="list-style-type: none"> o TCO comparison: Costs of multiple assets are compared. o TCO vs benchmark: Costs of assets are compared with the benchmark cost.
Report table	Table for Hardware Asset Management, Hardware (alm_hardware).

Field	Description
Total cost type	<ul style="list-style-type: none"> ○ Actual TCO: The TCO value of the selected asset. <ul style="list-style-type: none"> ▪ If both Actual TCO and Real time report check boxes are selected, the generated TCO report is real-time and offline based on the Real time report selection. ▪ If only Actual TCO is selected, the generated TCO report is offline. ○ Projected TCO: This value is referenced from the following formulas and the generated report is only offline. <ul style="list-style-type: none"> ▪ When useful life of the asset is equal to or greater than asset life, the Projected TCO (at end of life) is calculated by using the following formula: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> $\text{Normalized TCO} * \text{Useful life}$ </div> <p>, where Normalized TCO (TCO per month) is</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> $\left(\frac{\text{Purchase cost}}{\text{Useful life}} \right) + \left(\frac{\text{Sum of operational cost}}{\text{Asset life}} \right)$ </div> ▪ When useful life of the asset is lower than asset life, the Projected TCO (at end of life) is calculated by using the following formula: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> $\text{Normalized TCO} * \text{Asset life}$ </div> <p>, where Normalized TCO (TCO per month) is</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> $\left(\frac{\text{Purchase cost} + \text{Sum of operational cost}}{\text{Asset life}} \right)$ </div>
Description	A brief and meaningful description of the report.
Show benchmark	<p>Option for indicating the benchmark cost in the report.</p> <p>This field appears only when Type is selected as TCO comparison.</p>
Benchmark model	Asset model to indicate the benchmark cost.

Field	Description
	When TCO comparison is selected in the Type field, this field appears only when the Show benchmark check box is selected.
Real time report	Option for generating real-time data on the report.
Workspace	The workspace you're working on. Default: HAM

4. Select Save.

Result

The TCO report is generated and displayed in the Comparative reports section of the Total Cost of Ownership dashboard.

Create a TCO report source

Create a Total Cost of Ownership (TCO) report source for TCO reports.

Before you begin

Role required: asset

Procedure

1. Navigate to **Hardware Asset Workspace > Asset analytics**.
2. Open the report for which you want to create report sources from the Comparative reports section.
You can also create a comparative report. For more information, see [Create a TCO report in Hardware Asset Workspace](#).
3. Select the **Report sources** tab.
4. Select **New**.
5. On the form, fill in the fields.

Create New TCO report source

Field	Description
Name	Name of the report source.
Active	Option to indicate if the report source is active or not. By default, this check box is selected. Note: You can have a maximum of four active report sources for a report at any given time. If you want to add another active report source, you must inactivate another report source.

Field	Description
Report table	Table for Hardware Asset Management, Hardware (alm_hardware).
Set conditions	Filter to select assets with certain conditions.
Description	A brief and meaningful description of the report source.

6. Select **Save**.

Result

The new report source is added to the list of TCO report sources in the **TCO report sources** tab.

Manage and monitor hardware asset performance

Configure settings for asset KPI tracking and monitor asset KPIs using performance reports in the Hardware Asset Workspace.

i Important:

The settings to enable the tracking of asset performance are available with Hardware Asset Management version 13.0.0 and later.

Configure settings to monitor asset key performance indicators (KPIs) in the Hardware Asset Workspace

Set up the necessary configurations in the Asset operations view to enable the tracking of KPIs for your hardware assets. These settings enable you to monitor and manage the performance your assets.

i Important:

The settings to enable the tracking of asset performance are available with Hardware Asset Management version 13.0.0 and later.

As an administrator, configure the following settings to monitor asset KPIs:

1. [Opt in to model categories to track performance KPIs for hardware assets.](#)
2. [Create an operational schedule for hardware assets.](#)
3. [Map hardware assets to an operational schedule.](#)

For details on asset performance and the related reports, see [Asset performance reports in the Hardware Asset Workspace](#) and [Asset analytics view](#).

Opt in to model categories to track performance KPIs for hardware assets

Monitor the performance KPIs of hardware assets in your organization by enabling the KPI tracking for the models to which the assets belong.

Before you begin

i Important:

The settings to enable the tracking of asset performance are available with Hardware Asset Management version 13.0.0 and later.

Role required: admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations > KPI configuration.**
2. From the KPI configuration list, select **KPI opt in.**
3. From the list of model categories, select the one for which you want to enable the KPI tracking.
4. On the Asset performance tracking form, select the **Track performance KPI** check box.
5. Select **Save.**

Result

[Create an operational schedule for hardware assets.](#)

Create an operational schedule for hardware assets

Define the scheduled operational time, which is the duration during which the asset will be in use, by creating an operational schedule.

Before you begin

i Important:

The settings to enable the tracking of asset performance are available with Hardware Asset Management version 13.0.0 and later.

Role required: asset

About this task

An operational schedule record is stored in the Asset schedule [sn_itam_common_asset_schedule] table. If an operational schedule isn't defined, the Default operation schedule (24/7) hours is applied.

i Note:

The calculation of asset key performance indicators (KPIs) begins when the asset first moves to the In Use state. Therefore, the linked operational schedule must cover the entire period for accurate results.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations > KPI configuration.**
2. From the KPI configuration list, select **Operational schedules.**
3. Select **New.**
4. On the form, fill in the fields.

Create New Operation schedule form

Field	Description
Name	Unique name for the operational schedule.
Parent	Parent schedule that constraints the new schedule. For more details, see Parent and child schedules  .
Time zone	Time zone for the schedule. If you select Floating , the time zone is relative to whatever process is accessing the item at the time.

Field	Description
	<ul style="list-style-type: none"> ○ For example, if an enterprise administrator in Amsterdam sets a floating schedule for 8:00A.M. to 5:00P.M., a user in San Jose sees the schedule as 8:00 A.M. to 5:00 P.M. ○ When a schedule is defined in a specific time zone, users in different time zones see the schedule with their own time zone applied.
Description	Description of the operational schedule.

5. Select **Save**.

6. Add one or more schedule entries to the operational schedule.

a. Select the **Schedule Entries** tab.

b. Select **New**.

c. On the Schedule Entry New record, fill in the fields.

For details on Schedule Entry New record fields, see [Schedule entry fields](#).

d. Select **Submit**.

A schedule entry is created and listed under the Schedule Entries tab.

Note:

You can't edit a schedule or its entries. If you want to stop using an asset schedule, you can deactivate it by deselecting the **Active** check box. You can then create a new schedule as needed.

7. **Optional:** To view the calendar view of the schedule with the schedule entries, select **Show schedule**.

What to do next

[Map hardware assets to an operational schedule.](#)

Map hardware assets to an operational schedule

Create an asset schedule to map the hardware assets to an operation schedule.

Before you begin

Important:

The settings to enable the tracking of asset performance are available with Hardware Asset Management version 13.0.0 and later.

Role required: admin

About this task

An asset schedule record is stored in the Asset schedule policy [sn_asset_cmn_schedule_policy] table.

Note:

If an asset isn't associated with an operational schedule, the Default asset schedule (24 hours, 7 days a week or 24/7) will be applied.

The *Asset performance - Map schedule policies* job runs weekly to sync the mapping between assets and the operational schedule.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations > KPI configuration**.
2. From the KPI configuration list, select **Asset schedules**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Asset schedule form

Field	Description
Name	Unique name for the asset schedule.
Source table	Source table for the assets. You can select any of the following tables: <ul style="list-style-type: none"> ○ Hardware [alm_hardware] ○ Enterprise asset [sn_ent_asset] ○ Construction asset [sn_ent_construction_asset] ○ Facility asset [sn_ent_facility_asset] ○ Industrial asset [sn_ent_industrial_asset] ○ Linear asset [sn_eam_linear_asset] ○ Medical asset [sn_ent_medical_asset] ○ Retail asset [sn_ent_retail_asset] ○ Tactical equipment asset [sn_ent_tactical_asset] ○ Transportation asset [sn_ent_transportation_asset] ○ Wearable asset [sn_ent_wearable_asset]
Condition	Set a condition to select the assets that you want to associate with the operational schedule. For example, if you set the Department field to IT , the operational schedule is inked to all assets within the IT department. Note: Select the source table before setting the condition.
Schedule	Operational schedule that you want to associate with the assets.
Priority	Order in which schedules should be applied to an asset when there are overlapping schedules.
Active	Indicates whether the asset schedule is active.

5. Select **Save**.
6. **Optional:** To sync the mapping between the assets and the operational schedules on demand, select **Sync KPI records**.

Monitor hardware asset performance with Asset KPIs report

Track the asset availability and related KPI values in the report to see how well a hardware asset is performing.

Before you begin

Important:

The Asset KPIs report is available with Hardware Asset Management version 13.0.0 and later.

Role required: asset

About this task

The Asset KPIs report is available for a hardware asset under the following conditions:

- The asset belongs to a model category of an opted in resource category, and for which the performance tracking is enabled. For details, see [Opt in to model categories to track performance KPIs for hardware assets](#).
- The asset has moved to the In use state, and its KPIs have been calculated and are available in the Asset Availability table [sn_ent_asset_availability].

Note:

The *Calculate asset performance KPIs* scheduled weekly job runs every Saturday to calculate the KPIs for the assets. These KPIs are then reflected in the Asset availability and related KPIs report, which displays the most recent KPI values.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset estate**.
2. Select the **All assets** tab.
3. Select the asset record for which you want to view the details of the asset key performance indicators (KPIs).
4. On the contextual sidebar, select the Asset availability and related KPIs icon [].
The Asset KPIs report is displayed.

5. To view the details of the report, select any section on the report.

A form view of the availability record for the asset is shown with additional details such as the following:

- **Current asset schedule:** The asset schedule linked to the asset currently and used for KPI calculations. If no schedule is linked, the Default asset schedule is used.
- **Start:** The date and time when the asset KPI values were first calculated.
- **End:** The date and time when the asset KPI values were last calculated.
- **Outages During Interval** tab: A list of outages with details like start and end time of the outage and the duration of the outage. For more details on outage record creation and handling, see [Asset performance reports in the Hardware Asset Workspace](#).

View the total time worked on all tasks related to a hardware asset

Use the Asset task time summary report to see the details of the time spent on all tasks for an asset and its child assets, grouped by task category.

Before you begin

Important:

The Asset task summary report is available with Hardware Asset Management version 13.0.0 and later.

Role required: asset

About this task

Asset task time refers to the total time spent on all tasks related to an asset. The total time spent includes the sum of time worked on all related tasks for the asset and its child assets.

Note:

Time spent on tasks related to child assets is rolled up to the parent asset only if the tasks were created and closed after the **last_used** date on the child assets. The total time from these tasks is then aggregated and added to the parent asset's time spent.

When a child asset is removed from a parent asset, the total time spent on the parent asset remains the same. Therefore, the time spent lines associated with the parent asset will be available even after the child asset is removed.

The time worked on a task is tracked after you start working on it and select **Start Timer** until you close the task. The timer automatically stops when you close the task, and the total duration is updated. You can also pause the timer when you aren't working on the task by selecting **Pause**, and then select **Resume** when you continue to work on the task. You can also add time worked details to the task manually by selecting **Record Time**. The time worked on a task is stored in the Time worked [task_time_worked] table.

After a task is closed on a parent or child asset, a time spent line is generated and stored in the Time spent line table [sn_itam_common_time_spent_line]. Each time spent line includes the time worked on the asset task. The sum of the time spent values in these time spent lines gives the total asset task time. If a task involves multiple assets, the total time spent is equally divided among them. This equally distributed time is then aggregated to the parent asset if there are any child assets involved.

Note:

When you upgrade to Hardware Asset Management version 13.0.0, the *Calculate asset time spent* fix script creates time spent lines for asset tasks that have already been completed and closed.

The total time spent is grouped by the following task categories:

- **Purchase - Asset:** Includes the following tasks
 - All tasks in the Refresh flow except the Reclaim aged asset task.
 - All tasks in the Zero touch refresh flow
 - Replacement task in the Return Merchandise Authorization (RMA) flow
 - Replacement task in the Recall flow
- Labor - Maintenance
- **Labor - Repair:** Includes tasks in the following workflows:
 - Repair order
 - RMA order
 - Incident
- **Labor - General:** Includes tasks in the following workflows:
 - Asset reclamation
 - Asset donation
 - Resale
 - Disposal
 - Lease return
 - Transfer order
 - Loaner
 - Asset onboarding
 - Asset refresh flow (only the Reclaim aged asset task)
 - Asset request (Pick task)
 - Drop off and Receive task
 - Change

**Note:**

Total time spent on an asset task isn't calculated for pallets, consumables, and bundle assets. Therefore, the Asset task time summary report isn't available for these assets.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset estate**.
2. Select the **All assets** tab.
3. Select the asset record for which you want to view the details of the total time spent on the tasks.
4. On the contextual sidebar, select the Asset task time summary icon [].
Total time spent by task category report is displayed.

Asset task time summary

Total time spent by task category

Total time spent: **15 Hours 19 Minutes**

The Asset task time summary report includes the following details:

- **Total time spent:** Total time worked on all related tasks for the asset, including tasks on child assets.
- **Breakdown of total time spent:** Total time worked on all related tasks, divided and shown separately for each task category. This visualization helps you to see how much time was spent on tasks within each task category.
- **Legends for the task categories:** Legends shown are based on the actual asset tasks and their task categories. The legends include the following:
 - **Purchase - Asset**
 - **Labor - Maintenance**

- **Labor - Repair**
- **Labor - General**

5. To view the details of the time spent on all tasks within a specific task category, select the corresponding task category section in the report.

The list of time spent lines is displayed, with each line showing the following details:

- **Source asset:** Display name of the asset, including both parent and child assets, for which time was spent on the task.
- **Task:** Task number
- **Task type:** Type of the task, such as the Hardware RMA Order Line task.
- **Task name:** Name of the task, such as Prepare or On-site repair.
- **Time spent:** Time worked on the asset task.
- **Short description:** A brief description of the task.
- **Closed:** The date and time when the asset task was closed.
- **Task category:** Category to which the task belongs.

Manage Hardware Asset Management subscriptions

Save on Hardware Asset Management licensing cost by choosing only the Hardware Asset Management Resource Categories that you use.

For details on Hardware Asset Management licensing, see [Hardware Asset Management subscription](#).

Opt-in or opt-out of HAM license resource categories

Opt in the Hardware Asset Management (HAM) license resource categories that are part of the HAM subscription. You can purchase and opt in the resource categories that you use, and you can opt out and not pay for the categories that you don't use.

Before you begin

Role required: admin or HAM admin

About this task

This procedure is a one-time activity. If you're upgrading from HAM 1.0 or 2.0 version, then all resource categories are by default opted in. The exception is the Mobile Device resource category.

If you're a new user, manually opt in all the resource categories that are part of the HAM subscription.

i Important:

The Mobile Device resource category is only accessible with HAM Mobile Device License entitlement. Resource categories are available irrespective of entitlements in non-production instances. However, in production instances, you would find the resource categories available only with their associated entitlements.

Hardware assets belonging to a category that you don't opt in are excluded by default. For example, if you don't opt in for the End User Computer category, all End user computers would be excluded. For more information, see [Hardware Asset Management license exclusion](#).

i Note:

All the HAM license resource categories are opted in by default when you load demo data in an instance. You must deselect the resource categories that you don't want to opt in for.

Procedure

1. Navigate to **All > Asset > Hardware Model Normalization > HAM Resource categories**.
2. Open a resource category.
Each resource category lists the model categories associated with it.
3. To opt in or opt out of the resource category, do one of the following:
 - If you want to opt in the resource category, select **Opt in**.
 - If you want to opt out of the resource category, select **Opt out**.
A pop-up message appears and asks if you want to opt in or opt out.
4. Select **Ok**.

Result

The resource category is opted in or opted out. A one time run job execution executes the following updates:

- Sets the License opt in column on the models that have the model categories belonging to the opted in or opted out resource categories.
- Sets the exclusion flag on the assets of these models. For more information, see [Hardware Asset Management license exclusion](#).
- A normalization job is triggered for the models that are associated with the resource category.

View the license report for the Hardware Asset Management application

View details of the subscriptions purchased and consumed by your organization for the managed IT resource types such as Server, End User Computing Device, Networking Device, Mobile Device, and Telecom Network Inventory using the ITAM License Report.

Before you begin

Role required: admin, usage_admin

About this task

Note:

Every week on Sunday, the license count for the managed IT resource types is calculated. Any changes to the license consumption reflect on the ITAM license report only after the weekly license count calculation.

Procedure

1. Navigate to **All > ITAM Licensing > ITAM License Report**.
2. Search for the Hardware Asset Management application.

Application	Resource Category	Resource Subcategory	Resource Total Count	Subscription Unit Ratio	Total Subscription Units Consumed
Application: Hardware Asset Management (4)					
Hardware Asset Management	Printer		39	10:1	4
Hardware Asset Management	Monitors		5	15:1	1
Hardware Asset Management	End User Computers		1,019	4:1	255
Hardware Asset Management	Storage		3	3:1	1
Sum					261
Application: Hardware Asset Management for TNI (3)					
Hardware Asset Management for TNI	Network Gear		5	5:1	1
Hardware Asset Management for TNI	Servers		69	1:1	69
Hardware Asset Management for TNI	Telecom Network Inventory		0	1:1	0
Sum					70
Application: Hardware Asset Management for Zero Touch Mobility (2)					
Hardware Asset Management for Zero Touch...	Mobile Device	Bring Your Own Asset	0	10:1	0
Hardware Asset Management for Zero Touch...	Mobile Device	Corporate Asset	0	10:1	0
Sum					0
Sum					331

Subscription details of all the Hardware Asset Management applications activated on your ServiceNow instance are shown.

You can view the following information on subscriptions purchased for the resource categories that you opted-in for all the Hardware Asset Management applications:

- **Application:** Name of the application that is activated on your ServiceNow instance. The ITAM License Report is grouped by the application.
- **Resource Category:** Managed IT resource types available for the Hardware Asset Management application. The resource types include the following:
 - Server
 - End User Computers
 - Network gear
 - Mobile Device
 - Telecom Network Inventory
 - Printers
 - Monitors
 - Storage
 - Unclassified hardware

Note the following:

- Printers, Monitors, Storage, and Unclassified hardware are available with Hardware Asset Management version 10.1.0 and later.
- When more than one Hardware Asset Management solution is activated on your ServiceNow instance, an opted-in resource category that is available with the activated solutions is licensed only under solution. For more details, see [Licensing framework for Hardware Asset Management solutions](#).
- **Resource Subcategory:** Subcategories of a Resource category.

Note:

- Resource Subcategory is available with Hardware Asset Management version 10.1.0 and later.
- Based on the acquisition method, the following resource subcategories are available for the Mobile Device only when the Hardware Asset Management integration with Zero Touch Mobility is activated on your ServiceNow instance:
 - Bring Your Own Asset
 - Corporate Asset
- **Resource Total Count:** Asset count of the managed IT resources that is grouped by Resource categories and Model categories.
- **Subscription Unit Ratio:** Predefined ratios that determine how many assets of a Resource category require a subscription. For example, the defined ratio of 4:1 for End User Computers means that every four assets of that resource category require one Subscription Unit.
- **Total Subscription Units Consumed:** The number of subscriptions per Resource category that your organization consumed. The licensing module calculates this number by applying the Subscription Unit Ratio to the Resource Total Count for each Resource Category.

Exclude assets

Exclude an asset for which you don't want to use Hardware Asset Management licensed features.

Before you begin

Role required: admin

Procedure

1. Navigate to **Hardware Asset Workspace > Asset estate > Hardware assets**.
2. Select a hardware asset that you want to exclude.
3. On the asset form, select the **Exclude from HAM features** check box.

Note:

The **Exclude from HAM features** check box is automatically selected under these conditions:

- If the hardware asset belongs to a resource category that's opted out of Hardware Asset Management licensed features.
- If the hardware asset belongs to a custom model category whose parent model category is associated with an opted-out resource category.

4. Select **Save**.

Result

The asset is excluded from using the licensed Hardware Asset Management features.

Manage hardware asset requests using the Zero Touch request flow

Fulfill hardware asset requests of your employees through an external provider by using the Zero Touch request flow.

Setup required for providers

The provider must complete the following tasks to fulfill the requests received through the Zero Touch request flow:

1. [Complete the Service Exchange setup for providers.](#)
2. [Configure Scratchpad to send updates to your consumer.](#)

i Note:

After completing the prerequisites of the Zero Touch request flow, the provider can fulfill provider tasks. For details, see [Fulfill a provider task](#).

Setup required for your Service Catalog requests

Make sure that you have completed the following tasks so that your catalog requests can be fulfilled through an external provider:

1. [Complete the Service Exchange setup for your service catalog requests.](#)
2. [Manage Service Catalog items for the Zero Touch request flow.](#)
3. [Create a provider integration profile.](#)

i Note:

You must perform this task only if the Scratchpad update received from your provider isn't in the format required for the Zero Touch request flow. You must also [create a Script Include to transform Scratchpad updates from your provider](#).

Zero Touch request flow tasks for your employees

1. [Request a hardware asset through the Zero Touch request flow.](#)
2. [Acknowledge receipt of an asset received through the Zero Touch request flow.](#)

Configure Service Exchange for the Zero Touch request flow

The Zero Touch request flow uses the Service Exchange application to connect providers with your ServiceNow instance to manage hardware asset requests submitted through the Service Catalog.

Service Exchange setup for providers

Providers must perform the following tasks to communicate about the request details with your organization:

1. [Install Service Exchange for Providers](#) .
2. [Register a Service Exchange consumer](#) .
3. [Create and publish remote record producers in a Remote Catalog](#) .

Service Exchange setup for your service catalog requests

Perform the following steps to receive updates on the catalog requests from your provider:

1. [Install Service Exchange for Consumers](#) .
2. [Activate the remote record producers published by the provider](#) .

Use the Scratchpad to complete your request fulfillment tasks

As a provider, use the Scratchpad feature of the Service Exchange application to send updates to the ServiceNow instance of your consumer while performing the request fulfillment tasks.

The Zero Touch request flow requires you to send Scratchpad updates to your consumer's ServiceNow instance when you complete the confirmation and shipment tasks successfully. Based on the updates that you send, the Zero Touch flow progresses on your consumer's ServiceNow instance.

You must include the code specific to your tasks in the *PSBScratchpadUtil* API. For more information, see [Using the Scratchpad for Service Exchange tasks](#) . Confirm that the Scratchpad codes associated with the tasks of your request fulfillment flow are in the following format.

Sample code for request confirmation

```
var scratchPadJSON = {
  "orderStatus": "confirmed"
};
var value = JSON.stringify(scratchPadJSON);
var rtGR = new GlideRecord("sn_sb_pro_provider_task");
rtGR.get(<ProviderTaskID>);
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "confirmation", value);
}
```

When you confirm a provider task, a Scratchpad update with the order status as **Confirmed** is sent to your consumer's ServiceNow instance.

Sample code for shipment

```
var scratchPadJSON = {
  "orderStatus": "partially_shipped / fully_shipped"
  "orderLineItems" :
  [
    {
      "status": "shipped",
      "trackingNumber": "123",
      "carrier": "C1",
      "modelName": 'MD322LL/A',
      "assetTag": 'P1000177',
      "serialNumber": 'P1000177'
    },
    {
      "status": "shipped",
      "trackingNumber": "123",
      "carrier": "C1",
      "modelName": 'MD322LL/A',
      "assetTag": 'P1000178',
      "serialNumber": 'P1000178'
    }
  ]
};
```

When you ship the requested items and confirm the shipment, a Scratchpad update with the following details are sent to your consumer's ServiceNow instance:

- **Order status:** Depending on how the provider has shipped the assets in a request, the Order status can have the following values:
 - **partially_shipped:** Assets in the request are shipped through multiple shipments.
 - **fully_shipped:** All the assets in the request are shipped.
For example, consider that a requester has requested for five assets. If you ship only three assets through a shipment, you should pass the **Order status** as **partially_shipped**. When you ship the remaining two assets, you should pass the **Order status** as **fully_shipped**.
- **Tracking number:** Every shipment has a unique tracking number.
- **Carrier:** The name of the carrier through which the provider shipped the assets.
- **Model number:** Unique model number of the asset that is shipped.
- **Asset tag:** Unique asset tag of the asset that is shipped.
- **Serial number:** Serial number of the asset.

Note:

The shipment update for consumable assets doesn't include Asset tag and Serial number details. If there are multiple shipments, the information of the asset in a shipment must be sent to your consumer's ServiceNow instance only once.

Manage Service Catalog items for the Zero Touch request flow

As a catalog administrator, configure your Service Catalog items so that the hardware asset requests can be fulfilled by an external provider.

Complete the following tasks for your catalog requests to be available for fulfillment through the Zero Touch request flow:

1. [Associate your catalog items with the Zero Touch request flow.](#)
2. [Create variables for the catalog item associated with the Zero Touch request flow.](#)
3. [Associate a catalog item with a remote record producer.](#)

Associate your catalog items with the Zero Touch request flow

Set the flow of your catalog item to Zero Touch request flow for fulfilling all the requests for that catalog item through an external provider.

Before you begin

Role required: catalog_admin

Procedure

1. Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items**.
2. Select the catalog item.
3. On the Catalog form, select **Zero touch request** in the **Flow** field.
4. Select **Update**.

What to do next

[Create variables for the catalog item associated with the Zero Touch request flow.](#)

Create variables for the catalog item associated with the Zero Touch request flow

Create variables for your catalog item so that your provider can fulfill the requests for that item based on the variable details.

Before you begin

Role required: catalog_admin

About this task

To enable your provider to fulfill the catalog requests accurately, you must create variables similar to the variables associated with your provider's remote record producer. For example, if the remote record producer has size and color variables, then you must create the same set of variables for the catalog item. For details, see [View the variables of a remote record producer](#).

Procedure

1. Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items**.
2. Select the catalog item.
3. On the catalog form, select the **Variables** tab.
4. Select **New**.
5. On the form, fill in the fields.
For details on the form fields, see [Service Catalog variable form fields](#).

i Important:

If your provider supports multiple quantities of an asset in a single request, hide the equivalent quantity variable for the catalog item by selecting the **Hidden** check box. This approach avoids multiple quantity fields on the catalog request.

6. Select **Submit**.

Result

The variables are displayed on the Service Catalog request for that catalog item.

What to do next

[Associate a catalog item with a remote record producer](#).

Associate a catalog item with a remote record producer

Associate a service catalog item with your provider's remote record producer to send the order details to your provider for fulfillment.

Before you begin

Role required: catalog_admin

Procedure

1. Navigate to **All > Asset > HAM Zero Touch > Catalog Item mappings**.
2. On the form, fill in the fields.

Catalog item mapping form

Field	Description
Catalog item	Service Catalog item that you want to associate with the remote record producer.
Remote record producer	Remote record producer of the external provider.
Multiple quantity supported	Option to indicate that your provider's remote record producer supports multiple quantities for the catalog item.

Field	Description
Quantity variable	Variable to capture quantity from the list of variables defined for the catalog item. This field is editable only when the Multiple quantity supported check box is selected.
Active	Option to indicate that the catalog item mapping is available for use.

3. Select **Submit.**

View the variables of a remote record producer

View the variables associated with your provider's remote record producer. Variables help you identify the necessary details to include in catalog requests for fulfillment by your provider.

Before you begin

Role required: catalog_admin

Procedure

- 1. Navigate to **All > Service Bridge Consumer > Provider connections**.**
- 2. Select your provider connection.**
- 3. Select the **Remote record producers** tab.**
- 4. Select the remote record producer.**
- 5. Select the **Variables** tab.**

Result

The variables of the selected remote record producer are listed in the Variables tab.

Request a hardware asset through the Zero Touch request flow

Request a hardware asset directly with the external provider through the Zero Touch request flow by ordering the asset from the Service Catalog.

Before you begin

Role required: none

Procedure

- 1. Navigate to **All > Service Catalog > Hardware**.**
- 2. On the catalog request, provide the required details.**
The fields displayed on the catalog request form vary with the catalog item and the provider. The provider requires these field values to fulfill the request.
- 3. In the **Quantity** field of the Order this item section, select the quantity of items that you want to order.**

Note:

If your provider supports multiple assets in a single request, an additional field to enter the quantity details is displayed on the catalog request only when your Catalog Administrator hasn't hidden the equivalent quantity variable for the catalog item. However, the quantity that you selected in the **Order this item** section is considered for your request.

4. Select Submit.**Result**

Your hardware catalog request is successfully submitted.

Fulfill a provider task

As a provider, ship the asset requested through the Zero touch request flow to the requester.

Before you begin

1. The Service Exchange configuration necessary for the Zero Touch Refresh flow must have been set up. For more details, see [Configure Service Exchange for the Zero Touch request flow](#).
2. The Scratchpad must have been configured for the confirmation and shipment tasks involved in your request fulfillment flow. For more information, see [Use the Scratchpad to complete your request fulfillment tasks](#).

Role required: Roles are provider-specific

About this task

When an employee places an order for the catalog item associated with the Zero Touch request flow on your consumer's ServiceNow® instance, a corresponding Provider task is created on your ServiceNow® instance. The provider task triggers a request fulfillment flow on your ServiceNow® instance. As the provider task moves through various stages in the fulfillment flow, the information is sent to your consumer's instance through the Scratchpad updates.

Procedure

1. Log in to your ServiceNow® instance.
2. Navigate to **All > Service Bridge Provider > Open Records > Provider Tasks**.
3. Select a provider task that is in the Received state.
4. Review the details on the Provider task form.
The Variables section provides details that the requester provided on the Service Catalog request.
5. Confirm the provider task by sending a Scratchpad update to your consumer's ServiceNow® instance.
6. Ship the assets requested in the provider task and send a Scratchpad update with the shipment details to your consumer's ServiceNow® instance.
The following shipment details are included in the Scratchpad:
 - Order status: Order status could be either **fully_shipped** or **partially_shipped**.
 - Tracking number: Unique tracking number for the shipment.
 - Model number: Unique model number of the asset that is shipped.
 - Asset tag: Unique asset tag of the asset that is shipped.
 - Serial number: Serial number of the asset.

Result

An asset with the serial number and asset tag specified in the Scratchpad is assigned to the requester.

Acknowledge receipt of an asset received through the Zero Touch request flow

As an employee, acknowledge receipt of the new asset that you received through the Zero Touch request flow on a mobile device.

Before you begin

To use your mobile device for this acknowledgment, you must have the ServiceNow mobile app installed on your iOS or Android mobile device.

Role required: User of the asset.

About this task

You can only confirm the receipt of hardware assets on a mobile device. To acknowledge the receipt of consumable assets, contact your Asset Manager.

Procedure

1. Navigate to **My Items > My assets**.
2. Tap the asset.
3. Tap **Scan delivered asset**.
4. Provide the asset tag information.
 - To provide the information through a scan, scan the asset tag of the asset.
 - To provide the information manually, enter a value in the **Asset tag** field.
5. Select **Submit**.

Result

- The state of the asset changes to **In use**.
- The stage of the requested item in the catalog request changes to **Complete**.

Create a provider integration profile

Create a provider integration profile to convert any format of Scratchpad update sent by your provider to a format required for the Zero Touch request flow.

Before you begin

You must have the Script Include with the method *transformScratchPadToHAMZTRFormat*. For details, see [Create a Script Include to transform Scratchpad updates from the provider](#).

Role required: admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations**.
2. From the **Zero touch** list, select **Provider integration profiles**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Provider Integration Profile form

Field	Description
Provider	Name of the external provider.
API	Name of the Script Include that includes the business logic for transforming the Scratchpad update sent by the provider to the required format.
Active	Option for indicating the status of the provider integration profile.

5. Select **Save**.

Result

The provider integration profile is created and added to the Provider integration profiles list.

Create a Script Include to transform Scratchpad updates from the provider

To transform Scratchpad updates sent by your provider into a format required for the Zero Touch request flow, you must have a Script Include with the method *transformScratchPadToHAMZTRFormat*.

In the confirmation and shipment stages of the Zero Touch request flow, your provider should ideally send Scratchpad updates to your ServiceNow instance in a particular format. For details, see [Use the Scratchpad to complete your request fulfillment tasks](#). However, if your provider's Scratchpad update isn't in the required format, you can transform it by using a Script Include with the method *transformScratchPadToHAMZTRFormat*.

Consider the following points when you create the Script Include:

- The Script Include is accessible from the Asset Management Common application scope by adjusting the following settings on the application resource record:
 - Set the **Accessible from** field to **All application scopes**.
 - Set the **Caller Access** field to **None** to make sure the caller access isn't restricted.
- Define the method *transformScratchPadToHAMZTRFormat* in the following format:

```
/** Input to the following method is scratchpad value of type
  JSON */
transformScratchPadToHAMZTRFormat: function (input) {
  // Logic to transform the input to the expected format
  // This method should return a value of type JSON with expected
  format
}
```

View hardware asset requests submitted through the Zero Touch request flow

View the list of hardware asset requests of your employees submitted through the Zero Touch request flow in the Asset operations view.

Before you begin

Role required: admin or asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations**.
2. From the **Zero touch** list, select **Asset requests**.

The list of asset requests is displayed. You can get the request details such as requested item, quantity, and stage.

3. Select an asset request to view the details.

Manage repair of defective assets in your stockroom in the Hardware Asset Workspace

Optimize your inventory by getting the defective hardware assets in your stockroom repaired using the Repair flow.

In the Repair flow, an asset manager requests the repair of defective assets in the stockroom. An asset technician troubleshoots, repairs, and evaluates the asset. The evaluated asset is either put to use or disposed of. For details on stages in the Repair flow, see [Repair flow to fix defective hardware assets within a stockroom](#).

Request repair of defective hardware assets in your stockroom

As an asset manager, you can get the defective hardware assets in your stockroom repaired by creating repair orders.

You can request repair of defective hardware assets through any of the following options:

- [Request repair of hardware assets using Service Catalog](#)
- [Create repair orders for hardware assets in the Inventory view](#)
- [Request repair of a hardware asset using the Repair option](#)

Note:

Consider the following points when you create a repair order:

- You can't request repair of the following assets:
 - Consumables
 - Assets that are part of any other workflow
- You can request repair of a child asset only if you have added its parent asset to the repair order. However, assets in the pallets can be repaired.

Request repair of hardware assets using Service Catalog

Submit a Service Catalog request to repair hardware assets that are defective or pending repair in your stockroom.

Before you begin

Role required: asset

About this task

You can request repair of multiple defective hardware assets in your stockroom using a single catalog request.

Procedure

1. Navigate to **All > Service catalog > Asset Lifecycle > Asset Repair**.
2. On the form, fill in the fields.

Request for stockroom repair of an asset form

Field	Description
Due Date	Date by which you want the defective assets to be repaired.
Stockroom	Stockroom that has assets to be repaired.

3. Select assets to be repaired.

- a. Select the Edit Asset(s) icon ().
- b. Select the assets from the list.
You can add one or more assets to the request.
- c. Select the Lock icon ().

4. Select **Submit.****Result**

- Your repair request is submitted successfully.
- A repair order is created in the **Draft** stage.
- Each asset in the repair order is associated with a repair order line that is in the **Troubleshoot** stage.

Create repair orders for hardware assets in the Inventory view

Request repair of hardware assets that are defective or pending repair by creating a repair order in the Inventory view of the Hardware Asset Workspace.

Before you begin

Role required: asset

About this task

When you create a repair order from the Inventory view, you must explicitly create a repair order line for the asset that you want to get repaired.

Procedure

- 1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.**
- 2. Select the **Repair orders** tab.**
- 3. Create a Repair order.**
 - a. Select **New**.
 - b. On the form, fill in the fields.

Note:

The following fields are optional:

- **Assignment group**
- **Assigned to**
- **Due date**
- **Work note**

Create New Repair order form

Field	Description
Stockroom	Stockroom that has assets to be repaired. This field is required.
Assignment group	Assignment group to which you want to assign the repair order.
Assigned to	Person from the assignment group who is primarily responsible for the Repair order.
Due date	Date by which the defective hardware assets should be repaired.
Work notes	Notes about the repair order.

c. Select **Save**.

- A repair order that's in the **Draft** stage is created.
- The **Repair order lines** tab is displayed next to the **Details** tab of the repair order.

4. Add repair order lines to the repair order.

a. Select the **Repair order lines** tab.

b. Select **Add**.

c. In the **Add assets** dialog box, select the assets and then select **Add**.

Note:

You can add child assets of a pallet asset to the repair order. The asset that you added to the repair order is removed from the pallet automatically.

For each asset that you added, a repair order line that's in the **Troubleshoot** stage is created.

5. Select **Save**.

Request repair of a hardware asset using the Repair option

Request repair of a defective hardware asset in your stockroom directly through an option on the asset form.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset Estate**.
2. Select the **All assets** tab.
3. Select an asset with State as **In stock** and Substate as **Defective** or **Pending repair**.
4. Select the More Options icon (**⋮**) on the asset form.
5. Select **Repair**.

Result

A repair order with a repair order line in the **Troubleshoot** stage is created.

Fulfill repair orders in the Hardware Asset Workspace

Fulfill a repair order by completing all the open repair asset tasks associated with its repair order lines.

A repair order can have one or more repair order lines depending on the number of assets to be repaired through that repair order. A repair order is fulfilled only when all its repair order lines are completed.

As a technician, you must complete the following tasks associated with each repair order line to fulfill a repair order:

1. [Troubleshoot asset](#)
2. [Repair asset](#)
3. [Evaluate asset](#)

You can also work on the asset repair tasks assigned to you by using the Mobile Agent application. For details, see [Manage hardware asset repair tasks using the Mobile Agent application](#).

View open repair orders for your stockroom in the Hardware Asset Workspace

View open repair orders for your stockroom to get the details of the repair order lines and repair tasks that need action.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom.
In the Open stockroom tasks section, the **Open repair orders** card displays the number of open repair orders.
4. Select the **Open repair orders** card.

Result

The list of open repair orders for the stockroom is displayed.

Troubleshoot assets requested for repair in the Hardware Asset Workspace

Complete the troubleshooting task to assess the issues with the defective asset. Based on your observations, you can confirm whether the asset can be repaired, redeployed, or should be disposed of.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order that's in the Draft or In Progress stage.
4. Select the **Repair order lines** tab.
5. Select a repair order line that's in the Troubleshoot stage and Open state.
6. Select the **Repair asset tasks** tab.
7. Select the **Troubleshoot asset** task that's in the Open state.
8. Indicate that you have started working on the Troubleshoot task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Hardware Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Troubleshoot asset task.
10. Select the **Details** tab.
11. Select the troubleshooting result in the **Troubleshoot result** field.
 - If the asset is repairable, select **Repairable**.
 - If the asset is unrepairable, select **Unrepairable**.
 - If the asset can be redeployed, select **Redeployable**.
12. **Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.
Once the task is closed, this field can't be modified.
The value in the **Issue identified** field is carried forward to the repair asset task after the troubleshooting task is closed.
13. Enter notes related to the task in the **Work notes** field.
14. Select **Close task**.

Result

- If you had set the Troubleshooting result to **Unrepairable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and substate changes to Pending disposal.
- If you had set the Troubleshooting result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.

- If you had set the Troubleshooting result to **Repairable**, the following changes happen on closure of the task:
 1. The stage of the repair order line changes to Repair.
 2. The state of the asset changes to In stock and the substate changes to Pending repair.
 3. Repair asset task is created.

What to do next

[Complete the repair asset task in the Hardware Asset Workspace.](#)

Complete the repair asset task in the Hardware Asset Workspace

Complete the repair of the defective asset and confirm if the asset is repaired, unrepairable, or redeployable.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order for which you want to complete the Repair asset task.
4. Select the **Repair order lines** tab.
5. Select the repair order line that's in the Repair stage.
6. Select the **Repair asset tasks** tab.
7. Select the **Repair asset** task that's in the Open state.
8. Indicate that you have started working on the Repair asset task by selecting **Start Work**. The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Hardware Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Repair asset task.
10. Select the **Details** tab.
11. Select the repair result in the **Repair result** field.
 - If the asset is repaired, select **Repaired**.
 - If the asset couldn't be repaired, select **Unrepairable**.
 - If the asset can be redeployed, select **Redeployable**.
12. **Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.

(Optional) This field is automatically populated with the value carried forward from the troubleshoot asset task if the issue is identified and a value is provided in the **Issue identified** field. Once the task is closed, this field can't be modified.

The value in the **Issue identified** field is carried forward to evaluate repaired asset task after the repair task is closed.
13. Enter notes related to the task in the **Work notes** field.
14. Select **Close task**.

Result

- If you had set the Repair result to **Unrepairable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Pending disposal.
- If you had set the Repair result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.
- If you had set the Repair result to **Repairable**, the following changes happen on closure of the task:
 1. The stage of the repair order line changes to Evaluate.
 2. The state of the asset changes to In stock and the substate changes to Pending evaluation.
 3. Evaluate asset task is created.

What to do next

Evaluate the repaired asset in the [Hardware Asset Workspace](#).

Evaluate the repaired asset in the Hardware Asset Workspace

Evaluate the repaired asset and confirm if the asset is redeployable or should be disposed of. The Repair flow completes after the repaired asset is evaluated.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order for which you want to evaluate the repaired asset.
4. Select the **Repair order lines** tab.
5. Select a repair order line that's in the Evaluate stage and Open state.
6. Select the **Repair asset tasks** tab.
7. Select the **Evaluate asset** task that's in the Open state.
8. Indicate that you have started working on the Evaluate asset task by selecting **Start Work**. The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Hardware Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Evaluate asset task.
10. Select the **Details** tab.
11. Select the evaluation result in the **Evaluation result** field.
 - If the asset is repaired and redeployable, select **Redeployable**.
 - If the asset can't be used and should be disposed of, select **To be disposed**.
12. **Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.

This field is automatically populated with the value carried forward from the repair asset task if the issue is identified and a value is provided in the **Issue identified** field. Once the task is closed, this field can't be modified.

13. Enter notes related to the task in the **Work notes** field.

14. Select **Close task**.

Result

- If you had set the Evaluation result to **To be disposed**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Pending disposal.
- If you had set the Evaluation result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.

Bulk close asset repair tasks in the Hardware Asset Workspace

Complete and close multiple repair tasks at one go to process a repair order with multiple repair order lines.

Before you begin

Role required: asset

About this task

You can bulk close only similar asset repair tasks that are in the Open state. However, you can't bulk close similar repair tasks for which the task result isn't the same. For example, you can't bulk close two Troubleshoot assets tasks, when one task has a repairable asset and the other has an unrepairable asset.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order with multiple open repair order lines for which you want to complete the asset repair tasks.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you want to complete.
6. Select the repair task that you want to close.
7. On the Details form, select the task result.
 - If you're completing a Troubleshoot asset task, then select any of the following results in the **Troubleshoot result** field:
 - **Repairable**
 - **Unrepairable**
 - **Redeployable**
 - If you're completing a Repair asset task, then select any of the following results in the **Repair result** field:

- **Repaired**
 - **Unrepairable**
 - **Redeployable**
 - If you're completing an Evaluate asset task, then select any of the following results in the **Evaluation result** field:
 - **Redeployable**
 - **To be disposed**
8. Enter notes related to the task in the **Work notes** field.
 9. Select **Save**.
 10. Select **Bulk Close**.
The **Select Assets** dialog box with similar repair tasks is displayed.
 11. Select the tasks that you want to close and select **Close Task**.

Result

All the selected repair tasks are closed with the same task result and Work notes.

Cancel a repair order in the Hardware Asset Workspace

Cancel a repair order that no longer needs to be fulfilled.

Before you begin

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order that's in the Draft or In Progress stage.
4. Select **Cancel**.

Result

- The stage of the repair order changes to Cancelled and the state changes to Closed Incomplete.
- The stage and state of the repair order lines that weren't completed change to Cancelled and Closed Incomplete.

Cancel a repair order line in the Hardware Asset Workspace

Cancel a repair order line that no longer needs to be fulfilled.

Before you begin

Role required: asset

About this task

You can only cancel a repair order line that is not in the Completed stage.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order that's in the Draft or In Progress stage.

4. Select the **Repair order lines** tab.
5. Select the repair order line that you want to cancel.
6. Select **Cancel**.

Result

- The stage of the repair order line changes to Cancelled and the state changes to Closed Incomplete.
- The state of the associated repair asset tasks that were open changes to Closed Incomplete.
- The stage of the repair order changes to Cancelled only if there aren't any other repair order lines that are in the Troubleshoot, Repair, Evaluate, or Completed stage.

Record time worked on asset repair tasks in the Hardware Asset Workspace

Manage and record time worked on Troubleshoot asset, Repair asset, and Evaluate asset tasks in the Hardware Asset Workspace. After you start work on a repair asset task, you can pause and resume work. You can also record the time worked manually.

Record time worked on a repair task automatically in the Hardware Asset Workspace

Record the time that you took to complete a repair task without taking any break until you completed the task.

Before you begin

Role required: asset

About this task

You can record the time worked for Troubleshoot asset, Repair asset, and Evaluate asset tasks that are in the Open state.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order that you're working on.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you're working on.
6. Select the **Repair asset tasks** tab.
7. Select the asset repair task for which you want to record the time worked.
8. Indicate that you started work on the task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. Select **Start Timer**.
10. After you have completed working on the task, on the Details form, select the task result.
 - If you have completed a Troubleshoot asset task, then select any of the following results in the **Troubleshoot result** field:
 - **Repairable**
 - **Unrepairable**
 - **Redeployable**
 - If you have completed a Repair asset task, then select any of the following results in the **Repair result** field:

- **Repaired**
- **Unrepairable**
- **Redeployable**
- If you have completed an Evaluate asset task, then select any of the following results in the **Evaluation result** field:
 - **Redeployable**
 - **To be disposed**

11. Enter notes related to the task in the **Work notes** field.

12. Select **Close Task**.

Result

The actual time you worked on the task completion is automatically calculated. An entry for the time worked is created in the Time Worked tab of the asset repair task.

Record time worked on a repair task manually in the Hardware Asset Workspace

Create an entry for the time worked on an asset repair task manually in the Hardware Asset Workspace.

Before you begin

Role required: asset

Procedure

- 1.** Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
- 2.** Select the **Repair orders** tab.
- 3.** Select the repair order that you're working on.
- 4.** Select the **Repair order lines** tab.
- 5.** Select the repair order line that you're working on.
- 6.** Select the **Repair asset tasks** tab.
- 7.** Select the task for which you want to record time manually.
- 8.** Indicate that you started work on the task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
- 9.** Select **Record Time**.
- 10.** In the **Record Time** dialog box, enter the details of the time worked.
 - a.** Enter the time duration that you worked on the task in the **Days**, **Hours**, and **Minutes** fields.
 - b. Optional:** Provide any additional information in the **Comments** field.
- 11.** Select **Save**.

Result

The Time Worked form is saved and the time card is added to the Time Worked tab of the asset repair task.

Pause a repair task in the Hardware Asset Workspace

Record a break from a repair task in the Hardware Asset Workspace if you're not continuing to work on it. Resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Before you begin

You can pause an asset repair task that is in the Work in Progress state. The option to pause the task is available only after you perform the following actions for the asset repair task:

1. Indicate that you have started working on the task by selecting **Start Work**.
2. Start recording the time by selecting **Start Timer**.

Role required: asset

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order that you're working on.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you're working on.
6. Select the **Repair asset tasks** tab.
7. Select the task that you want to pause.
8. Select **Pause Work**.
The **Pause Work** changes to **Resume Work**
9. Select **Resume Work** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time Worked tab.

Manage picking hardware assets within your stockroom for Hardware Asset Management workflows

Enable the Asset pick task explicitly for your stockroom and provide granular location details of the asset to facilitate asset picking within your stockroom.

Enable the Asset pick task for your stockroom in the Hardware Asset Workspace

Enable the Asset pick task for your stockroom so that the task is automatically added to Standard Hardware Asset requests, Hardware Asset Refresh requests, and Sourcing workflow.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom for which you want to enable the Asset pick task and Asset put away task.
4. On the **Stockroom Details** form, select the **Warehouse tasks required** check box.
5. Select **Save**.

Add aisles and spaces to a stockroom in the Hardware Asset Workspace

Add details of aisles and spaces in a stockroom to provide granular location details of an asset in that stockroom. The aisle and space details enable you to locate and pick an asset in the stockroom.

Before you begin

Role required: inventory_user

About this task

A space is associated with an aisle in the stockroom. You can add a space only after you have added a minimum of one aisle to the stockroom.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.

2. Select the **All stockrooms** tab.

3. Select a stockroom.

4. Select the **Aisle and spaces** tab.

The list of existing aisles and spaces in that stockroom is displayed.

5. Add aisles to the selected stockroom.

a. Select **Add aisle**.

The **Add aisle** dialog box is displayed.

b. In the **Aisle** field, enter a unique identifier for the aisle.

You can enter any string value in this field. For example, aisle_0001.

c. **Optional:** To add more aisles, select the Add icon (**+**) and enter a unique identifier for the aisle in the **Aisle** field.

d. Select **OK**.

The aisle is added to the list in the Aisle and spaces tab.

6. Add a space to an aisle in the stockroom.

a. Select **Add space**.

The **Add space** dialog box is displayed.

b. In the **Aisle** field, select the aisle for which you want to add a space.

c. In the **Space** field, enter a unique identifier for the space.

You can enter any string value in this field. For example, space_0001.

d. **Optional:** To add more spaces, select the Add icon (**+**) and enter a unique identifier for the space in the **Space** field.

e. Select **OK**.

- The space is added to the list in the Aisle and spaces tab.
- The Display name of the space is automatically set based on the **Aisle** and **Space** fields. For example, the display name of the space whose aisle is aisle_001 and space is space_001 is **aisle_001 - space_001**.

View the open hardware asset pick tasks for your stockroom

View the open hardware asset pick tasks for your stockroom to get the details of the tasks that need action.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom.
In the Open stockroom tasks section, the **Open pick tasks** card displays the number of open pick tasks.
4. Select the **Open pick tasks** card.

Result

The list of open asset pick tasks for the stockroom is displayed.

What to do next

Manage all the hardware asset pick tasks assigned to you by using the Mobile Agent application. For details, see [Manage hardware asset pick tasks using the Mobile Agent application](#).

Manage asset put away using the Hardware Asset Workspace

Enable the Asset put away task explicitly for your stockroom to put away the assets from the receiving bay in the designated aisle-space. View the open Asset put away task and close it after specifying the aisle-space value to move the asset in the stockroom.

Important:

The Asset put away feature is available with Hardware Asset Management version 13.0.0 onwards.

Enable the asset put away task for your stockroom

Enable the Asset put away feature for your stockroom so that the Asset put away task is automatically created to track asset movement.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom for which you want to enable the Asset pick task and Asset put away task.

4. On the Stockroom Details form, select the **Warehouse tasks required** check box.

5. Select **Save**.

Result

You can perform asset put away for in stock assets in the stockroom.

View open put away tasks for your stockroom

View the open put away tasks for your stockroom in the Hardware Asset Workspace to get the details of the tasks that need action.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. View the open put away task either from the Inventory overview section or the All Stockrooms tab.
 - In the Inventory overview section, select the **Open put away tasks** number.
 - In the **Stockrooms** tab, select a stockroom. In the Open stockroom tasks section, select the **Open put away tasks** number.

Result

The list of open Asset put away tasks are displayed.

What to do next

Put away the asset in the desired drop-off location in the stock room. Close the Asset put away task after adding the **Drop off location** field value in the Asset put away task form. For more information about closing Asset put away task, see [Close an Asset put away task](#).

Create an Asset put away task

Create an Asset put away task manually for the In stock assets in the Hardware Asset Workspace to track the movement of assets within the stockroom.

Before you begin

Role required: inventory_user

About this task

You can create an asset put away task in the Hardware Asset Workspace for the In stock assets for which the **Aisle and Space** field value isn't already specified. When you create a put away task, you can either directly close the task or save it. To close the task, the **Drop off location** field value is required.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Open the Create New Asset put away task form either from the Inventory overview section or the All Stockrooms tab.
 - In the Inventory overview section, select the **Open put away tasks** card and select **New**.
 - In the Stockrooms tab, select a Stockroom. Then in the Open stockroom tasks section, select the **Open put away tasks** card. Select **New**.
3. On the Asset put away task form, fill in the fields.
For a description of the field values, see [Asset put away task fields](#).

4. Save your modifications.

- To save your changes and create the Asset put away task, select **Save**.
- To save your changes and close the Asset put away task, select **Close task**.

Note:

Drop off location field value is required to close the Asset put away task.

Close an Asset put away task

Add the asset drop-off location for an open Asset put away task and close it in the Hardware Asset Workspace.

Before you begin

Role required: inventory_user

About this task

You can bulk close selected Asset put away tasks that are open and assigned to you by specifying a drop-off location, which moves all associated assets to that location. You can also close individual tasks by specifying a drop-off location.

Note:

When you make the following changes to a hardware asset, the associated Asset put away task is closed:

- When the asset's **Aisle and Space** value is filled, the associated Asset put away task for the asset is closed, and the **State** field is updated to **Closed Complete**.
- When the asset's State field is updated from In stock to some other value without adding the **Aisle and Space** field value, the associated Asset put away task is closed and its state is updated to Closed Incomplete.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Open the put away task either from the Inventory overview section or the **All Stockrooms** tab.
3. In the Put away task form, select the **Drop off location** value.
4. Save your modifications or close the put away task.
 - To close the put away task, select **Close task**.
 - To save your changes and stay on the same page, select **Save**.
 - To close multiple put away tasks, select **Bulk close**.

The **Select Assets** dialog box is displayed listing the Asset put away tasks assigned to you. Select the tasks that you want to close and select **Close Task**.

Result

- Closed tasks aren't displayed in the Open put away tasks list.
- The task closure is captured in the **Activity** tab. The name of the user who closed the task is shown in the work notes.

Manage hardware asset tasks using the Mobile Agent application

Manage hardware asset tasks such as repair tasks and asset pick tasks using the intuitive Mobile Agent application.

Manage hardware asset repair tasks using the Mobile Agent application

Manage all the repair tasks associated with the defective hardware assets in your stockroom using the intuitive Mobile Agent application.

View your hardware asset repair tasks using the Mobile Agent application

View the Troubleshoot asset, Repair asset, and Evaluate asset tasks assigned to you by using the Mobile Agent application.

Before you begin

Role required: admin or asset

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. View all the tasks assigned to you by selecting **See all**.
4. **Optional:** Filter your tasks by field values.
 - a. Tap the Filter icon ()
 - b. Enter values in the fields by which you want to filter your task: **Due Date, Asset, Location, or Priority**.
5. **Optional:** Sort your tasks.
 - a. Tap the Filter icon ()
 - b. Tap **Sort by**.
 - c. Select the fields by which to sort your tasks.

Start working on a hardware asset repair task using the Mobile Agent application

Indicate in the Mobile Agent application when you start work on a repair task assigned to you.

Before you begin

Role required: asset

About this task

You can work on the repair tasks that belong to the following task types:

- Asset troubleshoot task
- Asset repair task
- Asset evaluate task

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.

3. If the task you want to start isn't displayed, tap **See all**.

4. **Optional:** Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the repair task that you want to start.

6. On the **Details** tab, tap **Start work**.

Result

On the **Details** tab, the **Start work** link changes to **Start timer, Record time, and Close** automatically.

What to do next

[Record time worked on a hardware asset repair task using the Mobile Agent application.](#)

Record time worked on a hardware asset repair task using the Mobile Agent application

Manage and record time worked on Troubleshoot asset, Repair asset, and Evaluate asset tasks using the Mobile Agent application. After you start working on a task, you can pause and resume work. You can also record the time worked manually.

Pause a hardware asset repair task using the Mobile Agent application

Record a break from a repair task for the hardware assets using the Mobile Agent application if you're not continuing to work on it.

Before you begin

After you start work on the repair task, start recording the time by tapping the **Start Timer** in the **Details** tab.

Role required: asset

About this task

You can resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Procedure

1. From your mobile device, launch the Mobile Agent application.

2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.

The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.

3. If the task you want to pause isn't displayed, tap **See all**.

4. **Optional:** Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the task record that you want to pause.

6. On the **Details** tab, tap **Pause**.

On the **Details** tab, the **Pause** option changes to **Resume**.

7. Tap **Resume** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the repair task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time worked section of the Related tab.

Record time worked on a hardware asset repair task manually using the Mobile Agent application

Record time worked on a hardware asset repair task manually and provide any additional comments on the task using the Mobile Agent application.

Before you begin

Make sure you have indicated that you started working on the repair task by tapping **Start work** in the **Details** tab.

Role required: asset

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task for which you want to record time isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon () , tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the repair task record for which you want to record time.
6. On the **Details** tab, tap **Record time**.
7. On the Record time screen, specify the details of the task.
 - a. Enter the time duration that you worked on the task in the **Time worked (Hours)** and **Time worked (Minutes)** fields.
 - b. **Optional:** Provide any additional information in the **Time worked comments** field.
8. Tap **Done** and then tap **Submit**.

Result

The Record time form is saved and the time card is added to the Time worked section of the Related tab.

Close a hardware asset repair task using the Mobile Agent application

Complete an assigned hardware asset repair task and mark the task as closed using the Mobile Agent application.

Before you begin

Role required: asset

About this task

You can close any task that belongs to the following task types:

- Troubleshoot asset task
- Repair asset task
- Evaluate asset task

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to close isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields to sort your tasks.
5. Tap the repair task that you want to close.
6. On the **Details** tab of the repair task, tap **Close**.
7. On the Repair task input form screen, enter the result of your task.
8. In the **Work notes** field, enter your closure comments.
9. Tap **Done** and then tap **Submit**.

Result

The state of the repair task changes to Closed Complete.

Manage hardware asset pick tasks using the Mobile Agent application

Work on the hardware asset pick tasks assigned to you by using the Mobile Agent application.

Start working on a hardware asset pick task using the Mobile Agent application

Indicate in the Mobile Agent application when you start work on an asset pick task assigned to you.

Before you begin

Role required: inventory_user

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the Asset pick task that you want to start.

Use the details provided in the following fields on the **Details** tab to start work on the assigned asset pick task:

- **Asset:** Asset that you should pick.
- **Stockroom:** Stockroom from which you should pick the asset.
- **Pick location:** Aisle and space within the stockroom from where you should pick the asset.

6. On the **Details** tab, tap **Start work**.

Result

On the **Details** tab, the **Start work** link changes to **Start timer**, **Locate**, and **Scan asset** automatically.

What to do next

Complete the Asset pick task assigned to you. For details, see [Locate and pick the hardware assets in your stockroom using the Mobile Agent application](#).

Record time worked on a hardware asset pick task using the Mobile Agent application

Manage and record time worked on hardware asset pick tasks using the Mobile Agent application. After you start working on a task, you can pause and resume work.

Pause a hardware asset pick task using the Mobile Agent application

Record a break from a hardware asset pick task by using the Mobile Agent application if you're not continuing to work on it.

Before you begin

After you start work on the hardware asset pick task, make sure to start recording the time by tapping **Start timer** in the **Details** tab.

Role required: inventory_user

About this task

After you pause a task, you can resume when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to pause isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the asset pick task record that you want to pause.

6. On the **Details** tab, tap **Pause**.

Note:

The **Pause** option is displayed only after you tap **Start timer**.

On the **Details** tab, the **Pause** option changes to **Resume**.

7. Tap **Resume** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the asset pick task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time worked section of the Related tab.

Locate and pick the hardware assets in your stockroom using the Mobile Agent application

Locate a hardware asset placed in a specific aisle and space in the stockroom by using indoor maps. After locating the asset, pick and drop off the asset to another location within the stockroom using the Mobile Agent application.

Before you begin

You should explicitly install Indoor Mapping for Assets (com.sn_ima) application from the ServiceNow Store. When you install this application, Indoor Mapping (sn_map_core) and Indoor Mapping component (sn_map_component) are also installed.

Role required: inventory_user

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the Asset pick task for which you have started work.
6. To locate the hardware asset in the stockroom, on the **Details** tab, tap **Locate**.
 - The exact location of the hardware asset in the stockroom is displayed on the map.
 - The **Get directions** option is displayed.
7. Get directions to the asset location in the stockroom.

- a. Tap **Get directions**.
- b. Choose the start location on the map.
- c. Tap **Save**.
 - The following details are displayed on the map:
 - Path from the start location to the asset location
 - Approximate time required for you to reach the asset location
 - **View steps** and **Scan asset** options are displayed.
8. **Optional:** To view the route to the asset location, tap **View steps**.
9. After reaching the asset location, pick the asset.
10. Complete the Asset pick task.
 - a. Tap **Scan asset**.
 - b. Provide the asset tag information.
 - To provide the information through a scan, scan the asset tag of the asset.
 - To provide the information manually, enter a value in the **Asset tag** field.
 - c. **Optional:** In the **Drop off location** field, select the space within the stockroom where you want to drop off the asset that you picked.
 - d. Select **Close complete**.
 - The state of the Asset pick task changes to Closed complete.
 - The **Location** field of the asset is updated with the drop off location only if you have specified the drop off location.
 - The Hardware Asset request flow and Hardware Refresh request flow proceed to the next stage.

Manage asset put away using the ServiceNow Agent application

Scan and put away the assets from the receiving bay in the designated aisle-space using the ServiceNow Agent application.

Important:

The Asset put away feature is available with Hardware Asset Management version 13.0.0 onwards.

Put away assets using the ServiceNow Agent application

Scan available assets in the inventory and perform an asset put away task in the designated scanned drop-off location.

Before you begin

Role required: inventory_user

About this task

The inventory user can scan the available assets in the inventory and put them away in the scanned aisle-space in the stockroom. The Hardware Asset Management application checks the existence of an active put away task for the asset and makes the required update in the Hardware Asset Workspace.

- If an active Asset put away task exists, the task is closed when the asset is placed in the designated stockroom location.
- If an active Asset put away task doesn't exist for the asset, then a task is created and closed when the asset is placed in the designated stockroom location.

Procedure

- 1.** From your mobile device, launch the Mobile Agent application.
- 2.** On the navigation bar, tap the Asset put away menu.

Audit your hardware assets by using Asset Attestation

Improve the asset utilization by auditing the hardware assets assigned to your employees and validating if the employees are using the assigned assets.

As an Asset manager or an Inventory administrator, you can create an asset attestation in any of the following ways:

- [Create an asset attestation or a schedule using the playbook](#)
- [Create an asset attestation in the Inventory view.](#)

- [Create an asset attestation schedule.](#)
- [Create an attestation for a hardware asset](#)

i Important:

Starting with Hardware Asset Management version 13.0.0, the playbook is the default option for the creation of asset attestations and schedules. However, if you set the value of the `sn_itam_common.enable_asset_attestation_playbook` system property to **false** with the asset or inventory_admin role, you will be shown forms to complete the attestation process instead of the playbook.

As an employee, you can confirm the assets assigned to you in any of the following ways:

- [Confirm the assigned assets using the Now Mobile app.](#)
- [Confirm the assigned assets on the Employee Center portal.](#)

For more details, see [Asset Attestation](#).

Playbook for asset attestation

The Create asset attestation playbook provides detailed, step-by-step instructions for creating an asset attestation. This playbook guides you through each stage of the attestation process, starting from filling in the asset attestation details to the completion of attestation.

The Create asset attestation playbook includes multiple lanes on the left-hand pane, each corresponding to the different activities in the asset attestation process. Each lane includes status indicators that display the current state of each activity.

Once you mark an activity in a lane as complete, you can move on to the next lane. You can return to the playbook anytime later to finish any pending activities. As you complete each lane, the status updates in the left-hand panel. The final activity in the playbook involves reviewing the attestation schedule details that you provided and marking that activity as complete.

Create an asset attestation or a schedule using the playbook

Create a one-time asset attestation or a schedule for recurring attestations to verify if your serialized hardware assets are in use, using the playbook.

Before you begin

Role required: asset or inventory_admin

About this task

A single asset attestation can have attestations involving more than one employee. Also, an employee can have more than one asset assigned. Therefore, an asset attestation can have multiple users and assets involved.

Only serialized hardware assets that belong to the opted-in resource categories can be requested for attestation. Consumables, bundles, and pallets can't be attested.

The *ITAM Common - Asset attestation* daily job runs daily to check through all the attestation schedules that are created. Based on the frequency specified in the attestation schedule, the job creates an asset attestation.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Asset attestations** tab.
3. Select **New**.

The Create asset attestation playbook displays the following activities that you must complete in the sequence:

- **Provide attestation details**
 - **Select users**
 - **Select model categories**
 - **Attestation completed**
4. Select whether you want to create an asset attestation or an attestation schedule, and then fill in the necessary details in the **Provide attestation details** activity.

The **Schedule number** field is automatically populated with a unique identifier for the attestation schedule.

- To create an asset attestation, select **One-time** in the Mode field and follow these steps:
 - a. In the **Schedule name** field, enter the name of the attestation.
 - b. Select **Mark Complete**.
- To create a schedule for recurring asset attestations, select **Recurring** in the Mode field and follow these steps:
 - a. On the form, fill in the fields.

Provide attestation details form

Field	Description
Schedule name	Name of the asset attestation schedule.
Frequency (days)	Frequency in days when the asset attestation schedule must create an asset attestation.
Schedule start date	Date on which the attestation schedule should be processed for the first time to create an asset attestation. Note: The Schedule start date must be at least the current date and can't be in the past.
Schedule end date	Date on which the attestation schedule should be processed for the last time to create an asset attestation. Note: The Schedule end date should be after the schedule start date.

b. Select **Mark Complete**.

5. In the **Select users** activity, select employees required to confirm assets.
- a. In the Editor section, set a condition to select employees who are required to confirm assets through the asset attestation request.
 For example, to select employees in the Development department, set the **Department** field to **Development**.

The **User list** section displays the number of records that match your condition. You can also view these results.

b. Select **Mark Complete.**

6. In the **Select model category** activity, select the model categories of assets that you want to attest.

7. In the **Attestation completed** activity, review the details on the Attestation schedule overview form, and then select **Mark Complete**.

Result

- If you selected **One-time** in the Mode field, the following changes happen:
 - An email notification is sent to the employees who are required to confirm assets. Employees can confirm assets through the Now Mobile app or on the Employee Center portal.
 - An asset attestation is created in the In progress state and the following tabs are displayed:
 - The Assets tab shows the list of assets to be confirmed by the employees.
 - The Users tab shows the list of employees who are required to confirm the assets assigned to them.
 - The Excluded Assets tab shows the assets that are opted-out and not part of the asset attestation.
 - The Remediation task tab displays any remediation tasks created for assets that your employees have confirmed they don't have.
- If you selected **Recurring** in the Mode field, and set the **Schedule start date** field to a date in future, the following changes happen:
 - An asset attestation schedule is created in the Ready state.
 - The Attestations tab displays the list of attestation request details after the requests are created.
 - An email notification is sent to the employees who are required to confirm assets on the scheduled attestation date. Employees can confirm assets through the Now Mobile app or on the Employee Center portal.
- If the **Schedule start date** field is set to the current date, the following changes happen:
 - An attestation schedule is created in the Ready state.
 - The attestation schedule creates an asset attestation in the In progress state.
 - An email notification is sent to the employees who are required to confirm assets. Employees can confirm assets through the Now Mobile app or on the Employee Center portal.

What to do next

View the asset attestation or the attestation schedule that's created.

- To view the attestation record, follow any of these steps:
 - Navigate to the **Inventory** view and select the **Asset attestations** tab
 - Navigate to the **Asset operations** view and select **Attestations** from the Attestation list.
- To view the attestation schedule record, navigate to **Asset operations** and select **Schedule** from the Attestation list.

Return to the playbook to continue pending asset attestation activities

Resume work on the incomplete asset attestation activities in the playbook by using the attestation schedule details.

Before you begin

Role required: asset or inventory_admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations.**
2. From the Attestation list, select **Schedule.**
3. From the list of schedules, select the one where you have incomplete activities in the playbook.
4. Select **Continue on playbook.**

Result

The Create asset attestation playbook is displayed for the schedule number that you selected.

What to do next

Complete all the pending activities in the playbook. For details, see [Create an asset attestation or a schedule using the playbook.](#)

Create an asset attestation in the Inventory view

Create an asset attestation to validate whether the serialized hardware asset that's assigned to an employee is still in use.

Before you begin

Role required: asset or inventory_admin

About this task

A single asset attestation can have attestations involving more than one employee. Also, an employee can have more than one asset assigned. Therefore, an asset attestation can have multiple users and assets involved.

Only serialized hardware assets that belong to the opted-in resource categories can be requested for attestation. Consumables, bundles, and pallets can't be attested.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory.**
2. Select the **Asset attestations** tab.
3. Select **New.**
4. In the dialog box, under the **Attestation mode**, select **One time.**
5. Select **Create.**
6. On the form, fill in the fields.

Create New Attestation form

Field	Description
Asset details	
Attestation number	Unique identifier for asset attestation.

Field	Description
Requested by	User who is creating the asset attestation.
Submission date	Date on which the asset attestation is submitted.
Schedule	Attestation schedule that created the attestation. Note: This field is empty for a one-time asset attestation request.
State	Status of the asset attestation.
Model categories	Model categories of the assets for which the attestation is requested. Note: You can select more than one model categories. However, you can only select the model categories that belong to the resources categories that are opted-in and that don't need a license.
User Criteria	
Filter	Set conditions to select employees who are required to confirm assets. For example, if you want to select employees who belong to the Development department, you can set the Department field to Development and then select Set .
Work notes	
Work notes	Comments related to asset attestation.

Note:
 The following fields on the form are automatically populated:

- **Attestation number**
- **Requested by**
- **Submission date**
- **Schedule**
- **State**

7. Select **Save**.

Result

- An email notification with the link to the **My Assets** page on the Employee Center portal is sent to the employees who are required to confirm assets.
- An asset attestation is created in the In progress state.
- The Assets tab shows the list of assets to be confirmed by the employees.
- The Users tab shows the list of employees who are required to confirm the assets assigned to them.
- The Excluded Assets tab shows the assets that are opted-out and not part of the asset attestation.

What to do next

[View open asset attestations in the Hardware Asset Workspace.](#)

Create an asset attestation schedule

Create an attestation schedule so that recurring asset attestations are created based on the frequency that you specify.

Before you begin

Role required: asset or inventory_admin

About this task

The *ITAM Common - Asset attestation* daily job runs daily to check through all the attestation schedules that are created. Based on the frequency specified in the attestation schedule, the job creates an asset attestation.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory.**
2. Select the **Asset attestations** tab.
3. Select **New.**
4. In the dialog box, under the **Attestation mode**, select **Recurrence.**
5. Select **Create.**
6. On the form, fill in the fields.

Create New Asset attestation schedule form

Field	Description
Attestation schedule details	
Schedule number	Unique identifier for the attestation schedule.
Schedule name	Name of the asset attestation schedule.
Frequency (days)	Frequency in days when the asset attestation schedule must create an asset attestation.
State	Status of the asset attestation schedule.
Schedule start date	Date on which the attestation schedule should be processed for the first time to create an asset attestation. Note: The Schedule start date must be at least the current date and can't be in the past.
Schedule end date	Date on which the attestation schedule should be processed for the last time to create an asset attestation. Note: The Schedule end date should be after the schedule start date.
Requested by	User who is creating the attestation schedule.

Field	Description
Next scheduled run	<p>Date on which the attestation schedule is planned to be run the next time.</p> <p>This field is updated automatically only after the asset attestation schedule is processed successfully to create an asset attestation. Also, this field is populated based on the value in the Frequency (days) field. For example, if the Schedule start date is set to 2024 - 01 - 01 and the Frequency is set to 10, then the following events happen:</p> <ul style="list-style-type: none"> a. An asset attestation is first created on 2024-01-01. b. The Next scheduled run field is set to 2024-01-11 automatically.
Model categories	<p>Model categories of the assets for which the attestation schedule is created.</p> <p>Note: You can select more than one model categories. However, you can only select the model categories that belong to the resources categories that are opted-in and that don't need a license.</p>
User Criteria	
Filter	<p>Set conditions to select employees who are required to confirm assets through the asset attestation request. For example, if you want to select employees who belong to Development department, you can set the Department field to Development and then select Set.</p>
Work notes	
Work notes	<p>Comments related to the asset attestation schedule.</p>

Note:

The following fields on the form are automatically populated:

- **Schedule number**
- **State**
- **Requested by**
- **Next schedule run**

7. Select Save.

Result

- An asset attestation schedule is created in the Ready state.
- The Attestations tab displays the list of attestation request details after the requests are created.
- An email notification with the link to the **My Assets** page on the Employee Center portal is sent to the employees who are required to confirm assets on the scheduled attestation date.

What to do next

[View open asset attestations in the Hardware Asset Workspace.](#)

Create an attestation for a hardware asset

Validate a particular serialized hardware asset by creating an attestation for that asset.

Before you begin

Role required: asset or inventory_admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset Estate**.
2. Select the **Hardware assets** tab.
3. Select the asset that you want to attest.
4. Select the More Options icon (**⋮**) on the asset form.
5. Select **Create attestation**.
An attestation is created for the asset.
6. **Optional:** View the asset attestation record details.
 - a. Navigate to the **Asset operations** view.
 - b. From the Attestation list, select **Attestations**.
 - c. Select the attestation record.

Confirming the assigned serialized hardware assets

As an employee, acknowledge whether you have the serialized hardware that's assigned to you either through the Now Mobile app or on the Employee Center portal.

Confirm the assigned assets using the Now Mobile app

As an employee, acknowledge or deny the ownership of the serialized hardware assets assigned to you using the Now Mobile app.

Before you begin

Role required: Log in as an employee.

Procedure

1. From your mobile device, launch the Now Mobile app.
2. On the home screen of the Now Mobile app, tap **My assets** from the My items list.
The list of all assets assigned to you, as well as those assets that need your confirmation, is displayed.

Note:

The **Confirm asset** indicator on any asset in the list indicates that you should acknowledge whether you have that asset or not.

3. Tap the asset with the **Confirm asset** indicator.
The following asset details are displayed:
 - **Asset tag**
 - **Serial number**
 - **Display name**
4. Verify the asset details and tap **Confirm asset**.
5. Acknowledge or deny the ownership of the asset by selecting your response in the **Verify asset** dialog box.
 - To confirm that you have the asset, tap **Yes**.
 - To confirm that you don't have the asset, tap **No**.

To further confirm whether you have the asset or not, select your response to the question **Are you sure you don't have this asset?**

- a. To proceed with your confirmation, tap **Confirm**.
- b. To cancel your confirmation, tap **Cancel**.

Result

- The **Confirm asset** indicator is no longer displayed for the asset.
- The **Attestation date** field of the asset on the asset attestation form is updated with the actual date on which you confirmed the asset.
- The **State** field of the asset attestation changes from In progress to Closed complete only when that attestation has no other users and assets involved.
- The **Status** field of the asset on the asset attestation form is updated based on your confirmation:
 - If you selected **Yes**, the **Status** field changes from **Open** to **Yes**.
 - If you selected **No**, the **Status** field changes from **Open** to **No**. Also, a remediation task is created for that attestation. The administrator can work on that task and initiate an investigation to find the asset status.

Confirm the assigned assets on the Employee Center portal

As an employee, acknowledge or deny the ownership of the serialized hardware assets assigned to you on the Employee Center portal.

Before you begin

Role required: Log in as an employee.

To view the **My Assets** option on the global header navigation bar of the Employee Center portal, the value of the **enable_assets** option must be set to **true** on the Additional options, JSON format field of the Employee Center menu record. For more details, see [Enable or disable global header options](#) .

Note:

The **My Assets** option requires the Hardware Asset Management application to be activated.

Procedure

1. View the assets that are assigned to you on the Employee Center portal.
 - Select the **Confirm assets** link in the email notification that you received.

The link opens the **My Assets** page on the Employee Center portal.

- Select **My Assets** in the global header navigation bar of the Employee Center portal.

Note:

The number displayed on the **My Assets** option indicates the number of assets that you must confirm.

- View the list of assets from the Employee Profile.
 - a. Select **Profile** on the global header navigation bar of the Employee Center portal.
 - b. Select the **Assets** tab.

The page displays all the hardware and consumable assets assigned to you. However, you can only confirm serialized hardware assets that are opted-in.

2. For the hardware asset that you want to confirm, select **Confirm asset.**

You can view the following details of the asset:

- Display name
- Asset tag
- Serial number
- Asset function

Note:

Any field that's empty isn't shown on the Confirm asset page.

3. Acknowledge or deny the ownership of the asset by selecting your response to the question **Do you have this asset?**

- To confirm that you have the asset, select **Yes**.
- To confirm that you don't have the asset, select **No**.

4. Select **Submit.**

Result

- The **Confirm asset** option is no longer displayed for the asset.
- The **Attestation date** field of the asset on the asset attestation form is updated with the actual date on which you confirmed the asset.
- The **State** field of the asset attestation changes from In progress to Closed complete only when that attestation has no other users and assets involved.
- The **Status** field of the asset on the asset attestation form is updated based on your confirmation:
 - If you selected **Yes**, the **Status** field changes from **Open** to **Yes**.
 - If you selected **No**, the **Status** field changes from **Open** to **No**. Also, a remediation task is created for that attestation. The administrator can work on that task and initiate an investigation to find the asset status.

Raise issue related to your asset on the Employee Center portal

Get the issue related to your assets resolved by reporting the issue on the Employee Center portal.

Before you begin

Role required: Log in as an employee.

To view the **My Assets** option on the global header navigation bar of the Employee Center portal, the value of the **enable_assets** option must be set to **true** on the Additional options, JSON format field of the Employee Center menu record. For more details, see [Enable or disable global header options](#) .

Note:

The **My Assets** option requires the Hardware Asset Management application to be activated.

Procedure

1. View the assets that are assigned to you on the Employee Center portal.
 - Select **My Assets** in the global header navigation bar of the Employee Center portal.
 - View the list of assets from the Employee Profile.
 - a. Select **Profile** on the global header navigation bar of the Employee Center portal.
 - b. Select the **Assets** tab.
 The page displays all the hardware and consumable assets that are assigned to you.
2. For the asset for which you want to report an issue, select **Raise issue**.
3. On the form, fill in the fields.

Raise Issue form

Field	Description
Location	Location details of the asset.
Who is affected?	Name of the user who is impacted by the issue with the asset. By default, this field is automatically populated with the name of the logged-in user. However, you can raise the issue on behalf of any other user.
Urgency	Priority to be given to the issue. By default, this field is set to 3- Low . The other available values are: <ul style="list-style-type: none"> ○ 1 - High ○ 2 - Medium
Short description	Brief information about the issue related to the asset. This field is required.
Preferred methods of contact	Mode of communication preferred. The available methods of contact are: <ul style="list-style-type: none"> ○ Email ○ Phone ○ Self-service ○ Walk-in ○ Chat ○ Virtual Agent

4. **Optional:** Select the Add attachments icon () to attach any document related to the issue.
5. Select **Submit**.

Result

Your request is submitted successfully.

What to do next

You can view and track the submitted requests by selecting **My Requests** on the global header navigation bar of the Employee Center portal.

View attestations for a serialized hardware asset

View all the attestation records associated with a serialized hardware asset to check the status of previous asset attestations.

Before you begin

Role required: asset or inventory_admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset estate**.
2. Select the **Hardware assets** tab.
3. Select the asset for which you want to view the list of attestations.
4. From the contextual side bar of the asset form, select the AssetLifeCycle icon ()
All the asset lifecycle events are shown.
5. In the **Attestation** card, select **View records**.
The list of all attestations created for that asset is shown with the following details:
 - **Attestation number**
 - **Status**
 - **User**
 - **Attestation date**

View open asset attestations in the Hardware Asset Workspace

Get the details of all asset attestations that are awaiting action from your employees in the Hardware Asset Workspace.

Before you begin

Role required: asset or inventory_admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Overview** tab.
In the Inventory overview section, the **Open asset attestations** card shows the number of open attestations.
3. Select the **Open asset attestations** to view the list of attestations that need action from your employees.

Result

The list of asset attestations with **Status** as **Open** is displayed.

Cancel an asset attestation

Cancel an asset attestation when you no longer have to validate the ownership of the serialized assets.

Before you begin

Role required: asset or inventory_admin

About this task

An asset attestation that's in the In progress state can only be canceled.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations**.
2. From the **Attestation** list, select **Attestations**.

The list of all asset attestations that are in the In progress, Closed complete, or Canceled state is displayed.

3. Select an attestation record that's in the In progress state.
4. Select **Cancel attestation**.
5. In the Confirmation dialog box, select **Yes**.

Result

- The state of the asset attestation changes to Canceled.
- The status of the assets in the asset attestation that aren't confirmed by the employees' changes from Open to Canceled.

Cancel an attestation schedule

Cancel an attestation schedule when you no longer want to create recurring asset attestations.

Before you begin

Role required: asset or inventory_admin

About this task

You can only cancel an asset attestation schedule that's in the Ready or In progress state. When you cancel the attestation schedule, the associated asset attestations that are in the In progress state aren't canceled. However, new asset attestations aren't created.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Asset operations**.
2. From the **Attestation** list, select **Schedules**.
The list of all attestation schedules that are in the Ready, In progress, Closed complete, or Canceled state is displayed.
3. Select an attestation schedule record that's in the Ready or In progress state.
4. Select **Cancel schedule**.
5. In the **Confirmation** dialog box, select **Yes**.

Result

The state of the attestation schedule changes to Canceled.

View open remediation tasks for asset attestations in the Hardware Asset Workspace

Get the details of all the remediation tasks for asset attestations that are awaiting your action in the Hardware Asset Workspace.

Before you begin

Role required: asset or inventory_admin

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Overview** tab.
In the Inventory overview section, the **Open asset remediation tasks** card shows the number of open remediation tasks for asset attestations.
3. On the Open asset remediation tasks card, select the **View records** to view the list of remediation tasks that need your action.

Result

The list of asset remediation tasks with **Status** as **Open** is displayed.

What to do next

[Complete the remediation task for asset attestation in the Hardware Asset Workspace.](#)

Complete the remediation task for asset attestation in the Hardware Asset Workspace

As an asset manager or inventory administrator, complete the open remediation task that was created when your employee denied ownership of the assigned serialized hardware asset.

Before you begin

Role required: asset or inventory_admin

Procedure

1. View the list of asset attestations.
2. Select the asset attestation record for which you want to complete the open asset remediation task.
3. Select the **Remediation tasks** tab.
4. Select the remediation task that's in the Open state.
5. **Optional:** In the **Work notes** field of the Asset Task Details form, provide comments related to the asset remediation task.
6. Select **Close Task**.

Result

- The State of the asset changes from **In use** to **Missing**.
- The **Assigned to** field on the asset record is empty.

Acknowledge receipt of assets on the Employee Center portal

After receiving hardware or consumable assets that were in transit and reserved for you, confirm their receipt on the Employee Center portal.

Before you begin**Important:**

The option to receive assets on the Employee Center portal is supported in Hardware Asset Management version 13.0.0 and later.

Role required: Log in as an employee.

To view the **My Assets** option on the global header navigation bar of the Employee Center portal, the value of the **enable_assets** option must be set to **true** on the Additional options, JSON format field of the Employee Center menu record. For more details, see [Enable or disable global header options](#)

**Note:**

The **My Assets** option requires the Hardware Asset Management application to be activated.

About this task

When an asset reserved for you is in transit, you will receive an email notification with a link to the Employee Center Portal, where you can acknowledge its receipt. You can receive an asset even if

the asset is excluded from Hardware Asset Management workflows or if the associated resource category isn't opted in.

Procedure

1. View the assets that are reserved for you on the Employee Center portal.
 - o Select the **Receive assets** link in the email notification that you received.

The link opens the **My Assets** page on the Employee Center portal.

- o View assets using any of the options available in the global header navigation bar of the Employee Center portal.

UI options on the global header navigation bar

UI option	Action
My Assets	Select My Assets in the global header navigation bar of the Employee Center portal. Note: The number displayed on the My Assets option represents the total count of assets that must be attested and received.
Profile	<ol style="list-style-type: none"> a. Select Profile on the global header navigation bar of the Employee Center portal. b. Select the Assets tab.

The page displays all the hardware and consumable assets that are assigned to you, in transit, and reserved for you. You can acknowledge the receipt of hardware and consumable assets that are in transit.

2. Acknowledge after you receive the asset.

Update associated Decision tables for HAM flows

Update associated Decision tables for Hardware Asset Management (HAM) flows to trigger a new or customized HAM flow.

Before you begin

Role required: admin, decision_table_admin

Procedure

1. Navigate to **All > System Definition > Decision Tables**.
2. Open a decision table that you want to update.
3. On the flow page, select the Add icon () in the Decision table section.
4. Select **Add condition column**.
5. In the NEW CONDITION COLUMN dialog box, fill in the conditions according to the conditions that you want to trigger the flow.
6. Select **Done**.
A new row is created and the condition shows up in the Decision table section.

7. In the Flow column, select the flow that you have created.
8. Select **Save**.
9. Navigate to the Decisions (sys_decision_question) table and search the updated Decision table that you updated.
10. Update the **Order** field with a value less than 100.

Hardware Asset Management reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Hardware Asset Management.

Domain separation and Hardware Asset Management

Domain separation is supported in Hardware Asset Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Enhanced

- Includes all aspects of **Basic** and **Standard** levels of support.
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer cannot affect another.
- Tenants of the instance must be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application's normal function.

Sample use case: Tenant-customers of a shared environment must be able to modify the impact, urgency, or priority matrix to set priority within their domain.

For more information on support levels, see [Application support for domain separation](#) .

Domain separation overview

Domain separation support in the product enables service providers to offer managed services for software and hardware asset management to their customers. This feature also caters to large organizations who manage their subsidiaries as independent domains.

How domain separation works in Hardware Asset Management

In HAM, domain separation occurs in two stages: data separation and process separation. There are no system properties specific to Hardware Asset Management that can be used to enable or disable the separation. However, the Domain Asset Process Settings table (alm_domain_asset_process_setting) stores configurations for asset processes, including the normalization of hardware models. By default, normalization is performed only for models within the TOP/Default domain. However, if you have the asset or domain_admin role, you can enable normalization for hardware models in any domain. To enable normalization for a specific domain, follow these steps:

1. Navigate to the Domain Asset Process Settings table (alm_domain_asset_process_setting).
2. Locate the specific domain for which you want to enable normalization of models.
3. Set the **Run asset process** field to **true**.

Note:

The [Recommended practice](#) is to avoid customizing the base system domain configuration record.

Multi-Tenant support for IT Asset Management

Multi-Tenant Support for IT Asset Management

Manage the entire IT Asset Management lifecycle for your customers in a shared ServiceNow instance

Complete data and process separation | Tenant admin support

Service Provider Benefits

- Accelerate into new markets
 - Software Asset Management
 - Hardware Asset Management
- Provide ITAM as a service:
 - ❖ Contract and entitlement management
 - ❖ Discovery and normalization reporting
 - ❖ Software reconciliation, optimization and licensing expertise
 - ❖ Audit response
 - ❖ Software lifecycle and vulnerability reporting

Customer Benefits

- Experts provide best practice services and processes
- No platform or process ownership required

Required plugins

- Service Catalog – Domain Separation (com.glideapp.servicecatalog.domain_separation)
- Domain separation extension (com.glide.domain.msp_extensions.installer)
- Performance Analytics – Domain Support (com.snc.pa.domain_support)
- HAMP (store app)

To learn more, see [Domain separation explained](#), [Contains queries and domain access](#), and [Importance of Default domain](#).

Roles to access Hardware Asset Workspace

Role	Access details
inventory_admin	Access to create, edit, manage, and delete stockrooms.
procurement_user	Access to procurement tasks such as creating purchase orders and viewing transfer orders.
inventory_user	Access to stock information.
model_manger	Access to create, modify, and delete records of the base Model [cmdb_model] table.
contract_manager	Access to create, edit, and delete contracts through the Contract Management application.
itil	Access to open, update, and close the following items: <ul style="list-style-type: none"> • Incidents • Problems • Changes • Configuration management items
sam_admin	Access to work on any functionality that the Software Asset Management application offers.
asset	Access to create, edit, manage, and delete the hardware and consumable asset records.
catalog_manager	Access to view and assign catalog editors to their categories. Also create, modify, and publish items within those categories.
ham_admin	This role is available only when the Hardware Asset Management (HAM) is installed and provides access to all HAM features.
sam_user	This role is available only when the Hardware Asset Management application is installed
catalog_admin	Access to create, edit, and manage the Service Catalog.
sam	Access to Software Asset Management features included with Asset Management. Different roles such as sam_admin, sam_user, and sam_developer are required to use the Software Asset Management application.

Stockroom types

Stockroom types are categories of stockrooms.

The stockroom type has two significant characteristics.

- **Priority:** Order of stockrooms the parts should be sourced from. For example, if a personal stockroom (priority 2) contains the required part, the personal stockroom receives priority over the Central Stockroom (priority 7) because the part in the personal stockroom doesn't require delivery.
- **Shipment Required:** Informs the system if a transfer order must be created when the part is sourced from a stockroom of the given type. For example, a part in a personal stockroom doesn't require shipment, so no transfer order is needed.

Stockroom types defined in the base system

Value	Name	Priority	Shipment Required	Description	Comment
on_site	On Site	1	False	Stockroom at the customer site.	Close to the users and doesn't require shipping.
field_agent	Field Agent	2	False	Virtual, personal stockroom linked with a field service agent (FSA) directly, used for delivery.	Used to indicate to the system that the part has been delivered and is with the FSA.
fsl	FSL	4	True	Forward Shipping Location.	Small stockrooms where the parts can typically be shipped via overnight delivery.
pudo	PUDO	5	True	Pick Up/Drop out location.	This type is sometimes called a by-box. Can be a postal box that can receive new and returned parts that are often near major customer sites.
stockroom	Warehouse	6	True		A regional stockroom.
central_stockroom	Central Warehouse	7	True		A central stockroom, usually a large facility from which most parts are shipped.

Installed with Hardware Asset Management

Several types of components are installed with activation of the sn_hamp plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title	Description	Contains roles
ham_admin	Grants full access to the respective features of the Hardware Asset Management application including the ability to Opt-in for the Content Service. This role is used for Hardware Asset Management.	<ul style="list-style-type: none"> • inventory_admin: Access to create, edit, manage, and delete stockrooms. • catalog_manager: Access to view and assign catalog editors to their categories. Also, create, modify, and publish items within those categories. • report_user • sn_hamp.ham_user: Access to manage hardware assets and reports. • asset: Access to create, edit, manage, and delete the hardware and consumable asset records. • procurement_admin
sn_hamp.ham_user	Manage hardware assets and reports. This role enables users to view, create, update, and delete hardware asset records, and to generate and view asset-related reports. This role is tailored for everyday asset management tasks.	asset

Scheduled jobs installed

Scheduled job	Description
HAM - Content Upload	Publishes the normalized hardware models.
HAM - Daily Job	Calculates number of hardware and consumable models for each model category, active life cycle phase for models, and sets client schedule pull-time.
HAM - Hardware Lifecycles	Generates hardware life cycles.
HAM - Hardware Normalization	Normalizes hardware and consumables models.
HAM - Loaner Asset Order Allocations	Allocates assets to Loaner Asset Orders.

Scheduled job	Description
HAM - Populate Licensing Data	Populates licensing details.
HAMP - Content File Manager	Job is triggered from the Manage Hardware Library.
Purge Asset Audits More Than Year Old or with More Than 10k Assets	Removes old asset audit records or asset audits with more than 10K assets.
[PA HAM] Daily collection job	Daily job that collects scores for different parameters.

Tables installed

Table	Description
Bundle [alm_bundle]	Details of bundle assets.
Asset Audits [sn_hamp_asset_audit]	Details of the asset audits.
Hardware Asset Reclamation Line [sn_hamp_asset_reclaim_line]	Details of the Hardware Asset Reclamation Lines created for each reclaimed asset.
Hardware Asset Reclamation Task [sn_hamp_asset_reclaim_task]	Details of the tasks created for each Hardware Asset Reclamation Line.
Asset RMA Task [sn_hamp_asset_rma_task]	List of RMA asset task records.
Hardware Asset Configuration [sn_hamp_configuration]	Configuration records of Hardware Asset Management.
HAM Content Audit [sn_hamp_content_audit]	Details of content values that changed.
Contract Renewal Request [sn_contract_renewal_request]	Stores all the contract renewal requests through the contract renewal workflow.
Contract Renewal Request Line [sn_contract_renewal_request_line]	Stores all the contract renewal request lines through the contract renewal workflow.

Table	Description
Contract Renewal Task [sn_contract_renewal_task]	Stores all the contract renewal request tasks through the contract renewal workflow.
Custom Device Type [sn_hamp_custom_hw_device_type]	List of custom hardware device type records.
Custom Hardware Manufacturer [sn_hamp_custom_hw_manufacturer]	List of custom hardware device manufacturer records.
Custom Hardware Product [sn_hamp_custom_hw_product]	List of custom hardware product records.
Custom Hardware Model Library [sn_hamp_custom_hw_prod_model]	List of custom hardware model library records.
Hardware Disposal Order [sn_hamp_hardware_disposal]	List of Hardware Disposal Order records.
Hardware Disposal Tasks [sn_hamp_hw_asset_disposal_task]	Details of the tasks associated with the Hardware Disposal Order flow.
Device Type [sn_hamp_hw_device_type]	List of hardware device type records. <div style="background-color: #e0f2f1; padding: 5px; border: 1px solid #ccc;"> <p>i Important: You mustn't modify the records of this table.</p> </div>
Hardware Manufacturer [sn_hamp_hw_manufacturer]	List of hardware device manufacturer records.
Hardware Normalization Map [sn_hamp_hw_normalization_map]	Product details such as hardware product and hardware product model IDs.
Hardware Product [sn_hamp_hw_product]	Product details such as name of the product and type of device.
Hardware Model Library [sn_hamp_hw_product_model]	Product details such as product and model number.

Table	Description
Hardware Asset Refresh Line [sn_hamp_hw_refresh_line]	Hardware Asset Refresh Line details such as stage, requested item, replacement model, and replacement asset.
Refresh Line Tasks [sn_hamp_hw_refresh_line_task]	Details of Refresh Line tasks associated with the Hardware Asset Refresh Lines.
Import Staging [sn_hamp_import_template]	Template for importing assets and model records.
Hardware Lifecycle Definition [sn_hamp_lifecycle_definition]	Life cycle phase of a hardware or consumable model and the associated dates.
Loaner Asset Order [sn_hamp_loaner_asset_order]	List of Loaner Asset Order records.
Loaner Asset Task [sn_hamp_loaner_asset_task]	List of Loaner Asset Order task records.
Audits to Scanned Assets [sn_hamp_m2m_audit_asset]	List of audit records of scanned assets.
Planned Assets [sn_hamp_m2m_hw_asset_disposal]	Details of the assets included in Hardware Asset Disposal Orders.
Replacement Models [sn_hamp_m2m_ztr_replacement_model]	List of replacement records for Zero Touch Refresh models.
Manage Hardware Library [sn_hamp_manage_hw_library]	List of Hardware Library content import records.
Model Category Normalization Summary [sn_hamp_model_ctg_norm_summary]	Summary of normalization of model category.
HAM Resource Category [sn_hamp_resource_category]	Subscription unit ratio and other licensing-related details of each Resource category.

Table	Description
RMA Request [sn_hamp_rma_request]	List of RMA request records.
RMA Request Line [sn_hamp_rma_request_line]	List of RMA request line records of RAM requests.
HAM Success Activity [sn_hamp_success_activity]	List of HAM Success Activity records.
HAM Success Goal [sn_hamp_success_goal]	List of HAM Success Goal records.
Zero Touch Refresh Model [sn_hamp_ztr_refresh_model]	Details of refresh model records for the Zero Touch Refresh flow.
Zero Touch Refresh Request [sn_hamp_ztr_request]	List of Zero Touch Refresh request records.
Zero Touch Refresh Task [sn_hamp_ztr_task]	Details of tasks associated with the Zero Touch Refresh flow.
RFID asset [rfid_asset]	Stores the RFID information of assets.

Asset record fields

Fields on the Hardware Asset Details form help you create hardware, software, consumable, bundle, pallet, mobile, and facility assets.

Field	Description
Display name	Name of the asset as it appears in the record lists. This field is automatically set when you create an asset, based on the Asset Tag and Model fields.
Model category	Model grouping of the asset. Based on the model category you select, the asset is linked to a configuration item.
Model	Specific product model of the asset.
Configuration Item	CI is automatically created when you create an asset. Point to the reference icon to view the configuration item details inherited from the asset record. The CI value is populated as follows:

Field	Description
	<ul style="list-style-type: none"> • By default, the CI value is based on the Model field. • If the model category of the asset is associated with a CI and the Serial number field isn't empty, then the CI value is based on the Serial number and Model field values. • If an asset is created in the On Order state, then the CI value is based on the Model field.
Quantity	<p>The number of items this asset represents. An asset has a quantity of one unless one or more of these points are true.</p> <ul style="list-style-type: none"> • If the asset is a consumable, the quantity is unrestricted because consumables are tracked in groups. • If the asset is pre-allocated, the quantity is unrestricted when the Model category and Model values are defined and Substate is set to Pre-allocated. <p>Note: When the Quantity field value is greater than one, the asset is managed as a group and do not require individual asset tags and serial numbers. This applies to pre-allocated assets and consumables where individual tracking is not required.</p>
<p>General</p> <p>All the fields aren't available for each type of asset.</p>	
Asset tag	<p>Alphanumeric information assigned by your organization to help track the asset.</p> <p>Note: When the Quantity field value is greater than one, the asset is managed as a group and the Asset tag field value isn't populated.</p>
State	<p>Current state of the asset, such as On order or In use.</p>
Assigned to	<p>The person using or primarily responsible for this item. This field appears when the State is In Use.</p> <p>Note: When the State field value is updated from In Use to On Order, In Stock, or In Transit, this field value is automatically cleared. For more information about the business rules for updating the Assigned to field, see the https://support.servicenow.com/nav_to.do?uri=%2Fkb%3Fid%3Dkb_article_view%26sysparm_article%3DKB0719392 article in the Now SupportKnowledge Base.</p>
Stockroom	<p>Name of the stockroom. This field appears only when the state of the asset is In stock or Build.</p>
Aisle and space	<p>Aisle and space details of the asset within the stockroom. This field appears only when the state of the asset is In stock or Build.</p>

Field	Description
	<p>Note: This field would appear only when the Hardware Asset Management Professional plugin (com.sn_hamp) is installed.</p>
Managed by	The person who maintains the asset. This field value can be different from the person in the Owned by field.
Owned by	The person who has financial ownership of the asset. This field value can be different from the person in the Managed by field.
Parent	Parent asset of the asset. For example, a monitor or peripheral can have a workstation as their parent asset. When a parent link is defined, the fields related to the assignment and state of the child assets is set to read-only and are populated based on the parent assignment and state fields. For more information, see Bundled models .
Asset function	<p>Function of the asset.</p> <p>The available values are as follows:</p> <ul style="list-style-type: none"> • Primary • Secondary • Shared • Loaner • Asset Bundle
Class	Asset group, for example, base, hardware, license, or consumable.
Comments	Information about the asset that would be helpful for others to know.
Serial number	<p>Serial number of this asset.</p> <p>Note: When the Quantity field value is greater than one, the asset is managed as a group and the Serial number field value isn't populated.</p>
Substate	Current substate of the asset. The available substate settings depend on the state selected. For example, the Retired state contains the Substate options Disposed, Sold, Donated, and Vendor credit .
Location	Current physical location of the asset.

Field	Description
	<p>Note: You can set the location to a place, floor, building, or campus. When you set the location to any of the options except the campus, the Location hierarchy section is shown on the asset form. The location hierarchy shows the hierarchical relationship between the specified location and its parent locations.</p> <p>If you meet the following criteria, the asset form displays an interactive map that shows the real-time location of the asset:</p> <ul style="list-style-type: none"> The location is set to a specific place. Access indoor maps through the Indoor Mapping for Assets (com.sn_ima) application. This application gets installed on your ServiceNow instance along with Hardware Asset Management. You can also install this application explicitly from the ServiceNow Store. The <code>sn_itam_common.sn_enable_indoormap_for_assets</code> system parameter is set to true on your ServiceNow instance. <p>The Location map doesn't appear by default. To view the map, select the Location map  icon on the contextual sidebar of the asset record.</p> <p>Location map doesn't appear for excluded assets.</p>
Department	Department to which the asset belongs.
Company	Company or organization to which this asset belongs.
Assigned	The date on which the asset was assigned to a user.
Installed	The date on which the asset was installed.
<p>Location Hierarchy</p> <p>The Location Hierarchy section is available only for hardware, consumables, bundles, and pallet assets. This section appears only under the following conditions:</p> <ul style="list-style-type: none"> When the <code>sn_itam_common.sn_enable_indoormap_for_assets</code> system parameter is set to true on your ServiceNow instance When you select any location except the campus 	
Floor	<p>Floor where the place specified in the Location field is located.</p> <p>Note: This field appears only when you select a place in the Location field and is populated automatically based on the location.</p>
Building/ Structure	<p>Building to which the floor belongs.</p> <p>Note: This field appears only when you select a place or floor in the Location field and is populated automatically based on the location.</p>
Campus	Campus where the building is located.

Field	Description
	<p>i Note: This field appears only when you select a place, floor, or building in the Location field and is populated automatically based on the location.</p>
Financial	The Financial section is available only for hardware, software entitlement, and facility assets.
Request line	Requested item to which the asset is linked.
Invoice number	Invoice under which the asset was billed.
Cost	The price at which the asset was purchased.
Vendor	Vendor from which the asset was purchased. The assets that are automatically created from purchase orders in Procurement, the default value of the Vendor field is the vendor specified on the purchase order.
Opened	The date on which the requested item record was opened. The system automatically populates the field when a request line is specified.
GL account	General ledger account number with which the asset is associated.
Cost center	Group financially responsible for the asset.
Acquisition method	<p>The way of acquiring the asset. Base system choices are Purchase, Lease, Rental, Bring Your Own Asset and Loan.</p> <p>The assets that are automatically created from purchase orders in Procurement, the default value is Purchase</p>
Expenditure type	<p>The type of expenditure.</p> <ul style="list-style-type: none"> • Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. • Opex: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Eligible for refresh	
Asset TCO	<p>The total cost of ownership of the asset, where the total cost includes initial capital cost and operation cost.</p> <p>For more information about Asset TCO, see Asset Total Cost of Ownership for Hardware Asset Management.</p> <p>i Note: Amount displayed in the system currency.</p>
TCO benchmark cost	<p>Predefined benchmark cost of the asset model.</p> <p>i Note: This field is referenced from the Hardware model details form. For more information, see Hardware model details.</p>

Field	Description
TCO benchmark threshold	<p>The threshold value of your asset model cost identifying that the asset is reaching the TCO benchmark cost value. The benchmark threshold is set to 75% of the TCO benchmark cost by default.</p> <p>For example, if you set the TCO benchmark cost of an asset model as \$1000, the TCO benchmark threshold is set to \$750 automatically.</p> <p>Use the system property <code>sn_itam_common.asset_tco_benchmark_threshold_percentage</code> to update the benchmark threshold value. This field is referenced from the Hardware model details form. For more information, see Hardware model details.</p>
TCO benchmark status	<p>Status of the asset TCO.</p> <ul style="list-style-type: none"> • Reached: If the Asset TCO value is equal to or more than the TCO benchmark cost value, the TCO benchmark status shows as Reached. • Approaching: If the Asset TCO value is less than the TCO benchmark cost and more than the TCO benchmark threshold value, the TCO benchmark status shows as Approaching. • Not reached: If the Asset TCO value is less than the TCO benchmark threshold value, the TCO benchmark status shows as Approaching.
Disposal	
Disposal order number	<p>A unique number assigned to the asset disposal order.</p> <p>Note: This field appears only if you've installed Hardware Asset Management from ServiceNow Store.</p>
Disposal vendor	<p>The vendor assigned to carry out the asset disposal order.</p> <p>Note: This field appears only if you've installed Hardware Asset Management from ServiceNow Store.</p>
Vendor disposal order ID	<p>The order number assigned by the vendor to carry out the asset disposal order.</p> <p>Note: This field appears only if you've installed Hardware Asset Management from ServiceNow Store.</p>
Disposal date	<p>The date when the asset disposal order process is completed.</p> <p>Note: This field appears only if you've installed Hardware Asset Management from ServiceNow Store.</p>
Disposal reason	<p>Text explaining why the asset is being retired.</p>

Field	Description
Beneficiary	Organization that receives the asset when it's retired.
Resale price	Value of the asset when it's retired. For example, if the asset is donated, the value is used when reporting taxes.
Scheduled retirement	Scheduled date on which the asset is retired.
Retired date	Actual date on which the asset was retired.
<p>Depreciation</p> <p>The Depreciation section is available only for hardware and facility assets.</p>	
Depreciation	Depreciation method that is applied. Base system choices are Declining Balance and Straight Line . The depreciation value is defaulted from the associated Model.
Depreciation effective date	The date on which the specified depreciation method begins.
Salvage value	Estimated value of an asset at the end of its useful life. This value must be less than or equal to the Cost of the asset.
Residual date	Date on which the residual value was calculated.
Residual value	Residual value of the asset.
Depreciated amount	Amount the asset has depreciated.
<p>Contracts</p> <p>The Contract section is available only for hardware, software entitlement, or facility assets.</p>	
Lease contract	Name of the lease contract that applies to the asset.
Warranty expiration	Expiration date of the asset warranty.
Lease expiration date	<p>The date on which the contract gets expired.</p> <p>i Note: This field would appear only when Hardware Asset Management (sn_hamp) is installed.</p>
Lease term (months)	<p>The period in months the lease contract is active for.</p> <p>i Note: This field would appear only when Hardware Asset Management (sn_hamp) is installed.</p>

Field	Description
Monthly lease payment	Amount that you pay monthly for the contract. Note: This field would appear only when Hardware Asset Management (sn_hamp) is installed.
Support group	The group managing the contract covering the asset.
Like-kind exchange	A similar asset that you want to return to the contract vendor instead of the asset that you brought in lease. Note: This field would appear only when Hardware Asset Management (sn_hamp) is installed.
Supported by	The person managing the contract covering the asset.
Activities	
Work notes	Work notes are updated for the following cases: <ul style="list-style-type: none"> • Updates to Assigned To, Managed To State, Substate, and Reserved fields of asset. The columns for these fields are audited by default and any updates is recorded in the work notes. • Work notes for hardware and software assets are updated when the asset is received by a purchase order and transfer order. These work notes help in tracking the life cycle of the asset.
Audit	
Audit number	Audit number of the asset.
Audit type	Type of audit that was carried out on the asset.
Last audit date	The date on which the last audit was done.
Last audit state	State of the last audit.
Audited by	The person who performed the last audit.
Attestation	
Attestation number	Unique identifier of the asset attestation request.
Attested by	Employee who confirmed the asset.
Last attestation date	Date on which the asset was last attested.
Last attestation state	Last attestation status of the asset. This field can have any of the following values:

Field	Description
	<ul style="list-style-type: none"> • Yes- Employee confirmed the ownership of the asset. • No- Employee denied the ownership of the asset • Canceled- The asset attestation is canceled before the employee confirmed the asset. • Closed incomplete- When an attestation is created for the asset which already has an attestation yet to be confirmed by the employee, the existing attestation is closed incomplete.
<p>Mobile</p> <p>The Mobile section is available only for the Mobile Device model category.</p> <p>Note: This section of the form and the relevant data model appear only when Hardware Asset Management (sn_hamp) is installed.</p>	
Carrier	Name of the carrier company.
Ownership	Ownership of the asset. The available values are: <ul style="list-style-type: none"> • Employee • Corporate
IMEI	Unique number for tracking the mobile device.
Pre-enrollment ID	The user who conducted the last audit.
MAC Address	<p>MAC address of the mobile device.</p> <p>Important: From the Hardware Asset Management 12.0.0 release onward, the value in this field is populated based on the MAC address [mac_addr] field in the Asset [alm_asset] table instead of the MAC address [mac_address] field in the Hardware [alm_hardware] table.</p> <p>Also, the MAC address [mac_address] field in the Hardware [alm_hardware] table is deprecated in the Hardware Asset Management 12.0.0 release. The MAC address [mac_addr] field in the Asset [alm_asset] table is available only when the Hardware Asset Management (sn_hamp) store app is installed.</p>
Enrollment ID	User conducting the current audit.
Phone number	The phone number associated with the mobile device.
Enrollment name	Name of the mobile device enrollment.
Platform	Platform of the mobile device. The available options are: <ul style="list-style-type: none"> • Android • iOS • Windows

Field	Description
	<ul style="list-style-type: none"> • ChromeOS • Other
Enrollment state	Current enrollment state of the device. The available options are: <ul style="list-style-type: none"> • Enrolled • Unenrolled • Expired • Pending enrollment • Pending unenrollment
Purchased	The date on which the mobile device was purchased.
Enrollment date	Initial enrollment date.
Upgrade eligible date	The date on which the mobile device is eligible for an upgrade.
Last enrolled	Date of last enrollment.
Service contract	Contract number associated with the mobile device.
Device activated	Activation status of the mobile device. The available options are: <ul style="list-style-type: none"> • Yes- The mobile device is activated. • No- The mobile device isn't activated.
DaaS i Note: This section appears only when Hardware Asset Management for DaaS application (com.sn_daas_ham) is installed.	
DaaS asset	Option for selecting the asset as a DaaS asset.
DaaS account	The account to which the DaaS asset is associated to.
Related links	
Calculate Depreciation	Select to calculate the depreciation amount and residual value.
Delete Assets Only	Select to delete the assets and not the associated CI.
Related lists	
Assets	Assets that 's related to the asset you created.
Expense lines	Expense line associated with the asset.
RMA	Return Merchandise Authorization associated with the asset.

Consumable model fields

Consumable Models form and related list field descriptions.

Consumables section

Field	Description
Display name	Name of the model that is dependant on name of the asset and the manufacturer.
Model category	Model category of the asset. The type of category depends if the asset is linked to a CI.
State	Current state of the asset.
Substate	Current substate of the asset.
Stockroom	Name of the stockroom where the asset is located if the asset is in stock.
Quantity	Number of assets.

Vendor Catalog Item related list

Field	Description
Name	Display name of the vendor catalog item.
Vendor	Name of the product vendor.
Product Model	Product model associated with the vendor catalog item.
Out of Stock	Option that indicates if the product is out of stock.
Application	Application that contains the product record.
Product ID	Manufacturer product ID.
List Price	List price of the product before any discounts are applied.
Vendor Price	Vendor price of the product.
Rank tier	Vendor rank tier.
Short Description	Description of the product.
General	
Product Catalog Item	Product catalog item that was created when the item was published.
UPC	Universal Product Code (UPC) of the product.
Description	Description of the product.
Picture	Picture of the product.
Active	Option that indicates if the product is active or not.
Information	
Specifications	Product specifications that come from the vendor.
Features	Product features that come from the vendor.

Consumable Model Lifecycles related list

Field	Description
Model	Name of the model.
Lifecycle type	Type of lifecycle. <ul style="list-style-type: none"> • Internal • Publisher
Lifecycle phase	Phase of the lifecycle. <ul style="list-style-type: none"> • General Availability • End of Sale • End of Support • End of Extended support • End of Life
Source	Source of the lifecycle of the model.
Description	Description of the lifecycle.
Phase start date	Date the lifecycle phase starts.
Phase end date	Date the lifecycle phase ends.
Risk	Risk associated with the lifecycle.
Active	Option that indicates the lifecycle of the model is active.

Asset audit fields

Create New Asset Audits form and related fields description.

Create New Asset Audits form

Field	Description
Audit number	Audit reference number.
Assignment group	Assignment group to which you want to assign the inventory audit record.
Type	Type of the asset audit. The available values are: <ul style="list-style-type: none"> • Location • Stockroom
Assigned to	Person responsible for the audit.
Location	Location in which you want to perform the audit.

Field	Description
<p>i Note: This field appears only if you set the Type field to Location.</p>	
<p>Include child locations</p> <p>i Note: This field appears if you set the Type field to Location.</p>	<p>Option to include child locations in the audit.</p>
<p>Stockroom</p> <p>i Note: This field appears only if you set the Type field to Stockroom.</p>	<p>Stockroom in which you want to perform the audit.</p>
<p>Status</p>	<p>Present status of the audit.</p>
<p>Model category</p>	<p>Model category for which you want to perform the audit.</p> <p>i Important: This field is available with Hardware Asset Management version 15.0.0 onwards.</p>
<p>Scan date</p>	<p>Date when you want to scan the assets.</p>
<p>Aisle and space</p> <p>i Note: This field appears only if you set the Type field to Stockroom.</p>	<p>Aisle and space for which you want to perform the audit.</p> <p>i Important: This field is available with Hardware Asset Management version 15.0.0 onwards.</p>
<p>Include consumables</p>	<p>Option to include consumable assets in the stockroom audit. The available options are:</p> <ul style="list-style-type: none"> • Yes: When this field is set to Yes, consumable assets are included in the inventory audit. • No: When this field is set to No, consumable assets aren't included in the inventory audit. <p>i Note: You can include consumable assets only for stockroom audit. When the Type field is set to Stockroom, this field is activated. When the Type field is set to Location, this field is automatically set to No and inactive.</p>

Field	Description
	<p>The default populated value for this field is derived using the <code>sn_itam_common.set_default_include_consumables</code> system property.</p> <ul style="list-style-type: none"> • When this system property value is set to yes, the default value for the Include consumables field is set to Yes. • When this system property value is set to no, the default value for the Include consumables field is set to No. <div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #ccc;"> <p>i Important: This field is available with Hardware Asset Management version 15.0.0 onwards.</p> </div>
Scheduled date	Scheduled date when you want to perform the audit.
Scan method	<p>Type of scan method for scanning the assets. The available options are:</p> <ul style="list-style-type: none"> • Single scan • Multi scan <p>Depending on the value of the Include consumables field, the default selection for the scan method is automatically determined.</p> <ul style="list-style-type: none"> • When the Include consumables field is set to Yes, the Scan method field value is automatically set to Single Scan and can't be edited. • When the Include consumables field is set to No, the Scan method field becomes editable, enabling you to select the desired scan type. <p>Depending on the selected scan method for the audit record, you can scan the assets in the inventory using the ServiceNow Agent app.</p> <ul style="list-style-type: none"> • To complete asset scanning for the single scan audit record, see Complete a single scan inventory audit using the ServiceNow Agent app. • To complete asset scanning for multi scan audit records, see Complete multi scan inventory audit using the ServiceNow Agent app.

Field	Description
	 Important: This field is available with Hardware Asset Management version 15.0.0 onwards.

 **Note:**

The audit result fields such as **Expected, Not expected and location corrected, Missing, New, and Excluded from licensing** can't be edited. When the asset is scanned in the inventory using the ServiceNow Agent app, values are automatically updated in these fields. For more information about scanning assets, see [Complete a single scan inventory audit using the ServiceNow Agent app](#) and [Complete multi scan inventory audit using the ServiceNow Agent app](#).

Audit results

The Audit results shows the status of the assets when the scheduled or blind audits of asset stockrooms and other locations is complete.

The audit results are generated by comparing the assets scanned at the physical location or stockroom and the asset records present in the ServiceNow instance.

 **Important:**

If the `sn_hamp_migrate_hamaudit` system property is set to **false** and you haven't enabled audit enhancements in your ServiceNow instance, the audit results are populated from the Asset Audits [sn_hamp_asset_audit] table.

Audit Results

Field	Description
Scanned and expected	Number of assets scanned in the audit that are expected to be present at the location or stockroom.
Scanned and not expected	Number of assets scanned in the audit that are not expected to be present at the location or stockroom. These asset records are present in the ServiceNow instance.
Expected and not found	Number of assets that are expected to be present at the location or stockroom but not scanned as part of the audit.
New	Number of asset records that were missing from the ServiceNow instance when the assets were scanned. In such cases, a new asset record is created with the model category set as Unknown model category and the model set as Unknown model .

Audit Results (continued)

Field	Description
Excluded from HAM	Number of assets scanned as part of the audit process that are excluded from Hardware Asset Management features. For these assets, audit fields aren't updated.

The following related lists show asset information:

- **Expected Assets:** Shows a list of all assets that are part of the stockroom or location that is being audited. This list gets populated when you scan an asset for the first time in the audit.
- **Scanned Assets:** Shows a list of all assets that are scanned during the audit. The list is updated each time scans are submitted from the ServiceNow Agent app.
- **Excluded Assets:** Shows a list of all assets scanned as part of the audit which are excluded from Hardware Asset Management.

i Important:

If you have set the `sn_hamp_migrate_hamaudit` system property value to **true** to enable audit enhancements in your ServiceNow instance, the audit results are populated from the Asset Audits [sn_itam_common_asset_audit] table. Audit enhancements feature is available with Hardware Asset Management version 15.0.0 onwards.

Asset audit result

Description	Description
Expected	Number of expected assets that were scanned.
Not expected and location corrected	Number of assets that were scanned but weren't expected.
Missing	Number of expected assets that weren't scanned.
New	<p>Number of assets that were scanned but don't have a record in your ServiceNow instance.</p> <p>i Note: If the audit record's Scan method is set to Multi scan, a new asset record is created using the provided Asset tag. The new asset record is created with unknown product model and unknown model category value. Additionally, an asset remediation task is also created to notify you that an asset record is created with unknown model category and unknown product model. Open the asset remediation task from the Hardware Asset Workspace and update the Model category and Model fields value for the asset. For more information, see Close an asset remediation task.</p>

Asset audit result (continued)

Description	Description
Excluded from licensing	<p>Number of scanned assets that are excluded from licensing. A value is shown in this field when you scan an asset that meets one of the following conditions:</p> <ul style="list-style-type: none"> • When you scanned an enterprise asset that is considered as an excluded from licensing asset, if your ServiceNow® instance doesn't have an Enterprise Asset Management license. • When you have opted out of any HAM Resource Categories, then any asset you scan that belongs to those Resource Categories is considered as an asset excluded from licensing.
Found but not in audit scope	<p>The number of scanned assets that are not within the scope of the current audit record. For example, if the audit is created to scan assets located in Aisle and Space 001 of the stockroom, but an asset belonging to Aisle and Space 002 in the stockroom is scanned, that asset cannot be categorized as an unexpected asset for the stockroom. Since the asset is still an expected asset for the stockroom, it is categorized as found but not in audit scope asset.</p>

Hardware model details

Find the hardware model details and related list field descriptions.

Details

Field	Description
Display name	Display name of the model. The display name is generated from the Manufacturer and Name field.
Manufacturer	Name of the model manufacturer.
Short description	Description of the model.
Model categories	Model categories that the model can be associated with. Model categories are used to create configuration items (CIs) and assets.

Field	Description
Asset tracking strategy	Asset tracking for the model.
Useful life (months)	Number of months that the hardware model can be used for.
Asset tracking unit	Unit that is used to measure the asset.
Acquisition method	Method the assets or CIs were procured.
Cost	Cost of the an individual model.
Depreciation	Depreciation scheme of the model.
Salvage value	An estimate of the residual value of the model.
Name	Name of the model.
Model number	The number that identifies the model. This number can be defined internally or by the manufacturer of the model.
Barcode	Bar code that identifies the model.
Owner	The person responsible for the model.
Status	Status of the hardware model, which is being inherited from the product model. This field is hidden when you've opted in for the Common Service Data Model (CSDM).
Life Cycle Stage	Stage in the overall life cycle of hardware assets and CIs as related to their products. This field appears only when you've opted in for the Common Service Data Model (CSDM).
Life Cycle Stage Status	Status in the overall life cycle of hardware assets and CIs as related to their products. This field appears only when you've opted in for Common Service Data Model (CSDM).
Expenditure type	Type of expenditure.
Certified	Option that indicates if a model is certified for use.
Calculated lifecycle template	Applied template to calculate life cycle dates.
Calculated lifecycle start date	Date to apply the template and derive the final dates for each phase defined in the template.
TCO benchmark cost	Benchmark cost of the asset model. Note: Amount displayed in the currency specified on the model record.

Field	Description
TCO benchmark threshold	<p>The threshold value of your asset model cost identifying that the asset is reaching the TCO benchmark cost value.</p> <p>The benchmark threshold is set to 75% of the TCO benchmark cost by default.</p> <p>For example, if you set the TCO benchmark cost of an asset model as \$1000, the TCO benchmark threshold is set to \$750 automatically.</p> <p>Use the system property <code>sn_itam_common.asset_tco_benchmark_threshold_percentage</code> to update the threshold percentage.</p> <p>Note: Amount displayed in the currency specified on the model record.</p>
Hazardous materials	Option to indicate if your asset model contains hazardous materials.
Comments	Comments about the model.
Normalization	
Normalized manufacturer	Normalized name of the model manufacturer.
Product	Normalized name of the product.
Model	Normalized name of the model.
Normalization status	Normalization status of the model.
Device type	Type of device.
Exclude from content service	Option indicating whether the normalization information is excluded from the content service.
Dimensions	
Height	Height of the model populated from the content service.
Width	Width of the model populated from the content service.
Depth	Depth of the model populated from the content service.
Electrical Specifications	Electrical specifications of the model (such as voltages and frequencies) populated from the content service.
Weight	Weight of the model populated from the content service.
Environmental Social Governance (ESG)	
Energy star	Energy Star certified status of the model populated from content service.
EPEAT compliant	Electronic Product Environmental Assessment (EPEAT) compliant status of the model populated from the content service.
EPEAT level	EPEAT level (Gold, Silver, or Bronze) of the model populated from the content service.
Additional Details	

Field	Description
Manufacturer warranty	Manufacturer warranty terms of the model populated from content service.
Features	Product overview, specifications, or attributes of the model populated by the content service.
Information	
Power (watts)	Power requirement of the model in watts.
Height (U)	Height of the model in rack units.
Flow Rate (cfm)	Flow rate of the model in cubic feet per minute.
Sound Power (bels)	Sound power of the model in bels.
Weight (lbs)	Weight of the model in lbs.
Expected lifetime CO2e	Consumed Carbon dioxide equivalent (CO ₂ e) over the life of the model.
Energy use	Energy consumed by this model.
Energy Star	Requirements to be Energy Star certified by the Environmental Protection Agency (EPA).
Product Catalog	
Catalog Item	Name of the catalog item.
Description	Description of the catalog item.

Compatibles

Field	Description
Model	Name of the hardware model.
Model	Name of the hardware model that is compatible with the hardware model record.

Substitutes

Field	Description
Model	Name of the hardware model.
Substitute	Name of the hardware model that can be substituted for the hardware model.
Domain	Domain of the hardware model record.

Assets

For information about the fields on the Assets tab, see [Create assets](#).

Configuration Items

Field	Description
Name	Name of the CI. This name is often the Domain Name System (DNS) or computer host name.
Manufacturer	Name of the manufacturer.
Location	Location of the manufacturer.
Description	Description of the CI.
Class	Type of asset class.

Model Components

Field	Description
Is main component	Option for indicating if this component is the one that other components are attached to.
Component	Model that the child component will be instantiated as when the asset is created.
Model category of component	Model category that the child component will be instantiated as when the asset is created.
Component parameter	Component parameter requirement. <ul style="list-style-type: none"> • Mandatory • Optional
Main component	Name of the bundle if the model is an abstract model. <p>Note: This field is only used if an abstract model has been defined.</p>

Vendor Catalog Items

Field	Description
Name	Name of the vendor catalog item.
Product ID	The item identification number assigned by your organization.
Short Description	A brief description of the item.
Vendor Price	The price at which the item is available in the vendor catalog. If the vendor offers a discount, the vendor price reflects the discounted price.
Rank Tier	Displays the overall ranking for products and services of this vendor, such as Valued Partner or Tactical Supplier.

Field	Description
	Rank tier expresses the opinion of your organization of the vendor performance. It can be used to decide if the vendor's products should be promoted or discontinued. Users with the vendor_manager role can edit this field.

Hardware Model Lifecycles

Field	Description
Model	Name of the hardware model.
Lifecycle type	Type of life cycle.
Lifecycle phase	Phase of the life cycle for a hardware model. <ul style="list-style-type: none"> • General Availability: The date when the hardware becomes generally available through the manufacturer’s sales channels, including its worldwide subsidiaries, affiliates, and country distributors. The hardware is considered current/active and receiving support from the manufacturer. • End of Sale:The last date to order the hardware through the manufacturer’s sales channels, including its worldwide subsidiaries, affiliates, and country distributors. After end of sale date, the hardware is no longer available for sale. • End of Support: The last date upon which the manufacturer provides standard/regular support for the hardware as entitled by active service contracts. After this date, the manufacturer may continue to provide active support for certain issues in a limited capacity, the scope of which may vary across different manufacturers according to their lifecycle and/or support policies. • End of Extended Support: Up until this date, the manufacturer extends limited support for the hardware (after standard/regular support expires), for a defined period according to manufacturer policy. • End of Life:The date which indicates the hardware is at the end of its useful life (from the manufacturer’s point of view). The manufacturer stops marketing, selling, or sustaining the hardware.
Source	Source of the hardware model.
Phase start date	Start date of the life cycle phase.
Phase end date	End date of the life cycle phase.
Risk	Risk associated with the life cycle.
Active	Option that indicates if the hardware model life cycle is active.
Description	Description of the hardware model.

Hardware disposal order stages

A hardware disposal order goes through various stages in the disposal process before it's completed. With each stage, the task that's associated with that stage changes too.

Closing a task in the hardware disposal process completes that task and automatically creates the next task in the process. For example, after you close the Schedule Pickup task, the state for that task changes to Closed Complete and the next task, Asset Departure, is created. This process continues until you close all the tasks required for disposing of the selected assets. After you close all the tasks, the disposal order is completed.

Hardware disposal order stages

Hardware disposal stages	Task	Description
Draft	Verify Assets	Hardware disposal record is created.
Scheduling	Schedule Pickup	Scheduling details for the hardware asset disposal order.
Transit	Asset Departure	Verified assets are ready for departure.
Confirmation	Vendor Confirmation	Hardware disposal order is confirmed by the vendor.
Documentation	Disposal Documentation	Documentation for the disposal record is attached.
Completed	None	Hardware disposal record request is completed.
Cancelled	None	Disposal order can be canceled only until the transit stage.

Components installed with Hardware Model Normalization

Several types of components are installed with activation of the Hardware Model Normalization plugin, including tables.

Note:

To view all other components that are installed with this application, see the Application Files table. For instructions on how to access this table, see [Find components installed with an application](#).

Tables installed

Table	Description
Device Type	Type of the device, such as computer, printer, or monitor.
Hardware Lifecycle Definition	Lifecycle phase of a hardware or consumable model and the associated dates.
Hardware Manufacturer	Name of the hardware manufacturer.
Hardware Model Library	Name of the product and model number.

Table	Description
Hardware Normalization Map	Hardware product and hardware product model IDs.
Hardware Product	Name of the product and type of device, such as Apple Mac or Lenovo Printer.

HAM Success Goal Details

Fields on the HAM Success Goal Details form help you create success goals for tracking the success of the Hardware Asset Management application in your instance.

HAM Success Goal Details form

Field	Description
Number	A unique identifier of the success goal.
Status	Status of the success goal. By default, the success goal is in draft status.
Title	The title for the success goal.
Category	The category the success goal belongs to. Choose from the following options: <ul style="list-style-type: none"> Automation Inventory Improvement Loss Reduction Normalization Process Improvement Vendor/Contract Negotiation
Vendor	Vendor or publisher associated to the success goal.
Goal Type	Defines the metrics of your goal. <ul style="list-style-type: none"> Savings Count
Goal Description	A detailed explanation of the success goal.
Group	The group the goal is to be assigned to.
Owner	The user from the assigned group the goal is assigned to.
Projected Start Date	The projected start date for the success goal.
Projected End Date	The projected end date for the success goal.
Actual Start Date	The actual start date of the success goal.
Actual End Date	The actual end date of the success goal.
Projected Savings	Anticipated savings from the success goal.

HAM Success Goal Details form (continued)

Field	Description
	This field appears only when Goal Type is selected as Savings .
Actual Savings	The actual savings from the success goal. This field appears only when Goal Type is selected as Savings .
Projected Count	Anticipated count from the success goal. This field appears only when Goal Type is set to Count .
Actual Count	The actual count from the success goal. This field appears only when Goal Type is set to Count .
Achievement Description	A description of how the success goal was achieved.

HAM Success Activity

Fields on the HAM Success Activity form help you create success activities to track the success of your created goals.

HAM Success Activity form

Field	Description
Number	A unique identifier of the success activity.
Success Goal	The success goal that the activity is being associated to.
State	The current state of the success activity. Choose from the following options: <ul style="list-style-type: none"> • Open • Pending • Work in progress • Closed Complete • Closed Incomplete • Closed Skipped
Assignment group	The group this activity is assigned to.
Assigned to	A particular person in the assigned group.
Short description	A short description of the success activity.
Description	A detailed description of the success activity.

HAM Success Activity form (continued)

Field	Description
Work notes	Notes relating to the success activity.

Maturity item details

Fields on the Maturity item details form help you view and update the state and success goal of the maturity item.

Maturity item details

Field	Description
Name	Name of the maturity item.
Type	Type of the maturity item. <ul style="list-style-type: none"> • Process • End user
Short description	A brief summary of the maturity item.
Success goal	Success goal associated to the maturity item. For more information about creating a success goal, see Create a success goal for Hardware Asset Management .
State	Current stage of the maturity item. <ul style="list-style-type: none"> • New • Work in Progress • Closed Complete • Closed Skipped
Maturity level	Current maturity level. <ul style="list-style-type: none"> • Crawl • Walk • Run
Suggested maturity level	Suggested maturity level for improved value return of your HAM application. <ul style="list-style-type: none"> • Crawl • Walk • Run
Start date	The start date of the maturity item.
Completed date	Completed date of the maturity item.

Maturity item details (continued)

Field	Description
Purpose	Description of the purpose and outcome for the maturity item.
Steps to complete	List of steps of how to accomplish the purpose of the maturity item.
Work notes	Notes about the maturity item, which are visible to all users within your organization.

Maturity stages of your Hardware Asset Management program

The maturity of your Hardware Asset Management (HAM) program is divided into three stages such as Crawl, Walk, and Run.

Maturity stages

Stage	Description
Crawl	Begin your HAM journey, such as implementing or developing a new HAM program. At this stage, you can define models, create stockrooms, identify tools to discover data, and establish processes and roles. You can set up a normalization process to normalize models and get the date or time of asset lifecycles.
Walk	Begin establishing processes, procedures, policies, resources, and tools to execute on the roadmap of the Hardware Asset Management program. You can automate the manual processes and procedures, which you've established during the Crawl stage. Move to automating more complex processes by using HAM workflow.
Run	At this stage, you establish and use mature, advanced, and automated processes and procedures for centralized hardware asset tracking and system management. You use advanced capabilities like zero-touch refresh, asset bundles, mobile classes, and contract renewal workflows. You must also be evaluating processes and establishing HAM goals regularly.

Task closures that create shipment records

A shipment record is created automatically when any shipment task is closed. You can track a shipment easily by specifying a tracking number and shipping carrier on the shipment task.

Sources of shipments

Source flow	Task source for shipment record creation	Source for updating the shipment record to Closed or Delivered
Asset Donation	The Select the assets departing for donation task is closed.	The Confirmation from charity organization task is closed.
Asset disposal	The Asset departure task is closed.	<p>The Vendor confirmation task is closed.</p> <p>i Note: You can change the tracking number until this task is closed. If you don't specify any tracking number, a shipment record is created with the Vendor order ID as the tracking number.</p>
Purchase order	<ul style="list-style-type: none"> • Create hardware assets prior to delivery: When the hardware asset records are automatically created. • Advanced shipment notification: When the assets are imported for every unique tracking number specified in the import file. <p>i Note:</p> <p>If the shipping carrier specified for a row in the import file isn't available in the Shipping carrier [sn_itam_shipping_carrier] table, then that row isn't imported. Also, no shipment record is created. You must do one of the following and reimport the file:</p> <ul style="list-style-type: none"> ○ The shipping carrier must be included in the Shipping Carriers list. For more details, see Create a shipping carrier record. ○ The value of the sn_hamp.enable_shipping_carrier_validation_asn system property must be set to false. 	The purchase order is received.

Sources of shipments (continued)

Source flow	Task source for shipment record creation	Source for updating the shipment record to Closed or Delivered
	<ul style="list-style-type: none"> • Receive an asset: When the assets are received. <p>Note: The shipment record is created in the Delivered stage.</p>	
Transfer order	The Ship task of the Transfer order line item is closed.	<p>The transfer order line item is delivered.</p> <p>Note: You can change the tracking number until the Transfer order line item is in the In Transit stage.</p>
Lease expiration	The Ship task of the Return lease action is closed.	Return confirmation task is closed.
Return Merchandise Authorization (RMA)	<ol style="list-style-type: none"> 1. The Shipment task of the Off-site return action is closed. 2. The Vendor RMA decision task is closed. 	<ol style="list-style-type: none"> 1. Vendor RMA decision task is closed. 2. The Receive task is closed.
Asset reclamation	The Schedule shipment task for the Ship reclaim method is closed.	The Receive asset task is closed.
Zero Touch Refresh	The Request shipment task is closed.	The User asset receive task is closed.

Remote task definition inbound and outbound fields

The inbound and outbound fields of the remote task definition required for the Zero Touch Refresh flow.

Inbound field values

For each field, the source table and target table are the Zero Touch Refresh Fulfillment Request table [sn_itam_ztr_fulfillment_req].

The **Target field** value is the same as the **Source field** value. The value in the source field is sent from the source table on the requester's ServiceNow instance to the target field in the table on the provider's instance to which the source field is synced.

The **Sync when** value is **Insert**, which updates the target field on the remote task's parent record only when the remote task is initially inserted.

Inbound fields

Field label	Field name	Max length	Source field
Customer request number	customer_request_number	40	Customer request number
Model	model	255	Model
State	state	40	State
Name	name	151	Name
Email	email	100	Email
Mobile	mobile	40	Mobile
Street	street	255	Street (street)
City	city	40	City (city)
State or Province	state_loc	40	State/Province (state_loc)
Country	country	40	Country (country)
Zip or Postal code	zip	40	Zip/Postal code
Return name	return_name	151	Name (return_name)
Return street	return_street	255	Street (return_street)
Return city	return_city	40	City (return_city)
Return state or province	return_state_loc	40	State/Province (return_state_loc)
Return country	return_country	40	Country (return_country)
Return zip or postal code	return_zip	40	Zip/Postal code (return_zip)

Outbound field values

For each field, the source table and target table are Zero Touch Refresh Fulfillment Request table [sn_itam_ztr_fulfillment_req].

The **Target field** value is the same as the **Source field** value. The value in the Source field is sent from the source table on the provider's ServiceNow instance to the target field on the table on the requester's instance to which the source field is synced.

The **Sync when** value is **Insert and Update**, which updates the target field on the remote task's parent record every time the remote task is updated.

Outbound fields

Field label	Field name	Max length	Source field
Serial number	serial_number	100	Serial number
Asset tag	asset_tag	40	Asset tag
State	state	40	State
Tracking number	tracking_number	40	Tracking number (tracking_number)
Carrier	carrier	80	Carrier (carrier)
Return tracking number	return_tracking_number	40	Tracking number (return_tracking_number)
Return carrier	return_carrier	80	(return_carrier)

Decision tables for Hardware Asset Management flows

These readily available decision tables help you customize the flows in some of the Hardware Asset Management features.

Decision tables

Hardware Asset Management features	Decision tables
Hardware Asset Refresh	Hardware Asset Refresh Line Flow
Lease Contract Expiration	Lease Contract Expiration Flow
Leased Asset Buyout	Leased Asset Buyout Flow
Leased Asset Extension	Leased Asset Extension Flow
Leased Asset Return	Leased Asset Return Flow
Loaner Asset Request	Loaner Asset Request Flow
Source request from local stockroom	Asset Local Order Subflow Note: The Asset Local Order Subflow decision table is available with both Hardware Asset Management and Procurement plugins.
Reclamation	Asset Reclamation Flow
Hardware reclamation flow	Hardware Asset Reclamation Flow, Hardware Asset Reclamation Line Flow
RMA request	Asset RMA Flow
RMA on-site repair	Asset RMA On-site Flow
RMA off-site repair	Asset RMA Off-site Flow
Contract renewal request	Contract Renewal Flow
Contract renewal tasks	Contract Renewal Tasks Flow

Service Catalog variable form fields

Fields on the variable help you to define variables for a catalog item.

Field	Description
Application	Read-only field that indicates the application can use this variable.
Type	The variable type that you want to create.
Catalog item	Catalog item associated with the variable.
Order	Order in which the variable is placed on the catalog item page. The variables are organized with lowest order value on the top and greatest order value at the bottom.
Active	Option to make the variable available for use.
Mandatory	Option to mark the variable as required to order the catalog item.
Read only	Option to make the variable read only.
Hidden	Option to hide the variable.
Question tab	
Question	Question to ask when ordering the catalog item.
Name	Name to identify the question. Note: If this field is empty, its value is auto-populated based on the Question field.
Tooltip	Tooltip text to display when you hover over the variable. Enter a brief note to describe the purpose of the Question.
Example text	Hint that is displayed in the question field before you enters a value. Applicable for the following variables: <ul style="list-style-type: none"> • IP Address • Email • URL • Single Line Text • Wide Single Line Text • Multi Line Text • Date • Date/Time
Annotation	
Show help	Option to provide additional help and instructions for the variable.
Help tag	Tag to display the Help text. For example, "More information."
Help text	Help information for a service catalog variable.

Field	Description
Instructions	Information that requires rich text formatting or adding images to support help information.
<p>Type specifications</p> <p>The fields in this section vary for each variable type.</p>	
Variable Width	Width of the variable on the catalog item page, to specify what percentage of the screen size that it can span.
Enable also request for	Option to allow a catalog item request to be submitted for multiple users. After you select this option, the Also request for Requested For variable in a catalog item.
Roles to use also request for	Option to specify the roles that can submit a catalog item request for multiple users.
Choice direction	<p>The direction in which the list is arranged.</p> <ul style="list-style-type: none"> • Across: Arranges choices horizontally. • Down: Arranges choices vertically. <p>This field appears for lookup multiple choice variables.</p>
Choice field	<p>Table field to populate options for the variable. If no choices are defined for a field, then the variable loads field-related distinct values from the table.</p> <p>This field appears for select box variables.</p>
Choice table	<p>Table with values to populate in the Choice field.</p> <p>This field appears for select box variables.</p>
Don't select the first choice	<p>Check box to leave all options for the variable cleared on the catalog item page.</p> <p>If this check box is selected, the first choice for the variable selected by default. This field appears for multiple choice and numeric scale variables.</p>
Dynamic ref qual	<p>Dynamic qualifier. Select a dynamic filter to run a query against the reference field.</p> <p>This field appears for reference variables when Use reference qualifier is set to Dynamic.</p>
Include none	<p>Check box to include the None option in a list of choices.</p> <p>This field appears for lookup multiple choice, lookup select box, multiple choice, and select box variables.</p>
Layout	<p>Layout for a container.</p> <p>This field appears for container start variables.</p>
List table	<p>Table with the values for the list collector.</p> <p>The table should have a display column specified. For more This field appears for list collector variables.</p>

Field	Description
Lookup from table	Table from which values are obtained for users to select. The values from this table are populated in the Lookup value field. This field appears for lookup multiple choice and lookup select box variables.
Lookup value field	Field in the lookup table that populates options for the variable. This field appears for lookup multiple choice and lookup select box variables.
Lookup label field(s)	Comma-separated list of fields in the lookup table whose values are used to display options. This field appears for lookup multiple choice and lookup select box variables.
Lookup price field	Field in the lookup table whose value is used to modify the price of the item being ordered. This field appears for lookup multiple choice and lookup select box variables.
Lookup recurring price field	Field in the lookup table whose value is used to modify the recurring price of the item being ordered. This field appears for lookup multiple choice and lookup select box variables.
Macro	UI macro to insert into the catalog item. This field appears for macro, macro with label, and UI page variables.
Summary macro	Applicable only for Macro, and Macro with Label type variables.
Widget	Applicable only for Marco, and Macro with Label type variables.
Price if checked	Price of the item. This field appears for check box variables.
Recurring price if checked	Price that increments for the item when you request more than one order of the item. This field appears for check box variables.
Reference	Reference table for the variable. The table should have a display column specified. This field appears for reference variables.
Reference qual	Qualifiers to restrict data that is available in the field. Supports reference qualifiers and advance qualifiers. This field appears for list collector, lookup multiple choice, lookup select box, reference, and Requested For variables. The field also appears for reference variables when Use reference qualifier is set to Dynamic .
Reference qualifier condition	Options to build conditions. This field appears for reference variables when Use reference qualifier is set to Simple .

Field	Description
Scale max	Highest value on the scale of available options for the variable. This field appears for numeric scale variables.
Scale min	Lowest value on the scale of available options for the variable. This field appears for numeric scale variables.
Unique values only	Check box to require a unique value for the field. When this check box is selected, two records can't have the same value for that field. This field appears for lookup multiple choice, lookup select box, and select box variables.
Use confirmation	Check box to prompt users to reenter data to verify their entries. This field appears for masked variables.
Use encryption	Check box to store the answer in encrypted format in the database. If not encrypted, the answer is stored in plain text format. This field appears for masked variables.
Use reference qualifier	Type of qualifier to use. This field appears for reference variables.
Validation Regex	Regular expression that validates the variable value. This field is displayed only for Single Line Text and Wide Single Line Text variable types.
Variable attributes	Attributes that define the behavior and restrictions for a variable.
Default value	
Default value	Default value for the variable.
Auto-populate	
Dependent question	Reference type variable for the catalog item. This field is used to auto-populate the variable.
Reference	Reference field for auto-populating the variable.
<p>Permission</p> <p>If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role.</p> <p>A user with a role that doesn't match any of the following roles can't set variable values even through scripting.</p> <p>These roles aren't available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.</p>	

Field	Description
Read roles	Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.
Write roles	Roles that can edit the variable in the variable editor after requesting the catalog item. If a user doesn't have the roles specified in this field, the variable is read-only in the variable editor.
Create roles	Roles that can create values for the variable before requesting the catalog item or record producer. If a user doesn't have the specified role, the variable is read only before requesting the catalog item or record producer.
Availability	
Visible Elsewhere	If selected, the variable appears on the item form before ordering the item, in the Variable Editor after ordering the item, and in the cart view of the item.
Visible on Bundles	If selected, the variable appears when the item is added to a bundle.
Visible on Guides	If selected, the variable appears when it's added to an order guide, or when it's added to a catalog item that is included in the order guide. Note: If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.
Visible on Summaries	If selected, the variable appears on any variable summarizer of the catalog item.

Asset put away task fields

Fields on the Asset put away task form help you create a put away task for the in stock assets.

Create New Asset put away task form

Field	Description
Number	Task number. This field is automatically set.
State	Current state of the Asset put away task. When a new task is created, this field is automatically set to Open .
Asset	Asset for which the put away task is created. All the in stock assets are listed.
Task name	Name of the task. This field value is automatically set to Put away .
Stockroom	Stockroom for the task. This field value is automatically populated when the asset is selected.
Assignment group	Assignment group to which you want to assign the Asset put away task.
Drop off location	Aisle and space in the stockroom where you want to put away the hardware asset. This value is required to close the Asset put away task.

Create New Asset put away task form (continued)

Field	Description
Assigned to	Person from the assignment group who is primarily responsible for the Asset put away task.
Due date	Date by which the Asset put away task should be closed.
Notes	Notes about the task. The Short description and Description field values are automatically populated.

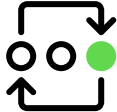

Now Assist for Hardware Asset Management (HAM)

Use the Now Assist for Hardware Asset Management (HAM) application to streamline and automate the hardware asset request process and the repair process with the agentic workflows.

Watch this short video for an introduction to the agentic AI for Hardware Asset Management application.

https://player.vimeo.com/video/1096608088?h=2b114916d2&badge=0&autoplay=0&player_id=0&app_id=58479

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by [ServiceNow's AI Acceptable Use Policy](#), which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our [CORE Compliance Portal](#).

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about legal request and/or legal matter (including related field information, comments, and work notes). Customers can opt out of future data collection at any time, as described in the [Now Assist Opt-Out page](#).

For more information, see the [Now Assist documentation](#).

Exploring Now Assist for Hardware Asset Management (HAM)

The Now Assist for Hardware Asset Management (HAM) application includes an agentic workflow driven by AI agents that can manage hardware asset requests and repair requests autonomously. This automation helps asset managers skip manual tasks, enhancing their productivity and efficiency.

Now Assist for HAM overview

The agentic workflow in the Now Assist for HAM application operates in a structured manner.

- The agentic workflow first verifies licenses and models, then checks stock availability, and finally triggers the necessary AI agents to fulfill hardware asset requests automatically.
- The AI agents also verify the repair tasks, provide detailed evaluation guide and repair steps, and close the tasks after receiving user confirmation.

Now Assist for HAM benefits

The collection of AI agents included in the Now Assist for HAM application offers the following benefits:

- Automation of repetitive and complex tasks involved in sourcing hardware assets, reducing the workload on asset managers.
- Reduced need for human involvement in tasks, enabling asset managers to focus on activities of higher priority.
- Faster resolution of hardware asset requests and repair requests, leading to quicker turnaround times.
- Increased employee satisfaction, with quicker resolution of asset requests and repair requests.
- Improved asset utilization, for effective allocation of hardware assets.

Supporting information for Now Assist for Hardware Asset Management (HAM)

Get a quick overview of the important information related to the Now Assist for Hardware Asset Management (HAM) application.

Supported versions

The Now Assist for HAM application is supported starting with the Yokohama Patch 4 release.

Supported user interfaces

You can access the agentic workflow included in the Now Assist for HAM application through the Now Assist panel in the Hardware Asset Workspace.

Licensing requirements

The Now Assist for HAM application requires a Hardware Asset Management Pro Plus license.

Application information

Activate the Now Assist for Hardware Asset Management (HAM) store application (sn_now_assist_ham) to use the agentic workflow.

This store application has the following dependencies:

- Hardware Asset Management (com.sn_hamp)
- Now Assist for Platform (com.sn_genai_platform)
- AI Agents for IT Asset Management (com.sn_itam_aia)

Activate the applications in the following order:

- Hardware Asset Management (com.sn_hamp)
- Now Assist for Platform (com.sn_genai_platform)
- AI Agents for IT Asset Management (com.sn_itam_aia)
- Now Assist for Hardware Asset Management (HAM) (sn_now_assist_ham)

Configuring Now Assist for Hardware Asset Management (HAM)

Configure the Now Assist for Hardware Asset Management (HAM) application to use the agentic workflow capabilities for managing your hardware asset requests autonomously.

Install Now Assist for Hardware Asset Management (HAM)

If you have the admin role, you can install the Now Assist for Hardware Asset Management (HAM) application. Now Assist for HAM enables asset managers and procurement users to use the capabilities of agentic workflows in Hardware Asset Management.

Before you begin

Role required: admin

Procedure

1. Go to the [ServiceNow Store](#) .
2. In the search bar, enter Now Assist for Hardware Asset Management (HAM) and then select **Search**.
3. Select the Now Assist for Hardware Asset Management (HAM) widget and then select **Get** to make this application available for installation on your ServiceNow instance.
4. On your ServiceNow instance, navigate to **All > System Definitions > Plugins**.
5. Search for the Now Assist for Hardware Asset Management (HAM) application.
6. Select **Install**.

Result

The agentic workflow and the AI agents included in the Now Assist for Hardware Asset Management (HAM) application are installed on your ServiceNow instance.

What to do next

1. Enable the Now Assist panel to access the AI agents. For details, see [Activate Now Assist panel standard chat](#) .
2. Activate the AI Search application on your ServiceNow instance enabling the AI agents to search and get related records.
 - a. Navigate to **All > AI Search > AI Search Status**.
 - b. Trigger the automatic AI Search activation process on your ServiceNow instance by selecting **Request AI Search**.

Note:

The activation process can take up to 24 hours.

Using agentic workflows in Now Assist for HAM

Use the Now Assist for HAM AI agent collection to complete hardware asset sourcing tasks autonomously and optimize the asset repair workflow. These AI agents help resolve hardware requests quickly, improve the productivity of asset managers, and speed up repairs.

Available agentic workflows for Now Assist for Hardware Asset Management (HAM) AI agent collection

Agentic workflow name	Description	Available AI agents
Help manage hardware asset requests	Automatically fulfills hardware asset requests by either using the available local stock, or by generating transfer orders to move assets from other stockrooms, or purchase orders to acquire assets from vendors.	<ul style="list-style-type: none"> • Hardware asset management sourcing AI agent • Transfer order creation AI agent • Purchase order creation AI agent
Help repair hardware assets	Automates and optimizes the repair workflow for hardware assets by validating repair tasks, guiding inventory users and technicians through troubleshooting steps, suggesting suitable repair actions, and closing relevant tasks with details.	<ul style="list-style-type: none"> • Asset next best action AI agent • Evaluate asset AI agent • Repair asset AI agent

i Important:

By default, all agentic workflows and AI agent records are inactive. To use the agentic workflows and AI agents, follow these steps:

- Activate the agentic workflow.
- Activate all agents within the agentic workflow.
- Activate the trigger to invoke the agentic workflow automatically. If you prefer to invoke it manually, activating the trigger isn't necessary.

By default, all agentic workflows and AI agent records are read only. To customize them, you must first [duplicate the agentic workflow](#), and then activate the duplicated workflow.

After you duplicate the agentic workflow, you can test it in the AI Agent Studio to analyze its performance as it executes the instructions that you have defined. For details on testing your agentic workflow, see [Manually test the execution of an agentic workflow](#).

You can implement security in AI agents and the agentic workflow using access control lists (ACLs) that specify which users can discover and invoke an agentic workflow or an AI agent. For more details on configuring ACLs, see [Implement access control in Now Assist AI agents](#).

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see [Find AI agents](#).
- To find agents that might not be installed on your instance, visit the [AI Agent Marketplace](#) on the ServiceNow Store.

Now Assist for Hardware Asset Management (HAM) AI agent collection Help manage hardware asset requests agentic workflow

Use the Help manage hardware asset requests agentic workflow, driven by AI agents, to handle your employees' hardware asset requests automatically. The AI agents fulfill requests by either consuming the available local stock, or by generating transfer orders or purchase orders.

Help manage hardware asset requests agentic workflow overview

The AI agents in the Help manage hardware asset requests agentic workflow help to speed up request resolution, improve operational efficiency, and enhance user satisfaction. This agentic workflow processes and fulfills requests for hardware, consumables, bundles, and pallets.

Note:

The `itil`, the `procurement_user`, and the `now_assist_panel_user` roles have access to the Now Assist panel. The fulfiller needs the `itil` and `procurement_user` roles if you have the Now Assist for IT Service Management (ITSM) store application installed. If you have the Now Assist for Hardware Asset Management (HAM) store application but not the Now Assist for IT Service Management (ITSM) store application, then the fulfiller requires the `itil`, `procurement_user`, and `now_assist_panel_user` roles to fulfill the request via the Now Assist panel trigger.

Auto-sourcing scenarios

To enable AI agents to perform sourcing autonomously, the following options are available at the stockroom level:

- **Auto-consume:** Automatically use the available local stock.

Automatic consumption of local stock happens when a minimum of one stockroom serving the location of the requester has the **Auto-consume** option enabled. If several stockrooms at the location of the requester have the **Auto-consume** option enabled, assets are first consumed from the stockroom with the highest available quantity. If there are still assets needed, they're consumed from the stockroom with the next highest quantity.

- **Auto-transfer:** Automatically transfer stock from another stockroom.

Automatic transfer of assets happens under the following conditions:

- There's only one destination stockroom serving the location of the requester that has the **Auto-transfer** option enabled.
- The destination stockroom must be linked to distribution channels that serve as source stockrooms. Sourcing from these channels is based on their rank, beginning with the distribution channel having the lowest rank and moving on to the next ranks.
- The **Auto-transfer** option is enabled on both the source and destination stockrooms.

- **Auto-purchase:** Automatically create purchase orders to procure assets from a vendor.

Automatic purchase of assets happens under the following conditions:

- There's only one stockroom serving the location of the requester that has the **Auto-purchase** option enabled.
- There's only one vendor from whom the model of the requested item can be purchased.

Requested item (RITM) validations

Before sourcing any hardware asset requests, the Help manage hardware asset requests agentic workflow validates the requested item (RITM). The agentic workflow doesn't proceed with sourcing under the following conditions:

- The RITM number is missing or invalid.
- More than one requested items have the same RITM number.
- The requested item is already sourced.
- The request isn't sourceable.
- The request isn't approved.
- The model that's requested is invalid or missing.
- The model isn't associated with any model category.
- The resource category of the requested model isn't opted in.
- The model associated with the catalog item isn't licensed.

Stages in the agentic workflow

The fulfillment of hardware asset requests through the agentic workflow includes the following stages:

1. Hardware asset request initiation

- a. An employee creates a hardware asset request in the Service Catalog application.
- b. The request is either automatically approved or, when necessary, approved by the asset manager.
- c. The requested item is assigned to a procurement user, which triggers the Help manage hardware asset requests agentic workflow.

2. Asset availability checks by the AI agent

- a. The AI agent verifies whether the requested item is available in the inventory.
- b. The AI agent also checks the stockrooms that are set up for automatic consumption of local stock, transfer, and purchase.

3. Asset sourcing and allocation

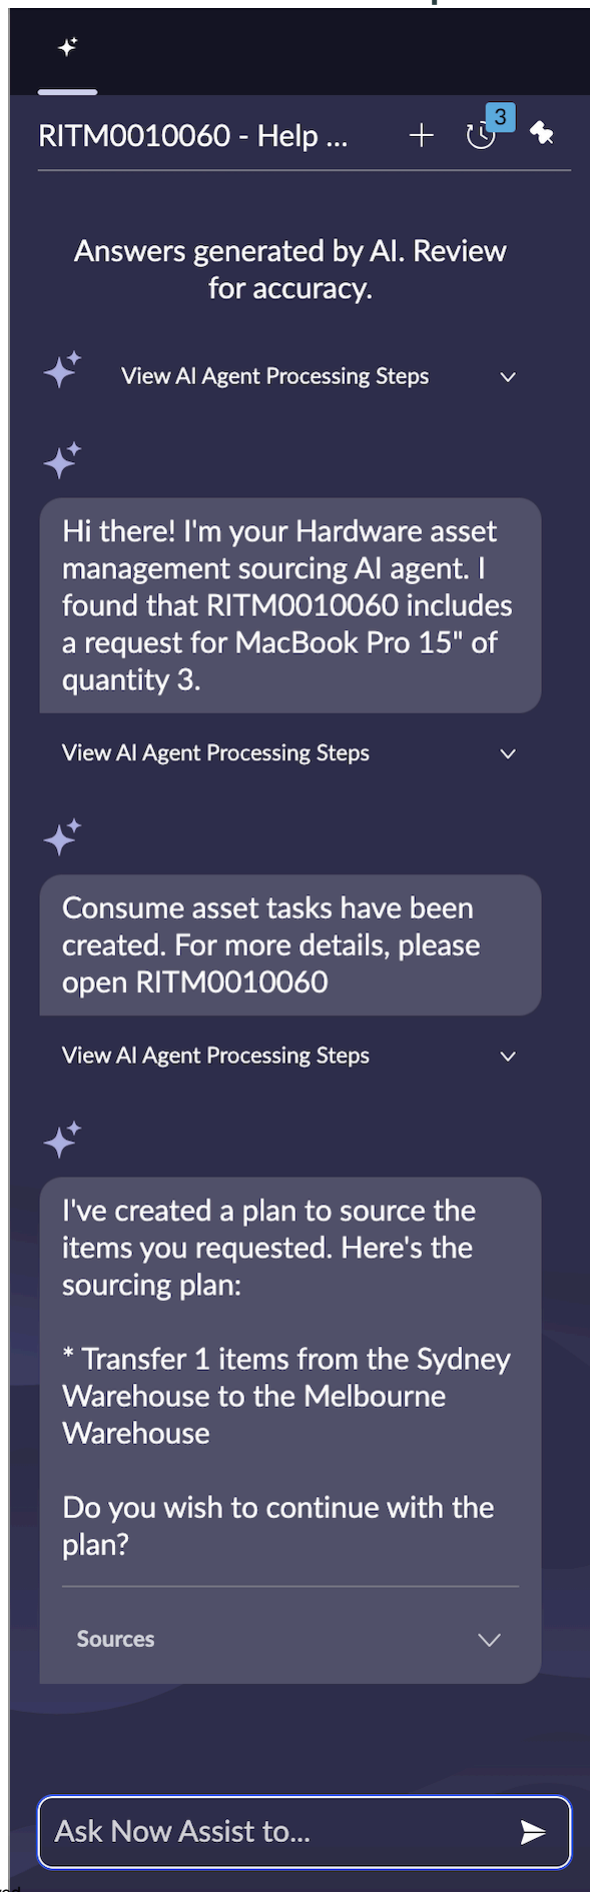

- a. When stockrooms are configured to consume, transfer, and purchase assets automatically through the AI agents, the following events occur:
 - i. The AI agent first uses the available stock in the stockroom.
 - ii. For any remaining assets that can be transferred from another stockroom, the AI agent creates a transfer order.
 - iii. If there are still assets to be sourced, the AI agent creates a purchase order to buy them from a vendor.

- b. When assets are available in stockrooms that aren't set up for automatic sourcing, the AI agent creates a sourcing plan and asks for confirmation from the assignee of the requested item (RITM) or the person who started the conversation through the Now Assist panel before proceeding.

 **Note:**

To access the Now Assist panel after it has been activated, you should have the `now_assist_panel_user` role. To access the Help manage hardware asset requests agentic workflow in the Hardware Asset Workspace, select the sparkle icon.

Conversations in the Now Assist panel

- i. If the AI agent receives the confirmation to proceed and there have been no changes to the plan, it sources the assets according to the sourcing plan.

Note:

If there's a change in the plan, the agentic workflow stops, and the conversation should be reinitiated through the Now Assist panel.

- ii. If the AI agent receives a confirmation not to proceed with the sourcing plan, or if there's still some quantity of assets remaining to be sourced, the agentic workflow continues as follows:

1. The AI agent first verifies whether the assets can be sourced through a transfer order or purchase order.

If the transfer is possible, the following events happen:

- a. The AI agent asks to confirm whether it can proceed with the transfer.
- b. If the AI agent receives confirmation to proceed, it asks to confirm both the source and destination stockrooms.
- c. After receiving confirmation, the AI agent creates a transfer order.

Note:

If there's only one stockroom available as the source or destination, it's automatically selected. The AI agent displays only the source stockrooms that have the quantity of assets to be sourced. Only the stockrooms that serve the location of the requester are shown as destination stockrooms.

2. If the AI agent receives a confirmation not to proceed with the transfer order:
 - a. The AI agent further requests confirmation to proceed with the purchase order.
 - b. If the AI agent receives confirmation to proceed, it asks to confirm the vendor and the destination stockroom.
 - c. After receiving confirmation, the AI agent creates a purchase order.

Note:

If there's only one stockroom or vendor available, these values are automatically selected. The AI agent displays the list of vendors for the requested item. Only the stockrooms that serve the location of the requester are shown as destination stockrooms.

3. If the user doesn't agree to either the transfer order or the purchase order, the request must be sourced manually.

Refer to the information provided here on the AI agents related to the Help manage hardware asset requests agentic workflow.

To modify the Help manage hardware asset request agentic workflow [duplicate it](#) , and adjust the settings according to your requirements.

Important:

In the Edit trigger form, make sure that the **Active** button is turned on to enable the AI agent to trigger autonomously.

AI agents used in the Help manage hardware asset requests agentic workflow

The Help manage hardware asset requests agentic workflow uses specific AI agents to consume local stock, transfer assets between stockrooms, and procure assets from vendors.

Role of AI agents the Help manage hardware asset requests agentic workflow

AI agent	AI agent role
Hardware asset management sourcing AI agent	<ul style="list-style-type: none"> • The AI agent checks if the requested item is available in the stockroom. Depending on the automatic sourcing set up in the stockroom, the AI agent either uses the local stock autonomously or creates a sourcing plan and requests user confirmation to consume the assets. • Triggers the Transfer order creation AI agent to create transfer orders. • Triggers the Purchase order creation AI agent to create purchase orders.
Transfer order creation AI agent	Sources the requested item by either creating a transfer order autonomously or according to the sourcing plan created by the Hardware asset management sourcing AI agent. If there are multiple source or destination stockrooms, the AI agent requests user input to create the transfer order.
Purchase order creation AI agent	Sources the requested item by either creating a purchase order autonomously or according to the sourcing plan created by the Hardware asset management sourcing AI agent. If there are multiple destination stockrooms or vendors, the AI agent requests user input to create the purchase order.

Access the Help manage hardware asset requests agentic workflow in the AI Agent Studio

- Navigate to **All > AI Agent Studio > Create and manage**.
- Select **Help manage hardware asset requests**.

Now Assist for Hardware Asset Management (HAM) AI agent collection Help repair hardware assets agentic workflow

Use the Help repair hardware assets agentic workflow, driven by AI agents, to handle the repair requests of defective and out-of-warranty hardware assets automatically. These AI agents validate the repair tasks, provide detailed troubleshooting and repair steps, and finally close the relevant tasks after receiving user confirmation.

Help repair hardware assets agentic workflow overview

The AI agents in the Help repair hardware assets agentic workflow offers these benefits:

- AI-guided troubleshooting and repair steps help improve accuracy and consistency
- End-to-end task automation helps reduce delays in resolving hardware issues

Prerequisites to use the Help repair hardware assets agentic workflow

- Your organization must have an IT asset management system integrated with AI-driven repair workflows.
- AI agents must have access to repair order records and the web.

- Repair task numbers are required to initiate requests.
- Users must have the inventory_user role.

Actors in the Help repair hardware assets agentic workflow

- Asset manager: Reports hardware issues by submitting repair requests.
- Inventory user: Works on assigned troubleshooting and repair tasks.
- AI agents: Provide detailed troubleshooting and repair steps through web-based search and complete the relevant tasks.

Stages in the agentic workflow

i Important:
In the Edit trigger form, make sure that the **Active** button is turned on to enable the AI agent to trigger autonomously. Only by enabling this option can the agentic workflow manage hardware repair requests when a troubleshoot or repair task is assigned to a technician.

The repair of defective or out-of-warranty hardware assets through the agentic workflow includes the following stages:

1. Repair order creation by an Asset manager

- a. Initiates the repair process for defective or out-of-warranty hardware assets in the stockroom by creating a repair order.
- b. Adds one or more repair order lines to the repair order, depending on the number of assets that must be fixed, and saves the repair order.

Result: A Troubleshoot task is created for each repair order line.

- c. Assigns a technician for the troubleshooting task, automatically triggering the Help repair hardware assets agentic workflow.

i Note:
The assigned technician with the inventory_user role can log in and view the active conversation with the AI agents in the Now Assist panel in the Hardware Asset Workspace by selecting the sparkle icon [✨].

To access the Now Assist panel after it has been activated, you should have the now_assist_panel_user role.

2. Repair order task validation by the AI agent

- a. The Asset next best action AI agent retrieves the task details and validates them.
- b. Based on the validation result, one of the following events occurs:
 - If the task number is invalid or the task isn't active, the agentic workflow ends.
 - If the task is valid, the AI agent checks whether it's a troubleshooting task, or a repair task and triggers the appropriate AI agent to handle it.

3. Processing of tasks by AI agents

Handling of the troubleshooting task by the Evaluate asset AI agent

The Evaluate asset AI agent manages the troubleshooting task as follows:

- a. Searches the web to find a detailed evaluation guide that matches the model and manufacturer of the asset.

If the model or manufacturer details aren't present on the asset record, the agentic workflow stops.

i Important:

Web searches using third-party large language models (LLMs) like Gemini won't be supported for Federal customers.

- b. Displays the evaluation guide in the Now Assist panel, to help the technician to identify the issue with the asset.
- c. Checks with the technician to confirm whether the troubleshooting steps were helpful.
 - If the technician confirms that the troubleshooting steps helped, the AI agent performs these steps:
 - i. Asks the technician to confirm the troubleshoot result (**Repairable**, **Unrepairable**, or **Redeployable**) and provide the issue details.
 - ii. Updates the task with the details provided by the technician and closes the task.
 - If the technician confirms that the troubleshooting steps didn't help, the AI agent performs these steps:
 - i. Requests more details about the issue to refine the web search.
 - ii. Searches the web again to find a detailed evaluation guide that matches with the details provided.
 - iii. Displays the evaluation guide in the Now Assist panel, to assist the technician in identifying the issue.
 - iv. Checks with the technician to confirm whether the new troubleshooting steps were helpful.
 - If the technician confirms that the new troubleshooting steps were helpful, the AI agent updates the task with the troubleshooting result and the issue details provided by the technician, and then closes the task.
 - If the technician confirms that the new troubleshooting steps weren't helpful, the agentic workflow stops.

When a troubleshoot asset task is marked as Repairable and closed, the following events occur:

- a. A repair task is automatically generated and assigned to the technician who handled the troubleshoot task. This action also initiates the Help repair hardware assets agentic workflow.
- b. The Asset next best action AI agent fetches the details of the repair task and performs a validation check.
- c. Depending on the validation result, one of these events occurs:

- If the task number is invalid or the task isn't active, the agentic workflow ends.
- If the task is valid, the AI agent confirms the task type and triggers the Repair asset AI agent to manage the repair process.

Handling of the repair task by the Repair asset AI agent

The Repair asset AI agent checks if the issue is identified and present on the repair task.

- If the issue is present on the repair task, the AI agent performs the following actions:

- a. Searches the web to find detailed repair steps to resolve the issue identified on the asset.

Note:

If the model or manufacturer details aren't present on the asset record, the agentic workflow stops.

- b. Displays the repair instructions in the Now Assist panel, to help the technician to fix the asset issue.
- c. Checks with the technician to confirm whether the repair steps were helpful.
 - If the technician confirms that the repair steps were helpful, the AI agent performs these steps:
 - i. Asks the technician to confirm the repair result (**Repaired**, **Unrepairable**, or **Redeployable**) and provide the issue details.
 - ii. Updates the repair task with the repair result and the issue details provided by the technician, and closes the task.
 - If the technician confirms that the repair steps weren't helpful, the AI agent performs these steps:
 - i. Requests more details about the issue to refine the web search.
 - ii. Searches the web again to find repair steps that match with the details provided.
 - iii. Displays the repair steps in the Now Assist panel, to assist the technician in resolving the issue.
 - iv. Checks with the technician to confirm whether the new repair steps were helpful.
 - If the technician confirms that the new repair steps were helpful, the AI agent updates the task with the details provided by the technician and closes the task.
 - If the technician confirms that the new repair steps were not helpful, the agentic workflow stops.
- If the issue isn't present on the repair task, the AI agent performs the following actions:
 - a. Requests more details about the issue to refine the web search.
 - b. Searches the web again to find repair steps that match with the details provided.

- c. Displays the repair steps in the Now Assist panel, to assist the technician in resolving the issue.
- d. Checks with the technician to confirm whether the new repair steps were helpful.
 - If the technician confirms that the new repair steps were helpful, the AI agent updates the task with the details provided by the technician, and then closes the task.
 - If the technician confirms that the new repair steps weren't helpful, the agentic workflow stops.

AI agents used in the Help repair hardware assets agentic workflow

The Help repair hardware assets agentic workflow uses specific AI agents to validate repair tasks, handle troubleshooting and repair tasks, and complete the tasks autonomously.

Role of AI agents in the Help repair hardware assets agentic workflow

AI agent	AI agent role
Asset next best action AI agent	Validates the repair tasks, checks the task type, and triggers the Evaluate asset AI agent to manage the troubleshooting task or the Repair asset AI agent to manage the repair task.
Evaluate asset AI agent	Performs a web search and provides a detailed evaluation guide to help the technician identify the issue on the asset. Updates the troubleshooting task with the details received from the technician and then closes the task.
Repair asset AI agent	Performs a web search and provides detailed repair steps to help the technician resolve the issue identified on the asset. Updates the repair task with the details received from the technician and then closes the task.

Using generative AI skills for Now Assist for Hardware Asset Management (HAM)

Streamline asset management tasks in the Hardware Asset Workspace by using the generative AI skills available in the Now Assist for HAM application.

Available generative AI skills for Now Assist for Hardware Asset Management (HAM)

Generative AI skill name	Description	Introduced in Now Assist for HAM version
Generate hardware asset insights	Generates comprehensive asset summaries and actionable recommendations for the asset.	Now Assist for Hardware Asset Management (HAM) v4.0

Analyze your hardware assets by using Now Assist for HAM

View consolidated asset data and identify key action items with the comprehensive AI-generated analysis summary.

Before you begin

Summaries are available only for assets within the Hardware and Asset classes and that are licensed and associated with an opted-in resource category.

i Important:

This feature doesn't support pallets, consumables, bundles, and assets that are opted out of HAM workflows.

Role required: asset

About this task**i Important:**

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

The Generate hardware asset insights generative AI skill generates comprehensive asset analysis summaries by aggregating data from related records. These summaries provide insights into the asset lifecycle, chain of custody, audit status, and financial metrics to support key asset management activities. The level of detail in the summary depends on the amount of data available for that specific asset. The summary dynamically updates based on asset state and includes context from any active incidents, change requests, or tasks. To maintain data integrity and streamline workflows, the skill highlights missing information and lists specific action items.

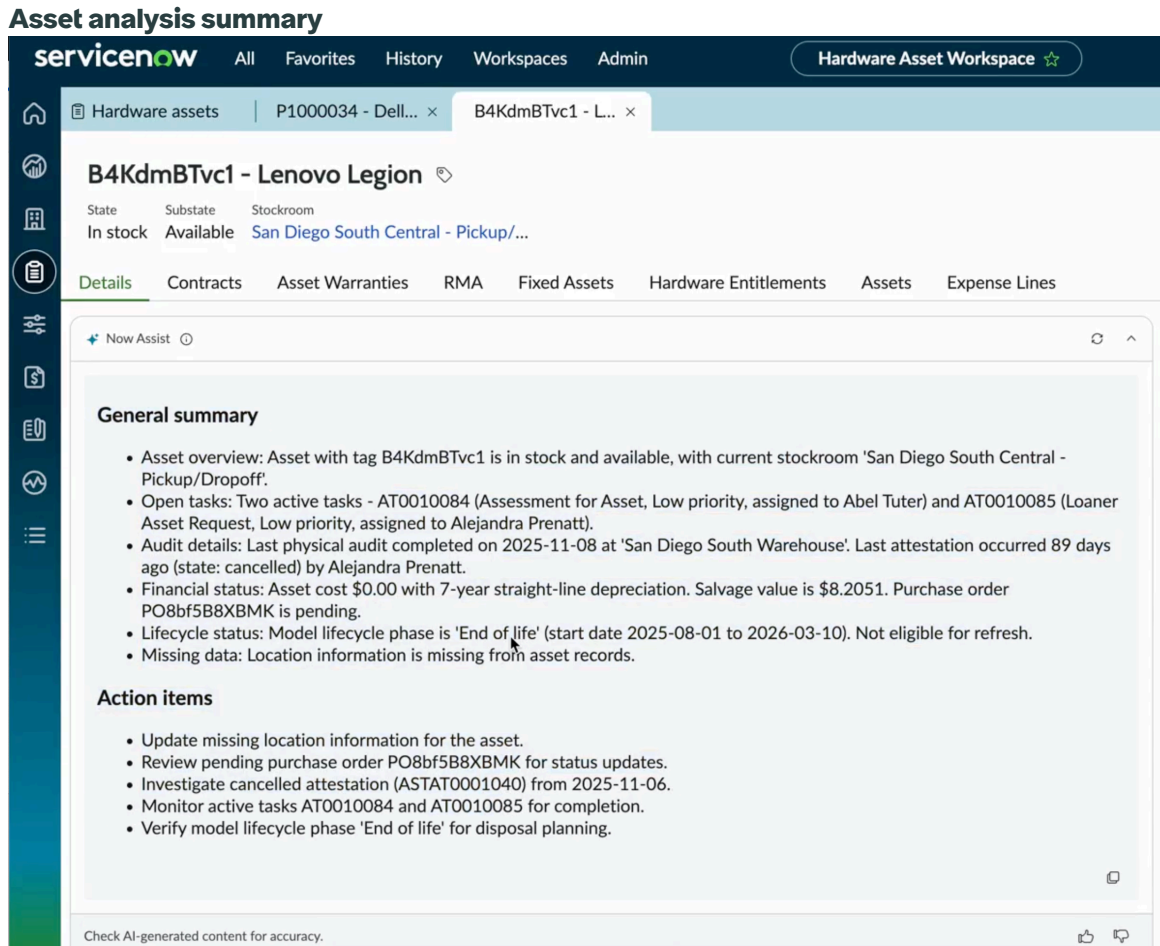

i Note:

You can view incident and change request details in the summary only if the asset role is provisioned with read access to the Incident [incident] and Change Request [change_request] tables.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **Hardware assets** tab.
3. Select the asset record that you want to analyze.
4. Select **Summarize**.

An asset analysis summary card with a consolidated overview of critical asset data and potential actions is displayed.

Hardware Asset Management integration with Zero Touch Mobility

ServiceNow® Hardware Asset Management is integrated with Samsung SDS Zero Touch Mobility to manage the complete life-cycle of mobile devices.

The benefits of Hardware Asset Management integration with Zero Touch Mobility are as follows:

- Deploy, manage, and monitor mobile assets on a single platform leveraging automated workflows for day-to-day mobile device management tasks like the following:
 - Onboarding new devices
 - Unenrolling devices
 - Requesting new orders, upgrades, or replacements with self-service options
- Manage and report on the mobile device life-cycle with an integrated solution that improves visibility and collaboration across the organization.
- Optimize costs and utilization of all your mobile devices.

Requirements and limitations

Requirements and limitations for Hardware Asset Management integration with Zero Touch Mobility solution are as follows:

- The solution is dependent on the Hardware Asset Management (sn_hamp) application.
- Only the Mobile Device resource category is available. This resource category is opted-in automatically.

Based on the acquisition method of assets, the following resource subcategories are available for the Mobile Device:

- Bring Your Own Asset
 - Corporate Asset
- Only mobile devices are licensed under this solution. You can view the subscription details using the ITAM license report. For more information, see [View the license report for the Hardware Asset Management application](#).

Note:

Even if Hardware Asset Management is activated explicitly on your ServiceNow instance, the mobile devices are licensed only under the Mobile Device resource category of the Hardware Asset Management integration with Zero Touch Mobility solution. For more information, see [Licensing framework for Hardware Asset Management solutions](#).

- The following Hardware Asset Management features aren't available:
 - Hardware Model Normalization
 - Content upload and download
 - Performance Analytics Dashboard
 - Asset Executive Dashboard
 - Success Portal

Note:

HAM Guided Setup is available. However, it isn't required to run the setup.

For more information on the Hardware Asset Management workflows and features, see [Hardware Asset Management subscription](#).

Supported Hardware Asset Management features

The following Hardware Asset Management features are available without any restrictions:

- [Stock order](#)
- [Advanced Shipment Notification](#)
- [Standard Asset Request flow](#)
- [Shipment carrier integration](#)
- [Advanced inventory and distribution](#)
- [Asset reclamation](#)

The following Hardware Asset Management features have limited availability:

- **HAM workflows:** Non-mobile devices are excluded from the HAM workflows.
- **Lease expiration flow:** Non-mobile devices are excluded from this flow.
- **Hardware Asset Workspace:** Reports and dashboards related to normalization of assets aren't available.

Systematically refresh, decommission, and dispose of assets at the end of their usable life according to a predetermined schedule.	<ul style="list-style-type: none"> • DaaS Asset manager • Inventory user

Configuring DaaS

Plan and configure the Device as a Service (DaaS) features and functionalities.

Configuration overview

Here's an overview of the process for configuring DaaS features and functionalities.

Configure Hardware Asset Management for DaaS

Step	Action	Resource
 <p>Install Hardware Asset Management</p>	Get the Hardware Asset Management application from the ServiceNow Store .	Install Hardware Asset Management
 <p>Install Hardware Asset Management for DaaS</p>	Get the Hardware Asset Management for DaaS application from the ServiceNow Store .	Install Hardware Asset Management for DaaS
 <p>Mark assets as DaaS assets</p>	Mark your assets as DaaS assets on the Hardware Asset Details form.	Asset record fields
 <p>Explore DaaS provider view in Hardware Asset Workspace</p>	Explore the intuitive DaaS provider view in Hardware Asset Workspace to manage the DaaS assets.	DaaS provider view
 <p>Use Hardware Asset Management for DaaS</p>	Use Hardware Asset Management for DaaS to offer assets and asset management services to the customers of DaaS providers.	<ul style="list-style-type: none"> • Managing inbound asset orders for DaaS assets • Managing RMA response orders for DaaS assets

Install Hardware Asset Management for DaaS

You can install the Hardware Asset Management for DaaS application (com.sn_daas_ham) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Hardware Asset Management for DaaS:

- Store applications
- Roles
- Tables

For more information, see [Components installed with Hardware Asset Management for DaaS](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.

2. Find the Hardware Asset Management for DaaS application (com.sn_daas_ham) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the available versions are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Managing inbound asset orders for DaaS assets

Following a request for a hardware asset, an inbound asset order is associated with this request by creating an order in the DaaS provider interface.

Completing the following tasks in the Inbound asset order workflow results in the successful completion of an asset order:

1. [Create an inbound asset order](#)
2. [Create an inbound asset order line](#)
3. [Select an asset](#)
4. [Pick the selected asset](#)
5. [Prepare the picked asset](#)
6. [Ship the prepared asset](#)
7. [Receive the shipped asset](#)

Create an inbound asset order

Create an inbound asset order to associate a customer request to an asset order.

Before you begin

Role required: sn_daas_ham.daas_asset_manager

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#).
- Install the Hardware Asset Management application from [ServiceNow Store](#).

About this task

For an inbound asset order to be considered complete, all its inbound asset order lines must reach the **Complete** stage.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select **New**.
5. On the form, fill in the fields.

Create New Inbound asset order form

Field	Description
Number	Unique number for the inbound asset order.
External request reference	Customer-provided reference for the asset request that helps you track the source. For example, the customer has requested an asset through an email. Here, the external request reference would be xyz@gmail.com.
DaaS account	Associated DaaS account of the customer.
Delivery address	Designated delivery address for the asset.
State	Status of the inbound asset order. This field is automatically set to Open.
Requested for	The name of the customer associated with the DaaS account, for whom the asset is requested.
Estimated delivery date	Estimated delivery date of the asset that's being sent to the specified delivery address.

6. Select **Save**.

Result

- An inbound asset order with a unique number is created.
- **Inbound asset order line** tab is created.

What to do next

[Create an inbound asset order line](#)

Create an inbound asset order line

Create an inbound asset order line for every asset in an inbound asset order.

Before you begin

Role required: sn_daas_ham.daas_asset_manager

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

About this task

For an inbound asset order line to be considered complete, the **State** field of all its tasks must be **Closed Complete**.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select **New**.
7. On the form, fill in the fields.

Create New Inbound asset order line form

Field	Description
Number	Unique number for the inbound asset order line.
Inbound asset order	Unique number for the inbound asset order, which is associated with this order number line.
Model	Model of the asset as requested by the DaaS provider.
Quantity	Quantity of the asset. This field is automatically set to 1.
Stage	Status of the inbound asset order. This field is automatically set to Draft .
Assigned to	The individual responsible for working on the inbound asset order line.
Asset	Asset that is selected matching the model. This field automatically populates when you select an asset in the Asset selection task.

8. Select **Save**.

Result

- An inbound asset order line with a unique number is created for the requested asset.
- The **Stage** field is set to `Selection`.
- The **Asset tasks** tab is created, displaying a unique asset task number with the task type as **Asset selection task**.

What to do next

Select a DaaS asset matching the model specified by the DaaS provider.

Select an asset

Select a DaaS asset matching the model specified by the DaaS provider by using the Asset selection task.

Before you begin

Role required: `sn_daas_ham.daas_asset_manager` or `inventory_user`

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select an inbound asset order line number.
7. Select the **Asset tasks** tab.
8. Select the asset task number with the Task type as **Asset selection task**.
9. On the form, fill in the fields.

Asset Task Details form

Field	Description
Number	Unique number for the Asset selection task.
Asset order line	The inbound asset order line number associated with this task.
Due date	Estimated date of completing this task.
Stockroom	The designated stockroom where the asset is allocated.
Model	This field is automatically populated with the details of the model provided while creating an inbound asset order line. For more information, see Create an inbound asset order line .
Task name	Name of the current task.

Field	Description
	This field is automatically set to <code>Select</code> .
State	Status of the Asset selection task. This field is automatically set to <code>Open</code> .
Assignment group	The assignment group for the individual who is responsible for working on the Asset selection task.
Assigned to	The individual responsible for working on the Asset selection task.
Asset	List of DaaS assets that fulfill one or more of the following conditions: <ul style="list-style-type: none"> ○ Assets with Status as In stock and Substate as Available ○ An account is selected in the DaaS account field while creating an inbound asset order. ○ The DaaS account field is empty while creating an inbound asset order.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about the task that are visible to all users within your organization.

10. Select **Close Task**.

Result

- After the Asset selection task is completed and you refresh the list, a task is created displaying a unique asset task number with the task type as **Asset pick task**.
- The **State** field of the Asset Selection task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Pick**.

What to do next

[Pick the selected asset](#)

Pick the selected asset

Pick the selected asset by using the Asset pick task.

Before you begin

Role required: `sn_daas_ham.daas_asset_manager` or `inventory_user`

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select an inbound asset order line number.
7. Select the **Asset tasks** tab.
8. Select the asset task number with the Task type as **Asset pick task**.
9. On the form, fill in the fields.

Pick form

Field	Description
Number	Unique number for the Asset pick task.
Task name	Name of the current task. This field is automatically set to Pick .
Asset order	The inbound asset order number associated with this task.
Asset order line	The inbound asset order line number associated with this task.
Stockroom	The designated stockroom where the asset is allocated.
Asset	The asset that is selected in the Asset selection task. For more information, see Select an asset .
State	Status of the Asset pick task. This field is automatically set to Open .
Assignment group	The assignment group for the individual who is responsible for working on the Asset pick task.
Assigned to	The individual responsible for working on the Asset pick task.
Due date	Estimated date of completing this task.
Drop off location	Location where the asset must be delivered.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about the task that are visible to all users within your organization.

10. Select **Close Task**.

Result

- After the Asset pick task is completed and you refresh the list, a task is created displaying a unique asset task number with the task type as **Asset prepare task**.
- The **State** field of the Asset pick task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Prepare**.

What to do next

Prepare the picked asset by using the [Asset prepare task](#).

Prepare the picked asset

Prepare the picked asset by inspecting the checklist and also check for any defects by using the Asset prepare task.

Before you begin

Role required: sn_daas_ham.daas_asset_manager and inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select an inbound asset order line number.
7. Select the **Asset tasks** tab.
8. Select the asset task number with the Task type as **Asset prepare task**.
9. On the form, fill in the fields.

Prepare form

Field	Description
Number	Unique number for the Asset prepare task.
Asset order line	The inbound asset order line number associated with this task.
Due date	Estimated date of completing this task.
Stockroom	The designated stockroom where the asset is allocated.
Model	This field is automatically populated with the details of the model provided while creating an inbound asset order line. For more information, see Create an inbound asset order line .
Task name	Name of the current task.

Field	Description
	This field is automatically set to Prepare.
State	Status of the Asset prepare task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Asset prepare task.
Assigned to	The individual responsible for working on the Asset prepare task.
Asset	The asset that is selected in the Asset selection task. For more information, see Select an asset .
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about the task that are visible to all users within your organization.

10. Select Close Task.

Result

- After the Asset prepare task is completed and you refresh the list, another task is created displaying a unique asset task number with the task type as **Asset ship task**.
- The **State** field of the Asset prepare task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Ship**.

What to do next

[Ship the prepared asset](#)

Ship the prepared asset

Ship the prepared asset and capture the shipment details by using the Asset ship task.

Before you begin

Role required: sn_daas_ham.daas_asset_manager and inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select an inbound asset order line number.

7. Select the **Asset tasks** tab.
8. Select the asset task number with the Task type as **Asset ship task**.
9. On the form, fill in the fields.

Ship form

Field	Description
Number	Unique number for the Asset ship task.
Asset order line	The inbound asset order line number associated with this task.
Due date	Estimated date of completing this task.
Asset	The asset that is selected in the Asset selection task. For more information, see Select an asset .
Shipping carrier	Organization that's responsible for shipping the assets to your customers. For example, FedEx.
Ship from	The origin location for shipping the assets.
Ship date	The shipment date for delivering the assets to your customers.
Task name	Name of the current task. This field is automatically set to Ship.
State	Status of the Asset ship task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Asset ship task.
Assigned to	The individual responsible for working on the Asset ship task.
Tracking number	Tracking number or reference number of the shipment of the asset.
Ship to	Destination for the asset shipment.
Shipment order	Reference to the shipment record created in the Shipment [sn_itam_common_shipment] table. This field is automatically populated when the Asset ship task is closed.
Short description	Brief description of the task.
Description	Detailed description of the task.

Field	Description
Work notes (Private)	Notes about the task that are visible to all users within your organization.

10. Select Close Task.

Result

- After the Asset ship task is completed and you refresh the list, another task is created displaying a unique asset task number with the task type as **Receive task**.
- The **State** field of the Asset ship task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Receive confirmation**.

What to do next

[Receive the shipped asset](#)

Receive the shipped asset

Once the shipment of the asset is complete, confirm the receipt of the asset by using the Receive task.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **Inbound asset orders** tab.
4. Select an inbound asset order number.
5. Select the **Inbound asset order lines** tab.
6. Select an inbound asset order line number.
7. Select the **Asset tasks** tab.
8. Select the asset task number with the Task type as **Receive task**.
9. On the form, fill in the fields.

Receive confirmation form

Field	Description
Number	Unique number for the Receive task.
Asset order line	The inbound asset order line number associated with this task.
Due date	Estimated date of completing this task.
Asset	The asset that is selected in the Asset selection task. For more information, see Select an asset .

Field	Description
Asset received	<p>Option to confirm the receipt of the asset.</p> <p>Values:</p> <ul style="list-style-type: none"> ○ Yes: The asset is received by the customer. ○ No: The asset isn't received by the customer. <p>Note: You must select Yes to close this task.</p>
Task name	<p>Name of the current task.</p> <p>This field is automatically set to Receive confirmation.</p>
State	<p>Status of the Receive task.</p> <p>This field is automatically set to Open.</p>
Assignment group	<p>The assignment group for the individual who is responsible for working on the Receive confirmation task.</p>
Assigned to	<p>The individual responsible for working on the Receive task.</p>
Short description	<p>Brief description of the task.</p>
Description	<p>Detailed description of the task.</p>
Work notes (Private)	<p>Notes about the task that are visible to all users within your organization.</p>

10. Select Close Task.

Result

- The **State** field of the Receive task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Completed**.
- The **State** field of the Inbound asset order is set to **Closed Complete**.

Managing RMA response orders for DaaS assets

Following a request for a hardware asset return or replacement, a Return Merchandise Authorization (RMA) order is associated with this request by creating an RMA response order in the DaaS provider interface.

Completing the following tasks in the RMA order workflow results in the completion and success of an RMA response order:

1. [Create an RMA response order](#)
2. [Create an RMA response order line](#)
3. [Assess the RMA asset](#)

4. [Schedule a visit to the customer site](#) or [Ship the asset to the DaaS provider](#)

Note:

Follow the next steps according to the values you select when scheduling a visit to the customer site or shipping the asset to the DaaS provider for assessing the RMA asset.

Create an RMA response order

Create a Return Merchandise Authorization (RMA) response order to associate an RMA request for an asset.

Before you begin

Role required: sn_daas_ham.daas_asset_manager

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#).
- Install the Hardware Asset Management application from [ServiceNow Store](#).

About this task

For an RMA response order to be considered as complete, all its RMA response order lines must reach the **Complete** stage.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select **New**.
5. On the form, fill in the fields.

Create New RMA response form

Number	Unique number for the RMA response order.
External RMA number	Customer-provided reference for the RMA request that helps you track the source.
DaaS account	Associated DaaS account of the customer.
Contact Email	Email of the customer who initiated the RMA request.
Delivery address	Address of the customer associated with the RMA request.
State	Status of the RMA response order. This field is automatically set to Open.
Requested for	Name of the customer associated with the DaaS account, for whom the asset is requested.
Opened by	Estimated delivery date of the asset that's being sent to the specified delivery address.
Customer mobile number	Mobile number of the customer who initiated the RMA request.

Device location	The physical whereabouts of the device currently in operation.
RMA justification	Reason of the RMA request creation provided by the customer.

6. Select **Save**.

Result

- An RMA response order with a unique number is created.
- **RMA response order lines** tab is displayed.

What to do next

[Create an RMA response order line.](#)

Create an RMA response order line

Create a Return Merchandise Authorization (RMA) response order line for every asset in an RMA response order.

Before you begin

Role required: sn_daas_ham.daas_asset_manager

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

About this task

For an RMA response order line to be considered as complete, the **State** field of all its tasks must be **Closed Complete**.

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select **New**.
7. On the form, fill in the fields.

Create New RMA response order line form

Field	Description
Number	Unique number for the RMA response order line.
Parent	Unique number for the RMA response order, which is associated with this order number line.
Model	Model of the asset for which the customer has initiated an RMA request.

Field	Description
Quantity	Quantity of the asset. This field is automatically set to 1.
Stage	Status of the RMA response order line. This field is automatically set to <i>Draft</i> .
Assigned to	The individual responsible for working on the RMA response order line.
Asset	List of assets that are in use and assigned to the customer.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

8. Select **Save.**

Result

- An RMA response order line with a unique number is created.
- The **Stage** field is set to *Assess*.
- The **Asset tasks** tab is created, displaying a unique asset task number with the task type as **RMA assessment**.

What to do next

[Assess the RMA asset.](#)

Assess the RMA asset

Assess the Return Merchandise Authorization (RMA) asset using either an on-site or off-site assessment procedure.

Before you begin

Role required: `sn_daas_ham.daas_asset_manager` or `inventory_user`

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

- 1. Navigate to **Workspaces > Hardware Asset Workspace**.**
- 2. Select the **DaaS provider** view.**
- 3. Select the **RMA orders** tab.**
- 4. Select an RMA order number.**
- 5. Select the **RMA response order lines** tab.**
- 6. Select the asset task number with the Task type as **RMA assessment**.**
- 7. On the form, fill in the fields.**

RMA assessment form

Field	Description
Number	Unique number for the RMA assessment task.
Asset order line	The RMA response order line number associated with this task.
Due date	Estimated date of completing this task.
Asset	The asset that is selected while creating the associated RMA response order line. For more information, see Create an RMA response order line .
Assessment action	Assessment procedure to be followed for the RMA asset. <ul style="list-style-type: none"> ○ On site: A representative from the DaaS provider visits the customer's premises to assess the asset. ○ Off site: The asset arrives at the DaaS provider site for assessment. ○ Denied: The RMA request is rejected.
Task name	Name of the current task. This field is automatically set to RMA assessment.
State	Status of the RMA assessment task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the RMA assessment task.
Assigned to	The individual responsible for working on the RMA assessment task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select Close Task.

Result

- The result of the task completion changes according to the value selected in the **Assessment action** field:
 - If you select **On site**, a task is created displaying a unique asset task number with the task type as **Schedule** after you refresh the list. The **Stage** field of the RMA response order line is set to `Schedule`.
 - If you select **Off site**, a task is created displaying a unique asset task number with the task type as **Ship** after you refresh the list. The **Stage** field of the RMA response order line is set to `Ship`.
 - If you select **Denied**, the RMA response order line is set to **Closed Complete**. If there are no more open RMA response order lines, then the RMA response order is closed.
- The **State** field of the RMA assessment task is set to **Closed Complete**.

What to do next

[Schedule a visit to the customer site](#) or [Ship the asset to the DaaS provider](#)

Schedule a visit to the customer site

Schedule a visit of the DaaS provider representative to the customer location.

Before you begin

Role required: `sn_daas_ham.daas_asset_manager` or `inventory_user`

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select the asset task number with the Task type as **Schedule**.
7. On the form, fill in the fields.

Schedule task form

Field	Description
Number	Unique number for the Schedule task.
Asset order line	The RMA response order line number associated with this task.
Due date	Estimated date of completing this task.
Scheduled date	The scheduled date for the DaaS provider representative to visit the customer's location.
Task name	Name of the current task. This field is automatically set to <code>Schedule</code> .

Field	Description
State	Status of the Schedule task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Schedule task.
Assigned to	The individual responsible for working on the Schedule task.
Asset	The asset that is selected while creating an RMA response order line. For more information, see Create an RMA response order line .
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select Close Task.

Result

- After the Schedule task is completed and you refresh the list, a task is created displaying a unique asset task number with the task type as **Evaluate RMA asset**.
- The **State** field of the Schedule task is set to **Closed Complete**.
- The **Stage** field of the Inbound asset order line is set to **Evaluation**.

What to do next

[Evaluate the RMA asset](#)

Evaluate the RMA asset

Evaluate the Return Merchandise Authorization (RMA) asset on the scheduled date at the customer location.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

- 1. Navigate to Workspaces > Hardware Asset Workspace.**
- 2. Select the DaaS provider view.**
- 3. Select the RMA orders tab.**
- 4. Select an RMA order number.**
- 5. Select the RMA response order lines tab.**

6. Select the asset task number with the Task type as **Evaluate RMA asset**.

7. On the form, fill in the fields.

Evaluate RMA asset form

Field	Description
Number	Unique number for the Evaluate RMA asset task.
Asset order line	The RMA response order line number associated with this task.
Due date	Estimated date of completing this task.
State	Status of the Evaluate RMA asset task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Evaluate RMA asset task.
Evaluation result	<ul style="list-style-type: none"> ○ Repairable: The asset can be repaired. ○ Replace: The asset can't be repaired and the old asset would be returned to the DaaS provider. A new inbound asset order would get created for requesting a new asset with the same model.
Task name	Name of the current task. This field is automatically set to Evaluate RMA asset.
Assigned to	The individual responsible for working on the Evaluate RMA asset task.
Asset	The asset that is selected while creating an RMA response order line. For more information, see Create an RMA response order line .
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select **Close Task**.

Result

- The result of the task completion changes according to the value selected in the **Evaluation result** field:
 - If you select **Repairable**, a task is created displaying a unique asset task number with the task type as **Repair asset** after you refresh the list. The **Stage** field of the RMA response order line is set to **Repair**.
 - If you select **Replace**, a task is created displaying a unique asset task number with the task type as **Ship** after you refresh the list. The **Stage** field of the RMA response order line is set to **Inbound shipment**. A new inbound asset order is created.
- The **State** field of the Evaluate RMA asset task is set to **Closed Complete**.

What to do next

[Repair the RMA asset](#) or [Ship the asset to the DaaS provider](#)

Repair the RMA asset

Indicate whether the Return Merchandise Authorization (RMA) asset has been repaired or considered unrepairable.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select the asset task number with the Task type as **Repair asset**.
7. On the form, fill in the fields.

Repair asset form

Field	Description
Number	Unique number for the Repair asset task.
Asset order line	The RMA response order line number associated with this task.
State	Status of the Repair asset task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Repair asset task.
Task name	Name of the current task.

Field	Description
	This field is automatically set to Repair asset .
Stockroom	This field is automatically populated with the stockroom details that you provided in the Receive task. For more information, see Receive asset . Note: This field doesn't include any information for the On-site assessment flow. For more information about selecting the assessment action, see Assess the RMA asset .
Due date	Estimated date of completing this task.
Assigned to	The individual responsible for working on the Repair asset task.
Repair result	Indication of whether the Return Merchandise Authorization (RMA) asset has been repaired or considered unrepairable. <ul style="list-style-type: none"> ○ Repaired ○ Unrepairable
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select Close Task.

Result

- The result of the task completion changes according to the value selected in the **Repair result** field:
 - If you select **Repaired**, a task is created displaying a unique asset task number with the task type as **Evaluate asset** after you refresh the list. The **Stage** field of the RMA response order line is set to **Quality check**.
 - If you select **Unrepairable**, a task is created displaying a unique asset task number with the task type as **Ship** after you refresh the list. The **Stage** field of the RMA response order line is set to **Inbound shipment**. A new inbound asset order is created.
- The **State** field of the Repair asset task is set to **Closed Complete**.

What to do next

[Evaluate the repaired asset](#) or [Ship the asset to the DaaS provider](#)

Evaluate the repaired asset

Evaluate the status of the repaired asset and indicate the evaluation result as redeployable or identified for disposal.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select the asset task number with the Task type as **Evaluate asset**.
7. On the form, fill in the fields.

Evaluate asset form

Field	Description
Number	Unique number for the Evaluate asset task.
Asset order line	The RMA response order line number associated with this task.
State	Status of the Evaluate asset task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working on the Evaluate asset task.
Evaluation result	Indication of whether the asset has to be redeployed or disposed. <ul style="list-style-type: none"> ○ Redeployable: The asset is functioning properly. ○ To be disposed: The asset didn't pass certain quality checks and can't be returned to the customer.
Task name	Name of the current task. This field is automatically set to Evaluate asset.
Stockroom	This field is automatically populated with the stockroom details that you provided in the Receive task. For more information, see Receive asset .

Field	Description
	<p>Note:</p> <p>This field doesn't include any information for the On-site assessment flow. For more information about selecting the assessment action, see Assess the RMA asset.</p>
Due date	Estimated date of completing this task.
Assigned to	The individual responsible for working on the Repair asset task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select **Close Task**.

Result

The result of the task completion changes according to the value selected in the **Evaluation result** field:

- If you select **Redeployable**, the **State** field of the Evaluate task is set to **Closed Complete**. The **Stage** field of the RMA response order line is set to **Completed**.
- If you select **To be disposed**, a task is created displaying a unique asset task number with the task type as **Ship** after you refresh the list. The **Stage** field of the RMA response order line is set to **Inbound shipment**. A new inbound asset order is created.

What to do next

[Ship the asset to the DaaS provider](#)

Ship the asset to the DaaS provider

Return the asset to the DaaS provider and record the shipment details using the Ship task.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select the asset task number with the Task type as **Ship**.
7. On the form, fill in the fields.

Asset Task Details form

Field	Description
Number	Unique number for the Ship task.
Asset order line	The inbound asset order line number associated with this task.
Due date	Estimated date of completing this task.
Asset	The asset that is selected while creating the associated RMA response order line. For more information, see Create an RMA response order line .
Shipping carrier	Organization that's responsible for shipping the assets to the DaaS provider. For example, FedEx.
Ship from	The origin location for shipping the assets.
Ship date	The shipment date for delivering the assets to the DaaS provider.
Task name	Name of the current task. This field is automatically set to Ship.
State	Status of the Ship task. This field is automatically set to Open.
Assignment group	The assignment group for the individual who is responsible for working the Ship task.
Assigned to	The individual responsible for working on the Ship task.
Tracking number	Tracking number or reference number of the shipment of the asset.
Ship to	Destination for the asset shipment.
Shipment order	Reference to the shipment record created in the Shipment [sn_itam_common_shipment] table. This field is automatically populated when the Ship task is closed.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

8. Select Close Task.

Result

- After the Ship task is completed and you refresh the list, a task is created displaying a unique asset task number with the task type as **Receive asset**.
- The **Shipment assets** tab is displayed, which includes the shipment information.
- The **State** field of the Ship task is set to **Closed Complete**.
- The **Stage** field of the RMA response order line is set to **Receive**.

What to do next

[Receive asset](#)

Receive asset

After the shipment of the asset to the DaaS provider is complete, confirm the receipt of the asset by using the Receive task.

Before you begin

Role required: sn_daas_ham.daas_asset_manager or inventory_user

- Install the Hardware Asset Management for DaaS application from [ServiceNow Store](#) .
- Install the Hardware Asset Management application from [ServiceNow Store](#) .

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace**.
2. Select the **DaaS provider** view.
3. Select the **RMA orders** tab.
4. Select an RMA order number.
5. Select the **RMA response order lines** tab.
6. Select the asset task number with the Task type as **Receive asset**.
7. On the form, fill in the fields.

Receive asset form

Field	Description
Number	Unique number for the Receive asset task.
Asset order line	The RMA response order line number associated with this task.
Due date	Estimated date of completing this task.
Asset	The asset that is selected while creating the associated RMA response order line. For more information, see Create an RMA response order line .
Asset received	Option to confirm the receipt of the asset. Values:

Field	Description
	<ul style="list-style-type: none"> ○ Yes: The asset is received by the DaaS provider. ○ No: The asset isn't received by the DaaS provider. <p>Note: You must select Yes to close this task.</p>
Task name	<p>Name of the current task.</p> <p>This field is automatically set to Receive confirmation.</p>
State	<p>Status of the Receive task.</p> <p>This field is automatically set to Open.</p>
Assignment group	<p>The assignment group for the individual who is responsible for working the Receive confirmation task.</p>
Assigned to	<p>The individual responsible for working on the Receive task.</p>
Stockroom	<p>Brief description of the task.</p>
Short description	<p>Detailed description of the task.</p>
Description	<p>Notes about the task that are visible to all users within your organization.</p>
Work notes	<p>Unique number for the Receive task.</p>

8. Select **Close Task**.

Result

- The result of the task completion changes according to the value selected in the **Asset received** field:
 - If you select **Yes** for an on-site assessment of your asset, the **State** field of the Receive task is set to **Closed Complete**. The **Stage** field of the Inbound asset order line is set to **Completed**. The **State** field of the Inbound asset order is set to **Closed Complete**.
 - If you select **Yes** for an off-site assessment of your asset, a task is created displaying a unique asset task number with the task type as **Evaluate RMA asset** after you refresh the list. The **Stage** field of the Inbound asset order line is set to **Evaluation**.
- The **State** field of the Receive asset task is set to **Closed Complete**.

What to do next

[Evaluate the RMA asset](#)

DaaS reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Asset as a Service.

Components installed with Hardware Asset Management for DaaS

Several types of components are installed with activation of the Hardware Asset Management for DaaS (com.sn_daas_ham) plugin, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
DaaS Manager [sn_daas_ham.daas_asset_manager]	<ul style="list-style-type: none"> Manages all aspects of DaaS, including access and execution of important actions, reports, and requests such as inbound asset orders and Return Merchandise Authorization (RMA) orders. Marks assets as DaaS assets. 	Asset Manager [asset]

Tables installed

Table	Description
RMA response [sn_daas_common_rma_response_order]	Information about the Return Merchandise Authorization (RMA) request with multiple order lines, including details, such as the originating account and the delivery address.
RMA response order line [sn_daas_common_rma_response_orderline]	Model and asset information associated with the RMA creation.
Inbound asset order [sn_itam_common_inbound_asset_order]	Information about the asset request with multiple order lines, such as the originating account and the delivery address.
Inbound asset order line [sn_itam_common_inbound_asset_orderline]	Information about the model for which the asset is requested.

Asset Management

The Asset Management application integrates the physical, technological, contractual, and financial aspects of information technology assets. Asset Management focuses on the financial tracking of company property.

Troubleshoot and get help

- [Ask or answer questions in the Asset Management ServiceNow Community](#) 
- [Search the Known Error Portal for known error articles](#) 
- [Contact Customer Service and Support](#) 

Exploring Asset Management Workspace

The user interface of the Asset Management application is enhanced to make it more user-friendly and intuitive, enabling you to manage your hardware installations better.

You can use the Asset Management new user interface, referred to as Asset Workspace, or continue using the classic Asset Management.

The Asset Management application's core functionality remains the same in both the user interfaces.

If you're using the Asset Management application newly from the Vancouver release, the Asset Management Workspace is installed by default.

Note:

The Asset Workspace is installed by default only on the zBoot ServiceNow instances and not on the ServiceNow instances upgraded to the latest version. When the Hardware Asset Management application is activated, the Hardware Asset Workspace replaces the Asset Workspace.

Using the Asset Management Workspace

The Asset Workspace is a unified medium with multiple views that help you manage your assets efficiently. The views provide you with visibility into all the important aspects of your assets, such as dashboards on Stockroom, Asset count by model, lifecycle state, model category, and overall performance of assets.

The Asset Workspace contains the following views:

- [Hardware asset overview](#)
- [Inventory view](#)

- [Asset estate view](#)
- [Model management view](#)
- [Contract management view](#)

If you're upgrading to the Vancouver release, you must activate the Asset Management Workspace (sn_itam_workspace) plugin to use the Asset Workspace.

Note:

After moving to Asset Management Workspace, you can still use the Asset Management classic. For more information, see [Asset Management](#).

Hardware asset overview

Enhance your Asset Management experience by using the modernized and user-friendly Hardware asset overview view. The Hardware asset overview is a simplified and intuitive environment that helps you use the application more effectively by reducing complexity.

Use the Hardware asset overview view to:

- Act on discrepancies such as when an asset is missing PO number, model number, asset function, or manufacturer.
- Navigate to specific dashboards on asset functions such as Asset requests, Transfer orders, and Stock orders.
- View the 360 asset view section displaying asset counts by model category and asset value by model category.
- View the overall performance section displaying the Discovered and undiscovered asset count and Assets eligible for refresh by model category.

Select any widget or chart to view detailed information and take appropriate actions. You can also use **Location**, **Stockroom**, and **Model category** lists to filter your results.

360 asset view

Asset count by model category

Asset value by model category

Overall performance

Discovered and undiscovered asset count

Assets eligible for refresh by model category

Quick links

Widget or chart	Description
Asset requests	Number of requested items where the item's model is hardware, consumable, or bundle.
Transfer orders	Number of active transfer orders.
Stock orders	Number of requested hardware inventory stock order items.

360 asset view

Widget or chart	Description
Asset count by model category	Number of assets grouped by the model category such as Consumable, Computer, and Mobile Device.
Asset value by model category	Cost of assets grouped by the model category such as Software License, Consumable, and Server.

Overall performance

Widget or chart	Description
Discovered and undiscovered asset count	Comparison of the number of discovered and undiscovered assets grouped by model category. Undiscovered assets are the assets that aren't discovered at all or not discovered within one month.
Assets eligible for refresh by model category	Number of assets that have already expired or the current day is the expiry date, and are eligible for a refresh.

Load reports on Hardware asset overview

You can load charts or widgets that fetch a huge set of asset records on demand instead of loading them along with the page. This approach enables you to reduce the loading time for the Hardware asset overview page.

The system property

`sn_itam_workspace.asset_overview_enable_lazy_loading` provides you with an option to either selectively load reports you want to view or load reports concurrently with the page. By default, this system property is set to **False**. When this system property is enabled on your ServiceNow instance, you can view reports by using the **Load report** option.

Load reports on Hardware Asset overview

The screenshot displays the 'Hardware asset overview' dashboard in the ServiceNow Asset Workspace. The interface includes a top navigation bar with 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', 'Admin', and 'Asset Workspace'. A search bar is located in the top right corner.

The main content area is titled 'Hardware asset overview' and features a sidebar with navigation icons. The primary section is 'Important Actions' with 19 items. It contains five widgets, each with a 'View records' button:

- Fill in missing model number:** 2 models are missing a model number. Add this information for improved model data accuracy. Model count: 2.
- Fill in missing useful life:** 81 models are missing useful life data. Add this information for improved model data accuracy. Model count: 81.
- Fill in missing manufacturer:** 6 models are missing manufacturer data. Add this information for improved model data accuracy. Model count: 6.
- Fill in missing location:** 56 assets are missing location data. Add this information for improved asset data accuracy. Asset count: 56.
- Fill in acquisition m:** 1149 assets have acquisition information missing. Add this information for improved asset data accuracy. Asset count: 1149.

Below the actions are filter buttons for 'All locations', 'All stockrooms', and 'All model categories'. The 'Quick links' section includes three cards: 'Asset requests' (1), 'Transfer orders' (23), and 'Stock orders' (5), each with a corresponding dashboard link. The '360 asset view' section contains two 'Load report' buttons for 'Asset count by model category' and 'Asset value by model category'. The 'Overall performance' section includes two more 'Load report' buttons for 'Discovered and undiscovered asset count' and 'Assets eligible for refresh by model category'.

Inventory view

Use the Inventory view in the Asset Workspace to view and manage inventory-related functions such as stockrooms and transfer orders.

The Inventory view provides access to actions for filling in missing stockroom details such as assignment group, stockroom name, manager, and type.

Select any widget or chart to view the details. You can also use Location, Stockroom, Model category, and Domain filters to narrow down your results.

Note:

The Domain filter is available only when you've enabled the Domain Extensions Installer (com.glide.domain.msp_extensions.installer) and Domain Separation (plugin com.snc.pa.domain_support) plugins.

Inventory view

Inventory overview

Widget or chart	Description
Open hardware requests from stock (YTD)	Number of transfer orders of Procurement type that are already delivered and created this calendar year.
Open transfer orders	Number of canceled or undelivered transfer orders.
Active stock rules by model category	All active stock rules grouped by their model category.

Asset estate view

Use the Asset estate view in the Asset Workspace to create, view, and modify the assets and also manage asset functions and notifications.

Note:

Software license tab is hidden when Software Asset Management (com.snc.software_asset_management) or Software Asset Management Professional (com.snc.pa.samp) is active. You can view this Software license tab in Software Asset Workspace.

Asset estate view

Asset overview

Chart or widget	Description
Hardware warranty expiration this year	Count of hardware and consumable assets that are expiring this current year.
Asset requests	Count of hardware, consumable, and bundle requests in the catalog.
Asset lifecycle by state	Number of assets grouped by the lifecycle state such as Retired, In use, In stock.
Assets by model category	Number of assets grouped by the model category such as Software License, Consumable, Server.
Incomplete assets by model category	Asset models without purchase order number, purchase order line, or receiving line.
Spend by model category	Cost of assets grouped by their model category.

Load reports on Asset estate view

You can load charts or widgets that fetch a huge set of asset records on demand instead of loading them along with the page. This approach enables you to reduce the loading time for the Asset estate view.

The system property `sn_itam_workspace.asset_estate_enable_lazy_loading` provides you with an option to either selectively load reports you want to view or load reports concurrently with the page. By default, this system property is set to **False**. When this system property is enabled on your ServiceNow instance, you can view charts or widgets by using the **Load report** option.

Load reports on Asset estate view

Exclude Install Base Item (IBI) assets from reports

Any item that is provided as a service or sold to your customer is tracked as an Install Base Item (IBI). The Model category table associates Asset class, CI class, and Install Base Item (IBI) class.

By default, the reports and Important Actions in the Asset estate view include all the assets in the Asset [alm_asset] table. However, you can filter IBI assets from reports and Important Actions cards. For details on configuration required to filter IBI assets, see the [Sold products exclusion from the reports and Important Actions of Asset Workspace \[KB1584331\]](#) article in the Now Support Knowledge Base

Model management view

Use the Model management view in the Asset Workspace to create or modify models, view and manage the asset model-related functions such as hardware and consumable models nearing the end of life.

Note:

Software model tab is hidden when Software Asset Management (com.snc.software_asset_management) or Software Asset Management Professional (com.snc.pa.samp) is active. You can view this Software model tab in Software Asset Workspace.

Model management view

Model overview

Widget or chart	Description
Hardware models up for end of life this year	Count of hardware models whose start date of the end of life phase is the current year.
Consumable models up for end of life this year	Count of consumable models whose start date of the end of life phase is the current year.
Missing data	Count of models that have missing model name, manufacturer, and model number.
Product model status	Current count of hardware, consumable, and software models based on the status of the models.

Contract management view

Use the Contract management view in the Asset Workspace to view and manage details of contracts such as Contract number, Contract start and end dates, terms and conditions statements.

The Contract management view includes important actions for managing your contract, contract expenditure by type and vendor, and the list of expiring contracts.

Contract management view

Using Asset Management

Use the Asset Management application to manage your assets efficiently.

Mobile app for Hardware Asset Management

Use the ServiceNow Mobile and ServiceNow Agent apps to manage your assets.

ServiceNow Agent app

Use the ServiceNow Agent app to create assets, look up assets, and receive assets from a purchase order.

Create an asset

Use the ServiceNow Agent app to create an asset record by scanning the asset.

Before you begin

Download the ServiceNow Agent app from Apple App Store or Google Play Store.

Role required: asset

The Procurement plugin (com.snc.procurement) must be installed to get the procurement features in ServiceNow Agent app.

Procedure

1. Navigate to **Asset** and tap **Create Asset**.

11:20

Asset

In Progress	ASTAUD0001005	New
10065 East Harvard Avenue, Denver,...		1007 Gre
Created 2023-01-12 18:42:43		Created 20
 Assigned to Asset Manager		 Assig

2. Scan the asset serial number or asset tag, then tap **Search**.
If the asset exists in your ServiceNow instance, an asset record is displayed. This information is to ensure that you don't create duplicate asset records.
3. **Optional:** To update an existing asset, select the asset and then tap **Update Asset**.
4. If no existing asset record is found, tap the action icon in the upper right and select **Create Asset**.
5. Scan or enter values for the **Asset Tag**, **Serial Number**, **Model** (non-software), **Stockroom**, **State**, and **Substate** fields.
6. Tap **Submit** to create the asset.

Asset lookup

Search for an asset record in your ServiceNow instance by scanning the asset.

Before you begin

Role required: asset

Procedure

1. Navigate to **Asset** and tap **Asset lookup**.
2. Scan the asset tag, then tap **Search**.
3. An asset record is displayed if the asset exists in your ServiceNow instance.
You can select the existing asset to update it or to create an incident related to it.

Receive assets from a purchase order

Scan assets from a purchase order (PO) to verify that you received all assets from the order.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **Procurement** and tap **POs Next 30 Days**.
2. Select a purchase order.
3. Tap **Related list**.
4. Tap the **PO Line Items** asset that you ordered and swipe **Receive** to receive the asset.

5. If you only need to receive a single purchase, on the Receive form, scan the QR code for either the asset tag or serial number.
6. If you need to receive multiple purchases, on the Receive form, tap **Scan next item** until you've scanned all of your purchases.
7. Tap **Submit**.

Result

The purchase order is marked as received.

Verify and depart your assets for disposal

Use the ServiceNow Agent app to scan, verify, and depart your assets for disposal.

Before you begin

To verify an asset using the ServiceNow Agent app, make sure that a Disposal order exists in your Hardware Asset Management instance.

Role required: asset

About this task

After a Disposal order is initiated for your asset, use the ServiceNow Agent app to scan, verify, and depart the asset. You do not have to manually verify and depart your assets.

On the app, you can use the same functionalities when you are offline. For more information, see [Offline mode](#).

Procedure

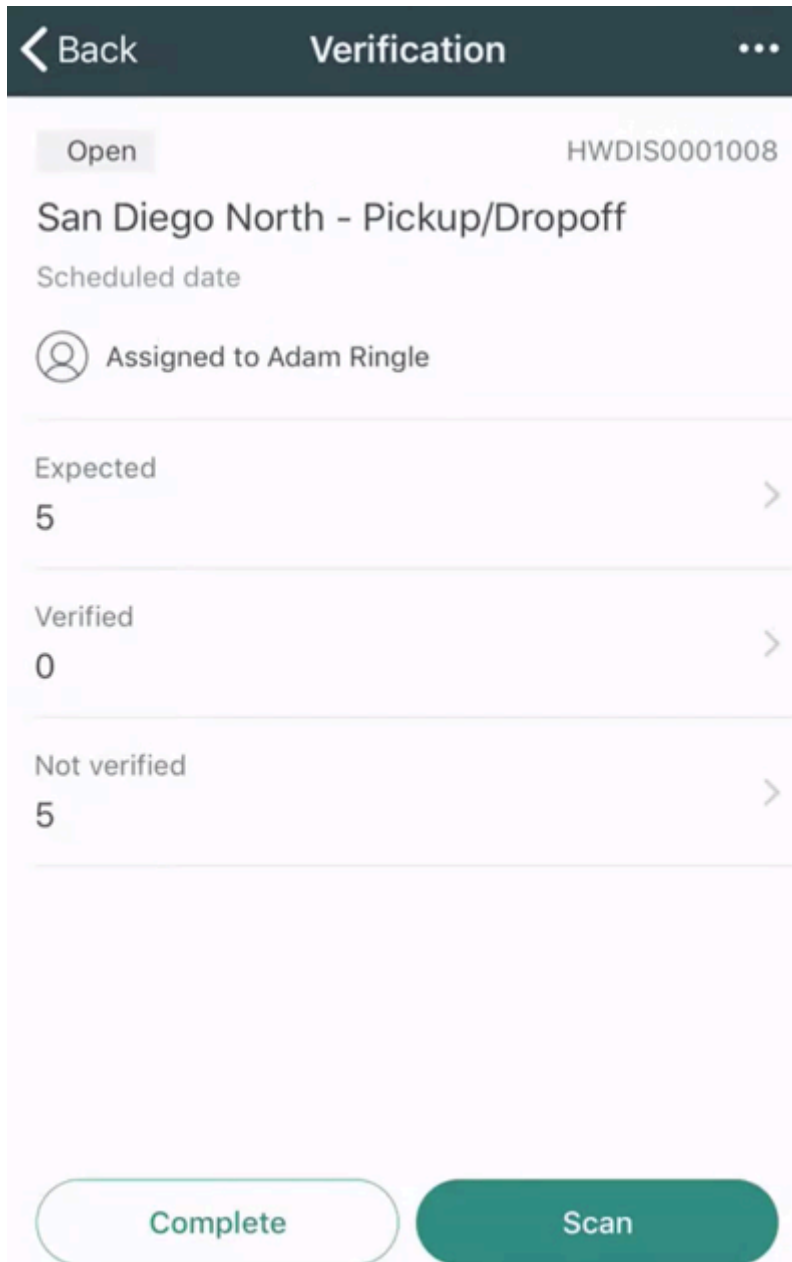

1. Navigate to **All > Asset > Asset disposal**.

The **Verification** tab shows the list of verification tasks, while the **Departure** tab shows the list of departure tasks. These tasks are for the assets that are present in a particular asset location for disposal.

2. Scan and verify your assets in one of the following ways.
 - Swipe a verification task to the left.
 - Tap a verification task to open it and then tap **Scan**.

You can scan multiple assets together. After you open a verification task, the verification task shows the number of assets that are verified, not verified, or expected to be verified. Click **Expected**, **Verified**, or **Not verified** to view the respective types of assets.

Here is an example of a **Verification** tab that shows expected, verified, and not verified assets.

3. Tap Review > Submit.

A pop-up message appears and shows the successful verification of the scanned assets. The lists of verified and not verified assets are updated.

4. Once you scan all the assets, tap Complete to close the verification task.

If there are still some assets left for scanning and you click **Complete**, then a pop-up window appears to confirm if you still want to close the task. If you tap **Complete**, the task is closed.

5. Enter the vendor details and the scheduled date by using your Hardware Asset Management instance.

See [Create a disposal order](#).

After you enter the vendor details and close the Schedule Pickup task from your Hardware Asset Management instance, the **Departure** tab shows the list of departure tasks to process.

6. Scan and depart your assets in one of the following ways.

- Swipe a departure task to the left.
- Tap a departure task to open it and then tap **Scan**.
You can scan multiple assets together. After you open a departure task, the departure task shows the number of assets that are departed, not departed, or expected to be departed. Click **Expected**, **Departed**, or **Not departed** to view the respective types of assets.

7. Tap **Review > Submit**.

A pop-up window appears and shows the successful departure of the scanned assets. The lists of departed and not departed assets are updated.

8. Once you scan all the assets, tap **Complete** to close the departure task.

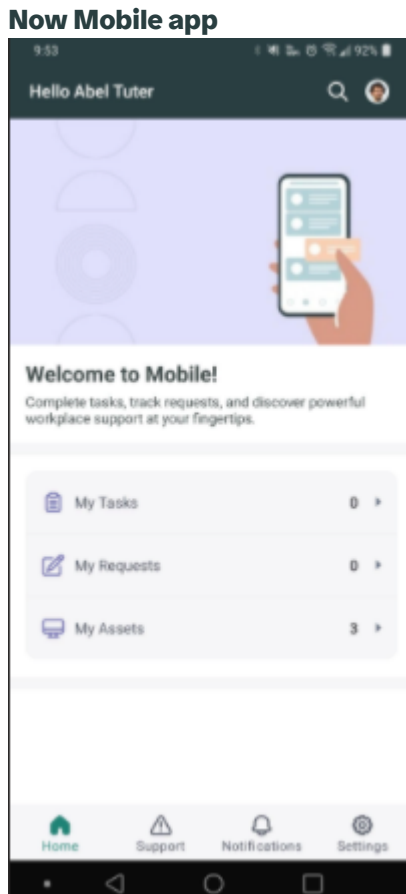

If there are still some assets left for scanning and you click **Complete**, then a pop-up window appears to confirm if you want to close the task. If you tap **Complete**, the task is closed.

Now Mobile app

Use the Now Mobile app to view the assets that are assigned to you, to report any issues with your assets, and to remotely receive new assets. Create incidents to report any issues with your assets to your IT department.

Download the Now Mobile app from Apple App Store or Google Play Store.

The Now Mobile app provides different services for tasks and requests.

To view all the assets that are assigned to you, navigate to **My Items > My Assets > Hardware**. The tab shows the assets that have the State field set to In transit or In use, Sub-state set to

Reserved, and the Reserved to field set to your name. You can create an incident for an asset that is in use.

When you are away from your office, you can remotely receive an asset that is in transit. Scan the QR code for the asset tag so that you can automatically notify the IT department that you have received the asset.

Work with Asset and CI

Asset and configuration item (CI) management refers to creating assets, setting appropriate states and substates, synchronizing assets and CIs, managing consumables, and retiring assets.

Create assets

Create hardware, software, consumable, bundle, pallet, mobile, and facility assets using the Core UI or the Hardware Asset Workspace.

Before you begin

Role required: asset

Procedure

1. Create an asset.

2. On the Asset record fields form, fill in the fields.

For a description of the field values, see [Asset record fields](#).

3. Submit or save the asset form.

Retire assets

You can retire an asset at any time.

Before you begin

Role required: asset

About this task

After you change the state of an asset to **Retired**, the **Substate** field is active. When you retire an asset, the status of related CIs also changes to **Retired**. Selecting a substate is not required, but can be helpful for tracking and reporting.

Note:

When you manually change the state of the asset from **Retired** to any other value such as **In use** the asset becomes active again.

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets**.

2. In **State**, select **Retired**.

3. **Optional:** In **Substate**, select **Disposed**, **Sold**, **Donated**, or **Vendor Credit**.

4. Click **Update**.

Delete assets

You can delete an asset at any time.

Before you begin

Note:

If an asset is a part of an asset bundle, the asset cannot be deleted.

Role required: asset

About this task

A confirmation must be accepted before the asset and components are permanently deleted. If a CI and asset are linked, deleting one also deletes the other.

Only delete an asset to clean up errors. For tracking purposes, the correct method for managing an asset that is no longer in use is to change the state of the asset to **Retired**.

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets**.
2. Select the check box to the left of the asset **Name**.
3. In the **Actions** choice list below the list, select **Delete**.

Map asset and CI fields

When you map the asset and CI fields, synchronization happens both ways. Changes to either the asset or CI record are updated to the logically mapped record. You can synchronize custom mappings and mappings provided with the base instance.

Before you begin

Role required: admin or asset

Note:

If you upgraded from a prior release and customized the *AssetAndCISynchronizer* script include before the upgrade, you must overwrite the customization and then recreate the custom mappings.

About this task

You can conditionally map the fields for synchronization. For example, you can map the Location field only for a hardware asset and not for a software asset. So when an asset is updated, the **Location** field is synchronized only for the hardware asset.

Note:

You can't map the asset and CI fields if the asset value is present only in the Hardware [alm_hardware] table and not in the Asset [alm_asset] table.

Procedure

1. Navigate to **All > Asset > Administration > Asset-CI Field Mapping** and click **New**.
2. From the **Asset field** list, select the field.
This list refers to the alm_asset table.
3. Select the logically associated field from the **Configuration Item field** list that refers to the cmdb_ci table.
4. To create conditions for the mapping, click the **Advanced view** related link.
 - To specify conditions for synchronizing the asset field with the CI field, use the **Asset mapping condition** builder.
 - To specify conditions for synchronizing the CI field with the asset field, use the **Configuration Item mapping condition** builder.

5. Select the **Active** check box to activate the mapping.
6. Select **Submit**.

Map asset state and CI install status

Map the asset **State** and **Substate** fields to the **CI Install Status** field. The **Substatus** field of the **CI Install Status** field should not be used for hardware CIs.

Before you begin

Role required: admin or asset

Note:

If you upgraded from a prior release and customized the *AssetAndCISynchronizer* script include before the upgrade, you must overwrite the customization and then recreate the custom mappings.

About this task

Asset synchronization does not update this field when hardware assets are updated. When you create the mapping, you can set the synchronisation direction from Asset to CI, but not from CI to Asset. For non-Hardware CI classes, you can set the synchronisation in both the directions.

The hardware and consumable assets don't have the Build state and Design substate because they are already prepared. Therefore, the Asset CI install status mappings table doesn't have a mapping for the Build state. For more details on asset states, see [Set asset states and substates](#).

Procedure

1. Navigate to **All > Asset > Administration > Asset-CI Install Status Mapping**.

By default, only custom mappings display. The list of mappings uses the filter condition of **[Out of the box] [is] [False]**.

2. Click **New**.
3. From the **Asset State** list, select the state you want to map.
4. **Optional:** If available, select a substate from the **Asset Substate** list.
Some of the asset states do not have a substate.
5. From the **Configuration Item Status** list, select the logically associated CI status you want to map.
6. From the **Sync direction** list, select the direction you want to drive the synchronization.
7. Select the **Active** check box to activate the mapping.
8. Click **Submit**.

Map asset state and CI hardware status

Map the asset **State** and **Substate** fields to the **CI Hardware Status** field. Don't use the **Substatus** field on hardware CIs because the CI synchronization does not update the field when assets are updated. When you create the mapping, you can set the synchronization direction from the asset, CI, or both.

Before you begin

Role required: admin or asset

Note:

If you upgraded from a prior release and you've customized the *AssetAndCISynchronizer* script before the upgrade, overwrite the customization and then recreate the custom mappings.

The hardware and consumable assets don't have the Build state and Design substate because they are already prepared. Therefore, the Asset CI hardware state mappings table doesn't have a mapping for the Build state. For more details on asset states, see [Set asset states and substates](#).

About this task

The **Install Status** and **Hardware Status** fields of a CI are independent of each other. There is no correlation between them. A change to the **Hardware Status** field does not change the **CI Install Status** field and vice versa.

Procedure

1. Navigate to **All > Asset > Administration > Asset-CI Hardware Status Mapping**.
By default, only custom mappings display. The list of mappings uses the filter condition of **[Out of the box] [is] [False]**.
2. Click **New**.
3. From the **Asset state** list, select the state you want to map.
4. **Optional:** If available, select a substate from the **Asset substate** list.
Some of the asset states do not have a substate.
5. From the **Configuration Item status** list, select the logically associated CI state you want to map.
6. **Optional:** If available, select a substate from the **Configuration Item substatus** list.
Some of the CI statuses do not have a substatus.
7. From the **Sync direction** list, select the direction you want to drive the synchronization.
8. Select the **Active** check box to activate the mapping.
9. Click **Submit**.

Manage various assets through asset classes

The default asset classes are Hardware, Software License, Consumable, Bundle, Software Entitlement, and Facility. These general classes can be used to manage various assets.

If the general classes that are provided aren't appropriate for a specific group of assets, consider creating a new asset class. For example, a fleet of cars could be tracked in a custom asset class named Vehicle. Before creating new asset classes, analyze business needs to see if the general classes can be used. Managing a lot of asset classes can be difficult to maintain.

Built-in functionality allows you to use asset classes for financial tracking, in a model bundle, and as a pre-allocated asset.

Create an asset class

Creating an asset class requires defining a new table and creating a corresponding application and module, then adding the new asset class to new or existing model categories. The default asset classes are Hardware, Software License, and Consumable. These general classes can be used to manage various assets.

Before you begin

Role required: asset or category_manager

About this task

If the general classes aren't appropriate for a specific group of assets, consider creating an asset class. For example, a fleet of cars could be tracked in a custom asset class named Vehicle. Before creating asset classes, analyze business needs to see if the general classes can be used. A large number of asset classes can be difficult to maintain.

Built-in functionality allows you to use asset classes for financial tracking, in a model bundle, and as a pre-allocated asset.

Ensure that the model categories contain models. Use the Table form to extend an existing table.

Procedure

1. Navigate to **All > System Definition > Tables & Columns > Create Table** and fill out the Table form fields with information on the new table.

Field	Description
Label	Display name of table that can be localized. For example, a custom asset class to track a fleet of cars can be labeled as Vehicle.
Name	Internal name of table that can't be changed later. For example, the Vehicle asset class can be named alm_u_vehicle.
Extends table	Table that new table inherits fields from. The Asset (alm_asset) table can be extended to create a custom asset class.
Application	Application that uses the record.
Create module	Check box for creating a module.
Create mobile module	Check box for creating a mobile module.
Add module to menu	Menu that module displays.
New menu name	New menu name.

2. Click **Submit**.
3. Navigate to the new application (for example, **Asset > Vehicle**) and click **New**.
4. Configure the form to include **Model**, **Model Category**, and **Quantity**.
5. Create a model category and add the asset class you created to the **Asset class** field.
6. Create models and add them to the model category.

What to do next

Now that the model category (associated with the new asset class) and the models are created, manage the models as assets. For example, use the model in a bundle.

Create license assets

You can manage your organization's software license assets.

Before you begin

Role required: sam

About this task

Examples include a license to use a single copy of a desktop software program and an enterprise license to install a software program on multiple computers.

Procedure

1. Navigate to **All > Asset > Portfolios > License Assets** and click **New**.
2. In the **Rights** field, type the number of entitlements to be granted by this license.
3. Complete the form as described in [Create assets](#).

Set asset states and substates

Use asset states and substates to track assets accurately and at a detailed level.

Before you begin

Role required: asset

About this task

Good asset information helps you with reporting, controlling assets, and lowering costs. For example, recording missing items using the **State** and **Substates** fields enables you to run reports and analyze the information. You can use this information to lower costs.

Tip:

You shouldn't modify state values. If the state values are supported and defined by the process, you can modify substates.

Some of the substate values are available with more than one state. For example, the substate **Pending disposal** is available with the state **In stock**, **In transit**, and **Retired**. The combination of the **State** and the **Substate** fields provide the correct asset tracking information. For example, an asset that is **In stock** and **Pending disposal** indicates that the asset is no longer used and is in the stockroom waiting to be disposed of.

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets**.
2. Select an asset.
3. Edit the **State** and **Substate** fields.

Asset states and substates definitions

State	Available substates	Notes
On order	None	Asset is ordered but isn't received.
In stock	<ul style="list-style-type: none"> ○ Available: Asset is available for use. ○ Reserved: Asset is reserved for a user who requested it through a sourcing request. ○ Defective: Asset is faulty or inoperative. ○ Pending repair: Defective asset is marked for repair by the vendor. ○ Pending install: Asset is yet to be installed. 	Asset is stored in a stockroom. Substate indicates if the asset can be put to use.

State	Available substates	Notes
	<ul style="list-style-type: none"> ○ Pending donation: Asset is marked for donation because it's no longer required in your stockroom. ○ Pending disposal: Asset is marked for disposal because it's no longer required in the stockroom. ○ Pending transfer: Asset is being planned to be transferred through a transfer order. ○ Pre-allocated: Asset is ready to be allocated but isn't a financial liability until it's allocated to a user. ○ On hold: Asset isn't ready to be used because it's awaiting something. For example, necessary documentation is pending. ○ Legal hold: Asset is kept on hold because of some legal reasons. ○ Quarantine: Asset is kept in isolation in the stockroom. ○ Pending certificate: Asset is awaiting certificate for disposal. ○ Pending return: Asset that is leased is yet to be returned. ○ Test: Asset is in the testing phase and not yet operational. ○ Pending resale: Asset is awaiting resale. ○ Pending evaluation: Asset is yet to be evaluated or assessed to confirm if it can be used. 	
In transit	<ul style="list-style-type: none"> ○ Available: Asset is available for use. ○ Reserved: Asset is reserved for a user who requested it through a sourcing request. 	Asset is being transported.

State	Available substates	Notes
	<ul style="list-style-type: none"> ○ Defective: Asset is faulty or inoperative. ○ Pending install: Asset is yet to be installed. ○ Pending disposal: Asset is marked for disposal because it's no longer required in your stockroom. ○ Pending donation: Asset is marked for donation because it's no longer required in your stockroom. ○ Pre-allocated: Asset is ready to be allocated but isn't a financial liability until it's allocated to a user. ○ Pending resale: Asset is awaiting resale. 	
In use	<ul style="list-style-type: none"> ○ Pending fulfillment: Asset is functional but awaiting business conditions such as billing and signoff. ○ End of support: Asset isn't provided any support services through incidents or contracts. ○ Pending retirement: Asset is marked for retirement because it's no longer in service. Asset has reached the end of life and can be sold, disposed, or donated. ○ None 	Asset is in use. This option is available for non-consumables only.
In maintenance	None	Asset is being repaired or undergoing maintenance.
Retired	<ul style="list-style-type: none"> ○ Disposed: Asset is disposed because it has reached end of life. ○ Pending disposal: Asset is marked for disposal because it's nearing the end of life. ○ Sold: Asset is sold. ○ Donated: Asset is donated to charity organization through asset donation orders. 	Set the asset to a Retired state when the asset has reached the end of life. Only delete asset records if they were created erroneously.

State	Available substates	Notes
	<ul style="list-style-type: none"> ○ Vendor credit: Old faulty asset is returned to the vendor for a replacement asset through Return Merchandise Authorization (RMA). ○ Lease return: Leased hardware asset is returned before the expiry of contract. ○ Obsolete: Asset is obsolete and should be disposed. ○ RMA: Faulty asset is returned to or replaced by the vendor through Return Merchandise Authorization (RMA). ○ Buy out: Leased hardware asset is bought before the expiry of contract. ○ Pending resale: Asset is awaiting resale. 	
Missing	<ul style="list-style-type: none"> ○ Lost ○ Stolen 	An asset that is missing or lost.
Build	None	<p>Asset is being prepared. This state is used during the creation of an asset bundle.</p> <p>Note: Hardware and consumables don't have a Build state.</p>

Add depreciation to an asset

Depreciation is the reduction in the value of an asset over time.

Before you begin

Role required: asset

About this task

A depreciation schedule can be added to hardware assets. Based on the information specified in the asset record, the ServiceNow AI Platform calculates the depreciation amount using the **Calculate Depreciation** scheduled job. The following system properties determine when the **Calculate Depreciation** scheduled job should be triggered to calculate the depreciation amount:

- The `sn_itam_depreciation_job_last_run` system property stores the date on which the **Calculate Depreciation** scheduled job was last run.
- The `sn_itam_trigger_depreciation_job_after_days` system property determines the frequency (in days) at which the **Calculate Depreciation** scheduled job should be triggered.

Note:

By default, this system property is set to **7**. Therefore, the **Calculate Depreciation** scheduled job runs weekly to calculate depreciation amount.

The ServiceNow AI Platform calculates the read-only **Residual date** and **Residual value** fields based on the **Cost**, **Depreciation**, and **Depreciation effective date** fields. For example, if the asset **Cost** is \$1000.00, the **Straight Line** depreciation method is selected, and exactly two years have passed, the **Residual value** would be \$500.00.

When an asset is in the **In Use** state, the asset form populates a Deprecation effective date.

For more information about fixed assets and depreciation, see [Using Depreciation with Fixed Assets](#).

Procedure

1. Navigate to **All > Asset > Portfolios > Hardware Assets**.

2. Select an asset.

3. Fill in the **Depreciation**, **Depreciation effective date**, **Salvage Value**, and **Covered by fixed asset** fields as described in [Create assets](#).

Consider these points.

- If the depreciation effective date is in the future, depreciation is 0 and the current residual value is the original purchase price. The system doesn't begin to calculate depreciation until the effective date is reached.
- The salvage value must be less than or equal to the asset cost. If a salvage value greater than the cost is entered, a warning message appears and the record can't be saved.

4. Select and hold (or right-click) the header and select **Save**.

5. Select **Calculate Depreciation**.

The **Residual date**, **Residual value**, and **Depreciated amount** fields are automatically calculated.

Important:

The **Calculate Depreciation** scheduled job calculates the depreciation amount weekly. If you perform this step before the next run date of the scheduled job, the recently calculated depreciation amount is displayed.

Create fixed assets

Fixed assets are containers that can hold multiple assets. Fixed assets are commonly tracked at the corporate level by a finance or accounting department, but may contain IT assets such as hardware and software.

The **Fixed Asset** option in the Cost application shows the IT assets related to a fixed asset record. This link can help IT stay coordinated with the corporate asset system. Users with the `financial_mgmt_admin` and `financial_mgmt_user` roles can create fixed assets. After creating a fixed asset and adding assets, the residual value can be automatically calculated.

To create a fixed asset:

1. Navigate to **Cost > Fixed Assets**.
2. Click **New**.
3. Enter a name for the fixed asset.
4. Click **Submit**.

To add assets to a fixed asset:

1. Navigate to **Cost > Fixed Assets**.
2. Click a fixed asset.
3. In the **Covered assets** related list, click **Edit**.
4. In the **Collection** list, double-click an asset to add it to the **Covers Assets List**.
5. Click **Save**.

To sum the residual values of all assets in a fixed asset:

1. Navigate to **Cost > Fixed Assets**.
2. Click a fixed asset.
3. Click **Sum Residual Value**.

The ServiceNow platform calculates the **Residual Value**, **Total cost**, and **Total depreciation** based on information in the **Financial** and **Depreciation** sections on the individual asset records.

Use depreciation with fixed assets

You can calculate depreciation for a fixed asset using a choice of depreciation schedules. Calculating depreciation for a fixed asset can help IT coordinate with the corporate fixed asset system to report correct valuation and book value.

Before you begin

Role required: financial_mgmt_admin or financial_mgmt

About this task

When creating a new depreciation schedule, select the **Declining Balance** or **Straight Line** depreciation **Category**. The two categories depreciate an asset by the same overall amount during the asset life cycle, but do so on different schedules.

- **Declining Balance:** depreciates an asset by a greater amount in earlier accounting periods than in later periods.
- **Straight Line:** depreciates an asset by an equal amount each accounting period.

The following example shows depreciated value on a \$10,000.00 asset over five years using the two different methods.

Using depreciation with fixed assets

Year	Declining balance	Straight line
1	\$5000.00	\$8000.00
2	\$2500.00	\$6000.00
3	\$1250.00	\$4000.00
4	\$625.00	\$2000.00

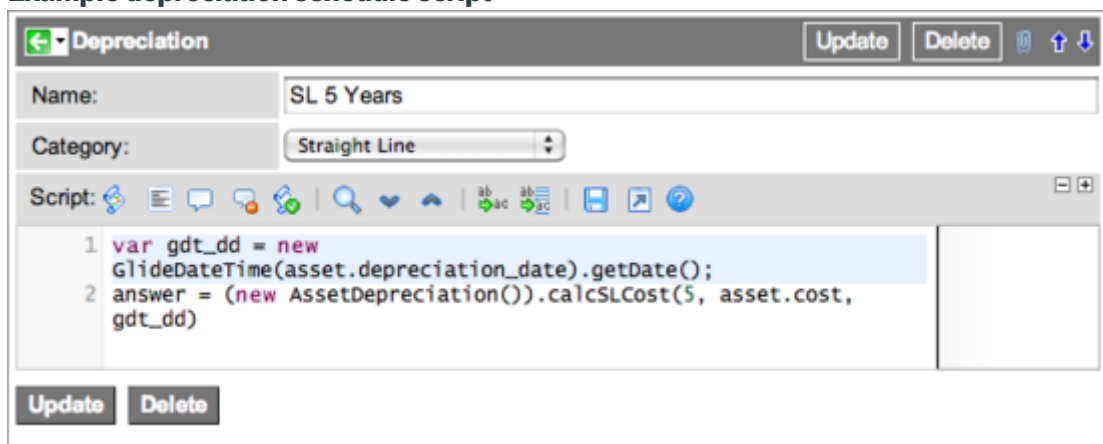

Using depreciation with fixed assets (continued)

Year	Declining balance	Straight line
5	\$0	\$0

Procedure

1. To view a depreciation schedule, navigate to **Financial Management > Depreciation** and click the **Category**.
2. To create a new depreciation schedule, click **New**.
3. Enter a **Name**.
4. Select a **Category**.
5. Add a **Script** to calculate depreciation value.

Example depreciation schedule script

6. Click **Submit**.

The depreciation schedule is now available in the **Depreciation** field on the asset record.

Consumables life cycle

Consumables are assets that are not tracked individually, but as a group of the same model.

The group of consumables has one or more of the following traits.

- Same location
- Same state
- Consumed by the same asset, typically as accessories or parts

Some common consumable assets include mouse devices, computer keyboards, and pencils. The base ServiceNow system includes the **Consumable** model category. The first step in working with models is to create a model within the model category for an individual consumable asset. Items such as monitors, keyboards, and mouse devices are often tracked as consumables. Consumables cannot be pre-allocated.

Consumable assets are stored in the Consumable [alm_consumable] table. Consumables follow a slightly different life cycle from other assets.

Stages of consumables

The consumable lifecycle stages are as follows.

- On order
- In stock
- In transit
- Consumed
- In maintenance
- Retired
- Missing

View consumable assets

Consumables are tracked as a group of the same model, but you can view individual consumables in the consumable model record.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Consumable Models**.
2. Open a consumable model record.
3. View individual consumables in the **Consumables** related list.

Create consumable assets

Create a consumable to track an asset as a group of the same model.

Before you begin

Role required: asset

Procedure

1. Navigate to **All > Asset > Portfolios > Consumables** and create a new record (see table for field descriptions).

Consumable record form

Field	Description
Display name	Name of the asset.
Model category	Model category that controls if an asset is linked to a CI.
Model	Product model of the asset.
Quantity	Amount of items the asset represents.
General	
State	State of the asset.

Field	Description
Parent	Parent asset. When a parent asset is defined, the Assignment and State fields of the child asset are automatically populated based on the Assignment and State fields of the parent asset and are read-only.
Class	Type of asset. The system automatically sets the Class to Consumable .
Expenditure type	The type of expenditure. Choose from the following options: <ul style="list-style-type: none"> ○ Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. ○ Opex: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Substate	Substate of the asset.
Location	Location of the asset.
Cost	Price that the asset was purchased for.
Cost Center	Cost center financially responsible for the asset.
Disposal	
Disposal order number	A unique number assigned to the asset disposal order. <p>i Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Disposal vendor	The vendor assigned to carry out the asset disposal order. <p>i Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Vendor disposal order ID	Order number assigned by the vendor assigned to carry out the asset disposal order. <p>i Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Disposal date	The date when the asset disposal order process is completed. <p>i Note: This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.</p>
Disposal reason	Text explaining why the asset is being retired.
Beneficiary	Organization that receives the asset when it is retired.

Field	Description
Resale price	Value of the asset when it is retired. For example, if the asset is donated, the value used when reporting taxes.
Scheduled retirement	Scheduled date on which the asset is retired.
Retired date	Actual date on which the asset was retired.
Activities	
Work Notes	Work notes related to the asset.

2. Click **Submit**.

Consume consumable assets

To consume consumable assets, they must have a state of **In Stock** and a substate of **Available**.

Before you begin

Role required: asset

Procedure

1. Navigate to **All > Asset > Portfolios > Consumables**.
2. Click the **Display Name** of a consumable asset with a state of **In Stock** and a substate of **Available**.
3. Click **Consume**.
4. Enter the **Quantity** to consume.
5. In **Asset**, click the lookup icon and select the asset associated with the consumable.

Example

For example, a mouse tracked as a consumable asset can be associated with a non-consumable asset such as a computer.

6. In **User**, click the lookup icon and select a user associated with the consumable.
7. Click **OK**.
On the **Consumable** form, the **Quantity** field shows the reduced number. The Consumables list contains two records for the consumable in the specific stockroom: one with a state and substate of **In Stock** and **Available** (if you did not consume the entire quantity), and one with a state of **Consumed**. If a consumable is not in the process of being transferred to a different stockroom and information in the data record is the same, similar records merge automatically. After a consumable is consumed, the record remains in the system for reporting purposes.

Return consumable assets to stockrooms

Move a consumable asset that is in a consumed state and has completed its life cycle back to an in-stock status.

Before you begin

Role required: asset, itil, itil_admin

Procedure

1. Navigate to **All > Asset > Consumables**.
2. In the consumable record, click **Retire**.

Retire appears only if the consumable asset is currently in a consumed state.

3. In the Retire Asset dialog box, select a stockroom.
The quantity gets populated based on the quantity of the consumption of the consumable asset.
4. Update the **Quantity** field based on the quantity of consumable assets that you want to retire.
You can choose to retire the entire quantity of consumable assets or only a part of the quantity.
5. Select a substate and click **OK**.
You return to the consumable record. A message appears at the top of the form layout with the number of assets that you have retired.

Dispose of consumable assets

Dispose of those consumable assets that are no longer required in your stockrooms.

Before you begin

Role required: asset, itil, itil_admin

Know that the Planned for disposal column in the Consumable [alm_consumable] table indicates if the consumable asset is marked for disposal or not.

Procedure

1. Navigate to **All > Asset > Consumables**.
2. In the consumable record on the top right of the page, click **Mark for disposal**.
Mark for disposal appears only for consumable assets that are in the in-stock state and not marked for disposal.
3. In the Planned for disposal dialog box, enter the total quantity or partial quantity of the consumable asset.
If you enter a partial quantity, a new consumable record is created with the substate as pending disposal. If you enter a total quantity, the consumable's record substatus changes to "pending disposal" and you return to the same consumable record.
After you mark the consumable asset for disposal, **Mark for disposal** no longer appears.

i Note:

Only a consumable marked for disposal is included in a disposal order. After you mark a consumable for disposal, it does not get merged with another consumable record.

4. Click **Cancel from disposal** to cancel disposing a consumable asset.
Cancel from disposal appears if the Planned for disposal column for the consumable is set to true and the **Disposal number** field is blank.
5. In the Cancel from disposal dialog box, select a stockroom.
If a stockroom is already selected, then the **Stockroom** field is read-only.
6. Select a substate and click **OK**.
The Planned for disposal column is set to false. If you added this consumable record to a disposal record, the planned asset record is deleted.

Stockrooms

Stockrooms are places to which assets are assigned.

When stock is low on a particular asset, stock rules can either notify an asset manager or automatically transfer inventory from one stockroom to another.

Stockrooms are separate, standalone entities in the Asset Management application.

Stock rules

Stock rules are defined criteria stating that when the inventory of a particular asset in a particular stockroom reaches a specified threshold, a certain number should either be transferred from another stockroom or ordered from a vendor.

For example, a specific model of computer keyboard reaches an inventory of 10 in a particular stockroom and, because a stock rule is in place, a transfer order is automatically created to transfer 50 from a different stockroom. Because there can be multiple assets of a model within a stockroom, stock rules enable you to check all assets fitting the criteria and view a total count.

There are two restocking options:

- Email notifications can be sent to the stockroom manager (specified in the **Manager** field on the stockroom record) through the **Asset Restocking** email action when the inventory of a particular asset in the stockroom reaches a specified threshold. You can customize this email notification by updating the details in the following tabs:
 - **When to send:** Set the conditions under which the email should be triggered.
 - **Who will receive:** Specify the recipients of the email.
 - **What it will contain:** Define the content and information included in the email.

A task is automatically created for the stockroom manager or, if Procurement is active, a purchase order and a purchase order line item are created.
- A transfer order can be generated automatically to restock the item from another stockroom.

Stock Rule Runner job

The Stock Rule Runner job runs everyday to check if the inventory in the stockroom has reached the threshold set by the stock rule. The job then triggers tasks or workflows to restock the inventory. This job creates tasks for stockroom managers and also sends email notifications to them.

Important:

If restocking is in progress, the system doesn't create duplicate email messages or duplicate transfer orders. It's important to act on it promptly.

By default, the `glide.sc.checkout.twostep` system property that's set to **false**, results in the automatic submission of requests when items are added to the Service Catalog cart. Also, with this setting of the system property, the Stock Rule Runner job triggers the creation of tasks, purchase orders, transfer orders, and Service Catalog requests.

If the value of the `glide.sc.checkout.twostep` system property is set to **true**, then the `CartJSAPI` adds items to the cart but the requests aren't submitted automatically. Instead, the request submission requires additional actions to be performed, affecting the automatic flow of the Stock Rule Runner job.

The **pending_delivery** is used to indicate whether a stock rule is awaiting fulfillment or delivery. The `pending_delivery` can be set to any of the following values:

- When this flag is set to **true**, the stock rule is in progress, and the system doesn't generate duplicate tasks or orders for the same item.
- When this flag is set to **false**, the system reprocesses the stock rule and triggers the creation of tasks and orders again.

Note:

Make sure that the `pending_delivery` flag is updated to false when a stock rule has been processed, enabling the Stock Rule Runner job to run without redundancy.

Based on the Stock rule type and the plugin activated on your ServiceNow instance, the Stock Rule Runner job creates purchase orders, transfer orders, Service Catalog requests, or tasks.

i Important:

If the Procurement plugin and the Hardware Asset Management application aren't activated, the Stock Rule Runner job creates a task instead of a purchase order or a Service Catalog request. This task prompts the stockroom manager to take the necessary actions to replenish the inventory.

Stock Rule Runner job behavior

Stock rule type	Orders/Requests created
Stockroom	<p>A transfer order is created automatically when the inventory in a stockroom reaches the threshold set by the stock rule.</p> <p>The transfer order is created to transfer stock from another stockroom to replenish the inventory.</p> <p>i Note: If a transfer order is already in progress, then additional transfer orders aren't created.</p>
Vendor	<p>When the Procurement plugin (com.snc.procurement) is activated, a purchase order and corresponding purchase order line items are created.</p> <p>Purchase orders and purchase order line items are created when the inventory in a stockroom reaches the defined threshold and needs replenishment directly from the vendor.</p> <p>i Note: You must have a procurement_user role to access the purchase order and purchase order line item.</p>
Vendor or Service Catalog	<p>When the Hardware Asset Management application is installed and the stock rule is set to Vendor or Service Catalog, then note the following points:</p> <ul style="list-style-type: none"> • The Stock Rule Runner job submits a Service Catalog request instead of creating a purchase order. • The Service Catalog request is automatically submitted for stock replenishment through the Service Catalog. The items are added to the Service Catalog cart for the Stockroom manager to review and approve. • The pending_delivery flag is used to track the status of the Service Catalog requests. This flag guarantees that the Service Catalog requests are processed correctly, avoiding duplicate actions.

Manage pre-allocated assets

Manage pre-allocated assets, which are the assets that the vendor still owns, but has agreed to store in a customer stockroom for just-in-time procurement.

Create pre-allocated assets

Create a pre-allocated asset that physically exists, but isn't yet a financial liability.

Before you begin

Role required: asset

About this task

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets** and create a record (see table for field descriptions).

Note:

Category must have the **Allow pre-allocated** option selected.

Consumable record form

Field	Description
Display name	Name of the asset.
Model category	Model category that controls whether an asset is linked to a CI.
Model	Product model of the asset.
Quantity	Number of items the asset represents.
General	
State	State of the asset.
Stockroom	Stockroom of the asset. This field is only available if the State field is set to In stock .
Parent	Parent asset. When a parent asset is defined, the Assignment and State fields of the child asset are automatically populated based on the Assignment and State fields of the parent asset and are read-only.
Class	Type of asset. The system automatically sets the Class to Consumable .
Expenditure type	The type of expenditure. Choose from the following: <ul style="list-style-type: none"> ○ Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. ○ Opex: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Substate	Substate of the asset.
Location	Location of the asset.
Cost	Price that the asset was purchased for.
Cost Center	Cost center financially responsible for the asset.
Activities	
Work Notes	Work notes related to the asset.

2. Select **Submit**.

Allocate a pre-allocated asset

Assets can be allocated from pre-allocated asset records, which creates new asset records and reduces the **Quantity** in the original pre-allocated asset record.

Before you begin

Role required: asset

About this task

Allocating an asset makes it a financial liability. After all pre-allocated assets have been allocated, the pre-allocated asset record is removed from the asset list.

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets**.
2. Filter the **Substate** column to show only **Pre-allocated** assets.
3. Select the reference icon in the row containing the asset to allocate.
4. Select **Allocate** at the bottom of the form.

Note:

If the `glide.asset.create_ci_with_ire` property is set to `true`, a form appears when you click **Allocate**. On the form, fill in the **Asset tag**, **Serial number**, and **Reserved for** fields, then click **OK**.

Result

The system creates and navigates to a new asset record, which has the same model and parent information as the pre-allocated asset. The new asset has a **Quantity** of one, while the pre-allocated asset's **Quantity** is reduced by one.

Split a pre-allocated asset

You can split a pre-allocated asset to create a group that can be moved to a different stockroom.

Before you begin

Role required: asset

About this task

For example, a group of 100 pre-allocated computers is in Stockroom A. Split the group into two groups of 50 and move one group to Stockroom B. Allocate the computers from the two different stockrooms.

Procedure

1. Navigate to **All > Asset > Portfolios > All Assets**.
2. Filter the **Substate** column to show only **Pre-allocated** assets.
3. Select the reference icon in the row containing the asset to split.
4. Select **Split**.
5. Enter a **Quantity to Split** and select **OK**.
The pre-allocated asset is split into two groups and the **Quantity** field on each record indicates the number in each group.

Manage transfer order

Manage the asset movement from one stockroom to the other using transfer order.

Transfer orders for Asset Management

Transfer orders move assets between company stockrooms.

The Asset Management application enables asset managers to create transfer orders for moving assets between company stockrooms.

Consumable assets and non-consumable assets can be transferred as follows:

- If an asset is consumable, it can be transferred and the quantity can be greater than one. Consumable parts are tracked by the system qualitatively.
- If an asset is non-consumable, it must be transferred as a single entity with a quantity of one. Non-consumable parts correspond to assets defined in the system.

i Important:

The Transfer Order Line workflow in the Asset Management application handles the processing of transfer order lines. However, if the Service Management Core plugin is also activated on your ServiceNow instance, the Transfer Order Line SM core workflow will process the transfer order lines instead. For more information, see [Move an asset through the transfer process](#).

Transfer order lines

Transfer Order Lines is a new module under Inventory with Template Tasks and Template Subtasks as the sub modules. Transfer order lines allow the transfer of multiple assets on one transfer order. Actions such as shipment preparation can take place at the transfer order line level. Pre-allocated assets can be included in a transfer order line, but can only be transferred in their full quantity. A business rule prevents the same asset from being transferred on two different transfer orders at the same time.

i Note:

The Transfer Order and the Transfer Order Line workflows have moved from the Procurement plugin to the Asset Management plugin. The Transfer Order Line workflow runs only if no other workflows are matched or running on a specific record.

Transfer order line tasks

When you create a transfer order line, based on the model category specified in the asset, a transfer order line task is automatically created. Transfer order line tasks are created to move transfer order lines from one stage to the other. Transfer order line tasks also help you to track service levels and the time frame needed to complete a transfer order.

Default template tasks are available with the Asset Management application. The template tasks are based on model categories. Default template tasks cannot be deleted or modified. If required, you can also create your own customized template tasks. For more information, see [Create a customized template task](#). When you create a transfer order line and select an asset, that asset corresponds to a model category. If a customized template task exists for that model category then that template task is added to the transfer order line as a transfer order line task. If no customized template task match is found for the asset you selected, then the default template task is added as a transfer order line task.

Closing a transfer order line task completes the task and creates the next task in the process. For example, once you close the Ready for fulfillment task, the state for this task appears as **Closed Complete** and a new task is opened for the next stage, Ready for Shipment. This process continues till you close all the tasks required for completing the transfer order line. As you close a task and as a task moves from one stage to the next, the asset gets automatically updated

too. For example, when the transfer order line moves from Ready to Fulfillment to Prepare for Shipment, the asset's status also moves from available to reserved.

Note:

If you skip a transfer order line task and select **Closed Skipped**, the asset is not updated automatically. Once the asset is received or delivered, you can make the update manually.

If you are upgrading from any previous release to the New York release, and you have an open transfer order line that is still being processed, all the transfer order line tasks associated with that transfer order line are simultaneously created and displayed in the transfer order line form layout. Based on the stage of the transfer order line, the tasks that still need to be processed will be open; all the other tasks that have already been completed will be closed. Based on the order, if you close a later transfer order line task, all the previous tasks, which are currently open, automatically will be **Closed Skipped**.

Transfer order line subtasks

To further add granularity and efficiency to the process, you can also create subtasks for each transfer order line task. Each transfer order line task can have multiple subtasks. For example, before preparing for shipment, for a computer, you may want to create subtasks for imaging the computer or adding additional software. If subtasks have been defined for a particular transfer order line task, then the subtasks are automatically added to the transfer order line task. Once all the subtasks are closed, the transfer order line task is automatically closed. For more information, see [Create a template subtask](#).

Transfer assets using transfer orders

Transfer assets from one location to the other by moving the assets through the transfer order process. Transfer order lines specify the exact items that comprise a transfer order.

Before you begin

Role required: `inventory_user`

The `inventory_user`, `asset`, or `procurement_user` role can only access the Transfer Order [`alm_transfer_order`] reports. You must activate the Procurement (`com.snc.procurement`) plugin for the `inventory_user`, `asset`, and `procurement_user` roles.

About this task

You create a transfer order and move it from its initial **Draft** status to the final **Received** status. A transfer order can contain one or more transfer order lines. Under a single transfer order, all transfer order lines have the same From location and To location. Each line contains an asset to transfer and the quantity to transfer. The item to transfer is identified by asset name and model name. A transfer order line can involve one quantity of a non-consumable asset or multiple quantities of a consumable asset. A bundled model can be transferred.

Procedure

1. Complete the following steps to create a transfer order.
 - a. Navigate to **All > Inventory > Transfer Orders > Create Transfer Order**.
 - b. In the **From Stockroom** list, select a stockroom from which you want to ship the items.
 - c. In the **To Stockroom** list, select a stockroom where you want to ship the items.

Note:

If you select the same stockroom in both the From Stockroom and To Stockroom fields, the transfer order automatically moves from **Draft** to **Received** when a transfer order line is added.

- d. Select a date and time for the delivery from the **Delivery by date** date picker.
 - e. Select **Submit**.
- Transfer order record is created.
2. Complete the following steps to create a transfer order line under the transfer order.

a. Navigate to **All > Inventory > Transfer Orders** and open the transfer order.

b. Next to **Transfer Order Lines**, select **New**.

c. On the Create transfer order line form, fill in the fields.
For a description of the field values, see [Transfer order line fields](#).

d. If the model is a consumable, specify a quantity in **Quantity Requested**.

e. Select **Submit**.

After creating transfer order lines, the transfer order and all the transfer order lines are in the draft stage. While a transfer order or a transfer order line is in the draft stage, it can be deleted.

Note:

When an asset is part of a transfer order set to **Draft**, the asset record updates to show the asset as reserved. You can't request or transfer the asset while it's reserved.

A transfer order line is created along with a transfer order line task.

3. Open the transfer order line task and select **Close Task**.

The transfer order line task is completed and a new transfer order line task is opened.

What to do next

Keep closing each task until you reach the last stage (**Received**). After you close the task for the Received stage, the transfer order line is completed and closed. All transfer order lines and the transfer order are marked **Delivered**.

[Summary of transfer order line tasks](#)

[Transfer order line fields](#)

Summary of transfer order line tasks

As assets move through the transfer process, the stage of a transfer order is always based on the individual transfer order lines tasks.

Transfer order line tasks

Transfer order line stages	Description
Draft	<p>When a transfer order line is created.</p> <p>On the asset form, the State field value remains In stock, and the Substate field value is updated to Pending transfer.</p>
Requested	<p>This task is created first for the transfer order line.</p> <p>On the asset form, the State field value remains In stock, and the Substate field value remains Pending transfer.</p>
Shipment Preparation	<p>After the Requested task is closed, this task is created. This task deals with preparing the transfer order line for shipment. Specify the values for the shipment tracking fields such as Shipping carrier, Vendor, Tracking number, and Ship date.</p> <p>On the asset form, the State field value remains In stock, and the Substate field value remains Pending transfer.</p>
In Transit	<p>After the Shipment Preparation task is closed, this task is created.</p> <p>On the asset form, the State field value changes to In transit, and the Substate field value is updated to Reserved.</p>
Received	<p>After the In Transit task is closed, this task is created.</p> <p>On the asset form, the State field value changes to In stock, and the Substate field value is updated to Available. The Stockroom field value is updated as the asset is received in the destination stockroom.</p>
Delivered	<p>After the Received task is closed, this task is created. After you close the Delivered task, the transfer order line is completed.</p> <p>On the asset form, the State field value remains In stock and the Substate field value is updated to Reserved.</p>

Delete a transfer order

You can delete a transfer order only if the transfer order is still in the draft stage.

Before you begin

Role required: inventory_user

The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports. You must install the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.

Procedure

1. Navigate to **All > Inventory Management > Transfer Orders > Transfer Orders**
2. Select the check box beside a transfer order.
3. From the Actions on the selected rows menu at the bottom of the list, select **Delete**.

Related topics

[Delete a transfer order line](#)

[Return items received in a transfer order](#)

Delete a transfer order line

You can delete a transfer order line only if it's still in the draft stage.

Before you begin

Role required: `inventory_user`

The `inventory_user`, `asset`, or `procurement_user` role can only access the Transfer Order [alm_transfer_order] reports. You must install the Procurement (com.snc.procurement) plugin for the `inventory_user`, `asset`, and `procurement_user` roles.

Procedure

1. Open a transfer order.
2. Select the check box beside a transfer order line.
3. From the Actions on the selected rows menu at the bottom of the list, select **Delete**.

Alternatively, you can cancel a transfer order or a transfer order line while it is in **Requested** or **Shipment Preparation** stage. Once all the lines are canceled, the transfer order is automatically canceled.

Related topics

[Delete a transfer order](#)

[Return items received in a transfer order](#)

Return items received in a transfer order

When you receive a transfer order and if there's a problem with all or some of the items, you can return the transfer order.

Before you begin

Role required: `inventory_user`

The `inventory_user`, `asset`, or `procurement_user` role can only access the Transfer Order [alm_transfer_order] reports. You must activate the Procurement (com.snc.procurement) plugin for the `inventory_user`, `asset`, and `procurement_user` roles.

About this task

Items in a transfer order must be received before they can be returned.

Procedure

1. Navigate to **All > Inventory Management > Transfer Orders**.
2. Select a transfer order that is in the **Received** stage.
3. Click the transfer order line **Number** of the item to return.
4. Click **Return**.
5. Enter a quantity to return.
6. Enter a reason for the return.
7. Select the **Defective** check box to return items that are broken.

Defective items are returned to the stockroom from which they were delivered, but aren't added to available stock. Instead, they're tracked in the separate category named "Defective" so they can't be requested or transferred again.

8. Click **OK**.

9. Click **Update**.

A new transfer order line is automatically created.

A new corresponding parent transfer order is also automatically created with the new transfer order line on it.

10. If you're returning a consumable, navigate to the transfer order line record, and click the model name to open the model record.

The model record shows which stockrooms contain the model. The one defective model is listed.

Note:

The defective model is still at the stockroom to which it was delivered. The defective model must be transferred back to the stockroom where it originated.

11. Move the new transfer order through the regular transfer order process.

Items are automatically returned to the stockroom from which they were delivered. A transfer order line item that has been returned can't be delivered later.

If you return another defective model from the same, original order, the two defective returns are merged into one line item.

Create a transfer order for Asset Management

Create a transfer order in order to transfer assets from one location to the other.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **All > Inventory Management > Transfer Orders > Create Transfer Order**.

2. Click the **From stockroom** list to select a stockroom from which the item(s) is to be shipped.

3. Click the **To stockroom** list to select a stockroom where the item(s) is to be shipped.

4. Click **Submit**.

Once the transfer order is created, you can create transfer order lines to specify the items that the transfer order comprises of. See [Create a transfer order line](#).

Create a transfer order line

Transfer order lines specify the exact items that comprise a transfer order.

Before you begin

Role required: inventory_user

About this task

A transfer order can contain one or more transfer order lines. Under a single transfer order, all transfer order lines will have the same From location and To location. Each line contains an asset to transfer and the quantity to transfer. The item to transfer is identified by asset name and model

name. A transfer order line can involve one quantity of a non-consumable asset or multiple quantities of a consumable asset. A bundled model can be transferred.

Procedure

After creating a transfer order, click **New** in the **Transfer Order Lines** related list and fill in the fields as appropriate.

Field	Description
Number	Internal unique number identifying the transfer order line.
Transfer Order	The transfer order to which the transfer order line belongs.
Model	Model of the items requested by the transfer order line. For example, a printer. If the Asset field is filled out first, the Model field is automatically filled in with the model corresponding to the asset.
Quantity requested	Number of items requested by the transfer order line. For example, 3 computers are requested to be transferred.
Quantity received	Number of items already received. For example, 3 keyboards are transferred, 2 are received.
Stage	Current stage of the transfer order. Transfer order lines can only be created when a transfer order is in Draft stage.
Request line	Requested item to associate with the transfer order line.
Asset	Asset requested by the transfer order line. For example, a specific printer. The asset can filter on stockrooms.
Quantity remaining	Number of items yet to be received. For example, 3 keyboards had been requested, 2 are received, 1 is remaining.
Quantity returned	Number of items that already needed to be returned.

Create a customized template task

Create customized template tasks to configure your specific task workflow for transfer order lines. Default template tasks are available with the Asset Management application. You can't modify or delete a default template task.

Before you begin

Role required: inventory_user

About this task

Template tasks help you progress through the various stages of the transfer order line. Custom template tasks are stored in the Custom Template Task [alm_custom_template_task] table. The template tasks are based on model categories. For example, when you create a customized template task for the Application model category, whenever a transfer order line is created for the Application model category, the template tasks associated with the Application model category are used as transfer order line tasks. When you create customized template tasks, make a copy of the Transfer Order Line workflow and update the workflow accordingly. For example, if you need only four tasks out of five, you can delete the additional task from the workflow.

Note:

Two template tasks can't be created when they're based on the same model category, the same order number and the same stage. The model category, the order, and the stage have to be unique for each template task. For example, you can't create two template tasks for Prepare for Shipment, based on the Application model category, order number 200, and the stage as Requested. If you try to create an identical template task as mentioned in the example, an error message is displayed.

Procedure

1. Navigate to All > Inventory > Transfer Order Lines > Template Tasks.

All the default template tasks that are available with the Asset Management application are listed.

2. Click New.

You can also customize a template task by copying a default template task. Click **Copy Default Template** and select a model category.

3. Fill out the form fields (as shown in the table).

Field	Description
Task name	Name of the template task
Model category	Model category this template task is based on.
Order	Order in which the template task is added to the transfer order line.
Short description	Brief description about this template task.
Next stage	Stage that this template task gets executed.

4. Click Submit.

Create a template subtask

Create template subtasks to add granularity to the transfer order line tasks. For example, before preparing for shipment, for a computer, you may want to create sub tasks for imaging the computer or adding additional software.

Before you begin

Role required: inventory_user

About this task

The template subtasks that you create are stored in the Template Subtask [alm_template_subtask] table. When a transfer order line task is created and if subtasks are defined for that transfer order line task, then the subtasks are automatically added to the transfer order line task.

Procedure

1. Navigate to All > Inventory > Transfer Order Lines > Template Subtasks.

2. Click New and fill out the form fields (as shown in the table).

Field	Description
Short Description	A brief description of the subtask.
Subtask name	A name for the subtask.
Task	The task that this subtask is associated to.

3. Click **Submit.**

Transfer order line asset tracking

As transfer order line actions are triggered, the stock information and states of any affected assets are updated. Consumables and non-consumables are tracked differently.

When an asset is included in a transfer order line, the following takes place:

- A substate field on the asset form changes to reflect the transfer order line states
- The Active TO option on the asset form is automatically selected to show that the asset is part of a transfer order and cannot be added to multiple transfer orders
- The asset is removed from the pool of available assets and changed to a state of *In Stock Pending Transfer*

Related topics

- [Delete a transfer order](#)
- [Delete a transfer order line](#)
- [Return items received in a transfer order](#)

Transfer order line asset tracking of non-consumables

When transfer order line stages change for non-consumables, it affects asset substates.

Transfer order line stage	Affect on asset substate
Draft	Asset moves to In Stock > Pending Transfer (from the current stockroom). If the asset is a consumable, the quantity can be edited.
Requested	Asset stays in In Stock > Pending Transfer .
Shipment Preparation	Asset stays in In Stock > Pending transfer .
In Transit	Asset moves to In Transit > Reserved .
Received	Asset moves to In Stock > Available (in the destination stockroom).
Delivered	Asset moves to In Stock > Reserved .

Related topics

- [Delete a transfer order](#)
- [Delete a transfer order line](#)
- [Return items received in a transfer order](#)

Transfer order line asset tracking consumables

When a consumable is added to a transfer order line, the stock for the consumable is split into two records and the transfer order links to the newly created stock line.

For example:

1. Stockroom A has ten keyboards in stock.
2. A transfer order line named TOL1 transfers three keyboards from stockroom A to stockroom B.
3. The stock of ten keyboards in A is split into two records: seven shown as **In stock > Available** and three shown as **In Stock > Pending Transfer**.
4. Another transfer order is created with a transfer order line named TOL2 that transfers two keyboards from stockroom A to stockroom B.
5. The seven remaining keyboards are split into another two lines: five **In stock > Available** and two **In stock > Pending Transfer**.

Note:

The three **In Stock > Pending Transfer** and the two **In Stock > Pending Transfer** are not merged together because they are not part of the same transfer order line and not necessarily from the same person.

6. As TOL2 for two keyboards moves from *Draft* to *Requested* to *Shipment Preparation*, TOL1 for the three keyboards remains **In Stock > Pending Transfer**.
7. When TOL1 for the three keyboards moves to the *In Transit* stage, the three keyboards are changed to the **In Transit > Reserved** stage. The same happens for TOL2 with two keyboards.
8. When TOL1 is *Received*, the three keyboards move to **In stock > Available** in stockroom B.
9. When TOL2 is received in stockroom B, the two keyboards move to **In stock > Available** and are merged with the three keyboards that are also **In Stock > Available** in B.
10. At the end, stockroom B shows five keyboards are **In Stock > Available**.

Perform bulk updates for transfer order lines

Update tasks for multiple transfer order lines at one go to streamline the transfer order process.

Before you begin

Transfer order lines enable the transfer of multiple assets on a transfer order. When you create a transfer order line, a transfer order line task is automatically created. Transfer order line tasks are created to move transfer order lines from one stage to the other. Each transfer order line can have multiple tasks such as **Requested**, **Shipment Preparation**, **In Transit**. For information on the stages of a transfer order line task, see [Summary of transfer order line tasks](#).

Role required: inventory_user

Procedure

1. Navigate to **All > Inventory > Transfer Order**.
2. Select **Bulk Update** next to the Transfer Order Lines related list.

The system property *sn_itam_to1_bulk_update_max_count* determines the maximum count of transfer order lines that would be processed during a single bulk update operation.

The Bulk Update - Transfer Order Line dialog box appears.

3. In the **Select a stage** field, select the stage that you want to move this task to. For example, if all the transfer order lines are currently in the **Draft** stage and you want to move them to the next stage, which is **Requested**, select **Requested** in the **Select a stage** field. All transfer order lines, along with the asset display names that are eligible to move to the selected stage appear in the **Available** box.

Note:

If there are no transfer order lines eligible to move to the selected stage, the **Available** box doesn't display any transfer order lines.

4. In the **Assigned to** field, select the person you want to assign this task to. The **Assigned to** field defaults to the logged-in user.
5. Select the transfer order lines in the **Available** box and move them to the **Selected** box. When you select the transfer order lines, you can view the model and asset display names for hardware and consumable assets. For consumable assets, you can view additional details such as quantity requested and quantity received.
6. Select **Update**. All the selected transfer order line tasks and associated subtasks for the selected stage are closed and the next task in the process is created. For example, all the transfer order line tasks in the **Requested** stage are closed and the next task in the process **Shipment Preparation**, is created.
7. Return to the Bulk Update - Transfer Order Line dialog box to continue this process until you close all the tasks required for completing the transfer order line.

Example Asset Management process

The best method for managing assets depends on business needs and how your business is organized.

Before you begin

Role required: asset

About this task

These steps are one possible process for getting started with Asset Management.

Procedure

1. Identify assets in your system.

A key component of asset management is the initial and ongoing inventory or discovery of what you own. The ServiceNow platform provides the following options for asset discovery.

- The separate, robust Discovery tool.
- For organizations that want to use the discovery technologies they have deployed already, such as SMS, Tally NetCensus, LanDesk, or others, ServiceNow can support integration to those technologies via web services. Scanned data can be mapped directly into the Configuration Management Database (CMDB).

2. Clean up information in the CMDB. Remove information that is obsolete or invalid. Ensure that all remaining information is accurate and complete. Add any necessary information.

3. Create categories of asset models such as computers, servers, printers, and software.
4. Create asset models.
Models are specific versions or various configurations of an asset, such as a MacBook Pro 17".
5. Create individual assets, such as hardware, consumables, and software licenses.
If you used a discovery tool, you may already have many assets identified accurately.
6. Manage assets by counting software licenses, viewing assets that are in stock, setting asset states and substates, and analyzing unallocated software.

Use Organization Management

The Organization Management application provides an easy way to perform such asset management tasks as updating users and adding vendors.

It includes managing your vendors and manufacturers, as well as managing locations.

Create a new vendor or manufacturer

You can create a new vendor, which is a company that sells assets or services that your organization purchases. You can also create a new manufacturer, which is a company that builds assets that your organization purchases.

Before you begin

Role required: user_admin and asset

Procedure

1. Navigate to one of the following:
 - **Organization > Vendors**
 - **Organization > Manufacturers**
 - **Organization > Companies**
2. Click **New** and create a new record.
3. Complete the form and select either **Manufacturer** or **Vendor**.

Note:

A company can be considered both a vendor and a manufacturer.

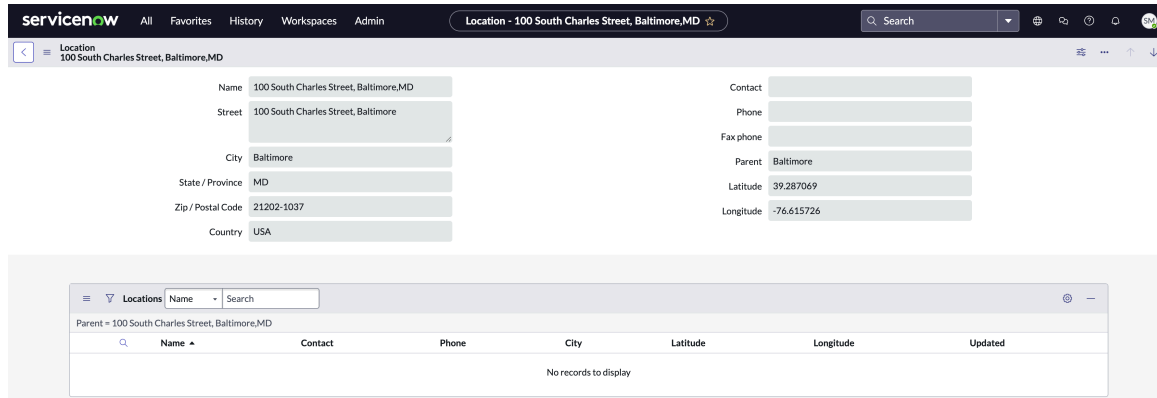

4. Click **Submit**.

Locations module

The Locations module is the Asset view of the Location table [cmn_location].

In addition to the physical specifics for the location, the Asset view includes the **Stock room** designation and a list of configuration items (CI) in stock at that location.

Asset location

Asset Management references

Reference topics provide additional information about the lists and forms that you use to configure and administer Asset Management.

Domain separation and Asset Management

Domain separation is supported in Asset Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the customer must be able to see the SP’s response.

For more information on support levels, see [Application support for domain separation](#).

Installed with Asset Management

Several tables, user roles, UI policies, script includes, client scripts, and business rules are installed with Asset Management.

Demo data is available with asset management. The demo data provides information such as users, assets, and individual stockrooms.

Tables

Asset Management includes the following tables.

Asset Management tables

Table	Description
Asset [alm_asset]	Stores general, financial, and contractual information about assets.
Asset Entitlement [alm_entitlement_asset]	Enables ServiceNow to categorize the Asset Entitlement table and enforce how entitlements behave.
Consumable [alm_consumable]	Stores data about consumable assets (previously known as parts).
Default Stockroom [alm_user_stockroom]	Stores the relationship between a user and their default stockroom.
Fixed Assets [alm_fixed_assets]	Stores fixed assets, which are containers that can hold multiple assets.
Fixed asset to asset [m2m_fixed_asset_to_asset]	Stores associations between fixed assets and assets.
Hardware [alm_hardware]	Stores general, financial, and contractual information about hardware assets.
License Entitlement [alm_entitlement]	Stores entitlements that permit users or machines to use a software license.
Software License [alm_license]	Stores general, financial, and contractual information about software license assets.
Stock Rule [alm_stock_rule]	Transfers stock or sends an email message to the asset manager when a specified asset drops below a set threshold.
Stockroom [alm_stockroom]	Stores information about stockrooms.
Stockroom Model [alm_m2m_stockroom_model]	Tracks all models that have ever been stocked in a stockroom. This table is automatically populated.

Asset Management tables (continued)

Table	Description
Stockroom Type [alm_stockroom_type]	Stores general information about stockroom types.
Transfer Order [alm_transfer_order]	<p>Contains data about transfer orders, including the state and stockrooms.</p> <p>Note: The <code>inventory_user</code>, <code>asset</code>, or <code>procurement_user</code> role can only access the reports. You must activate the Procurement (<code>com.snc.procurement</code>) plugin for the <code>inventory_user</code>, <code>asset</code>, and <code>procurement_user</code> roles.</p>
Transfer Order Line [alm_transfer_order_line]	Contains data about individual assets being shipped with a transfer order.
User Entitlement [alm_entitlement_user]	Enables ServiceNow to categorize the User Entitlement table and enforce how entitlements behave.

User roles

Asset Management includes the following user roles.

Asset Management user roles

Role	Contains roles	Tasks
asset (Asset Manager)	<ul style="list-style-type: none"> category manager contract manager financial mgmt user inventory user procurement user 	<ul style="list-style-type: none"> Manage hardware and consumable assets ([alm_hardware] and [alm_consumable]). Asset manager can't edit asset records that are created and updated automatically, but can read and delete the asset records when needed. Create requests. Create and delete stock information. Access to requests, purchase orders, and base system catalog tasks.
inventory_admin	inventory user	<ul style="list-style-type: none"> Create and delete stock information. Edit stock rules, stockrooms, and stockroom types.
inventory_user	none	<ul style="list-style-type: none"> Access stock information. Create and manage transfer orders.

Asset Management user roles (continued)

Role	Contains roles	Tasks
sam	<ul style="list-style-type: none"> contract manager model manager financial mgmt user 	<ul style="list-style-type: none"> Create, edit, change, and manage software licenses. Edit the Software model field on a Discovery models and software installations. Approve a model. Has full control of the Software Asset Management application. Controls the Software Asset Management IBM PVU Process Pack, if activated.

UI policies

Asset Management includes the following UI policies.

Asset Management UI policies

Name	Table	Description
Hide asset tag and serial num	[alm_asset]	Hides the asset tag when the asset is pre-allocated and the quantity is greater than 1.
Hide/show parent stockroom on Stockroom Replenish	[alm_stock_rule]	Shows the Parent stockroom field only when the Restocking option field is set to Stockroom.
Make allocated to and assigned to required.	License Entitlement [alm_entitlement]	Makes the Allocated to and Assigned to fields required.
Make substatus read-only when not required	[alm_asset]	Sets the Substatus to read-only if the State is On order, In use, Consumed, or In maintenance.
Model bundle field hidden but present for UI Policy conditions purposes	[alm_asset]	Hides the Model Bundle field. Exists on page only for use by UI policies and client scripts.
Pre-allocated constraints	[alm_asset]	Hides unneeded fields and related lists when the asset is pre-allocated.
Quantity readonly until model and category qualify the asset and are not bundle	[alm_asset]	Sets the Quantity field to read-only for assets that aren't consumable, software, or pre-allocated. Quantity is also read-only if the model or model category fields are empty.
Show 'Assigned to'	[alm_asset]	Shows the Assigned to field if the State field is not On order, In stock, or In transit.
Show 'Reserved for'	[alm_asset]	Shows the Reserved for field if the State field is On order, In stock, or In transit.
Show 'Stockroom'	[alm_asset]	Shows the Stockroom field if either of the following conditions is true:

Asset Management UI policies (continued)

Name	Table	Description
		<ul style="list-style-type: none"> • The State field is In stock and Substate isn't Pre-allocated. • The Substate is Pre-allocated and Parent is empty.

Script includes

Asset Management includes the following script includes.

Asset Management script includes

Name	Description
AssetandCI	Code for creating and managing the relationship between asset and CI records.
AssetAndCISynchronizer	Synchronization code between asset and CI records.
AssetUtils	Utility functions for asset management. Also checks if a license can be merged and then merges licenses if requirements are met.
AssetUtilsAJAX	AJAX-based utility functions for asset management. Call the AssetUtils script include from a client-side UI action.
Consumables	Code to change (for example, consume, split, and merge) consumables.
FixedAssetUtils	Methods for rolling up fixed asset costs.
PortalFilters	Filters used in the My Assets portal.
PreAllocatedAssets	Code to change pre-allocated assets.
StockRuleFilters	Reference qualifier code for filtering options on reference fields on stock rules.
StockRuleTransfer	Transfer order creation code for when stock rules are triggered.
TransferOrderDateTimeAjax	Date comparison utility for transfer orders.
TransferOrderFilters	Reference qualifier code for reference field filtering options on transfer orders.
TransferOrderFinder	Finds an appropriate transfer order to put a transfer order line into.
TransferOrderHelper	Function that checks if a transfer order has multiple transfer order lines.
TransferOrderLineFilters	Reference qualifier code for reference field filtering options on transfer order lines.
TransferOrderReceiver	Code for receiving a transfer order line.
TransferOrderReturn	Code for returning a transfer order line.
TransferOrderStageHandler	Code for changing transfer order stages and transfer order line stages.

Asset Management script includes (continued)

Name	Description
TransferOrderStageHelper	Helper method to get numeric stages for transfer orders and transfer order lines.

Client scripts

Asset Management includes the following client scripts.

Asset Management client scripts

Name	Table	Description
Correct substatus	[alm_asset]	Updates the Substatus field when the Status field is modified.
Ensure no negative quantity	[alm_asset]	Clears the Quantity field when set to less than 1.
Error on pre-allocated substatus	[alm_consumable]	Prevents Substatus field from being set to be Pre-allocated for consumable assets. Also displays an error message.
Error on pre-allocated substatus	[alm_license]	Prevents Substatus field from being set to be Pre-allocated for license assets. Also displays an error message.
Null out allocated_to	[alm_entitlement]	Does the following when the Assigned to field is set: <ul style="list-style-type: none"> • Clears the Allocated to field and makes it not required. • Makes the Assigned to field required.
Null out assigned_to	[alm_entitlement]	Does the following when the Allocated to field is set: <ul style="list-style-type: none"> • Clears the Assigned to field and makes it not required. • Makes the Allocated to field required.
Salvage must be less than cost	[alm_asset]	Displays a warning if a salvage value greater than the cost of an asset is entered.
Set Cost of the Asset	[alm_asset]	Populates the Cost field when the Model field is set.
Set Loc/ CC/Dep/Com from assigned to	[alm_asset]	Populates the Location, Cost center, Department, and Company fields when the Assigned to field is set.
Set Location from stockroom	[alm_asset]	Populates the Location field when the Stockroom field is set.

Asset Management client scripts (continued)

Name	Table	Description
Update From Location from Stockroom	[alm_transfer_order]	Populates the From location field when the From stockroom field is set.
Update Model and Quantity based on Asset	[alm_transfer_order_line]	Populates the Model field when the Asset field is set. If the asset is a pre-allocated asset, this client script also populates the Quantity field.
Update To Location from Stockroom	[alm_transfer_order]	Populates the To location field when the To stockroom field is set.
Update UI on load and model change	[alm_transfer_order_line]	Runs checks, and updates the user interface, when the transfer order line form is loaded and when a model is selected.
Validate Delivery by Date	[alm_transfer_order]	Validates that the delivery date is in the future.
Verify Stock Available	[alm_transfer_order_line]	Verifies that stock exists to fulfill the quantity requested.
Verify Stock Available (Stockroom)	[alm_transfer_order_line]	Verifies that stock exists to fulfill the quantity requested when the From stockroom value changes.

Business rules

Asset Management includes the following business rules.

Asset Management business rules

Name	Table	Description
Allocated more licenses than rights	Software License [alm_license]	Prevents creation or update of a license if the number of licenses allocated is larger than the total rights.
Asset Retirement	Asset [alm_asset]	Clears the Assigned to, Stockroom, and Reserved for fields and sets the retirement date to the current time when the asset is retired.
Automatically Change TOL State	Transfer Order Line [alm_transfer_order_line]	<p>If a transfer order has the same From stockroom and To stockroom and it's a personal stockroom, this business rule:</p> <ul style="list-style-type: none"> • Sets the transfer order line Stage to Delivered. • Sets the asset Substate to Reserved. <p>If a transfer order has the same From stockroom and To stockroom and it isn't a personal stockroom, this business rule:</p> <ul style="list-style-type: none"> • Sets the transfer order Stage to Received. • Sets the asset Substate to Pending transfer.

Asset Management business rules (continued)

Name	Table	Description
Build bundle components on Insert	Asset [alm_asset]	Creates assets for the components related to a bundle if the model of the created asset is a bundle.
Clear Assigned To on update	Asset [alm_asset]	Clears the Assigned to field if the State field changes to On order, In stock, or In transit.
Clear fields irrelevant for preallocated	Asset [alm_asset]	Clears the value of fields that are irrelevant for pre-allocated assets.
Create Asset on insert	Configuration Items [cmdb_ci]	Creates a corresponding asset when a new configuration item with no asset is created.
Create asset on model change	Configuration Items [cmdb_ci]	Creates a new associated asset when the Model ID field changes.
Create CI on insert	Asset [alm_asset]	Creates a corresponding configuration item when a new asset with no configuration item is created.
Create Stockroom Model Relation	Asset [alm_asset]	Creates a record (if none exists) in the Stockroom Model table indicating the stockroom that holds the model when an asset is created or updated.
Delete all Transfer Order Lines	Transfer Order [alm_transfer_order]	Deletes all related transfer order lines when a transfer order is deleted.
Ensure Entitlements do not exceed rights	License Entitlement [alm_entitlement]	Checks that the total number of entitlements for the related license doesn't exceed the number of rights given by the license when an entitlement is created.
GenerateAssets	Model Categories [cmdb_model_category]	Executes a scheduled script job to create assets for configuration items.
Inherit information from parent	Asset [alm_asset]	Assigns some parent values to the asset when assigning a new parent to an asset.
Managed Stockroom for Vendor	Stock Rule [alm_stock_rule]	Validates that a vendor replenishing stock rule has a stockroom selected and the stockroom has an related manager with a valid email address.
Mandate allocated to or assigned to	License Entitlement [alm_entitlement]	Makes a value in either the Allocated to field or the Assigned to field required.
Merge Records	Consumable [alm_consumable]	Merges consumables that have matching fields and aren't In Transit into one record containing the total count.
Null out asset on insert and stay	Configuration Items [cmdb_ci]	Clears the Asset field on insert when the field includes an asset that has a CI.
Null out Ci on insert and stay	Asset [alm_asset]	Nulls out the asset field so a new asset is created for the CI when an insert is performed on an existing CI.

Asset Management business rules (continued)

Name	Table	Description
Populate reserved for field	Transfer Order Line [alm_transfer_order_line]	If the transfer order line has an related request line, this business rule populates the related asset's Reserved for field with the appropriate information from the request line.
Push Status to Asset/ Consumable	Transfer Order Line [alm_transfer_order_line]	Changes the corresponding asset to reflect the current state of transit when a transfer order line moves to another state.
Release Asset on TOL cancel/ delete	Transfer Order Line [alm_transfer_order_line]	Places the corresponding asset back into stock and unsources the part requirement when a transfer order line in the draft state is canceled or deleted.
Rollup TOL cancellation to TO	Transfer Order Line [alm_transfer_order_line]	Signals to the corresponding transfer order that the transfer order line has been canceled.
Salvage value must be less than cost	Asset [alm_asset]	Prevents saving an asset record if the salvage value is greater than the cost.
Sanity check on pre-allocated	Asset [alm_asset]	Prevents creation or update of pre-allocated assets if they don't satisfy the conditions to be pre-allocated.
Set Class	License Entitlement [alm_entitlement]	Sets the class for this entitlement depending on the entitlement is assigned or allocated.
Set Transfer Order Type	Transfer Order [alm_transfer_order]	Sets the type of the transfer order depending on whether there's a related service order or work order task.
Sync model category	Product Models [cmdb_model]	When the model category changes, this business rule creates assets if they didn't previously exist for configuration items associated with the model.
Transfer Order Stockroom Rules	Transfer Order [alm_transfer_order]	Prevents the From stockroom field from being changed if the transfer order has multiple transfer order lines.
Transition reserved to assigned	Asset [alm_asset]	Populates the Assigned to field with the value from the Reserved for field when the asset is in the appropriate state.
Trickle information down to components	Asset [alm_asset]	Updates components of an asset to reflect any changes that have been made to the asset record.
Update Asset fields on change	Configuration Items [cmdb_ci]	Synchronizes fields so changes made on the Configuration Item form trigger the same update on the corresponding Asset form, ensuring consistent reporting. You must update statuses on the Asset form.
Update CI fields on change	Asset [alm_asset]	Synchronizes fields so changes made on the Asset form trigger the same update on the

Asset Management business rules (continued)

Name	Table	Description
		corresponding Configuration Item form, ensuring consistent reporting.
Update location as needed	Asset [alm_asset]	Updates the location of the asset, if the asset is set to a new stockroom or assigned to a new user.
Validate Field Agent Type	Stockroom [alm_stockroom]	Ensures that you don't create a stockroom of the type Field Agent without Work Management or Field Service Management activated. Allows for only one personal stockroom per user.
Validate TOL and check availability	Transfer Order Line [alm_transfer_order_line]	Validates changes made to the transfer order line and checks the availability of the assets to be transferred in the specified stockroom.
Validate transfer order	Transfer Order [alm_transfer_order]	Validates that the Delivery by date isn't earlier than the current date.
Validate Unique Users	Default Stockroom [alm_user_stockroom]	Prevents the creation of multiple records with the same user.
Verify Entitlement (Allocated)	License Entitlement [alm_entitlement]	Ensures that the allocation of the entitlement follows the allocation condition on the license when a condition exists.
Verify Entitlement (Assigned)	License Entitlement [alm_entitlement]	Ensures that the assignee of the entitlement follows the assignment condition on the license when a condition exists.
Verify Entitlements (Allocated)	Software License [alm_license]	Ensures that the allocations of all the license's entitlements follow the allocation condition on the license when a condition exists.
Verify Entitlements (Assigned)	Software License [alm_license]	Ensures that the assignees of all the license's entitlements follow the assignment condition on the license when a condition exists.
Verify Not Field Agent	Default Stockroom [alm_user_stockroom]	Verifies that the selected default stockroom isn't of the Field Agent type.

Installed with Model Management

Several types of components are installed with Model Management.

Demo data is available with Model Management.

Business rules installed with Model Management

Model Management uses a number of business rules.

Name	Table	Description
Abort action if no license type	[cmdb_software_product_model]	Ensures that a license type (not a license type group that cannot be handled by counters) has been selected.
Calculate display_name	Product Model [cmdb_model]	Sets the Display name field when any of the following field values change: Manufacturer ,

Name	Table	Description
		Name, Version, Edition. The display name differs depending on whether the <i>glide.cmdb_model.display_name.shorten</i> property is set to true or false .
Date validation	[cmdb_m2m_downgrade_model]	Ensures that the Start date is before the End date.
Enforce CI Rules	[cmdb_model_category]	Ensures that categories that track assets as consumables or software licenses do not have a CI class.
Flag parent as bundle on creation	[cmdb_m2m_model_component]	Flags a model that has components as a bundle.
License Type - Fullname	[cmdb_sw_license_calculation]	Computes the full name of the license type.
License validation	Software Upgrade and Downgrades [cmdb_m2m_downgrade_model]	Prevents software upgrades and downgrades from being duplicated and prevents having duplicate upgrades and downgrades for the same license where duplication also involves having the same dates. Also ensures that both the Upgrade parent and Downgrade child fields are mandatory and that if the License field is not empty, either Upgrade parent or Downgrade child must be equal to the license.model.
Protect cmdb_ci_class	[cmdb_model_category]	Prevents CI class from being changed after creation.
Protect cmdb_ci_class on insert	[cmdb_model_category]	Prevents creation of a category if another category already exists for the chosen CI class.
Protect Contract	[cmdb_model_category]	Prevents changes to the Contract model category record.
Set parent's main component link	[cmdb_m2m_model_component]	Populates a read-only reference from the bundle to the component when a bundle component is selected as the main component.
Unflag parent on last delete	[cmdb_m2m_model_component]	Removes the bundle flag from a model when the last component is deleted from the bundle.
Update model category	[cmdb_ci]	Updates the model categories for the associated model if the model is not already associated with the CI's model category.
Validate record before creation	[cmdb_m2m_model_component]	Ensures that a component is not already in a bundle when an attempt is made to add the component to a bundle.

Client scripts installed with Model Management

Model Management includes a number of client scripts.

Name	Table	Description
Clear models not matching license	[cmdb_m2m_downgrade_model]	Clears the Upgrade parent and Downgrade child fields when the License field is changed to a license and neither the upgrade or downgrade fields match the license model.
Constraints based on asset class	[cmdb_model_category]	Enables or disables bundling options based on the asset class of the category.
Hide sections when needed	[cmdb_model]	Shows and hides sections according to what is relevant for a given model.
model_category change	[cmdb_model]	Ensures compatibility of classes between the several categories referenced by the same model (client part).
Populate downgrade from license	[cmdb_m2m_downgrade_model]	Sets the downgrade child to the software model on the referenced license when an upgrade is selected. Only sets the downgrade to the license if the license is not empty.
Populate upgrade from license	[cmdb_m2m_downgrade_model]	Sets the upgrade parent to the software model on the referenced license when a downgrade is selected. Only sets the upgrade to the license if the license is not empty.

Properties installed with Model Management

Model Management includes the property *glide.cmdb_model.display_name.shorten*.

Name	Description
<i>glide.cmdb_model.display_name.shorten</i>	<p>When set to true, generates shorter display names for models by eliminating duplication of the manufacturer name. Consider the following model, for which Manufacturer is set to Spotify and Name is set to Spotify Premium.</p> <p>The Display name field is set as follows, based on the property setting.</p> <ul style="list-style-type: none"> • false: Display name is Spotify Spotify Premium • true: Display name is Spotify Premium <p>For software models, the edition and version are also included in the name, if they are specified.</p>

Name	Description
	<ul style="list-style-type: none"> • Type: true false • Default value: false • Location: System Properties [sys_properties] table

Script includes installed with Model Management

Model Management includes script includes.

Name	Description
ModelAndCategoryFilters	Refines reference qualifiers for models and model categories based on class.
ModelCategoryCheck	Ensures compatibility of classes between the several categories referenced by the same model.

Tables installed with Model Management

Model Management includes numerous tables.

Table	Description
Application Model [cmdb_application_product_model]	Stores models used to describe software application products.
Consumable Model [cmdb_consumable_product_model]	Describes consumable product models.
Contract Model [cmdb_contract_product_model]	Stores all contract models.
Depreciation [cmdb_depreciation]	Stores asset depreciation patterns.
Hardware Model [cmdb_hardware_product_model]	Describes hardware product models.
Model Category [cmdb_model_category]	Defines groups of assets, consumables, product bundles, and configuration items.
Model Compatibility [cmdb_m2m_model_compatibility]	Stores many-to-many relationship between two models signifying their compatibility with one another.
Model Component [cmdb_m2m_model_component]	Stores many-to-many relationship between two models signifying that they form a bundle.
Product model [cmdb_model]	Describes all kinds of product models.
Software License Calculation [cmdb_sw_license_calculation]	Defines commonly used software licensing patterns.
Software Model [cmdb_software_product_model]	Describes software product models.
Software Suite [cmdb_m2m_suite_model]	Stores many-to-many relationship between two models that defines elements of a software suite.

Table	Description
Software Upgrade and Downgrades [cmdb_m2m_downgrade_model]	Stores many-to-many relationship between two models signifying that being licensed for one model grants rights to the other as well.

UI policies installed with Model Management

Model Management includes UI policies.

Name	Table	Description
Hide unverified	Model Category [cmdb_model_category]	Shows the Enforce CI verification field if the Asset class and CI class fields are not empty.
Lock fields for Contract and Work Lock fields for Contract	Model Category [cmdb_model_category]	Sets all fields on the Model Category form to read-only if the Name is Contract or Work Order or Work Task .
Protect model category	Product Model [cmdb_model]	Makes the Model categories field mandatory and read-only if it contains any of the following values: Software License , Contract , Work Order , Work Task .
Show is an option if Oracle	Software Model [cmdb_software_product_model]	Shows the Is an option field if the selected Manufacturer name starts with Oracle .

User roles installed with Model Management

Model Management includes user roles.

Role	Contains Roles	Description
category_manager	model manager	Can create, edit, and delete model categories.
model_manager	none	Can create new CMDB models. The model manager role can control the base models and any model extensions that are not hardware, software, or consumables. Hardware and consumable models are controlled by the asset manager (asset) role. Software models are controlled by the software asset manager (sam) role.

Transfer order line fields

Transfer order line form and related fields description.

Transfer order line form

Field	Description
Number	Internal unique number identifying the transfer order line.
Transfer Order	The transfer order to which the transfer order line belongs.
Model	Model of the items requested by the transfer order line. For example, a printer. If the Asset field is filled out first, the Model field is automatically filled in with the model corresponding to the asset.
Quantity requested	Number of items requested by the transfer order line. For example, 3 computers are requested to be transferred.
Quantity received	Number of items already received. For example, 3 keyboards are transferred, 2 are received.
Stage	Current stage of the transfer order. Transfer order lines can only be created when a transfer order is in Draft stage.
Request line	Requested item to associate with the transfer order line.
Asset	Asset requested by the transfer order line. For example, a specific printer. The asset can filter on stockrooms. Note: To create transfer order for an asset, the asset must have a state of In Stock and a substate of either Available or Pre-allocated .
Quantity remaining	Number of items yet to be received. For example, 3 keyboards had been requested, 2 are received, 1 is remaining.
Quantity returned	Number of items that already needed to be returned.

Exploring Enterprise Asset Management

Use the Enterprise Asset Management application to optimize the quality and performance of assets by reducing downtime, increasing asset utilization, and extending asset lifespan while reducing operating costs for asset-intensive organizations.

Enterprise Asset Management overview

The Enterprise Asset Management automates the full lifecycle of your physical business assets with prescriptive workflows. With Enterprise Asset Management, you can maximize the return on your enterprise assets, control capital and operating costs, and reduce risk by tracking and managing your assets from planning to disposal.

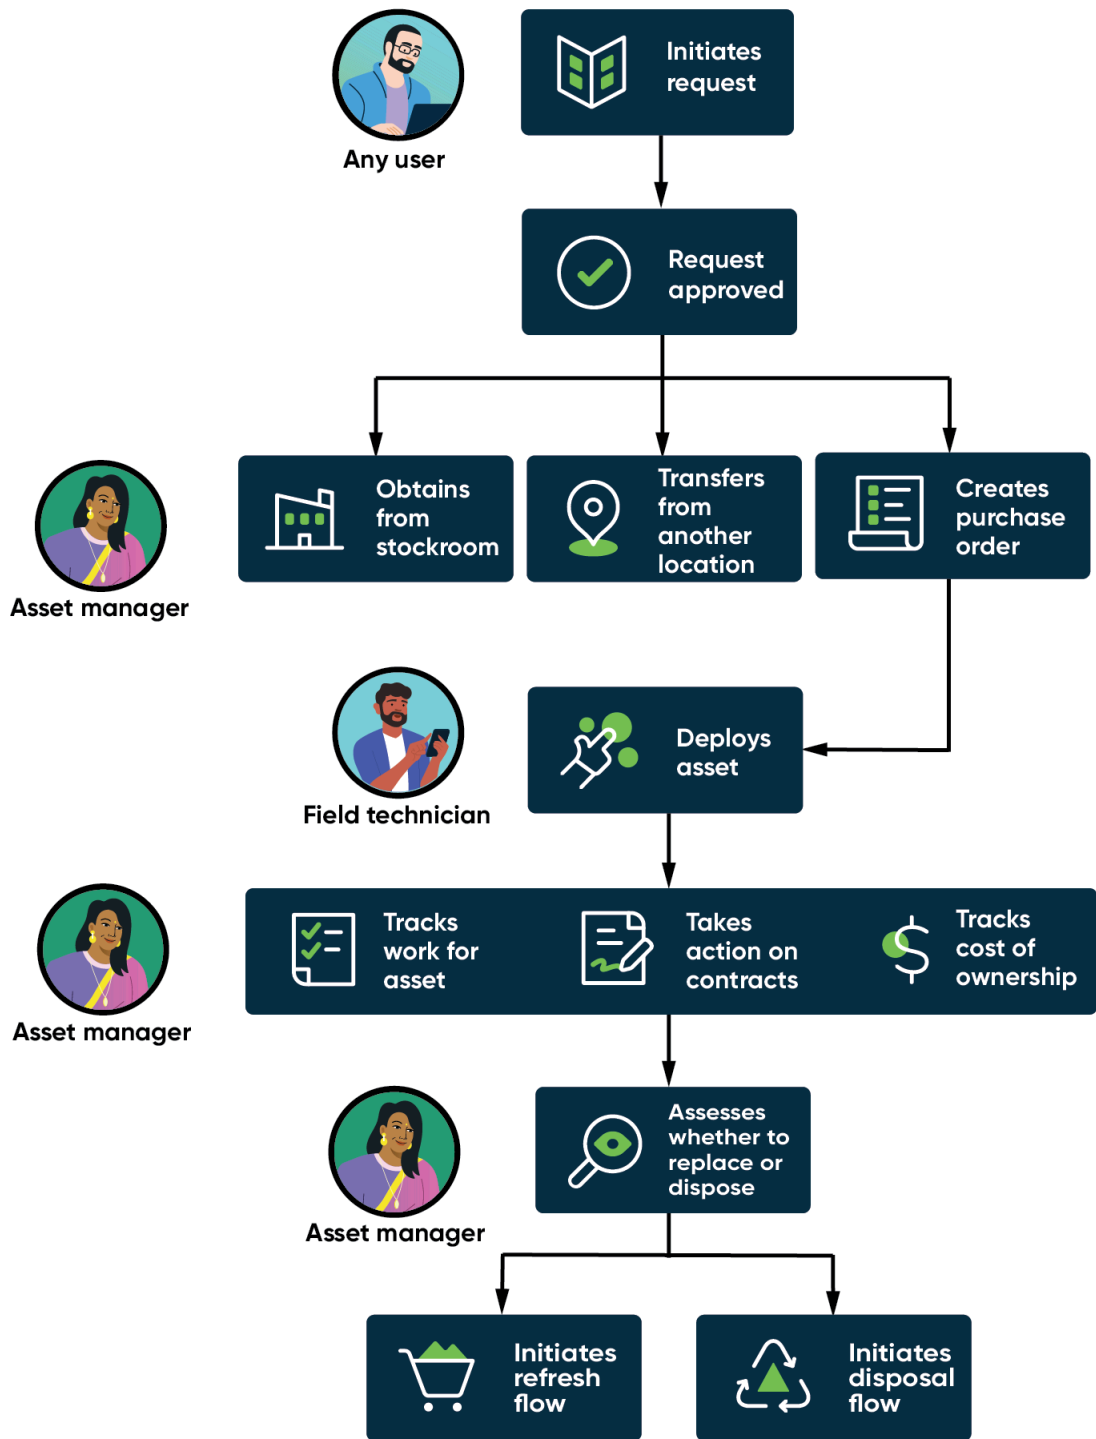

Enterprise Asset Management users

User	Description
Enterprise administrators	Work involves planning strategic initiatives, managing capital planning, and optimizing asset returns.
Enterprise asset managers	Work involves decreasing downtime, extending asset life, and rationalizing inventory.
Enterprise technicians	Work involves increasing productivity and improving response time.
Medical asset managers	Similar to the tasks carried out by an enterprise asset manager, though specifically within the healthcare sector.
Medical technicians	Similar to the tasks carried out by an enterprise asset technician, though specifically within the healthcare sector.
Facility asset manager	Similar to the tasks carried out by an enterprise asset manager, though specifically within the facility management sector.
Facility technician	Similar to the tasks carried out by an enterprise asset technician, though specifically within the facility management sector.
Operational technology asset manager	Similar to the tasks carried out by an enterprise asset manager, though specifically within the operation technology sector.
Operational technology asset technician	Similar to the tasks carried out by an enterprise asset technician, though specifically within the facility management sector.

Enterprise Asset Management workflow

The following illustration describes the tasks involved in the Enterprise Asset Management workflow.

Workflow depicting different users using the Enterprise Asset Management

1. A user in any role initiates a request for an asset using the Service Catalog application
2. The request is created and sent for approval.
3. Following approval, the asset manager begins the process of sourcing the requested asset.
4. The asset manager evaluates whether to source the asset locally from a stockroom, transfer it from another location, or create a new purchase order.
5. The asset manager decides to create a new purchase order to source the asset.

6. Upon receipt of the purchase order, the field technician deploys the asset.
7. The asset manager uses work order and work order tasks to track and manage work for the asset.
8. Additionally, the asset manager can create contracts for the asset and manage by taking actions on contracts that are nearing expiration or already expired.
9. The asset manager can also track the total cost of ownership for the asset.
10. As the asset approaches the end of its useful life, the asset manager assesses whether to replace or dispose of the asset.
11. Based on the decision, the asset manager initiates either a refresh flow or a disposal flow for the asset.

Enterprise Asset Management benefits

Benefit	Feature	Users
Get visibility into all aspects of your assets such as dashboards, asset count by model, lifecycle state, model category, and the overall performance of assets.	Enterprise Asset Workspace	<ul style="list-style-type: none"> • Enterprise administrator • Enterprise asset manager

Enterprise Asset Workspace

Use the Enterprise Asset Workspace to get a comprehensive view of all your assets and manage them efficiently.

Enterprise Asset Workspace landscape

The Enterprise Asset Workspace is a unified medium with multiple views. The views give you visibility into all your assets, models, stockroom and stockroom types. You can also create multiple workflows such as transfer orders, disposal orders, and also provides access to analytics via dashboards.

Note:

Include the *Enterprise Asset Classes* and *Enterprise Model Classes* properties from the Asset Properties table in update sets whenever you move any changes from one environment to another. For details on update sets, see [Update Sets transfer](#).

You can navigate to the Enterprise Asset Workspace in the following two ways:

- If the Next Experience UI Framework is turned on your instance: Select **Workspaces** and then select **Enterprise Asset Workspace**.
- If the Next Experience UI Framework is turned off on your instance: On the left navigation bar, enter `Enterprise Asset Workspace`. Select to open the Enterprise Asset Workspace menu in a new tab.

The Enterprise Asset Workspace contains the following views:

- [Enterprise asset overview for Enterprise Asset Workspace](#)
- [Asset Analytics overview for Enterprise Asset workspace](#)
- [Inventory overview for Enterprise Asset Workspace](#)
- [Enterprise asset estate overview for Enterprise Asset Workspace](#)
- [Enterprise model management overview for Enterprise Asset Workspace](#)
- [Normalization overview for Enterprise Asset Management](#)
- [Contract and lease management overview for Enterprise Asset Workspace](#)

Inline editing

Ensure that you enable Inline editing in your ServiceNow instance to directly make changes to fields instead of opening the record and changing the field on the form.

Note:

Once you enable inline editing in your ServiceNow instance, it is enabled for all ServiceNow applications.

Enterprise asset overview for Enterprise Asset Workspace

Use the Enterprise asset overview as the landing page for the Enterprise Asset Workspace to get insights into key metrics.

Use the Enterprise asset overview dashboard to perform the following tasks:

- Identify and attend to critical action items that require your immediate attention such as entering missing manufacture data, model number, or asset tag information.
- Search for and track asset requests, transfer orders, stock orders, asset refresh requests, disposal orders, and Return Merchandise Authorization (RMA) orders.

Quick links

- Asset requests: 0
- Refresh requests: 0
- Recall orders: 4
- Disposal orders: 22
- Stock orders: 0
- Loaner asset orders: 16
- RMA orders: 18
- Transfer order lines: 19

To access detailed information and take relevant action, select the relevant widget. You can also narrow down your results by using the **Location**, **Stockroom**, **Model category**, and **Classification** filters. For detailed information on the Classification filter, see [Classification codes](#).

Quick links on the dashboard

Widget	Description
Asset requests	Number of requested items where the item's model is a consumable or an enterprise model.
Transfer order lines	Number of active transfer order lines.
Stock orders	Number of requested inventory stock order items.
Refresh requests	Number of open assets refresh order requests.
Recall orders	Number of open recall orders.
Disposal orders	Number of open disposal orders.
Loaner asset orders	Number of requested loaner asset orders.
RMA orders	Number of open Return Merchandise Authorization (RMA) orders.

Asset Analytics overview for Enterprise Asset workspace

Use the Asset Analytics view to get a detailed view of all your assets, their overall performance, and the asset total cost of ownership (TCO).

Enterprise Asset Dashboard

Use the Enterprise Asset Dashboard to get comprehensive information on all your enterprise assets.

You can filter the data based on location, stockroom, model category, and classification.

360 asset view

Widget	Description
Asset count by Gear model category	Number of assets grouped by the model category such as Medical General, Medical Diagnostic.
Asset count by lifecycle state	Number of assets grouped by the lifecycle state such as Retired, In use, and In stock.
Asset value by model category	Cost of assets grouped by the model category such as Vehicle, Cameras, and Field Devices.

Overall performance

Widget	Description
Model lifecycle overview	Overview of the model lifecycle grouped by the lifecycle phase such as General Availability, End of Life, End of Support, and End of Sale.
Discovered and undiscovered asset count	Comparison of the number of discovered and undiscovered assets grouped by model category.
Assets available for refresh by model category	Number of assets that have already expired or the current day is the expiry date, and are eligible for a refresh.

Asset TCO

This tab provides a detailed view of the TCO and displays key metrics that show the real-time status of assets regarding TCO benchmarks.

You can create new comparative reports and view existing ones.

You can filter the data based on location, stockroom, model category, and classification.

Select **View all** to view a list of all the comparative reports. Only reports that have at least one active report source are displayed with the exception of an offline report (where the cost type is either **Actual TCO** or **Projected TCO**). To update data sources on an offline report, open the report and select **Run update job**. This button only appears on an offline report. Once this job is complete, the latest collection date gets updated.

Note:

Offline reports will not appear in the list of comparative reports until the latest collection date is populated.

You can select **New** to create a TCO report.

Select a report icon to directly open a report or select the report name to open the report form.

Widget	Description
Reached benchmark TCO	Number of assets that reached the benchmark TCO.
Approaching benchmark TCO	Number of assets that are approaching the benchmark TCO
Capital planning	Number of assets for capital planning. The Assets for capital planning are assets that are not retired and their current life cycle phase is true.

Widget	Description
Top 10 models with highest average TCO	A bar chart showing the top 10 models with the highest average TCO.
Assets reached benchmark cost by category	Number of assets by category that reached the benchmark cost.
Assets expense distribution	<p>The asset expense distribution based on the following cost types:</p> <ul style="list-style-type: none"> • Purchase - Asset • Purchase - Part • Configuration • Software • Contract - Lease • Contract - Warranty • Contract - Maintenance • Contract - Service • Contract - Other • Utilities • Shipment • Labor - Maintenance • Labor - Repair • Labor - General • Resold value
Monthly asset expense distribution (last 12 months)	<p>Distribution of assets over the last 12 months, based on the following cost types:</p> <ul style="list-style-type: none"> • Purchase - Asset • Purchase - Part • Configuration • Software • Contract - Lease • Contract - Warranty • Contract - Maintenance • Contract - Service • Contract - Other • Utilities • Shipment • Labor - Maintenance • Labor - Repair

Widget	Description
	<ul style="list-style-type: none"> • Labor - General • Resold value

Asset performance

i Important:

The Asset performance tab is available with Enterprise Asset Management version 9.0 and later.

The Asset performance tab provides details on the average values of the following key performance indicators (KPIs):

- Availability
- Mean time between failures (MTBF)
- Mean time to repair (MTTR)

i Note:

For more details on calculation of KPIs, see [Asset performance reports in the Enterprise Asset Workspace](#).

By default, the **Model category** filter is applied to the KPI reports. To further narrow down and focus on specific data, you can also select any one of the following filters:

- **Domain**
- **Location**
- **Classification**
- **Model**

i Note:

You can apply a maximum of two filters to any KPI report.

You can see a weekly trend of the average KPI values in the report. The Asset Availability list provides KPI details for all enterprise assets that are tracked. The average KPI values are calculated based on the assets in this list.

When you select any KPI report, the **KPI Details** page appears. This page enables you to explore the information within that KPI. You can set targets you want to achieve and also set signals to notify you of any significant changes in the KPI.

Asset performance dashboard

Widget	Description
Availability	Average availability percentage of all enterprise assets that are tracked, calculated by dividing the total asset availability percentage by the number of assets listed in the Asset availability report.
MTBF	Average MTBF of all enterprise assets that are tracked, calculated by dividing the total Asset MTBF by the number of assets listed in the Asset availability report.
MTTR	Average MTTR of all enterprise assets that are tracked, calculated by dividing the total Asset MTTR by the number of assets listed in the Asset availability report.
Asset availability	Report that lists the availability and other related KPIs of all enterprise assets that are tracked.

Data Visualizations

i Important:

The Data Visualizations tab is available with Enterprise Asset Management version 9.0 and later.

The Data Visualizations tab enables the asset managers to view and create data visualizations in the Visualization Designer. As an asset manager, you can view the visualizations that are bookmarked, certified, owned by you, and shared with you. You can only edit the visualizations that you created.

Data Visualizations tab

Inventory overview for Enterprise Asset Workspace

Use the Inventory view in the Enterprise Asset Workspace to optimize inventory thresholds and automate re-order process. You can create workflows and view detailed information on your inventory.

Take care of any urgent inventory related action items such as entering a missing stockroom type or stockroom name.

You can access the Inventory view by navigating to **Enterprise Asset Workspace > Inventory**.

To access detailed information and take relevant action, select any widget. You can also narrow your results by using the **Location**, **Stockroom**, and **Model category** filters.

Use the following tabs to view your inventory:

- **Overview:** Get a glimpse of all your inventory data such as open transfer order lines, open asset audits, and loaner asset orders by status.
- **All stockrooms:** Create new stockroom and view stockrooms where your inventory is stored.
- **Stockroom types:** Create new storeroom types and view the various types of storerooms available for your inventory.
- **Stock rules:** Create new stock rules and view a list of existing stock rules.
- **Asset audits:** Create new asset audit records and view existing ones.
- **Disposal orders:** Create disposal order workflows for assets that have reached their end of life cycle or are no longer functional.
- **Loaner asset orders:** View all loaner asset orders and take appropriate actions.
- **RMA orders:** View all Return Merchandise Authorization (RMA) orders for your defective assets and take appropriate actions.
- **RMA order lines:** View all Return Merchandise Authorization (RMA) order lines within your RMA orders and take appropriate actions.
- **Transfer orders:** Create transfer order workflows for moving assets between your stockrooms.
- **Recall orders:** Create recall order workflows for assets that have been recalled by the asset vendor.
- **Reclamation requests:** View and fulfill all your reclamation requests.
- **Resale orders:** View and fulfill all your asset resale requests.

- **Move orders:** Create and view move orders for assets that need to be moved from one location to another.
- **Repair orders:** View the list of repair orders submitted for repair of assets with your stockroom. You can also create repair orders.

Enterprise asset estate overview for Enterprise Asset Workspace

Use the Enterprise asset estate view in the Enterprise Asset Workspace to create and manage your assets. You can also view details such as asset life cycle by state, disposed assets this year, and asset requests.

Take care of any urgent asset related action items such as entering a missing asset tag or asset function.

You can access the Enterprise asset estate view by navigating to **Enterprise Asset Workspace > Enterprise asset estate**.

To access detailed information and take relevant action, select any widget. You can also narrow your results by using the **Location, Stockroom, and Model category** filters.

Enterprise asset estate view

Enterprise asset estate overview

Widget or chart	Description
Asset warranty expirations this year	Count of assets that are expiring this current year.
Asset requests	Count of enterprise and consumable requests in the catalog.
Assets refresh request	Count of assets that are pending refresh.
Lease contract expiration in 90 days	Contracts expiring in 90 days.
Assets eligible for refresh	Assets nearing end of life and which are eligible for refresh.

Enterprise asset estate overview (continued)

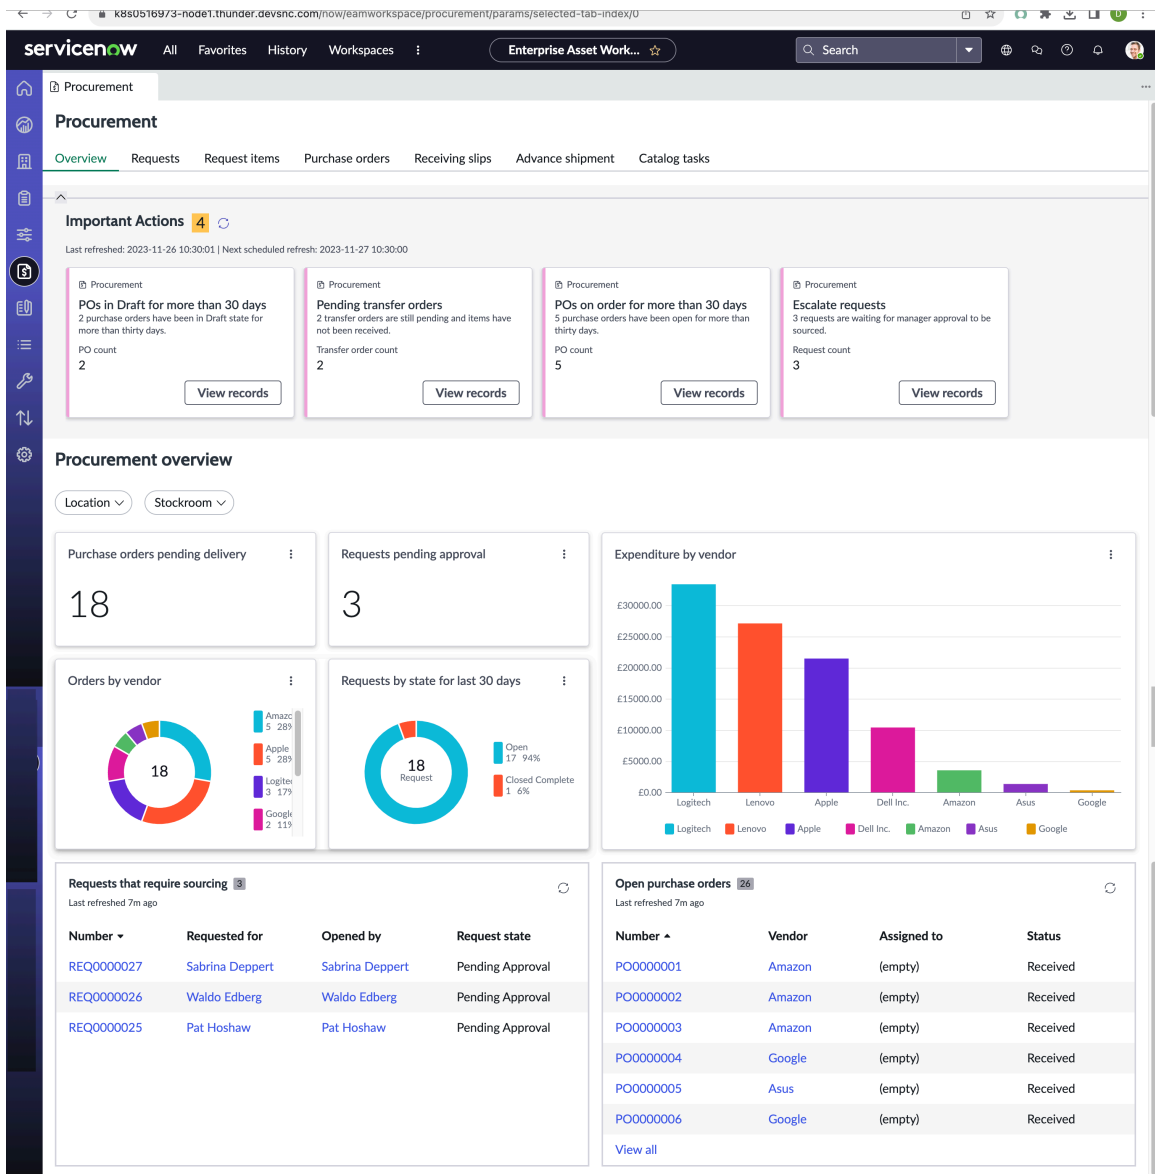

Widget or chart	Description
Disposed assets this year	Assets disposed this current year.
Assets disposed by model category	Assets disposed until the current date in this year and grouped by their model category.
Enterprise asset risk heat map	Displays the risk heat map for number of assets that have the likelihood and impact values. To view this heat map, ensure that the band score records in the Risk Score module are frozen.

Procurement overview for Enterprise Asset Workspace

View and manage procurement-related details such as procurement requests, purchase orders, sourcing tasks, and receiving slips through the Enterprise Asset Workspace.

The Procurement view in the Enterprise Asset Workspace provides access to actions for managing your open requests, pending purchase orders and transfer orders, and requests that need manager approval.

Procurement view

Select any widget or chart to view more specific details. You can also narrow down your results by using the **Location**, **Stockroom**, and **Domain** filters.

Note:

The Domain filter is available only when you've enabled the Domain Extensions Installer (com.glide.domain.msp_extensions.installer) and Domain Separation (plugin com.snc.pa.domain_support) plugins.

Procurement overview

Widget or chart	Description
Purchase order pending delivery	Count of purchase orders that aren't received and aren't canceled. Only purchase orders that have a status of Requested, Ordered, or Pending Delivery are displayed.
Requests pending approval	Count of sourceable and active requests with the request state of Pending approval.

Procurement overview (continued)

Widget or chart	Description
Expenditure by vendor	Cost that you've paid to each of your vendors for procuring the inventory. Only purchase orders that have a status of Ordered, Pending Delivery, or Received are listed.
Orders by vendor	Counts of purchase orders that have been ordered, are pending delivery, or have been received by individual vendors.
Requests by state for last 30 days	Requests created in the last 30 days grouped by their state.
Requests that require sourcing	List of requests for which a purchase order, local order, or transfer order hasn't been initiated.
Open purchase orders	List of purchase orders that have been requested or ordered or have not been delivered.

Enterprise model management overview for Enterprise Asset Workspace

Use the Enterprise model management view in the Enterprise Asset Workspace to create and manage enterprise models. You can also view details such as model lifecycle overview, model status, and enterprise models up for end of life.

Take care of any urgent model related action items such as entering a missing model number or manufacture name.

You can access the Enterprise model management view by navigating to **Enterprise Asset Workspace > Enterprise model management**.

To access detailed information and take relevant action, select any widget. You can also narrow your results by using the **Model category** filter.

Enterprise model management view

Model overview

Widget or chart	Description
Enterprise models up for end of life this year	Count of enterprise models whose start date of the end of life phase is the current year.
Consumable models up for end of life this year	Count of consumable models whose start date of the end of life phase is the current year.
Missing data	Count of models that have missing model name, manufacturer, and model number.
Model lifecycle overview	Count of models that are present in each life cycle stage such as General Availability, End of Support, End of Life, and End of Sale.
Alternate equipment maintenance models	Count of models for which alternate equipment maintenance is enabled and are grouped by model categories.
Model status	Current count of models based on the status of the models.

Model overview (continued)

Widget or chart	Description
Enterprise model risk heat map	<p>Displays the risk heat map for number of models that have the likelihood and impact values. To view this heat map, ensure that the band score records in the Risk Score module are frozen.</p> <p>Note: If risk likelihood, risk impact, and risk score are not frozen, the heat map is rendered in a draft mode with no risk values in the model record. If only one of these vectors is frozen, the heat map is not rendered. If all three vectors are frozen, the heat map is rendered in a production mode and the risk values are populated in the model record.</p>

Normalization overview for Enterprise Asset Management

Use the Normalization view in the Enterprise Asset Workspace to view information related to normalization such as normalization status, model content service download, lifecycle overview.

You can also create custom enterprise model types, product models, and model libraries from this view.

You can access the Normalization view by navigating to **Enterprise Asset Workspace > Normalization**.

Enterprise model normalization

Normalization widgets

Widget	Source	Description
Enterprise models up for end of life	Enterprise Model Lifecycle [sn_eam_model_lifecycle]	<p>The beginning phase of the end of life for enterprise models. Shows the count of enterprise models whose start date of the end of life phase is either the current month, quarter, or year.</p> <p>Note: Only enterprise model life cycle records that are active, model status is in production, and life cycle type is Publisher appear in This month, This quarter, or This year</p>
Normalization status		<p>Normalization status of all the enterprise models. View the count of enterprise models that were normalized and those models that didn't get normalized. For details on the normalization status, see Normalization status for enterprise models.</p>
Lifecycle overview	Enterprise Model Lifecycle [sn_eam_model_lifecycle]	<p>The count of enterprise models that are present in each life cycle stage: General availability, end of support, end of extended support, and end of sale.</p> <p>Note: Only enterprise model life cycle records that are active appear in this widget.</p>
Enterprise model content service download. <ul style="list-style-type: none"> Days until next content download Days since last content download 	Data Services Download Schedules [cds_client_schedule]	<p>The days since the content service library was last downloaded on your instance and the days remaining for the next download to take place.</p>

Contract and lease management overview for Enterprise Asset Workspace

Use the Contract and lease management view in the Enterprise Asset Workspace to create and manage your enterprise asset contracts.

You can access the Contract and lease management view by navigating to **Enterprise Asset Workspace > Contract and lease management**.

Contract and lease management view

The screenshot displays the 'Contract and lease management' interface. At the top, there's a navigation bar with tabs: Overview, All contracts, Lease contracts, Leased assets, Lease-end assets, My contracts, My contract tasks, My contract approvals, and Terms and conditions. Below this is an 'Important Actions' section with six cards, each with a 'View records' button. The main content area is titled 'Contract overview' and features two donut charts showing contract expenditure by type and by vendor, both totaling \$4143.84. To the right, there's an 'Expiring contract' table with columns for Number, Contract model, Vendor, Name, and End date.

Use the following tabs to view and manage your enterprise asset contracts:

- **Overview:** Get a glimpse of all your contract data, including the contract expenditure by type, contract expenditure by vendor, and expiring contracts. You can narrow down this data by using the Domain, Type, and Vendor filters.

In addition, view all important actions for your enterprise asset contracts.

- **All contracts:** Create and view contracts for your enterprise assets. Supported contract types include lease, insurance, maintenance, warranty, purchase agreement, non-disclosure, terms & conditions, service, purchase order, software license, and subscription.
- **Lease contracts:** Create and view contracts for your leased enterprise assets.
- **Leased assets:** View all leased enterprise assets across your organization.
- **Lease-end assets:** View all leased enterprise assets that are associated with contracts for which the lease-end process has begun. Take action on any of the leased enterprise assets that do not have a State of Complete.
- **My contracts:** View all enterprise asset contracts that you are managing.
- **My contract tasks:** View all open tasks for the enterprise assets that are associated with the contracts you are managing.

- **My contract approvals:** View all enterprise asset contract and contract renewal requests that are waiting for your approval.
- **Terms and conditions:** Create and view terms and conditions for your enterprise asset contracts.

For more information on contracts, see [Contract Management](#).

Asset operations overview for Enterprise Asset Workspace

Use the Asset operations view in the Enterprise Asset Workspace to track and manage shipments, service catalog requests, requested items, catalog tasks, and contract renewal requests.

Use the Asset operations view to perform the following tasks:

- View and create shipments
- Create shipment notifications
- View the list of all import records that were performed in any stockroom. For more details, see [Import and receive assets in bulk at your stockroom in the Enterprise Asset Workspace](#).
- View onboarding requests and tasks
- Create and view move orders.
- Create onboarding orders to onboard multiple enterprise assets at one go. For more details, see [Onboarding multiple enterprise assets in the Enterprise Asset Workspace](#).
- Create Calculated model lifecycle templates for enterprise models. For more details, see [Manage the lifecycle of enterprise models with calculated lifecycle templates](#).

Asset operations view

The screenshot shows the ServiceNow interface for the 'Asset operations view' in the 'Enterprise Asset Workspace'. The main content area displays a table titled 'Calculated model lifecycle templates' with 8 rows. The table columns are Name, Active, Description, and Updated. The 'Updated' column shows dates and times. The table is paginated to show 1 of 8 rows.

Name	Active	Description	Updated
Caterpillar heavy machinery model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:18:05
FAST-ACT equipment model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:42:24
Freightliner model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:42:36
High-tech diagnostic medical devices model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:17:46
H5G laser cutting equipment model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-02 01:02:10
Pelco sarix equipment model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:43:14
Retail equipment model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-02 01:02:37
Sollant group compressor model lifecycle	true	Manufacturer recommended model lifecycle template aj	2024-05-01 23:44:17

After you’ve created your request in the Service Catalog application, you can view the request, the requested items, the catalog tasks, and source the request from the Enterprise Asset Workspace.

- **Note:** All requests created for hardware assets and enterprise assets are listed in the **Requests** list section. Similarly all catalog tasks created for hardware assets and enterprise assets are listed in the **Catalog tasks** list section. The Requested items list section only shows the requested items pertaining to enterprise assets.

Work management overview for Enterprise Asset Workspace

Use the Work management view in the Enterprise Asset Workspace to create and manage maintenance plans, work orders, and work order tasks.

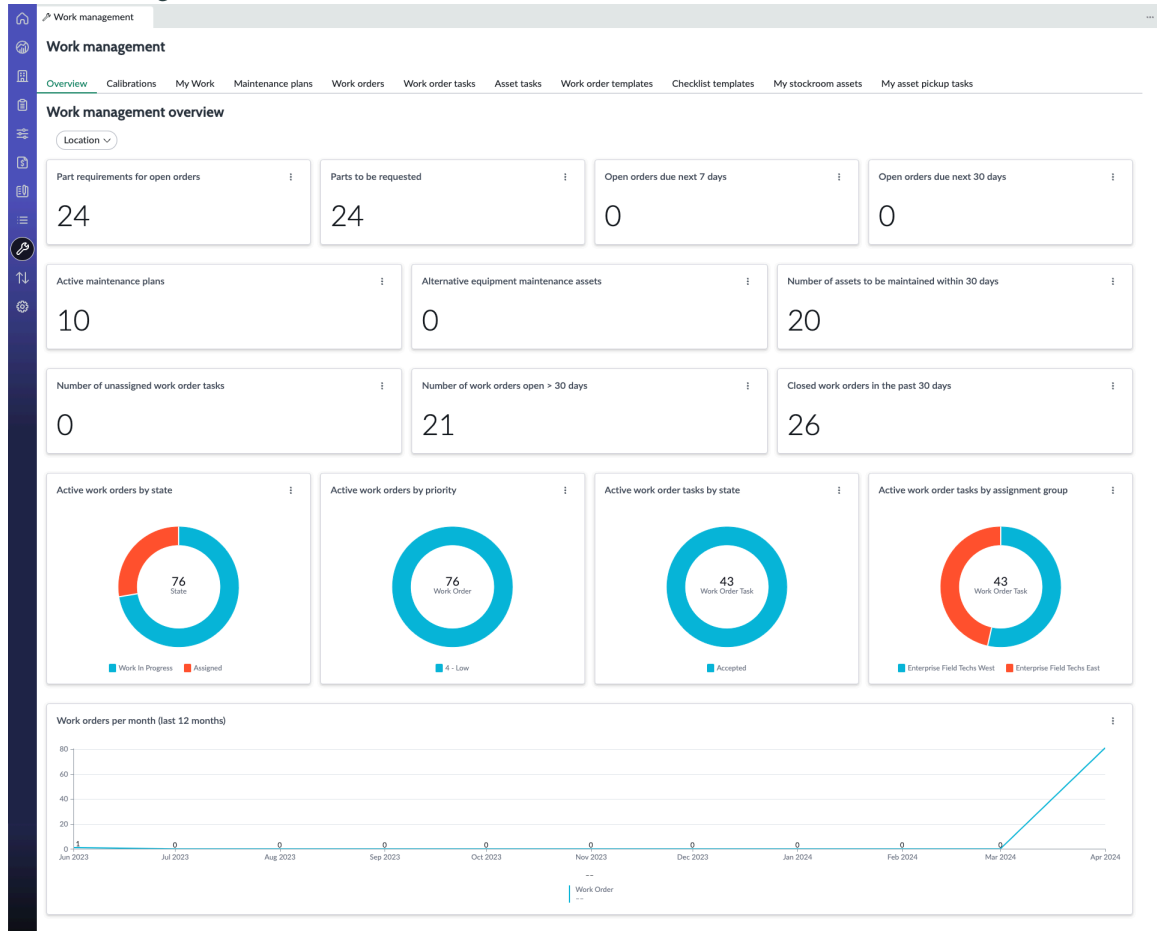

Important: Before you can access and use the Work management view, edit your Field Service Management configurations as needed. See [Edit Field Service Management configurations for the Work management view](#) for detailed instructions.

You can access the Work management view by navigating to **Enterprise Asset Workspace > Work management**.

Note: Only users with the system administrator (admin), enterprise asset manager (sn_eam.enterprise_asset_manager), and agent (wm_agent) roles can access the Work management view.

To access detailed information and take relevant action, click any widget. You can also narrow your results by using the **Location** filter.

Work management view

Use the following tabs to view and manage your work orders, work order tasks, maintenance plans, and other relevant work order information:

Note: The tabs that appear on the Work management view differ based on your assigned role.

- **Overview:** Get a glimpse of all your work order data, such as part requirements for open orders, active work orders by state, work orders per month, and active maintenance plans.

Note:

This tab appears if you have the system administrator (admin) or enterprise asset manager (sn_eam.enterprise_asset_manager) role.

- **Calibrations:** Get a glimpse of all your calibration data, such as all calibration events and calibrations pending verification.

Note:

This tab appears if you have the system administrator (admin) or enterprise asset manager (sn_eam.enterprise_asset_manager) role.

- **My work:** View all open requests and tasks that are associated with your work orders.

Note:

This tab appears if you have the system administrator (admin) or agent (wm_agent) role.

- **Maintenance plans:** Create and view maintenance plans for your enterprise assets.

Note:

This tab appears if you have the system administrator (admin) or enterprise asset manager (sn_eam.enterprise_asset_manager) role.

- **Work orders:** Create and view work orders for any planned or ad-hoc work that you want to perform on your enterprise assets.

Note:

This tab appears if you have the system administrator (admin), enterprise asset manager (sn_eam.enterprise_asset_manager), or agent (wm_agent) role.

- **Work order tasks:** View all work order tasks that are associated with your work orders.

Note:

This tab appears if you have the system administrator (admin), enterprise asset manager (sn_eam.enterprise_asset_manager), or agent (wm_agent) role.

- **Asset tasks:** View all tasks for the enterprise assets that are associated with your work orders.

Note:

This tab appears if you have the enterprise technician (enterprise_asset_technician) or agent (wm_agent) role.

- **Work order templates:** Create and view templates for your work orders.

Note:

This tab appears if you have the system administrator (admin) or enterprise asset manager (sn_eam.enterprise_asset_manager) role.

- **Checklist templates:** Create and view checklist templates for your work orders.

Note:

This tab appears if you have the system administrator (admin) or enterprise asset manager (sn_eam.enterprise_asset_manager) role.

- **My stockroom assets:** View enterprise assets that are available within your stockrooms.

Note:

This tab appears if you have the system administrator (admin) or agent (wm_agent) role.

- **My asset pickup tasks:** View all scheduled pickup tasks for the enterprise assets that are associated with your work orders.

Note:

This tab appears if you have the system administrator (admin) or agent (wm_agent) role.

- **Work order plan templates:** Create and view work order plan templates.

Note:

This tab appears with Enterprise Asset Management version 10.0 and later if you have the enterprise asset manager (sn_eam.asset_manager) role.

- **Work order plans:** Create and view work order plans.

Note:

This tab appears with Enterprise Asset Management version 10.0 and later if you have the enterprise asset manager (sn_eam.asset_manager) role.

The Overview tab also displays work order plan reports that include **Work order plans by status**, **Active tasks by work order plan**, and **Overdue tasks by work order plan**.

Admin center overview for Enterprise Asset Workspace

Use the Admin center view in the Enterprise Asset Workspace to perform all your configuration and administrative tasks.

Only the Enterprise admin [sn_eam.enterprise_admin] and the Enterprise asset manager [sn_eam.enterprise_asset_manager] roles can view and perform operations in the Admin center view.

Use the Admin center to perform the following tasks:

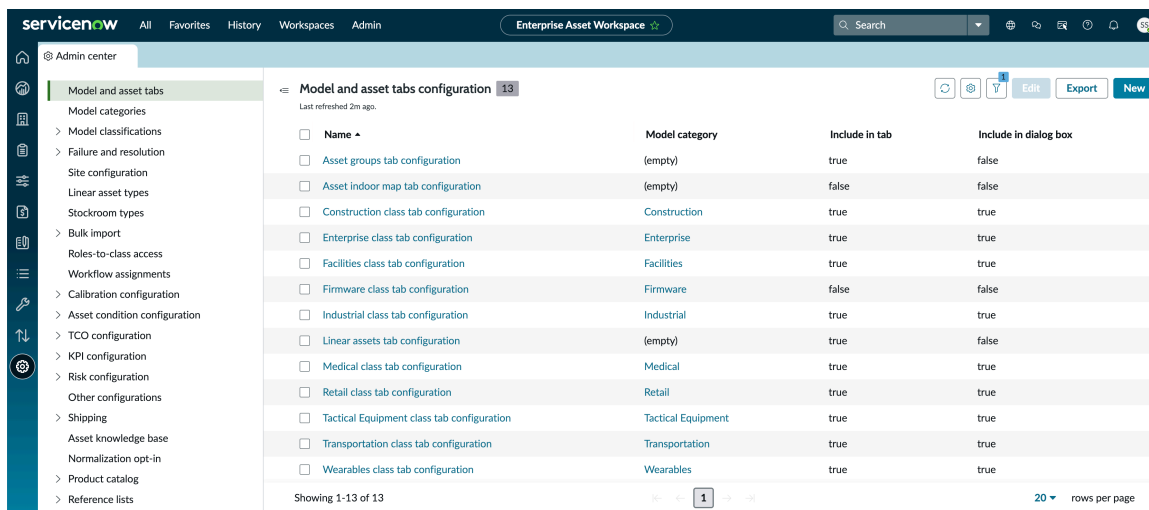

- Configure model and asset tabs
- Create model categories
- Create and import classification codes
- Create sources for classification codes
- Create linear asset types
- Create stockroom types
- Import enterprise models and assets
- Workflow assignments
- Create and view task rate and labor rate cards
- Create configuration values for risk likelihood, risk impact, and risk scores
- Create shipment carriers

- Integrate with third-party shipping carriers
- Create a knowledge article
- Opt-in to Enterprise Asset Management
- [Create failure and resolution codes](#)

i Important: Options to create failure and resolution codes are available in Enterprise Asset Management version 9.0 and later.

- [Set up the configurations to monitor the key performance indicators \(KPIs\) of the enterprise assets](#)

i Important: The KPI configuration options are available in Enterprise Asset Management version 9.0 and later.

Expanded Model and Asset Classes Store application

The Expanded Model and Asset Classes Store application adds model and asset classes that extend out-of-the-box classes within the Configuration Management Database (CMDB) class hierarchy. These extensions include class descriptions, identification rules, identifier entries, and dependent relationships. The application also adds model categories and API categories.

i Note: This application is compatible with the Rome and later family releases.

For more information on the CMDB, see [Configuration Management Database \(CMDB\)](#).

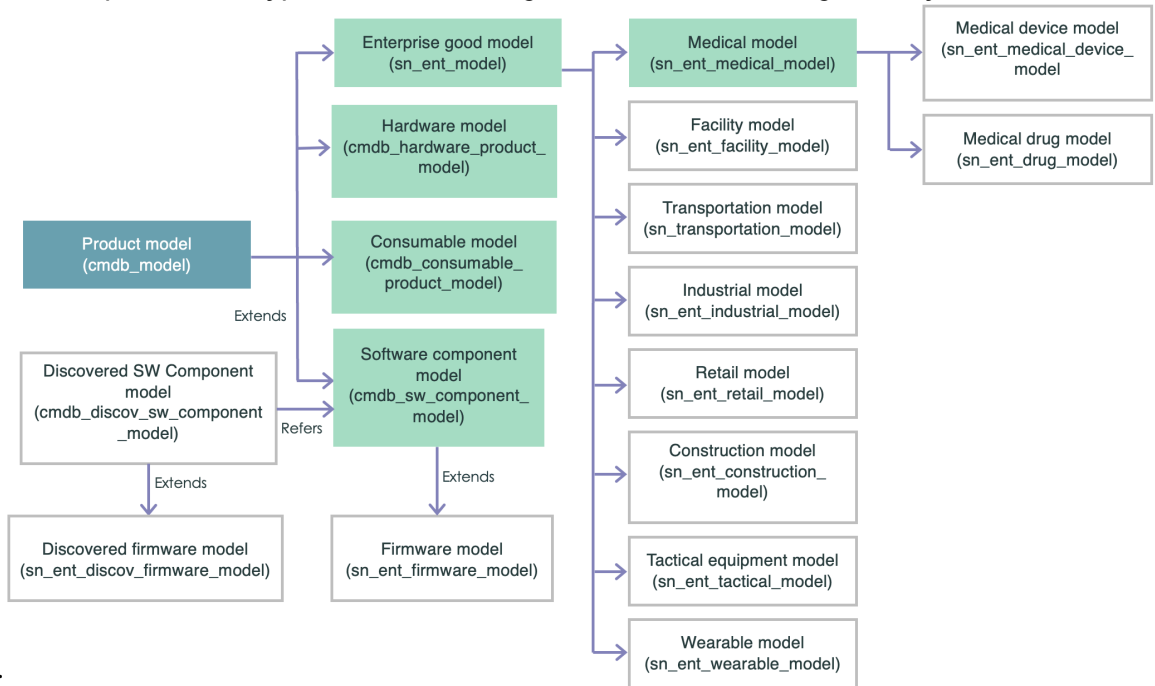

In addition to extending CMDB model and asset classes, the Expanded Model and Asset Classes application creates model categories that associate model and asset classes with CMDB configuration item (CI) classes. The Enterprise Asset Management application uses these classes and model categories to create asset and model records that can be used to track and manage enterprise assets. Discovery tools, such as the ServiceNow® Discovery application, can also use these classes and model categories to create asset and model records for discovered CIs. See [Model categories](#) for more information on model categories.

The Expanded Model and Asset Classes application also adds the API and Managed API model categories, which allow the Configuration Management Database (CMDB) application to create and associate application models with API and Managed API CMDB CI classes. API CMDB CI

classes provide classifications for APIs (application programming interfaces), which are sets of definitions and protocols that enable computer programs to communicate with each other. Managed API CMDB CI classes provide classifications for APIs that are discovered through gateways or management services, such as Amazon API Gateway. By associating application models with these CMDB CI classes, the Configuration Management Database (CMDB) application can create version-agnostic representations of your APIs. These representations can then provide a more holistic view of each API during reporting and analysis. For more information on API and Managed API CMDB CI classes, see [API extension classes](#).

Enterprise model classes added by the application

The Expanded Model and Asset Classes application adds the Enterprise good model [sn_ent_model] class, Firmware model [sn_ent_firmware_model] class, and Discovered firmware model [sn_ent_discov_firmware_model] class, which extend the base Product model [cmdb_model] class. The Enterprise good model [sn_ent_model] class includes classifications for various enterprise model types, which are categorized into the following industry-based child

classes:

Enterprise Good Model Child Classes

Enterprise good model child class	Description
Medical model [sn_ent_medical_model]	Classifies medical-based enterprise models, such as ER Medical Cart Kit and ECG Electrodes.
Medical device model [sn_ent_medical_device_model]	Classifies medical device-based enterprise models, such as Blood Pressure Monitor and MRI Patient Table.

Enterprise Good Model Child Classes (continued)

Enterprise good model child class	Description
	<p>Note: When you upgrade to version 1.2.0 or later of the Expanded Model and Asset Classes application, the application automatically runs the <code>Update_medical_device_category_fix</code> script to associate the Medical Device model <code>[sn_ent_medical_device_model]</code> class with the existing Medical device model category. However, you may need to manually reclassify existing enterprise models under the Medical device model category from the Medical model <code>[sn_ent_medical_model]</code> class to the Medical Device model <code>[sn_ent_medical_device_model]</code> class. Refer to KB1182183 for detailed instructions.</p> <p>Product Instance Identifier (PID) which is a unique and common identifier that links the asset, CI, and IBI classes is generated for the assets of Medical Device model category. PID is generated based on the PID configurations applicable for the Medical Device model category.</p> <p>The Product Instance Identifier Configurations <code>[product_instance_identifier_configuration]</code> table stores the PID configurations. By default, the following configurations are available:</p> <ul style="list-style-type: none"> • PID - Serial number that includes a parameter defined based on the Serial number field of the Asset <code>[alm_asset]</code> table. • PID - Parent that includes parameters defined based on the Parent and Model Component ID fields of the Asset <code>[alm_asset]</code> table. <p>When many PID configurations are associated with the Medical Device model category, the configuration with the highest priority is considered first during the generation of the PID. The PID - Serial number configuration is mostly given the highest priority.</p>
<p>Medical drug model <code>[sn_ent_drug_model]</code></p>	<p>Classifies medical drug-based enterprise models, such as Amoxicillin and Prilosec.</p>
<p>Facility model <code>[sn_ent_facility_model]</code></p>	<p>Classifies facility-based enterprise models, such as HVAC Split System and Wire Shelf.</p>
<p>Transportation model <code>[sn_ent_transportation_model]</code></p>	<p>Classifies transportation-based enterprise models, such as Disc Brake Rotor Front and Fuel Cell Car.</p>
<p>Industrial model</p>	<p>Classifies industrial-based enterprise models, such as CNC Milling Machine and Laser Cutting Machine.</p>

Enterprise Good Model Child Classes (continued)

Enterprise good model child class	Description
[sn_ent_industrial_model]	
Retail model [sn_ent_retail_model]	Classifies retail-based enterprise models, such as Retail Counter Scale and 80mm Thermal Receipt Printer.
Tactical equipment model [sn_ent_tactical_model]	Classifies tactical equipment-based enterprise models, such as K19 Plate Carrier and Triple Mag Pouch.
Construction model [sn_ent_construction_model]	Classifies construction-based enterprise models, such as Excavator and Hex Breaker Hammer Kit.
Wearable model [sn_ent_wearable_model]	Classifies wearable asset-based enterprise models, such as N95 Respirator and High-vis Safety Vest.

Enterprise asset classes added by the application

The Expanded Model and Asset Classes application adds the Enterprise asset [sn_ent_asset] class, which extends the Base asset [alm_base] class. The Enterprise asset [sn_ent_asset] class includes classifications for various enterprise asset types, which are categorized into the following industry-based child

classes:

Enterprise Asset Child Classes

Enterprise asset child class	Description
Medical asset	Classifies medical-based enterprise assets, such as hospital beds and X-ray machines.

Enterprise Asset Child Classes (continued)

Enterprise asset child class	Description
[sn_ent_medical_asset]	
Facility asset [sn_ent_facility_asset]	Classifies facility-based enterprise assets, such as coffee makers and HVAC systems.
Transportation asset [sn_ent_transportation_asset]	Classifies transportation-based enterprise assets, such as airplanes and brake pads.
Industrial asset [sn_ent_industrial_asset]	Classifies industrial-based enterprise assets, such as forklifts and casting machines.
Retail asset [sn_ent_retail_asset]	Classifies retail-based enterprise assets, such as display cases and clothing racks.
Tactical equipment asset [sn_ent_tactical_asset]	Classifies tactical equipment-based enterprise assets, such as hydration carriers and tactical plate carriers.
Construction asset [sn_ent_construction_asset]	Classifies construction-based enterprise assets, such as sledgehammers and hand saws.
Wearable asset [sn_ent_wearable_asset]	Classifies wearable enterprise assets, such as helmets and uniforms.

Service model classes added by the application

The Expanded Model and Asset Classes application adds the following child classes to the base Service model [cmdb_service_product_model] class. These child classes provide classifications for various service model types.

Service Model Child Classes

Service model child class	Role required for read access	Description
Card service model [sn_ent_card_service_model]	sn_ent.card_service_model_viewer	Classifies service models that are based on card offerings from banks and financial institutions, such as credit cards and gift cards.

Service Model Child Classes (continued)

Service model child class	Role required for read access	Description
Deposit model [sn_ent_deposit_account_model]	sn_ent.deposit_account_model_viewer	Classifies service models that are based on deposit accounts offered by banks and financial institutions, such as savings and checking accounts.
Loan model [sn_ent_loan_account_model]	sn_ent.loan_account_model_viewer	Classifies service models that are based on loan options offered by banks and financial institutions, such as personal loans and mortgage loans.
Line of credit model [sn_ent_line_of_credit_model]	sn_ent.line_of_credit_model_viewer	Classifies service models that are based on lines of credit offered by banks and financial institutions, such as overdrafts on savings and checking accounts.
Financial service model [sn_ent_financial_services_model]	sn_ent.financial_services_model_viewer	Classifies service models that are based on financial services offered by banks and financial

Service Model Child Classes (continued)

Service model child class	Role required for read access	Description
		institutions, such as safe lockers and wire services.
Investment model [sn_ent_investment_model]	sn_ent.investment_model_viewer	Classifies service models that are based on wealth management options offered by banks and financial institutions, such as mutual funds and retirement planning.
Personal lines insurance product model [sn_ent_b2c_ins_policy_model]	sn_ent.b2c_ins_policy_model_viewer	Classifies service models that are based on personal lines insurance policies offered by insurance carriers, such as coverage and payment plans for personal auto insurance.
Commercial lines insurance product model [sn_ent_b2b_ins_policy_model]	sn_ent.b2b_ins_policy_model_viewer	Classifies service models that are based on commercial lines insurance policies offered by insurance carriers, such as coverage and payment plans for commercial

Service Model Child Classes (continued)

Service model child class	Role required for read access	Description
		property insurance.
Group life insurance product model [sn_ent_group_life_ins_policy_model]	sn_ent.group_life_ins_policy_model_viewer	Classifies service models that are based on group life insurance policies offered by insurance carriers, such as coverage and payment plans for group term life insurance.
Individual life product model [sn_ent_indiv_life_ins_policy_model]	sn_ent.indiv_life_ins_policy_model_viewer	Classifies service models that are based on individual life insurance policies offered by insurance carriers, such as coverage and payment plans for individual whole life insurance.
Medical insurance model [sn_ent_medical_insurance_model]	sn_ent_medical_insurance_model_viewer	Classifies medical insurance models, including health insurance plans and government insurance programs such as Medicare or Medicaid.
Social benefit model [sn_ent_social_benefit_model]	sn_ent.social_benefit_model_viewer	Classifies service models that

Service Model Child Classes (continued)

Service model child class	Role required for read access	Description
		are based on social insurance programs and means-tested assistance programs, such as social security and the Supplemental Nutrition Assistance Program (SNAP).

Contract model classes added by the application

Contract model class	Role required for read access	Description
Permit model [sn_ent_permit_model]	contract_manager	The Permit model is an extension of the Contract model table and is used to model licenses and permits that have been issued and entitles the recipients to perform certain activities or make use of specific resources.

Firmware model and Discovered firmware model classes

The Expanded Model and Asset Classes application adds the Firmware model [sn_ent_firmware_model] and Discovered firmware model [sn_ent_discov_firmware_model] classes. These firmware model class tables extend the tables that the CMDB CI Data Foundation application installs.

The Firmware installation [cmdb_firmware_install] table added with the CMDB CI class model application stores the installation records based on the firmware embedded into assets. Based on the records in the Firmware installation table, the Discovered firmware model and Firmware model tables store the details of the firmware.

AI model classes added by the application

The Expanded Model and Asset Classes application adds the AI system component product model [cmdb_ai_systems_component_product_model] class, which extends the Software component model [cmdb_sw_component_model] class. The application also adds the AI content product model [cmdb_ai_content_product_model] class, which extends the Content product model [cmdb_content_product_model] class. Both the Software component model [cmdb_sw_component_model] class and Content product model [cmdb_content_product_model] class extend the base Product model [cmdb_model] class.

The AI system component product model [cmdb_ai_systems_component_product_model] class classifies product models that are based on AI system components, such as machine learning, Natural Language Processing (NLP), and generative or agentic AI.

The AI content product model [cmdb_ai_content_product_model] class includes classifications for various AI content model types, which are categorized into the following child classes:

AI content product model child classes

AI content product model child class	Description
AI model product model [cmdb_ai_model_product_model]	Classifies content models for the AI models that are used to generate AI system responses without any human intervention. Examples of AI models include Now LLM and GPT 3.5 Turbo.
AI dataset product model [cmdb_ai_dataset_product_model]	Classifies content models for the datasets that are used to train and test AI models. Examples of datasets include Wikipedia and Google Open Images.
AI prompt product model [cmdb_ai_prompt_product_model]	Classifies content models for the prompts, or instructions, that are given to AI models to generate AI system responses without any human intervention. Examples of prompts include sets of instructions to generate x-char summaries for given inputs in specific tones or voices.

AI asset classes added by the application

The Expanded Model and Asset Classes application adds the AI digital asset [alm_ai_digital_asset] class, which extends the Information asset [alm_information_asset] class. The Information asset [alm_information_asset] class extends the base Asset [alm_asset] class. The AI digital asset [alm_ai_digital_asset] class includes classifications for various AI asset types, which are categorized into the following child classes:

AI digital asset child classes

AI digital asset child class	Description
AI system digital asset [alm_ai_system_digital_asset]	Classifies the software artifacts that provide machine learning (ML) and AI capabilities for generating outputs, such as decisions, recommendations, content, and predictions. Examples include incident summarization and fraud detection capabilities.
AI model digital asset [alm_ai_model_digital_asset]	Classifies the AI models that are used to generate AI system responses without any human intervention. Examples include Now LLM and GPT 3.5 Turbo.
AI dataset digital asset [alm_ai_dataset_digital_asset]	Classifies the datasets that are used to train and test AI models. Examples include Wikipedia and Google Open Images.
AI prompt digital asset [alm_ai_prompt_digital_asset]	Classifies the prompts, or instructions, that are given to AI models to generate AI system responses without any human intervention. Examples include sets of instructions to generate x-char summaries for given inputs in specific tones or voices.

Requesting the Expanded Model and Asset Classes application

You must request the Expanded Model and Asset Classes application from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all available applications and for information about submitting requests to the Store. For cumulative release notes information for all released applications, see the [ServiceNow Store version history release notes](#).

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.
3. In the search bar, enter `Expanded Model and Asset Classes` and then click **Search**.
4. Select the result called **Expanded Model and Asset Classes**.
5. On the Expanded Model and Asset Classes page, click **Request Install**.

The ServiceNow Request for App Installation - Expanded Model and Asset Classes dialog box opens.

6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - Expanded Model and Asset Classes dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, click Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Click **Request**.
8. Click **Close**.

If your request is approved, you will receive an email with detailed instructions on how to install the application. You can then install the application according to the instructions in the email.

Verifying successful application installation

After you request and install the Expanded Model and Asset Classes application, verify that all enterprise model and asset classes have been added to the CMDB class hierarchy successfully.

1. From your ServiceNow instance, navigate to **All > Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list, where you can view all classes within the CMDB class hierarchy.
3. Verify that all enterprise model and asset classes have been added to the list.
4. (Optional) Select a class to verify the corresponding class description, identification rules, identifier entries, and dependent relationships.

Warning:

Uninstalling the Expanded Model and Asset Classes application may compromise the integrity of the Enterprise Asset Management application, resulting in unexpected behavior.

OT Asset Management

Operational Technology (OT) Asset Management is a specialized offering within the suite of Enterprise Asset Management solutions for managing Operational Technology (OT) and Operational Equipment (OE) assets. With OT Asset Management, you can effectively manage the lifecycle of OT and OE assets.

OT Asset Management is a licensable application that helps you to manage assets of the Industrial model category for Operational Technology. The OT Asset Management (com.sn_otam) application is available on the ServiceNow Store. When this application is installed on your ServiceNow instance, the Enterprise Asset Management application also gets installed. For more information, see [Install OT Asset Management](#).

The OT Asset Management application provides the functionalities, features, and workflows of Enterprise Asset Management that support roles related to Operational Technology.

OT Asset Management licensing

The ServiceNow® platform uses a licensing method where your organization is charged for using the OT Asset Management application. In this licensing model, all assets of the Industrial and Hardware model categories are charged based on the Subscription unit ratio.

The ServiceNow® OT Asset Management licensing is based on resource categories. A resource category is a group of related model categories. The OT Asset Management application supports some default resource categories. These resource categories enable assets of the Industrial and Hardware model categories to use the features and workflows of the OT Asset Management application. Any asset of the Industrial and Hardware model category is counted toward a Subscription Unit based on the predefined ratio of number of assets to subscription units.

When you create a custom model category with a licensable Industrial or Hardware model category as its parent, the custom model category is automatically associated with the resource category of the parent model category. Based on the resource category, the assets of these custom model categories are licensed and counted toward a Subscription Unit.

Note:

When the OT Asset Management application is activated on your ServiceNow instance, all the OT Asset Management license resource categories are opted in by default.

OT Asset Management license resource categories

Resource category	Subscription unit ratio	Model category
Unclassed OT	1:1	<ul style="list-style-type: none"> Industrial Industrial General
OT Supervisory System	1:1	<ul style="list-style-type: none"> OT Supervisory OT Supervisory EWS OT Supervisory Historian OT Supervisory HMI

OT Asset Management license resource categories (continued)

Resource category	Subscription unit ratio	Model category
		<ul style="list-style-type: none"> • OT Supervisory OPC • OT Supervisory SCADA
OT Control System	3:1	<ul style="list-style-type: none"> • OT Control • OT Control 3D Printer • OT Control CNC • OT Control DCS • OT Control DPU • OT Control IED • OT Control Module • OT Control PLC • OT Control RTU • OT Control SCADA • OT Control Server
OT Field Devices	10:1	<ul style="list-style-type: none"> • OT Field Actuator • OT Field Device • OT Field Drive • OT Field Robot • OT Field Sensor
Industrial Consumable	25:1	Any consumable asset created using any of the preceding model categories.
Operational Equipment	1:1	Not applicable
Hardware resource categories		
OT Servers	1:1	<p>Any model category which contains Server in the name and belongs to the alm_asset or alm_hardware class. Examples:</p> <ul style="list-style-type: none"> • AIX Server • ESX Server • HPUX Server • Linux Server • Netware Server • OS/X Server • Solaris Server

OT Asset Management license resource categories (continued)

Resource category	Subscription unit ratio	Model category
		<ul style="list-style-type: none"> • UNIX Server • Windows Server
OT Network Gear	5:1	<ul style="list-style-type: none"> • IP Router • IP Switch • Network Gear
OT Storage	3:1	Storage Device
OT End User Computers	4:1	Computer
OT Mobile Devices	10:1	Mobile Device
OT Monitors	15:1	Monitor
OT Printers	10:1	Printer
OT Unclassified Hardware	1:1	Hardware

The Subscription unit ratio is the ratio of the number of assets to the number of subscription units. For example, the subscription unit ratio of Industrial Consumable is 25:1, where 25 assets require a single unit of license. If 1 license costs \$100, then 25 industrial consumable assets cost \$100 and 50 industrial consumable assets cost \$200.

You can view the subscription details of your OT Asset Management application using the ITAM License Report. For more details, see [View the license report for the OT Asset Management application](#).

OT hardware assets in OT Asset Management licensing

The OT Asset Management licensing model includes a few default hardware resource categories to license OT hardware assets.

In the OT Asset Management licensing model, only hardware assets with the **OT entity** flag set to **true** are licensed and counted toward a Subscription unit under the hardware resource categories of OT Asset Management licensing. The OT Asset Management workflows support OT hardware assets.

i Note:

Non-OT Hardware assets with the **OT entity** flag set to **false** can't use the features and workflows of the OT Asset Management application even if you have installed the application. The non-OT hardware assets aren't licensed under OT Asset Management.

The Hardware Asset Management (HAM) licensing model includes default resource categories equivalent to the hardware resource categories of OT Asset Management.

Comparison of resource categories

OTAM hardware resource category	Equivalent HAM resource category
OT Servers	Servers
OT Network Gear	Network Gear
OT Storage	Storage
OT End User Computers	End User Computers
OT Mobile Devices	Mobile Devices
OT Monitors	Monitors
OT Printers	Printers
OT Unclassified hardware	Unclassified Hardware

When both OT Asset Management and Hardware Asset Management applications or licensed HAM solutions are activated, and HAM resource categories are opted in, consider the following points:

- OT hardware assets are licensed only under the hardware resource categories of OT Asset Management licensing.
- Non-OT hardware assets are licensed only under the resource categories of HAM licensing.
- OT Asset Management workflows support only OT hardware assets.
- HAM workflows support both OT hardware assets and non-OT hardware assets.

For more details on licensing hardware assets, see [Licensing framework for Hardware Asset Management solutions](#).

View the license report for the OT Asset Management application

View details of the subscriptions consumed by your organization for the OT Asset Management application by using the ITAM License Report.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

The EAM Populate Licensing Data job runs every Sunday and populates the ITAM License Report. Any changes to the license consumption will reflect on the ITAM license report only after the weekly license count calculation.

Procedure

1. Navigate to **All > ITAM Licensing > ITAM License Report**.
2. Search for the OT Asset Management application.

Application	Resource Category	Resource Subcategory	Resource Total Count	Subscription Unit Ratio	Total Subscription Units Consumed
OT Asset Management	Industrial Consumable		102	25:1	5
OT Asset Management	OT Supervisory System		0	1:1	0
OT Asset Management	OT Field Devices		1,016	10:1	102
OT Asset Management	Operational Equipment		0	1:1	0
OT Asset Management	OT Control System		603	3:1	201
OT Asset Management	Unclassed OT		0	1:1	0
Sum					308

You can view the following information on subscriptions consumed for the resource categories for the OT Asset Management application.

- **Application:** Name of the application that is activated on your ServiceNow instance. The ITAM License Report can be grouped by the application.
- **Resource Category:** Managed OT resource types available for the OT Asset Management application. The resource types include the following:
 - Unclassed OT
 - OT Supervisory System
 - OT Control System
 - OT Field Devices
 - Industrial Consumable
 - Operational Equipment
 - OT Servers
 - OT Network Gear
 - OT Storage
 - OT End User Computers
 - OT Mobile Devices
 - OT Monitors
 - OT Printers
 - OT Unclassified Hardware
- **Resource Subcategory:** Subcategories of a Resource category.
- **Resource Total Count:** Asset count of the managed OT resources that is grouped by Resource categories and Model categories.
- **Subscription Unit Ratio:** Predefined ratios that determine how many assets of a Resource category require a subscription. For example, the defined ratio of 25:1 for Industrial Consumable means that every 25 assets of that resource category require one Subscription Unit.
- **Total Subscription Units Consumed:** The number of subscriptions per Resource category that your organization consumed. The licensing module calculates this number by applying the Subscription Unit Ratio to the Resource Total Count for each Resource Category.

OT Asset Workspace

The OT Asset Workspace is the intuitive and streamlined user interface of the OT Asset Management application to manage your Operational Technology (OT) and Operational Equipment (OE) assets.

OT Asset Workspace overview

The OT Asset Workspace is a unified medium with multiple views that help you manage your OT and OE assets efficiently. The views provide you with visibility into all the important aspects of your assets, such as dashboards on Asset count by model, lifecycle state, model category, and overall performance of assets.

OT Asset Workspace roles

Role title	Contains roles	Description
OT asset manager [sn_otam.ot_asset_manager]	<ul style="list-style-type: none"> • model_manager • model_admin 	<p>This role has full access to the OT Asset Workspace.</p> <p>Note: Given that this role is part of the Enterprise Admin (sn_eam.enterprise_admin) role, the Enterprise Admin role also has complete access to the OT workspace.</p>
OT technician sn_otam.ot_asset_technician	<ul style="list-style-type: none"> • sn_eam.asset_technician • sn_eam.enterprise_mobile_user • canvas_user 	<p>This role is for users who perform tasks and update OT hardware asset records as part of the OT hardware asset lifecycle.</p>

OT Asset Workspace views

Efficiently manage your assets by utilizing the different views available in the OT Asset Workspace.

The following table mentions all the views that the OT Asset Workspace consists of, a brief description of each view, and the tabs or lists that are present in each view:

Name of the view	Description of the view	Tabs/lists in the view
OT asset overview	View important actions and quick links to active tasks.	No tabs in this view.
Asset analytics	Manage resources efficiently by tracking the Total Cost of Ownership (TCO) of assets.	Overview, Asset TCO, Asset performance, and Data visualizations.
Inventory	View details of the entire asset inventory and stockrooms that enable you to perform inventory tasks.	Overview, All stockrooms, Stock rules, Transfer orders, Asset audits, Loaner asset orders, RMA orders, RMA line orders, Repair orders, Recall orders, Reclamation requests, Resale orders, and Disposal orders.
OT asset estate	View the asset functions and maintain accurate hardware and consumable records.	Overview, All assets, All enterprise, Industrial,

Name of the view	Description of the view	Tabs/lists in the view
		Hardware, Consumables, and Pallets.
OT model management	View details of different types of OT models that are being managed.	Overview, All models, All enterprise, Industrial, Hardware, Firmware, Firmware discovered, and Pallet.
Procurement	View and manage details of all ongoing procurement activities.	Overview, Requests, Request items, Purchase orders, Receiving slips, Advance shipment, and Catalog tasks.
Contract and lease management	View and manage all asset contracts.	Overview, All contracts, Lease contracts, Leased assets, Lease-end assets, Renewals, Renewal lines, My contracts, My contract tasks, My contract approvals, and Terms and conditions.
Asset operations	View asset operations related to shipment, onboarding, move orders, and calculated model lifecycle.	Shipment, Onboarding, Moves, and Calculated model lifecycle.
Work management	Create and manage maintenance plans, work orders, and work order tasks.	Overview, Calibrations, My work, Maintenance plans, Work orders, Work order tasks, Asset tasks, Work order templates, Checklist templates, My stockroom assets, and My asset pickup tasks.
OT model normalization	View information related to normalization of models.	Overview, Custom OT model types, Custom OT product models, Custom OT model libraries, Custom firmware UNSPSC, Custom firmware products, Custom firmware versions, and Custom firmware CPE

Name of the view	Description of the view	Tabs/lists in the view
		<p>Note: The Custom firmware UNSPSC, Custom firmware products, Custom firmware versions, and Custom firmware CPE tabs are available only in the OT Asset Workspace. For more information on these tabs, refer to the following topics:</p> <ul style="list-style-type: none"> • Create a custom United Nations Standard Products and Services Code (UNSPSC) classification for firmware in your operational technology (OT) assets • Create a custom firmware product for your operational technology (OT) assets • Create a custom firmware version for your operational technology (OT) assets • Create a custom Common Platform Enumeration (CPE) mapping for firmware in your operational technology (OT) assets
Admin center	Perform configuration and administrative tasks related to TCO configuration.	<p>Model and asset tabs, Model categories, Model classifications, Stockroom types, Bulk import, Roles-to-class access, Workflow assignments, Calibration configuration, TCO configuration, Risk configuration, Other configuration, Shipping, Asset knowledge base, and Normalization opt-in.</p> <p>As an OT asset manager and OT asset technician, you can only make changes to the Task rate card and Labor rate</p>

Name of the view	Description of the view	Tabs/lists in the view
		card options under the TCO Configuration list.

Hardware models and OT hardware assets in OT Asset Workspace

OT managers can create hardware models and OT hardware assets in the OT Asset Workspace. The **Hardware** tab in the OT model management and OT asset estate views lists the hardware models and OT hardware assets for all categories.

You can publish hardware models, more than once, to the enterprise catalog using the **Publish** button in the OT model management view. The **Publish** button appears only if there isn't already an active enterprise catalog item for that specific hardware model.

Note:

Only the OT asset manager (sn_otam.ot_asset_manager) and the enterprise admin (sn_eam.enterprise_admin) can publish hardware models.

Hardware models and OT hardware assets are also integrated into the following Enterprise Asset Management flows:

- [Asset request](#)
- [Asset refresh](#)
- Stock order
- [Single and multi-asset onboarding](#)
- [Return Merchandise Authorization \(RMA\)](#)
- [Repair](#)
- [Disposal](#)
- [Bulk import](#)

Note:

Starting with the Zurich release, the bulk import templates include the **OT entity** and **Parent asset attribute** columns. When the OT Asset Management application is activated, you can bulk import hardware assets and models in both the Enterprise Asset Workspace and the OT Asset Workspace only if the OT entity column is marked as **TRUE**. With the **Parent asset attribute** field, you can choose to identify the parent of a child asset using either the Asset tag, Serial number, or MAC address.

To view instructions for bulk importing assets, select the **Bulk import instructions** icon  on the contextual side bar.

- [Asset reclamation](#)

Note:

When a reclamation request for an OT hardware asset is created in the OT Asset Workspace, a hardware reclamation request line is generated and displayed in the **Hardware Asset Reclamation Lines** tab.

- [Advanced shipment notification \(ASN\)](#)

Note:

Starting with the Zurich release, the Download template for Advanced Shipment Notification includes the **OT entity** column. When this column is set to **TRUE** for hardware models, it creates OT hardware assets in the OT Asset Workspace.

- [Asset audits](#)
- [Asset Total Cost of Ownership \(TCO\)](#)

Note:

You can create a TCO report using a hardware model as a benchmark model, by selecting **Hardware** in the Report table field and then selecting the required hardware model in the **Benchmark model** field.

- [Lease contract](#)

Note:

The **Begin lease-end process** option is available if the contract includes OT hardware assets.

- [Risk](#)

Note:

The Enterprise asset risk heat map in the OT asset estate view and the Enterprise model risk heat map in the OT model management view also include hardware models with OT entity flag set to **TRUE**.

- [Asset resale](#)
- [Loaner](#)
- [Move orders](#)
- [Recall](#)
- [Stock rule](#)

Note:

The **OT stock rule** check box on the stock rule form indicates whether the stock rule was created in the OT Asset Workspace.

This check box appears for all models in both the OT Asset Workspace and Enterprise Asset Workspace only when the OT Asset Management application is activated. However, only the OT asset manager can select or deselect this check box in the OT Asset Workspace.

If you have activated the Hardware Asset Management application, the *com.sn.otam.enable_ot_stock_rule* asset property enables you to separate OT and non-OT hardware assets in stock rules and stock rule reports. If you set this property to **true** and select the **OT stock rule** check box, only OT hardware assets are included. If the **OT stock rule** check box isn't selected, only non-OT hardware will be included. By default, for existing stock rules, this property is set to **false**, and the OT stock rule is also set to **false**. This means that both OT and non-OT hardware assets are included in the stock rules and reports, regardless of the OT entity flag.

Furthermore, you can generate maintenance plans and work orders for OT hardware assets.

All OT hardware assets are automatically tagged as an OT entity. When an OT hardware asset is sourced from an existing stockroom via a transfer order or from the local stockroom, the asset is automatically tagged as an OT entity. Similarly, during the receiving process of OT hardware assets procured via a purchase order, the asset is automatically tagged as an OT entity. The **OT entity** field appears in the Hardware asset form in OT asset estate view and is selected by default for all OT hardware assets.

You can evaluate how effectively your assets are functioning and being used through the reports based on asset key performance indicators in the **Asset performance** tab of the **Asset analytics** view. The asset performance report is also available on the contextual sidebar of the asset record, displayed by selecting the **Asset availability and related KPIs** icon .

You can receive assets from any workflow directly at the stockroom using the unified receiving functionality in the OT asset Asset Workspace. You can receive assets in any of the following ways:

- Receive a single asset
- Receive multiple assets in the shipments
- Import assets in bulk and receive them

You can also manage supply and demand in your stockrooms effectively with inventory demand reports. To view the reports, follow these steps

1. Navigate to **Inventory**.
2. Select the **All stockrooms** tab.
3. Select a stockroom for which you want to view the inventory reports.
4. Select the **Inventory insights** tab.

Consumables in OT Asset Workspace

Consumables can be created in the OT Asset Workspace for hardware models, OT hardware assets, and industrial assets.

- For hardware models: Create consumables while creating a hardware model by selecting **Create consumable asset** from the **Asset tracking strategy** drop-down. Once selected, all OT hardware assets for the given hardware model will be consumables. After a consumable is created, the following related lists appear in the hardware model form: Compatibles, Substitutes, Consumables, Vendor catalog items, Consumable model lifecycle, Skills, Knowledge, Application.
- For OT hardware assets: Create consumables from the Consumables tab in the OT asset estate view by selecting **Hardware asset** in the **Type** drop-down.
- For industrial assets: Create consumables from the Consumables tab in the OT asset estate view by selecting **Industrial asset** in the **Type** drop-down.

Any consumable model that you create in the in the OT Asset Workspace, has the consumable model category.

Asset and Configuration Item (CI) synchronization for Operational Technology (OT) assets

Maintain synchronization between asset and CI for OT assets through MAC address on the asset and the Network Adapter CI.

Synchronization between asset and CI is achieved using the **Serial number** field. However, an OT asset need not necessarily have a serial number, but it's associated with a MAC address. Therefore, the asset-CI synchronization for OT assets includes the **MAC address** (mac_addr) field in the Asset [alm_asset] table in addition to the serial number.

A CI can have multiple MAC addresses. The Network Adapter [cmdb_ci_network_adapter] table stores all the MAC addresses and also has a reference field to the CI [cmdb_ci] table. Therefore, the relationship between MAC address and CI is maintained.

Synchronization from asset to CI

When an asset is created with a MAC address, synchronization happens as follows:

1. A CI is created.
2. A record for the corresponding MAC address is created in the Network Adapter [cmdb_ci_network_adapter] table with a reference to the CI.

When the MAC address of an asset is updated, the existing record in the Network Adapter [cmdb_ci_network_adapter] table isn't updated. Instead, a new record is created in the Network Adapter [cmdb_ci_network_adapter] table.

Synchronization from CI to asset

When a CI is created with a MAC address, synchronization happens as follows:

1. An asset is created.
2. The MAC address of the CI is copied to the asset.

If there's an existing CI, then the associated asset is updated with the MAC address only if the asset doesn't have it already.

Rules for generating CI names

A CI name follows a format that's based on the following conditions:

Conditions and CI name

Condition	CI name format
Asset has a Serial number	Concatenation of Serial number and Model name separated by hyphen. For example, SN123 - DemoModel.
Asset has a Serial number and a MAC address	Concatenation of Serial number and Model name separated by hyphen. For example, SN123 - DemoModel.
Asset has no Serial number but has a MAC address	Concatenation of MAC address and Model name separated by hyphen. For example, 88-22-33-66-888-AB - DemoModel.
Asset has no Serial number and MAC address	Model name

Whenever there are updates to **Serial number** or **MAC address** fields, the CI name is synchronized only under the following conditions:

- CI name isn't updated manually.
- The Discovery source is *SNassetmanagement*, which means that the CI is created from an asset.
- CI name hasn't been modified by CMDB.

Note:

The `sn_itam_common.mac_address_sync` system property enables you to synchronize MAC address from the CI (Network Adapter [cmdb_ci_network_adapter] table) to the Asset [alm_asset] table. By default, this system property is set to **false**. To enable synchronization of MAC address, set the value of this system property to **true** by navigating to **Enterprise Asset Workspace > Admin center > Other configuration**. After this property is set to true, a scheduled job will run daily to synchronize the MAC addresses for all enterprise assets.

OT entity synchronization between asset and CI

The CI [cmdb_ci] table has the **OT entity** [cmdb_ot_entity] field. Also, the Asset [alm_asset] has a corresponding **OT entity** [ot_entity] field. Synchronization of the OT entity happens as follows:

- When a CI is created with the OT entity reference set on the CI, the **OT entity** [ot_entity] field in the Asset [alm_asset] table is set to **true**.
- When an asset with the OT entity set to **true** is created, a corresponding CI and an OT entity are created on the CMDB side. The OT entity reference is then set on the CI.

Important:

After a CI is marked as an OT entity, it can't be reverted to a non-OT entity.

Enterprise Asset Management for Healthcare

The Enterprise Asset Management for Healthcare application is a licensable application that on activation enables you to manage healthcare-specific models, assets, and workflows.

The Enterprise Asset Management for Healthcare (com.sn_eamhc) application is available on the ServiceNow Store. When you install this application on your ServiceNow instance, the Enterprise Asset Management application also gets installed. For more information, see [Installed with Enterprise Asset Management for Healthcare](#).

This application provides functionalities, features, and workflows of Enterprise Asset Management that support healthcare-related roles and asset models.

[Exploring Enterprise Asset Management](#)

Configurable workspaces for medical and facilities industries

Use configurable workspaces for creating and managing medical and facility assets and models.

Overview of configurable workspaces for medical and facilities industries

Configurable workspaces are available for the following applications to work specifically on medical and facilities industries:

- Enterprise Asset Management for Healthcare
- Enterprise Asset Management for Facilities

Configurable workspaces give you a personalized experience as you get to work on assets and models pertaining to your industry. The following table mentions the applications, their corresponding workspaces, and benefits of using each workspace.

Application	Configurable workspace	Benefits
Enterprise Asset Management for Healthcare	Medical Asset Workspace	Create and manage medical assets and models.
Enterprise Asset Management for Facilities	Facility Asset Workspace	Create and manage facilities assets and models.

Note:

The normalization process only runs in the Enterprise Asset Workspace and doesn't run for medical models and facility models within their specific workspaces.

If you're logged in as a medical asset manager or a medical asset technician, by default you only get to see the medical asset category in the **Medical asset estate** view and the medical model category in the **Medical model management** view. Similarly if you're logged in as a facility asset manager or a facility asset technician, you only get to see the facility asset category in the **Facility asset estate** view and the facility model category in the **Facility model management** view.

If you're logged in to a specific workspace, you may see other assets and model categories that aren't specific to your industry and have been added by the Enterprise admin or the system administrator role. As an example, if you're logged in as a medical asset manager or a medical asset technician, you may see other assets and model categories such as construction, transportation, or facilities. However, you can't create or modify anything in these categories as these are read only.

You can evaluate how effectively your assets are functioning and being used through the reports based on asset key performance indicators in the **Asset performance** tab of the **Asset analytics** view. The asset performance report is also available on the contextual sidebar of the asset record, displayed by selecting the **Asset availability and related KPIs** icon [].

You can receive assets from any workflow directly at the stockroom using the unified receiving functionality in the Medical Asset Workspace and Facility Asset Workspace. You can receive assets in any of the following ways:

- Receive a single asset
- Receive multiple assets in the shipments
- Import assets in bulk and receive them

You can also manage supply and demand in your stockrooms effectively with inventory demand reports. To view the reports, follow these steps

1. Navigate to the **Inventory** view.
2. Select the **All stockrooms** tab.
3. Select a stockroom for which you want to view the inventory reports.
4. Select the **Inventory insights** tab.

Workspace roles

The workspace that you can access depends on the role with which you log in to your ServiceNow instance. You can only view the workspace for which you have access.

Roles needed for accessing workspaces

Workspace	Role needed
Medical Asset Workspace	<ul style="list-style-type: none"> • Medical asset manager (sn_eamhc.medical_asset_manager) • Medical asset technician (sn_eamhc.medical_asset_technician) • Enterprise admin [sn_eam.enterprise_admin] • System administrator [sys_admin]
Facility Asset Workspace	<ul style="list-style-type: none"> • Facility asset manager (sn_eamhc.facility_asset_manager) • Facility asset technician (sn_eamhc.facility_asset_technician) • Enterprise admin (sn_eam.enterprise_admin) • System administrator (sys_admin)
Medical Asset Workspace and Facility Asset Workspace	<ul style="list-style-type: none"> • Medical asset manager (sn_eamhc.medical_asset_manager) and facility asset manager (sn_eamhc.facility_asset_manager) • Medical asset technician (sn_eamhc.medical_asset_technician) and facility asset technician (sn_eamhc.facility_asset_technician) • Enterprise admin (sn_eam.enterprise_admin) • System administrator (sys_admin)
Medical Asset Workspace, Facility Asset Workspace, and Enterprise Asset Workspace	<ul style="list-style-type: none"> • Enterprise admin (sn_eam.enterprise_admin) • System administrator (sys_admin)

Accessing the Admin center

Only the Enterprise admin role and the system administrator role can make configuration changes in the Admin center of the Medical Asset Workspace and the Facility Asset Workspace.

The Medical asset manager, Medical asset technician, Facility asset manager, or Facility asset technician can't make any changes in the Admin center except for the Task rate card and the Labor rate card options under the **TCO configuration** list.

Roles to class mapping for configurable workspaces

In configurable workspaces, roles can access classes in addition to the default seeded classes for each specific role.

New roles are assigned to each configurable workspace. New roles are based on the following applications and their designated workspace.

Application	Designated workspace	Roles
Enterprise Asset Management for Healthcare	Medical Asset Workspace	<ul style="list-style-type: none"> • sn_eamhc.medical_asset_manager • sn_eamhc.medical_asset_technician
Enterprise Asset Management for Facilities	Facility Asset Workspace	<ul style="list-style-type: none"> • sn_eamfam.facility_asset_manager • sn_eamfam.facility_asset_technician
Operational Technology (OT) Asset Management	OT Asset Workspace	<ul style="list-style-type: none"> • sn_otam.ot_asset_manage • sn_otam.ot_asset_technician

A default configuration of classes is seeded for each role that maps to its corresponding model category.

The following mapping is a default configuration that is seeded for the Medical, the Facilities, and the OT technician roles.

Note:

The manager roles include the respective technician roles for Enterprise Asset Management for Healthcare, Enterprise Asset Management for Facilities, and Operational Technology (OT) Asset Management applications.

Roles to classes access

Enterprise roles	Seeded model categories	Seeded enterprise classes for roles
Medical technician sn_eamhc.medical_asset_technician	Medical	sn_ent_medical_model sn_ent_medical_device_model sn_ent_medical_asset
Facility technician sn_eamfam.facility_asset_technician	Facilities	sn_ent_facility_model sn_ent_facility_asset
OT technician sn_otam.ot_asset_technician	Industrial, Hardware	sn_ent_industrial_asset sn_ent_industrial_model, alm_hardware

Roles to classes access (continued)

Enterprise roles	Seeded model categories	Seeded enterprise classes for roles
		cmdb_hardware_product_model sn_ent_firmware_model sn_ent_discov_firmware_model

The Roles to classes access table shows the various classes that each role has access to by default. For example, the facility technician role has access to the facility classes: sn_ent_facility_model and sn_ent_facility_asset. When a facility technician logs in to the Facility Asset Workspace, they will automatically get access to only the models and assets related to the Facilities model category.

Based on the mapping, roles get access to the respective asset and model classes. The roles further get access to the workflow tasks and work orders related to those classes. Additionally, you can view information only pertaining to your classes on all dashboards in the workspace. For example, a medical asset manager role can initiate disposal orders only for medical assets because of access configuration. Similarly, a facilities technician role can only work on disposal tasks created for facility assets.

The Enterprise admin (sn_eam.enterprise_admin) role can modify the default configuration to add more classes to a role. So, the roles for the Medical Asset Workspace, the Facilities Asset Workspace, and the OT Workspace can be configured to access additional classes from different model categories. For example, the Medical technician role can get access to the Facilities classes. Similarly, the Facilities technician role can get access to the Transportation classes. For more details on adding additional classes to a role, see [Map enterprise roles to enterprise classes](#).

Note:

A soft filter exists in configurable workspaces that shows information relevant to a particular workspace. You can remove that filter to display assets and models for all classes but only read access is available for the other classes.

Mobile Agent application for Enterprise Asset Management

You can use the ServiceNow® Mobile Agent application to create, update, and view your enterprise assets. You can also use the application to scan enterprise assets for inventory audits and to complete verifications and departures for asset disposals.

The ServiceNow Mobile Agent application is supported on both iOS and Android devices. You can download the application from the [Apple App Store](#) or [Google Play Store](#).

See [Mobile Agent app](#) for more information on the Mobile Agent application.

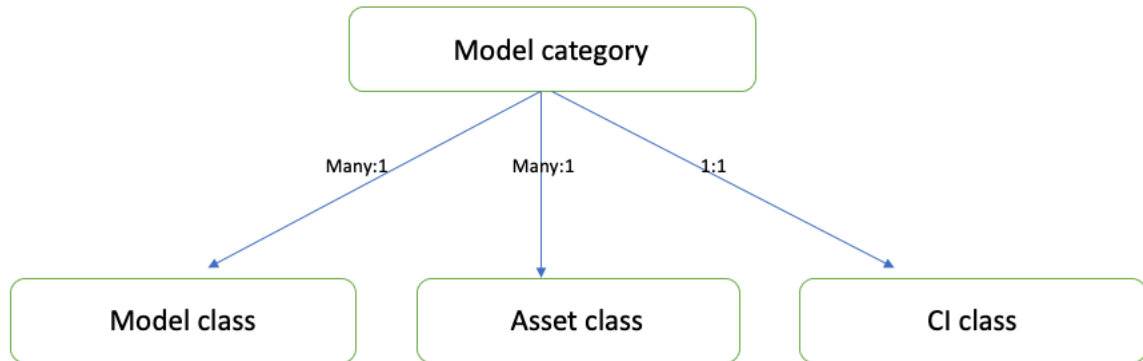

Related topics

[Managing enterprise assets and tasks using the Mobile Agent application](#)

Model categories

Model categories define relationships between asset classes, product model classes, and Configuration Management Database (CMDB) configuration item (CI) classes in the Enterprise Asset Management application.

Each model category is divided into sub-categories that correspond to a model class, an asset class, and an existing CMDB CI class. Multiple model categories can be assigned to a single model class and a single asset class. A CI class can be assigned to only a single model category. However, it is not mandatory to assign a CI class to a model category.

Various base model categories are available for you to choose from. The top tier model categories are as follows:

- Medical
- Facility
- Transportation
- Industrial
- Retail
- Construction
- Tactical equipment
- Wearable

For the complete list of available model categories and their corresponding CMDB CI, asset, and model classes, see [Enterprise model categories and corresponding classes](#).

Note:

If you do not wish to use any of the existing sub-categories within a top tier model category, you can create your own sub-categories. See [Create model categories](#) for detailed instructions.

Warning:

ServiceNow strongly recommends that you use only the existing top tier model categories.

Multi-component models and assets in Enterprise Asset Management

Multi-component models and multi-components assets help you track the maintenance of your enterprise assets.

Multi-component model

An Enterprise Asset Management model associated with one or more model components is defined as a multi-component model.

A model component can be a consumable or an enterprise model. The same model can be listed more than once as a model component of a multi-component model. For example, consumable model component A can be repeated thrice for the multi-component model.

Every model component has the following three relationships with a multi-component model each with a true or false value:

- **Required:** If the value is true, then the model component is essential for the multi-component model to work and can't be permanently removed.
- **Hot Swappable:** If the value is true, then the model component can be swapped while the multi-component model is operational
- **Repairable:** If the value is true, then the model component can be repaired.

A model component's relationship to a multi-component model is mutually exclusive. For example if a multi-component model comprises of two model component A's, each model component A can have its own relationship with the multi-component model.

There are two types of multi-component models: Pre-assembled and user-assembled models.

You can change a pre-assembled or a user-assembled multi-component model to a simple model by disassociating all its model components, while the model is still in the **Build** state. Once you save the model record, the multi-component model is changed to a simple model and all associations to model components are removed.

Multi-component asset

Multi-component assets are created from a multi-component model.

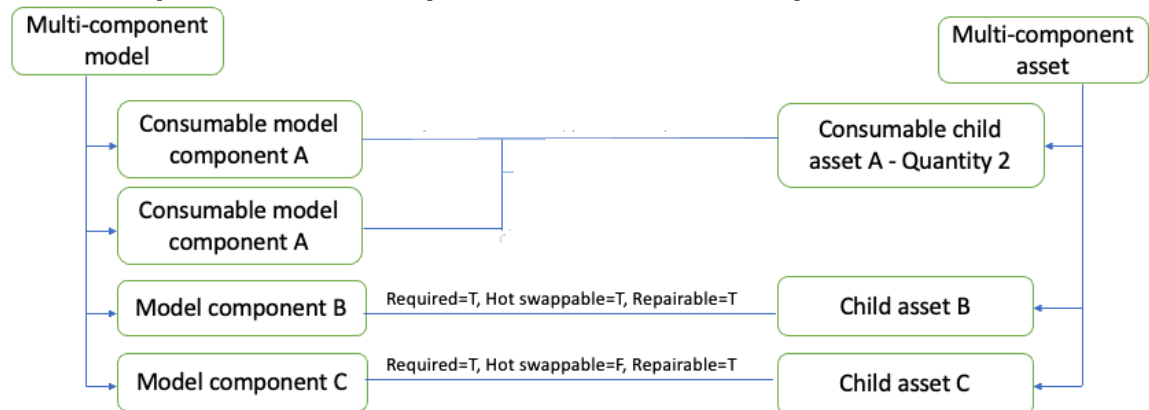

If a consumable model component is listed more than once in a multi-component model, they are merged into a single record regardless of whether the **Required**, **Hot Swappable**, or **Repairable** fields are the same or not.

There are two kinds of assets: consumable assets and serialized assets.

For enterprise model components, serialized child assets are created that are based on the model component. For example, Child Asset B is the child asset created for Model Component B.

The model component relationship defined with the multi-component model is extended and visible in the child asset records. Swapping of child assets can only be performed with the same model component. A child asset can't be swapped with a different model component.

Relationship between multi-component model and multi-component asset

Pre-assembled and user-assembled assets

Assets associated with pre-assembled and user-assembled multi-component models are referred to as pre-assembled and user-assembled multi-components assets, respectively.

- **Pre-assembled asset:** when the parent asset is created, the child assets are automatically created. Child assets are created in the same stockroom where the parent asset is created. The child assets inherit the parent asset's properties such as stockroom, state, sub status. No asset tag or serial tag is attached to the child asset when it's created. You can add additional child assets, add-ons, even if it's not defined in the model component. When an add-on asset is added, the **Asset type** field displays the value **Pre-assembled with add-on**.
- **User-assembled asset:** assemble assets using assets present in the parent asset stockroom.
 - Assemble the assets yourself by using the **Assemble** button in the asset record. For details, see [Select assets for user-assembled asset](#).
 - Automatically assemble assets via the **Auto-assemble** button to trigger a process to automatically select assets from a stockroom and associate the assets to a parent asset. If the required quantity of assets isn't available in the stockroom, an error appears and you can't automatically assemble assets. Use the **Assemble** button to assemble the assets on your own.
 - Release all child and add-on assets from the parent asset. For details on releasing assets, see [Release assets from the parent asset](#).

You can swap child assets for any multi-component asset that is in one of the following states:

- In-Use
- In-Maintenance
- In Stock Defective
- In Stock Pending Repair

Note:

For more details on swapping assets, see [Swap assets for parent multi-component asset](#).

Multiple model components for an enterprise model

You can add multiple model components to an enterprise model at one go by specifying the quantity. The **Quantity** field in the Add model components dialog lets you create multiple serialized components and consumable components for a single enterprise model.

- For serialized components: each row in the Add model components dialog box is split into multiple model components based on the quantity. For example, if the Quantity field has a value of 10 for a row, then 10 model component records are created.
- For consumable components: one model component is created per row. For example, if the quantity field has a value of 10 for a row, then only one model component record is created with the quantity as 10.

For consumable child models, one child asset is created per component, with a quantity equal to the quantity of the component. For serialized child models, assets are created per component.

When you create assets, the consumable assets do not merge. Consumable assets are individual assets with a quantity. For example, model component A record has a quantity value of two and the model component B record has a quantity value of three. So two assets are created. One asset record with quantity two and the other asset record one with quantity three.

The add on assets of consumables are however merged as they are not linked to a model component. For example, model A has two components of consumable model C. When you create a complex asset from that model, two child assets get created of that same model C.

Component number usage for consumable components

Since consumables don't have an asset tag or serial numbers, the **Component number** field in the model component form helps you to identify and keep track of child consumables. While creating a consumable component record, ensure to enter a value in the **Component number** field.

For consumable components, the component number gets propagated to the display name of the child asset as a prefix.

Component number usage for serialized components

For serialized components, it's optional to enter a component number. You can specify a component number if the value you enter in the **Quantity** field is 1. If you enter a value of more than one in the **Quantity** field, then the **Component number** field is disabled. However, the component numbers are automatically generated by the system. You can go to the model component form and change the component number if you want.

For serialized components, if an asset tag isn't mentioned, then the component number is propagated as the asset tag. If you later decide to add an asset tag, the component number gets overridden by the asset tag.

Bulk import of your enterprise models and assets

Use a subflow to import enterprise models and assets of multiple types to your ServiceNow instance at one go. You can also perform a bulk update on existing models and assets.

Overview of Bulk import

Use the Enterprise Asset workspace to do a bulk transfer of all your enterprise models and asset from a different database to the ServiceNow instance.

Create an import record by downloading a template in the form of a spreadsheet (.xlsx). Ensure that you enter valid values in all the mandatory fields before uploading the template. Attach the template to the import record and select **Import** to begin the import process.

After you select **Import**, the EAM Bulk Import subflow gets triggered. Scheduled jobs are initiated and data in the spreadsheet is copied to the appropriate staging tables. The staging tables are validated and records are created in the ServiceNow instance.

Modes

Modes refer to the type of import that you want to process. There are modes for only importing models, assets, and a combined mode for both models and assets. You can choose from the following available modes:

- Create models
- Update models
- Create assets
- Update assets
- Create models and assets
- Update models and assets

Templates

Based on the mode you select in the import record, you can download the corresponding template.

Note:

Ensure that you enter valid values in all the mandatory fields for the import process to run effectively. For a list of all the mandatory fields, see [Mandatory fields in the bulk import spreadsheets](#).

Modes and templates

Modes	Corresponding template
<ul style="list-style-type: none"> • Create models • Update models 	Model template
<ul style="list-style-type: none"> • Create assets • Update assets 	Asset template
<ul style="list-style-type: none"> • Create models and assets • Update models and assets 	Model and asset template

Note:

From the Yokohama release onward, the **MAC address** field is available in the Download template of the following Bulk import modes:

- Create assets
- Update assets
- Create models and assets

After a successful import, the MAC address that you provided in the template is added to the **MAC address** [mac_addr] field in the Asset [alm_asset] table.

You can customize the templates to add more columns. Make the following modifications to add more columns:

1. Add the new columns to the staging tables.
2. Modify the list view on the Database view table [sn_eam_import_template] to include the columns you want to display in the spreadsheet. Enter the string `sn_eam_import_template.list` in the filter field on your instance's navigation bar.
3. Add field mappings in the Model or Asset transform map.

Scheduled jobs

The following scheduled jobs execute as part of the EAM Bulk Import subflow.

The scheduled jobs execute based on the mode that you select.

The EAM Bulk Import - Upload File job is executed for all modes. For the Create Model or Update Model modes, the EAM Bulk Import - Transform Asset doesn't execute. Similarly, for the Create asset or Update asset modes, the EAM Bulk Import - Transform Model doesn't execute.

For example, if you select the Create models and assets mode, the scheduled job, *EAM Bulk Import - Upload file* uploads the data from the spreadsheet to the three staging tables. Then the Scheduled job, *EAM Bulk Import - Transform Model* executes the model and model component transform maps. After the model transform maps are complete, the *EAM Bulk Import - Transform Asset* scheduled job executes the asset transform map.

Staging tables

The data that you enter in the spreadsheet is copied to one or more of the following staging tables:

- Model Import Staging [sn_eam_model_import_row]
- Model Component Import Staging [sn_eam_mc_import_row]
- Asset Import Staging [sn_eam_asset_import_row]

Enterprise Asset Management normalization

The Enterprise Asset Management normalization process enables you to normalize your manufacturer, model name, model number, and model type data of your enterprise models.

Normalization overview

The normalization process compares the discovered manufacturer, discovered model, discovered model type, and the discovered model number values against the ServiceNow repository of normalized equivalents in the Enterprise Asset Management Content Service.

To standardize your enterprise models, the data must be normalized. You can manually update the model records with the normalization content, or you can compare your data against the Enterprise Asset Management Content Service.

Scheduled jobs for Normalization

The following are the scheduled jobs that run during the normalization process.

Scheduled job	Description
EAM - Daily Job	<p>Sets the time when data is pulled by the Enterprise Asset Management Content Service. This job runs only once, when the normalization process is started for the first time.</p> <p>If a model has gone beyond its end of its lifecycle date, this job enables the Content lifecycle phase check box in the Enterprise Model Lifecycle tab in a model record.</p>
EAM - Content Upload	<p>A daily job that uploads any content to the Enterprise Asset Management Content Service that you have added in the following custom tables:</p> <ul style="list-style-type: none"> • Custom Enterprise Model Type [sn_eam_cd_custom_model_type] • Custom Enterprise Manufacturer [sn_eam_cd_custom_manufacturer] • Custom Enterprise Product Model [sn_eam_cd_custom_product_model] • Custom Enterprise Model Library [sn_eam_cd_custom_model_library] <p>Note: This job only runs if you have opted in to the Enterprise Asset Management Content Service.</p>
EAM - Enterprise Lifecycles	Updates the model record with information about newly created or deleted life cycles.
EAM - Normalization	Normalizes all the models that haven't been normalized.
EAM - Apply latest content changes	Updates any changes in the content tables to the Enterprise Asset Management Content Service.

Tables installed with Enterprise Asset Management normalization

Several normalization tables are installed with the activation of the Enterprise Asset Management application.

Tables installed

Table	Description
Custom Enterprise Model Type [sn_eam_cd_custom_model_type]	Stores custom enterprise model type records.

Tables installed (continued)

Table	Description
Custom Enterprise Manufacturer [sn_eam_cd_custom_manufacturer]	Stores custom enterprise manufacturer records.
Custom Enterprise Product Model [sn_eam_cd_custom_product_model]	Stores custom enterprise product model records.
Custom Enterprise Model Library [sn_eam_cd_custom_model_library]	Stores enterprise model library records.
Enterprise Model Type [sn_eam_cd_model_type]	Stores enterprise model type records.
Enterprise Manufacturer [sn_eam_cd_manufacturer]	Stores enterprise model manufacturer records.
Enterprise Product Model [sn_eam_cd_product_model]	Stores enterprise product model records.
Enterprise Model Library [sn_eam_cd_model_library]	Stores enterprise model library records.
Enterprise Lifecycle Definition [sn_eam_cd_lifecycle_definition]	Stores lifecycle phase of an enterprise model and associated dates.
EAM Content Audit [sn_eam_content_audit]	Stores the content values that changed.
Manage Enterprise Library [sn_eam_manage_cd_library]	Stores import and export content data.
Enterprise Asset Configurations [sn_eam_configuration]	Stores opt-in and opt-out data.

Risk scoring

Calculate a risk score for an enterprise model record based on two vectors: likelihood and impact.

Assets associated to a model inherit the risk score values of the model. However, you can override the model risk scores by defining risk scores for the assets that are different from the risk score values specified on the model.

Access the Risk modules for the Enterprise Asset Management application by navigating to **Asset > Enterprise Risk Configuration**. Use the following modules to enter configuration values for likelihood, impact, and score.

- **Risk Likelihood**
- **Risk Impact**
- **Risk Score**

Note:

For details on configuring values for likelihood, impact, and score, see [Create configuration values for risk likelihood](#), [Create configuration values for risk impact](#), or [Create configuration values for risk scores](#).

After you’ve configured the values in the Risk modules and frozen them, the heat maps are rendered on the following views on the Enterprise Asset Workspace:

- Enterprise asset estate view: heat map for asset scores
- Enterprise model management view: heat map for model risk scores.

If a model is no longer in the **Build** stage and you update the Model's risk scores, you can propagate the updated values to the associated assets using the **Update risk** button on the model form. On clicking this button, the *EAM - Update model risk values to asset* scheduled job runs and updates the risk values for all the assets associated with this model.

Note:

If the model is in the **Build** stage, the **Update risk** button doesn't appear.

Zebra MotionWorks RFID integration for Enterprise Asset Management

You can integrate your ServiceNow instance with third-party Zebra MotionWorks location solutions to import and view real-time radio-frequency identification (RFID) location data for your enterprise assets.

RFID is an asset tracking technology that uses radio frequencies to transfer location and identification data for your assets. This data is stored and transferred through RFID tags, which are small devices that are either attached to or embedded in each asset. Each RFID tag consists of the following components:

- An antenna that receives and transmits radio frequencies so that you can transfer location and identification data for the associated asset. The antenna receives and transmits these radio frequencies each time you scan the RFID tag.
- A unique microchip or integrated circuit (IC) that stores location and identification data for the associated asset.
- A substrate that holds the other two components together.

Zebra MotionWorks location solutions use RFID technology to track the real-time locations of your assets and inventory automatically. When you integrate your ServiceNow instance with Zebra MotionWorks location solutions, this RFID location data is imported into your instance so that you can identify and track your enterprise assets. Any data changes that Zebra MotionWorks location solutions detect are automatically updated on your ServiceNow instance.

For more information on Zebra MotionWorks, refer to the [Zebra MotionWorks Location Solutions website](#).

Importing RFID location data from Zebra MotionWorks location solutions

When you import RFID location data from Zebra MotionWorks location solutions, the data is added to the RFID Stage Asset [sn_itam_common_rfid_stg_asset] table based on the enterprise assets that it is associated with. The Enterprise Asset Management application automatically creates a separate table entry for each enterprise asset that you import this RFID location data for.

After the RFID location data is added to the RFID Stage Asset [sn_itam_common_rfid_stg_asset] table, the Enterprise Asset Management application uses the RFID Resource Data transform map to process and then map this data to the RFID Asset [sn_itam_common_rfid_asset] table. However, RFID location data can be mapped to the RFID Asset [sn_itam_common_rfid_asset] table only for enterprise assets that contain serial numbers.

On successful mapping, you can run the *RFID Asset Mapping Job* scheduled job daily or on-demand to then map the resulting data from the RFID Asset [sn_itam_common_rfid_asset]

table to the Asset [alm_asset] table. However, this data mapping is dependent on the existence of corresponding asset records within the Asset [alm_asset] table.

- If a corresponding asset record already exists for an enterprise asset that you want to map data for, it automatically updates each time the RFID location data for that enterprise asset changes. In addition, the **Status** of the enterprise asset changes from **New** to **Matched** in the RFID Asset [sn_itam_common_rfid_asset] table.
- If a corresponding asset record does not already exist, data for that enterprise asset cannot be mapped from the RFID Asset [sn_itam_common_rfid_asset] table to the Asset [alm_asset] table. The **Status** of the enterprise asset changes from **New** to **Unmatched** in the RFID Asset [sn_itam_common_rfid_asset] table.

You can view and take action on these unmatched enterprise assets by using the **Unmatched RFID tags** important action that appears on the **Overview** tab of the Enterprise asset estate view. For more information on the Enterprise asset estate view, see [Enterprise asset estate overview for Enterprise Asset Workspace](#).

You can view your asset records in the [Enterprise asset estate view](#) of the Enterprise Asset Workspace. For details on the RFID fields that are included in each asset record, see [Asset fields for enterprise assets](#).

Note:

If you are importing RFID location data for parent enterprise assets with one or more child enterprise assets, RFID location data for those child enterprise assets is based on the RFID tags that they are associated with.

- If a child enterprise asset contains an RFID tag, RFID location data for that asset is based on that RFID tag.
- If a child enterprise asset does not contain an RFID tag, RFID location data for that asset is based on the RFID tag of the parent enterprise asset. If you remove the parent enterprise asset, all RFID location data is cleared for the child enterprise asset.

Enterprise asset reclamation

Use a reclamation workflow to coordinate an employee's offboarding process that lets you request, assess, and reclaim enterprise assets.

When an employee leaves an organization or moves to a different role, retrieving the assets assigned to the employee needs extensive coordination between the Human Resources department and the enterprise asset managers. You can create an offboarding service catalog request, which initiates a prescriptive workflow to efficiently retrieve assets and restock them in the inventory, reassign them, send them for repair, or dispose as required.

You can create an asset reclamation request via the Service Catalog application. After the request is created, reclamation line items are created that comprise a series of tasks. These tasks can only be accessed and performed by the sam_user role. After all the tasks are closed, the reclamation line item is complete. After all the reclamation line items are complete, the catalog request is also completed.

Note:

To use the Service Catalog application to reclaim enterprise assets, you must install the Enterprise Asset Management application.

When you [create a reclaim asset](#) request via the Service Catalog application, an asset reclamation request is created. For each enterprise asset assigned to the departing employee, an enterprise asset reclamation line is created for the assets you select in the Reclaim Asset

Service Catalog. Each enterprise asset reclamation line is closed through the following Enterprise Asset Reclamation Tasks:

- Schedule drop off, Schedule pickup, or Schedule shipment task based on which reclamation method you select in the Reclaim Asset form
- Receive asset
- Evaluate

The Enterprise Asset Reclamation Line also has a stage field, which changes when you [close a Enterprise Asset Reclamation Task](#) as follows:

- Pending
- Pending evaluation
- Complete

Asset conditions in Enterprise Asset Management

Assessing the condition of assets in your organization aids in effective maintenance planning, resource allocation, and managing the asset life cycle.

Overview of asset conditions

You need to evaluate assets based on specific conditions to ensure reliability. Asset health helps your organization in various ways:

- Maximizes asset life.
- Reduces unplanned downtime.
- Improves operational effectiveness and safety.
- Helps to comply with regulations and industry standards.

Roles for asset conditions

The following are the two new roles added for the asset conditions feature:

- Asset technician (sn_smart_asmt.actor) role added to the Enterprise technician (sn_eam.asset_technician) role
- Asset manager (sn_smart_asmt.template_manager) role added to the Enterprise asset manager (sn_eam.asset_manager) role

Asset condition workflow

The asset condition workflow comprises of the following stages:

Create condition templates

Create condition templates and associate condition attributes that you have defined to a condition template. Create questions and enable scoring in the templates to indicate whether the condition attributes for a model or asset passed or failed. For more details, see [Create condition templates for condition attributes](#).

Define condition attributes

Enterprise asset managers define condition attributes for evaluating models and assets. For more details, see [Define condition attributes on enterprise models and assets](#).

Schedule condition evaluations

The Enterprise asset manager schedules evaluations via maintenance plans or work orders. For more details, see [Schedule condition evaluations for enterprise models or assets](#).

Perform condition evaluations

The technician performs the evaluation via the web interface or through the mobile application. Once the evaluation is complete, a score and a result are calculated. The Enterprise asset manager either accepts or rejects the evaluation. For more details, see [Perform condition evaluation from the Enterprise Asset Workspace](#) and [Perform condition evaluation from the Mobile Agent application](#).

View the evaluation reports

The Enterprise asset manager views the report for the evaluation. For more details, see [Review the asset condition results](#).

Plugin dependencies for asset conditions

The following are the plugin dependencies that are required to use asset conditions:

Plugin Name	Plugin ID
app-smart-assessment-core	com.sn_smart_asmt
sn-smart-assessment-connected	com.sn_smart_assessment_connected
sn-smart-assessment-designer	com.sn_smart_assessment_designer
app-smart-assessment-scoring	com.sn_smart_scoring
app-smart-assessment-mobile	com.snc.smart_assessment_mobile
mobile scripted screen	com.glide.sg.scriptedscreen

Domain separation supported

The asset conditions feature supports domain separation.

Asset groups in Enterprise Asset Management

Asset groups in Enterprise Asset Management provide organizations with a systematic approach to asset structuring for complex asset ecosystems thereby improving data integrity and providing actionable insights.

Overview of asset groups in Enterprise Asset Management

An asset group is a logical grouping of assets.

Asset groups can be used in the Enterprise Asset Workspace, Facility Asset Workspace, Medical Asset Workspace, and the Operational Technology (OT) Asset Workspace.

An asset group can have multiple subgroups; however a subgroup can be a part of only one asset group. Asset groups and subgroups can have assets and an asset can belong to multiple groups.

Asset groups are listed in the Asset groups subtab, located within the Asset groups tab in the Enterprise asset estate view. The asset groups and the descendant asset groups are displayed in a content tree. For details on creating asset groups and subgroups, see [Create an asset group in Enterprise Asset Management](#) and [Create an asset subgroup in Enterprise Asset Management](#).

Enterprise Asset Management administrators can configure the **Asset groups** tab to show or hide in the Enterprise Asset Workspace, Facility Asset Workspace, Medical Asset Workspace, and the OT Asset Workspace. For more details, see [Configure tabs in the Enterprise Asset Workspace](#).

An asset group or subgroup can optionally refer to a service instance that helps in pulling in all related assets from a chosen node in that hierarchy. Alternatively, a subgroup can be defined without referencing the subgroup to a service instance, allowing users to manually select assets. For details on adding assets to asset groups, see [Add assets to an asset group or subgroup](#).

A subgroup inherits some fields from its parent group. For details on the fields that get inherited, see [Fields inherited from a parent asset group to a sub group](#).

Sites in asset groups

A site is an ISA-95 hierarchical entity model. Sites are entity records in the Equipment Model Entity [cmdb_ci_ot_isa_entity] table, organized in a hierarchical structure with site being the top-level entity, followed by area, work center, and work unit. Each level of the ISA-95 entity model can be associated with CIs.

You can associate an asset group to a site. Associating an asset group to a site enables all CIs associated with that specific site to be also associated with the asset group.

Note:

Only assets from the associated site and its specific location can be added to the asset group. You don't have access to add assets from outside the associated site and location.

If an asset group references a service instance, and that service instance is an entity record in the Equipment Model Entity [cmdb_ci_ot_isa_entity] table, the **Site** field in the asset group record is automatically populated.

If an asset group doesn't refer to a service instance, or it's referring to a service instance that doesn't have entity records in the cmdb_ci_ot_isa_entity table, then a site for that asset group doesn't exist and that asset group gets listed under the Unassigned site group in the Asset groups subtab.

All sites for asset groups are listed in the Sites subtab, located within the Asset groups tab in the Enterprise asset estate view. For details on creating sites, see [Create sites in the Enterprise Asset Management](#).

Considerations for asset groups

The following are some considerations to keep in mind for asset groups:

- An asset group can't contain itself as a sub group.
- An asset group can't have a model or model category as it's a separate entity.
- An asset group can have a service instance link only if its parent group has one or if it has no parent.
- An asset group can't be deleted if it contains subgroups and assets. To delete an asset group, the sn_eam.enterprise_asset_manager or the sn_eam.enterprise_admin role must first remove the subgroups and assets within the asset group.

Considerations for adding assets to asset groups

The sn_eam.enterprise_admin role and the sn_eam.enterprise_asset_manager role can create asset groups and add assets to asset groups.

The **Service instance** field on the asset form refers to the Application Service [cmdb_ci_service_auto] table and to its following descendant tables:

- Mapped Application Service [cmdb_ci_service_discovered] table
- Calculated Application Service [cmdb_ci_service_calculated] table
- Equipment Model Entity [cmdb_ci_ot_isa_entity] table

Keep the following considerations in mind while adding assets to asset groups:

- If the asset group isn't referring to a service instance, the cmdb_ci_service_auto table, or any of its descendent tables, you can add any asset that is not included in any asset group.
- If the asset group is referring to a service instance, the cmdb_ci_service_auto table, or any of its descendent tables, you can add assets whose asset CI has a CI relationship to the service instance, the cmdb_ci_service_auto table, or any of its descendent tables, referenced by the asset group.
- You can only add assets without a parent. The child assets won't be added automatically to the asset group. Any assets that have as their parent the asset that was just added to the asset group won't be added automatically. For example, you add a pre-assembled asset that has no parent. The child assets of that pre-assembled asset won't also be added.
- Assets that are from the same location as the asset group's location or a descendent of the asset group's location.
- Only hardware and enterprise assets can be added.
- Consumable asset, linear assets, linear segments, and pallets can't be added.
- If a subgroup isn't referring to a service instance, the cmdb_ci_service_auto table, or any of its descendent tables, but an ancestor asset group is referring to a service instance, the cmdb_ci_service_auto table, or any of its descendent tables, you can only add assets whose asset CI has a CI relationship to a service instance, the cmdb_ci_service_auto table, referenced by the ancestor asset group.
- Asset should only be in the **In use** or **In maintenance** state.

Considerations for asset groups in flows and in the Enterprise Asset Workspace

Asset groups won't be available in the following flows and scenarios:

- Asset resale flow.
- Transfer order lines.
- Repair order lines.
- Disposal orders.
- While creating shipment assets.
- Contracts.
- Move orders.
- Any flow where the asset requires a model.

Additionally, the asset hierarchy contextual side panel doesn't appear for asset groups and all assets and enterprise assets lists don't show asset groups.

Plugin dependencies for asset groups

Install the sn_isa_model plugin for using asset groups.

Classification codes

Use classification codes to organize and categorize your enterprise models and use them effectively.

Overview of classification codes

Create classification codes to increase the visibility and efficiency of your enterprise models.

Classification codes are assigned to models, are based on model categories, and each code has a source.

A classification code can be based on one or more model categories. For example, the facility model category is assigned to Code A and the medical model category is assigned to Code B. You can assign a code to each model you create. When you create a facility model, you can assign the classification code, Code A to that model. Similarly, when you create a medical model, you can assign Code B to that model.

A source is a system of classification for a particular industry. OmniClass, for example, is a classification system for the construction sector. Some sources have a hierarchical structure with a parent-child relationship. In such a hierarchical system, there's only one parent for each code. Your data infrastructure determines whether a source adheres to a hierarchical structure or not.

Use the parent-child relationship between models to filter out models and assets based on a classification code. You can filter reports on dashboards based on classification codes.

You can create and edit classification codes in the Enterprise Asset Workspace by navigating to **Enterprise model management view > Classification**.

When a classification code is created, the ancestor list for that code is generated automatically. When a parent of an existing code is updated, the ancestor list of that code and all its children gets updated.

Filter using classification codes

You can filter models based on classification codes in the following Enterprise Asset Workspace views:

- Enterprise asset overview
- Enterprise asset dashboard
- Inventory
- Enterprise model management
- Enterprise asset estate

When you select a code in the **Classification** filter and apply the filter, you see reports for all the models aligned to that code, as well as all their ancestors.

Roles used

You need the following roles to work with classification codes.

Role title	Contains roles	Description
Classification manager [sn_eam.enterprise_classification_manager]	sn_eam.enterprise_admin	This role has complete access to the classification code table. This role can create

Role title	Contains roles	Description
		classification codes as well as edit and view them.
Model manager [model_manager]	sn_eam.enterprise_asset_manager	This role can only view classification codes.

Failure and resolution codes in Enterprise Asset Management

Enhance maintenance efficiency with standardized and predefined failure and resolution codes.

Failure codes are used to identify the exact reason an asset has failed, while resolution codes specify the method used to resolve the issue.

i Important:

The failure and resolution codes are available with Enterprise Asset Management version 9.0 and later.

Benefits of failure and resolution codes

- The predefined codes help in consistent reporting, analysis, and tracking of issues and their resolutions.
- The hierarchical structure of the codes, with each code having a parent-child relationship, offers a detailed and organized approach to maintenance.
- The **Failure code** and **Resolution code** fields in the Repair flow task forms help asset technicians to record the reason for failure of an asset and the resolution used for its repair.

Hierarchy of codes

A code can have a parent and a path. For example, Major engine failure can be a parent failure code, with child codes like Engine oil dried out or Carburetor broken down.

When a code is created, its path is generated by tracing back to the root code. For example:

- For Code A that doesn't have any parents, the path is Code A.
- For Code B that has a parent Code A, the path is Code A, Code B.
- For Code C that has a parent Code B, the path is Code A, Code B, Code C.

i Note:

The parent code is of the same type as the child code. For example, the parent of a failure code is another failure code, and the same applies to resolution codes. If the parent changes, the path of the children is automatically updated. A failure code or resolution code can be linked to only one parent code.

For more details, see [Manage failure and resolution codes](#).

Playbooks for Enterprise Asset Management

Playbooks provide a step-by-step guidance for setting up your assets with important information.

Playbook overview

A playbook takes a workflow and breaks it into multiple lanes. The workflow for a playbook is generally created using the [Exploring playbooks](#) . Each lane in a playbook includes:

- A list of activities that you review.
- Status indicators that display the current state of each activity.
- Check marks that indicate where you are in the workflow.

As you mark an activity complete in a lane, you move to the next activity. You can save an activity at any time and return to the playbook later. After you complete all the activities in a lane, you move to the next lane. As you keep completing activities and lanes, the status keeps getting reflected in the left-hand panel. An Activity log, on the right-hand side of the playbook shows all the data that you've entered for each activity.

Playbook layout

The playbook is divided into the following parts:

- lanes on the left-hand side.
- work area in the center.

Available playbooks for Enterprise Asset Management

Use the following playbooks to complete various Enterprise Asset Management workflows:

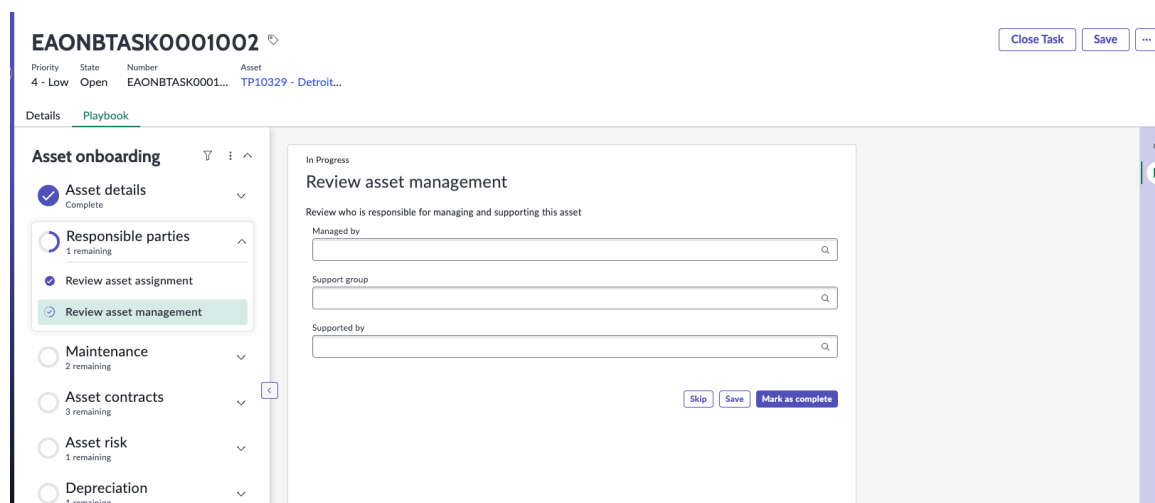

- Asset onboarding playbook: Allows you to onboard a single asset.
- Multi-asset onboarding playbook: Allows you to onboard multiple assets at one go.
- Calibration event playbook: Allows you to track and manage the asset calibrations that you are performing as part of your work orders.

Asset onboarding playbook

The asset onboarding playbook provides context at each step of the process and helps you enter critical information for your assets.

Each asset can have only one onboarding process and for each onboarding process, there's an onboarding task to track the process.

The Asset Onboarding Task [sn_itam_common_asset_onboarding_task] table tracks the asset onboarding process.

Multi-asset onboarding playbook

The multi-asset onboarding playbook enables you to onboard multiple assets for a single model at one go.

As an enterprise asset technician, you can perform any of the following tasks to onboard multiple assets:

- [Create a catalog request.](#)
- [Create an Onboarding order in the Enterprise Asset Workspace.](#)

After the catalog request or the Onboarding order is submitted, an Onboard Asset Task is created. The enterprise asset manager can complete the Onboard Asset task by using the playbook associated with the task. After the onboarding task is completed, the catalog request and the requested item's state changes to **Closed Complete**.

The Multi-asset onboarding playbook has a series of activities that can be either skipped or marked as complete. The Deployment activity in the playbook enables the enterprise asset manager to specify the following details and create a deploy task:

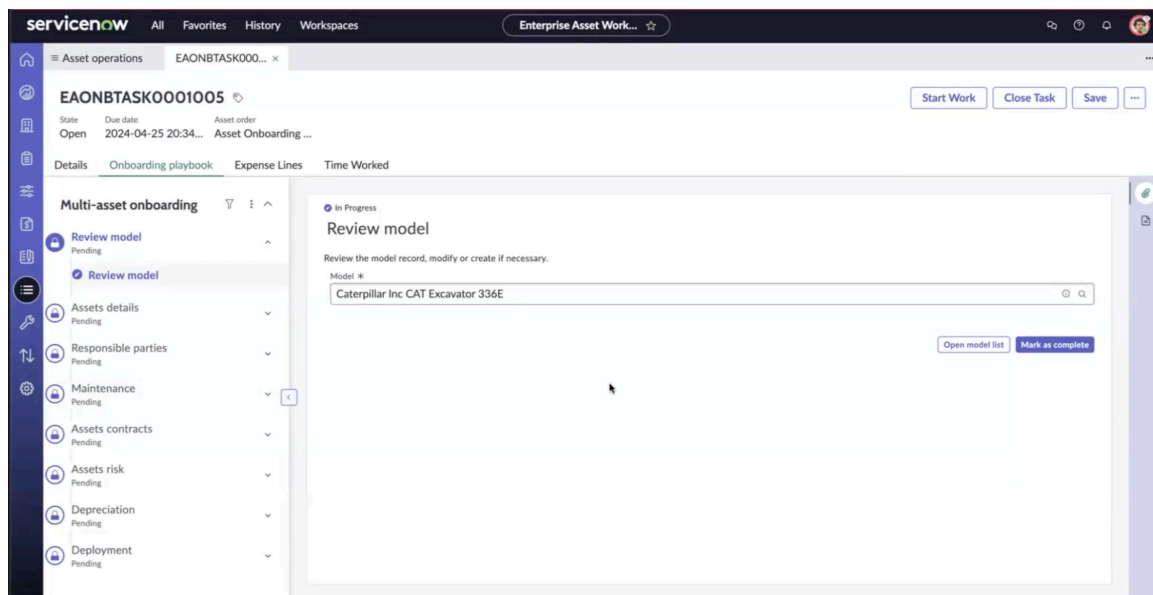

- The person for whom the asset is assigned
- Location where the asset should be deployed

Note:

You can work on the Deployment activity only after you have reviewed all the preceding activities in the Multi-asset onboarding playbook.

The deploy task for multi-asset onboarding can be either created as an Enterprise asset deployment task or a Work order task by configuring the `com.sn_eam.default_deployment_task` asset property using the `enterprise_admin` role. By default, the **Value** field of this asset property is set to `sn_eam_deploy_asset_task` and an Enterprise asset deployment task is created. However, you can create a work order task by setting the **Value** field to `wm_task`.

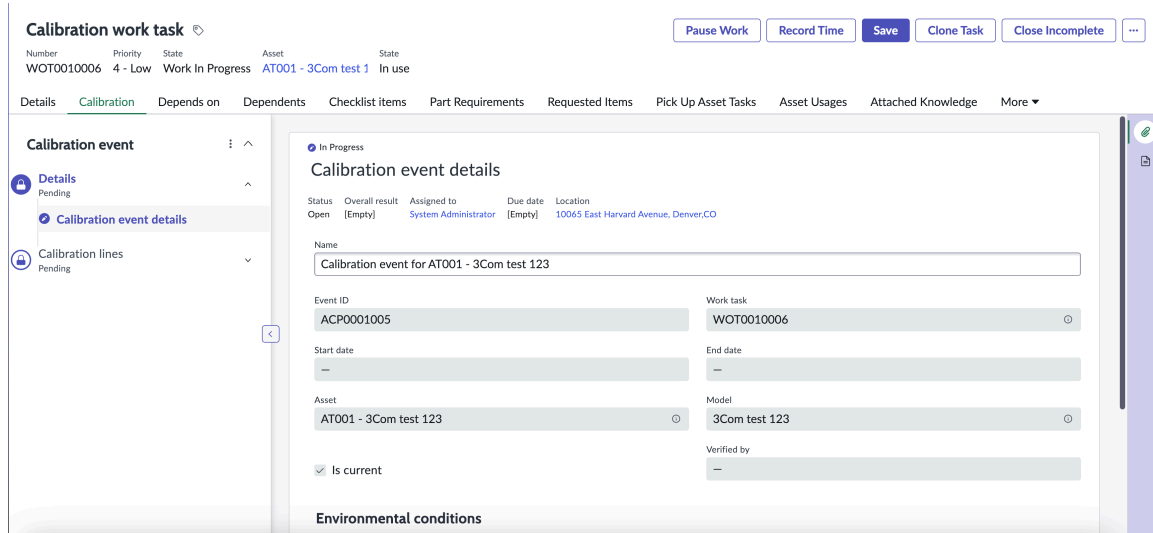

For details on using the multi-asset playbook, see [Create a multi-asset onboarding process](#).

Calibration event playbook

The Calibration event playbook enables you to track and manage the asset calibrations that you are performing as part of your work orders. This playbook is available in any work order task that has a Work type of Calibration.

For more details on using the Calibration event playbook on your ServiceNow instance, see [Complete and close a work order for an enterprise asset](#). For more details on using the Calibration event playbook in the ServiceNow® Mobile Agent® application, see [Take action on an enterprise asset using the Mobile Agent application](#).

Linear assets in Enterprise Asset Management

Use linear assets to expand your asset management portfolio and increase diversification by creating and managing linear assets.

Overview of linear assets

A linear asset is an asset that has a physical length or dimension, such as roads, railways, pipelines, power transmission lines, and telecommunication networks. These assets are often characterized by their linear topology, which means that they have a defined starting point and ending point, and can be represented as a sequence of interconnected segments or nodes.

You can create segments on linear assets, associate discreet asset to linear assets, and find relationships between linear assets such as overlapping assets, continuing assets, and intersecting assets. For details on the terminology used for linear assets, see [Terminology for linear assets](#).

You can create and manage linear assets and segments using geographic (geo) maps. Geo maps are integrated into the Enterprise Asset Management.

Extent of support for linear assets

Linear assets are supported keeping the following considerations in mind:

- Support for linear assets that are modeled by geopoints.
- Support for signed decimal degree geopoints up to seven digits after the decimal point. For example [37.3800091, -121.9635865].

- Support for each linear asset extends to up to 1000 geopoints, 500 markers, and 500 segments.
- Support for up to 1000 work orders on a linear asset per month.

Geo maps for linear assets

Geo maps are visual representations of the Earth's surface or a specific region, displaying various features such as landforms, bodies of water, cities, roads, and other geographical elements.

sn-geo-map is the UI component used to support the map visualization in linear assets.

The Enterprise Asset Manager [sn_eam.enterprise_asset_manager] has access to the geo map.

A geo map helps you perform the following actions on the workspace:

- Draw linear assets to define coordinates.
- Pick up segment start and end markers.
- Pick up markers for discrete assets.
- View related assets such as discrete assets, overlapping assets, intersecting assets, continuing assets, and segments.

For more information on using the Geomap icon to connect geo coordinate points on a map, watch this short video [Connect geo coordinate points on a map](#)

Knowledge articles for Enterprise Asset Management

Create and attach knowledge articles about enterprise models.

Use the Enterprise Asset Workspace or the Knowledge Management application to create articles about Enterprise Asset Management application. You can create articles on subjects such as troubleshooting, configuration. For information on creating knowledge articles, see [Create a knowledge article for Enterprise Asset Management](#).

The enterprise asset manager [sn_eam.enterprise_asset_manager] role can create articles and the Enterprise technician [enterprise_asset_technician] role can view articles.

After an article is created and published, the enterprise technician [enterprise_asset_technician] role can attach the articles to enterprise models.

To search or view articles in your instance, type **Enterprise Asset Knowledge Base** in the navigation bar. All articles on Enterprise Asset Knowledge Base are listed.

You can also see the asset's model knowledge articles in the Model Knowledge related list in the asset form. The work order and the work order task forms also has the Parts Knowledge related list.

Asset Total Cost of Ownership for Enterprise Asset Management

Asset managers like to know the Total Cost of Ownership (TCO) for assets to gain insights into the total cost of assets and enable capital planning.

During an asset's life span, assets incur costs, which include initial capital costs, costs associated with purchasing new parts, labor costs, and contract costs. TCO for an asset is the sum of all these expenses.

Benefits of TCO

- Track and analyze expenses such as procurement, maintenance, repairs, and disposal across the asset hierarchy.
- Gain better visibility and control over asset-related expenses throughout the life-cycle.
- Bench mark asset costs against similar assets and asset models to compare performance.

TCO calculation

TCO is the sum of all the expenses that occurred on the asset during its lifetime. TCO is calculated for the asset by adding the amount for all the expense lines that are created against the asset. The total cost of an asset is updated whenever an expense line is added.

Considerations while calculating TCO:

- Initial TCO includes the purchase cost coming from the expense line created when an asset record is created.
- When a new asset record is created, a new expense line is created using the cost field on the asset record.
- When the cost field is updated, the existing expense line record is also updated.
- For simple and complex assets, TCO is calculated by aggregating all the expense lines associated with the asset. Whenever a new expense line is added to the asset, the TCO reflects the updated total automatically.
- For serialized assets, asset TCO is the sum of all expense lines under that asset.
- For complex assets, the cost incurred on the child is also added to the TCO of the parent asset.
- If a child asset is swapped, there will be one expense line created that is the operational cost. The capital cost of new child assets is also added to the parent TCO. The **last_used** field in the swap asset is populated and this field is used to query any expense lines created after that. The **last_used** field on the swapped out asset is populated as it goes back to the stockroom.
- The cost of child assets is part of the parent asset cost for a complex asset and thus expense lines for child assets are empty.
- If a child asset is removed, its expense lines persist and the parent TCO doesn't get affected.
- In the case of user-assembled assets, parent and child both have expense lines and the child expense line roll ups to the parent and the amount is added to the parent TCO.
- For multi-hierarchy assets, any expense line created on the child asset is referenced by a many-to-many relationship between all the parents in the hierarchy.
- Consumables are set to merge and split and so are the expense lines. Any expense lines created by task rate cards are added to the TCO. The calculation applies for simple assets. In case consumables are used as child assets, then their expense lines are rolled up to the parent. TCO won't be tracked for individual consumables.
- The value obtained by reselling assets is added as a negative cost to TCO. For leased assets that have a monthly lease payment, create expense lines on the start date of the lease for every month.
- The **Asset** field on expense lines is populated with the asset reference from the task record.
- Expense lines created after closing a work order task or an incident will have its **Asset** field populated from the asset reference on the work order task or incident.

TCO benchmark and threshold

After you specify a TCO benchmark cost, the TCO benchmark threshold is automatically calculated by multiplying the TCO Benchmark by the TCO benchmark threshold percentage. You can manually override the TCO benchmark threshold by changing the percentage in the *asset_tco_benchmark_threshold_percentage* system property.

You can manually override the TCO benchmark threshold by changing the value on the **TCO benchmark threshold** field in the Financial section of a model form.

If you update the TCO benchmark, the TCO benchmark threshold gets recalculated.

Rate cards, expense lines, and expense categories

The Enterprise Asset Management application automatically sums the time worked records and calculates the total cost by multiplying the rate cards. Rate cards are created for each task across all workflows. Rate cards capture costs on a per task basis or on the time consumed. The Enterprise Asset Management application supports the following rate cards:

- **task rate cards:** Cost captured by tasks.
- **labor rate cards:** Cost captured by the time consumed on an hourly basis. Labor rates can be defined at the user level.

Note:

To use rate cards, you must activate the ServiceNow® Cost Management (com.snc.cost_management) plugin.

By default, the task rate card is used. To change to using the labor rate card, open a task rate record and select the **Use time worked** field.

After a task is closed, an expense line is created based on the task time worked captured. An expense category is then attributed to the expense line. The expense lines amounts are added to the total cost on the asset. The expense lines appear under the Expense line related list under the asset.

Time capturing for tasks

Each task has a time capturing capability that creates time worked records for you.

You can start, record time, pause, resume, and close your tasks as described below:

1. Select **Start Work** to begin your work. This moves the status of the task from **Open** to **Work in Progress**. You can then either select **Start Timer** or **Record Time** to capture time.
 - **Start Timer:** Automatically captures time. After you select this button, the timer is initialized.
 - **Record Time:** Manually enter the time in hours, minutes, and seconds in the Record Time dialog box and select **Save** to capture the time record.
2. Select **Pause Work** to pause work. After you pause your work, the timer stops and a task work record automatically gets created in the Time Worked tab. Every time you pause your work, a task work record gets created. Based on the number of times you pause work, multiple task work records get created.
3. Select **Resume** to resume your work and restart the timer. You can also select **Close Task** to close your task.

When you select **Close task**, the time as well as the task gets closed. To arrive at the total time spent on a task, all task work record entries created for that task are added up and then multiplied with the labor rate to arrive at the total cost for a task.

TCO reports

There are two types of TCO reports; TCO comparison and TCO vs benchmark. TCO comparison reports are stacked by expense category.

Normalize TCO

Normalizing TCO refers to averaging the cost over the useful life and the asset life. The normalized calculation is for Projected TCO reports, which are only offline.

Domain separation

TCO reports support domain separation.

Upgrade considerations

If you're upgrading to Yokohama, after the scheduled job **TCO Upgrade for Enterprise Assets** runs, the following updates are made:

- The **Asset** field on task records is populated on all the expense lines using the source table mentioned in the **Source ID** field. The source table defines from where the expense line has been created. Whether it's being created for a task, a configuration item, a contract, or for a purchase asset. When the scheduled job **TCO Upgrade for Enterprise Assets** runs, it searches for all task records and populates asset references from the task record to the corresponding expense line for the task. Similarly, the same scheduled job searches for all configuration items (CI) and populates asset references from the CI to the corresponding expense lines.
- The **Expense category** field, introduced in Yokohama, is populated based on the source of the expense line. There are several expense categories for tasks. For example, the expense lines created for a purchase asset and for a contract asset have different expense categories. Similarly, there are different expense categories for CIs too.
- The following three fields in an asset record get populated:
 - **cmn_asset_tco**: View this field in the Financial section in an asset record.
 - **cmn_end_of_useful_life**: View this field in an asset record by selecting the vertical ellipsis next to **Asset Details** and then select **Show XML**.
 - **cmn_first_used**: View this field in an asset record by selecting the vertical ellipsis next to **Asset Details** and then select **Show XML**.
- Any expense lines created on simple assets will be added up to **asset_tco**.
- For pre-assembled and user-assembled assets, any expense lines created on assets will also roll up to the parent TCO.

Related topics

[Configuring Total Cost of Ownership for enterprise assets](#)

Repair flow to fix defective enterprise assets within a stockroom

Use the repair flow to get the defective enterprise assets in your stockroom fixed so that the repaired assets can be used in different Enterprise Asset Management workflows.

By using the Repair flow, your organization can internally fix the assets that are damaged or out of the warranty period. The repaired assets can be put back to use after validation. There's no external vendor involved in the repair of defective assets.

As an asset manager, you can request repair of assets that are either defective or pending repair in your stockroom by submitting repair orders. For more details, see [Request repair of defective enterprise assets](#). The repair flow is triggered when you submit a repair order. A repair order has repair order lines that are associated with repair tasks for the assets. The asset technician completes the repair tasks associated with the repair order. The repair flow completes after the repaired asset is evaluated. For more details, see [Manage repair of defective assets in your stockroom in the Enterprise Asset Workspace](#) and [Manage enterprise asset repair tasks using the Mobile Agent application](#).

Stages in the Repair flow

1. Troubleshoot: Stage to evaluate the defective asset and assess the following:

- Issues with the asset
- Parts required
- Steps to repair the defective asset

At this stage, an asset technician confirms if the asset is repairable, redeployable, or unrepairable. The Repair flow proceeds to the next stage only if the asset is repairable. Otherwise the repair order is marked as Complete.

2. Repair: Stage to confirm repair of the defective asset. In this task, the asset is either repaired, redeployed, or marked as unrepairable.

The repair flow proceeds to the next stage only if the asset is repaired. Otherwise the repair order is marked as Complete.

3. Evaluate: Stage to perform a quality control check of the repaired asset. Based on the evaluation results, the asset is either redeployed or disposed of. The Repair flow is completed after asset evaluation.

Note:

You can specify the reason for the asset failure using failure codes in the Troubleshoot asset and Repair asset tasks. You can also specify the solution that you applied to address the asset issue using the resolution codes in the Repair asset task. These details are also available on the repair order line form. For more details, see [Failure and resolution codes in Enterprise Asset Management](#).

The failure and resolution codes are available with Enterprise Asset Management version 9.0 and later.

Inventory picking for Enterprise Asset Management

As an inventory user working in large stockrooms, use the Inventory picking feature to pick the assets in the stockroom easily and facilitate the asset pick-up by technicians.

The Inventory picking feature includes adding an Asset pick task in the following Enterprise Asset Management workflows:

- [Standard Enterprise Asset Request](#)
- [Enterprise Refresh Request](#)
- [Sourcing workflow](#)

Note:

The Asset pick task is available only if it's enabled explicitly for a stockroom that's used to source asset requests, refresh requests, or sourcing requests. For details, see [Enable the Asset pick task for your stockroom in the Enterprise Asset Workspace](#).

The Asset pick task enables you to pick the assets from any aisle and space within your stockroom. You can then drop the picked asset to a specified place within the stockroom. After you complete the Asset pick task, asset technicians can pick up the assets to fulfill the requests assigned to them.

For more information on the Asset pick task, see [Manage picking enterprise assets within your stockroom for Enterprise Asset Management workflows](#) and [Manage enterprise asset pick tasks using the Mobile Agent application](#).

Managing inventory by putting away enterprise assets in the stockroom drop-off location

Use the Asset put away feature to track asset movement efficiently in the inventory.

Important:

Asset put away feature is available with Enterprise Asset Management version 9.0 onwards.

The Asset put away task enables you to track asset movement from the receiving bay of the inventory to the designated space within the stockroom. The Asset put away task confirms that when an asset is received in the inventory, you have filled the aisle-space information for it. An Asset put away task is automatically created in the Enterprise Asset Management when the following required business rules are met:

- When an enterprise asset is created in the Enterprise Asset Management and the **Aisle-space** field value isn't available, an Asset put away task is created. Open the Asset put away task and updated the **Drop off location** field value, to move the asset to designated aisle-space in the stockroom.

Note:

You can create an Asset put away task manually for the in stock assets in the inventory. For more information about manually creating an Asset put away task in the Enterprise Asset Management, see [Create an Asset put away task in the Enterprise Asset Workspace](#).

- When the **Stockroom** field is updated for an enterprise asset in the [Asset Details](#) form, an Asset put away task is created. Open the Asset put away task and update the **Drop off location** field value, to move the asset to the designated aisle-space in the stockroom.

Note:

You can create the Asset put away task for a stockroom only if the stockroom is enabled to perform warehouse tasks. For more information about enabling the feature, see [Enable the asset put away task for your stockroom in the Enterprise Asset Workspace](#).

In the Enterprise Asset Workspace, the inventory users can perform the following actions:

- Create an Asset put away task manually for the in stock assets. For more information, see [Create an Asset put away task in the Enterprise Asset Workspace](#).
- View the open put away tasks related to the inventory and stockroom. For more information, see [View open put away tasks for your stockroom in the Enterprise Asset Workspace](#).
- Update the **Drop off location** field for the open task in the Put away form and close it. For more information, see [Close an Asset put away task in the Enterprise Asset Workspace](#).

Using the ServiceNow Agent application, you can scan the in stock assets in the inventory and put away them in the scanned drop-off location. After the asset is placed in the drop-off location within the stockroom, you can close the Asset put away task. For more information on the mobile experience for Asset put away task, see [Manage enterprise asset put away using the ServiceNow Agent application](#).

Receiving enterprise and consumable assets at stockrooms

As an enterprise asset manager or enterprise asset technician, you can receive assets at a stockroom from any workflow using the unified and standardized receiving mechanism.

i Important:

The standardized asset receiving mechanism is available with Enterprise Asset Management version 9.0 and later.

With the standardized receiving process, you don't need to be familiar with the specific workflow to which the assets belong. Therefore, you can receive hardware and consumable assets from different shipments originating from sources, like transfer orders, purchase orders, or any other workflows seamlessly.

Requirements and limitations

- You can receive enterprise assets in the Hardware Asset Workspace only if the Enterprise Asset Management applications is activated.
- You can receive hardware assets in the Enterprise Asset Workspace only if the Hardware Asset Management application is activated.
- You can only receive complete quantity of consumables.
- You can receive assets from a purchase order line only in the Zurich or later releases.

Asset receiving mechanisms

You can receive a single asset or multiple assets in bulk using any of the following options on the enhanced stockroom form:

- **Receive assets:** You can either search for an asset using its Asset Tag, Serial Number, or MAC address and receive it, or select one or more assets from the list of inbound shipment assets and receive them. For more details, see [Receive an enterprise asset at a stockroom in the Enterprise Asset Workspace](#) and [Receive assets from inbound shipments at your stockroom in the Enterprise Asset Workspace](#).
- **Import assets:** You can download the Excel template, add the asset details that you want to receive, and import the Excel template. During the import process, the system performs validations, and you can view the imported asset records, validation status, and comments in the Import asset row [sn_itam_cmn_import_asset_row] table. Based on the validation status, you can select and receive the assets. If there are any issues with the asset records, you must address those issues before you can receive the assets. For more details, see [Import and receive assets in bulk at your stockroom in the Enterprise Asset Workspace](#).

When any asset is received at the stockroom, the following changes happen:

- The State of the asset changes from **In transit** to **In stock**.
- The stockroom field on the asset form is automatically updated.
- The receive tasks in the source workflows associated with the asset that you received are automatically closed.

Asset performance reports in the Enterprise Asset Workspace

Gain insights into the overall operational efficiency of your organization's enterprise assets by using the asset performance reports available in the Asset analytics view.

i Important:

Asset performance reports are available with Enterprise Asset Management version 9.0 and later.

Asset performance involves assessing how effectively and efficiently assets fulfill their intended functions within an organization. The evaluation includes measuring and analyzing key performance indicators (KPIs), such as:

- Asset availability to determine when the asset is operational.
- Mean time between failures (MTBF) to measure reliability.
- Mean time to repair (MTTR) to measure repair efficiency.
- Total asset task time summary to measure the total time worked on the related tasks for an asset and its child assets.

Benefits of tracking asset performance

Reduce unplanned downtime

Monitoring asset health in real-time help prevent and predict issues before they cause downtime.

Improve maintenance efficiency

Metrics like MTTR and MTBF help you schedule maintenance more effectively, reducing wasted time, and improving technician efficiency.

Maximize asset life and return on investment (ROI)

By detecting early signs of wear and tear and scheduling timely repairs, organizations can make their equipment last longer and delay the need for replacements.

Enhance financial planning

Insights into performance help identify models or locations that aren't performing well or have ongoing problems, guiding better investment choices.

Align operations with service levels

Tracking availability helps assets meet the required uptime targets set by service level agreements (SLAs), compliance standards, or production schedules.

Considerations, requirements, and limitations

- The **First Used** field on EAM assets must contain a valid timestamp for accurate asset performance tracking. Assets with missing or invalid First Used values are excluded from performance calculations, creating gaps in lifecycle and utilization reporting.
- Asset key performance indicators (KPIs) aren't calculated for pallets, consumable, and bundle assets.
- Asset KPIs aren't calculated by default.
- To track the asset KPIs that include Asset availability, MTBF, and MTTR, you must perform the following configurations:

1. Opt in to the model categories of the assets for which you want to monitor the KPIs.

Note:

If a model category has child categories, selecting the parent category for performance tracking doesn't automatically include the child categories. You should opt in to the specific child categories you want to track.

2. Define an operation schedule, which is a collection of schedule entries that specify the operational status and total operational duration for any entity that references the schedule. The schedule entries define calendar hours of operation within a schedule.

For details, see [Create an operational schedule for enterprise assets](#)

Note:

If an operational schedule isn't defined, the Default operation schedule is applied.

3. Create an Asset schedule to associate the assets with an operational schedule.

Note:

If an asset isn't associated with an operational schedule, the Default asset schedule will be applied.

- The calculation of asset KPIs for enterprise assets begins when the asset transitions to the In use state for the first time.
- KPIs are tracked until the state of the asset changes to Retired or Missing.

Calculation of asset KPIs

The KPIs are calculated based on the tasks associated with the asset and the operational schedule of the asset. The KPI values are stored in the Asset availability [sn_ent_asset_availability] table, which extends the Service Availability table.

Performance tracking for assets that belong to a model category opted in for performance tracking begins when the asset's state changes to In use for the first time. A record is then created in the Asset Availability table with **Asset availability %** set to **100**. The Asset availability % value decreases when the asset experiences an outage.

Outage record creation

An outage record is created in the Outages [cmdb_ci_outage] table when:

- The state of an asset changes from In use to any of the following:
 - In stock - Pending repair
 - In stock - Pending disposal
 - In stock - Defective
- A work order task is created
- An incident is created

The outage record is closed when:

- The status of the asset changes back to In use.
- The work order task is closed.
- The incident is closed.

The duration of the outage is calculated when the repair task is closed.

Classification of outages

- Planned outage: The task type is Planned maintenance or Calibration.
- Unplanned outage: The task type is Break-Fix.

Handling overlapping outages

Outages can overlap due to multiple events being logged within the same time window. To maintain accurate KPI calculations, overlapping outages are handled with these rules:

1. Overlaps between unplanned outages:

- When multiple unplanned outages occur during overlapping time periods, they are not treated as separate outages. Instead, they are merged into a single outage to help prevent downtime from being overstated.
- The total duration of this combined outage is calculated by merging all overlapping time intervals.
- A sample outage calculation is here:
 - a. Outage A: 10:00 AM – 12:00 PM
 - b. Outage B: 11:30 AM – 1:00 PM

Result: The resulting outage window is 10:00 AM – 1:00 PM (a single 3-hour outage).

2. Overlaps between planned and unplanned outages:

- When a planned outage overlaps with an unplanned outage, the system prioritizes the unplanned outage. The reason is that unplanned failures have a significant impact on asset reliability and performance, and should be fully accounted for in downtime metrics.
- The overlapping period is classified as an unplanned outage, while any remaining time is classified as a planned outage.
- A sample outage calculation is here:
 - a. Planned outage: 2:00 PM – 4:00 PM
 - b. Unplanned outage: 3:00 PM – 5:00 PM
 - c. Overlapping period: 3:00 PM – 4:00 PM
 - d. Resulting outage window: 2:00 PM – 5:00 PM

Result:

- The period from 2:00 PM to 3:00 PM is counted as planned outage time.
- The period from 3:00 PM to 5:00 PM is counted as unplanned outage time.

Passing on outages through the asset hierarchy

In an asset hierarchy, outage on assets or their child assets are handled as follows:

- If a child asset with the **Required** field set to **true** experiences an outage, its parent asset will also have the outage.
- If a parent asset has an outage, all its child assets will also have the outage.

Asset KPIs

Asset KPI	Formula
Asset availability (in %)	$\frac{(\text{Operating hours} - \text{Total planned downtime} - \text{Total unplanned downtime})}{(\text{Operating hours} - \text{Total planned downtime})}$
Mean time between failures (MTBF) (in hours)	$\frac{(\text{Operating hours} - \text{Total planned downtime} - \text{Total unplanned downtime})}{(\text{Total unplanned outages})}$
Mean time to repair (MTTR) (in hours)	$\frac{(\text{Total unplanned downtime})}{(\text{Total unplanned outages})}$

Definition of the variables used in the KPI calculations is as follows:

Variable	Definition
Operating hours	The duration from when the asset first transitioned to the In use state until the current date and time within the asset schedule.
Planned downtime	The duration from when the asset transitioned from the Work in progress state to the Closed complete state for work order tasks of the work types Planned Maintenance or Calibration, within the asset schedule.
Unplanned downtime	<p>The duration from when the asset transitions from the In use state to any repair state, such as In stock - Pending repair, In stock - Pending disposal, or In stock - Defective, until it returns to the In use state, within the asset schedule.</p> <p>If there's no repair state present on the asset through a repair order or other processes, the Work in progress duration of the Breakfix work order task type is used to determine the outage duration. However, if there are overlapping durations between the repair state and the Breakfix work order tasks, the combined duration of both is considered. The asset schedule is also considered when determining the outage duration.</p>
Total unplanned outages	The count of total outage records for an asset excluding planned outages accounting for overlaps. Overlapping and concurrent outages are consolidated as one outage.

Accessing asset KPI reports

- Contextual side bar: You can view the following reports on the contextual side bar:
 - [Asset availability and related KPIs report for an individual asset.](#)
 - [Asset task time summary report for all enterprise assets.](#)
- Asset performance tab on the Asset analytics view: You can view the average values of the KPIs, including Average availability, Average MTTR, and Average MTBF, for all the assets that are being tracked. Additionally, you can see a list of the assets that contributed to the calculation of these KPIs. For details, see [Asset Analytics overview for Enterprise Asset workspace.](#)

Scheduled job for calculation of asset KPIs

- The *Calculate asset performance KPIs* scheduled weekly job runs every Saturday to calculate the KPIs for the assets that belong to the model categories opted in for performance tracking. These KPIs are then reflected in the Asset availability and related KPIs report, which displays the most recent KPI values.

Note:

To track historical KPIs for existing assets in the opted-in model categories, run the *Calculate availability for historical data* job. This job considers the following tasks associated with an asset to calculate the outages and KPIs:

- RMA task
 - Work order task
 - Repair task
 - Troubleshoot task
 - Evaluate task
 - Recall task
- The *Asset availability data collection* scheduled weekly job runs every Sunday to calculate the average values of the KPIs that includes Average availability, Average MTTR, and Average MTBF. The job then generates the reports in the Asset performance tab of the Asset analytics view.

Asset work order plans in Enterprise Asset Management

Work order plans organize sequential asset tasks — such as shutdowns, safety inspections, calibrations, asset condition assessments, and restarts — under a single unified plan, enabling repeatable and scalable execution.

Important:

Work order plans are available with Enterprise Asset Management version 10.0 and later.

Key benefits

- Increased operational efficiency: Organize complex asset-centric tasks under a single plan with support for technician assignment and scheduling.
- Guided experience: Create, assign, track, and complete work order plans through a structured Playbook interface.
- Asset-centric workflows: Sequence maintenance operations across multiple assets or asset groups for consistent and repeatable execution.

Roles

The following roles are involved in the work order plan workflow:

- Asset manager (sn_eam.asset_manager): Creates and manages work order plans, defines the scope of work, assigns work order tasks to technicians, and schedules and tracks tasks.
- Asset technician (sn_eam.asset_technician): Receives assigned tasks with all instructions and completes tasks using the Mobile Agent application with real-time status updates.

Work order plan workflow

The work order plan workflow involves the following stages:

1. **Details:** Create a work order plan by providing the details of the assets or asset groups in scope, and the work order tasks to be performed. Tasks can include safety preparation, shutdown, maintenance, calibration, asset condition assessment, and restart.
2. **Review affected assets:** Confirm the assets to include in the work order plan.
3. **Review assignments:** Assign work order tasks to assignment groups or technicians.
4. **Review schedule:** Set the scheduled start and end times for each work order task.
5. **Track status:** Track task status updated by the assigned technicians and review the available work order plan reports.

For details on creating work order plans, see [Manage asset-centric work tasks using work order plans](#).

Configuring Enterprise Asset Management

Configure the Enterprise Asset Management application to manage the life cycle of your enterprise connected and non connected assets.

Configuration overview

Configuring the Enterprise Asset Management application by system administrators involves performing the following tasks. Depending on your organization's needs and requirements, some configuration tasks are optional.

Enterprise Asset Management configuration

Task	Required/optional	Resource
Install the Enterprise Asset Management application	Required to use the Enterprise Asset Management application.	Install Enterprise Asset Management Enterprise Asset Workspace
Opt-in to the Enterprise Asset Management Content Service	Optional. This task enables your organization to share unnormalized enterprise model data with ServiceNow to improve the normalization process,	Opt-in to Enterprise Asset Management Content Service Enterprise Asset Management normalization
Install the Enterprise Asset Management for Healthcare application	Optional. This application provides functionalities, features, and workflows of Enterprise Asset Management that support healthcare-related roles and asset models	Install Enterprise Asset Management for healthcare Enterprise Asset Management for Healthcare
Install OT Asset Management application	Optional. This application helps you to manage assets of the Industrial model category for Operational Technology.	Install OT Asset Management Install OT Asset Management

Enterprise Asset Management configuration (continued)

Task	Required/optional	Resource
Install the Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application	Optional. This application provides the functionalities, features, and workflows of Enterprise Asset Management but for mission-critical facility-based enterprise assets and linear assets only	Install Enterprise Asset Management for Data Center and Network Asset Management (DCNAM)
Install the Enterprise Asset Management for Providers application	Optional. This application adds DaaS provider-based functionalities and workflows to the base Enterprise Asset Management application	Install Enterprise Asset Management for Providers

Install Enterprise Asset Management

Request the Enterprise Asset Management application from the ServiceNow® Store so that you can track and manage your enterprise assets.

Before you begin

Role required: sys_admin

About this task

The following plugins and applications are automatically installed with the ServiceNow Enterprise Asset Management application:

Name	Description
Plugins	
Asset Management (com.snc.asset_management)	Provides functionalities to integrate the physical, technological, contractual, and financial aspects of information technology assets. See Asset Management for more information on asset management.
Procurement (com.snc.procurement)	Provides the capability to source and receive requested assets so that you can fulfill service catalog requests. See Procuring enterprise assets for more information on procurement.
Field Service Management (com.snc.work_management)	Provides the capability to manage work orders and related tasks. See Field Service Management for more information on Field Service Management.
Enterprise Asset Management Core (com.sn_eam_core)	Provides core functionalities, such as normalization, for the Enterprise Asset Management application.
Asset Management Workspace - Recommendations plugin (com.sn_itam_recomm)	Provides actionable recommendations for users in configurable workspaces.

Name	Description
SM Planned Maintenance (com.snc.planned_maintenance)	Provides the capability to manage regular preventative maintenance of assets. See Planned Maintenance for more information on Planned Maintenance.
Physical Assets (com.sn_phy_assets)	Marker that aligns features for physical asset-based applications, including the Hardware Asset Management and Enterprise Asset Management applications.
Indoor Mapping for Assets com.sn_ima	Provides the capability to track the location of the assets using indoor maps.
Applications	
Expanded Model and Asset Classes	Adds enterprise model and asset classes that extend out-of-the-box product model and asset classes within the CMDB class hierarchy. In addition, creates model categories that associate these enterprise model and asset classes with CMDB configuration item (CI) classes. See Expanded Model and Asset Classes Store application for more information on this application.
CMDB CI Class Models	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships. See CMDB CI Class Models store app for more information on this application.
Asset Management Common	Provides features that are common to the Hardware Asset Management, Software Asset Management, and Enterprise Asset Management applications, including the catalog item to request asset reclamation.
GRC: Risk Heatmap	Provides a heatmap component that enables you to visualize the risk posture of your organization. See Risk heatmap for classic risk assessment or Operational risk heatmap for Advanced Risk Assessment in the Risk Workspace for more information on risk heatmaps.

Procedure

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.
3. In the search bar, enter **Enterprise Asset Management** and then select **Search**.
4. Select the result called **ServiceNow Enterprise Asset Management**.
5. On the ServiceNow Enterprise Asset Management page, select **Request Install**.
The ServiceNow Request for App Installation - ServiceNow Enterprise Asset Management dialog box opens.
6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - ServiceNow Enterprise Asset Management dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Select **Request**.

8. Select **Close**.

Result

If your request is approved, you will receive an email with detailed instructions on how to install the application.

What to do next

Install the application according to the instructions in the email.

Install Enterprise Asset Management for healthcare

You can install the Enterprise Asset Management for Healthcare application (com.sn_eamhc) if you have the admin role. The application includes demo data and installs related ServiceNow[®] Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: sys_admin

About this task

The following items are installed with Enterprise Asset Management for Healthcare:

- Store applications
- Roles
- Plugins

For more information, see [Installed with Enterprise Asset Management for Healthcare](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Enterprise Asset Management for Healthcare application (com.sn_eamhc) application (com.sn_eamhc) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install.**

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. Optional: If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install.**

Install OT Asset Management

You can install the OT Asset Management application (com.sn_otam) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: sys_admin

About this task

The following items are installed with OT Asset Management:

- Plugins
- Store applications
- Roles

For more information, see [Installed with OT Asset Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All.**

2. Find the OT Asset Management application (com.sn_otam) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you're displayed.

3. Select a version from the list and select **Install.**

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. Optional: If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select Install.

Opt-in to Enterprise Asset Management Content Service

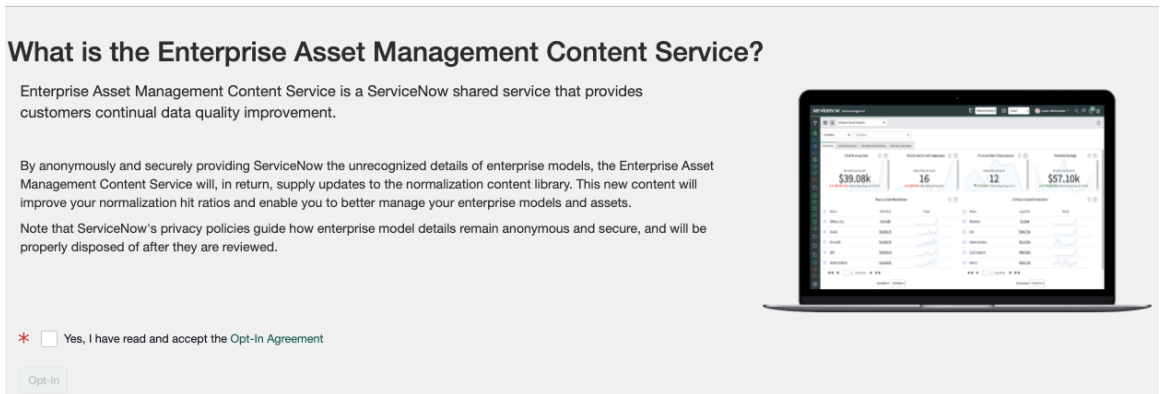

Opt in to the Enterprise Asset Management Content Service to share unnormalized enterprise model data from your organization with ServiceNow to improve the normalization process.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to Enterprise Asset Workspace > Admin center > Normalization opt-in.

2. Select Opt-In Agreement to read the agreement and then select the check box, Yes, I have read and accept the Opt-in Agreement.

3. Select Opt-In.

After you opt in, the Enterprise Models, Enterprise Model Lifecycles, Firmware Discovery Models, Firmware Model Lifecycles, Custom Firmware Models KPIs, and Custom Firmware CPE mapping are automatically enabled. The Custom Enterprise Product Models KPI is automatically disabled.

4. To disable a KPI, select the toggle button next to the KPI and then select Save.

5. To opt out, select **I would like to opt my company out of the Enterprise Asset Management Content Service Program and then select **Opt-Out**.**

After you opt out, the Enterprise Models, Enterprise Model Lifecycles, Custom Enterprise Product Models, Firmware Discovery Models, Firmware Model Lifecycles, Custom Firmware Models KPIs, and Custom Firmware CPE mapping are disabled and your company no longer contributes to the improvement of the normalization process. You still receive incremental content updates, based on what the Content Service team can create from other sources. Your company can rejoin the Enterprise Asset Management Content Service at any time.

Create sites in the Enterprise Asset Management

Create a site for asset groups in the Enterprise Asset Management application.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

For detailed information on what sites are and how are they used in asset groups, see [Asset groups in Enterprise Asset Management](#).

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate > Asset groups**.
2. Select **Sites**.
3. Select **New** to open the Create New Equipment Model Entity page.
4. On the form, fill in the fields.

Field	Description
Entity name	Name of the equipment model entity.
Short code	Short code that is assigned to this equipment model entity.
Parent	Parent of the entity. Once a parent is selected, the Template field is automatically populated
Path	Auto-generated based on the short code and the hierarchy.
Template	The template that defines the hierarchy of the parent according to the ISA-95 hierarchical entity model.
Location	Location of the equipment model entity. For example, Atlanta Building 64 would be the location for each associated equipment model that is located there.
Level	The hierarchical levels of a site with site being at the highest level, followed by area, work center, and work unit.
Site	Refers to an ISA-95 hierarchical entity model. Sites are entity records in the Equipment Model Entity [cmdb_ci_ot_isa_entity] table, organized in a hierarchical structure.

Field	Description
Company	Name of the company that this entity belongs to.
Business Unit	Business unit of the company that this entity belongs to.
Short Description	A description of the site entity.
Assigned to	The person primarily responsible for the entity.
Support group	The group to contact if you encounter any issues with the entity.
Managed by	Name of the assigned person who owns and is responsible for managing this entity.
Managed by group	The group who maintains the entity.
Process criticality	Measure of how critical, or important, the equipment model entity is to the process. Select the process criticality for the entity. For example: <ul style="list-style-type: none"> ○ 1 - most critical. ○ 2 - somewhat critical.
Operational status	Current operational status of the entity: <ul style="list-style-type: none"> ○ Operational: Entity that is fully operational in the production process. ○ Non-Operational: Entity that is non-operational in the production process.

5. Select Save.

The newly created site appears in the Sites tab.

Map enterprise roles to enterprise classes

Gain additional access to model categories by mapping individual enterprise roles to additional enterprise classes.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

To map enterprise roles to enterprise classes, you need to first provide roles access to the classes and then expose the tabs associated with those classes in the designated workspace.

Procedure

- 1. Navigate to All > Enterprise Asset Workspace > Admin center.**
- 2. Select Roles-to-class access**
- 3. Select the role record that you want to configure.**
The respective class access rules page opens. For example, if you select the Facility asset technician enterprise class access rules record, the Facility asset technician enterprise class access rules page opens.

4. Select a model category from the **Additional model categories** list.
The classes related to the model category appear in the **Class names**.
5. Select **Save**.
The role is now assigned to the classes that you selected. You need to now expose the model and asset tabs related to these classes by navigating to the Model and asset tabs in the Admin center.
6. Select Model and asset tabs in the Admin center.
7. Select the model category name, that you assigned to the role, to open the class tab configuration page.
8. Select **Include in tab** and **Include in dialog box**.
9. Select **Save**.
Role access is granted to the additional classes and the model and asset tabs associated with those classes are automatically visible in the specific workspace. Additionally, all dashboards are updated with data pertaining to the classes that you configured.

Manage failure and resolution codes

Improve maintenance efficiency by managing the failure and resolution codes in the Admin center of the Enterprise Asset Workspace.

Important:

The failure and resolution codes are available with Enterprise Asset Management version 9.0 and later.

As an enterprise administrator or inventory administrator, you can perform the following actions in the Admin center:

- [Create a source for failure and resolution codes](#).
- [Create failure and resolution codes](#).
- [Import failure and resolution codes through Excel template](#).

As an inventory user or enterprise asset technician, you can perform the following actions:

- View the available failure and resolution codes by navigating to **Workspaces > Enterprise Workspace > Admin center > Failure and resolution** and selecting the **Codes** list.
- View the sources for failure and resolution codes by navigating to **Workspaces > Enterprise Workspace > Admin center > Failure and resolution** and selecting the **Sources** list.
- Select the failure and resolution codes in the Repair flow task forms. For more details, see [Troubleshoot assets requested for repair in the Enterprise Asset Workspace](#) and [Complete the repair asset task in the Enterprise Asset Workspace](#).

Create a source for failure and resolution codes

Create a source to be associated with any failure or resolution code. The source for a code could be internal, external, or even from a manufacturer.

Before you begin

Important:

The creation of a source for failure and resolution codes is supported in Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_admin or inventory_admin

About this task

You should have at least one source before creating failure or resolution codes.

Note:

Sources of the codes are stored in the Asset service source [sn_ent_asset_service_source] table.

Procedure

1. Navigate to **Workspaces > Enterprise Workspace > Admin center > Failure and resolution**.
2. In the Failure and resolution list, select **Sources**.
Any existing sources are shown in the sources list.
3. Select **New**.
4. On the form, fill in the fields.

Create New Asset service source form

Field	Description
Source	Name of the source. For example, External or Internal.
Description	Brief description of the source.

5. Select **Save**.

Result

The source that you created is shown in the Sources list.

Create a failure or resolution code

Create a failure or resolution code to help enterprise asset technicians identify either the asset failure or the solution to the asset problem.

Before you begin

Important:

The creation of a failure or resolution code is supported in Enterprise Asset Management version 9.0 and later.

The source for the code that you want to create should already be available. For more details, see [Create a source for failure and resolution codes](#).

Role required: sn_eam.enterprise_admin or inventory_admin

About this task

Failure and resolution codes are stored in the Asset service source [Asset service code] table.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Admin center > Failure and resolution**.
2. In the Failure and resolution list, select **Codes**.
Any existing codes are shown in the Codes list.
3. Select **New**.

4. On the form, fill in the fields.

Create New Asset service code form

Field	Description
Display name	Name of the code that's automatically generated based on the values in the Code and the Description fields when the code is created. For example, if the Code field has a value F1001 and the Description field is Power failure, then the Display name is F1001-Power failure.
Code	Unique identifier used to identify an asset failure or the solution to it. For example, F1001 or R1001.
Description	Brief description that explains what the code signifies. For example, Power failure.
Type	Type of code. The following values are available: <ul style="list-style-type: none"> ○ Failure ○ Resolution
Parent	Code of the parent. <p>i Note: The parent code is of the same type as the child code. For example, the parent of a failure code is another failure code, and the same applies to resolution codes.</p>
Model categories	Model categories to which the code can be applied. <p>i Note: When you select a parent on the code, the model category is inherited from the parent code. However, you can still update the this field.</p> <p>If you don't select any model category, the code applies to all model categories.</p>
Source	Source of the code. This field is required.

5. Select **Save**.

Result

The code that you created is shown in the Codes list.

Import failure and resolution codes in bulk

Import multiple failure and resolution codes via Excel templates in the Admin center to assist enterprise asset technicians in diagnosing asset issues and their resolutions.

Before you begin

i Important:

The bulk import of failure and resolution codes is supported in Enterprise Asset Management version 9.0 and later.

The source for the codes that you want to import should already be available. For more details, see [Create a source for failure and resolution codes](#).

Role required: sn_eam.enterprise_admin or inventory_admin

About this task

Note:

The import records are stored in the Asset service import [sn_itam_common_asset_service_import] table.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Admin center > Failure and resolution**.

2. In the Failure and resolution list, select **Import**.

3. Create an asset service import.

a. Select **New**.

b. Download, update, and save the code import template.

i. Select **Download Template**.

ii. Fill in the template with the details of the codes.

The template has the following fields:

- **Code:** A unique identifier used to identify an asset failure or the solution to it. For example, F1001 or R1001. This field is required to import the template.
- **Description:** A brief description that explains what the code signifies. For example, Power failure.
- **Type:** Type of code. You can either specify Failure or Resolution in this field. This field is required to import the template.
- **Parent code:** Code of the parent.

Note:

The parent code is of the same type as the child code. For example, the parent of a failure code is another failure code, and the same applies to resolution codes.

- **Model categories:** Model categories to which the code can be applied.

Note:

When you select a parent on the code, the model category is inherited from the parent code. However, you can still update this field.

If you don't specify any model category, the code applies to all model categories.

- **Source:** Source of the code.

iii. Save the template.

c. On the Create New Asset service import form, fill in the details.

i. In the **Name** field, provide a name for the asset service import.

ii. Select **Attach file** and then select the code import template that you created in step b.

4. Select **Import**.

Result

- The Code import result section shows the following details:
 - Code rows
 - Code inserts
 - Code ignored
 - Code skipped
 - Code errors
- If the import is successful, the Status of the asset import changes from **Draft** to **Completed**.
- If there are no issues with the template, all the codes that you imported are shown in the Codes list.

Configure settings to monitor asset key performance indicators (KPIs) in the Enterprise Asset Workspace

Set up the necessary configurations in the Admin Center to enable the tracking of KPIs for your enterprise assets. These settings enable you to monitor and manage the performance your assets.

Important:

The settings to enable the tracking of asset performance are available with Enterprise Asset Management version 9.0 and later.

As an enterprise administrator, configure the following settings to monitor asset KPIs:

1. [Opt in to model categories to track performance KPIs for enterprise assets.](#)
2. [Create an operational schedule for enterprise assets.](#)
3. [Map enterprise assets to an operational schedule.](#)

For details on asset performance and the related reports, see [Asset performance reports in the Enterprise Asset Workspace](#) and [Asset Analytics overview for Enterprise Asset workspace](#).

Opt in to model categories to track performance KPIs for enterprise assets

Monitor the performance KPIs of enterprise assets in your organization by enabling the KPI tracking for the models to which the assets belong.

Before you begin

Important:

The settings to enable the tracking of asset performance are available with Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Admin center > KPI configuration**.
2. From the KPI configuration list, select **KPI opt in**.
3. From the list of model categories, select the one for which you want to enable the KPI tracking.
4. On the Asset performance tracking form, select the **Track performance KPI** check box.
5. Select **Save**.

What to do next

Create an operational schedule for enterprise assets.

Create an operational schedule for enterprise assets

Define the scheduled operational time, which is the duration during which the asset will be in use, by creating an operational schedule.

Before you begin

i Important:

The settings to enable the tracking of asset performance are available with Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_admin

About this task

An operational schedule record is stored in the Asset schedule [sn_itam_common_asset_schedule] table. If an operational schedule isn't defined, the Default operation schedule (24/7) hours is applied.

i Note:

The calculation of asset key performance indicators (KPIs) begins when the asset first moves to the In Use state. Therefore, the linked operational schedule must cover the entire period for accurate results.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Admin center > KPI configuration**.
2. From the KPI configuration list, select **Operational schedules**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Operation schedule form

Field	Description
Name	Unique name for the operational schedule.
Parent	Parent schedule that constraints the new schedule. For more details, see Parent and child schedules  .
Time zone	Time zone for the schedule. If you select Floating , the time zone is relative to whatever process is accessing the item at the time. <ul style="list-style-type: none"> ○ For example, if an enterprise administrator in Amsterdam sets a floating schedule for 8:00A.M. to 5:00P.M., a user in San Jose sees the schedule as 8:00 A.M. to 5:00 P.M. ○ When a schedule is defined in a specific time zone, users in different time zones see the schedule with their own time zone applied.
Description	Description of the operational schedule.

5. Select **Save**.
6. Add one or more schedule entries to the operational schedule.

- a. Select the **Schedule Entries** tab.
- b. Select **New**.
- c. On the Schedule Entry New record, fill in the fields.

For details on Schedule Entry New record fields, see [Schedule entry fields](#) .

- d. Select **Submit**.

A schedule entry is created and listed under the Schedule Entries tab.

Note:

You can't edit a schedule or its entries. If you want to stop using an asset schedule, you can deactivate it by deselecting the **Active** check box. You can then create a schedule as needed.

7. **Optional:** To view the calendar view of the schedule with the schedule entries, select **Show schedule**.

What to do next

[Map enterprise assets to an operational schedule.](#)

Map enterprise assets to an operational schedule

Create an asset schedule to map the enterprise assets to an operation schedule.

Before you begin

Important:

The settings to enable the tracking of asset performance are available with Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_admin

About this task

An asset schedule record is stored in the Asset schedule policy [sn_asset_cmn_schedule_policy] table.

Note:

If an asset isn't associated with an operational schedule, the Default asset schedule (24 hours, 7 days a week or 24/7) will be applied.

The *Asset performance - Map schedule policies* job runs weekly to sync the mapping between assets and the operational schedule.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Admin center > KPI configuration**.
2. From the KPI configuration list, select **Asset schedules**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Asset schedule form

Field	Description
Name	Unique name for the asset schedule.
Source table	Source table for the assets. You can select any of the following tables: <ul style="list-style-type: none"> Enterprise asset [sn_ent_asset] Construction asset [sn_ent_construction_asset] Facility asset [sn_ent_facility_asset] Industrial asset [sn_ent_industrial_asset] Linear asset [sn_eam_linear_asset] Medical asset [sn_ent_medical_asset] Retail asset [sn_ent_retail_asset] Tactical equipment asset [sn_ent_tactical_asset] Transportation asset [sn_ent_transportation_asset] Wearable asset [sn_ent_wearable_asset] Hardware [alm_hardware]
Condition	Set a condition to select the assets that you want to associate with the operational schedule. For example, if you set the Department field to IT , the operational schedule is inked to all assets within the IT department. <p>Note: Select the source table before setting the condition.</p>
Schedule	Operational schedule that you want to associate with the assets.
Priority	Order in which schedules should be applied to an asset when there are overlapping schedules.
Active	Indicates whether the asset schedule is active.

5. Select **Save**.

6. **Optional:** To sync the mapping between the assets and the operational schedules on demand, select **Sync KPI records**.

Managing enterprise models and assets

Create and manage your enterprise models and assets throughout their life cycle.

Overview of managing assets and models

Create and manage your enterprise models and assets by performing the following tasks.

Task	Role required	Resources
Create multi-component models and assets	<ul style="list-style-type: none"> sn_eam.enterprise_admin sn_eam.enterprise_asset_manager 	<ul style="list-style-type: none"> Create a multi-component model Create a multi-component asset
Create enterprise models and assets	<ul style="list-style-type: none"> sn_eam.enterprise_admin sn_eam.enterprise_asset_manager 	<ul style="list-style-type: none"> Create enterprise models Create enterprise assets
Create enterprise model components	<ul style="list-style-type: none"> sn_eam.enterprise_admin sn_eam.enterprise_asset_manager 	Create enterprise model components
Create and import classification codes	<ul style="list-style-type: none"> sn_eam.enterprise_admin (for creating classification codes) sn_eam.enterprise_asset_manager (for importing classification codes) 	<ul style="list-style-type: none"> Create classification codes Import classification codes
Add or clone calibration attributes to an enterprise model and asset	<ul style="list-style-type: none"> sn_eam.enterprise_admin sn_eam.enterprise_asset_manager 	<ul style="list-style-type: none"> Add calibration attributes to an enterprise model Clone calibration attributes to an enterprise model Add calibration attributes to an enterprise asset Clone a calibration attribute to an enterprise asset
Create linear assets and linear asset types	sn_eam.enterprise_asset_manager	<ul style="list-style-type: none"> Create linear assets Create linear asset types
Create pallet assets	<ul style="list-style-type: none"> sn_eam.enterprise_asset_manager sn_eam.enterprise_asset_technician 	Create pallet assets in the Enterprise Asset Workspace
Configure TCO for assets	sn_eam.enterprise_asset_manager	Configuring Total Cost of Ownership for enterprise assets

Task	Role required	Resources
Create asset onboarding process and multi-asset onboarding process.	sn_eam.enterprise_asset_manager	<ul style="list-style-type: none"> Create an asset onboarding process Create a multi-asset onboarding process
Track assets using Indoor maps	<ul style="list-style-type: none"> sn_eam.enterprise_admin sn_eam.enterprise_asset_manager 	Track assets using indoor maps in the Enterprise Asset Workspace

Manage risk scores	sn_eam.enterprise_admin	Managing risks scores in Enterprise Asset Management
Normalize enterprise models	sn_eam.enterprise_admin	Normalizing enterprise models
Manage incidents	itil	Managing incidents in Enterprise Asset Management
Create knowledge articles	sn_eam.enterprise_admin	Create a knowledge article for Enterprise Asset Management

Create and manage enterprise models

Create and manage your enterprise models to keep track of your enterprise assets.

Create a multi-component model

Create a multi-component model to define more than one model component based on the same product model.

Before you begin

For details on multi-component models, see [Multi-component models and assets in Enterprise Asset Management](#).

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. Create a model by navigating to **Enterprise Asset Workspace > Enterprise model management**
 You can create a pre-assembled or an user-assembled model. For details on creating a model, see [Create enterprise models](#).
2. After you created a model, add model components to the model.
 For details on creating model components, see [Create enterprise model components](#).

3. Once you added the model components to the model, change the status of the model to **In Production**.
4. Select **Publish to Enterprise Asset Catalog** to publish your model to the catalog.

Create enterprise models

Create a model based on a top tier Enterprise Asset Management model category. Use models to manage and keep track of your assets.

Before you begin

You can create a model based on any of the following Enterprise Asset Management model categories:

- Construction
- Medical
- Transportation
- Industrial
- Facility
- Retail
- Tactical equipment
- Wearable
- Pallet

i Note:

Only consumables created from models in the Enterprise Asset Management application can be used if the **Asset strategy tracking** for the model is set to **create consumable asset**.

i Note:

The Enterprise Asset Management application supports only facilities models that fall under the Facility model [sn_ent_facility_model] child class of the Enterprise good model [sn_ent_model] class. The application does not support facilities models that are listed in the Facility Models [cmdb_facility_product_model] table.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise model management**
2. Select the tab for the model type that you want to create.
 - Select the **All enterprise** tab for all available enterprise model types.
 - Select the tab for a specific enterprise model type, such as **Facility, Industrial, Medical, Retail, or Transportation**.
 - Select the **All models** tab for pallet models.
3. Select **New**.
If you are creating a pallet model, select **New pallet model**.

If you select **New** on any tab other than the **All models** tab, a dialog box opens, prompting you to specify the type and category of the new model that you are creating. Proceed to [step 4](#) to fill in the fields in the dialog box.

If you select **New pallet model** on the **All models** tab, you are automatically redirected to the Create New Product Model page. Proceed to [step 6](#) to fill in the fields on the page.

4. In the dialog box, fill in the fields.

Field	Description
Type  Note: This field appears only if you selected New on the All enterprise tab.	The type of model you want to create. Choose from the following options: <ul style="list-style-type: none"> <input type="radio"/> Enterprise Good Model <input type="radio"/> Construction Model <input type="radio"/> Facilities Model <input type="radio"/> Industrial Model <input type="radio"/> Medical Model <input type="radio"/> Retail Model <input type="radio"/> Transportation Model <input type="radio"/> Tactical Equipment Model <input type="radio"/> Wearable Model
Model category	The category that the model belongs to.

5. Select **Create**.

The Create New Product Model page appears. The model is in **Build** status by default and the model category is a read-only field set to the category that you chose. You can change the status only after you have saved the model record.

6. On the form, fill in the details.

For a detailed description of the fields, see [Model fields for Enterprise Asset Management](#).

7. Select **Save**.

The model is created along with the related tabs such as **Model Components, Assets, Enterprise Model Lifecycles, Compatibles, Substitutes, and Vendor Catalog Items**. You can perform additional configuration on the model by entering details in the related tabs.

8. Change the status of the model to **In Production** once you are done configuring the model.

9. Select **Publish to Enterprise Asset Catalog** to publish your model to the Service Catalog. **Publish to Enterprise Asset Catalog** appears only when you change the status of the model to **In Production**.

Enterprise models can be deleted only by the `sn_eam.enterprise_admin` role.

10. You may select **Update risk** if you updated the model's risk scores and want to propagate the updated scores to the associated assets too.

After the *EAM - Update model risk values to assets* scheduled job is completed, the risk values for all the assets associated with this model is updated.

Create enterprise model components

Create model components and add them to a model. A model comprising of one or more model components is a multi-component model.

Before you begin

Role required: `sn_eam.enterprise_admin` or `sn_eam.enterprise_asset_manager`

About this task

The model category for the component can differ from that of the model. You can choose a different model category for the model component. You can add model components to a model only when the model is in **Build** status.

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise model management**.
2. Select the **All enterprise** tab or the specific model tab for which you want to create model components.
3. Select a model to open the model record.
The Create New Model Component page opens.
4. Select the **Model Components** tab and select **New**.
5. On the form, fill in the details.
For detailed description of the fields, see Model fields for Enterprise Asset Management.
6. Select **Save**.
The newly created model component appears in the Model Components tab and by default, is in the **In production** status even though the model is in **Build** status.

Create model categories

You can create model categories for the Enterprise Asset Management application.

Before you begin

Various base model categories are already available for you to choose from.

Keep the following in mind while creating model categories:

- When you create a configuration item (CI) class in the Configuration Management Database (CMDB), you can also create a corresponding model category to associate that CI class with. By associating a CI class with a model category, you can then associate that CI class with the corresponding asset and product model classes.
- If you associate a CI class with a model category that is already associated with an asset class, the asset and CI synchronization capability automatically triggers, creating assets for all CIs under the given CI class. If an asset is not created automatically, you can create it manually.
- The **Allow pre-allocated**, **Allow in bundle**, and **Allow as main** options are available only if the model category is associated with an asset class.

Note:

These options are not applicable to enterprise model categories.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > Model categories**.
2. Select **New**.
The Create New Model Category page appears.
3. On the form, fill in the fields.

Create New Model Category form

Field	Description
Name	Display name of the model category in the Service Catalog.
Parent category	Parent model category that this model category falls under.
UNSPSC code	United Nations Standard Products and Services Code (UNSPSC) for all products under the model category.
Picture or icon	Visual representation of the model category in the Service Catalog.
CI class	<p>CMDB CI class that you want to associate with the model category.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>Important: You can select a CI class only when you are creating the model category. You can't select one after you have created the model category.</p> </div>
Product model class	Product model class that you want to associate the model category with.
Asset class	<p>Asset class that you want to associate the model category with. You can select a default asset class, such as Enterprise Asset, or any new asset class that you have created. If you select Consumable or Software License, the CI class field becomes read-only since consumables and software licenses do not create CIs. If you specify a CI class and then select Consumable or Software License, the CI class field automatically changes to None.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>Important: You can select an asset class after you have created the model category, but you can't change it after it has been selected.</p> </div> <p>After you associate the model category with an asset class, the Enterprise Asset Management application can automatically create assets based on the given model category.</p>
Allow pre-allocation	Option to allow items under this model category to be added and tracked as pre-allocated assets.
Allow in bundle	Option to allow items under this model category to be used in bundles.
Allow as main	Option to allow items under this model category to be used as the main component in a bundle.
Is product instance	Option that indicates if you are using a product instance to identify and synchronize the assets, CIs, and install base items (IBIs) under this model category.
Enforce CI verification	Option to prevent the Enterprise Asset Management application from automatically creating assets for a specific model category when CIs are added manually or found through Discovery. This option enables you to review and verify new CIs before adding them as assets.

4. Select **Save**.

Result

The model category is created. You can perform additional configurations on the model category by entering details in the **Product Models** tab.

Add a substitute model for an enterprise model

On an enterprise model record, specify the related models that you can substitute the enterprise model with.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise model management view.
 2. Select either the **All enterprise** tab or the tab for a specific model category, such as **Construction**.
 3. From the list of available enterprise models, select the enterprise model that you want to add substitute models for.
 4. On the **Substitutes** tab of the enterprise model record, add substitute models for the given enterprise model.
 - a. On the **Substitutes** tab, select **Add**.
 - b. In the Add model substitute dialog box, select the check box for each model that you want to add as a substitute model.
- Note:** The dialog box displays only the enterprise models that have the same **Asset tracking strategy** as the given enterprise model and do not have a **State of Build**.
- c. Select **Add**.
The dialog box closes and you return to the **Substitutes** tab.
 - d. On the **Substitutes** tab, select the Refresh list icon () to populate the list of newly added substitute models.

Create classification codes

Create classification codes and assign them to enterprise models and model categories to increase the efficiency of enterprise models.

Before you begin

Each classification code is assigned to one or many model categories. Classification codes are stored in the Enterprise model classification [sn_ent_model_classification] table.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise model management > Classification**.
2. Select **New**.
3. On the form, fill in the details.

Field	Description
Classification	<p>The display name of the classification code record which is automatically generated after the record is saved.</p> <p>The display name is a concatenation of the classification code, its description, and the source.</p>
Code	<p>The classification code.</p> <p>Based on your data infrastructure, the code may adhere to a hierarchical structure.</p>
Description	Description of the classification code.
Parent	Parent of the classification code. If you select a parent, the model categories assigned to the parent code are automatically populated in the Model categories field. This field is however editable. You can delete a model category that is automatically populated or you can add another model category.
Source	The source system that a classification code is based on. For example, OmniClass is a classification system for the construction industry.
Model categories	Mode categories assigned to the code.

4. Select Save.

The display name of the classification code is generated and displayed in the **Classification** field. The display name represents the code, the description, and the source. You can view the new classification code record in the Classifications list view page.

Create sources for classification codes

Create sources that you can then assign to classification codes.

Before you begin

A source is a system of classification for a particular industry. For more details on sources, see [Classification codes](#).

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to *Enterprise Asset Workspace* > **Asset operations**.
2. Select **Create sources** under Classifications and then select **New**.
3. On the Create New Enterprise model classification source page, enter a name of the source in the **Source** field.
4. Enter a description of the source in the **Description** field.

5. Select **Save**.

The source appears in the Create sources page.

Import classification codes

Import multiple classification codes at one go to your ServiceNow instance.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to *Enterprise Asset Workspace* > **Admin center** > **Model classifications** > **Import**.
2. Select **New**.
3. On the Create New Enterprise Classification Import page, enter a name for the import in the **Import** field.
4. Select **Download template** to download a spreadsheet.
5. Enter the details in the spreadsheet.
Ensure that you fill out either the Code or the Description column in the spreadsheet. Use commas to specify more than one model category in the Model categories column.
6. Select **Attach File** to upload the spreadsheet (.xlsx).
7. Select **Import** to perform a validation check on the spreadsheet.
After you select Import, the Status field changes from **Draft** and moves to **Pending, Uploading, Transforming**. After the import process is completed, the status changes to either **Completed, Completed with errors, or Failed**. The details of the import process are displayed in the **Enterprise Classification Import** and **Classification import results** sections.
8. Select the **Classification Import Stagings** related list to view the details of the spreadsheet that you uploaded and also view any errors you received.
9. Open any record for which you got an error.
10. Fix the error, upload the spreadsheet, and import the record again.

Add calibration attributes to an enterprise model

Add calibration attributes to an enterprise model to specify and manage the calibrations that are required for the associated enterprise assets throughout their life cycles.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

You can add calibration attributes at the enterprise model level or at the individual enterprise asset level. Alternatively, you can create common calibration attributes that are not associated with any enterprise models or enterprise assets. For details on how to add calibration attributes to an individual enterprise asset, see [Add calibration attributes to an enterprise asset](#). For details on how to create common calibration attributes, see [Create a calibration attribute library](#).

Procedure

1. Navigate to **Workspaces** > **Enterprise Asset Workspace**.
2. From the Enterprise Asset Workspace, open the Enterprise model management view.
3. Select either the **All enterprise** tab or the tab for a specific model category, such as **Construction**.

4. From the list of available enterprise models, select the enterprise model that you want to add calibration attributes to.
5. On the **Calibration attributes** tab of the enterprise model record, select **New**.
6. On the form, fill in the fields.

Create New Calibration Attribute form

Field	Description
Attribute details	
Name	Name of the calibration attribute.
Short description	Brief description of the calibration attribute.
Criticality	Criticality level that indicates how important the calibration attribute is.
Service frequency	Frequency at which you must perform the calibration.
Category	Type of calibration. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>i Note: The Enterprise Asset Management application includes default calibration categories such as Electrical, Flow, Humidity, and Pressure. You can create additional calibration categories for any calibrations that do not fall under the default categories. For detailed instructions, see Create a calibration category for your enterprise asset calibrations.</p> </div>
Active	Option that indicates if the calibration attribute is active.
Order	Order in which the calibration attribute applies to the enterprise model. If your enterprise model contains more than one calibration attribute, the attribute with the lowest numerical value applies to the model first. <div style="background-color: #e1f5fe; padding: 5px; margin-top: 10px;"> <p>i Important: You must use a unique numerical value for each calibration attribute.</p> </div>
Calibration properties	
Value type	Method by which you want to measure tolerance conformance. Select one of the following options: <ul style="list-style-type: none"> ○ Accuracy % full scale: Fixed percentage of accuracy that your calibration measurements must fall within at any point within the enterprise asset's full measurement range. The corresponding tolerance limits remain the same at every point within the measurement range. For example, if a measurement range is 100 units and the accuracy percentage is set to ±1%, the tolerance limits are ±1 unit at every point within the measurement range. ○ Accuracy % point: Fixed percentage of accuracy that your calibration measurements must fall within at a specific point within the enterprise asset's full measurement range. The corresponding tolerance limits increase or decrease proportionally based on the value of the point that you are comparing your calibration measurement against. For example, if your accuracy percentage is set to ±1% and you want to compare your calibration measurement against a point that has a value of 50 units, the tolerance limits for this specific point are ±0.5 units. If you want to compare your calibration

Field	Description
	<p>measurement against a point that has a value of 60 units, the tolerance limits increase to ± 0.6 units.</p> <ul style="list-style-type: none"> ○ Range: Measurement range that your calibration measurements must fall within. The corresponding tolerance limits are based on the lowest and highest acceptable point values within the range. ○ Less than: Value within the enterprise asset's full measurement range that your calibration measurements must fall below. The corresponding tolerance limit is based on the highest acceptable point value within the range. ○ Greater than: Value within the enterprise asset's full measurement range that your calibration measurements must lie above. The corresponding tolerance limit is based on the lowest acceptable point value within the range. ○ True/false: Option to assess any qualitative elements of the calibration.
Scale	<p>Full measurement range that you're measuring tolerance conformance against.</p> <p>Note: This field appears only if you set the Value type field to Accuracy % full scale.</p>
Unit	<p>Unit of measurement that you're using to measure tolerance conformance.</p> <p>Note: This field appears only if you set the Value type field to one of the following options:</p> <ul style="list-style-type: none"> ○ Accuracy % full scale ○ Accuracy % point ○ Range ○ Less than ○ Greater than
Accuracy (%)	<p>Percentage of accuracy that your calibration measurements must fall within.</p> <p>Note: This field appears only if you set the Value type field to either Accuracy % full scale or Accuracy % point.</p>
Resolution	<p>Smallest distinguishable change in value that you can detect and measure. The higher the resolution is, the more specific the change in value is.</p> <p>Note: This field appears only if you set the Value type field to one of the following options:</p> <ul style="list-style-type: none"> ○ Accuracy % full scale ○ Accuracy % point
Quality standard	
Quality standard	<p>Set of requirements and guidelines that you must follow when performing the calibrations.</p>

Field	Description
	<p>Note: You can create quality standards manually in the Admin center view of the Enterprise Asset Workspace. See Create a quality standard for your enterprise asset calibrations for detailed instructions.</p>
Instrument	
Instrument model	Model of the instrument that you must use to perform the calibrations.
Instruction	General instructions or instrument settings that you must follow when performing the calibrations.

7. Select Save.

The form closes and you are automatically redirected to the new calibration attribute record.

8. Specify the points at which you can measure tolerance conformance.

Important:
You must specify one or more points within each enterprise asset's measurement range. If you do not specify at least one point, the calibration attribute cannot be set to Active.

a. On the calibration attribute record, select Add calibration points.

The Calibration points dialog box opens.

b. In the dialog box, fill in the fields.

Calibration points dialog box

Field	Description
Point name	Name of the point.
Expected value	<p>Value that you want to measure tolerance conformance against. If you set the Value type field to either Accuracy % full scale or Accuracy % point in the Create New Calibration Attribute form, enter the value of the point that you want to measure against. If you set the Value type field to True/false, select a Boolean value of either true or false.</p> <p>Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form.</p> <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ True/false
Order	Order in which you want to use the point to measure tolerance conformance. If your calibration attribute contains more than one point, the point with the lowest numerical value is calibrated first.

Field	Description
	<p>i Important: You must use a unique numerical value for each point.</p>
Lower tolerance	<p>Lowest acceptable value that the calibration measurement can reach to stay in conformance.</p> <p>i Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form:</p> <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ Range ▪ Greater than <p>If you set the Value type field to either Accuracy % full scale or Accuracy % point, this field is read-only.</p>
Upper tolerance	<p>Highest acceptable value that the calibration measurement can reach to stay in conformance.</p> <p>i Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form:</p> <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ Range ▪ Less than <p>If you set the Value type field to either Accuracy % full scale or Accuracy % point, this field is read-only.</p>

c. To add an additional point to the calibration attribute, select the Add Content icon () and then fill in the fields.
Repeat this step for each point that you want to add.

d. Select **OK**.

The dialog box closes and the points appear on the **Calibration points** tab of the calibration attribute record.

What to do next

Create work orders to track the calibrations that are made to the associated enterprise assets. These work orders must use a work order template with tasks that have a Work type of Calibration. For more information on work orders, see [Managing work orders for your enterprise assets](#).

Clone calibration attributes to an enterprise model

Clone an existing calibration attribute to an enterprise model to add a calibration attribute with similar settings.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise model management view.
2. Select either the **All enterprise** tab or the tab for a specific model category, such as **Construction**.
3. From the list of available enterprise models, select the enterprise model that you want to clone a calibration attribute to or from.
4. On the **Calibration attributes** tab of the enterprise model record, use one of the following options to clone a calibration attribute:
 - To clone a calibration attribute from this enterprise model to another enterprise model, use the following steps:
 - a. From the list of available calibration attributes, select the check box for the calibration attribute that you want to clone.
 - b. Select **Clone to models**.
 - c. In the Select models dialog box, select the **Clone as active** check box to automatically set the cloned calibration attribute to active.
 - d. Select the check box for the enterprise model that you want to clone the calibration attribute to.
 - e. Select **Clone**.

The calibration attribute is cloned to the selected enterprise model.

Note:

If the selected enterprise model already contains another calibration attribute with the same name, this attribute is cloned with a numeric suffix appended to the name.

- To clone a calibration attribute from another enterprise model to this enterprise model, or to clone a common calibration attribute from your calibration attribute library to this enterprise model, use the following steps:
 - a. Select **Clone from**.
 - b. In the Select attribute to clone dialog box, select the **Clone as active** check box to automatically set the cloned calibration attribute to active.
 - c. Select the check box for the calibration attribute that you want to clone.
 - d. Select **Clone**.

The calibration attribute is cloned to the enterprise model and appears in the list of available calibration attributes.

Note:

If the enterprise model already contains another calibration attribute with the same name, this attribute is cloned with a numeric suffix appended to the name.

View the enterprise model hierarchy in the Enterprise Asset Workspace

View the hierarchy details of pre-assembled and user-assembled enterprise models in a tree-like format in the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

The Model hierarchy option is shown only for a model that's associated with a parent or that has model components. Model hierarchy isn't shown for simple, consumable, and hardware models. The parent hierarchy details of a model aren't displayed.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Model management.**
2. Select the pre-assembled or user-assembled model.
3. Select the Hierarchy icon () on the contextual sidebar.
The model hierarchy is shown in a tree-like format. All the model components of the model that you selected are displayed.

On the model hierarchy, the following details are displayed:

- A number at the right of the model shows the total number of model components associated with that model.
- Quantity is displayed only for consumable models.
- The component number is added as a prefix to the model component.

Manage the lifecycle of enterprise models with calculated lifecycle templates

Manage the complete lifecycle of enterprise models by creating calculated lifecycle templates and associating these templates with the models.

Create Calculated model lifecycle templates in the Enterprise Asset Workspace

Create Calculated model lifecycle templates to manage the complete lifecycle of the models efficiently.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Asset Operations.**
2. From the **Calculated model lifecycle** list, select **Calculated model lifecycle templates.**
The list of existing Calculated model lifecycle templates is displayed.
3. Select **New.**
4. On the form, fill in the fields.

Create New Calculated Lifecycle Template form

Field	Description
Name	Name of the Calculated lifecycle template.
Description	Brief information about the template.

Field	Description
Active	Option to indicate that the Calculated lifecycle template is available for use.

5. Select **Save**.

The **Calculated Lifecycle formulas** tab is displayed with the list of calculated lifecycle formulas for the following lifecycle phases:

- **End of Extended Support**
- **End of Life**
- **End of Sale**
- **End of Support**
- **End of General Availability**

6. Define the calculated lifecycle formula for a lifecycle phase.

a. Select the calculated lifecycle formula.

b. In the **Phase start** and **Phase end** fields, enter the number of months for calculating the start date and end date of the lifecycle phase.

c. Select **Save**.

The calculated lifecycle formula is updated with the values that you entered in the **Phase start** and **Phase end** fields.

What to do next

Associate the Calculated model lifecycle template with an enterprise model. For details, see [Associate an enterprise model with a Calculated model lifecycle template](#).

Associate an enterprise model with a Calculated model lifecycle template

Associate an enterprise model with a Calculated model lifecycle template to populate the lifecycle details of the model automatically.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Enterprise model management**.

2. Select the **All enterprise** tab.

3. Select the model that you want to associate with a Calculated model lifecycle template.

4. In the **Model Details** section of the Model form, enter the template details.

a. In the **Calculated lifecycle template** field, select the calculated model lifecycle template that you want to apply to the model.

b. In the **Calculated lifecycle start date**, select the date from which the Phase start date and Phase end date are calculated for each lifecycle phase defined in the Calculated lifecycle template that you selected.

5. Select **Save**.

Result

The list of lifecycle phases with details such as Phase start date, Phase end date, and Source is displayed in the **Enterprise Model Lifecycles** tab.

Create and manage enterprise assets

Create and manage enterprise assets throughout their life cycle.

Create a multi-component asset

Track and manage your assets by creating a multi-component asset from a multi-component model.

Before you begin

For details on multi-component models, see [Multi-component models and assets in Enterprise Asset Management](#).

Role required:

- sn_eam.enterprise_admin
- sn_eam.enterprise_asset_manager

Procedure

1. Create a model by navigating to [Enterprise Asset Workspace](#) > [Enterprise model management](#)

For details on creating a model, see [Create enterprise models](#).

2. After you created a model, add model components to the model.

For details on creating model components, see [Create enterprise model components](#).

3. Create assets from the multi-component model.

You can create a pre-assembled or an user-assembled asset.

For details on creating an asset, see [Create enterprise assets](#). Once you create assets, child assets are automatically created.

a. If you create a user-assembled asset, open the asset record.

b. Select either of the two to assemble assets:

- **Assemble:** gives you a choice to choose the assets present in the parent asset's stockroom. Once you select the assets, select **Assemble**. For details on assembling assets, see
- **Auto assemble:** triggers a process that automatically selects assets from a stockroom and associates those assets with the parent asset. If the required quantity of assets is not available, an error appears.

c. If you want to release all child assets, select **Release all assets**.

This process releases all child assets from the parent asset and assigns them back to the parent stockroom.

The released assets move to **In Stock** status. **Release all assets** is only visible on screen when assets are associated with a parent asset.

4. To swap child assets, in the Details tab select **SWAP.**

The multi-component asset needs to be in the **In maintenance** state to swap assets. You can swap multiple child assets at one go with other assets from the same model in any stockroom.

The model must be in the **In stock** state and **Available** sub state.

Create enterprise assets

Create assets for specific model categories in the Enterprise Asset Management application.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Enterprise asset classes have a one to one mapping to product model classes and model categories. Enterprise asset classes are mapped to existing CI classes where applicable.

There are two kinds of assets: consumable assets and serialized assets. Consumable assets don't have an asset tag or a serial number.

Note:

This topic provides details on how to create enterprise, construction, facility, industrial, medical, retail, tactical equipment, transportation, and wearable assets. For details on how to create pallet assets, see [Create pallet assets in the Enterprise Asset Workspace](#).

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate**.
2. Select the **All enterprise** tab to select from all the Enterprise Asset Management models or select a specific asset tab such as **Facility, Industrial, Medical, Retail, Transportation**, and **Consumable**.
3. Select **New**.
4. In the dialog box, fill in the fields.

Field	Description
Type	<p>The type of asset you want to create. Choose from the following options:</p> <ul style="list-style-type: none"> ○ Enterprise Asset ○ Construction Asset ○ Facilities Asset <p>Note: The Enterprise Asset Management application supports only facilities assets that fall under the Facility asset [sn_ent_facility_asset] child class of the Enterprise asset [sn_ent_asset] class. The application does not support facilities assets that are listed in the Facility [alm_facility] table.</p> <ul style="list-style-type: none"> ○ Industrial Asset ○ Medical Asset ○ Retail Asset ○ Transportation Asset ○ Tactical Equipment Asset ○ Wearable Asset

Field	Description
	<p>Note: This field only appears if you selected New from the All enterprise tab.</p>
Model category	The model category that the asset belongs to. Based on the model category selected, the asset can be linked to a configuration item.

5. Select Create.

The Create new asset page appears. By default, the asset is in **Build** state. You can change the status only after you've saved the asset record.

6. In the Create New asset page, fill in the details.

For a detailed description of the fields, see [Asset fields for enterprise assets](#).

7. Select Save.

The asset is created along with a Configuration Item (CI) for this asset. Child assets are automatically created for the newly created asset. You can perform additional configuration on the asset by entering details in the other tabs such as **Child Assets, Contracts, Expense Lines, and All Related Tasks**.

Note:

The All Related Tasks tab shows a list of the related tasks such as Disposal task, Resale task, Recall task, Work order task, and Move task associated with the asset. The Recall task and the Work order task associated with the child assets are also shown in the All Related Tasks tab.

For the pre-assembled industrial assets, the MAC address field is also shown in the **Child Assets** tab.

8. After you're done performing the additional configuration on the asset, you can change the status of the asset to In Use.

The asset can be deleted only by the sn_eam.enterprise_admin role.

Create linear assets

Create linear assets to diversify your Enterprise Asset Management portfolio.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to Enterprise asset estate > Linear assets.

2. Select New.

3. On the form, fill in the fields.

4. Select Save.

The linear asset is created and appears in the Linear assets list. You can perform additional configuration on the linear asset by entering details in the other related lists such as **Linear segments, Discreet assets, Related linear assets, Contracts, and Expense lines**.

Create linear asset types

Create linear asset types to categorize linear assets.

Before you begin

The following predefined linear asset types are already part of the base system:

- Railroad
- Roadway
- Sewer
- Sidewalk
- Utility cable
- Trail

Follow these steps to create customized linear asset types.

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Linear asset types**.
2. Select **New**.
3. Enter a name for the linear asset type in the **Name** field.
4. Select a parent for the linear asset type from the **Parent** list.
5. Select **Save**.

The new linear asset type appears in the Linear asset types related list. If you don't see it in the related list, select the Refresh List icon on the right side of the page.

Create segments for linear assets

Create segments for linear assets to assign work orders to the segments. You can also create maintenance plans for the segments.

Before you begin

Linear segments are parts of a linear asset. When creating a linear segment, you must enter values for any two of the following fields and the value for the third field is populated automatically. For example, when you enter the start and end markers, the **Length** field is automatically filled in. Similarly, entering the start marker and length populates the **End marker** field.

- Start marker
- End marker
- Length

If you enter start marker or end marker on the map, markers must be within 10 feet from the linear asset line. This value can be customized by changing the value of the asset_property *com.eam.linear_segment_marker_boundary*.

For details on creating work orders and maintenance plans, see [Create a work order for an enterprise asset](#) and [Create a maintenance plan for your enterprise assets](#).

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Linear assets.**
2. Open the linear asset record on which you want to add segments.
3. Select the Linear segments related list.
4. Select **New**.
5. On the form, fill in the details.

6. Select **Save**.
The linear segments appear in the Linear segments related list.

Associate a discrete asset to a linear asset

Associate a discrete asset to a linear asset in order to query and find these assets from the linear asset at a later point of time.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Linear assets.**
2. Open the linear asset record with which you want to associate a discrete asset.
3. Select the Discrete assets related list.
4. Select **New**.
5. On the form, fill in the fields.

6. Select **Save**.

Find linear asset relationships

You can find relationships between linear assets such as overlapping, continuing, or intersecting assets.

Before you begin

You may want to find a relationship between linear assets to associate them with each other. For example, you want to associate a linear asset with another linear asset such as an intersecting asset, in order to find all intersecting linear assets for the given linear asset. Similarly, you want to associate a linear asset with another linear asset such as an overlapping asset, in order to find all overlapping linear assets for that given linear asset. Once relationships are found between linear assets, records are created for the related linear assets.

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Linear assets.**
2. Open a linear asset record for which you want to find relationships with other linear assets.
3. Select **Find relationships**.
A confirmation message box appears.
4. Select **Find relationships** in the confirmation message box.

A search is performed for relationships between this linear asset and other linear assets. A message appears if any relationships have been identified, and for any relationship found, records are created in the Related linear assets related list.

5. Select **Save**.
6. Select the Related linear asset related list to view the identified relationships.
For each record, the kind of relationship it has with the linear asset is mentioned such as continuing, overlapping, or intersecting.

Create pallet assets in the Enterprise Asset Workspace

Create pallet assets to track and manage the pallets that can transport and store your enterprise, hardware, base, bundle, and consumable assets.

Before you begin

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. On the **All assets** tab, select **New pallet asset**.
3. On the form, fill in the fields.

Create New Pallet form

Field	Description
Pallet Details	
Vendor	Vendor that the pallet was purchased from. If the pallet was automatically created from a procurement purchase order, the Vendor field is automatically set to the same vendor that was specified on the purchase order.
Model	Pallet model that the pallet is associated with.
Asset tag	Alphanumeric value that your organization assigns to the pallet for tracking purposes.
State	Current state of the pallet. This field is automatically set to In stock . However, you can also set this field to one of the following options: <ul style="list-style-type: none"> ○ In transit ○ Retired ○ Missing
Stockroom	Stockroom that the pallet is located in.
Aisle and space	Stockroom aisle and space that the pallet is located in.
Parent	Parent asset of the pallet.
Comments	Message that you want to apply to the pallet.
Pallet type	Type of pallet. Select one of the following options: <ul style="list-style-type: none"> ○ Pallet ○ Bin

Field	Description
	<ul style="list-style-type: none"> ○ Box ○ Container ○ Other
Substate	Current substate of the pallet, such as Available or Reserved . The options that are available in the Substate field change based the option that you select in the State field.
Reserved for	User who the pallet is reserved for.
Location	<p>Physical location of the pallet.</p> <p>Note:</p> <p>If you set the location to a specific place and then set the <code>sn_itam_common.sn_enable_indoormap_for_assets</code> system parameter to true on your ServiceNow instance, the pallet asset record, which is generated after you fill in all fields and save this form, includes an interactive map that shows the real-time location of the asset.</p> <p>This map is still included in the pallet asset record when you open the record from an associated work order task or stockroom record.</p> <p>The map does not display by default. To display the map, select the Location map icon () on the sidebar of the pallet asset record.</p>
Disposal	
Disposal vendor	Vendor that is assigned to carry out the disposal order for the pallet.
Vendor disposal order ID	ID number that is assigned to the disposal order by the disposal vendor.
Disposal date	Date on which the disposal order is completed.
Resold value	Estimated price that the pallet can be resold for.
Scheduled retirement	Date on which you want to retire the pallet.
Retired date	Actual date on which you retired the pallet.
Beneficiary	Organization that receives the pallet after it is retired.
Resale price	Value of the pallet when it is retired.
Activities	
Work notes	Work notes related to the pallet.

4. Select Save.

Add assets to a pallet in the Enterprise Asset Workspace

Add enterprise, hardware, base, bundle, or consumable assets to a pallet so that you can track and manage them as a group.

Before you begin

To add hardware, base, or bundle assets to a pallet, install and activate the Hardware Asset Management application on your ServiceNow® instance. To install and activate the application, request it from the [ServiceNow Store](#).

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician

About this task

You can add an asset to a pallet only under the following conditions:

- The **State** field on the pallet asset record is set to **In stock**.
- The **State** field on the asset record is set to one of the following options:
 - **On order**
 - **In stock**
 - **In transit**
- The **Stockroom** field on the asset record is either empty or set to the same stockroom as the pallet.
- The asset isn't associated with another parent asset.

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. On the **All assets** tab, select the pallet that you want to add assets to.
The pallet asset record opens.
3. Select the **Assets** tab.
4. Add assets to the pallet.
 - To add enterprise, hardware, base, or bundle assets to the pallet, use the following steps:
 - a. Select **Add assets**.
The Add assets dialog box opens.
 - b. In the dialog box, select the check box for every asset that you want to add to the pallet.
 - c. Select **Add**.
 - To add consumable assets to the pallet, use the following steps:
 - a. Select **Add consumables**.
The Add consumable to pallet dialog box opens.
 - b. In the **Consumable** field, search for and select the consumable asset that you want to add to the pallet.
 - c. In the **Quantity** field, specify the quantity of the consumable asset that you want to add to the pallet.
 - d. Select **Add**.

Result

The assets are added to the **Assets** tab of the pallet asset record.

Remove assets from a pallet in the Enterprise Asset Workspace

Remove any enterprise, hardware, base, bundle, or consumable assets that you no longer want to track and manage as part of a pallet.

Before you begin

To remove hardware, base, or bundle assets from a pallet, install and activate the Hardware Asset Management application on your ServiceNow® instance. To install and activate the application, request it from the [ServiceNow Store](#) .

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. On the **All assets** tab, select the pallet that you want to remove assets from.
The pallet asset record opens.
3. Select the **Assets** tab.
4. From the list of available assets, select the check box for each asset that you want to remove from the pallet.
5. Select **Remove**.

Result

The assets no longer appear on the **Assets** tab.

Using pallet assets to manage your asset inventory in the Enterprise Asset Workspace

You can manage your asset inventory by using pallets and the assets contained within those pallets in your transfer orders, disposal orders, resale orders, and various consumption workflows.

Moving pallets between stockrooms

You can use transfer orders to move in-stock pallets from one stockroom to another. If you're moving a pallet that contains assets, those assets are also moved as part of the same transfer order. If you move only the assets that are contained within a pallet, those assets are automatically removed from the corresponding pallet asset record after the Ready for fulfillment task is closed.

For more information about transfer orders, see [Create a transfer order in Enterprise Asset Workspace](#).

Disposing of pallets

When a pallet is nearing the end of its life cycle or is no longer functional, you can dispose of it using a disposal order. If the pallet contains any assets, you can choose to dispose of the pallet and its assets using any of the following options:

 Note:

You can dispose of only the enterprise assets and enterprise-based consumable assets that are contained within your pallets. If a pallet contains any hardware, bundle, or hardware-based consumable assets, those assets are automatically updated with a State of Invalid and can't be processed as part of a disposal order.

- Dispose of both the pallet and all assets that are contained within that pallet.
- Dispose of both the pallet and only certain assets that are contained within that pallet. Any assets that you choose to retain are automatically removed from the corresponding pallet asset record.
- Dispose of the pallet but retain all assets that are contained within that pallet. If you select this option, all assets are automatically removed from the corresponding pallet asset record.
- Retain the pallet but dispose of all assets that are contained within that pallet. If you select this option, all assets are automatically removed from the corresponding pallet asset record.
- Retain the pallet but dispose of only certain assets that are contained within that pallet. Any assets that you dispose of are automatically removed from the corresponding pallet asset record.

For more information about disposal orders, see [Create a disposal order in the Enterprise Asset Workspace](#).

Reselling pallets

To help reduce waste and save costs, you can use resale orders to resell any pallets that you're no longer using. If a pallet contains any assets, you can choose to resell the pallet and its assets using any of the following options:

Note:

You can't resell any hardware assets, asset bundles, and non-enterprise consumable assets that are contained within your pallets.

- Resell both the pallet and all assets that are contained within that pallet.
- Resell both the pallet and only certain assets that are contained within that pallet. Any assets that you choose to retain are automatically removed from the corresponding pallet asset record.
- Resell the pallet but retain all assets that are contained within that pallet. If you select this option, all assets are automatically removed from the corresponding pallet asset record.
- Retain the pallet but resell all assets that are contained within that pallet. If you select this option, all assets are automatically removed from the corresponding pallet asset record.
- Retain the pallet but resell only certain assets that are contained within that pallet. Any assets that you resell are automatically removed from the corresponding pallet asset record.

For more information on resale orders, see [Create an asset resale flow](#).

Consuming assets within a pallet

Assets that are contained within a pallet can be consumed through various asset workflows.

Return Merchandise Authorization (RMA) flow

A Return Merchandise Authorization (RMA) is an agreement between a buyer and seller that allows the buyer to return, replace, or request the repair of a defective product within the specified warranty period. When an asset within a pallet becomes defective, you can initiate its replacement or repair by using an RMA order. Any assets that you include in an RMA order are automatically removed from the corresponding pallet asset record.

For more information about RMA orders, see [Requesting a Return Merchandise Authorization \(RMA\) for defective enterprise assets](#).

Local Order subflow

You can source and fulfill asset requests using assets that are available in the requester's local stockroom. When an asset within a pallet is sourced and consumed locally as part of an asset request, it's automatically removed from the corresponding pallet asset record after the Enterprise Confirm asset task is closed.

For more information on sourcing assets from local stockrooms, see [Source requests from Enterprise Asset workspace](#).

Loaner Request flow

If you need to use an asset for only a short period of time, you can request to loan that asset by using a loaner request. When an asset within a pallet is loaned out, it's removed from the corresponding pallet asset record after the Prepare task for the loaner request is closed.

For more information on loaning assets, see [Request a loaner asset in Enterprise Asset Workspace](#).

Leased Asset Return flow

If a contract for a leased asset is nearing its expiration, you can return the leased asset to the asset vendor before incurring any penalty fees. When a leased asset within a pallet is returned to the asset vendor, it is automatically removed from the corresponding pallet asset record after the Shipment task for the asset is closed.

For more information about returning leased assets, see [Return a leased enterprise asset](#).

Swap tasks from the IT Service Management Asset Management application

The ServiceNow[®] Asset Management application enables you to track and manage your assets. If you use the application to swap an asset within a pallet, that asset is automatically removed from the corresponding pallet asset record after it's swapped.

For more information on the Asset Management application, see [Asset Management](#) .

Update enterprise assets that have unknown enterprise models

If an enterprise asset is associated with an unknown enterprise model, update it with a known enterprise model so that you can accurately categorize and track it.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Note:

You can update the enterprise model only for serialized and multi-component enterprise assets.

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. Select either the **All enterprise** tab or the tab for a specific enterprise asset type, such as **Medical**.

3. From the list of available enterprise assets, select an enterprise asset for which the **Model** field is set to **Unknown Model**.
The asset record opens. All asset record fields are read-only.
4. On the asset record, select **Update**.
The To what type of enterprise asset would you like to change? dialog box opens.
5. In the dialog box, fill in the fields.

To what type of enterprise asset would you like to change? dialog box

Field	Description
Type	Enterprise asset type that you want to categorize the enterprise asset under.
Model category	Enterprise model category that you want the enterprise asset to belong to. The enterprise asset can be linked to a corresponding configuration item (CI) based on the enterprise model category that you select.
Model	Enterprise model that you want to associate the enterprise asset with.

6. Select **Update**.
The dialog box closes and you automatically return to the asset record. If the update is successful, the asset record fields become editable.

Note:

If the selected enterprise asset type, enterprise model category, and enterprise model update the enterprise asset to a user-assembled multi-component asset, the **State** field on the asset record automatically changes to **Build**. The **Assemble** and **Auto assemble** buttons also appear on the asset record. You can use these buttons to initiate the assembly process for the enterprise asset. For more information on user-assembled multi-component assets, see [Select assets for user-assembled asset](#).

Swap assets for parent multi-component asset

Swap child assets that are part of a multi-component asset. You can swap out only one child asset at a time.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

You can swap assets that are in the following states:

- In use, only if the child asset is hot swappable
- In maintenance
- In stock (Substate Defective or Pending repair)

The swap functionality is available only for the parent asset of a multicomponent asset.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise model management**.
2. Select a multi-component record.
3. Select the **Assets** tab and select a parent asset.
4. Select **Swap**.
5. In the **Swap asset** dialog box, fill in the details.

- a. In the **Asset to swap out** field, select the child asset that you want to swap. The **Asset Tag** and the **Serial Number** fields are displayed. These fields are automatically populated only if the details are available in the Asset [alm_asset] table. Otherwise, you must manually enter the details in these fields to proceed with the Swap action.

Note:

The **Asset Tag** and the **Serial Number** fields aren't displayed for consumables.

- b. In the **Choose stockroom for asset swap** field, select the stockroom from which you want to choose an asset to swap with your asset.
- c. To display assets that are based on substitute models, select the **Include assets based on substitute models** check box.

Assets of a substitute model are shown in the **Replacement asset** field only if they meet the following criteria:

- The asset function isn't a loaner or the asset function is empty.
- The **State** or **Substate** is **In Stock** or **Available**.
- The potential replacement asset's **Parent** field is empty.
- Stockroom is the same as the value entered in the stockroom field.

When the assets that meet the substitute model criteria aren't shown in the **Replacement asset** field, search for the model name because the search query refreshes with each keystroke.

- d. In the **Replacement asset** field, select the asset that you want to swap with. You can only choose from the similar assets that are available in the stockroom that you selected.
- e. In the **Quantity** field, enter the quantity of assets that you want to swap. This field is automatically populated with the quantity of the asset that you want to swap. However, you can change the value in this field only if the asset is a consumable. For all the other assets, this field is a read-only field. You can't swap more than the actual quantity of the consumable. For example, if you have five consumables, you can either swap less than 5 or swap all the five consumables.
- f. Select **OK**.

Result

- The asset is successfully swapped and the new asset inherit the State and Status of the parent asset.
- The state of the swapped-out asset changes to In stock and the substate changes to Pending repair. If the asset is a consumable, the state changes to In stock and the and substate changes to Pending disposal.
- The stockroom of the swapped out asset changes to the stockroom that you selected in the **Choose stockroom for asset swap** field.

Select assets for user-assembled asset

Create a user-assembled asset by selecting assets from the parent asset's stockroom.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Open the user assembled model and open an asset record from the **Assets** tab.
2. Select **Assemble** to open the Select assets dialog box.
3. Fill in the form details.

Field	Description
Model component	The model components associated with the multi-component model.
Quantity	Quantity of the model component.
Asset	Assets from the parent stockroom. For consumable assets, the quantity of the asset in the stockroom is also mentioned.
Action	Indicates if the corresponding model component is required or not. A enabled cross indicates that you can remove the model component. A disabled cross indicates that this is a required model component. If you remove a model component, the Select more model components drop-down box appears allowing you to restore the model components that you removed.

4. Select Assemble.

The assets you selected are added to the parent asset. You can view these assets in the **Child Assets** tab. All consumable assets are displayed as a single record, instead of individual records.

Release assets from the parent asset

Release a child asset that is no longer required to be associated with its parent asset.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

You can release only one child asset at a time from a user-assembled, pre-assembled, or a single asset.

You can release an asset that isn't required or an add-on asset that's in one of the following states:

- In use
- In maintenance
- In stock (Substate as Pending disposal)
- In stock (Substate as Pending repair)

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate**.
2. Select the parent asset record from which you want to release assets.
3. Select **Release assets**.
4. In the **Release asset** dialog box, fill in the details.
 - a. In the **Asset to release** field, select the child asset that you want to release. The **Asset Tag** and the **Serial Number** fields are displayed. These fields are automatically populated only if the details are available in the Asset [alm_asset] table. Otherwise, you must manually enter the details in these fields to proceed with the Release action.

Note:
The **Asset Tag** and the **Serial Number** fields aren't displayed for consumables.
 - b. In the **Select stockroom for released assets** field, select the stockroom to which the child asset should be released.
 - c. In the **Quantity** field, enter the quantity of assets that you want to swap. This field is automatically populated with the quantity of the asset that you want to swap. However, you can change the value in this field only if the asset is a consumable. For all the other assets, this field is a read-only field. You can't swap more than the actual quantity of the consumable. For example, if you have five consumables, you can either swap less than 5 or swap all the five consumables.

Result

- The asset that you released isn't listed in the **Child assets** tab.
- The state of the released asset changes to In stock and the substate changes to Pending disposal.

Create additional child assets

Create additional child assets for the model even if the assets are not defined in the model component.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace** and select either **Enterprise asset estate** or **Enterprise model management** to access the **Child Assets** related list tab.
2. Select **Add** to select assets from a stockroom. **Add** is visible only if the asset is in one of the following states:
 - In Build
 - In Use
 - In Maintenance
 - In Stock Defective
 - In Stock Pending Repair
3. Select a stockroom and assets in the *Select child asset to add* dialog box.
4. Select **Add**.

Configuring Total Cost of Ownership for enterprise assets

Configure your Total Cost of Ownership (TCO) to track your assets.

Configuring TCO involves the following procedures:

- Create task rate cards to capture costs per task type.
- Create labor rate cards to capture costs by the time consumed on an hourly basis.
- Create a TCO report to compare the actual or projected TCO of assets and a TCO report source.
- Create a TCO report source to add sources to a TCO report.
- Create expense lines for closed tasks.

Create a TCO report in Enterprise Asset Workspace

Create a TCO report to compare the actual or projected TCO of assets or to compare the actual or projected asset TCO with the benchmark cost of the enterprise model.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Asset analytics > Asset TCO**.
2. Select **New** on the right side of the page.
3. Select **Save**.
The report is created and the TCO report sources related list appears. You can now add the report sources.

Create a TCO report source in Enterprise Asset Workspace

Create a TCO report source to add report sources to a TCO report.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Asset analytics > Asset TCO**.
2. Open the report for which you want to create report sources from the Comparative reports section.
3. Select the TCO report sources tab.
4. Select **New**.
5. On the form, fill in the fields.

Create New TCO report source

Field	Description
Name	Name of the report source
Active	Indicates if the report source is active or not. By default, this check box is selected.

Field	Description
	<p>Note: You can have a maximum of four active report sources for a TCO comparison report at any given time. If you want to add another active report source, you need to inactivate a report source.</p> <p>For a TCO comparison report, you can have a maximum of four active report sources at any given time. If you want to add another active report source, you need to inactivate an existing report source.</p> <p>For a TCO vs benchmark report, you can only have only one active report source.</p>
Report table	The table this report is based on.
Set conditions	Specify a filter to select assets with certain conditions.
Description	Description of the report source.

6. Select Save.

The new report source is added to the TCO report sources tab.

Create a task rate card in Enterprise Asset Workspace

Create a task rate card to capture costs per task type in the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Task rate cards are included in the base system. Except for the **Number** field, all other fields on the default task rate cards are editable. You can't delete any of the base system task rate cards. The following steps are to create a task rate card.

To use task rate cards, you must activate the ServiceNow® Cost Management (com.snc.cost_management) plugin.

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > TCO configuration > Task rate card.**
2. Select **New.**
3. On the form, fill in the fields.

Create New Task Rate Card

Field	Description
Number	A unique number automatically created for each task rate card.
Name	Name of the task rate card.

Field	Description
Table	The table this rate card is created for.
Order	Order in which the task rate card applies to the same task. When more than one task rate card applies to the same task, the one with the lowest order is used.
Summary type	Select a summary that relates to the task rate card.
Active	Indicates if the task rate card is being used or not. By default, this check box is selected.
Short description	Short description of the task rate card.
Use time worked	By default, this check box isn't selected. This denotes that the task rate is used for capturing costs. If you want to use the labor rate option where cost is captured based on the time worked, select this check box.
Task rate	Rate of the task along with the currency code.
Default labor rate	The hourly rate to apply to the time worked entries if the worker doesn't have a labor rate card. This field appears only when the Use time worked check box is selected.
Set conditions	Filter to run on the table selected to determine whether this rate card applies to a given task. This field uses the Condition Count Widget to preview what records would be returned by the conditions.
Description	Detailed description of the task rate card.

4. Select Save.

After a task rate card is created, expense lines are created based on the value in the **Use time worked** field.

Create expense lines for closed tasks in Enterprise Asset Workspace

Automatically create expense lines for previously closed tasks, that originally had no expense lines, in order to calculate costs for those tasks.

Before you begin

If you haven't used task rate cards, then expense lines do not get created. When you upgrade to Yokohama, you can automatically create expense lines in bulk for all your closed tasks. This is only a one time process that runs on active task rate cards with a populated task rate value. Using time worked will not result in creation of expense lines if the time worked records are not present for tasks.

Note:

To use task rate cards, you need to activate the ServiceNow® Cost Management (com.snc.cost_management) plugin.

In order to avoid creation of duplicate expense lines, keep the following factors in mind:

- Configure the task rate cards.
- Configure the conditions within each task rate card.
- Specify the amount you want to use for each task.
- Do not create duplicate task rate cards where you create multiple task rate cards for the same task and condition.

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > TCO configuration > Task rate card**.
2. Select **Create expense lines for tasks**.
A confirmation message box opens.
3. Select **Create expense lines**.
The background job **Asset Common Expense Lines for Historical tasks** runs only once and looks for closed tasks without any expense lines and creates expense lines for all those closed tasks. Once the expense lines are created, the **Create expense lines for tasks** button is no longer visible.

Create a labor rate card in Enterprise Asset Workspace

Create a labor rate card to capture costs by the time consumed on an hourly basis.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Labor rate cards are included in the base system. Except for the **Number** field, all other fields on the default labor rate cards are editable. You can't delete any of the base system labor rate cards. The following steps are to create a labor rate card.

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > TCO configuration > Labor rate card**.
2. Select **New**.
3. On the form, fill in the fields.

Create New Labor Rate Card

Field	Description
Number	A unique number automatically created for each labor rate card.
Name	Name of the labor rate card.
Rate code	Code for each labor rate card.

Field	Description
Rate type	Standard rate type. You can add your own rate types.
Active	Indicates if the labor rate card is being used or not. By default, this check box is selected.
Short description	Short description of the labor rate card.
Hourly rate	The currency code and the cost per hour.
Set conditions	Filter to run on the table selected to determine whether this rate card applies to a given task. This field uses the Condition Count widget to preview what records would be returned by the conditions.
Description	Detailed description of the labor rate card.

4. Select Save.

After a labor rate card is created, expense lines are created based on the value in the **Use time worked** field.

Add calibration attributes to an enterprise asset

Add calibration attributes to an enterprise asset to specify and manage the calibrations that are required for the asset throughout its life cycle.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

You can add calibration attributes at the individual enterprise asset level or at the enterprise model level. Alternatively, you can create common calibration attributes that are not associated with any enterprise assets or enterprise models. For details on how to add calibration attributes to an enterprise model, see [Add calibration attributes to an enterprise model](#). For details on how to create common calibration attributes, see [Create a calibration attribute library](#).

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace**.
2. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
3. Select either the **All enterprise** tab or the tab for a specific enterprise asset category, such as **Facility assets**.
4. From the list of available enterprise assets, select the enterprise asset that you want to add calibration attributes to.
5. On the **Calibration attributes** tab of the enterprise asset record, select **New**.
6. On the form, fill in the fields.

Create New Calibration Attribute form

Field	Description
Attribute details	
Name	Name of the calibration attribute.

Field	Description
Short description	Brief description of the calibration attribute.
Criticality	Criticality level that indicates how important the calibration attribute is.
Service frequency	Frequency at which you must perform the calibration.
Category	Type of calibration. Note: The Enterprise Asset Management application includes default calibration categories such as Electrical, Flow, Humidity, and Pressure. You can create additional calibration categories for any calibrations that do not fall under the default categories. For detailed instructions, see Create a calibration category for your enterprise asset calibrations .
Active	Option that indicates if the calibration attribute is active.
Order	Order in which the calibration attribute applies to the enterprise asset. If your enterprise asset contains more than one calibration attribute, the attribute with the lowest numerical value applies to the asset first. Important: You must use a unique numerical value for each calibration attribute.
Calibration properties	
Value type	Method by which you want to measure tolerance conformance. Select one of the following options: <ul style="list-style-type: none"> ○ Accuracy % full scale: Fixed percentage of accuracy that your calibration measurements must fall within at any point within the enterprise asset's full measurement range. The corresponding tolerance limits remain the same at every point within the measurement range. For example, if a measurement range is 100 units and the accuracy percentage is set to $\pm 1\%$, the tolerance limits are ± 1 unit at every point within the measurement range. ○ Accuracy % point: Fixed percentage of accuracy that your calibration measurements must fall within at a specific point within the enterprise asset's full measurement range. The corresponding tolerance limits increase or decrease proportionally based on the value of the point that you are comparing your calibration measurement against. For example, if your accuracy percentage is set to $\pm 1\%$ and you want to compare your calibration measurement against a point that has a value of 50 units, the tolerance limits for this specific point are ± 0.5 units. If you want to compare your calibration measurement against a point that has a value of 60 units, the tolerance limits increase to ± 0.6 units. ○ Range: Measurement range that your calibration measurements must fall within. The corresponding tolerance limits are based on the lowest and highest acceptable point values within the range. ○ Less than: Value within the enterprise asset's full measurement range that your calibration measurements must fall below. The corresponding tolerance limit is based on the highest acceptable point value within the range.

Field	Description
	<ul style="list-style-type: none"> ○ Greater than: Value within the enterprise asset's full measurement range that your calibration measurements must lie above. The corresponding tolerance limit is based on the lowest acceptable point value within the range. ○ True/false: Option to assess any qualitative elements of the calibration.
Scale	<p>Full measurement range that you're measuring tolerance conformance against.</p> <p>Note: This field appears only if you set the Value type field to Accuracy % full scale.</p>
Unit	<p>Unit of measurement that you're using to measure tolerance conformance.</p> <p>Note: This field appears only if you set the Value type field to one of the following options:</p> <ul style="list-style-type: none"> ○ Accuracy % full scale ○ Accuracy % point ○ Range ○ Less than ○ Greater than
Accuracy (%)	<p>Percentage of accuracy that your calibration measurements must fall within.</p> <p>Note: This field appears only if you set the Value type field to either Accuracy % full scale or Accuracy % point.</p>
Resolution	<p>Smallest distinguishable change in value that you can detect and measure. The higher the resolution is, the more specific the change in value is.</p> <p>Note: This field appears only if you set the Value type field to one of the following options:</p> <ul style="list-style-type: none"> ○ Accuracy % full scale ○ Accuracy % point
Quality standard	
Quality standard	<p>Set of requirements and guidelines that you must follow when performing the calibrations.</p> <p>Note: You can create quality standards manually in the Admin center view of the Enterprise Asset Workspace. See Create a quality standard for your enterprise asset calibrations for detailed instructions.</p>
Instrument	

Field	Description
Instrument model	Model of the instrument that you must use to perform the calibrations.
Instruction	General instructions or instrument settings that you must follow when performing the calibrations.

7. Select Save.

The form closes and you are automatically redirected to the new calibration attribute record.

8. Specify the points at which you can measure tolerance conformance.

i Important:
 You must specify one or more points within the enterprise asset's measurement range. If you do not specify at least one point, the calibration attribute cannot be set to Active.

a. On the calibration attribute record, select Add calibration points.

The Calibration points dialog box opens.

b. In the dialog box, fill in the fields.

Calibration points dialog box

Field	Description
Point name	Name of the point.
Expected value	Value that you want to measure tolerance conformance against. If you set the Value type field to either Accuracy % full scale or Accuracy % point in the Create New Calibration Attribute form, enter the value of the point that you want to measure against. If you set the Value type field to True/false , select a Boolean value of either true or false . i Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form. <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ True/false
Order	Order in which you want to use the point to measure tolerance conformance. If your calibration attribute contains more than one point, the point with the lowest numerical value is calibrated first. i Important: You must use a unique numerical value for each point.
Lower tolerance	Lowest acceptable value that the calibration measurement can reach to stay in conformance.

Field	Description
	<p>Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form:</p> <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ Range ▪ Greater than <p>If you set the Value type field to either Accuracy % full scale or Accuracy % point, this field is read-only.</p>
Upper tolerance	<p>Highest acceptable value that the calibration measurement can reach to stay in conformance.</p> <p>Note: This field appears only if you set the Value type field to one of the following options in the Create New Calibration Attribute form:</p> <ul style="list-style-type: none"> ▪ Accuracy % full scale ▪ Accuracy % point ▪ Range ▪ Less than <p>If you set the Value type field to either Accuracy % full scale or Accuracy % point, this field is read-only.</p>

c. To add an additional point to the calibration attribute, select the Add Content icon () and then fill in the fields.
Repeat this step for each point that you want to add.

d. Select **OK**.

The dialog box closes and the points appear on the **Calibration points** tab of the calibration attribute record.

9. Optional: If your enterprise asset also contains calibration attributes at the enterprise model level, enable this enterprise asset level attribute to override an existing enterprise model level attribute.

a. On the calibration attribute record, select the **Details** tab.

b. In the Identification section of the **Details** tab, select the Search for Record icon () next to the **Override** field.
The Override dialog box opens.

c. In the dialog box, select the enterprise model level attribute that you want to override.

The dialog box closes and you automatically return to the calibration attribute record.

d. Select Save.

The enterprise model level attribute is removed from the **Calibration attributes** tab of the enterprise asset record.

What to do next

Create work orders to track the calibrations that are made to your enterprise asset. These work orders must use a work order template with tasks that have a Work type of Calibration. For more information on work orders, see [Managing work orders for your enterprise assets](#).

Clone a calibration attribute to an enterprise asset

Clone an existing calibration attribute to an enterprise asset to add a calibration attribute with similar settings.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. Select either the **All enterprise** tab or the tab for a specific enterprise asset category, such as **Facility assets**.
3. From the list of available enterprise assets, select the enterprise asset that you want to clone a calibration attribute to or from.
4. On the **Calibration attributes** tab of the enterprise asset record, use one of the following options to clone a calibration attribute:
 - To clone a calibration attribute from this enterprise asset to another enterprise asset, use the following steps:
 - a. From the list of available calibration attributes, select the check box for the calibration attribute that you want to clone.
 - b. Select **Clone to assets**.
 - c. In the Select assets dialog box, select the **Clone as active** check box to automatically set the cloned calibration attribute to active.
 - d. Select the check box for the enterprise asset that you want to clone the calibration attribute to.
 - e. Select **Clone**.

The calibration attribute is cloned to the selected enterprise asset.
 - To clone a calibration attribute from another enterprise asset to this enterprise asset, use the following steps:
 - a. Select **Clone from**.
 - b. In the Select attribute to clone dialog box, select the **Clone as active** check box to automatically set the cloned calibration attribute to active.
 - c. Select the check box for the calibration attribute that you want to clone.

d. Select Clone.

The calibration attribute is cloned to the enterprise asset and appears in the list of available calibration attributes.

Create a calibration category for your enterprise asset calibrations

Create a calibration category to indicate the type of calibration that you need to perform on your enterprise assets.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

You can specify the calibrations that are required for your enterprise assets by using calibration attributes. When you create a calibration attribute, you must select a calibration category to indicate the type of calibration that you need to perform. The Enterprise Asset Management application includes default calibration categories such as Electrical, Flow, Humidity, and Pressure. You can create additional calibration categories for any calibrations that do not fall under the default categories.

For more details on calibration attributes, see [Add calibration attributes to an enterprise asset](#) or [Add calibration attributes to an enterprise model](#).

Procedure

1. From the Enterprise Asset Workspace, open the Admin center view.
2. From the left navigation menu of the Admin center view, navigate to **Calibration configuration > Category**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Category form

Field	Description
Name	Name of the calibration category.
Description	Detailed description of the calibration category.

5. Select **Save**.

Result

The calibration category is available to use in your calibration attributes.

Create condition templates for condition attributes

Create a condition template and associate the template to condition attributes for enterprise models and assets.

Before you begin

Role required: Asset technician (sn_smart_asmt.actor) and Asset manager (sn_smart_asmt.template_manager)

About this task

Create condition templates before defining condition attributes on enterprise models and assets.

Procedure

1. From the Enterprise Asset Workspace, navigate to either of the views:

- Admin center
- Enterprise asset estate
- Enterprise model management

2. Depending on the view you are in, do one of the following:

- Admin center: Select **New** in the Asset condition templates page.
- Enterprise asset estate or Enterprise model management: Select the **All enterprise** tab or the tab for a specific model or asset category, such as Construction. Open an enterprise model or asset, select the Condition attributes related list, select **New**, and then select **Create condition template**.

3. In the **Create new condition template** dialog box, enter a name for the template.

4. Select **Create**.

The fields in the **General** tab are automatically populated.

The template opens in the Assessment Workspace that belongs to the Governance, Risk, and Compliance application.

The fields in the **General** tab are automatically populated.

5. Select the **Scoring** tab to add scores to the overall template.

Scoring helps to evaluate the condition of assets and indicates whether the condition evaluation passed or failed. Scoring can be also added for each section in the **Questions** tab and also for each question.

6. Select **Enable scoring**

You must enable scoring to make results available for the condition attributes. For more details on scoring, see [Create Smart Assessment templates for BIA](#) .

7. After entering the details in the **Scoring** tab, select **Save**.

8. Select the **Questions** tab to create sections and questions.

You can create sections and questions in this tab and enable scoring for any specific section and for individual questions. For more details on creating questions, sections, and scoring, see [Create Smart Assessment templates for BIA](#) .

9. After entering all the details in the **Questions** tab, select **Save**.

10. Select **Publish**

The questions and scores are published. Publishing finalizes the template and makes the template ready to be used for evaluation.

If you don't publish the template, the template won't be available in the condition template picker when creating condition attributes.

Define condition attributes on enterprise models and assets

Define the conditions to be inspected on enterprise models and assets throughout their life cycle.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Once condition attributes are defined on an enterprise model, all the assets for that models inherit the condition attributes.

Before defining condition attributes, create a condition template from the Admin center view. You can also create condition templates while defining condition attributes from the enterprise asset or enterprise model page.

Procedure

1. Navigate to **All > Enterprise Asset Workspace**.
2. Navigate to either of the two views.
 - Enterprise asset estate: For adding condition attributes to an asset.
 - Enterprise model management: For adding condition attributes to a model.
3. Select either the **All enterprise** tab or the tab for a specific model or asset category, such as Construction.
4. From the list of available enterprise models or assets, open the enterprise model or asset that you want to define the condition attributes on.
5. Select **New** on the Condition attributes related list.
6. On the form, fill in the fields.

Create New Condition Attribute form

Field	Description
Attribute details	
Name	Name of the condition attribute.
Model or Asset The Model field appears in the Enterprise model management view. The Asset field appears in the Enterprise asset estate view.	The model or asset the condition attribute is being added to.
Short description	Brief description of the condition attribute.
Weight	Desired weight for each line. The total sum of weights for all lines of an asset should equal one.
Attribute type This field appears only in the Enterprise asset estate view.	Type of attribute.
Category	Type of condition. i Note: The Enterprise Asset Management application includes many default condition categories such as Area, Concentration, Density, and Electrical.
Condition template	The template that the condition is associated with.

Field	Description
	You can select an existing template or select Create condition template to create a template.
Criticality	Criticality level that indicates how important the condition attribute is.
Service frequency	Frequency at which you must perform the condition.
Pass condition minimum	Enter a minimum numerical value for the condition to pass. The value can't be less than zero.
Pass condition maximum	Enter a maximum numerical value for the condition to pass. The value can't be more than 100. For example, if you enter the value 100 in this field and the value 0 in the Pass condition minimum field, then if the overall score is between this range of 0-100, the result indicates that the condition passed.
Order	Order in which the condition attribute applies to the enterprise model or the asset. If your enterprise model or asset contains more than one condition attribute, the attribute with the lowest numerical value applies to the model or the asset first.
Active	Option that indicates if the condition attribute is active. Select this check box.

7. Select Save.

The form closes and you're automatically redirected to the new condition attribute record.

Create an asset group in Enterprise Asset Management

Create asset groups to create a logical group of entities that includes assets, locations, and users.

Before you begin

Role required:

- sn_eam.enterprise_admin
- sn_eam.enterprise_asset_manager
- sn_eamfam.facility_asset_manager
- sn_eamhc.medical_asset_manager
- sn_otam.ot_asset_manager

About this task

Asset groups can be used and created in the Enterprise Asset Workspace, Facility Asset Workspace, Medical Asset Workspace, and the Operational Technology (OT) Asset Workspace. This task specifically describes how to create an asset group in the Enterprise Asset Workspace.

After you create an asset group, you can create subgroups and add assets to the subgroups.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate > Asset groups.**

The Asset groups tab contains two subtabs:

- Asset groups: all the asset groups in your organization.
- Sites: equipment model entities that are picked up from the Equipment model [cmdb_ci_ot_isa_entity] table. The Equipment model table is a descendant of the Application Service CI [cmdb_ci_service_auto] table.

The Asset groups subtab is further classified into the following sites:

- Unassigned sites: sites not assigned to any asset group.
- Assigned sites: sites assigned to an asset group.

2. Select **New** to open the Create New Asset group page.

3. On the form, fill in the fields.

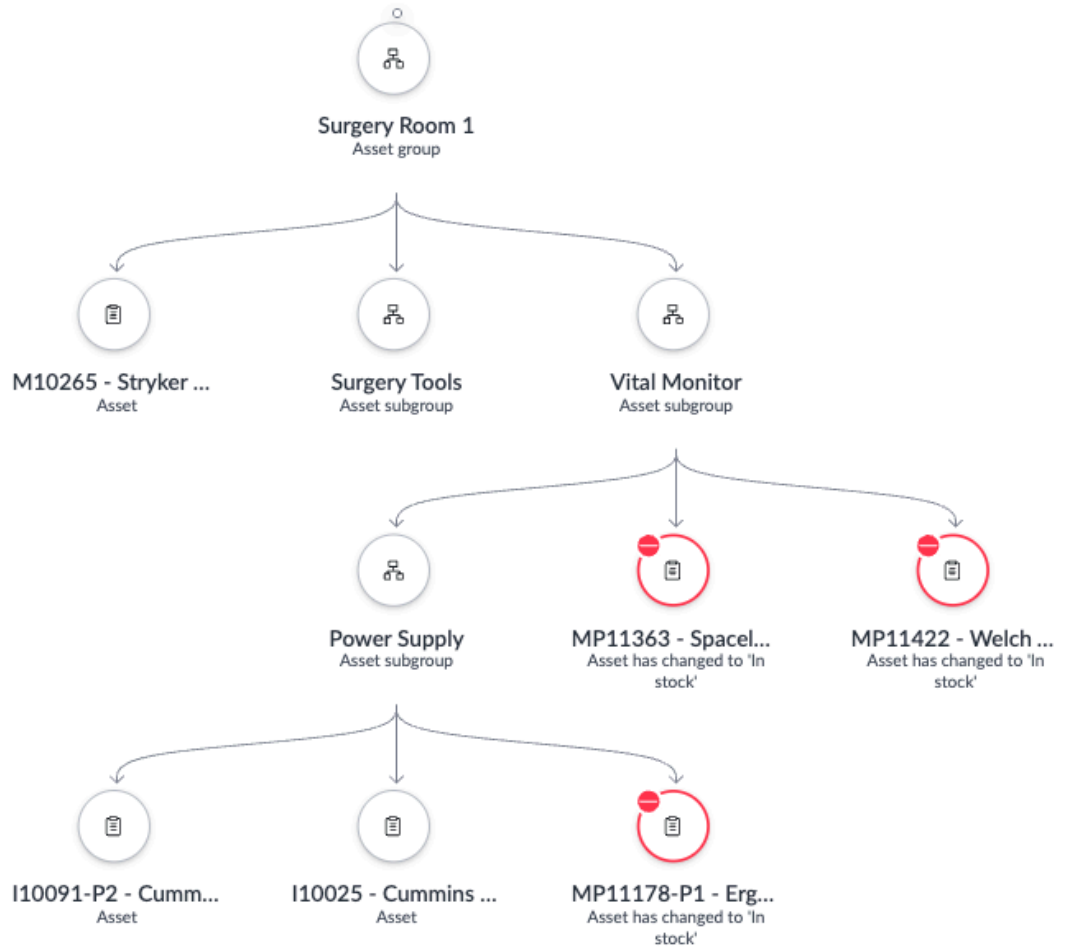

Field	Description
Name	
Service instance	Reference that you can assign to the asset group. This creates a bridge between the CI and the assets. If you assign a reference to the asset group, then the asset group is bound by the reference to the selected Service instance.
Description	Brief description of the asset group.
Parent	Parent group of the asset group.
Location	Specific geographical location of the asset group.
Site	Equipment model entities that are picked up from the Equipment model [cmdb_ci_ot_isa_entity] table.
State	The current state of the asset group. By default, a newly created asset group is in the Build state.
Substate	The substate of the asset group.
Support group	The group to contact if you encounter any issues with the asset group.
Supported by	The person who can be contacted within the support group for any issues that you may encounter with the asset group.
Department	Department to which the asset group belongs.
Company	Company or organization to which the asset group belongs.

Field	Description
Owned by	Person who has financial ownership of the asset group. This can be different from the person in the Managed by field.
Managed by	Person who maintains the asset group. This can be different from the person in the Owned by field.
Assigned to	Person using or primarily responsible for this asset group. This field is visible when the asset state is In Use .
Assigned	Date on which the asset group was assigned to a user.
Installed	Date on which the asset group was assigned to the person mentioned in the Assigned to field.
Retired date	The date this asset group is retired.
Comments	Any comments to add.

4. Select Save.

The asset group record opens with related lists for adding subgroups and assets.

5. Optional: Select the View dependency map icon, , next to an asset group, in the Asset groups page, to view the relationship between an asset group, subgroups, and assets.

(Optional)

If you have the `sn_cmdb_user` role, you can further drill down by selecting the dependency map icon. For example, in the screenshot, select the dependency map icon on the Surgery Room 1 node to further drill down. Additionally, if you have the `app_service_admin` role, you can view the **Related items** contextual panel on the right side of the Dependency map page.

Create an asset subgroup in Enterprise Asset Management

Create a subgroup to add child asset groups to an asset group.

Before you begin

Role required:

- `sn_eam.enterprise_admin`
- `sn_eam.enterprise_asset_manager`
- `sn_eamfam.facility_asset_manager`
- `sn_eamhc.medical_asset_manager`
- `sn_otam.ot_asset_manager`

Asset subgroups can be used and created in the Enterprise Asset Workspace, Facility Asset Workspace, Medical Asset Workspace, and the Operational Technology (OT) Asset Workspace. This task specifically describes how to create an asset subgroup in the Enterprise Asset Workspace.

About this task

You can add or remove a subgroup from an asset group.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate > Asset groups**.
2. Open the asset group record for which you want to create a subgroup.
3. Select the Subgroups related list.
4. Select **New** on the Create New Asset group page.
The **Parent** field is automatically filled with the parent asset group.
5. On the form, fill in the required details.
For more details on the fields, see [Create an asset group in Enterprise Asset Management](#).
6. Select **Save**.
The subgroup is created and is listed in the Subgroups related list.

Add assets to an asset group or subgroup

Add existing assets to an asset group or a subgroup.

Before you begin

Role required:

- sn_eam.enterprise_admin
- sn_eam.enterprise_asset_manager
- sn_eamfam.facility_asset_manager
- sn_eamhc.medical_asset_manager
- sn_otam.ot_asset_manager

Assets can be added to an asset group or subgroups in the Enterprise Asset Workspace, Facility Asset Workspace, Medical Asset Workspace, and the Operational Technology (OT) Asset Workspace.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise asset estate > Asset groups**.
2. Open the asset group record to which you want to add assets.
3. Select the Assets related list.
4. Select **Add** to open the Add asset dialog box.
For details on the type of assets that appear, see the section titled [Considerations for adding assets to asset groups](#).
5. Select the assets that you want to add.
You can also use the condition builder to search for specific assets.
6. Select **Add**.
The selected assets are added to the asset group and are listed in the Assets related list.

Create consumable assets in Enterprise Asset Workspace

Create consumables in the Enterprise Asset Workspace to track enterprise assets.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Consumable.**
2. Select **New.**
3. Select the type of the consumable and the model category from the **Type** and **Model category** drop-downs.
4. Select **Create.**
5. Fill in the details in the Create New Consumable page.

Field	Description
Display name	Name of the asset.
Model	Product model of the asset.
Model category	Model category of the asset.
Parent	The parent asset. When a parent asset is defined, the Assignment and State fields of the child asset are automatically populated based on the Assignment and State fields of the parent asset and are read-only.
Quantity	Amount of items the asset represents.
General	
State	State of the asset. The default state is set to Build.
Substate	Substate of the asset.
Asset function	The purpose for which the asset will be used.
Planned for disposal	Indicates if the asset is slated for disposal.
Stockroom	Stockroom where the asset resides.
Location	Location of the asset.
Aisle and space	The aisle and space in the stockroom where the asset resides.
Expenditure type	The type of expenditure. Choose from the following options: <ul style="list-style-type: none"> ○ Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. ○ Opex: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Assigned to	The person the asset is assigned to
Cost	Price that the asset was purchased for.
Cost Center	Cost center financially responsible for the asset.
Asset Disposal	
Disposal order number	A unique number assigned to the asset disposal order.

Field	Description
Disposal vendor	The vendor assigned to carry out the asset disposal order.
Vendor disposal order ID	Order number assigned by the vendor assigned to carry out the asset disposal order.
Disposal date	The date when the asset disposal order process is completed.
Resold value	Estimated cost the disposal asset can be resold for.
Scheduled retirement	Scheduled date on which the asset is retired.
Resale price	Value of the asset when it is retired.
Beneficiary	Organization that receives the asset when it is retired.
Activities	
Work Notes	Work notes related to the asset.

6. Select Save.

The consumable asset is created and appears in the Consumable assets list.

Use consumable assets in Enterprise Asset Workspace

To use consumable assets, ensure that they are in the **In stock** state and **Available** substate.

Before you begin

Note:

Only consumables created from models in the Enterprise Asset Management application can be used if the **Asset strategy tracking** for the model is set to **create consumable asset**.

Role required: asset

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Consumable assets**.
2. Select a consumable asset with a state of **In Stock** and a substate of **Available**.
3. Select **Consume**.
The Consume dialog box appears.
4. Enter the quantity to consume in the **Quantity** field.
5. In **Asset** list, select the lookup icon and select the asset associated with the consumable.

Example

For example, a mouse tracked as a consumable asset can be associated with a non-consumable asset such as a computer.

6. In **User** list, select the lookup icon and select a user associated with the consumable.
7. Select **OK**.

On the **Consumable** form, the **Quantity** field shows the reduced number. The Consumables list contains two records for the consumable in the specific stockroom: one with a state and

substate of **In Stock** and **Available** (if you did not consume the entire quantity), and one with a state of **Consumed**. If a consumable is not in the process of being transferred to a different stockroom and information in the data record is the same, similar records merge automatically. After a consumable is consumed, the record remains in the system for reporting purposes.

Create a quality standard for your enterprise asset calibrations

Create a quality standard to indicate the requirements and guidelines that you must follow while performing your enterprise asset calibrations.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

You can specify the calibrations that are required for your enterprise assets by using calibration attributes. When you create a calibration attribute, you can apply a quality standard to indicate the set of requirements and guidelines that you must follow during the associated calibrations. By following a quality standard, you can achieve consistent, reliable, and accurate calibrations across your deployment.

For more details on calibration attributes, see [Add calibration attributes to an enterprise asset](#) or [Add calibration attributes to an enterprise model](#).

Procedure

1. From the Enterprise Asset Workspace, open the Admin center view.
2. From the left navigation menu of the Admin center view, navigate to **Calibration configuration > Quality standard**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Quality Standard form

Field	Description
Name	Name of the quality standard.
Short description	Brief description of the quality standard.
Valid from	Date from which the quality standard is valid.
Valid to	Date on which the quality standard is no longer valid.
Description	Detailed description of the quality standard.

5. Select **Save**.

Result

The quality standard is available to apply to your calibration attributes.

Create a service frequency for your enterprise asset calibrations

Create a service frequency to specify how often you must perform an enterprise asset calibration.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

You can specify the calibrations that are required for your enterprise assets by using calibration attributes. When you create a calibration attribute, you must specify the frequency at which you need to perform the associated calibrations.

For more details on calibration attributes, see [Add calibration attributes to an enterprise asset](#) or [Add calibration attributes to an enterprise model](#).

Procedure

1. From the Enterprise Asset Workspace, open the Admin center view.
2. From the left navigation menu of the Admin center view, navigate to **Calibration configuration** > **Service frequency**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Service Frequency form

Field	Description
Name	Name of the service frequency.
Service frequency	Frequency at which you must perform the calibrations.
Service frequency type	Type of frequency.

5. Select **Save**.

Result

The service frequency is available to use in your calibration attributes.

Create a calibration attribute library

Create a library of common calibration attributes that are not associated with any enterprise models or enterprise assets. Use these attributes to define the details and requirements of your commonly used calibrations.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

You can create common calibration attributes that are not associated with any enterprise models or enterprise assets. These calibration attributes can be cloned to any of your available enterprise models. You can also create calibration attributes for a specific enterprise model or enterprise asset. For details on how to create a calibration attribute for a specific enterprise model, see [Add calibration attributes to an enterprise model](#). For details on how to create a calibration attribute for a specific enterprise asset, see [Add calibration attributes to an enterprise asset](#).

Procedure

1. From the Enterprise Asset Workspace, open the Admin center view.
2. From the left navigation menu of the Admin center view, navigate to **Calibration** > **Attribute library**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Calibration Attribute form

Field	Description
Attribute details	
Name	Name of the calibration attribute.
Short description	Brief description of the calibration attribute.
Criticality	Criticality level that indicates how important the calibration attribute is.
Service frequency	Frequency at which you must perform the calibration.
Category	Type of calibration. Note: The Enterprise Asset Management application includes default calibration categories such as Electrical, Flow, Humidity, and Pressure. You can create additional calibration categories for any calibrations that do not fall under the default categories. For detailed instructions, see Create a calibration category for your enterprise asset calibrations .
Active	Option that indicates if the calibration attribute is active.
Order	Order in which the calibration attribute applies to an enterprise model after it is cloned to the model. If the enterprise model contains more than one calibration attribute, the attribute with the lowest numerical value applies to the model first.
Calibration properties	
Value type	Method by which you want to measure accuracy. Select one of the following options: <ul style="list-style-type: none"> ○ Accuracy % full scale: Accuracy is based on a fixed percentage of the enterprise asset's full measurement range. The corresponding tolerance limits remain the same regardless of which point you measure accuracy at. For example, if a measurement range is 100 units and the accuracy percentage is set to $\pm 1\%$, the tolerance limits are ± 1 unit at every point within the measurement range. ○ Accuracy % point: Accuracy is based on a fixed percentage of the specific point that you are measuring accuracy at. The corresponding tolerance limits increase or decrease proportionally based on the point that you measure accuracy at. For example, if your accuracy percentage is set to $\pm 1\%$ and you measure accuracy at a point that has a value of 50 units, the tolerance limits for this specific point are ± 0.5 units. If you then measure accuracy at another point that has a value of 60 units, the tolerance limits increase to ± 0.6 units.
Scale	Full measurement range that you can measure accuracy within.

Field	Description
<p>Note: This field appears only if you set the Value type field to Accuracy % full scale.</p>	
Unit	Unit of measurement that you are using to measure accuracy.
Accuracy (%)	Percentage of accuracy that your enterprise assets must fall within.
Resolution	Smallest distinguishable change in value that you can detect and measure. The higher the resolution is, the more specific the change in value is.
Quality standard	
Quality standard	<p>Set of requirements and guidelines that you must follow while performing the calibrations.</p> <p>Note: You can create quality standards manually in the Admin center view of the Enterprise Asset Workspace. See Create a quality standard for your enterprise asset calibrations for detailed instructions.</p>
Instrument	
Instrument model	Model of the instrument that you must use to perform the calibrations.
Instruction	General instructions or instrument settings that you must follow when performing the calibrations.

5. Select **Save.**

The form closes and you are automatically redirected to the new calibration attribute record.

6. Specify the points at which you can measure accuracy.

Important:
You must specify one or more points within each enterprise asset's measurement range. If you do not specify at least one point, the calibration attribute cannot be set to Active.

a. On the calibration attribute record, select **Add calibration points.**

The Calibration points dialog box opens.

b. In the dialog box, fill in the fields.

Calibration points dialog box

Field	Description
Point name	Name of the point.
Expected value	Point value that you want to measure accuracy against.
Order	Order in which you want to use the point to measure accuracy. If your calibration attribute contains more than one point, the point with the lowest numerical value is used first.

- c. To add an additional point to the calibration attribute, select the Add Content icon () and then fill in the fields.
Repeat this step for each point that you want to add.

- d. Select **OK**.

The dialog box closes and the points appear on the **Calibration points** tab of the calibration attribute record.

What to do next

Clone the calibration attribute to all applicable enterprise models. See [Clone calibration attributes to an enterprise model](#) for detailed instructions.

Dispose consumable assets in Enterprise Asset Workspace

Dispose of those consumable assets that are no longer required in your stockrooms.

Before you begin

Role required: asset, itil, itil_admin

Know that the Planned for disposal column in the Consumable [alm_consumable] table indicates if the consumable asset is marked for disposal or not.

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate > Consumable assets**.
2. Open a consumable asset record and select **Mark for disposal**.
Mark for disposal appears only for consumable assets that are in the in-stock state and not marked for disposal.
3. In the Mark for disposal dialog box, enter the total quantity or partial quantity of the consumable asset.
If you enter a partial quantity, a new consumable record is created with the substate as pending disposal. If you enter a total quantity, the consumable's record substatus changes to "pending disposal" and you return to the same consumable record.
After you mark the consumable asset for disposal, **Mark for disposal** no longer appears.

Note:

Only a consumable marked for disposal is included in a disposal order. After you mark a consumable for disposal, it does not get merged with another consumable record.

Create an asset onboarding process

Create an asset onboarding process to walk you through the process of entering important information for assets.

Before you begin

The asset onboarding process is a playbook experience that provides an interactive user interface to complete a process. The asset onboarding process is triggered after an onboarding task is created. An onboarding task can be automatically created from the asset request flow or manually created from an asset record. For an overview of the asset onboarding playbook, see [Playbooks for Enterprise Asset Management](#).

Onboarding is available only for preassembled and simple assets. Also, only the parent preassembled asset can be onboarded; not the child preassembled assets.

The asset onboarding process is organized into lanes. The lanes appear in the left pane of the page. Each lane includes a few activities that you're asked to complete. Use the following buttons to skip, save, or complete a task:

- **Skip:** takes you to the next activity.
- **Save:** saves the information but doesn't complete the activity.
- **Mark as complete:** saves the information and completes the activity, and takes you to the next lane.

i Note:

You can close an onboarding task only after you've skipped all the activities or marked all them as complete.

While you're performing a particular activity, a status of **In progress** appears for that activity. As you mark an activity complete, the status of that activity changes to complete. After you complete all the activities in a lane, you move to the next lane.

The **Onboard asset** button that triggers an onboarding task only appears when the asset is in any one of the following states or substates as listed in the following table.

State	Substates
<ul style="list-style-type: none"> • Build • In use • In stock • In maintenance 	<ul style="list-style-type: none"> • Available • Reserved • Pending Install • Pending transfer

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Enterprise asset estate**.
2. Open the asset record for which you want to create an onboarding process.
3. Select **Onboard asset**.
The asset onboarding task opens.
4. Select the **Onboarding playbook** related list tab.
The asset onboarding page opens.
5. Review or enter details in the Asset details lane.

Note:

If you're onboarding a preassembled industrial asset, the **MAC address** field is included in the Asset details. Also, the **Child assets** activity under Asset details is displayed only for preassembled industrial assets.

If you have activated the OT Asset Management application, the Asset details activity displays the **MAC address** field for preassembled industrial assets and the hardware assets.

6. Select **Skip**, **Save**, or **Mark as complete** to proceed to the next lane.
7. Continue to review or enter details in the lanes until you reach the last lane.
8. After all the lanes show a status of skipped or complete, select **Close Task** to complete the asset onboarding process.
Your asset is successfully onboarded.

View an automatically created onboarding task

View an automatically created asset onboarding task.

Before you begin

Onboarding tasks for assets are automatically created after the asset is received in the Asset Request flow. The onboarding task in turn triggers the asset onboarding process. For each sourced asset, a separate onboarding task is created.

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Asset operations > Procurement > Requests**.
2. Open a request.
3. Select the **Requested items** tab and open a requested item.
4. Select the **Asset tasks** tab.
An onboarding and a deploy asset task are listed.
5. Open the onboarding task.

Track assets using indoor maps in the Enterprise Asset Workspace

Use indoor maps to locate and track the enterprise assets, consumable assets, and pallets that are deployed across your organization. Each indoor map consists of an interactive interface that enables you to visualize where your assets are located within your campuses, buildings, floors, and places.

Before you begin

To use indoor maps in Enterprise Asset Workspace, fulfill the following requirements:

- Explicitly install the Indoor Mapping for Assets (com.sn_ima) application from the ServiceNow® Store. When you install this application, Indoor Mapping (sn_map_core) and Indoor Mapping component (sn_map_component) are also installed.

If you purchased an Enterprise Asset Management license after November 3, 2023 using the updated Enterprise Asset Management SKU (PROD21613), you can install the Indoor Mapping for Assets (com.sn_ima) application.

Note:

To be able to view demo data for indoor maps, you must reinstall demo data after you install the Indoor Mapping for Assets application. For more information, see [Add or repair demo data for applications and plugins](#).

- Set the `com.sn_eam.indoormap.enabled` asset parameter to **true** on your ServiceNow instance.
- Set up your indoor maps: You can design indoor maps using Map Studio. For more information, see [Configure Indoor Mapping](#).

Note:

When you install indoor maps using the entitlement to the Enterprise Asset Management license, you can use only the PNG floor map files in the Map Studio. You can't import the files that are in AutoCAD or Raster file format. To use AutoCAD or Raster files, you should have entitlement to the Workplace Service Delivery application.

- Configure the option to display the **Asset indoor map** tab in the Enterprise asset estate view of the Enterprise Asset Workspace. For detailed instructions, see [Configure tabs in the Enterprise Asset Workspace](#).

Note:

This tab appears only if the **Include in tab** option is enabled in the Asset indoor map tab configuration.

- Synchronize location data: The Enterprise Asset Management application supports the following indoor mapping location types:
 - Campus: Represents a set of buildings within the same geographic location.
 - Building: Represents a multi-floor building within a specific campus.
 - Floor: Represents a floor within a specific building.
 - Place: Represents either a polygon or point of interest within a specific floor. Places can represent areas, rooms, desks, printers, assets, and more.

Note:

For indoor maps to show assets in the Enterprise Asset Workspace, assets should be assigned to a location of the type **place** or **room** in the Location [cmn_location] table.

To view the newly created locations within the Enterprise Asset Management application, make sure to synchronize the newly created locations from Map Studio to the Location [cmn_location] table. You can associate the locations created in Map Studio with pre-existing records or new records in the Location [cmn_location] table. For more information, see [Synchronize Indoor Mapping map data with CMN location](#).

Role required: `sn_eam.enterprise_admin` or `sn_eam.enterprise_asset_manager`

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. Select the **Asset indoor map** tab.
This tab contains an interactive map that enables you to view the real-time location of each enterprise asset, consumable asset, and pallet within a specific floor or place.
3. Set the map to a specific floor by using the Campuses, Buildings, and Floors filters.

By default, the map provides a high-level view of all campuses that are available across your organization. This default map view doesn't display the locations of your assets. To view the locations of your assets, you must set the map to the floor that those assets are located in. To set the map to a specific floor, select the appropriate values in the Campuses, Buildings, and Floors filters.

4. Optional: Specify the assets that you want the map to display the locations of.

By default, the map displays the locations of all enterprise assets, consumable assets, and pallets that are deployed across your organization. If you want the map to display the locations of only certain assets, use the following steps:

- a. Select the Filters Tab icon () on the sidebar of the map.
 - b. In the Filter by window, use any of the following filters to narrow down the assets that you want to display the location of:
 - **Department:** Department that the asset belongs to.
 - **User:** User who the asset belongs to.
 - **Model category:** Model category of the asset.
 - **Classification:** Classification code that is assigned to the asset model.
- 5. Optional:** Change the format through which you view your asset locations by selecting a display option at the bottom-right corner of the **Asset indoor map** tab. The **Asset indoor map** tab supports the following display options:
- **Show map only** (default display option): Displays an interactive map that shows the locations of the assets within the specified floor.
 - **Show list only:** Displays the list of assets that are located within the specified floor.
 - **Show map and list:** Displays both the interactive map and the list of assets.
- 6.** Use the interactive map or the list of assets to view the real-time locations of assets within the specified floor or place in that floor.
Select an asset from the map or list to view additional details about that asset.

View the asset hierarchy in the Enterprise Asset Workspace

View the hierarchy details of a multi-component asset in a tree-like format in the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

The Asset hierarchy option is shown only for an asset associated with a parent asset or that has child assets.

The asset hierarchy shows consumable assets associated with a parent asset.

Note:

Asset hierarchy is not applicable to Linear assets and Pallets.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise Asset Estate**.
2. Select the asset record.

3. Select the Asset hierarchy icon () on the contextual sidebar.

- The asset hierarchy is shown in a tree-like format.

The default view shows up to three child assets. A number at the right of the asset shows the total number of child assets. If that number is higher than three, view all of them by selecting **Expand all** or **Show More**.

- The asset for which the hierarchy is shown is highlighted in the asset hierarchy tree.

View the total time worked on all tasks related to an enterprise asset

Use the Asset task time summary report to see the details of the time spent on all tasks for an asset and its child assets, grouped by task category.

Before you begin

Important:

The Asset task summary report is available with Enterprise Asset Management version 9.0 and later.

Role required: `sn_eam.enterprise_asset_manager` or `enterprise_asset_technician`

About this task

Asset task time refers to the total time spent on all tasks related to an asset. The total time spent includes the sum of time worked on all related tasks for the asset and its child assets.

Note:

Time spent on tasks related to child assets is rolled up to the parent asset only if the tasks were created and closed after the **last_used** date on the child assets. The total time from these tasks is then aggregated and added to the parent asset's time spent.

When a child asset is removed from a parent asset, the total time spent on the parent asset remains the same. Therefore, the time spent lines associated with the parent asset will be available even after the child asset is removed.

The time worked on a task is tracked after you start working on it and select **Start Timer** until you close the task. The timer automatically stops when you close the task, and the total duration is updated. You can also pause the timer when you aren't working on the task by selecting **Pause**, and then select **Resume** when you continue to work on the task. You can also add time worked details to the task manually by selecting **Record Time**. The time worked on a task is stored in the Time worked [task_time_worked] table.

After a task is closed on a parent or child asset, a time spent line is generated and stored in the Time spent line [sn_itam_common_time_spent_line] table. Each time spent line includes the time worked on the asset task. The sum of the time spent values in these time spent lines gives the total asset task time. If a task involves multiple assets, the total time spent is equally divided among them. This equally distributed time is then aggregated to the parent asset if there are any child assets involved.

Note:

When you upgrade to Enterprise Asset Management version 9.0.0, the *Calculate asset time spent* fix script creates time spent lines for asset tasks that have already been completed and closed.

The total time spent is grouped by the following task categories:

- **Purchase - Asset:** Includes the following tasks
 - All tasks in the Refresh flow except the Reclaim aged asset task.
 - Replacement task in the Return Merchandise Authorization (RMA) flow
 - Replacement task in the Recall flow
- **Labor - Maintenance:** Includes Calibration and Planned maintenance in the Work order workflow.
- **Labor - Repair:** Includes tasks in the following workflows:
 - Work order (Breakfix work type)
 - Repair order
 - RMA order
 - Recall order (only the Repair task)
 - Incident
- **Labor - General:** Includes tasks in the following workflows:
 - Asset reclamation
 - Resale
 - Disposal
 - Lease return
 - Transfer order
 - Recall order (except the Repair task)
 - Move order
 - Loaner
 - Asset onboarding
 - Work order (Install task)
 - Asset refresh flow (only the Reclaim aged asset task)
 - Asset request (Pick task)
 - Drop off and Receive task

Note:

Total time spent on an asset task isn't calculated for pallets, consumables, and bundle assets. Therefore, the Asset task time summary report isn't available for these assets.

About this task

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Enterprise asset estate**.
2. Select the **All assets** tab.
3. Select the asset record for which you want to view the details of the total time spent on the tasks.
4. On the contextual sidebar, select the Asset task time summary icon [].
Total time spent by task category report is displayed.

Asset task time summary

Total time spent by task category

Total time spent: **15 Hours 19 Minutes**

The Asset task time summary report includes the following details:

- **Total time spent:** Total time worked on all related tasks for the asset, including tasks on child assets.
- **Breakdown of total time spent:** Total time worked on all related tasks, divided and shown separately for each task category. This visualization helps you to see how much time was spent on tasks within each task category.
- **Legends for the task categories:** Legends shown are based on the actual asset tasks and their task categories. The legends include the following:
 - **Purchase - Asset**
 - **Labor - Maintenance**

- **Labor - Repair**
- **Labor - General**

5. To view the details of the time spent on all tasks within a specific task category, select the corresponding task category section in the report.

The list of time spent lines is displayed, with each line showing the following details:

- **Source asset:** Display name of the asset, including both parent and child assets, for which time was spent on the task.
- **Task:** Task number
- **Task type:** Type of the task, such as the Enterprise RMA Order Line task.
- **Task name:** Name of the task, such as Prepare or On-site repair.
- **Time spent:** Time worked on the asset task.
- **Short description:** A brief description of the task.
- **Closed:** The date and time when the asset task was closed.
- **Task category:** Category to which the task belongs.

Monitor enterprise asset performance with Asset KPIs report

Track the asset availability and related KPI values in the report to see how well an enterprise asset is performing.

Before you begin

Important:

The Asset KPIs report is available with Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

About this task

The Asset KPIs report is available for an enterprise asset under the following conditions:

- The asset belongs to a model category for which the performance tracking is enabled. For details, see [Opt in to model categories to track performance KPIs for enterprise assets](#).
- The asset has moved to the In use state, and its KPIs have been calculated and are available in the Asset Availability [sn_ent_asset_availability] table.

Note:

The *Calculate asset performance KPIs* scheduled job runs every week on Saturday to calculate the KPIs for the assets. These KPIs are then reflected in the Asset availability and related KPIs report, which displays the most recent KPI values.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Enterprise asset estate**.
2. Select the **All assets** tab.
3. Select the asset record for which you want to view the details of the asset key performance indicators (KPIs).
4. On the contextual sidebar, select the Asset availability and related KPIs icon [].
The Asset KPIs report is displayed.

5. To view the details of the report, select any section on the report.

A form view of the availability record for the asset is shown with additional details such as the following:

- **Current asset schedule:** The asset schedule linked to the asset currently and used for KPI calculations. If no schedule is linked, the Default asset schedule is used.
- **Start:** The date and time when the asset KPI values were first calculated.
- **End:** The date and time when the asset KPI values were last calculated.
- **Outages During Interval tab:** A list of outages with details like start and end time of the outage and the duration of the outage. For more details on outage record creation and handling, see [Asset performance reports in the Enterprise Asset Workspace](#).

Import enterprise models and assets in workspace

Import multiple enterprise models and assets at one go in the Enterprise Asset Workspace.

Before you begin

You can import enterprise models and assets of different types such as simple, pre-assembled, user-assembled assets, and consumables. You can also view the import errors and status.

The enterprise models and asset import records are stored in Enterprise Bulk Import [sn_eam_bulk_import] table.

The Flow Designer application is used to initiate the EAM Bulk Import sub flow to assist you in importing enterprise models and assets. As the flow takes you through the various stages, the import details are automatically updated. You can open the EAM Bulk Import flow to view the status of the stages in the flow.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Asset operations**.
2. Select any of the import actions under **Bulk Import**.
3. Select **New**.
The Create New Enterprise Bulk Import page opens.
4. Enter a unique name for the import process in the **Name** field.
5. Select a mode for the import in the **Mode** field.
6. Select **Download template** to download a spreadsheet.
Based on the mode you select, a spreadsheet is available. Templates are available for models, for assets, and a combined template for models and assets.
7. Enter the details in all the mandatory fields in the spreadsheet.
If you don't enter values in all the mandatory columns in the template, the import fails, and an error message appears asking you to check the template format. For details on mandatory fields, see [Mandatory fields in the bulk import spreadsheets](#).
8. Select **Attach File** to upload the spreadsheet (.xlsx).
9. Select **Import** to perform a validation check on the spreadsheet.
After you select Import, the Status field changes from **Draft** and moves to **Pending, Uploading, Transforming**. After the import process is completed, the status changes to either **Completed, Completed with errors, or Failed**. You can view details regarding the result of the import process for models and assets in the **Model import result** and **Asset import result** sections.
10. Select **Model Import staging, Model component Import staging, or Asset Import Staging** related lists to view the details of the spreadsheet that you uploaded and also view any errors you received.

11. Open any record for which you got an error.
12. Fix the error, upload the spreadsheet, and import the record again.

Configure tabs in the Enterprise Asset Workspace

Configure the options to hide or display various tabs, including tabs that are associated with specific model categories, in the Enterprise model management view and Enterprise asset estate view of the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center**.
2. In the navigation panel of the Admin center view, select **Model and asset tabs**.
3. From the list of available tab configurations, select the configuration that you want to modify. The Enterprise Asset Management application includes the following tab configurations by default:
 - Asset groups tab configuration
 - Asset indoor map tab configuration
 - Construction class tab configuration
 - Enterprise class tab configuration
 - Facilities class tab configuration
 - Firmware class tab configuration
 - Industrial class tab configuration
 - Linear assets tab configuration
 - Medical class tab configuration
 - Retail class tab configuration
 - Tactical Equipment class tab configuration
 - Transportation class tab configuration
 - Wearables class tab configuration

Important:

You can also select **New** to create an additional tab configuration for any custom top tier model category that you have added under the enterprise model category. However, ServiceNow strongly recommends that you use only existing top tier model categories, such as Medical or Construction, with custom sub-categories instead. For more information on creating custom model categories, see [Create model categories](#).

If you choose to create an additional tab configuration, you must also use UI Builder to manually add the corresponding model and asset tabs to the Enterprise model management view and Enterprise asset estate view. For detailed instructions, see [Add tabbed content to UI Builder pages](#) .

4. On the tab configuration record, modify the fields as needed.

Tab configuration fields

Field	Description
Name	Name of the tab configuration.
Model category	<p>Model category that is associated with the tab configuration. The specified model category corresponds with a model tab in the Enterprise model management view and an asset tab in the Enterprise asset estate view.</p> <p>Note: This field is editable only if you are creating a tab configuration.</p>
Include in tab	<p>Option to display the given tab in the Enterprise model management view or Enterprise asset estate view. If you enable this option, the tab appears in the applicable views. If you disable this option, the tab no longer appears in the applicable views.</p> <p>For example, if you enable this option in the Retail class tab configuration, the Retail tab appears in both the Enterprise model management view and Enterprise asset estate view.</p> <p>Warning: If you enable the Include in tab option but disable the Include in dialog box option, the resulting tab configuration is invalid.</p>
Include in dialog box	<p>Option to display the associated model category in the dialog boxes for creating enterprise models and assets. If you enable this option, the model category appears in the Model category drop-down list of these dialog boxes. If you disable this option, the model category no longer appears in the drop-down list. You can access these dialog boxes by navigating to either the Enterprise model management view or Enterprise asset estate view, selecting the All enterprise tab, and then selecting New.</p> <p>Note: This option is editable only for tab configurations that are associated with a model category, such as the Tactical Equipment class tab configuration.</p> <p>Warning: If you enable the Include in tab option but disable the Include in dialog box option, the resulting tab configuration is considered invalid.</p>
Domain	Domain that the tab configuration is available in.

5. Select **Save**.

Managing enterprise asset shipments

Track and manage your enterprise asset shipments in real-time by integrating the Enterprise Asset Management application with third-party shipping carriers using the IT Asset Management integration framework.

Prerequisites

Before you can integrate the Enterprise Asset Management application with a third-party shipping carrier, the shipping carrier must complete the following prerequisites:

- Enable cross scope access on their third-party application.
- Create a script include that extends the base ITAMShipmentIntegration script so that you can connect to their third-party application and retrieve shipment details in real-time.
 - The script include must be available in the IT Asset Management application scope. However, the Caller access isn't restricted and Accessible from fields must be available in All application scopes.
 - Business logic must be implemented within the fetchShipmentinfo function to enable communication with the carrier API based on tracking numbers. The carrier API is required for connecting to the third-party application and for retrieving shipment details.
 - The fetchShipmentinfo function must return a JSON object with the following HTTP response code and message:

```
{
  httpResponseCode: 200, httpResponseMessage: 'SUCCESS'
}
```

- When the script include is in test mode, the shipping carrier invokes the carrier API to validate your connection to their third-party application. The shipping carrier can then either verify and return the response or query the shipments and invoke the processResponse function using the following response format:

```
[
  {
    trackingNumber: '',
    deliveryDate: '',
    pickupDate: '',
    packageStatus: '',
    statusDetail: '',
    trackingURL: '',
    parcelWeight: '',
    deliveryServicesCost: '',
    currency: ''
  }
]
```

If the shipping carrier invokes the processResponse function, they must return the response after the function completes.

- Create an integration profile with the appropriate name, carrier API details, and connection details. This integration profile enables you to connect to the third-party application so that you can retrieve shipment details.

- If the third-party application uses the ServiceNow Credentials [discovery_credentials] table or any other ServiceNow table with Password2 fields, provide a KMF access map policy to enable access to those tables. For more information on KMF access map policies, see [Password2 encryption with the Key Management Framework \(KMF\)](#) .

After the shipping carrier completes these prerequisites, you must complete these additional prerequisites:

- If the integration profile contains connection details through a connection and credentials alias, update those details as needed so that you can successfully authenticate and connect to the carrier API.
- Associate the shipping carrier with the integration profile.

Use Advanced Shipment Notification in Enterprise Asset Management

Use Advanced Shipment Notification (ASN) to automate and create enterprise asset records for when your assets are in transit.

Before you begin

Download your ASN template and have your asset vendor update it. Upload the updated template to your ServiceNow instance. Before using the ASN template to import asset records, ensure that your ServiceNow instance has the model ID defined and that the same model ID is mentioned in the template.

Role required: sn_eam.enterprise_admin

About this task

Creating enterprise asset records manually is time consuming and can lead to errors. Use ASN to reduce the risk of shipment going missing or misplaced and increase inventory accuracy.

Procedure

1. Navigate to **Enterprise Asset Workspace > Asset operations > Shipment Notifications**.
2. Select **New**.
The Create New Shipment Notification Upload page appears.
3. Enter a unique name for the ASN in the **Name** field.
4. Select **Attach File** to upload a spreadsheet (.xlsx).
The spreadsheet should be in the format of the download template. If you do not have a sample spreadsheet, select **Download template** to download a sample spreadsheet, fill in the details in the spreadsheet, and then select **Attach File** to upload the spreadsheet. Ensure that in the spreadsheet the format for **Ship date**, **Order date**, and **Warranty end date** fields is month/date/year.

Note:

From the Yokohama release onward, the Download template for Advanced Shipment Notification includes the **MAC address** field. After a successful import, the MAC address that you provided in the template is added to the **MAC address** [mac_addr] field in the Asset [alm_asset] table.

The upload may take some time. Once the file is uploaded, the name of the spreadsheet appears in the **File** field.

5. Select **Import** to perform a validation check on the spreadsheet.

After you select **Import**, the **Status** field changes from **Draft** and moves to **Pending, Extracting Rows and Importing**. Once the import process is completed, the status changes to either **Completed, Completed with errors**, or **Failed**.

The **Shipment Upload Result** section appears that gives information on the import process. Information such as how many records were inserted, ignored or skipped.

6. Select **Shipment Notification Upload Stagings** related link to view any errors you received as well as to view the details of the spreadsheet that you uploaded.
7. If you got an error, select the record in **Shipment Notification Upload Stagings** related link.
8. Scroll down to the **Errors** section and view the error in the **Comment** field.
9. Fix the error, upload the spreadsheet, and import the record again.
Serialized assets do not have duplicate enterprise import records created, but consumables do have duplicate entries.

Create a shipment carrier record in Enterprise Asset Workspace

Create a shipping carrier record in the Enterprise Asset workspace to associate the carrier with an integration profile.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center**.
2. Select **Shipping carrier** from the Shipping list.
3. Select **New**.
4. On the form fill in the fields.

Create New Shipping Carrier form

Field	Description
Name	Name of the shipping carrier.
Email	Email address of the shipping carrier.
Integration profile	Profile for integrating with the third-party carrier's application. For more details, see View integration profiles for third-party shipping carriers in the Enterprise Asset Workspace .
Status	Status of the carrier. This field is set to Active by default.
Phone	Phone number of the shipping carrier.
Website	Website of the shipping carrier.
Company	Company name of the shipping carrier.
Notes	Additional information about the carrier.

5. Select **Save**.
The shipping carrier record is created and added to the Shipping carrier list.

Script include for third-party shipping carrier integrations

Before you can integrate the Enterprise Asset Management application with a third-party shipping carrier, that shipping carrier must create a script include that extends the base ITAMShipmentIntegration script. By extending this script, you can connect to the third-party shipping carrier application and retrieve shipment details in real-time.

Example: Structure of the ITAMShipmentIntegration script include

```

var ITAMShipmentIntegration = Class.create();
ITAMShipmentIntegration.prototype = {
  initialize: function() {
  },

  /**
   * Encapsulates communication with end point and fetching tracking info
   * If used in test mode, only response details would be returned
   * Else this API should invoke processResponse with the shipment details and return response code, message
   *
   * @param {array of string} trackingNumbers Shipment tracking numbers
   * @param {string} mode Can be 'test' or empty string
   */
  fetchShipmentInfo: function (trackingNumbers, mode) {
    // Communicate with API
    // Process the response
    // If mode === 'test' return response
    // Else Invoke post processing function and then return response
    /**
     * Expected response format to be passed to processResponse: array of objects
     * where each object corresponds to a single shipment
     *
     * Expected response format to be returned: JSON object with keys - httpResponseCode, httpResponseMessage
     * httpResponseCode - response code
     * httpResponseMessage - detailed message
     */
  },

  /**
   * Encapsulates to update shipment records with the response received
   *
   * @param {array of objects} response Response from API
   * Expected response format: array of JSON, where each JSON would have values with below keys
   * trackingNumber, deliveryDate, pickupDate, packageStatus, statusDetail, trackingURL
   */
  processResponse: function (response) {
    // Update shipment records
    if (!gs.nil(response)) {
      var mappingObj = sn_itam_common.ITAMIntegrationUtil.SHIPMENT_RESPONSE_COL_MAPPING;
      response.forEach(function(recordObj) {
        var shipmentRecord = new global.GlideQuery(sn_itam_common.ITAMIntegrationUtil.SHIPMENT_TABLE)
          .where('tracking_number', recordObj.trackingNumber)
          .where('stage', '!=', 'cancelled')
          .toGlideRecord();
        shipmentRecord.query();
        while (shipmentRecord.next()) {
          for (col in mappingObj) {
            var value = recordObj[mappingObj[col]];
            if (gs.nil(value)) {
              shipmentRecord.setValue(col, null);
            } else {
              shipmentRecord.setValue(col, value);
            }
          }
          shipmentRecord.update();
        }
      });
    }
  },
};

type: 'ITAMShipmentIntegration'

```

fetchShipmentInfo function

The fetchShipmentInfo function within the ITAMShipmentIntegration script include retrieves tracking numbers from your ServiceNow instance and then invokes the carrier API to fetch shipment details for those tracking numbers. To enable communication with the carrier API based on tracking numbers, the shipping carrier must define the corresponding business logic

within the fetchShipmentInfo function. This function processes responses from the carrier API and then initiates the processResponse function.

processResponse function

The processResponse function within the ITAMShipmentIntegration script include retrieves responses from the carrier API and then updates your shipment records with the following shipping carrier details:

- Carrier link
- Carrier status
- Carrier status detail
- Carrier pick-up date
- Carrier delivered date
- Currency
- Delivery services cost
- Parcel weight

i Important:

The IT Asset Management application automatically defines the business logic within this function. The business logic should not be modified.

Integrate with a third-party shipping carrier in the Enterprise Asset Workspace

Integrate the Enterprise Asset Management application with a third-party shipping carrier so that you can track the real-time status of your enterprise asset shipments.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the left navigation menu of the Asset operations view, navigate to **Shipment > Shipping carriers**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Shipping Carrier form

Field	Description
Name	Name of the shipping carrier.
Email	Email address of the shipping carrier.
Integration profile	Integration profile that you are using to connect to the third-party shipping carrier application. i Note: Integration profiles are automatically created by each shipping carrier.
Status	Status of the shipping carrier.
Phone	Phone number of the shipping carrier.

Field	Description
Website	Third-party website of the shipping carrier.
Company	Company name of the shipping carrier, such as FedEx or UPS.
Notes	Additional notes about the shipping carrier.

5. Select **Save**.

View integration profiles for third-party shipping carriers in the Enterprise Asset Workspace

View the integration profiles for your third-party shipping carriers in the Asset operations view of the Enterprise Asset Workspace. These integration profiles enable you to connect to third-party shipping carrier applications so that you can retrieve shipment details for your enterprise assets.

Before you begin

Role required: sn_eam.enterprise_asset_technician, sn_eam.enterprise_asset_manager, or sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center**.
2. Select **Carrier integration** from the Shipping list.
3. View the complete list of integration profiles.
Select an integration profile to view additional details, including the connection details, associated shipping carriers, scheduled job for fetching shipment details, and logs of the scheduled job.

Associate a third-party shipping carrier with an integration profile in the Enterprise Asset Workspace

Associate a third-party shipping carrier with an integration profile so that you can successfully connect to that shipping carrier.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

Each shipping carrier can be associated with only one active integration profile at a time. If any of your integration profiles are not already associated with a shipping carrier, you can view and take action on those integration profiles by using the Unmapped carrier profiles important action in the Inventory view of the Enterprise Asset Workspace.

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the left navigation menu of the Asset operations view, navigate to **Shipment > Carrier integration profiles**.
3. Select the integration profile that you want to associate a shipping carrier with.
4. On the integration profile record, select the **Shipping Carriers** tab.
5. Associate a shipping carrier with the integration profile.

- To associate an existing shipping carrier with the integration profile, use the following steps:

a. Select Add.

The Add carriers dialog box opens.

- b. In the dialog box, search for and select the shipping carrier that you want to associate with the integration profile.**

***i* Note:**

The dialog box displays only the shipping carriers that aren't already associated with an integration profile.

c. Select Add.

- To associate a new shipping carrier with the integration profile, use the following steps:

a. Select New.

- b. On the form, fill in the fields.**

Create New Shipping Carrier form

Field	Description
Name	Name of the shipping carrier.
Email	Email address of the shipping carrier.
Integration profile	Integration profile that you are using to connect to the shipping carrier. This field populates automatically.
Status	Status of the shipping carrier.
Phone	Phone number of the shipping carrier.
Website	Third-party website of the shipping carrier.
Company	Company name of the shipping carrier, such as FedEx or UPS.
Notes	Additional notes about the shipping carrier.

c. Select Save.

Result

The shipping carrier is associated with the integration profile.

Remove a third-party shipping carrier from an integration profile in the Enterprise Asset Workspace

Remove a third-party shipping carrier that you no longer want to associate with an integration profile.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the left navigation menu of the Asset operations view, navigate to **Shipment > Carrier integration profiles**.
3. Select the integration profile that you want to remove a shipping carrier from.
4. On the integration profile record, select the **Shipping Carriers** tab.
5. Select the check box for the shipping carrier that you want to remove.
6. Select **Remove**.

Result

The shipping carrier is no longer associated with the integration profile.

Test the integration profile for a third-party shipping carrier in the Enterprise Asset Workspace

Test the integration profile for a third-party shipping carrier so that you can mitigate any connection issues that arise.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the left navigation menu of the Asset operations view, navigate to **Shipment > Carrier integration profiles**.
3. Select the integration profile that you want to test.
4. Select **Test connection**.
A message appears, indicating whether the connection was successful or not.

Note:

If the integration profile fails to connect three or more consecutive times, you can view and take action on the corresponding connection issues by using the Carrier integration failures important action in the Inventory view of the Enterprise Asset Workspace.

View and add enterprise asset shipments

Use the Shipments list to view all active enterprise asset shipments from a central location. If an existing shipment doesn't appear on the list, you can add it manually.

Before you begin

Role required: sn_eam.enterprise_asset_technician, sn_eam.enterprise_asset_manager, or sn_eam.enterprise_admin

Note:

Only the sn_eam.enterprise_admin role can add shipments manually.

About this task

You can view and add shipments for your transfer orders, purchase orders, move orders, Return Merchandise Authorization (RMA) orders, disposal orders, resale orders, recall orders, reclamation requests, Advanced Shipment Notifications (ASNs), and lease contracts.

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the left navigation menu of the Asset operations view, navigate to **Shipment > Shipments**.
3. View the complete list of active enterprise asset shipments.
Select a shipment to view additional shipment details, including the shipment source and associated enterprise assets.
4. If an existing enterprise asset shipment doesn't appear on the list, add it manually.
 - a. Select **New**.
 - b. On the form, fill in the fields.

Create New Shipment form

Field	Description
Shipping carrier	Shipping carrier through which the enterprise assets were shipped.
Ship date	Date and time at which the enterprise assets were shipped.
Shipped from	Geographic location that the enterprise assets were shipped from.
Receive date	Date and time at which the shipment was received.
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Shipped by	User who shipped the enterprise assets.
Shipped to	Geographic location that the enterprise assets were shipped to.
Shipment quantity	<p>Quantity of assets shipped for the shipment record.</p> <p>This field value is automatically populated when the assets are shipped to the destination.</p> <p>The shipment quantity is the sum of the asset quantities shipped for each shipment line.</p> <div style="background-color: #e0f2f7; padding: 5px;"> <p>i Important: The Shipment quantity field is available with Enterprise Asset Management version 9.1.0 onwards.</p> </div>
Received by	User who received the shipment.
Ignore stale check	Option to ignore stale checks for the shipment.

- c. Select **Save**.

Create a multi-asset onboarding process

Onboard multiple assets at one go by creating a multi-asset onboarding playbook.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

An enterprise asset technician submits an onboarding order. As an enterprise asset manager, you can work on the Multi-asset onboarding task associated with the onboarding order using the Onboarding playbook.

You can perform inline editing directly in the playbook. This capability enables you to change a value in a record directly instead of opening the record and updating the values on the form.

To close an onboarding task, you should either complete or skip all the activities in the playbook.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Asset operations**.
2. From the **Onboarding** list, select **Onboarding tasks**.
3. Select the onboarding task record for which you want to create a multi-asset onboarding process.
4. Select the **Onboarding playbook** tab.
The Multi-asset onboarding playbook is displayed.
5. Review or enter details in the **Review model details** lane.
6. Select **Mark as complete** to proceed to the next lane.
After you complete entering details in the Review model lane, all other review assets activities are unlocked.
7. Continue to review or enter details in all the lanes until you reach the last lane (Deployment).
8. Review and then complete or skip the **Deployment** activity.
 - Create a deploy task.
 - a. In the **Location** field, select the location where you want to deploy the asset.
 - Note:**
This field is required to deploy the asset.
 - b. In the **Assigned to** field, select the person to whom the asset should be assigned.
 - Note:**
By default, this field is auto-populated with the value that you selected in the **Reserved for** field when you performed the **Review assets assignment** activity.
 - c. In the **Create deploy task** field, select **true**.
 - d. Select **Mark as complete**.

Based on the value of the `com.sn_eam.default_deployment_task` asset property set by your enterprise administrator, either of the following deploy tasks are created:

- If the value is set to **sn_eam_deploy_asset_task**, an Enterprise Deploy Asset task is created for each asset that should be deployed. The deploy tasks are listed in the **Deploy Asset task** tab.
- If the value is set to **wm_task**, a Work order task is created for each asset that should be deployed. The deploy tasks are listed in the **Work Order Task** tab.

In the deploy task that's created, the **Assignment group** and the **Assigned to** fields are auto-populated with the values that you selected in the **Support group** and **Supported by** fields when you performed the **Review assets management** activity.

Note:

You can assign a work order task only to the Enterprise Field Technicians support group.

- Skip the Deployment activity by selecting **Skip**.

The asset technicians complete the deploy tasks assigned to them. For more information, see [Complete and close the Pick Up task for an enterprise asset](#) and [Complete and close a work order for an enterprise asset](#).

9. After all the lanes show a status of skipped or complete, select **Close Task** to complete the multi-asset onboarding process.
Your assets are successfully onboarded. The onboarding task is completed and the request and requested item's state changes to **Closed Complete**.

Managing enterprise asset move orders

You can use move orders to move in-use or consumed enterprise assets from one location to another.

When you submit a move order, the Enterprise Asset Management application automatically generates an enterprise move line record for each enterprise asset that you include in the order. These records enable you to individually track and manage the movement of each enterprise asset in your move order.

For each enterprise move line record within a move order, you must indicate how you are going to move the given enterprise asset. You can choose to ship the enterprise asset through a third-party shipping carrier or move the enterprise asset locally without shipping it. Based on the option that you choose, you must complete all subsequent tasks to move the enterprise asset and update the enterprise move line record with a status of Completed. After every enterprise move line record within a move order reaches a status of Completed, the move order is marked as complete.

Submitting an enterprise asset move order

You can submit an enterprise asset move order through either the ServiceNow® Service Catalog or the Inventory view of the Enterprise Asset Workspace.

Submit an enterprise asset move order through the Service Catalog

Use the ServiceNow® Service Catalog to submit a move order so that you can move in-use or consumed enterprise assets between locations.

Before you begin

Role required: sn_eam.enterprise_asset_manager or end user

Note:

The sn_eam.enterprise_asset_manager role can submit move orders for any enterprise assets within a deployment. The end user role can submit move orders for only assigned enterprise assets.

Procedure

1. Navigate to **All > Service Catalog > Enterprise Asset Lifecycle**.
2. From the list of available Enterprise Asset Lifecycle catalog items, select **Asset Move Order**.

3. On the Catalog item to initiate an asset move order form, fill in the fields.

Catalog item to initiate an asset move order form

Field	Description
Requested for	User who the move order is being submitted for. If you specify a user in this field, the move order can include enterprise assets that are assigned only to that user.
Assignment group	Group that you want to assign the move order to.
Assigned to	User who you want to assign the move order to.
Move date	Date on which you want to move the enterprise assets.
From location	Location that you want to move the enterprise assets from.
To location	Location that you want to move the enterprise assets to.
Asset(s)	Enterprise assets that you want to include in the move order. You can select from any of the enterprise assets that reside in the location specified in the From location field. Note: If you select an enterprise asset that contains any child assets, all child assets are also included in the move order.
Notes/ Special Instructions	Additional notes or instructions for the move order.

4. Select **Submit**.

Submit an enterprise asset move order through the Asset operations view

Use the Asset operations view of the Enterprise Asset Workspace to submit a move order so that you can move in-use or consumed enterprise assets between locations.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. Select **New**.
3. On the Create new move order form, fill in the fields.

Create new move order form

Field	Description
Requested for	User who the move order is being submitted for. If you specify a user in this field, the move order can include enterprise assets that are assigned only to that user.
Move date	Date on which you want to move the enterprise assets.

Field	Description
Assignment group	Group that you want to assign the move order to.
Assigned to	User who you want to assign the move order to.
From location	Location that you want to move the enterprise assets from.
To location	Location that you want to move the enterprise assets to.
Additional information	Additional information about the move order.

4. Select Save.

The form closes and you are automatically redirected to the new move order record.

What to do next

Add enterprise assets to the move order. See [Add enterprise assets to a move order](#) for detailed instructions.

Add enterprise assets to a move order

Add the enterprise assets that you want to include in a move order.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. From the list of available move orders, select the move order that you want to add enterprise assets to.
The move order record opens.
3. On the move order record, select the **Enterprise move lines** tab.
4. Select **Add**.
The Add assets dialog box opens.
5. In the dialog box, select the check box for every enterprise asset that you want to include in the move order.

You can select from any of the enterprise assets that reside in the location specified in the **From location** field of the move order.

Note:

If you select an enterprise asset that contains any child assets, all child assets are also included in the move order.

6. Select Add.

Result

The selected enterprise assets are added to the move order.

Remove enterprise assets from a move order

Remove any enterprise assets that you no longer want to include in a move order.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. From the list of available move orders, select the move order that you want to remove enterprise assets from.
The move order record opens.
3. On the move order record, select the **Enterprise move lines** tab.
4. From the list of enterprise move lines, select the check box for every enterprise asset that you want to remove.

Note:

Each enterprise move line corresponds with a specific enterprise asset.

Note:

If you select an enterprise asset that contains any child assets, all child assets are also removed from the move order.

5. Select **Remove**.

Result

The selected enterprise assets are automatically updated with a status of Cancelled. All enterprise move tasks that are associated with the corresponding enterprise move lines are also updated with a state of Closed Incomplete.

Completing an enterprise asset move order

After you submit a move order for the in-use or consumed enterprise assets that you want to move, you must perform various tasks to complete the order.

You must complete the required set of tasks for each enterprise asset that is included in the move order. After you complete all required tasks for an enterprise asset, the corresponding enterprise move line updates with a status of Completed. Once all enterprise move lines reach a status of Completed, the move order is complete.

Complete the Prepare task for a moving enterprise asset

Complete the Prepare task for an enterprise asset so that you can proceed with moving the asset between locations.

Before you begin

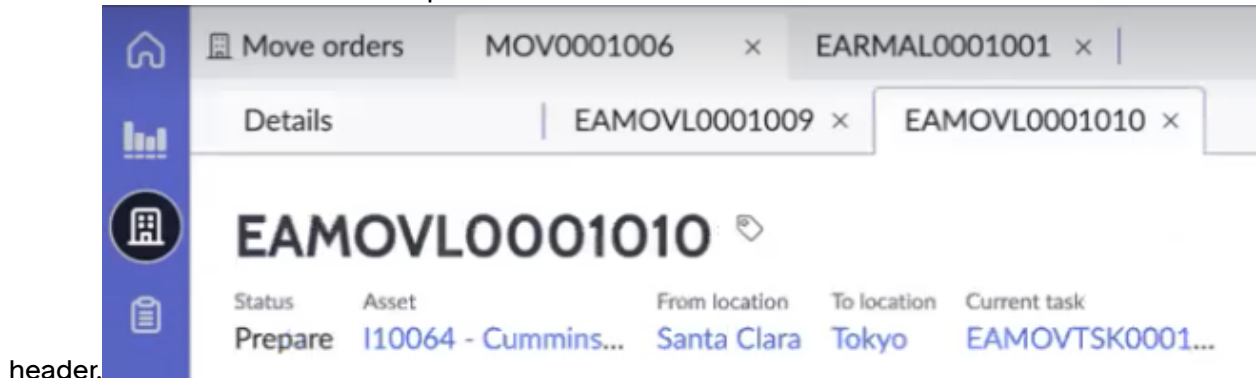

Role required: sn_eam.enterprise_asset_manager, sn_eam.enterprise_admin, or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. From the list of available move orders, select the move order that you want to complete.
The move order record opens.
3. On the move order record, select the **Enterprise move lines** tab.
4. From the list of available enterprise move lines, select the enterprise move line for the enterprise asset that you want to move.
The enterprise move line record opens.

5. On the **Enterprise move tasks** tab, select the task number for the **Prepare** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise move line record

header.

The Prepare task opens.

6. On the **Details** tab of the Prepare task, fill in the fields.

Details tab

Field	Description
Enterprise move task	
Assignment group	Group that the task is assigned to. This field populates automatically based on the group that the entire move order is assigned to.
Assigned to	User who the task is assigned to. This field populates automatically based on the user who the entire move order is assigned to.
Scheduled date	Date and time at which the task is scheduled to be completed.
Priority	Priority of the task.
Move type	Type of enterprise asset move. Select one of the following options: <ul style="list-style-type: none"> ○ Local Move: Option to move the enterprise asset to a different location without shipping it. ○ Ship: Option to ship the enterprise asset to a different location.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

7. Select **Close Task**.

Result

The Prepare task is automatically updated with a state of Closed Complete.

If you set the **Move type** field to **Local Move**, the Enterprise Asset Management application automatically generates a corresponding Local move task for the enterprise move line. If you set the **Move type** field to **Ship**, the Enterprise Asset Management application automatically generates a corresponding Ship task for the enterprise move line.

What to do next

If you set the **Move type** field to **Local Move**, proceed to [Complete the local move for an enterprise asset](#) to complete the move.

If you set the **Move type** field to **Ship**, proceed to [Complete the shipment for a moving enterprise asset](#) to complete the shipment.

Complete the local move for an enterprise asset

Perform all tasks that are required to move an enterprise asset without shipping it. You must perform these tasks if you set the **Move type** field to **Local Move** in an enterprise move line.

Before you begin

Before you can proceed with the local move, you must complete the Prepare task for the enterprise asset. See [Complete the Prepare task for a moving enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager, sn_eam.enterprise_admin, or enterprise_asset_technician

Procedure

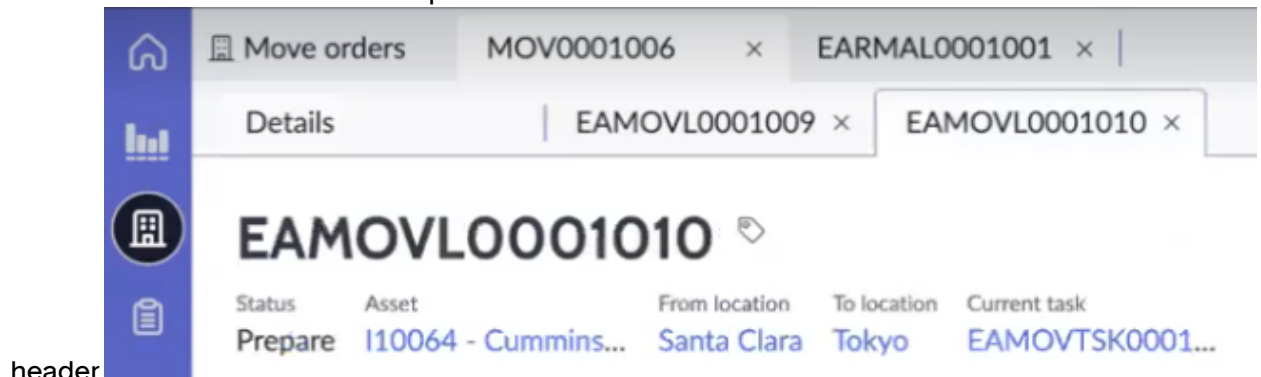

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. From the list of available move orders, select the move order that you want to complete. The move order record opens.
3. On the move order record, select the **Enterprise move lines** tab.
4. From the list of available enterprise move lines, select the enterprise move line for the enterprise asset that you want to move. The enterprise move line record opens.
5. Complete and close the Local move task for the enterprise move line.

By default, this Local move task applies only to the enterprise asset that is associated with the given enterprise move line. If you want to apply the same Local move task to additional enterprise assets within your move order, you can include those assets in the task.

To successfully complete and close this task, the enterprise asset must be moved to the target location without being shipped.

- a. On the **Enterprise move tasks** tab, select the task number for the **Local move** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise move line record

The Local move task opens.

- b. On the **Details** tab of the Local move task, fill in the fields.

Details tab

Field	Description
Enterprise move task	
Assignment group	Group that the task is assigned to. This field populates automatically based on the group that the entire move order is assigned to.
Assigned to	User who the task is assigned to. This field populates automatically based on the user who the entire move order is assigned to.
Scheduled date	Date and time at which the task is scheduled to be completed.
Priority	Priority of the task.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the task.

- To close the task without including additional enterprise assets from your move order, select **Close Task**.
- To close the task after including additional enterprise assets from your move order, use the following steps:

i. Select **Include more assets.**

The Select assets dialog box opens.

ii. In the dialog box, select the check box for each additional enterprise asset that you want to include.

iii. Select **Close Task.**

The Local move task is automatically updated with a state of Closed Complete.

Result

The enterprise move line is automatically updated with a status of Completed.

What to do next

Move all remaining enterprise assets that are included in the move order. After all corresponding enterprise move lines reach a status of Completed, the move order is complete.

Complete the shipment for a moving enterprise asset

Perform all tasks that are required to ship an enterprise asset. You must perform these tasks if you set the **Move type** field to **Ship** in an enterprise move line.

Before you begin

Before you can proceed with the shipment, you must complete the Prepare task for the enterprise asset. See [Complete the Prepare task for a moving enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager, sn_eam.enterprise_admin, or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, navigate to **Asset operations > Moves > Move orders**.
2. From the list of available move orders, select the move order that you want to complete.
The move order record opens.
3. On the move order record, select the **Enterprise move lines** tab.
4. From the list of available enterprise move lines, select the enterprise move line for the enterprise asset that you want to move.
The enterprise move line record opens.
5. Complete and close the Ship task for the enterprise move line.
To successfully complete and close this task, the enterprise asset must be shipped to the target location.

- a. On the **Enterprise move tasks** tab, select the task number for the **Ship** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise move line record header.

The Ship task opens.

- b. On the **Details** tab of the Ship task, fill in the fields.

Details tab

Field	Description
Enterprise move task	
Assignment group	Group that the task is assigned to. This field populates automatically based on the group that the entire move order is assigned to.
Assigned to	User who the task is assigned to. This field populates automatically based on the user who the entire move order is assigned to.
Scheduled date	Date and time at which the task is scheduled to be completed.
Priority	Priority of the task.
Shipment details	
Shipping carrier	Shipping carrier through which the enterprise asset was shipped.
Ship date	Date on which the enterprise asset was shipped.
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.

Field	Description
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Ship task is automatically updated with a state of Closed Complete. The Enterprise Asset Management application then automatically generates a corresponding Receive task for the enterprise move line.

6. Complete and close the Receive task for the enterprise move line.

To successfully complete and close this task, the enterprise asset must be received at the target location.

a. On the Enterprise move tasks tab, select the task number for the Receive task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise move line record header.

The Receive task opens.

b. On the Details tab of the Receive task, fill in the fields.

Details tab

Field	Description
Enterprise move task	
Assignment group	Group that the task is assigned to. This field populates automatically based on the group that the entire move order is assigned to.
Assigned to	User who the task is assigned to. This field populates automatically based on the user who the entire move order is assigned to.
Scheduled date	Date and time at which the task is scheduled to be completed.
Priority	Priority of the task.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Receive task is automatically updated with a state of Closed Complete.

Result

The enterprise move line is automatically updated with a status of Completed.

What to do next

Move all remaining enterprise assets that are included in the move order. After all corresponding enterprise move lines reach a status of Completed, the move order is complete.

Managing risks scores in Enterprise Asset Management

Manage risk scores in the Enterprise Asset Management application by creating configuration values for risk likelihood, risk impact, and risk scores.

Create configuration values for risk likelihood

Use the Risk Likelihood module to create configuration values for the likelihood vector.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > Risk configuration > Risk likelihood**.
2. Select **New**.
3. Enter a label in the Enterprise Risk Likelihood Configuration page.
The **Value** field is an incremental field and cannot be edited.
4. Select **Submit**.
The **Display Name** field is automatically populated and is a concatenation of the value and the label. For example, if 1 is the value and Low is the label, the **Display Name** field appears as 1 - Low.
5. To add more configuration values, repeat steps 2-4.
There should be a minimum of three likelihood records and a maximum of ten.
6. Select **Freeze** after you have added the configuration records.
7. Select **OK** in the warning message box to continue freezing your configuration records.

Note:

You cannot add or delete any likelihood configuration records after you select **Freeze**. You can however edit the **Label** field in the existing records.

Create configuration values for risk impact

Use the Risk Impact module to create configuration values for the impact vector.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > Risk configuration > Risk impact**.
2. Select **New**.
3. Enter a label in the Enterprise Risk Impact Configuration page.
The **Value** field is an incremental field and cannot be edited.
4. Select **Submit**.
The **Display Name** field is automatically populated and is a concatenation of the value and the label. For example, if 1 is the value and Low is the label, the **Display Name** field appears as 1 - Low.
5. To add more configuration values, repeat steps 2-4.
There should be a minimum of three impact records and a maximum of ten.
6. Select **Freeze** after you have added the configuration records.

7. Select **OK** in the warning message box to continue freezing your configuration records.

Note:

You cannot add or delete any impact configuration records after you select **Freeze**. You can however edit the **Label** field in the existing records.

Create configuration values for risk scores

Use the Risk Score module to create configuration values for risk score bands.

Before you begin

Before creating configuration values for risk score, ensure that you have added and frozen configuration value for the two vectors: likelihood and impact in the Risk Likelihood and the Risk Impact modules, respectively.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > Risk configuration > Risk score**.
2. Select **New**.
3. Fill in the form details.
4. Select **Submit**.
Based on the other fields, the **Band name** field is automatically populated.
5. To add more risk score bands, repeat steps 2-4.
There should be a minimum of two score band records and a maximum of four.
6. Select **Freeze** after you have added the entire risk range.
To edit the records, select **Unfreeze**.

Onboarding multiple enterprise assets in the Enterprise Asset Workspace

Onboard multiple enterprise assets at one go by creating onboarding orders in the Asset operations view.

As an enterprise asset technician, you should perform the following actions to initiate the onboarding of enterprise assets:

1. Create an onboarding order.
2. Add details of the assets that you want to onboard and submit the onboarding order.

The enterprise asset manager reviews and completes the activities listed in the Onboarding playbook to onboard the requested assets. For details, see [Create a multi-asset onboarding process](#).

Create an onboarding order for enterprise assets in the Enterprise Asset Workspace

Create an onboarding order in the Asset operations view to initiate the onboarding of multiple enterprise assets.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Asset operations.**
2. From the **Onboarding** list, select **Onboarding order.**
3. Select **New.**
4. On the form, fill in the fields.

Create New Asset Onboarding form

Field	Description
Requested for	Person for whom the asset is requested. This field is optional.
Stockroom	Stockroom where onboarded asset will be stored. This field is required. Note: When you select the stockroom, the Location field is automatically populated with the stockroom location.
Due date	Date by when the asset onboarding should be complete. This field is optional.

5. Determine whether you want to onboard assets of an existing model or a new model.

6. Select **Save.**

Result

- An onboarding order in the Draft stage is created and displayed in the Onboarding order list.
- The **Add asset details** option is displayed on the onboarding order.

What to do next

Add asset details to the onboarding order. For details, see [Add details of the enterprise assets to an onboarding order.](#)

Add details of the enterprise assets to an onboarding order

Specify the details of the enterprise assets that you want to onboard through an onboarding order.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Asset operations.**
2. From the **Onboarding** list, select **Onboarding order.**
3. Select the onboarding order for which you want to add asset details.
4. Select **Add asset details.**

5. In the **Add assets** dialog box, enter the asset details.
The **Serial number** field is required. You can also enter the values for the following fields:
 - **Asset tag**
 - **RFID tag**
 - **MAC address**
 - **Additional info**
6. For each asset that you want to onboard, select the Add Row icon (**+**) and enter the asset details.
7. Select **OK**.
8. Select **Save**.
The assets that you added to the onboarding order are displayed in the **Onboarding Assets** tab.
9. Select **Submit**.

Result

- The stage of the onboarding order changes to Review.
- A Multi-asset onboarding task is created and displayed in the **Onboard Asset Tasks** tab.

Normalizing enterprise models

To standardize enterprise models, the data must be normalized. The normalization process enables you to normalize your manufacturer, model name, model number, and model type data of your enterprise models.

If a specific model type, library, or product model is not available in the Enterprise Asset Management Content Service, you have the option to create a custom enterprise model type, custom enterprise model library, or custom enterprise product model. If you are using the Operational Technology (OT) Asset Management application, you also have the options to create custom United Nations Standard Products and Services Code (UNSPSC) firmware classifications, custom firmware products, custom firmware versions, and custom firmware mappings for your Customer Premises Equipment (CPE).

Import and export content data for Enterprise Asset Management

Import and export content data to the ServiceNow Enterprise Asset Management Content Service to improve the normalization process. On-premise users can use the Manage Enterprise Library module to import or export data via a zip file.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **All > Modules > Manage Enterprise Library**.
2. Open the Manage Enterprise Library form layout and select the **Active** check box to activate the module.
3. Select **Save** and refresh the form layout.
4. Navigate to the Manage Enterprise Library module.
5. Import the content data to get the new data into your system.

- a. Select **Import Enterprise Library Content**.
 - b. Select **Attach Content File** and then select the zip file that contains the content.
 - c. Select **Run Import**.
After the data is imported, the content update schedule job, *EAM - Apply latest content changes*, is triggered to process the content updates.
6. Export content to send the custom data or any enterprise models that are not fully normalized to the ServiceNow content service team.
- a. Select **Content Service Opt-in: Export Enterprise Normalization Content**.
 - b. If you already haven't opted in to share the data with ServiceNow content service, select **opt-in** and refresh the Manage Enterprise Library page.
For details on opting-in, see [Opt-in to Enterprise Asset Management Content Service](#).
 - c. Select **Run Export**.
 - d. After the status changes to Ready for Download, refresh the page.
A zip file is created and appears at the top of the Manage Enterprise Library page. If there is no content to export, an error message appears informing you that no content exists.
 - e. Download and send this zip file to the ServiceNow content service team.

Create custom enterprise model type

If you have an enterprise model type that isn't represented in the Enterprise Asset Management Content Service yet, you can create a custom model type.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

- 1. Navigate to **All > Enterprise Asset Workspace > Normalization**.
- 2. Select the **Custom enterprise model type** tab.
- 3. Select **New**.
- 4. Fill in the form details.

Field	Description
Name	Display name of the enterprise model type.
UNSPSC commodity ID	United Nations Standard Products and Services Code of the model type.
Description	A detailed description of the enterprise model type.
Active	Indicates that the model is active.

5. Select Save.

After the model type is created, normalize the model type.

Create custom enterprise model library

If you have an enterprise model library that isn't represented in the Enterprise Asset Management Content Service yet, you can create a custom model library.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Normalization.**
2. Select the **Custom enterprise model libraries** tab.
3. Select **New.**
4. Fill in the form details.

Field	Description
Model number	Assign a number to the model.
Model name	Name of the model.
Description	A detailed description of the model.
Active	Indicates that the model is active.
Exclude from content service	Option that excludes the model library details from being transferred to the Enterprise Asset Management Content Service even though you opted-in.

5. Select Save.

After the model library is created, normalize the model library.

Create custom enterprise product models

If you have a product model that is not represented in the Enterprise Asset Management Content Service yet, you can create a custom product model.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Normalization.**
2. Select the **Custom enterprise product models** tab.
3. Select **New.**
4. Fill in the form details.

Field	Description
Model Name	Name of the enterprise product model.

Field	Description
Manufacturer	Name of the manufacturer of the enterprise product model.
Model type	The model type.
Description	A detailed description of the product model.
Active	Indicates that the model is active.
Exclude from content service	Option that excludes the product model details from being transferred to the Enterprise Asset Management Content Service even though you opted-in.

5. Select **Save.**

After the product model is created, normalize the product model.

Revert normalization

You can revert the normalization of enterprise models in the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

Enterprise models with a status of **Fully Normalized**, **Partially Normalized**, **Manufacturer Normalized**, or **Manually Normalized** can be reverted. All the normalized fields present in the model are reverted and the normalization status changes to **Match not Found**.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Enterprise model management**.
2. Open an enterprise model record that is already normalized.
3. Select **Revert Normalization**.
4. Select **OK** on the confirmation message box.

Once the revert normalization process is complete, the following changes take place:

- fields are reset to their original values and any rule associated with the enterprise model is deactivated.
- After deactivation of the rule, revert normalization is run on all models that were normalized using that rule before.
- The deactivated rule can no longer normalize any more models. The deactivated rule can't be reactivated. It is a one time procedure.
- The **Revert Normalization** option on the model record is replaced with the **Normalize** option.

Normalizing firmware for your operational technology (OT) assets

To standardize the publisher, product, and version of the firmware that is embedded into your OT assets, you must normalize the corresponding data in the associated firmware discovery models. By standardizing this information, you can track and manage your firmware more accurately and efficiently.

Note:

You can standardize this information only in the OT Asset Management application. See [OT Asset Management](#) for more information on the application.

To begin standardizing this information, you must use a discovery tool, such as the ServiceNow® Discovery application, to discover all firmware installations across your OT asset deployment. Each discovered firmware installation is associated with a corresponding firmware discovery model, which provides information about the discovered firmware publisher, discovered firmware product, and discovered firmware version. After the discovery process is complete, normalization runs on the associated firmware discovery models, matching the discovered firmware publishers, discovered firmware products, and discovered firmware versions against normalized equivalents in the Enterprise Asset Management Content Library. Each discovered firmware installation is then updated with a firmware model containing the normalized firmware publisher, firmware product, and firmware version that best match the associated firmware discovery model.

If a specific United Nations Standard Products and Services Code (UNSPSC) firmware classification, firmware product, firmware version, or Customer Premises Equipment (CPE) firmware mapping is not available in the Enterprise Asset Management Content Library, you can create a custom UNSPSC firmware classification, custom firmware product, custom firmware version, or custom CPE firmware mapping.

Import and export content data for firmware in your operational technology (OT) assets

Import and export content data for firmware that is embedded into your on-premise OT assets. Share this data with the Content Service team so that you can help improve the normalization process.

Before you begin**Important:**

You can import and export this firmware content data only in the OT Asset Workspace. To use the OT Asset Workspace, install the OT Asset Management application on your ServiceNow instance. See [Install OT Asset Management](#) for detailed instructions.

Important:

To import and export this firmware content data, set the `sn_itam_common.onprem_content_import_export` system property to `true` on your ServiceNow instance. In addition, opt in to the Enterprise Asset Management Content Service and verify that the Custom Firmware Models KPI is enabled. See [Opt-in to Enterprise Asset Management Content Service](#) for detailed instructions.

Role required: `sn_otam.ot_asset_manager`

Procedure

1. Navigate to **All > OT Asset Workspace > Admin center**.
2. Import firmware content data onto your ServiceNow instance.
 - a. From the navigation menu of the Admin center view, navigate to **Manage library > Import firmware content**.
 - b. Select the Attachments icon (📎) on the sidebar of the Import page.
 - c. In the Attachments window, select **Select a file**.
 - d. When prompted, search for and select the zip file that contains your firmware content data.
 - e. In the Upload a file dialog box, select **Upload**.
 - f. After the dialog box closes, select **Run Import** on the Import page.

After the content data is successfully imported, the OT Asset Management application automatically triggers the *EAM - Apply latest content changes* scheduled job to process any corresponding content updates, which you can then use to normalize your firmware.

3. Export firmware content data from your ServiceNow instance.

By exporting your firmware content data, you can share any custom or partially normalized firmware with the Content Service team. In addition, you can share data for your firmware versions, firmware models, and firmware life cycles.

a. From the navigation menu of the Admin center view, navigate to **Manage library > Export firmware content.**

b. Select **Run Export.**

The OT Asset Management application compresses all of your firmware content data into a single zip file. When the zip file is ready for download, the page automatically reloads.

c. Select the Attachments icon (📎) on the sidebar of the Export page.

d. In the Attachments window, select the Actions icon (⋮) for the zip file that you want to download.

e. Download the zip file and then send it to the Content Service team.

Create a custom United Nations Standard Products and Services Code (UNSPSC) classification for firmware in your operational technology (OT) assets

If the UNSPSC classification for any firmware that is embedded into your OT assets isn't already represented in the Enterprise Asset Management Content Service, create a custom UNSPSC classification.

Before you begin

i Important:

You can create custom UNSPSC classifications only using the OT Asset Workspace. To use the OT Asset Workspace, install the OT Asset Management application on your ServiceNow instance. See [Install OT Asset Management](#) for detailed instructions.

Role required: sn_eam.enterprise_admin

About this task

The UNSPSC is a global multi-sector standard for classifying products and services. It encompasses a five-level hierarchical codeset that enables you to classify products and services at grouping levels relevant to your needs. You can use the UNSPSC to classify the firmware that is embedded into your industrial- and hardware-based OT assets.

Procedure

- 1. Navigate to **All > OT Asset Workspace > Normalization**.**
- 2. Select the **Custom firmware UNSPSC** tab.**
- 3. Select **New**.**
- 4. On the form, fill in the fields.**

Create New Custom UNSPSC firmware classification form

Field	Description
UNSPSC commodity ID	Eight-digit numeric code that identifies the firmware that is embedded into your OT assets.
UNSPSC title	Title of the UNSPSC classification.
UNSPSC description	Description of the UNSPSC classification.
Active	Option that indicates if the UNSPSC classification is active.
Exclude from content service	Option that excludes the UNSPSC classification from being shared with the Enterprise Asset Management Content Service.

5. Select **Save**.

Create a custom firmware product for your operational technology (OT) assets

If the firmware product that is embedded into your OT assets isn't already represented in the Enterprise Asset Management Content Service, create a custom firmware product.

Before you begin

i Important:

You can create custom firmware products only using the OT Asset Workspace. To use the OT Asset Workspace, install the OT Asset Management application on your ServiceNow instance. See [Install OT Asset Management](#) for detailed instructions.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **All > OT Asset Workspace > Normalization**.
2. Select the **Custom firmware products** tab.
3. Select **New**.
4. On the form, fill in the fields.

Create New Custom firmware product form

Field	Description
Manufacturer	Manufacturer of the firmware product.
Product	Name of the firmware product.
UNSPSC classification	Eight-digit numeric code that identifies the firmware product.
Description	Description of the firmware product.
Active	Option that indicates if the firmware product is active.
Exclude from content service	Option that excludes the firmware product from being shared with the Enterprise Asset Management Content Service.

5. Select **Save**.

Result

The custom firmware product is created. If any existing firmware publisher uses the same manufacturer as the custom firmware product, the Enterprise Asset Management application automatically associates that firmware publisher with the custom firmware product. Otherwise, the Enterprise Asset Management application creates a custom firmware publisher to associate with the custom firmware product.

Create a custom firmware version for your operational technology (OT) assets

If the version of the firmware that is embedded into your OT assets isn't already represented in the Enterprise Asset Management Content Service, create a custom firmware version.

Before you begin

i Important:

You can create custom firmware versions only using the OT Asset Workspace. To use the OT Asset Workspace, install the OT Asset Management application on your ServiceNow instance. See [Install OT Asset Management](#) for detailed instructions.

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **All > OT Asset Workspace > Normalization**.
2. Select the **Custom firmware versions** tab.
3. Select **New**.
4. On the form, fill in the fields.

Create New Custom firmware product version form

Field	Description
Version	Firmware version.
Product	Firmware product that the firmware version applies to.
Next version available	Option that indicates if the next firmware version is currently available.
Active	Option that indicates if the firmware version is active.
Exclude from content service	Option that excludes the firmware version from being shared with the Enterprise Asset Management Content Service.

5. Select **Save**.

Create a custom Common Platform Enumeration (CPE) mapping for firmware in your operational technology (OT) assets

If the CPE mapping for firmware that is embedded into your OT assets isn't already represented in the Enterprise Asset Management Content Service, create a custom CPE mapping.

Before you begin

i Important:

You can create custom CPE mappings only using the OT Asset Workspace. To use the OT Asset Workspace, install the OT Asset Management application on your ServiceNow instance. See [Install OT Asset Management](#) for detailed instructions.

Role required: sn_eam.enterprise_admin

About this task

CPE is a standardized naming scheme that enables you to map your information technology (IT) systems, software, and packages to corresponding vulnerability management data in the National Vulnerability Database (NVD). You can use these mappings to identify and mitigate potential vulnerabilities across your IT infrastructure. All official CPE names are listed in the CPE Product Dictionary, which is hosted and maintained by the National Institute of Standards and Technology (NIST).

Procedure

1. Navigate to **All > OT Asset Workspace > Normalization**.
2. Select the **Custom firmware CPE** tab.
3. Select **New**.
4. On the form, fill in the fields.

Create New Custom firmware CPE mapping form

Field	Description
Firmware product	Firmware product that you want to map to vulnerability management data in the NVD.
Firmware version	Version of the firmware product that you want to map to vulnerability management data in the NVD.
CPE publisher	Publisher of the firmware product, as listed in the CPE Product Dictionary.
CPE product	Name of the firmware product, as listed in the CPE Product Dictionary.
CPE version	Version of the firmware product, as listed in the CPE Product Dictionary.

5. Select **Save**.

View firmware models discovered on your Operational Technology (OT) assets

Get the details of all the firmware models that the discovery tool discovered on your Operational Technology (OT) assets.

Before you begin

i Important:
 The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

Role required: sn_otam.ot_asset_manager

About this task

The Discovered firmware model [sn_ent_discov_firmware_model] table stores the details of the firmware models discovered on your OT assets.

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT model management**.
2. Select the **Firmware discovered** tab.
 The list of all the installed firmware models that are discovered is shown with the following details:

- **Discovered manufacturer:** Name of the firmware manufacturer.
- **Discovered model:** Firmware model that's discovered on the OT asset.
- **Discovered model number:** Model number of the discovered firmware model.
- **Discovered version:** Version number of the discovered firmware model.
- **Normalization status:** Status of discovered firmware model normalization. This field can have one of the following values:
 - **New:** The discovered firmware model has not yet run-through the normalization process.
 - **Match not found:** The normalization process couldn't match any of the fields of the discovered firmware model. This status could also occur when a normalization rule doesn't exist for the firmware model.
 - **Manually normalized:** Firmware model is normalized manually.
 - **Normalized:** The discovered firmware model is normalized by the background job, and a firmware model is created in the Firmware model [sn_ent_firmware_model] table. A firmware model is normalized only when the publisher, product, model, model number, and version are available.
 - **Partially normalized:** The normalization process could at least match the product value.
 - **Publisher normalized:** The normalization process could only match the publisher value.
- **Normalized firmware model:** Firmware model that's created after the discovered firmware model is normalized.

Important:

A firmware model is created only when the discovered firmware model is either normalized or manually normalized by specifying the product and version details.

- **Updated:** Date and time when the discovered firmware model was last updated.

3. Select a record to view the details.

The form displays the information related to the discovered firmware model in the Details and the Normalization sections.

Create a firmware model for the firmware embedded into your Operational Technology (OT) assets

Create a firmware model for the firmware that's embedded into your OT assets if the model isn't already represented in the Enterprise Asset Management Content Service.

Before you begin

Important:

The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

The firmware product and the firmware version details should be available in the Enterprise Asset Management Content Service. If not, you can also create the firmware product and the firmware version for your firmware model. For more details, see [Create a custom firmware product for your operational technology \(OT\) assets](#) and [Create a custom firmware version for your operational technology \(OT\) assets](#).

Role required: sn_otam.ot_asset_manager

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT Model Management**.
2. Select the **Firmware** tab.
3. Select **New**.
4. On the form, fill in the fields.

Create New Firmware model form

Field	Description
Display name	Name of the firmware model. This field is populated automatically with a value that's based on the Publisher , Product , and Version fields.
Publisher	Manufacturer of the firmware model.
Product	Name of the firmware product. This field is required.
Version	Version of the firmware. This field is required.
Next version available	Option that indicates if the next firmware version is available.
Manually created	Option that indicates that the firmware version is created manually. The check box is automatically selected.

5. Select **Save**.

Result

- A firmware model is created and listed in the **Firmware** tab.
- The firmware model record displays the following related lists:
 - Discovered firmware
 - Firmware installations
 - Firmware model lifecycles
 - Knowledge
- The lifecycle phases associated with the firmware model are listed in **Firmware model lifecycles** tab only if that firmware version has lifecycles defined in the Firmware lifecycle definition [sn_itam_firmware_lifecycle_def] table.

Normalize the firmware embedded into your Operational Technology (OT) assets manually

Standardize the publisher, product, and version details of the firmware that is embedded into your OT assets by normalizing the discovered firmware models manually.

Before you begin

Important:

The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

The firmware product and the firmware version details of the discovered firmware model that you want to normalize should be available in the Enterprise Asset Management Content Service. If not, you can also create the firmware product and the firmware version for your firmware model. For more details, see [Create a custom firmware product for your operational technology \(OT\) assets](#) and [Create a custom firmware version for your operational technology \(OT\) assets](#).

Role required: sn_otam.ot_asset_manager

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT model management**.
2. Select the **Firmware discovered** tab.
3. Select the discovered firmware model that you want to normalize.
4. On the form, fill in the details in the Normalization section.

Normalization section

Field	Description
Normalized publisher	Name of the firmware manufacturer.
Normalized product	Name of the firmware product.
Normalized version	Version of the discovered firmware.
Exclude from content service	Option that excludes the firmware model details from being shared with the Enterprise Asset Management Content Service.

5. Select **Save**.

Result

The Normalization status changes to Manually Normalized.

Revert normalization of firmware models

Revert the normalization of firmware models in the OT Asset Workspace.

Before you begin

i Important:

The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

Role required: sn_otam.ot_asset_manager

About this task

Normalization of firmware models with a Normalization status of **Normalized, Partially normalized, Publisher normalized, or Manually normalized** can be reverted.

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT model management**.
2. Select the **Firmware discovered** tab.
3. Select the normalized discovered firmware model for which you want to revert normalization.
4. Select **Revert Normalization**.

Result

After the revert normalization process is complete, the following changes take place:

- All the normalized fields present in the firmware model are reverted and the normalization status changes to **Match not found**.
- The normalization rule associated with the firmware model gets deactivated. The deactivated rule can no longer normalize any more firmware models. The deactivated rule can't be reactivated. It's a one-time procedure.
- After deactivation of the normalization rule, revert normalization is run on all models that were normalized using that rule earlier.
- The **Revert Normalization** option on the model record is replaced with the **Normalize** option.

Create knowledge articles for firmware models

Attach helpful and relevant knowledge articles to the firmware model in the OT Asset Workspace.

Before you begin

Important:

The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

Role required: sn_otam.ot_asset_manager

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT Model Management**.
2. Select the **Firmware** tab.
3. Select the firmware model for which you want to attach the knowledge article.
4. Select the **Knowledge** tab.
5. Select **New**.
6. On the Create New Knowledge form, select the knowledge article that you want to add in the **Knowledge** field.
7. Select **Save**.

Related topics

Create life-cycle definitions for your firmware models

Manage the complete life cycle of firmware models by adding life-cycle information in the OT Asset Workspace.

Before you begin

Important:

The OT Asset Management application must be activated to access the OT Asset Workspace. For details, see [Install OT Asset Management](#).

Role required: sn_otam.ot_asset_manager

About this task

Note:

If the life-cycle phases of your firmware version are defined in the Enterprise Asset Management Content Service, then the life-cycle phase details are automatically populated for that firmware model record.

Procedure

1. Navigate to **Workspaces > OT Asset Workspace > OT model management.**
2. Select the **Firmware** tab.
3. Select the firmware model for which you want to add life-cycle details.
4. Select the **Firmware model lifecycles** tab.
5. Select **New**.
6. On the form, fill in the fields.

Create New Firmware model lifecycle form

Field	Description
Model	Name of the model. This field is read only.
Lifecycle type	Type of life cycle. The available values are: <ul style="list-style-type: none"> ○ Internal <p>Note: For the Internal life-cycle type, the life-cycle information isn't shared with your ServiceNow instance during the reverse push.</p> <ul style="list-style-type: none"> ○ Publisher
Lifecycle phase	Phase of the life cycle. The available values are: <ul style="list-style-type: none"> ○ General availability ○ End of sale ○ End of support ○ End of extended support ○ End of life
Source	Source of the firmware model.
Risk	Risk associated with the life cycle.
Description	Description of the firmware model.
Phase start date	Start date of the life-cycle phase. This field is required.
Phase end date	End date of the life-cycle phase.
Current lifecycle phase	Option that indicates if it's the current life cycle of the firmware model.
Active	Option that indicates if the firmware model life cycle is active.

7. Select **Save**.

Result

The life-cycle phase is listed in the **Firmware model lifecycles** tab.

Create a knowledge article for Enterprise Asset Management

Create and edit knowledge articles within a knowledge base to share information across your organization.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. Navigate to **Enterprise Asset Workspace > Admin center > Asset knowledge base**.
2. Select **New** in the Asset knowledge base page.
3. On the form, fill in the fields.
For detailed information on the fields, refer to the [Knowledge Management](#) application
4. Select **Save** to create the article.

Managing incidents in Enterprise Asset Management

Incident managers or users with the itil role configure the Enterprise Asset Management application by creating, updating, and resolving IT incidents for enterprise assets.

Create an Enterprise Asset Management incident

Create an incident record to document a deviation from an expected Enterprise Asset Management standard of operation.

Before you begin

Role required: itil

To create an Enterprise Asset Management incident record, you must install all applicable Incident Management plugins on your ServiceNow instance. See [Incident Management plugins](#) for the complete list of Incident Management plugins.

About this task

This procedure describes how an ITIL agent must complete an incident form to document and track an Enterprise Asset Management incident. Refer to [Incident Management](#) for more in-depth information on creating and managing incidents.

Procedure

1. [Create an incident](#).
After your incident is created, you are automatically redirected to the Incidents list.
2. From the list of available incidents, select the incident that you created in the previous step.
3. On the form header of your incident record, select the Additional actions menu icon () and then select **View > Enterprise Asset**.
This option sets your incident record to the Enterprise Asset Management incident form view, which contains additional fields that are specific to Enterprise Asset Management.
4. After the form reloads in the Enterprise Asset Management incident form view, specify the asset that is affected by this incident.
 - a. Select the Lookup using list icon () in the **Asset** field.
 - b. In the Assets pop-up window, search for and select the asset that is affected by this incident.

The pop-up window closes and you automatically return to the Incident form.

- c. On the form header, select the Additional actions menu icon () and then select **Save**.

When the form reloads, the **Configuration item** field and **Affected Assets** related list update automatically based on the asset that you selected.

Note:

The **Configuration item** field remains empty if you select a consumable asset.

Important:

If you select a multi-component asset, the **Affected Assets** related list displays only the parent asset. You must manually add each child asset that is affected by this incident. See [step 5](#) for more details.

5. If you selected a multi-component asset in the previous step, specify the child assets that are affected by this incident.

- a. On the **Affected Assets** related list, select **Edit**.

- b. In the Collection list on the Edit Members form, search for and select a child asset that is affected by this incident.

Note:

By default, the Edit Members form automatically runs a search filter to display only the relevant child assets in the Collection list.

- c. Select the Add icon () to move the selected child asset to the Affected Assets List.

- d. Repeat steps b and c for each child asset that is affected by this incident.

- e. Select **Save**.

- f. After you return to the Incident form, select **Update**.

What to do next

Resolve and close your incident.

Resolve and close an Enterprise Asset Management incident

Take action on the assets that are affected by an Enterprise Asset Management incident so that you can resolve and close the incident.

Before you begin

Role required: itil

Procedure

1. Navigate to **All > Incident > All**.
2. From the list of available incidents, select the Enterprise Asset Management incident that you want to resolve and close.
3. Specify what actions you want to take on the assets that are affected by the incident.

- a. On the Incident form, select the **Affected Assets** related list.
- b. From the list of affected assets, double-click the **Asset action** field for the asset that you want to take action on.
- c. When prompted, select the action that you want to take on the asset.
- d. Select the Save icon (✔).
- e. If you choose to swap the asset, specify the asset that you are swapping the existing asset with.
 - i. Double-click the corresponding **Swapped Asset** field.
 - ii. When prompted, select the Lookup using list icon (🔍) to search for and select the asset that you want to swap the existing asset with.
 - iii. Select the Save icon (✔).
- f. If you are taking action on a consumable asset, specify the number of available assets that you want to take action on.
You can take action on all available assets or only a portion of the available assets.
 - i. Double-click the corresponding **Consumable Quantity** field.
 - ii. When prompted, enter the number of available assets that you want to take action on.
 - iii. Select the Save icon (✔).

Important: The **Consumable Quantity** field does not display the updated value automatically. To view the updated value, **Refresh** the **Affected Assets** related list.

- 4. Based on the actions that you specified in the previous step, update/repair, swap, retire, or take no action on the affected assets.
- 5. After you have completed taking all necessary actions on the affected assets, provide details about how the incident has been resolved.
 - a. Return to your Incident form.
 - b. On the **Resolution Information** tab, fill in the fields.

Resolution Information tab

Field	Description
Knowledge	Option to automatically create a knowledge article upon incident closure.
Resolution code	Resolution category that specifies how the incident was resolved.
Resolution notes	Description of how the incident was resolved.
Resolved by	User who resolved the incident.
Resolved	Date and time at which the incident was resolved.

6. On the form header, select **Resolve.**

The incident is moved to the Resolved state, and you are automatically redirected to the Incidents list. If the asset has any child assets and was in a retired status as indicated in the **Asset action** box, the child assets will be released depending on the kind of asset.

Release of child assets based on type of asset in retired state

Type of asset	Action
Simple	No action
Simple with add-on	All child assets are released to the pending disposal state.
User-assembled	All child assets are released to the pending disposal state.
User-assembled with add-on	All child assets are released to the pending disposal state.
Pre-assembled	No action
Pre-assembled with add-on	All add-on assets are released to the pending disposal state.

The incident is moved to the Resolved state, and you are automatically redirected to the Incidents list.

7. From the list of available incidents, select the incident that you just resolved.

8. On the form header, select **Close Incident.**

The incident is closed.

Managing enterprise asset inventory and contracts

Create and manage your enterprise asset inventory and contracts.

Overview of managing enterprise inventory and contracts

Create and manage your enterprise asset inventory and contracts by performing the following tasks.

Task	Role required	Resources
Create and view stockrooms		<ul style="list-style-type: none"> • Create stockroom for enterprise assets • View stockroom details in the Enterprise Asset Workspace
Manage asset picking within your stockroom		Manage picking enterprise assets within your stockroom for Enterprise Asset Management workflows
Audit enterprise asset inventory		Audit enterprise asset inventory

Task	Role required	Resources
Create a disposal or a transfer order		<ul style="list-style-type: none"> • Create a disposal order in the Enterprise Asset Workspace • Create a transfer order in Enterprise Asset Workspace
Request a loaner asset		Request a loaner asset in Enterprise Asset Workspace
Request a RMA for defective assets		Requesting a Return Merchandise Authorization (RMA) for defective enterprise assets
Manage recalled enterprise assets		Managing recalled enterprise assets
Close an enterprise asset reclamation request		Close an enterprise asset reclamation request
Manage repair of defective assets		Manage repair of defective assets in your stockroom in the Enterprise Asset Workspace
Create contracts for leased enterprise assets		Create a contract for your leased enterprise assets
Manage expiring contracts		Managing expiring contracts for leased enterprise assets

- [Create a stockroom and assign assets to the stockroom](#)
- [Create a custom stock rule to automatically resupply a stockroom with an asset](#)
- Create a transfer order to transfer assets from one location to the other.
- Create a disposal order for assets that have reached the end of their life or are no longer functional.

Create stockrooms to assign assets to the stockroom.

Create and manage enterprise asset inventory

Keep track of your enterprise assets by efficiently managing inventory.

You can create various types of contracts for your enterprise assets, including lease, insurance, maintenance, warranty, purchase agreement, non-disclosure, terms & conditions, service, purchase order, software license, and subscription contracts.

Contracts are legally binding agreements that define mutual obligations between two or more parties. These obligations can include the contract start and end dates, terms and conditions, renewal information, financial terms, and covered users or assets.

For details on how to create insurance, maintenance, warranty, purchase agreement, non-disclosure, terms & conditions, and service contracts for your enterprise assets, see [Create a contract](#). For details on how to create contracts for your leased enterprise assets, see [Create a contract for your leased enterprise assets](#).

Create stockroom for enterprise assets

Create a stockroom in the Enterprise Asset Management application and assign assets to it.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > All stockrooms**.
2. Select **New**.
The Create New Stockroom page opens.
3. On the form, fill in the fields.

Field	Description
Name	Display name and identifier of the stockroom.
Assignment group	Group that primarily uses the stockroom.
Manager	Person in charge of the stockroom. Receives restocking notifications and requests for the stockroom's stock rules.
Location	Physical location of the stockroom.
Type	Type of stockroom. Choose from the following options: <ul style="list-style-type: none"> ○ Central Warehouse ○ Field Agent ○ FSL ○ On site ○ PUDO ○ Warehouse
Hours of operation	Hours during which the stockroom operates.
Description	Description of the stockroom.
Exclude from distribution channels	Option to exclude the stockroom from all stockroom distribution channels, which link stockrooms together for more efficient asset sourcing and transfers.
Exclude from service locations	Option to exclude the stockroom from all service locations in which you are completing work orders or work order tasks.
External	Indicates if this stockroom is managed internally (check box is cleared) or is managed externally by a third party (check box is selected).

4. Select **Save**.
The newly created stockroom appears in the **All stockrooms** tab.

Add a distribution channel to a stockroom in the Enterprise Asset Workspace

Add a distribution channel to a stockroom so that you can link that stockroom with other geographically-related stockrooms. By linking your stockrooms, you can efficiently source and transfer assets between those stockrooms. You can also assign a rank to each linked stockroom to specify the order of stockrooms that you can source and transfer assets between.

Before you begin

Role required: sn_eam.enterprise_admin

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. On the **All stockrooms** tab, select the stockroom that you want to add a distribution channel to. The stockroom record opens.
3. On the **Distribution Channel** tab of the stockroom record, select **New**.
4. On the form, fill in the fields.

Create New Stockroom Distribution Channel form

Field	Description
Channel Stockroom	Stockroom that you want to link as part of the distribution channel.
Rank	Rank of the stockroom that you want to link. If the distribution channel contains more than one linked stockroom, this rank corresponds directly with the order of linked stockrooms that you can source and transfer assets between. Enter a numerical value, such as 1 or 5. The lower the numerical value is, the higher the stockroom is within the order of linked stockrooms.
Active	Option that indicates if the linked stockroom is active within the distribution channel.

5. Select **Save**.
6. Repeat steps 3 to 5 for each stockroom that you want to link as part of the distribution channel.

Add service locations to a stockroom in the Enterprise Asset Workspace

Add service locations to a stockroom so that you can source, deploy, and retire its assets across multiple geographic locations.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

By default, you can source, deploy, and retire the assets of a stockroom only within the specified stockroom location. By adding additional service locations to a stockroom, you can source, deploy, and retire its assets across various locations.

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. On the **All stockrooms** tab, select the stockroom that you want to add service locations to. The stockroom record opens.
3. On the **Service locations** tab of the stockroom record, select **Add**.

The Add service locations dialog box opens.

4. In the dialog box, select the check box for every service location that you want to add to the stockroom.
5. Select **Add**.

View stockroom details in the Enterprise Asset Workspace

Use stockroom records to view detailed information about the stockrooms that your enterprise, hardware, consumable, bundle, loaner, and other assets reside in.

Before you begin

The following stockroom record tabs are available only if you've installed and activated the Hardware Asset Management application on your ServiceNow® instance:

- **Hardware**
- **Bundles**
- **Software Licenses**
- **Other Assets**
- **Hardware Loaner Pool**
- **Hardware Asset Audits**

To install and activate the application, request it from the [ServiceNow Store](#).

Role required: sn_eam.enterprise_admin, sn_eam.enterprise_asset_manager, or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom for which you want to view additional details.
The stockroom record opens.
4. Use the stockroom record tabs to view additional details about the stockroom.

Stockroom record tabs

Tab	Description
Details	<p>Get a detailed overview of the stockroom, including open stockroom tasks and general stockroom details.</p> <p>The Open stockroom tasks cards show all open orders, audits, and requests that are associated with the stockroom. Select a card to view the list of corresponding order, audit, or request records. If you select a card for any open Hardware Asset Management orders, audits, or requests, the list opens in the Hardware Asset Workspace.</p> <p>In addition, use the interactive map to view the location of the stockroom based on the specified stockroom address. Expand the map to view all supported service locations and all stockrooms that are linked as part of the stockroom distribution channel.</p>

Tab	Description
<p>Task Timeline</p>	<p>View the timeline of all stockroom tasks. Each stockroom task is added to the timeline based on either the creation date, the scheduled date, the start or return date, or the shipping date. Select a task to open the corresponding task record. If you select a Hardware Asset Management task, the record opens in the Hardware Asset Workspace.</p> <p>Use the timeline format filter at the top-right corner of the tab to change the format and duration in which you view the timeline. You can choose to view the timeline in a calendar format or timeline format. The calendar format supports the following timeline durations:</p> <ul style="list-style-type: none"> ○ Day ○ Work Week ○ Week ○ Month <p>The timeline format supports the following timeline durations:</p> <ul style="list-style-type: none"> ○ Day ○ Week ○ 4 Weeks
<p>Hardware</p> <p>i Note: This tab appears only if you have installed and activated the Hardware Asset Management application.</p>	<p>Create and view the hardware assets that reside in the stockroom.</p> <p>If you are creating a hardware asset, you are automatically redirected to the corresponding form in the Hardware Asset Workspace.</p>

<p>Pallets</p>	<p>Create and view the pallet assets that reside in the stockroom.</p>

Tab	Description
<p>Software Licenses</p> <p>Note: This tab appears only if you have installed and activated the Hardware Asset Management application.</p>	<p>Create and view the software licenses that reside in the stockroom.</p> <p>If you are creating a software license or selecting an existing software license, you are automatically redirected to the corresponding form or record in the Hardware Asset Workspace.</p>
<p>Other Assets</p> <p>Note: This tab appears only if you have installed and activated the Hardware Asset Management application.</p>	<p>Create and view all other types of assets that reside in the stockroom.</p> <p>If you are creating an asset, you are automatically redirected to the corresponding form in the Hardware Asset Workspace.</p>
<p>Hardware Loaner Pool</p> <p>Note: This tab appears only if you have installed and activated the Hardware Asset Management application.</p>	<p>View all hardware loaner assets that reside in the stockroom.</p> <p>If you select a loaner asset, you are automatically redirected to the corresponding record in the Hardware Asset Workspace.</p>
<p>Enterprise Loaner Pool</p>	<p>View all enterprise loaner assets that reside in the stockroom.</p>
<p>Service Locations</p>	<p>View all service locations that are supported by the stockroom.</p>
<p>Distribution Channel</p>	<p>Create and view the list and ranking of all linked stockrooms that you can source and transfer enterprise assets between. For more information on distribution channels, see Add a distribution channel to a stockroom in the Enterprise Asset Workspace.</p>
<p>Hardware Asset Audits</p>	<p>Create and view audits for your hardware asset inventory.</p>

Tab	Description
<p>Note: This tab appears only if you have installed and activated the Hardware Asset Management application.</p>	<p>If you are creating an audit or selecting an existing audit, you are automatically redirected to the corresponding form or record in the Hardware Asset Workspace.</p>
<p>Enterprise Asset Audits</p>	<p>Create and view audits for your enterprise asset inventory.</p>

5. View all active stock rules that are configured for the stockroom.

- a. From the sidebar of the stockroom record, select the Stock rules icon (1).
- b. View each stock rule to determine if your available stock is within the specified threshold. You can also determine if the corresponding model has reached the end of sale.

Create a stock rule for enterprise assets

Create a stock rule to automatically resupply a stockroom based on vendor purchase orders or transfer orders.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Stock rules control what happens when the inventory of a particular asset in a particular stockroom reaches a specified threshold. When available asset quantity drops below a specified quantity, the stock rule automatically creates an enterprise stock order request. Once the enterprise stock order request is created, the enterprise manager goes through the process of sourcing and receiving that order.

If a stock rule is created for an enterprise model that reaches the threshold limit, a notification is sent to the stockroom manager and a stock order request is automatically created.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory > Stock rules.**
2. Select **New.**
The Create New Stock Rule page opens.
3. On the form, fill in the details.

Model	Product model to which the rule applies.
Threshold	Quantity that the stock must reach to trigger restocking. For example, enter a threshold of 10 for a laptop computer that should be restocked when inventory drops below 10 in the specified stockroom.

	<p>Note:</p> <p>If a stock rule is created for an enterprise model that reaches the threshold limit, a notification is sent to the stockroom manager and a stock order request is automatically created.</p>
Restocking option	<p>Location where additional supplies should come from.</p> <p>If Procurement is not active, then restocking option is Stockroom only. Otherwise, select one of the following:</p> <ul style="list-style-type: none"> ○ Stockroom: creates a transfer order to obtain the asset from another stockroom. ○ Vendor: sends an email to the stockroom manager to order from a vendor. In addition to the email notification, a purchase order and purchase order line item are created.
Stockroom	Current physical location of the asset.
Order size	<p>Minimum order quantity for stockroom transfers or vendor purchases. ServiceNow calculates the smallest multiple of the order size needed to restock the item above the threshold. For example, there are 3 laptops in stock with a threshold of 10 and the Stockroom option selected. If the order size is set to 4, the system creates a transfer order for 8 laptops to exceed the threshold and satisfy the rule (3 in stock + 8 ordered = 11). When restocking from a vendor, ServiceNow sends an email to the stockroom manager showing the total number of items to order, as multiples of the order size.</p>
Active	Indicates whether this stock rule active (check box is selected). Clearing this check box prevents the stock rule from restocking automatically.
OT stock rule	<p>Important:</p> <p>This option is available with Enterprise Asset Management version 9.0 and later.</p> <p>Indicates whether the stock rule was created in the OT Asset Workspace.</p> <p>This check box appears on the stock rule form only for hardware models in both the OT Asset Workspace and Enterprise Asset Workspace. However, only the OT asset</p>

	manager can select or deselect this check box in the OT Asset Workspace.
--	--

4. Select Save.

Result

- The stock rule that you created appears in the **Stock rules** tab.
- If the restocking option was set to **Vendor**, the **Stock orders** tab will be displayed. All the stock orders that are created using this stock rule are listed under the Stock orders tab.

i Important:
The Stock orders tab is available with Enterprise Asset Management version 9.0 and later.

- If the restocking option was set to **Stockroom**, the **Transfer orders** tab will be displayed. All the transfers orders created using this stock rule are listed under the **Transfer orders** tab.

i Important:
The Transfer orders tab is available with Enterprise Asset Management version 9.0 and later.

For stock orders created through the restocking by a vendor, the stock order tab shows all stock orders generated by that stock rule. But for transfer orders, the tab only displays transfer orders after the upgrade.

Create a stockroom type for enterprise assets

If the base system stockroom types don't meet your needs, you can create a custom stockroom type in the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Stockroom types are categories of stockrooms. For detailed information on stockroom types, see [Stockroom types](#).

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > Stockroom types**.
2. Select **New**.
3. On the form, fill in the details.

Field	Description
Name	Display name of the stockroom type.
Description	General information about the stockroom type.
Priority	Level of precedence for this type of stockroom.
Value	Internal identifier of the stockroom type.

Field	Description
Shipment required	Option that determines if stockrooms of this type require shipment by default.
External stockroom	Indicates if stockrooms of this type are managed internally (check box cleared) or managed externally by a third party (check box selected).

4. Select **Save**.

The newly created stockroom type appears in the **Stockroom types** tab.

Audit enterprise asset inventory

Audit your enterprise asset inventory to learn where your assets are and what their current status is.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

You can use the [Mobile Agent application for Enterprise Asset Management](#) to scan asset tags or enter them manually. If an asset is scanned but its asset tag does not exist in our database, then by default, that asset is mapped to an unknown model record. The unknown model record appears on the **All enterprise models** tab of the **Model Management** view in the Enterprise Asset Workspace. The asset manager manually associates this asset to the appropriate model. You can't change, update or delete an unknown model.

Note:

Starting with Enterprise Asset Management version 9.0, you can also audit the licensed hardware assets in the Enterprise Asset Workspace only if the Hardware Asset Management application is activated.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Inventory > Asset audits**.

2. Select **New**.

The Create New Enterprise Asset Audit page opens.

3. On the Create New Asset Audits form, fill in the fields.

For a description of the field values, see [Asset audit fields for enterprise assets](#).

4. Select **Save**.

Result

The asset audit inventory record is created and appears with the **Expected Assets** and **Scanned Assets** tabs.

What to do next

Scan the assets in the inventory using the ServiceNow Agent app.

Related topics

[Asset audit fields for enterprise assets](#)

[Audit results](#)

[Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app](#)

[Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app](#)

Close an enterprise asset remediation task

View the open enterprise asset remediation from the **Inventory** view and close the task after updating the **Model category** and **Model** fields value for the asset.

Before you begin

Role required: asset, and sn_itam_common.asset_audit_admin, or sn_itam_common.asset_audit_user

About this task

Important:

This feature is available with Enterprise Asset Management version 10.0.0 onwards.

A new asset record is created when all of the following are true:

- The audit record's **Scan method** is set to **Multi scan**.
- During asset scanning, a new asset is detected that doesn't exist in the ServiceNow® instance,

For this new asset record, the application can't automatically determine the **Model category** and **Model** field values. These fields are initially set to **Unknown Model Category** and **Unknown Model**. An asset remediation task is then generated to notify you that an asset record has been created with an unknown model category and an unknown product model. In the Hardware Asset Workspace, you can access the open remediation task, update the asset record as required, and then close the remediation task.

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Inventory view**.
2. Select the **Overview** tab.
3. In the Important Actions section, in the Open asset remediation tasks tile, select **View records**. The Open asset remediation tasks list is displayed.
4. Select the task Number link. The Asset remediation form is displayed.
5. In the **Asset** field, select the Open Record icon. The asset form is displayed. The default value for the **Model category** and **Model** field is displayed in read-only mode.
6. Select the **Update** button.
7. On the form, fill in the details.

To what type of asset would you like to change

Field	Description
Asset type	Type of the asset.
Model category	Model category that the asset can be associated with.
Model	Model that the asset can be associated with.

8. Select **Update**. The updated Model category and Model value are displayed in the respective fields.
9. Open the **Details** tab. The Asset remediation task form is displayed.

10. Select the **Close Task button.**

The closed asset remediation task isn't listed on the Open asset remediation tasks list.

Create a disposal order in the Enterprise Asset Workspace

Create a disposal order for an asset that has reached the end of its life cycle or is no longer functional.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Only assets that are associated with enterprise or pallet models can be disposed of using an enterprise disposal order. You can add simple assets; multi-component assets, which include pre-assembled and user-assembled assets; and pallet assets with children to an enterprise disposal order.

Note:

If you are adding a multi-component asset or a pallet asset with children to a disposal order, any changes that you make to the parent asset are automatically applied to all child assets.

Use the Flow Designer application to create the disposal flow to take you through the entire asset disposal order process.

The disposal order goes through various stages before it's completed. Each stage is associated with a disposal task. To move through the various stages, close each task until you reach the last stage. After you complete the last task, the disposal order is complete. For more information about the disposal order stages, see disposal order stages.

Note:

You can cancel a disposal order until it reaches the transit stage of the workflow. Once your disposal order is in the confirmation stage, you can't cancel that order. You can cancel a task that is in a draft, scheduling, or transit stage by selecting **Closed Incomplete** from the State list and closing the task.

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > Disposal orders**.
2. Select **New**.
The Create New Enterprise Disposal Order page opens.
3. On the form, fill in the details.

Field	Description
Number	Reference number of the disposal order.
Stockroom	Stockroom where the asset is disposed from.
Location	Location of the stockroom where the asset gets disposed from. The location automatically appears after you select a stockroom.

Field	Description
	If you change the location and no location is associated with the selected stockroom, the stockroom field becomes empty. In this scenario, you can select a stockroom from the stockroom list for a specified location.
Assigned to	Person responsible for disposing of the asset.
Stage	Current stage of the disposal order.
Vendor	Vendor that you want to dispose the asset to.

4. Select Save.

The new disposal order is created and the disposal order workflow is triggered.

5. On the Pickup Details form, fill in the fields.

Pickup Details form

Field	Description
Scheduled date	Date when you want to dispose of the asset.
Pickup contact name	Name of the person from the vendor who will pick up the asset to dispose of.
Pickup details	Details of the pickup.
Additional info	Any message you want to add.

6. Open the Disposable Assets tab.

7. Select Add to select the assets that you want to dispose of.

8. Select the assets that you want to dispose of and select Add.

Only assets that are in a non-terminal state appear in the list. A non-terminal state is any state in which the asset can transition into a different state.

Under the **Enterprise Disposal Tasks** tab, a Verify Assets task is created.

9. Open the Enterprise Disposal Tasks tab and select the Verify Assets task.

10. In the Enterprise Disposal Tasks page, select the assets that you want to dispose of and select Verify.

The state of the asset changes to In stock and the substate changes to Pending disposal.

11. Select Close task.

Note:

You cannot add additional assets to the disposal order after you complete and close the Verify Assets task.

The draft stage is completed and the scheduling stage is in progress. The next task in the workflow, Schedule pickup, is automatically created and appears in the **Enterprise Disposal Tasks** tab.

12. Select the Schedule pickup task and in the Vendor and Scheduled date fields, enter the values that you want.

13. Select Close Task.

The stage changes to transit and the Asset departure task is created.

14. Select the Asset departure task and in the **Vendor order ID** and **Pickup contact name** fields, enter the value that you want.
15. Select the assets that you want to dispose of and in the **Actions on selected rows** picker, select **Depart**.
The state of the asset changes to in transit and the substate changes to pending disposal.
16. Select **Close Task**.
The stage changes to confirmation and the Vendor confirmation task is created.
17. Select the Vendor confirmation task and then select **Close Task**.
The stage changes to documentation and a Disposal Documentation task is created.
18. Select the Disposal Documentation task and do the following:
 - a. Select the Attach File icon to attach disposal documentation for the planned assets.
 - b. Select the assets that you want to dispose of.

Note:
If your disposal order contains any multi-component assets or pallet assets with children, the parent-child relationships within those assets are no longer applicable when you reach this task. Any changes that you make to a parent asset are no longer automatically applied to its child assets. You must individually select each asset that you want to dispose of, regardless of whether it is a parent or child asset.
 - c. Select **Dispose**.
The state of the asset changes to retired and the sub state changes to disposed.
 - d. In the **Certificate of disposal** list, select **Yes**.
19. Select **Close Task**.
All the enterprise disposal tasks are complete and the enterprise disposal order stage changes to completed.

Create a transfer order in Enterprise Asset Workspace

Create a transfer order in Enterprise Asset Management to transfer assets from one location to the other.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > Transfer orders**.
2. Select **New**.
The Create New Transfer Order page opens.
3. On the form, fill in the details.

Field	Description
Number	Number of the transfer order.
Stage	Current stage of the transfer order.

Field	Description
From stockroom	The stockroom from which the asset is to be shipped.
To stockroom	The stockroom where the asset is to be shipped.
From location	The location of the stockroom from where the asset is to be shipped.
To location	The location of the stockroom where the asset is to be shipped.
Requested date	The date the transfer order is created.
Delivery by date	
Drop Off	

4. Select Save.

The transfer order is created and displays the **Transfer Order Lines** tab. You can now create transfer order lines to specify the items that the transfer order comprises of.

Create transfer order lines in Enterprise Asset Workspace

Create transfer order lines in Enterprise Asset Management to specify the items that comprise a transfer order.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

A transfer order can contain one or more transfer order lines. Under a single transfer order, all transfer order lines have the same **From location** and **To location**. Each line contains an asset to transfer and the quantity to transfer. The item to transfer is identified by the asset name and the model name. A transfer order line can involve one quantity of a non-consumable asset or multiple quantities of a consumable asset.

Procedure

1. Navigate to the transfer order in the Enterprise Asset Workspace.
2. In the transfer order, select the **Transfer Order Lines** tab
The Transfer Order Lines page appears.
3. Select **New**.
4. On the form, fill in the details

Field	Description
Number	Internal unique number identifying the transfer order line.
Transfer Order	The transfer order to which the transfer order line belongs.
Model	Model of the items requested by the transfer order line. For example, a printer. If the Asset field is filled out first, the Model field is automatically filled in with the model corresponding to the asset.

Field	Description
Quantity requested	Number of items requested by the transfer order line. For example, 3 computers are requested to be transferred.
Quantity received	Number of items already received. For example, 3 keyboards are transferred, 2 are received.
Stage	Current stage of the transfer order. Transfer order lines can only be created when a transfer order is in Draft stage.
Request line	Requested item to associate with the transfer order line.
Asset	Asset requested by the transfer order line. For example, a specific printer. The asset can filter on stockrooms.
Quantity remaining	Number of items yet to be received. For example, 3 keyboards had been requested, 2 are received, 1 is remaining.
Quantity returned	Number of items that already needed to be returned.

5. Select Save.

The Transfer Order Line is created and displays the **Transfer Order Line Tasks** tab. Transfer order line tasks are created to move transfer order lines from one stage to the other.

Close transfer order line tasks in Enterprise Asset Workspace

Close transfer order line tasks to move transfer order lines from one stage to the other.

Before you begin

Role required: admin

About this task

When you create a transfer order line, based on the model category specified in the asset, a transfer order line task is automatically created. Default template tasks are available with the Enterprise Asset Management application. The template tasks are based on model categories. Default template tasks cannot be deleted or modified.

When you create a transfer order line and select an asset, that asset corresponds to a model category. If a template task exists for that model category then that template task is added to the transfer order line as a transfer order line task.

Closing a transfer order line task completes the task and creates the next task in the process. For example, once you close the **Requested** task, the state for this task appears as Closed Complete and a new task is opened for the next stage, **Shipment Preparation**. This process continues till you close all the tasks required for completing the transfer order line. As you close a task and as a task moves from one stage to the next, the asset gets automatically updated too. For example, when the transfer order line moves from **Requested** to **Shipment Preparation**, the asset's status also moves from available to reserved.

Procedure

1. Navigate to a transfer order line record in the Enterprise Asset Workspace.

2. Select the **Transfer Order Line Tasks** tab.

The following are the transfer order line tasks:

- Requested:
- Shipment Preparation

- In Transit
- Received
- Delivered

3. Open the Requested task.

4. Select **Close Task** to close this task.

As you close the Requested task, the **Shipment Preparation** task which is the next task in the process is created.

5. Continue to open the next task in the process, till you close the **Delivered** task.

Once you close the Delivered task, the transfer order line is completed.

Request a loaner asset in Enterprise Asset Workspace

Request a temporary or loaner asset or a consumable and use it for a specified period of time.

Before you begin

Role required: sys_admin

About this task

You can request a loner asset for yourself, for another employee of your organization, or for a third-party vendor. Before the asset is installed, you can cancel the loaner asset request at any time. You can submit a loaner order even if the product is not available at the moment in the location you want to select. In this case, your order is placed in queue.

While requesting a loaner asset, ensure that the start date is within three months from the date of submission and the end date is within six months from the start date.

Procedure

1. Navigate to **Service Catalog**.
2. Select the **Enterprise Asset Lifecycle** catalog.
The sys_admin role needs to add the Enterprise Asset Lifecycle catalog. For more details, see Service Catalog documentation.
3. Select **Enterprise Asset Loaner Request**.
The Enterprise Asset Loaner Request page opens.
4. On the form, fill in the fields.

Loaner Asset Request form

Field	Description
Requested for	Person for who you are requesting the asset. You can make a request for yourself, for another employee of your organization, or for a third-party vendor.
Requested for user	User for who you requested the asset. This field appears only when For company user is selected in the Requested for field.
Location	Location where the requested asset needs to be provided.
Model	Model of the asset that you are requesting.
Start date	Date when you want to start using the asset.

Field	Description
Return date	Date when you want to return the asset.
Justification	Reason why you need the asset.

After entering the **Start date** and **Return date**, if there are no loaner assets available in the selected location and for the selected time period, a warning appears. If you still submit the loaner order, your loaner order will be in a waitlist. For more information on waitlisted loaner orders, see [Loaner asset reservation](#).

5. Select Submit.

A message appears and shows whether your loaner order was placed successfully or the order was placed in a waitlist.

What to do next

To view your request, navigate to **Self-Service > My Requests**.

Before you receive your loaner asset, you can cancel the loaner asset request by selecting **Cancel**. After you receive your loaner asset, the **Cancel** button doesn't appear anymore. You can also return your loaner asset before the specified **Return date**.

Prepare, deploy, and reclaim loaner assets in Enterprise Asset Workspace

Select and prepare the loaner asset or consumable for deployment and reclamation by using loaner asset tasks. Deploy the loaner asset or consumable for a specific period of time, and reclaim it on the return date.

Before you begin

To use an asset as a loaner asset or consumable, go to the asset record and set the **Asset function** field to **Loaner**. These assets are reserved for use as loaner assets. You cannot use an asset that has the Asset function field set to anything other than **Loaner**.

The Loaner asset orders tab in the **Inventory** view shows all the loaner orders the asset has served in the past and at present. In case of consumables, if the consumable is not in a stockroom, it shows only the current loaner asset order that it's serving at present.

Role required: inventory_user

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > Loaner Asset Orders**.
2. Open an enterprise loaner asset order.
3. Select the **Loaner Asset tasks** tab.
4. Select the **Prepare** task and fill in the details.

Prepare task form

Fields	Descriptions
Asset	Asset that is used to fulfill the loaner asset request.
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Deploy task.

5. After entering the necessary details, select **Close Task** to close the Prepare task.

After the Prepare task is completed, a Deploy task is created under the Loaner Asset Tasks related list. On the Asset record [alm_asset] table, the following changes occur:

- The state of the loaner asset changes to In stock.
- The **Reserved for** field is automatically set to the name of the user who the loaner asset was requested for.
- The substate changes to Pending install.

6. Open the Deploy task and fill in the details in the form.

Deploy task form

Fields	Descriptions
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Deploy task.

7. Select **Close Task** to close the Deploy task.

On the Asset record [alm_asset] table, the following changes occur:

- The state of the loaner asset changes to In use.
- The **Stock room** field changes to Null.
- The **Assigned to** field is automatically set to the name of the user who the asset was requested for.
- If you requested the loaner asset for a third-party vendor, then the **Managed by** field is automatically set to the name of the user who the asset was requested for.

In case of consumable, state changes to Consumed.

Two days before the return date, the users who opened or requested the asset will receive an email notification about the reclaim. One day before the return date, a Reclaim task is created under the Loaner Asset Tasks tab.

8. Open the Reclaim task.

9. On the form, fill in the details.

Reclaim task form

Field	Description
Stockroom	Stockroom where the returned asset will be stored. If you entered a stockroom different from where you received the loaner asset, then a warning message appears which says that the existing loaner orders from the initial stockroom might be affected.
Returned on	Actual date when the asset was returned.
State	State of the task.
Assigned to	Person who is assigned the task of fulfilling the Reclaim task.

Field	Description
Asset returned	Option to mark the asset as returned. The Reclaim task cannot be closed if the asset is not returned.
Asset functional	Functional status of the loaner asset after it's reclaimed.

If the asset is not functional, the state of the asset changes to In stock and substate changes to Pending repair.

10. To close the Reclaim task, select **Close Task**.

11. If a user returns the asset before the return date, do the following:

a. Select **Reclaim**.

b. On the Reclaim Asset form, update the fields.

c. Close the Reclaim task.

On the Asset record [alm_asset] table, the following changes occur:

- The state of the loaner asset changes to In stock.
- The substate changes to Available.
- The **Stockroom** field is automatically set to the value that was selected on the Reclaim task form.
- If the asset is assigned to a future loaner order, the substate changes to Reserved and reflects the details of the loaner order.

Requesting a Return Merchandise Authorization (RMA) for defective enterprise assets

A Return Merchandise Authorization (RMA) is an agreement between a buyer and a seller that allows the buyer to return, replace, or request the repair of a defective product within the specified warranty period. With the Enterprise Asset Management application, you can submit RMA orders to either replace or repair your defective enterprise assets.

Return Merchandise Authorization flow

When you submit an RMA order for your defective enterprise assets, the Enterprise Asset Management application automatically generates an RMA order line for each defective enterprise asset that was added to the order. You can then use these RMA order lines to track and manage the RMA process for each of those enterprise assets separately.

Note:

You can submit RMA orders for serialized enterprise assets only.

For every RMA order line within an RMA order, you must complete a Prepare task to indicate how you want to proceed with the RMA process for the given enterprise asset. Based on the terms that you agreed upon with the asset vendor, you can choose to

- complete the RMA process on-site,
- complete the RMA process off-site with the asset vendor,
- or reject the RMA for the given enterprise asset.

If you choose to complete the RMA process on-site, the defective enterprise asset can only be repaired. You must complete all necessary on-site repair tasks to move the corresponding RMA order line to the Completed stage. If you choose to complete the RMA process off-site with the asset vendor, the defective enterprise asset can either be replaced or repaired. You must work

with the asset vendor to complete all necessary off-site replacement or repair tasks so that you can move the corresponding RMA order line to the Completed stage. If you choose to reject the RMA, the RMA order line automatically moves to the Completed stage without requiring any further action. After every RMA order line within an RMA order reaches the Completed stage, the order is closed.

Return Merchandise Authorization cancellations

If you have not completed the Prepare task for any of the RMA order lines within an RMA order, you can cancel the entire RMA order. After the order is canceled, all associated RMA order lines and tasks are also canceled.

Submit a Return Merchandise Authorization (RMA) order for your defective enterprise assets

Submit a Return Merchandise Authorization (RMA) order to initiate the replacement or repair of your defective enterprise assets.

Before you begin

Role required: asset or inventory_user

About this task

Note:

You can submit RMA orders for serialized enterprise assets only.

Procedure

1. Navigate to **All > Service Catalog > Enterprise Asset Lifecycle**.
2. From the list of available Enterprise Asset Lifecycle catalog items, select **Enterprise RMA Order**.
3. In the Enterprise RMA Assets list on the Enterprise RMA Order form, select **Add**.
The Add Row dialog box opens.
4. **Optional:** In the **Stockroom** field, search for and select the stockroom that the defective enterprise asset is located in.

(Optional) By selecting a stockroom, you can narrow down the list of enterprise assets that you can search and select from in the **Enterprise asset** field ([step 5](#)).

If you do not select a stockroom, this field populates automatically based on the enterprise asset that you select in the **Enterprise asset** field ([step 5](#)).

5. In the **Enterprise asset** field, search for and select the defective enterprise asset that you want to replace or repair through this RMA order.
6. Select **Add**.
The dialog box closes and the defective enterprise asset is added to the list of Enterprise RMA Assets.
7. Repeat steps 3 to 6 for each defective enterprise asset that you want to replace or repair through this RMA order.

Note:

You can add up to 50 enterprise assets to a single RMA order.

8. Select **Submit**.

Result

After the RMA order is submitted successfully, you are automatically redirected to the Service Catalog home page. A confirmation message then appears with the RMA order number, which you can use to track and manage your RMA order.

Closing a Return Merchandise Authorization (RMA) order for your defective enterprise assets

After you submit a Return Merchandise Authorization (RMA) order for your defective enterprise assets, you must complete various tasks to close the order.

You must complete the necessary set of tasks separately for each RMA order line within an RMA order. After you complete all necessary tasks for an RMA order line, it moves to the Completed stage. Once all RMA order lines within an RMA order reach the Completed stage, the RMA order is closed.

Complete the Prepare task for an RMA order line

Complete the Prepare task for an RMA order line so that you can proceed with replacing or repairing the given enterprise asset. Alternatively, you can reject the RMA to avoid taking any action on the given enterprise asset.

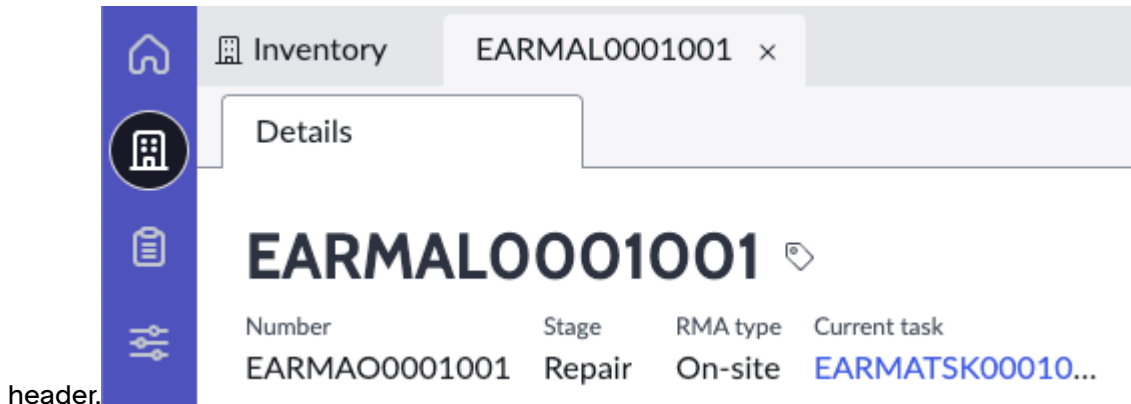

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, navigate to the Inventory view.
2. Select the **RMA orders** tab.
3. From the list of available RMA orders, select the RMA order that you want to close.
The RMA order record opens.
4. On the **RMA Order Lines** tab of the RMA order record, select the RMA order line of the enterprise asset that you want to replace, repair, or take no action on.
The RMA order line record opens.
5. On the **RMA Line Tasks** tab of the RMA order line record, select the task number for the **Prepare** task.

Alternatively, select the task number that is displayed in the **Current task** field of the RMA order line record

The Prepare task opens.

6. On the **Details** tab of the Prepare task, fill in the fields.

Details tab

Field	Description
RMA Line Task Details	
Stockroom	Stockroom that the defective enterprise asset is located in. This field populates automatically.
Vendor	Vendor of the defective enterprise asset. This field populates automatically.
Vendor RMA number	RMA reference number provided by the asset vendor.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
RMA type	Option that indicates how you want to proceed with the RMA process for the defective enterprise asset. Select one of the following options: <ul style="list-style-type: none"> ○ On-site: Option to complete the RMA process on-site. With this option, you can repair the defective enterprise asset on-site. ○ Off-site: Option to complete the RMA process off-site with the asset vendor. With this option, the defective enterprise asset can be replaced or repaired off-site by the asset vendor. ○ Reject: Option to reject the RMA for the defective enterprise asset. With this option, you can avoid taking any action on the defective enterprise asset.
Short description	Brief description of the task.
Description	Detailed description of the task.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

7. Select Close Task.

Result

The Prepare task automatically closes with an updated state of Closed Complete.

What to do next

If you set the **RMA type** field to **On-site** or **Off-site**, complete all subsequent replacement or repair tasks to move the RMA order line to the **Completed** stage. If you set the **RMA type** field to **Reject**, the RMA order line automatically moves to the Completed stage, and no further action is required.

Complete the RMA process for a defective enterprise asset through an on-site repair

Perform all tasks that are required for an on-site repair so that you can complete the RMA process for a defective enterprise asset. You must perform this set of tasks separately for each defective enterprise asset that requires an on-site repair.

Before you begin

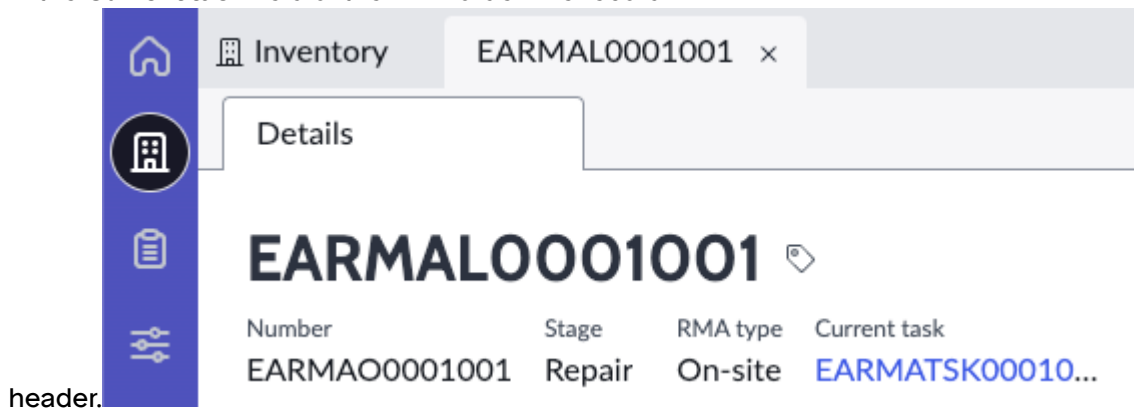

Before you can proceed with the RMA process for a defective enterprise asset on-site, you must complete the Prepare task for the associated RMA order line. See [Complete the Prepare task for an RMA order line](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
 2. Select the **RMA orders** tab.
 3. From the list of available RMA orders, select the RMA order that you want to close.
The RMA order record opens.
 4. On the **RMA Order Lines** tab of the RMA order record, select the RMA order line for the enterprise asset that you want to repair.
The RMA order line record opens.
 5. Complete and close the On-site repair task for the RMA order line.
To successfully complete and close this task, you must either repair the defective enterprise asset on-site, move the RMA process off-site with the asset vendor, or reject the on-site repair request.
- a. On the **RMA Line Tasks** tab of the RMA order line record, select the task number for the **On-site repair** task.

Alternatively, select the task number that is displayed in the **Current task** field of the RMA order line record

The On-site repair task opens.

- b. On the **Details** tab of the On-site repair task, fill in the fields.

Details tab

Field	Description
RMA Line Task Details	
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.

Field	Description
Work notes list	Users who receive notifications when work notes are added to the task.
RMA decision	<p>Action that you performed on the defective enterprise asset. Select one of the following options:</p> <ul style="list-style-type: none"> ▪ Repair: Option indicating that you successfully repaired the defective enterprise asset on-site. ▪ Off-site: Option indicating that you are moving the RMA process off-site with the asset vendor. Select this option if you are unable to repair the defective enterprise asset on-site. ▪ Reject: Option indicating that you rejected the on-site repair request.
Short description	Brief description of the task.
Description	Detailed description of the task.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The On-site repair task automatically closes with an updated state of Closed Complete.

If you set the **RMA decision** field to **Off-site**, proceed to [Complete the RMA process for a defective enterprise asset through an off-site replacement or repair](#) to continue with the RMA process off-site.

Result

If you successfully repaired the defective enterprise asset, the RMA order line moves to the Completed stage. In the corresponding asset record, the **State** field changes to **In stock** and the **Substate** field changes to **Available**.

If you moved the RMA process off-site, a Shipment task automatically populates on the **RMA Line Tasks** tab of the RMA order line. You must then ship the defective enterprise asset back to the asset vendor so that they can complete the remaining replacement or repair tasks off-site. See [Complete the RMA process for a defective enterprise asset through an off-site replacement or repair](#) for detailed instructions on how to replace or repair a defective enterprise asset off-site.

If you rejected the on-site repair request, the RMA order line moves to the Completed stage. However, the defective enterprise asset remains in the In stock state and Pending repair substate. You must submit a new RMA order to take additional action on the asset.

What to do next

Complete the RMA process for any remaining RMA order lines within the RMA order. After all RMA order lines reach the Completed stage, the RMA order is closed.

Complete the RMA process for a defective enterprise asset through an off-site replacement or repair

Work with your asset vendor to perform all tasks that are required for an off-site replacement or repair so that you can complete the RMA process for a defective enterprise asset. You must perform this set of tasks separately for each defective enterprise asset that requires an off-site replacement or repair.

Before you begin

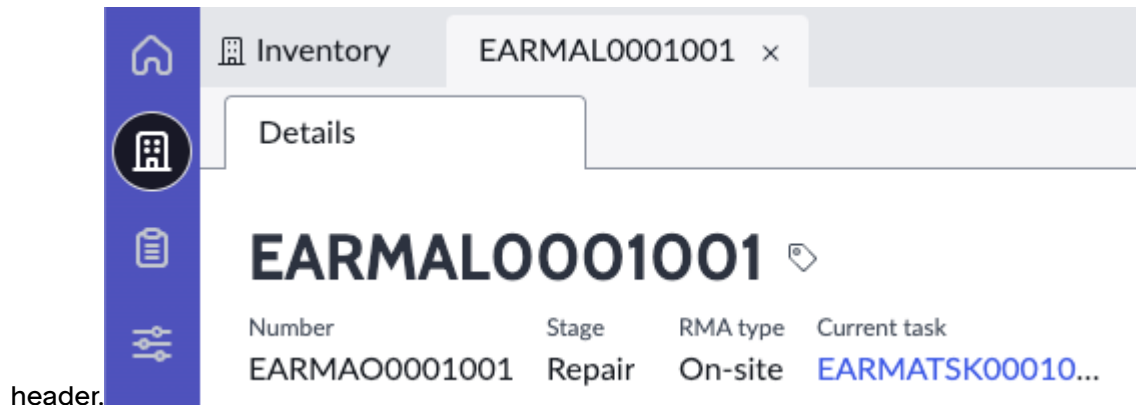

Before you can proceed with the RMA process for a defective enterprise asset off-site, you must complete the Prepare task for the associated RMA order line. See [Complete the Prepare task for an RMA order line](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **RMA orders** tab.
3. From the list of available RMA orders, select the RMA order that you want to close.
The RMA order record opens.
4. On the **RMA Order Lines** tab of the RMA order record, select the RMA order line for the enterprise asset that you want to replace or repair.
The RMA order line record opens.
5. Complete and close the Shipment task for the RMA order line.
To successfully complete and close this task, you must ship the defective enterprise asset back to the asset vendor.
 - a. On the **RMA Line Tasks** tab of the RMA order line record, select the task number for the **Shipment** task.

Alternatively, select the task number that is displayed in the **Current task** field of the RMA order line record

header.

The Shipment task opens.

- b. On the **Details** tab of the Shipment task, fill in the fields.

Details tab

Field	Description
RMA Line Task Details	
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.

Field	Description
Short description	Brief description of the task.
Description	Detailed description of the task.
Shipment	
Carrier	Shipping carrier through which you shipped the defective enterprise asset.
Ship date	Date on which you shipped the defective enterprise asset.
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

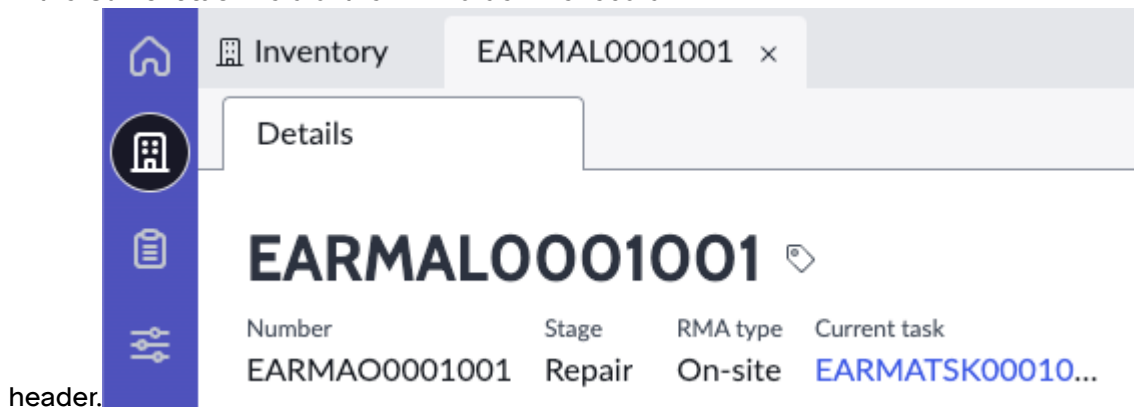

c. Select Close Task.

The Shipment task automatically closes with an updated state of Closed Complete.

6. Complete and close the Vendor RMA decision task for the RMA order line.
To successfully complete and close this task, the asset vendor must either repair the defective enterprise asset, replace the defective enterprise asset with a new asset, or reject the RMA.

- a. On the **RMA Line Tasks** tab of the RMA order line record, select the task number for the **Vendor RMA decision** task.

Alternatively, select the task number that is displayed in the **Current task** field of the RMA order line record

header.

The Vendor RMA decision task opens.

- b. On the **Details** tab of the Vendor RMA decision task, fill in the fields.

Details tab

Field	Description
RMA Line Task Details	
State	State of the task.
Assignment group	Group to which the task is assigned.

Field	Description
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
RMA decision	<p>Action that the asset vendor performed on the defective enterprise asset. Select one of the following options:</p> <ul style="list-style-type: none"> ▪ Repair: Option indicating that the asset vendor successfully repaired the defective enterprise asset. ▪ Replace: Option indicating that the asset vendor is replacing the defective enterprise asset with a new functioning asset. ▪ Reject: Option indicating that the asset vendor rejected the RMA for the defective enterprise asset. <p>If you select this option, the Reject reason field appears below the RMA decision field. In the Reject reason field, specify why the asset vendor rejected the RMA.</p>
Short description	Brief description of the task.
Description	Detailed description of the task.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Vendor RMA decision task automatically closes with an updated state of Closed Complete.

7. Complete and close the Receive task for the RMA order line.

To successfully complete and close this task, you must receive the new, repaired, or rejected enterprise asset from the asset vendor.

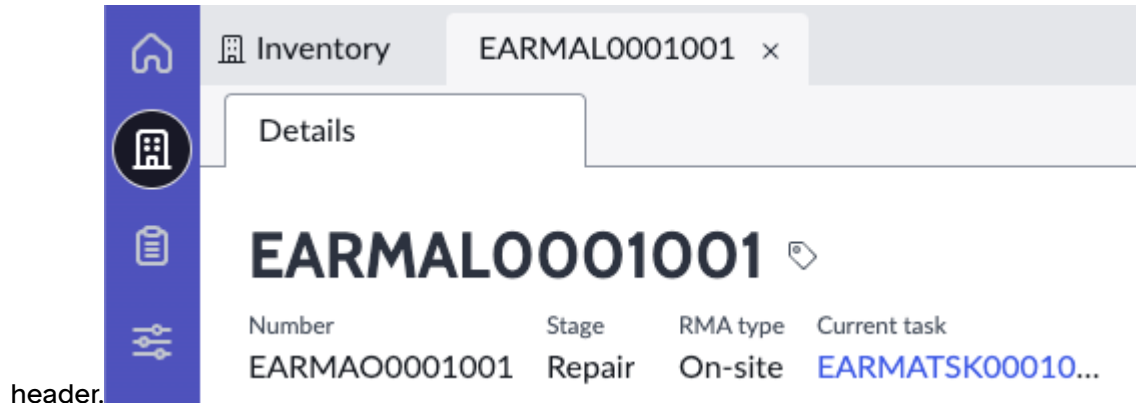

If you are receiving a new enterprise asset as a replacement for the defective enterprise asset, you must also create an asset record for the new enterprise asset. See [Create enterprise assets](#) for detailed instructions.

i Note:

When you create the asset record for the new enterprise asset, you must set the **State** field to **In stock**. You must also verify that the **Acquisition method** field is set to **RMA Replacement**.

- a. On the **RMA Line Tasks** tab of the RMA order line record, select the task number for the **Receive** task.

Alternatively, select the task number that is displayed in the **Current task** field of the RMA order line record

header.

The Receive task opens.

- b. On the **Details** tab of the Receive task, fill in the fields.

Details tab

Field	Description
RMA Line Task Details	
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Receive	
Asset received	Option that indicates if you received the new, repaired, or rejected enterprise asset from the asset vendor. To complete and close the Receive task, you must set this field to Yes .
Replacement asset stockroom	Stockroom that the new enterprise asset is located in.
i Note: This field appears only if the asset vendor replaced the defective enterprise asset with a new one.	
Replacement asset	New enterprise asset that has replaced the defective enterprise asset.

Field	Description
<p>Note: This field appears only if the asset vendor replaced the defective enterprise asset with a new one.</p>	
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Receive task automatically closes with an updated state of Closed Complete.

Result

The RMA order line moves to the **Completed** stage.

If the asset vendor successfully replaced the defective enterprise asset with a new one, the **Details** tab of the RMA order line automatically updates with information about the new enterprise asset, including the name, model, and stockroom of the asset. In addition, the Enterprise Asset Management application automatically retires the defective enterprise asset, triggering the **State** and **Substate** fields to change to **Retired** and **Vendor credit** in the corresponding asset record.

If the asset vendor successfully repaired the defective enterprise asset, the **State** and **Substate** fields change to **In stock** and **Available** in the corresponding asset record.

If the asset vendor rejected the RMA, the defective enterprise asset remains in the In stock state and Pending repair substate. You must submit a new RMA order to take additional action on the asset.

What to do next

Complete the RMA process for any remaining RMA order lines within the RMA order. After all RMA order lines reach the Completed stage, the RMA order is closed.

Managing recalled enterprise assets

You can track and take action on enterprise assets that have been recalled by the asset vendor by using recall orders. You can choose to replace, repair, or retire your recalled enterprise assets. Alternatively, you can choose to provide your users with additional instructions on how to operate your recalled enterprise assets.

Recall flow

When you submit a recall order, the Enterprise Asset Management application automatically generates an enterprise recalled asset record for each enterprise asset that you included in the order. You can then use these records to track and manage the recall process for each of those enterprise assets.

Within each recall order, you must indicate how you are going to proceed with the recall process for the given enterprise asset based on the remediation option that is recommended by the asset vendor in the corresponding recall notification. You can choose to

- repair the enterprise asset either on-site or off-site,
- replace the enterprise asset with a new asset,

- retire the enterprise asset,
- or provide additional instructions on how to operate the enterprise asset.

Based on the option that you choose, you must complete all subsequent tasks to remediate the asset and move the corresponding enterprise recalled asset record to the Completed stage. After every enterprise recalled asset record within a recall order reaches the Completed stage, the recall order is marked as complete.

Submit a recall order for your enterprise assets

Submit a recall order to initiate the replacement, repair, or retirement of enterprise assets that have been recalled by the asset vendor. You can also choose to provide your users with additional instructions on how to operate your recalled enterprise assets.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Note:

You can include multiple enterprise assets in a single recall order. However, all enterprise assets must be associated with the same model.

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. On the **Recall orders** tab, select **New**.
3. On the Create New Enterprise Recall Order form, fill in the fields.

Create New Enterprise Recall Order form

Field	Description
Recall source	Source of the enterprise asset recall.
Remediation	<p>Action that you are going to take on the recalled enterprise assets, based on the remediation option that is recommended by the asset vendor in the corresponding recall notification. Select one of the following options:</p> <ul style="list-style-type: none"> ○ Repair: Option to repair the recalled enterprise assets. ○ Replace: Option to replace the recalled enterprise assets with new assets. ○ Retire: Option to retire the recalled enterprise assets. ○ Notation: Option to provide users with additional instructions on how to operate the recalled enterprise assets. <p>If you select this option, the Recall remediation instruction field appears below the Serial numbers field. In the Recall remediation instruction field, enter the additional instructions.</p>
Models	<p>Models that the recalled enterprise assets are associated with.</p> <p>You can select one or more models from the list.</p>
Serial numbers	Serial numbers that identify each recalled enterprise asset. This field is optional.

Field	Description
	<p>To include multiple enterprise assets in this recall order, enter all associated serial numbers using one of the following options:</p> <ul style="list-style-type: none"> Serial number range, such as SN001 - SN010 Comma-separated list of individual serial numbers, such as SN020 , SN038 , SN054 Comma-separated list of both serial number ranges and individual serial numbers, such as SN001 - SN010 , SN202 , SN038 , SN100 - SN110 <p>If you do not enter any serial numbers, all enterprise assets that are associated with the model specified in the Model field are included in this recall order.</p> <p>Note: If you specify any serial numbers on a recall order, you cannot specify any vehicle identification numbers (VINs) on the same order.</p>
Location	Location in which the recalled enterprise assets reside.
Recall notice number	Identification number of the recall notification that was sent by the asset vendor.
Remediate by	Date by which the action that you selected in the Remediation field must be completed.
VINs	<p>Vehicle identification numbers (VINs) that identify each recalled enterprise asset. This field is optional and applicable only to automotive enterprise assets, such as cars and mopeds.</p> <p>To include multiple automotive enterprise assets in this recall order, enter all associated VINs using one of the following options:</p> <ul style="list-style-type: none"> VIN range, such as 3VWSB81H8WM210368 - 3VWSB81H8WM210370 Comma-separated list of individual VINs, such as 1B7HF13ZX1J572139 , JH4KA8150MC012098 Comma-separated list of both VIN ranges and individual VINs, such as 4JGAB54E81A277648 - 4JGAB54E81A277650 , 1GNDX03E03D188446 , KM8SC73E94U774838 <p>If you do not enter any VINs, all enterprise assets that are associated with the model specified in the Model field are included in this recall order.</p> <p>Note: If you specify any VINs on a recall order, you cannot specify any serial numbers on the same order.</p>
Include child locations	Option to include the child locations of the location that you specified in the Location field.
Additional info	Additional information about the recall order.

4. Select Save.

Result

- The **Acknowledge Recall** button appears.

Note:

The **Acknowledge Recall** button is available with Enterprise Asset Management version 9.0 and later.

- The **Recalled Assets** and **Recalled Tasks** tabs are shown.

What to do next

[Acknowledge enterprise assets in the recall order.](#)

Acknowledge enterprise assets in the recall order

Review and confirm the enterprise assets included in the recall order to proceed with the recall process.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Recall orders** tab.
3. Select the recall order that you want to acknowledge.
4. Select **Acknowledge Recall**.
The **Acknowledge Recall** button is available with Enterprise Asset Management version 9.0 and later.
An Acknowledge task in the Open state is created and listed under the Recall Tasks tab.
5. Select the acknowledge task.
6. Verify the recall order details and assets listed under the **Recall Assets** tab.
7. Select **Close task**.

Result

- The State of the Acknowledge task changes from **Open** to **Closed Complete**.
- The Stage of the recall order changes to **Acknowledged**.
- The **Begin recall process** button appears.

What to do next

Select **Begin recall process** to proceed with the recall process for the specified enterprise assets. For details, see [Completing a recall order for your enterprise assets](#).

Completing a recall order for your enterprise assets

After you submit a recall order for any enterprise assets that have been recalled by the asset vendor, you must perform various tasks to complete the order.

You can either complete the required set of tasks separately for each of your recalled enterprise assets or bulk update and complete the required set of tasks for all recalled enterprise assets that share the same task name, state, assignment group, and assigned user. After you complete all required tasks for a recalled enterprise asset, the corresponding enterprise recalled asset record moves to the Completed stage. Once all enterprise recalled asset records within a recall order reach the Completed stage, the recall order is completed.

Complete the Prepare task for a recalled enterprise asset

Complete the Prepare task for a recalled enterprise asset so that you can proceed with replacing, repairing, or retiring the given enterprise asset.

Before you begin

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

About this task

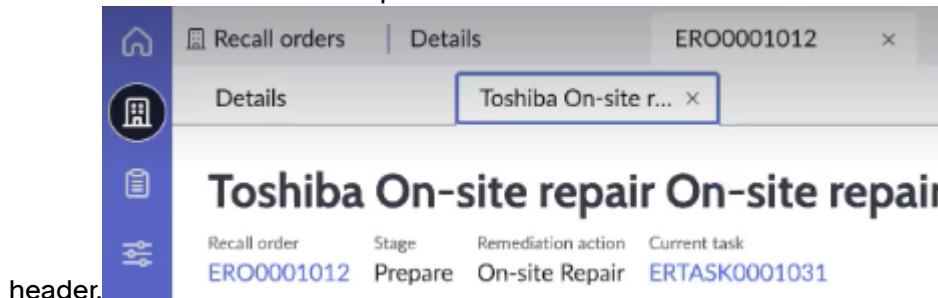

i Important:

The Prepare task is applicable only to recall orders in which the **Remediation** field is set to **Repair, Replace, or Retire**. If the **Remediation** field is set to **Notation**, you can proceed directly to the Notation task instead. See [Complete the Notation task for a recalled enterprise asset](#) for more information on the Notation task.

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete. The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to replace, repair, or retire. The enterprise recalled asset record opens.
5. On the **Enterprise Recall Tasks** tab, select the task number for the **Prepare** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Prepare task opens.

6. On the **Details** tab of the Prepare task, fill in the fields.

Details tab

Field	Description
Recall task details	
Stockroom	Stockroom of the recalled enterprise asset.
	<p>i Note:</p> <p>This field is editable only under the following conditions:</p> <ul style="list-style-type: none"> ○ The Remediation field in the associated recall order is set to Repair. In addition, the Remediation action field in this Prepare task is set to Off-site Repair. ○ The Remediation field in the associated recall order is set to Retire.

Field	Description
	<p>i Important: If the recalled enterprise asset has not already been moved to a stockroom, you must move it to an available stockroom before you can proceed with the asset retirement or off-site repair.</p>
Remediation action	<p>Option that indicates how you want to proceed with the recall process for the enterprise asset.</p> <p>i Note: This field is editable only if the Remediation field in the associated recall order is set to Repair.</p>
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to complete this task.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

7. Close the Prepare task.

You can either close the Prepare task for only the specified enterprise asset or bulk update and close the Prepare task for multiple enterprise assets.

If you want to close the Prepare task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Prepare task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Prepare task for. Select **Close Task** to close the dialog box and return to the Prepare task.

i Important:
You can bulk update the Prepare task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

Result

The Prepare task automatically reloads with an updated state of Closed Complete.

If you are proceeding with an on-site repair, enterprise assets with a state of In use are updated with a state of In maintenance. In addition, enterprise assets with a state of In Stock are updated with a substate of Pending repair.

If you are proceeding with an off-site repair, enterprise assets with a state of either In use or In maintenance are updated with a state of In stock and a substate of Pending repair.

If you are proceeding with an asset replacement, enterprise assets with a state of In use are updated with a state of In maintenance. In addition, enterprise assets with a state of In stock are updated with a substate of Pending repair.

If you are proceeding with an asset retirement, enterprise assets are updated with a state of In stock and substate of Pending disposal.

What to do next

Complete all subsequent replacement, repair, or retirement tasks.

Complete the Notation task for a recalled enterprise asset

Complete the Notation task for a recalled enterprise asset so that you can provide your users with additional instructions on how to operate the asset.

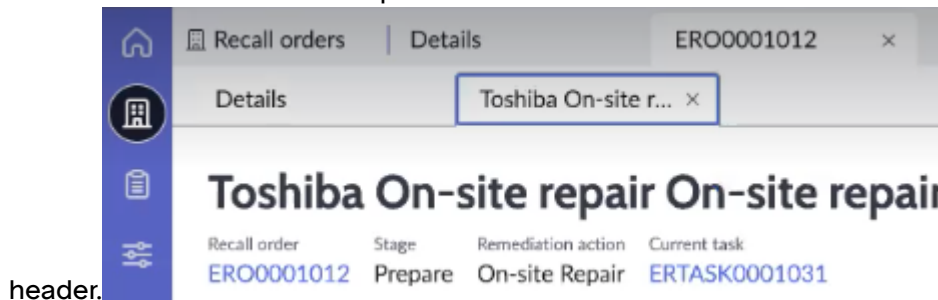

Before you begin

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete. The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to provide additional operating instructions for. The enterprise recalled asset record opens.
5. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Notation** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Notation task opens.

6. Close the Notation task.

You can either close the Notation task for only the specified enterprise asset or bulk update and close the Notation task for multiple enterprise assets.

If you want to close the Notation task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Notation task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Notation task for. Select **Close Task** to close the dialog box and return to the Notation task.

i Important: You can bulk update the Notation task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

Result

The enterprise recalled asset record moves to the Completed stage.

What to do next

Complete the recall process for all remaining enterprise assets that are included in the recall order. After all corresponding enterprise recalled asset records reach the Completed stage, the state of the recall order changes to Completed.

Complete the recall process for an enterprise asset through an on-site repair

Perform all tasks that are required for an on-site repair so that you can complete the recall process for an enterprise asset that has been recalled by the asset vendor.

Before you begin

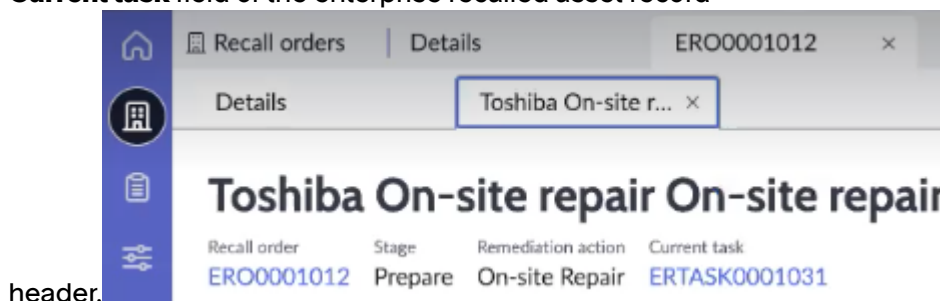

Before you can proceed with repairing a recalled enterprise asset on-site, you must complete the Prepare task for that asset. See [Complete the Prepare task for a recalled enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete. The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to repair. The enterprise recalled asset record opens.
5. Complete and close the On-site Repair task for the recalled enterprise asset. To successfully complete and close this task, you must repair the recalled enterprise asset on-site.
 - a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **On-site Repair** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The On-site Repair task opens.

- b. On the **Details** tab of the On-site Repair task, fill in the fields.

Details tab

Field	Description
Recall task details	
Remediation action	Option that indicates how you want to proceed with the recall process for the enterprise asset. This field is automatically set to On-site Repair .

Field	Description
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to perform the on-site repair.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the On-site Repair task.

You can either close the On-site Repair task for only the specified enterprise asset or bulk update and close the On-site Repair task for multiple enterprise assets.

If you want to close the On-site Repair task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the On-site Repair task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the On-site Repair task for. Select **Close Task** to close the dialog box and return to the On-site Repair task.

i Important:
 You can bulk update the On-site Repair task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The On-site Repair task automatically reloads with an updated state of Closed Complete.

Result

The enterprise recalled asset record moves to the Completed stage. In addition, the state and substate fields change to In stock and Available in the corresponding asset record.

What to do next

Complete the recall process for all remaining enterprise assets that are included in the recall order. After all corresponding enterprise recalled asset records reach the Completed stage, the state of the recall order changes to Completed.

Complete the recall process for an enterprise asset through an off-site repair

Work with your asset vendor to perform all tasks that are required for an off-site repair so that you can complete the recall process for an enterprise asset that has been recalled by the vendor.

Before you begin

Before you can proceed with repairing a recalled enterprise asset off-site, you must complete the Prepare task for that asset. See [Complete the Prepare task for a recalled enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete.
The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to repair.
The enterprise recalled asset record opens.
5. Complete and close the Shipment task for the recalled enterprise asset.
To successfully complete and close this task, you must ship the recalled enterprise asset to the asset vendor.
 - a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Shipment** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Shipment task opens.

- b. On the **Details** tab of the Shipment task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to ship the recalled enterprise asset to the asset vendor.
Shipment	
Carrier	Shipping carrier through which you shipped the recalled enterprise asset.
Ship date	Date on which you shipped the recalled enterprise asset.
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Notes	
Short description	Brief description of the task.

Field	Description
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the Shipment task.

You can either close the Shipment task for only the specified enterprise asset or bulk update and close the Shipment task for multiple enterprise assets.

If you want to close the Shipment task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Shipment task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Shipment task for. Select **Close Task** to close the dialog box and return to the Off-site Repair task.

i Important:
You can bulk update the Shipment task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Shipment task automatically reloads with an updated state of Closed Complete.

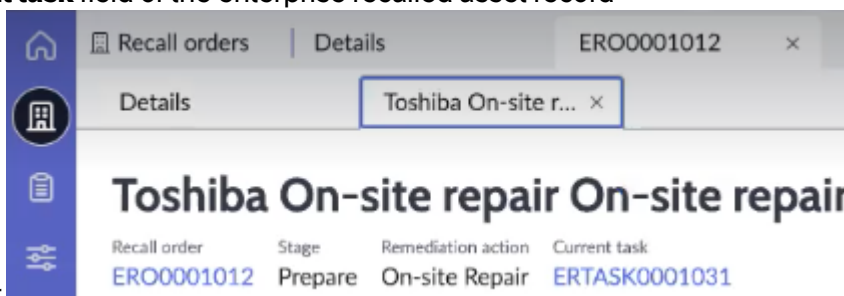

d. Close the Shipment task to return to the enterprise recalled asset record.

6. Complete and close the Off-site Repair task for the recalled enterprise asset.

To successfully complete and close this task, the asset vendor must repair the recalled enterprise asset.

a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Off-site Repair** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Off-site Repair task opens.

b. On the **Details** tab of the Off-site Repair task, fill in the fields.

Details tab

Field	Description
Recall task details	
Remediation action	Option that indicates how you want to proceed with the recall process for the enterprise asset. This field is automatically set to Off-site Repair .

Field	Description
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which the asset vendor plans to perform the off-site repair.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the Off-site Repair task.

You can either close the Off-site Repair task for only the specified enterprise asset or bulk update and close the Off-site Repair task for multiple enterprise assets.

If you want to close the Off-site Repair task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Off-site Repair task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Off-site Repair task for. Select **Close Task** to close the dialog box and return to the Off-site Repair task.

i Important:
 You can bulk update the Off-site Repair task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Off-site Repair task automatically reloads with an updated state of Closed Complete.

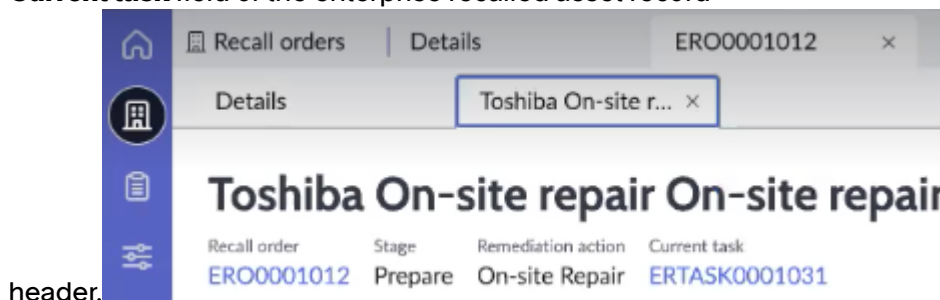

d. Close the Off-site Repair task to return to the enterprise recalled asset record.

7. Complete and close the Receive task for the recalled enterprise asset.

To successfully complete and close this task, you must receive the repaired enterprise asset from the asset vendor.

a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Receive** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

The Receive task opens.

- b. On the **Details** tab of the Receive task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to receive the repaired enterprise asset.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

- c. Close the Receive task.

You can either close the Receive task for only the specified enterprise asset or bulk update and close the Receive task for multiple enterprise assets.

If you want to close the Receive task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Receive task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Receive task for. Select **Close Task** to close the dialog box and return to the Receive task.

i Important:
 You can bulk update the Receive task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Receive task automatically reloads with an updated state of Closed Complete.

Result

The enterprise recalled asset record moves to the Completed stage. In addition, the state and substate fields change to In stock and Available in the corresponding asset record.

What to do next

Complete the recall process for all remaining enterprise assets that are included in the recall order. After all corresponding enterprise recalled asset records reach the Completed stage, the state of the recall order changes to Completed.

Complete the recall process for an enterprise asset through an asset replacement

Work with your asset vendor to perform all tasks that are required for an asset replacement so that you can complete the recall process for an enterprise asset that has been recalled by the vendor.

Before you begin

Before you can proceed with replacing a recalled enterprise asset, you must complete the Prepare task for that asset. See [Complete the Prepare task for a recalled enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

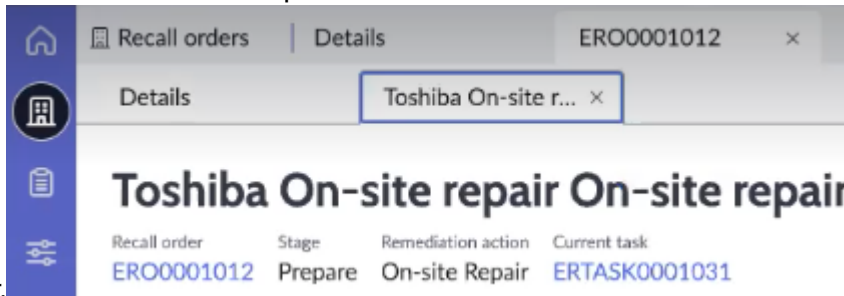

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete. The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to replace. The enterprise recalled asset record opens.
5. Complete and close the Receive New task for the recalled enterprise asset. To successfully complete and close this task, you must receive the new enterprise asset from the asset vendor. In addition, you must create an asset record for the new enterprise asset. See [Create enterprise assets](#) for detailed instructions.

Note:

When you create the asset record for the new enterprise asset, you must set the **State** field to **In stock**. You must also verify that the **Acquisition method** field is set to **Recall Replacement**.

- a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Receive New** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Receive New task opens.

- b. On the **Details** tab of the Receive New task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to receive the new enterprise asset.

Field	Description
Replacement asset	
Replacement asset	New enterprise asset that is replacing the recalled enterprise asset.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Receive New task automatically reloads with an updated state of Closed Complete.

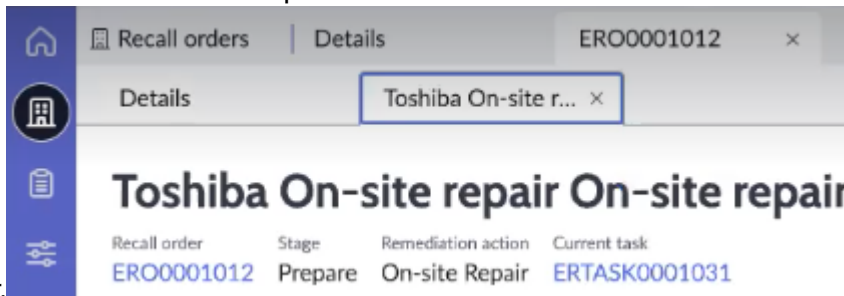

d. Close the Receive New task to return to the enterprise recalled asset record.

6. Complete and close the Replace task for the recalled enterprise asset.

To successfully complete and close this task, you must replace the recalled enterprise asset with the new asset.

a. On the Enterprise Recall Tasks tab of the enterprise recalled asset record, select the task number for the Replace task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Replace task opens.

b. On the Details tab of the Replace task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to replace the recalled enterprise asset with the new asset.
Replacement asset	

Field	Description
Replacement asset	New asset that has replaced the recalled enterprise asset.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the Replace task.

You can either close the Replace task for only the specified enterprise asset or bulk update and close the Replace task for multiple enterprise assets.

If you want to close the Replace task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Replace task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Replace task for. Select **Close Task** to close the dialog box and return to the Replace task.

i Important:
 You can bulk update the Replace task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Replace task automatically reloads with an updated state of Closed Complete.

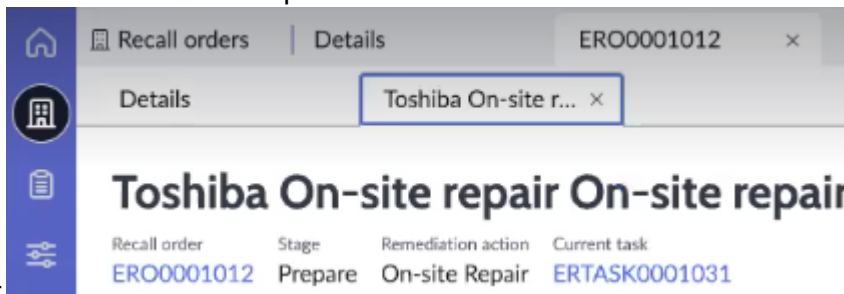

d. Close the Replace task to return to the enterprise recalled asset record.

7. Complete and close the Ship Old task for the recalled enterprise asset.

To successfully complete and close this task, you must ship the recalled enterprise asset back to the asset vendor.

a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Ship Old** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Ship Old task opens.

b. On the **Details** tab of the Ship Old task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to ship the recalled enterprise asset back to the asset vendor.
Shipment	
Carrier	Shipping carrier through which you shipped the recalled enterprise asset.
Ship date	Date on which you shipped the recalled enterprise asset.
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the Ship Old task.

You can either close the Ship Old task for only the specified enterprise asset or bulk update and close the Ship Old task for multiple enterprise assets.

If you want to close the Ship Old task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Ship Old task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Ship Old task for. Select **Close Task** to close the dialog box and return to the Ship Old task.

 **Important:** You can bulk update the Ship Old task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Ship Old task automatically reloads with an updated state of Closed Complete.

Result

The enterprise recalled asset record moves to the Completed stage. The Enterprise Asset Management application then automatically retires the recalled enterprise asset, triggering the state and substate fields to change to Retired and Vendor credit in the corresponding asset record.

What to do next

Complete the recall process for all remaining enterprise assets that are included in the recall order. After all corresponding enterprise recalled asset records reach the Completed stage, the state of the recall order changes to Completed.

Complete the recall process for an enterprise asset through an asset retirement

Perform all tasks that are required for an asset retirement so that you can complete the recall process for an enterprise asset that has been recalled by the asset vendor.

Before you begin

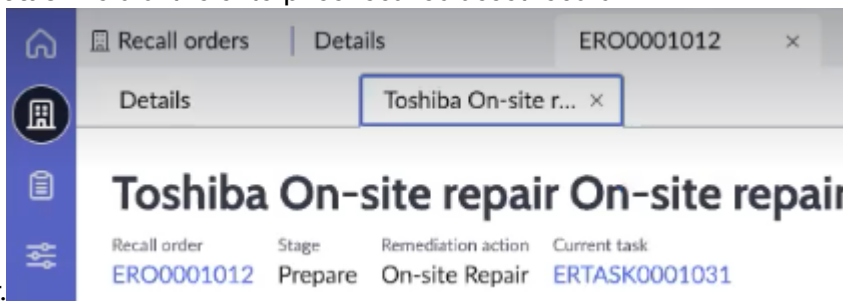

Before you can proceed with retiring a recalled enterprise asset, you must complete the Prepare task for that asset. See [Complete the Prepare task for a recalled enterprise asset](#) for detailed instructions.

Role required: sn_eam.enterprise_asset_manager or enterprise_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Inventory view.
2. Select the **Recall orders** tab.
3. From the list of available recall orders, select the recall order that you want to complete. The recall order record opens.
4. On the **Enterprise Recalled Assets** tab of the recall order record, select the enterprise asset that you want to retire. The enterprise recalled asset record opens.
5. Complete and close the Retire task for the recalled enterprise asset. To successfully complete and close this task, you must retire and move the recalled enterprise asset to an available stockroom.
 - a. On the **Enterprise Recall Tasks** tab of the enterprise recalled asset record, select the task number for the **Retire** task.

Alternatively, select the task number that is displayed in the **Current task** field of the enterprise recalled asset record

header.

The Retire task opens.

- b. On the **Details** tab of the Retire task, fill in the fields.

Details tab

Field	Description
Recall task details	
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Scheduled date	Date and time at which you plan to retire the enterprise asset.
Notes	

Field	Description
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

c. Close the Retire task.

You can either close the Retire task for only the specified enterprise asset or bulk update and close the Retire task for multiple enterprise assets.

If you want to close the Retire task for only the specified enterprise asset, select **Close Task**.

If you want to bulk update and close the Retire task for multiple enterprise assets, select **Include more assets**. When the Select assets for bulk update dialog box opens, select the check box for each enterprise asset that you want to bulk update and close the Retire task for. Select **Close Task** to close the dialog box and return to the Retire task.

Important: You can bulk update the Retire task only for enterprise assets that have the same task name, state, assignment group, and assigned to user.

The Retire task automatically reloads with an updated state of Closed Complete.

Result

The enterprise recalled asset record moves to the Completed stage. In addition, the state and substate fields change to Retired and Pending disposal in the corresponding asset record.

What to do next

Complete the asset retirement by disposing of the recalled enterprise asset using a disposal order. See [Create a disposal order in the Enterprise Asset Workspace](#) for detailed instructions.

After you successfully dispose of the recalled enterprise asset, you can complete the recall process for all remaining enterprise assets that are included in the recall order. After all corresponding enterprise recalled asset records reach the Completed stage, the state of the recall order changes to Completed.

Close an enterprise asset reclamation request

Close an asset reclamation request to efficiently reclaim enterprise assets when an employee leaves an organization or moves to a different role.

Before you begin

For each reclaimed asset, an Enterprise Asset Reclamation Line is created. You must close all the tasks of a Enterprise Asset Reclamation Line to close the Enterprise Asset Reclamation Line. Once all Enterprise Asset Reclamation Lines are closed, the Asset Reclamation Request is closed.

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Enterprise Asset Workspace > Inventory > Reclamation requests**.
2. In the Asset reclamation requests page, open the request that you want to fulfill and select the Enterprise Asset Reclamation Lines related list.

Based on what reclaim method the user selected while submitting the asset reclamation request, a **Schedule drop off**, **Schedule pickup**, or **Schedule shipment** task is created in the Enterprise Asset Reclamation Line.

3. Open the **Schedule drop off**, **Schedule pickup**, or **Schedule shipment** task that is present in the Enterprise Asset Reclamation Line.
4. On the form, fill in the fields.

Field names	Description
Number	Number assigned to the task.
Task Name	Name of the task.
Asset	Asset number and short description of the asset.
State	Current state of the task.
Return stockroom	Location where the reclaimed assets will be stored.
Assignment group	Group to which the Schedule shipment task is assigned.
Assigned to	User from the assignment group to whom the Schedule shipment task is assigned.
Quantity received	Number of consumables received.
Short description	Short description of the task.
Description	Detailed description of the task.
Carrier	Name of the carrier vendor who ships the asset to the stockroom. This is a mandatory field.
Tracking number	Shipment reference number given by the carrier vendor. This is a mandatory field.
Ship date	Date on which the asset is shipped. This is a mandatory field.
Work notes	Any additional information that you want to mention.

5. Select **Close Task**.
The **Stage** field of the Enterprise Asset Reclamation Line form changes from **Ready** to **Pending received**.
A Receive asset task is created in the Enterprise Asset Reclamation Line.
6. Open the Receive asset task.
7. On the Receive asset task form, fill in the fields.

Receive asset task form

Field names	Description
Number	Number assigned to the task.

Field names	Description
Task name	Name of the task.
Asset	Asset number and short description of the asset.
State	Current state of the task.
Return stockroom	
Assignment group	Group to which the Receive asset task is assigned.
Quantity received	Number of consumables received. This field appears only if the Hardware Asset Reclamation Line was created for a consumable, and this is a mandatory field.
Assigned to	User from the assignment group to whom the Receive asset task is assigned.
Short description	Short description of the task.
Description	Detailed description of the task.
Work notes	Any additional information that you want to mention.

8. Select Close Task.

The **Stage** field of the Enterprise Asset Reclamation Line form changes from **Pending received** to **Pending evaluation**.

After an asset is received, in the asset form, the following changes occur:

- The **Assigned to** field on the asset record becomes empty.
- State of the asset changes to **In stock** and substate changes to **Pending repair**.

9. Open the Evaluate asset task.

10. On the Evaluate asset task form, fill in the fields.

Evaluate asset task form

Field names	Description
Assignment group	Group to which the Evaluate asset task is assigned.
Assigned to	User from the assignment group to whom the Evaluate asset task is assigned.
Evaluation status	Status of the reclaimed asset. This is a mandatory drop-down list and the values are: <ul style="list-style-type: none"> ○ Re-deployable ○ Needs repair ○ To be disposed
Work notes	Any additional information that you want to mention.

11. Select **Close Task**.

Based on what you selected from the **Evaluation status** drop-down list, the State and Substate of the asset change as follows:

Evaluation status values	Asset state	Asset substate
Re-deployable	In stock	Available
Needs repair	In stock	Pending repair
To be disposed	In stock	Pending dispose

The **Stage** field of the Enterprise Asset Reclamation Line form changes from **Pending evaluation** to **Complete**.

Note:

When the stage of all Enterprise Asset Reclamation Lines has changed to **Closed Complete**, the state of the Asset Reclamation Request also changes to **Complete**.

Manage repair of defective assets in your stockroom in the Enterprise Asset Workspace

Optimize your inventory by getting the defective enterprise assets repaired using the Repair flow.

In the Repair flow, an asset manager requests the repair of defective assets in the stockroom. An asset technician troubleshoots, repairs, and evaluates the asset. The evaluated asset is either put to use or disposed of. For details on stages in the Repair flow, see [Repair flow to fix defective enterprise assets within a stockroom](#).

Request repair of defective enterprise assets

As an enterprise asset manager, you can get the defective enterprise assets repaired by creating Repair orders.

You can request repair of defective hardware assets through any of the following options:

- [Request repair of enterprise assets using Service Catalog](#)
- [Create repair orders for enterprise assets in the Inventory view](#)
- [Request repair of an enterprise asset using the Repair option](#)

Note:

Consider the following points when you create a repair order:

- You can't request repair of the following assets:
 - Consumables
 - Assets that are part of any other workflow
- You can request repair of a child asset only if you have added its parent asset to the repair order. However, assets in the pallets can be repaired.

Request repair of enterprise assets using Service Catalog

Submit a Service Catalog request to repair enterprise assets that are defective or pending repair in your stockroom.

Before you begin

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician.

About this task

You can request repair of multiple defective enterprise assets in your stockroom using a single catalog request.

Procedure

1. Navigate to **All > Service catalog > Enterprise Asset Lifecycle > Asset Repair**.
2. On the form, fill in the fields.

Request for stockroom repair of an asset

Field	Description
Due Date	Date by which you want the defective assets to be repaired.
Stockroom	Stockroom that has assets to be repaired.

3. Select assets to be repaired.
 - a. Select the Edit Asset(s) icon ().
 - b. Select the assets from the list.
You can add one or more assets to the request.
 - c. Select the Lock icon ().
4. Select **Submit**.

Result

- Your repair request is submitted successfully.
- A repair order is created in the **Draft** stage.
- Each asset in the repair order is associated with a repair order line that is in the **Troubleshoot** stage.

Create repair orders for enterprise assets in the Inventory view

Request repair of enterprise assets that are defective or pending repair by creating a repair order in the Inventory view of Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician.

About this task

When you create a repair order from the Inventory view, you must explicitly create a repair order line for the asset that you want to get repaired.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Create a Repair order.

- a. Select **New**.
- b. On the form, fill in the fields.

Note:
The following fields are optional:

- **Assignment group**
- **Assigned to**
- **Due date**
- **Work note**

Create New Repair order form

Field	Description
Stockroom	Stockroom that has assets to be repaired. This field is required.
Assignment group	Assignment group to which you want to assign the repair order.
Assigned to	Person from the assignment group who is primarily responsible for the Repair order.
Due date	Date by which the defective enterprise assets should be repaired.
Work notes	Notes about the repair order.

- c. Select **Save**.
 - A repair order that's in the **Draft** stage is created.
 - The **Repair order lines** tab is displayed next to the **Details** tab of the repair order.

4. Add repair order lines to the repair order.

- a. Select the **Repair order lines** tab.
- b. Select **Add**.
- c. In the **Add assets** dialog box, select the assets and then select **Add**.

Note:
You can add child assets of a pallet asset to the repair order. The asset that you added to the repair order is removed from the pallet automatically.

For each asset that you added, a repair order line that's in the **Troubleshoot** stage is created.

5. Select Save.

Request repair of an enterprise asset using the Repair option

Request repair of a defective enterprise asset in your stockroom directly through the asset form.

Before you begin

Role required: sn_eam.enterprise_asset_manager or sn_eam.enterprise_asset_technician.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Asset Estate**.
2. Select the **All assets** tab.
3. Select an asset with state as **In stock** and substate as **Defective** or **Pending repair**.
4. Select the More Options icon (**⋮**) on the Asset form.
5. Select **Repair**.

Result

A repair order with a repair order line in the **Troubleshoot** stage is created.

Fulfill repair orders in the Enterprise Asset Workspace

Fulfill a repair order by completing all the open repair asset tasks associated with its repair order lines.

A repair order can have one or more repair order lines depending on the number of assets to be repaired through that repair order. A repair order is fulfilled only when all its repair order lines are completed.

As a technician, you must complete the following tasks associated with each repair order line to fulfill a repair order:

1. [Troubleshoot asset](#)
2. [Repair asset](#)
3. [Evaluate asset](#)

You can also work on the asset repair tasks assigned to you by using the Mobile Agent application. For details, see [Manage enterprise asset repair tasks using the Mobile Agent application](#).

View open repair orders for your stockroom in the Enterprise Asset Workspace

View the open repair orders for your stockroom to get the details of the repair order lines and repair tasks that need action.

Before you begin

Role required: sn_eam.enterprise_asset_technician and sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom.
In the Open stockroom tasks section, the **Open repair orders** card displays the number of open repair orders.
4. Select the **Open repair orders** card.

Result

The list of open repair orders for the stockroom is displayed.

Troubleshoot assets requested for repair in the Enterprise Asset Workspace

Complete the troubleshooting task to assess the issues with the defective asset. Based on your observations, you can confirm whether the asset can be repaired, redeployed, or should be disposed of.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
 2. Select the **Repair orders** tab.
 3. Select a repair order that's in the Draft or In Progress stage.
 4. Select the **Repair order lines** tab.
 5. Select a repair order line that's in the Troubleshoot stage and Open state.
 6. Select the **Repair asset tasks** tab.
 7. Select the **Troubleshoot asset** task that's in the Open state.
 8. Indicate that you have started working on the Troubleshoot task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
 9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Enterprise Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Troubleshoot asset task.
 10. Select the **Details** tab.
 11. Select the troubleshooting result in the **Troubleshoot result** field.
 - If the asset is repairable, select **Repairable**.
 - If the asset is unrepairable, select **Unrepairable**.
 - If the asset can be redeployed, select **Redeployable**.
 12. **Optional:** In the **Failure code** field, select the code that corresponds to the reason for the asset failure.
For more details on codes, see [Failure and resolution codes in Enterprise Asset Management](#).
- i Important:**
The failure and resolution codes are available with Enterprise Asset Management version 9.0 and later.
13. **Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.
Once the task is closed, this field can't be modified.
The value in the **Issue identified** field is carried forward to the repair asset task after the troubleshooting task is closed.
 14. Enter notes related to the task in the **Work notes** field.
 15. Select **Close task**.

Result

- If you had set the Troubleshooting result to **Unrepairable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and substate changes to Pending disposal.
- If you had set the Troubleshooting result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.
- If you had set the Troubleshooting result to **Repairable**, the following changes happen on closure of the task:
 1. The stage of the repair order line changes to Repair.
 2. The state of the asset changes to In stock and the substate changes to Pending repair.
 3. Repair asset task is created.

What to do next

[Complete the repair asset task in the Enterprise Asset Workspace.](#)

Complete the repair asset task in the Enterprise Asset Workspace

Complete the repair of the asset and confirm if the asset is repaired, unrepairable, or redeployable.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order for which you want to complete the Repair asset task.
4. Select the **Repair order lines** tab.
5. Select the repair order line that's in the **Repair** stage.
6. Select the **Repair asset tasks** tab.
7. Select the **Repair asset** task that's in the Open state.
8. Indicate that you have started working on the Repair asset task by selecting **Start Work**. The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Enterprise Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Repair asset task.
10. Select the **Details** tab.
11. Select the repair result in the **Repair result** field.
 - If the asset is repaired, select **Repaired**.
 - If the asset couldn't be repaired, select **Unrepairable**.
 - If the asset can be redeployed, select **Redeployable**.

- 12. Optional:** In the **Failure code** field, select the code that corresponds to the reason for the asset failure.

i Important:

The failure and resolution codes are available with Enterprise Asset Management version 9.0 and later.

This field shows the failure code that you selected in the Troubleshoot task. However, you can update this field if the reason for the asset failure differs from what was identified in the Troubleshoot task. For more details on codes, see [Failure and resolution codes in Enterprise Asset Management](#).

i Note:

The Failure code field value that you selected is also displayed in the Evaluate Asset task and the repair order line.

- 13. Optional:** In the **Resolution code** field, select the code that matches the solution that you applied to fix the asset failure.

i Note:

The Resolution code field value that you selected is also displayed in the Evaluate Asset task and the repair order line.

- 14. Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.

(Optional) This field is automatically populated with the value carried forward from the troubleshoot asset task if the issue is identified and a value is provided in the **Issue identified** field. Once the task is closed, this field can't be modified.

The value in the **Issue identified** field is carried forward to evaluate repaired asset task after the repair task is closed.

- 15.** Enter notes related to the task in the **Work notes** field.

- 16.** Select **Close task**.

Result

- If you had set the Repair result to **Unrepairable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Pending disposal.
- If you had set the Repair result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.
- If you had set the Repair result to **Repairable**, the following changes happen on closure of the task:
 1. The stage of the repair order line changes to Evaluate.
 2. The state of the asset changes to In stock and the substate changes to Pending evaluation.
 3. Evaluate asset task is created.

What to do next

Evaluate the repaired asset in the [Enterprise Asset Workspace](#).

Evaluate the repaired asset in the Enterprise Asset Workspace

Evaluate the repaired asset and confirm if the asset is redeployable or should be disposed of. The Repair flow completes after the repaired asset is evaluated.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order for which you want to evaluate the repaired asset.
4. Select the **Repair order lines** tab.
5. Select a repair order line that's in the Evaluate stage and Open state.
6. Select the **Repair asset tasks** tab.
7. Select the **Evaluate asset** task that's in the Open state.
8. Indicate that you have started working on the Evaluate asset task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. **Optional:** Record the time worked on the task.
You can either use the timer or record the time manually. For more details, see [Record time worked on asset repair tasks in the Enterprise Asset Workspace](#).
An entry for the time you worked is created in the **Time Worked** tab of the Evaluate asset task.
10. Select the **Details** tab.
11. Select the evaluation result in the **Evaluation result** field.
 - If the asset is repaired and redeployable, select **Redeployable**.
 - If the asset can't be used and should be disposed of, select **To be disposed**.
12. **Optional:** Enter the issue identified with the asset during the repair process in the **Issue identified** field.
This field is automatically populated with the value carried forward from the repair asset task if the issue is identified and a value is provided in the **Issue identified** field. Once the task is closed, this field can't be modified.
13. Enter notes related to the task in the **Work notes** field.
14. Select **Close task**.

Result

- If you had set the Evaluation result to **To be disposed**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Pending disposal.
- If you had set the Evaluation result to **Redeployable**, the following changes happen on closure of the task:
 1. The repair order and the repair order line are in the Completed stage.
 2. The state of the asset changes to In stock and the substate changes to Available.

Bulk close asset repair tasks in the Enterprise Asset Workspace

Complete and close multiple repair tasks at one go to process a repair order with multiple repair order lines.

Before you begin

Role required: sn_eam.enterprise_asset_technician

About this task

You can bulk close only similar asset repair tasks that are in the Open state. However, you can't bulk close similar repair tasks for which the task result isn't the same. For example, you can't bulk close two Troubleshoot assets tasks, when one task has a repairable asset and the other has an unrepairable asset.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order with multiple open repair order lines for which you want to complete the asset repair tasks.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you want to complete.
6. Select the repair task that you want to close.
7. On the Details form, select the task result.
 - If you're completing a Troubleshoot asset task, then select any of the following results in the **Troubleshoot result** field:
 - **Repairable**
 - **Unrepairable**
 - **Redeployable**
 - If you're completing a Repair asset task, then select any of the following results in the **Repair result** field:
 - **Repaired**
 - **Unrepairable**
 - **Redeployable**
 - If you're completing an Evaluate asset task, then select any of the following results in the **Evaluation result** field:
 - **Redeployable**
 - **To be disposed**
8. Enter notes related to the task in the **Work notes** field.
9. Select **Save**.
10. Select **Bulk Close**.

The **Select Assets** dialog box with similar repair tasks is displayed.
11. Select the tasks that you want to close and select **Close Task**.

Result

All the selected repair tasks are closed with the same task result and Work notes.

Cancel a repair order in the Enterprise Asset Workspace

Cancel a repair order that no longer needs to be fulfilled.

Before you begin

Role required: enterprise_asset

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order that's in the Draft or In Progress stage.
4. Select **Cancel**.

Result

- The stage of the repair order changes to Cancelled and the state changes to Closed Incomplete.
- The stage and state of the repair order lines that weren't completed change to Cancelled and Closed Incomplete.

Cancel a repair order line in the Enterprise Asset Workspace

Cancel a repair order line that no longer needs to be fulfilled.

Before you begin

Role required: enterprise_asset

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select a repair order that's in the **Draft** or **In progress** stage.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you want to cancel.
You can cancel a repair order line that is not in the Completed stage.
6. Select **Cancel**.

Result

- The stage of the repair order line changes to Cancelled and the state changes to Closed Incomplete.
- The state of the associated repair asset tasks that were open changes to Closed Incomplete.
- The stage of the repair order changes to Cancelled only if there aren't any other repair order lines that are in the Troubleshoot, Repair, Evaluate, or Completed stage.

Record time worked on asset repair tasks in the Enterprise Asset Workspace

Manage and record time worked on Troubleshoot asset, Repair asset, and Evaluate asset tasks in the Enterprise Asset Workspace. After you start work on a repair asset task, you can pause and resume work. You can also record the time worked manually.

Record time worked on a repair task automatically in the Enterprise Asset Workspace

Record the time that you took to complete a repair task without taking any break until you completed the task.

Before you begin

Role required: enterprise_asset_technician

About this task

You can record the time worked for Troubleshoot asset, Repair asset, and Evaluate asset tasks that are in the Open state.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order that you're working on.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you're working on.
6. Select the **Repair asset tasks** tab.
7. Select the asset repair task for which you want to record the time worked.
8. Indicate that you started work on the task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. Select **Start Timer**.
10. After you have completed working on the task, on the **Details** form, select the task result.
 - If you have completed a Troubleshoot asset task, then select any of the following results in the **Troubleshoot result** field:
 - **Repairable**
 - **Unrepairable**
 - **Redeployable**
 - If you have completed a Repair asset task, then select any of the following results in the **Repair result** field:
 - **Repaired**
 - **Unrepairable**
 - **Redeployable**
 - If you have completed an Evaluate asset task, then select any of the following results in the **Evaluation result** field:
 - **Redeployable**
 - **To be disposed**
11. Enter notes related to the task in the **Work notes** field.
12. Select **Close Task**.

Result

The actual time you worked on the task completion is automatically calculated. An entry for the time worked is created in the Time Worked tab of the asset repair task.

Record time worked on a repair task manually in the Enterprise Asset Workspace

Create an entry for the time worked on a repair task manually in the Enterprise Asset Workspace.

Before you begin

Role required: enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order that you're working on.
4. Select the **Repair order lines** tab.
5. Select the repair order line that you're working on.
6. Select the **Repair asset tasks** tab.
7. Select the task for which you want to record time manually.
8. Indicate that you started work on the task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
9. Select **Record Time**.
10. In the **Record Time** dialog box, enter the details of the time worked.
 - a. Enter the time duration that you worked on the task in the **Days**, **Hours**, and **Minutes** fields.
 - b. **Optional:** Provide any additional information in the **Comments** field.
11. Select **Save**.

Result

The Time Worked form is saved and the time card is added to the Time Worked tab of the asset repair task.

Pause a repair task in the Enterprise Asset Workspace

Record a break from a repair task in the Enterprise Asset Workspace if you're not continuing to work on it. Resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Before you begin

You can pause an asset repair task that is in the Work in Progress state. The option to pause the task is available only after you perform the following actions for the asset repair task:

1. Indicate that you have started working on the task by selecting **Start Work**.
2. Start recording the time by selecting **Start Timer**.

Role required: asset_technician

Before you begin

Role required: enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Hardware Asset Workspace > Inventory**.
2. Select the **Repair orders** tab.
3. Select the repair order that you're working on.
4. Select the **Repair order lines** tab.

5. Select the repair order line that you're working on.
6. Select the **Repair asset tasks** tab.
7. Select the task that you want to pause.
8. Select **Pause Work**.
The **Pause Work** changes to **Resume Work**.
9. Select **Resume Work** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time Worked tab.

Manage picking enterprise assets within your stockroom for Enterprise Asset Management workflows

Enable the Asset pick task explicitly for your stockroom and provide granular location details of the asset to facilitate asset picking within your stockroom.

Enable the Asset pick task for your stockroom in the Enterprise Asset Workspace

Enable the Asset pick task for your stockroom so that the task is automatically added to Standard Enterprise Asset requests, Enterprise Asset Refresh requests, and Sourcing workflow.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom for which you want to enable the Asset pick task and Asset put away task.
4. On the Stockroom Details form, select the **Warehouse tasks required** check box.
5. Select **Save**.

Add aisles and spaces to a stockroom in the Enterprise Asset Workspace

Add details of aisles and spaces in a stockroom to provide granular location details of an asset in that stockroom. The aisle and space details enable you to locate and pick an asset in the stockroom.

Before you begin

Role required: inventory_user

About this task

A space is associated with an aisle in the stockroom. You can add a space only after you have added a minimum of one aisle to the stockroom.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select a stockroom.
4. Select the **Aisle and spaces** tab.
The list of existing aisles and spaces in that stockroom is displayed.

5. Add aisles to the selected stockroom.

a. Select **Add aisle**.

The **Add aisle** dialog box is displayed.

b. In the **Aisle** field, enter a unique identifier for the aisle.

You can enter any string value in this field. For example, `aisle_0001`.

c. **Optional:** To add more aisles, select the Add icon (**+**) and enter a unique identifier for the aisle in the **Aisle** field.

d. Select **OK**.

The aisle is added to the list in the Aisle and spaces tab.

6. Add a space to an aisle in the stockroom.

a. Select **Add space**.

The **Add space** dialog box is displayed.

b. In the **Aisle** field, select the aisle for which you want to add a space.

c. In the **Space** field, enter a unique identifier for the space.

You can enter any string value in this field. For example, `space_0001`.

d. **Optional:** To add more spaces, select the Add icon (**+**) and enter a unique identifier for the space in the **Space** field.

e. Select **OK**.

- The space is added to the list in the Aisle and spaces tab.
- The display name of the space is automatically set based on the **Aisle** and **Space** fields. For example, the display name of the space whose aisle is `aisle_001` and space is `space_001` is **aisle_001 - space_001**.

View the open enterprise asset pick tasks for your stockroom

View the open asset pick tasks for your stockroom to get the details of the tasks that need action.

Before you begin

Role required: `inventory_user`

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.

2. Select the **All stockrooms** tab.

3. Select the stockroom.

In the Open stockroom tasks section, the **Open pick tasks** card displays the number of open pick tasks.

4. Select the **Open pick tasks** card.

Result

The list of open asset pick tasks for the stockroom is displayed.

What to do next

Manage all the enterprise asset pick tasks assigned to you by using the Mobile Agent application. For details, see [Manage enterprise asset pick tasks using the Mobile Agent application](#).

Manage asset put away using the Enterprise Asset Workspace

Enable the Asset put away task explicitly for your stockroom to put away the assets from the receiving bay in the designated aisle-space. View the open Asset put away task and close it after specifying the aisle-space value to move the asset in the stockroom.

**Important:**

Asset put away feature is available with Enterprise Asset Management version 9.0 onwards.

Enable the asset put away task for your stockroom in the Enterprise Asset Workspace

Enable the Asset put away feature for your stockroom so that the Asset put away task is automatically created to track asset movement.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces** > *Enterprise Asset Workspace* > **Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of available stockrooms, select the stockroom for which you want to enable the Asset pick task and Asset put away task.
4. On the Stockroom Details form, select the **Warehouse tasks required** check box.
5. Select **Save**.

Result

The inventory user can perform asset put away for in stock assets in the stockroom.

View open put away tasks for your stockroom in the Enterprise Asset Workspace

View the open put away tasks for your stockroom in the Enterprise Asset Workspace to get the details of the tasks that need action.

Before you begin

Role required: inventory_user

Procedure

1. Navigate to **Workspaces** > *Enterprise Asset Workspace* > **Inventory**.
2. View the open put away task either from the Inventory overview section or the All Stockrooms tab.
 - In the Inventory overview section, select the **Open put away tasks** number.
 - In the **Stockrooms** tab, select a stockroom. In the Open stockroom tasks section, select the **Open put away tasks** number.

Result

The list of open Asset put away tasks are displayed.

What to do next

Put away the asset in the desired drop-off location in the stock room and close the Asset put away task after adding the **Drop off location** field value in the Asset put away task form. For more information about closing Asset put away task, see [Close an Asset put away task in the Enterprise Asset Workspace](#).

Create an Asset put away task in the Enterprise Asset Workspace

Create an Asset put away task manually for the In stock assets in the Enterprise Asset Workspace to track the movement of assets within the stockroom.

Before you begin

Role required: inventory_user

About this task

You can create an asset put away task in the Enterprise Asset Workspace for the In stock assets for which the **Aisle and Space** field value isn't already specified. When you create a put away task, you can either directly close the task or save it. To close the task, the **Drop off location** field value is required.

Procedure

1. Navigate to **Workspaces** > *Enterprise Asset Workspace* > **Inventory**.
2. Open the Create New Asset put away task form either from the Inventory overview section or the All Stockrooms tab.
 - In the Inventory overview section, select the **Open put away tasks** card and select **New**.
 - In the Stockrooms tab, select a Stockroom and then in the Open stockroom tasks section, select the **Open put away tasks** card. Select **New**.
3. On the form, fill in the fields.
For a description of the field values, see [Asset put away task fields](#).
4. Save your modifications.
 - To save your changes and create the Asset put away task, select **Save**.
 - To save your changes and close the Asset put away task, select **Close task**.

Note:

Drop off location field value is required to close the Asset put away task.

Close an Asset put away task in the Enterprise Asset Workspace

Add the asset drop-off location for an open Asset put away task and close it in the *Enterprise Asset Workspace*.

Before you begin

Role required: inventory_user

About this task

You can bulk close selected Asset put away tasks that are open and assigned to you by specifying a drop-off location, which moves all associated assets to that location. You can also close individual tasks by specifying a drop-off location.

Note:

When you make the following changes to an enterprise asset, the associated Asset put away task is closed:

- When the asset's **Aisle and Space** value is filled, the associated Asset put away task for the asset is closed, and the **State** field is updated to **Closed Complete**.
- When the asset's **State** is updated from In stock to some other value without adding the **Aisle and Space** field value, the associated Asset put away task is closed and its **State** field is updated to **Closed Incomplete**.

Procedure

1. Navigate to **Workspaces** > *Enterprise Asset Workspace* > **Inventory**.
2. Open the put away task either from the Inventory overview section or the **All Stockrooms** tab.
 - In the Inventory overview section, select the **Open put away tasks** card and select the **Number** link to open the Asset put away task.
 - In the **All Stockrooms** tab, select a stockroom. In the Open stockroom tasks section, select the **Open put away tasks** card and then select the **Number** link to open the Asset put away task.
3. In the Put away task form, select the **Drop off location** value.
4. Save your modifications or close the put away task.
 - To close the put away task, select **Close task**.
 - To save your changes and stay on the same page, select **Save**.
 - To close multiple put away tasks, select **Bulk close**.

The **Select Assets** dialog box is displayed listing the Asset put away tasks assigned to you. Select the tasks that you want to close and select **Close Task**.

Result

- Closed tasks aren't displayed in the Open put away tasks list.
- The task closure is captured in the **Activity** tab. The name of the user who closed the task is shown in the work notes.

Manage the receiving of assets at stockrooms in the Enterprise Asset Workspace

Receive enterprise and consumable assets at stockrooms from any workflow at a centralized location on the stockroom form in the Enterprise Asset Workspace.

Important:

The options to receive assets at your stockroom through the standardized asset receiving mechanism is available with Enterprise Asset Management version 9.0 and later.

Depending on the number and type of assets that you want to receive, you can select from the following options to receive assets at your stockroom:

- [Receive a single enterprise asset at your stockroom.](#)
- [Receive one or more enterprise and consumable assets from the list of shipment assets.](#)
- [Import and receive enterprise and consumable assets in bulk through an Excel template.](#)

Note:

You should have the `sn_eam.enterprise_admin` role to import asset records using the Excel template.

For more details, see [Receiving enterprise and consumable assets at stockrooms](#).

Receive an enterprise asset at a stockroom in the Enterprise Asset Workspace

Receive a single enterprise asset that has arrived at your stockroom, whether it's part of a workflow or not, in the Enterprise Asset Workspace.

Before you begin**Important:**

The option to receive an enterprise asset at your stockroom through the standardized asset receiving mechanism is available in Enterprise Asset Management version 9.0 and later.

Role required: `sn_eam.asset_technician` or `sn_eam.enterprise_asset_manager`

About this task

This task enables you to receive assets in the following scenarios:

Receiving an enterprise asset with an existing record

When you're receiving an enterprise asset from workflows such as a transfer order or Return Merchandise Authorization (RMA), where a repaired asset has arrived at your stockroom, the asset record exists in your ServiceNow instance. You can search for the existing asset record using the Asset tag or Serial number and then receive the asset, which automatically closes the receive task of the source workflow.

Receiving a new enterprise asset at your stockroom

When you're physically receiving a new enterprise asset at your stockroom, it's likely that the asset record isn't present in your ServiceNow instance. You can receive new assets through workflows like a purchase order, asset refresh, or RMA with a replacement asset. Through this task, you can create an asset record and associate it with the source workflow, which automatically closes the receive task linked to the source workflow.

Receiving an independent enterprise asset

You can receive an enterprise asset that isn't part of any workflow and has arrived at your stockroom.

Important:

You can also receive a hardware asset only if the Hardware Asset Management application is activated.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive the hardware asset.
4. Select **Receive assets**.
5. Find the enterprise asset that you want to receive.

- a. In the Receive assets dialog box, enter the Asset tag or Serial number of the asset that you want to receive in the search field.
- b. Select **Search**.
 - If the asset record is found, it appears in the Assets list.

Note:

The following asset details are displayed:

- **Display name**
 - **Model category**
 - **Asset tag**
 - **Quantity**
 - **State**
 - **Stockroom**
 - **Location**
- If the asset record isn't found, a message appears indicating that the asset isn't found, along with an option to create the asset record.

6. Receive the enterprise asset in your stockroom.

- If the asset record is found in the Assets list, select the asset record and then select **Receive**.

Result

- The State of the asset changes from **In transit** to **In stock**.
 - The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the asset.
 - The receive task in the source workflow associated with the asset that you received are automatically closed.
- If the asset record isn't found, create one to receive.
 - a. Select **Create asset**.
 - b. In the Create asset dialog box, enter the details.

Create asset dialog box

Field	Description
Model	Specific product model of the asset. This field is required.
Model Category	Model grouping of the asset. This field is required.
Serial Number	Serial number of the asset.

Field	Description
	<p>Note: Depending on the Model Category that you selected, this field is either required or optional. For instance, Serial number is required for Computer model category.</p>
Asset Tag	Tag to help track the asset.
Mac Address	MAC address of the asset.
Stockroom name	<p>Name of the stockroom that you selected to receive the asset.</p> <p>This field is automatically populated and is read only.</p>
Source type	<p>Source workflow to which the asset that you're receiving belongs.</p> <ul style="list-style-type: none"> To receive the asset from a purchase order, select PO. To receive the asset from the RMA flow, select Asset RMA. To receive the asset through asset refresh workflow, select Refresh.
Source ticket	<p>Request number of the source workflow that's associated with the asset that you want to receive.</p> <ul style="list-style-type: none"> To receive an asset from a purchase order or asset refresh order, select the associated PO line number. To receive an asset from an RMA order, select the associated RMA line number. <p>Note: Source tickets are displayed based on the model and source type that you selected.</p>

Important:

Providing the Source type and Source ticket details is optional when creating an asset record. However, including these details links the enterprise asset to the source workflow. This link results in the automatic closure of the Receive task in the source workflow when the asset is created. If you don't include these details, the asset record is still created, but you should close the Receive task manually in the source workflow.

Note the following points before you consider creating an asset record:

- If you're receiving an asset from an RMA workflow, you can create an asset record first. Later, you can manually add the details of this asset in the Asset RMA receive task, and then close the task.
- If you're receiving an asset from a purchase order, you can create an asset record for the asset you physically received. However, you can't receive the same asset later through the Receive task on the purchase order.

c. Select Create.

Result

- An asset record is created with State as **In stock** and Substate as **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the asset.
- The receive task in the source workflow is automatically closed only if you provided the Source type and Source ticket details.

Receive assets from inbound shipments at your stockroom in the Enterprise Asset Workspace

Receive enterprise and consumable assets from one or more shipments that are in transit to your stockroom in the Enterprise Asset Workspace. You can receive assets from shipments originating from any workflow.

Before you begin

Important:

The option to receive assets from inbound shipments at your stockroom through the standardized asset receiving mechanism is available in Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.asset_technician or sn_eam.enterprise_asset_manager

About this task

If you don't have the details of the assets you want to receive at your stockroom, you can view the list of assets that are on their way and then receive them. You can receive the complete quantity of consumables in the shipments, not a partial quantity.

Assets from an inbound shipment can be received under the following conditions:

- The assets must have a serial number and an asset tag.
- The assets must be in the In-transit state and linked to a shipment record.
- Hardware assets can be received only if the Hardware Asset Management application is activated.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive hardware or consumable assets.
4. Select **Receive assets**.
5. In the Receive assets dialog box, select **View all inbound assets**.
A list of all shipment assets currently on their way to the stockroom is displayed.

The following details of a shipment are displayed:

- **Asset:** Display name of the asset.
- **Stage:** Stage of the shipment.

Note:

Only shipments that are In transit are displayed.

- **Model categories:** Model grouping of the asset.
- **Quantity:** Number of assets to be received.
- **Asset tag:** Tag to track the asset.

- **Serial number:** Serial number of the asset.
- **Tracking number:** Identifier to track the shipment.
- **Source:** Details of the source workflow including the request number through which you're receiving the asset. The source could be a transfer order line, a purchase order line, an RMA order line, or any other workflow through which the asset is received.

6. Select the shipment asset that you want to receive and then select **Receive**.

Result

If the asset details are valid, the following changes occur:

- The assets are received successfully.
- The State of the assets changes from **In transit** to **In stock**, and the Substate of the assets changes from **Reserved** to **Available**.
- The stockroom field on the asset form is automatically updated with the stockroom at which you received the assets.
- The Status of the shipment tasks associated with the assets changes to **Delivered**.
- The receive tasks in the source workflows are automatically closed.

If any of the asset details are invalid, an error message is shown in the **Alert** column for the corresponding asset record. You should resolve the error before receiving the assets.

Import and receive assets in bulk at your stockroom in the Enterprise Asset Workspace

Receive multiple enterprise and consumable assets at your stockroom by importing the asset records using an Excel template in the Enterprise Asset Workspace.

Before you begin

i Important:

The option to import and receive assets in bulk through the standardized asset receiving mechanism is available in Enterprise Asset Management version 9.0 and later.

Role required: `sn_eam.enterprise_admin`

About this task

This task enables you to receive assets with existing records, and also new assets, only if you have provided valid asset details in the template.

When you import a template with asset details, extensive validation is performed on each row. The records from the template and the validation results are stored in the Import asset row [`sn_itam_cmn_import_asset_row`] table.

i Note:

The `sn_itam_common.receive_assets_batch_size` system property determines how many asset records are processed at once when logging imports and receiving jobs. By default, the system handles 1,000 asset records per batch. With the admin role, you can adjust this number to optimize the system performance and handle large volume of assets. This system property supports domain separation by using the application property.

The asset data validation takes care of the following points:

- Child assets can't be received.
- Hardware assets can only be received if the Hardware Asset Management application is activated.

- Operational Technology (OT) assets can only be received if the OT Asset Management application is activated.
- Assets can be received only if the following conditions are fulfilled:
 - The required fields are provided.
 - The asset quantity is valid.
 - The Source type and Source ticket details are valid.
- Asset from purchase order lines can be received only in Zurich and later releases.
- Asset bundles can't be received.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. Select the stockroom for which you want to receive hardware or consumable assets.
4. Select **Import assets**.
5. Prepare the asset data for import, and then proceed with the import.
 - a. Download, update, and save the asset import template.
 - i. Select **Download Template**.
 - ii. Fill in the template with the details of the assets that you want to import and receive.

The template has the following columns:

- **Asset tag** and **Serial number**: These fields are used to determine whether the asset record exists in your ServiceNow instance or not.
- **Model category**, **Model name**, and **Model number**: The fields required to validate an asset record depend on the model category. For example, a serial number is required for the Computer model category, and you can receive assets of that model category only if the serial number is provided. Additionally, if an asset record isn't found, fields related to the model are required to create one using the Asset tag and Serial number values provided in the template.
- **Quantity**: This field should have a value of 1 for enterprise assets, and for consumables, it should reflect the number of assets you're receiving. You can't receive a partial quantity of consumables.
- **Manufacturer**: Asset manufacturer.
- **Source type**: The source type is the workflow through which you're receiving the asset. You should enter values that correspond to the workflows, such as the following:
 - TOL for transfer order line
 - POL for purchase order line
 - RMAL for Return Merchandise Authorization (RMA)

Note:

This field is required for a consumable asset so that the correct asset is identified and received.

- **Source ticket**: The request number of the source workflow that's associated with the asset that you want to receive, such as TO line number, PO line number, or RMA line number.

Note:

This field is required for a consumable asset so that the correct asset is identified and received.

- **Reserved for**
- **Parent asset**
- **MAC address** and **OT entity**: These fields are required to identify and receive OT assets.

iii. Save the template.

b. On the Create New Import asset form, fill in the details.

- i. In the **Name** field, provide a name for the asset import record.
- ii. Select **Attach file** and then select the asset import template that you created in step a.

c. Select **Import**.

- The **Import asset data rows** tab is displayed, showing all the asset record rows that were imported through the Excel template.

Note:

Depending on the number of records being processed, it might take some time for the asset records to appear in the Import Asset Data Rows tab.

- The **Status** column indicates whether the asset is ready to be received. Here are the possible values:
 - **Ready to receive**: This status indicates that the asset data is valid and ready to be received at your stockroom.
 - **Receive error** (Asset not found): This error indicates that no asset records match the details you provided in the template. However, since the details are valid, asset records will be created when you proceed with the Receive action.
 - **Import error**: This error is because of the invalid asset data provided in the asset import template, such as duplicate serial numbers or invalid quantity for hardware assets.
- The **Alert** column provides details about any errors and the steps that you should take to resolve them and successfully receive the asset.

Note:

You can proceed to receive assets with a status of Ready to receive or Receive error.

For assets with a status of Import error, correct the data issues in your template and create a new import record to import the corrected template. You can then receive the assets.

6. Receive assets at your stockroom.

- a. Select the import data rows corresponding to the assets that you want to receive.
- b. Select **Receive**.

If you received the assets with Status Ready to receive, the following changes happen:

- The State of the assets changes from **In transit** to **In stock**, and the Substate of the assets changes from **Reserved** to **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the assets.
- The receive tasks in the source workflows associated with the assets that you received are automatically closed.

If you received the assets with Status Receive error, the following changes happen:

- Asset records are created with State as **In stock** and Substate as **Available**.
- The **Stockroom** field on the asset form is automatically updated with the stockroom at which you received the assets.
- The receive task in the source workflow is automatically closed only if you provided the Source type and Source ticket details.

Manage stockrooms with inventory reports in the Enterprise Asset Workspace

Track and manage stockrooms efficiently by evaluating the inventory reports in the Enterprise Asset Workspace.

i Important:

The inventory reports are available with Enterprise Asset Management version 9.0 and later.

The inventory reports help you:

- Find replacement options or spare part availability for assets.
- Quickly identify shortages and align current demand in your stockroom with both current and incoming supply.
- Analyze the supply to meet open demand across all stockrooms or locations.

Identify suitable replacement options for assets in the Enterprise Asset Workspace

Use the Inventory availability report to determine suitable replacement options for your assets and their child components that are in use, in maintenance, pending repair, or defective. The report also helps you to determine the quantity of available substitute models that can be used locally, moved through the distribution channels, and estimate the lead time for new purchases.

Before you begin

i Important:

The Inventory availability report is available with Enterprise Asset Management version 9.0 and later.

The Inventory availability report is available only for enterprise, consumable, and bundle assets that are in use, in maintenance, pending repair, or defective.

Service locations and distribution channels should be configured for the stockroom. If the asset's location is a service location of a stockroom, it automatically becomes the local stockroom. A location can have multiple local stockrooms if it is serviced by more than one stockroom. For more details, see [Add a distribution channel to a stockroom in the Enterprise Asset Workspace](#) and [Add service locations to a stockroom in the Enterprise Asset Workspace](#).

Role required: sn_eam.enterprise_asset_technician or sn_eam.enterprise_asset_manager

About this task

The Inventory availability report helps you to identify the best sourcing option when sourcing parts for assets or its components that are in use and nearing the end of their life, defective, or pending repair. Additionally, you can check how much stock is currently available at a stockroom.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Enterprise asset estate**.
2. Select the asset for which you want to view the replacement assets available in the local and remote stockrooms.
3. Select the **Inventory availability** tab.

The list displays the asset and any of its child assets, along with their linked models and any substitute models. The list includes the following details:

Inventory availability report

Field	Description
Asset	Display name of the asset.
Model	<p>Model of the asset.</p> <p>Note: If there are any substitute models for the asset model, they're also displayed.</p>
Asset type	<p>Indicates whether the asset is the original asset or a substitute model asset.</p> <p>This field can have any of the following values:</p> <ul style="list-style-type: none"> ○ Original parent for the actual parent asset. ○ Original child for the child of the original parent asset. ○ Substitute parent for the asset of the substitute model. ○ Substitute child for the child asset of the substitute model.
Local stockroom quantity	<p>Quantity of assets that are in stock and available in the stockrooms that service the asset location.</p> <p>Note: If you select the quantity shown, you can view the full list of assets in your local stockroom that can be used as replacements. There can be multiple local stockrooms if more than one stockroom serves the same location.</p>
Remote stockroom quantity	<p>Quantity of assets that are in stock and available in the distribution channel stockrooms that are marked as inbound stockrooms to the current local stockroom.</p> <p>Note: If you select the quantity shown, you can view the full list of assets in your distribution channel stockrooms that can be used as replacements.</p>
Purchase lead time	Average time in days it has taken from ordering to receiving replacement assets through new purchase orders.

Identify the supply and demand for models within a stockroom in the Enterprise Asset Workspace

Use the Supply vs Demand report to evaluate the available and incoming quantity of models in your stockroom and the requests for these models from different service locations. This report helps you determine if you have enough assets to meet the demand.

Before you begin

Important:

The Supply vs Demand report is available with Enterprise Asset Management version 9.0 and later.

Role required: `sn_eam.enterprise_asset_technician` or `sn_eam.enterprise_asset_manager`

About this task

Supply refers to the assets that are currently in stock and those that are incoming at your stockroom. Demand refers to the requests for assets from different service locations that your stockroom services.

Note the following points about the Supply vs Demand report:

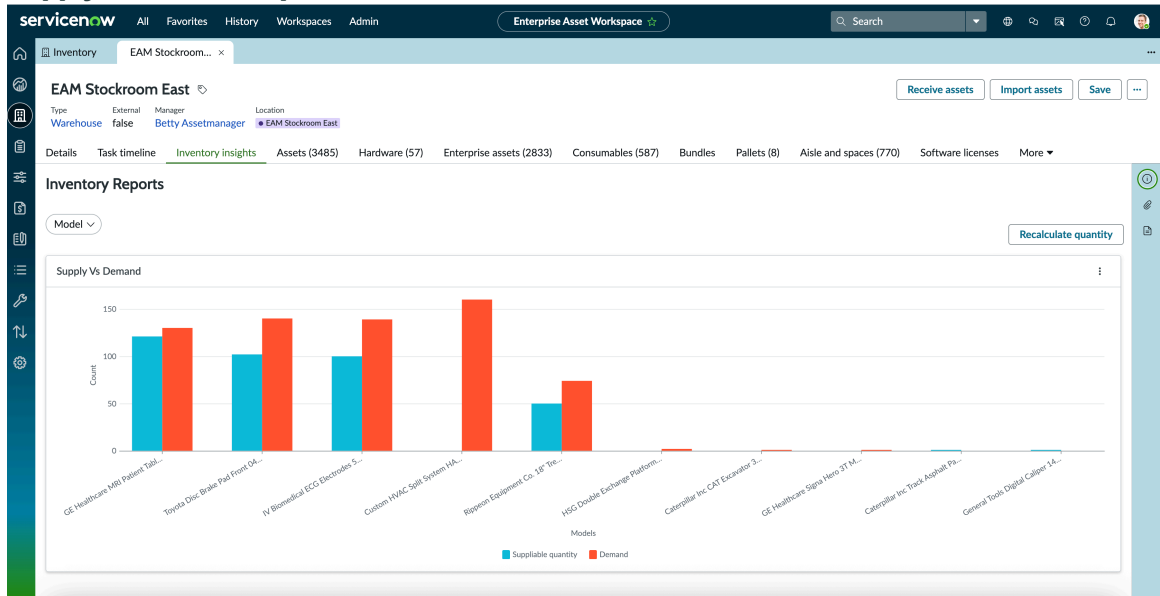

- Supply of an asset model to your stockroom includes:
 - In stock assets that are in the Available, Reserved, Pending transfer, and Pending install stage
 - Incoming transfer orders that are partially shipped, fully shipped, in transit, received, and delivered
 - Incoming purchase orders that are ordered
- Demand for an asset model includes:
 - Outgoing transfer orders that are in the Draft, Requested, and Shipment preparation stage
 - Asset requests
 - Refresh requests
 - Work order parts requests

The supply and demand details are stored in the Model and stockrooms [`sn_asset_model_and_stockroom`] table. The *Populate model and stockroom data* scheduled job runs daily to populate this table.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Inventory**.
2. Select the **All stockrooms** tab.
3. From the list of stockrooms, select the one for which you want to view the supply and demand details.
4. Select the **Inventory insights** tab.

Supply vs Demand report

The Supply vs Demand report shows the count on the y-axis and the model on the x-axis, with separate bars for supply and demand for each model. This visual representation helps you to compare the available quantity of each model in the stockroom with the number of requests from different service locations. By looking at the graph, you can determine which models have enough supply to meet demand and which ones need more stock.

Note:

By default, the graph shows details for only 10 models.

5. View the details of the model that isn't shown on the report.
 - a. Select the **Model** filter.
 - b. Enter the model in the search field or select the model from the **Available** list.
 - c. Move the selected model to the **Applied** list.
 - d. Select **Apply**.
6. To further drill down into the supply or demand for a model and view its component-level details, select the corresponding bar.
 - The supply graph shows the count of the following:
 - **In stock assets**
 - **Incoming transfer order**
 - **Incoming purchase order**
 - The demand graph shows the count of the following:
 - **Outgoing transfer order**
 - **Asset requests**
 - **Refresh requests**
 - **Work order parts requests**

By selecting the relevant bars, you can view the list of assets that make up the count.

7. Optional: To initiate the calculation of supply and demand for asset models manually, select **Recalculate quantity**.

(Optional) The Supply vs Demand graph updates to show the recently calculated values.

Identify the supply for open demands in the Enterprise Asset Workspace

Use the Open demands report to determine available stock within local stockrooms and distribution channels to fulfill sourcing requests that are open.

Before you begin

Important:

The Open demands report is available with Enterprise Asset Management version 9.0 and later.

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Procurement**.

2. In the Procurement overview, select **Open demands**.

The report displays the list of open demands with the following details:

- Requests and Requested items.
- The quantity of the requested model available in local stockrooms that serve the asset location.
- The quantity of the requested model available in distribution channel stockrooms that serve the asset location.
- The purchase lead time, which is the average time in days it has taken from ordering to receiving assets through new purchase orders.

3. To view the current stock availability in the local stockrooms for all open requests for a model and determine if there is sufficient quantity, select the number shown in the **Local stockroom quantity** column.

The available asset quantity is determined by the current state. If two requests from a service location, which is serviced by two or more stockrooms, are for the same model and the available quantity is 100, the report will show 100 available in the local stockroom for both requests. Once one request is fulfilled, the quantity will update to reflect the remaining amount for the other request.

4. To view the current stock availability in the distribution channel stockrooms for all open requests for a model and determine if there is sufficient quantity, select the number shown in the **Remote stockroom quantity** column.

Create and manage contracts for enterprise assets

Create contracts for your enterprise assets and manage them by taking actions on contracts that are nearing expiration or already expired.

You can take action on certain enterprise asset contracts that are either nearing their expiration or have already expired.

If a maintenance or warranty contract is expiring or has already expired, you can renew the contract by using the contract renewal workflow. For more information on renewing expiring maintenance and warranty contracts, see [Contract renewal workflow](#).

If a lease contract is expiring or has already expired, you can choose to:

- return the associated enterprise assets to the asset vendor,
- buy out the associated enterprise assets so that you can permanently add them to your asset inventory,
- or extend the contract.

For more information on managing expiring lease contracts, see [Managing expiring contracts for leased enterprise assets](#).

Create a contract for your leased enterprise assets

Create a contract to define the lease details of your enterprise assets.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

The following steps describe how to create contracts for leased enterprise assets only. For information on how to create other types of contracts, see [Contract Management](#).

Procedure

1. From the Enterprise Asset Workspace, open the Contract and lease management view.
2. On the **Lease contracts** tab, select **New**.
3. On the Create New Contract form, fill in the fields.
See [Contract fields for Enterprise Asset Management](#) for a detailed description of each field.
4. Select **Save**.
A new contract record is created for the lease contract.
5. Build terms and conditions for the lease contract.
Before you can build terms and conditions for a lease contract, you must create a terms and conditions record and add it to the contract. For detailed instructions on how to create a terms and conditions record, see [Create a terms and conditions record](#). For detailed instructions on how to add a terms and conditions record to a contract, see [Add terms and conditions to a contract](#).
 - a. On the lease contract record header, select the More Actions icon ().
 - b. When prompted, select **Build Terms and Conditions**.
The terms and conditions are built for the lease contract and added to the **Contract History** tab of the lease contract record. On the **Contract History** tab, you can select the date in the **Contract Starts** field to view the complete terms and conditions for the lease contract.
6. Add all enterprise assets that are covered by the lease contract.

Note:

If you created a multi-component asset from a multi-component model, only the parent asset can be added to the lease contract. The associated child assets cannot be added to the lease contract. See [Multi-component models and assets in Enterprise Asset Management](#) for more information on multi-component assets.

- a. On the **Assets Covered** tab of the lease contract record, select **Add**.
The Add assets dialog box opens.
- b. In the dialog box, select the check box for each enterprise asset that is covered by the lease contract.

Note:

The dialog box displays only the enterprise assets that are not already covered by another active lease contract.

c. Select Add.

The dialog box closes and the **Assets Covered** tab automatically reloads with the list of all enterprise assets that you added.

7. Create expense lines to track the cost of each enterprise asset that is covered by the lease contract.**a. On the Expense Lines tab of the lease contract record, select New.****b. On the Create New Expense Line form, fill in the fields.**

See [Expense line fields for Enterprise Asset Management](#) for a detailed description of each field.

c. Select Save.

A new expense line record is created for the selected enterprise asset.

d. Close the expense line record to return to the Expense Lines tab of the lease contract record.**e. Repeat steps a to d for each expense line that you want to create.****8. Create child contracts that you want to associate with the lease contract.****a. On the Child Contracts tab of the lease contract record, select New.****b. In the Contract model field of the Create New Contract form, search for and select the type of contract that you want to create.****c. Configure the child contract by following the same steps that you used to configure the lease contract (steps 3 to 7).****d. Select Submit For Review.**

A review notification is sent to the user that you specified in the **Approver** field of the child contract record. After reviewing the child contract, the user can either approve or reject it.

e. Repeat steps a to d for every child contract that you want to create.**9. Select Submit For Review.**

A review notification is sent to the user that you specified in the **Approver** field of the lease contract record. After reviewing the lease contract, the user can either approve or reject it.

Managing expiring contracts for leased enterprise assets

You can use the Contract and lease management view to track and take action on leased enterprise assets that are nearing the end of their contracts. You can choose to return your leased enterprise assets, buy out your leased enterprise assets, or extend your lease contracts.

Lease management flow

When a lease contract for a given enterprise asset is nearing its expiration, the Enterprise Asset Management application automatically sends out a notification informing you that the contract will be expiring soon. You can customize the timing, content, and recipients of this expiry notification by navigating to **System Notification > Email > Notifications** and then selecting **Contract Threshold breached** from the list of available email notifications.

After you receive an expiry notification for one of your lease contracts, you can begin the lease-end process for that contract.

Note:

You can begin the lease-end process only for active lease contracts that are expiring within 90 days but do not have a **Substate of Expiring**. A **Substate of Expiring** indicates that the lease-end process for that contract has already begun.

When the lease-end process begins, the Enterprise Asset Management application automatically generates a Planning task that you must complete to specify what action you want to take on either the associated enterprise asset or the lease contract itself. You can choose to

- return the enterprise asset to the asset vendor,
- buy out the enterprise asset so that you can permanently add it to your asset inventory,
- or extend the lease contract.

Based on the action that you select, you must then perform all subsequent tasks to complete the lease-end process and move the lease contract out of the expiring substate.

Begin the lease-end process for an expiring enterprise asset lease contract

Initiate the lease-end process for an expiring enterprise asset lease contract so that you can return the associated enterprise asset, buy out the associated enterprise asset, or extend the lease contract.

Before you begin

Important:

You can begin the lease-end process only for active lease contracts that are expiring within 90 days but do not have a **Substate of Expiring**. A **Substate of Expiring** indicates that the lease-end process for that contract has already begun.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Contract and lease management view.
2. On the **Lease contracts** tab, select the lease contract for the enterprise asset that you want to return, buy out, or extend the contract for.
The lease contract record opens.
3. On the lease contract record header, select **Begin lease-end process**.
4. When prompted to confirm that you want to begin the lease-end process for the contract, select **OK**.

Result

The lease-end process for the specified lease contract begins. The Enterprise Asset Management application then automatically generates a Planning task for the lease contract.

What to do next

Complete the Planning task for the lease contract so that you can specify what action you want to take on either the associated enterprise asset or the lease contract itself. See [Complete the Planning task for an expiring enterprise asset lease contract](#) for detailed instructions.

Complete the Planning task for an expiring enterprise asset lease contract

Complete the Planning task for an expiring enterprise asset lease contract so that you can proceed with either returning the associated enterprise asset, buying out the associated enterprise asset, or extending the lease contract.

Before you begin

To generate the Planning task for an expiring lease contract, you must initiate the lease-end process for that contract. See [Begin the lease-end process for an expiring enterprise asset lease contract](#) for detailed instructions.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Contract and lease management view.
2. On the **Lease-end assets** tab, select the lease contract for the enterprise asset that you want to return, buy out, or extend the contract for.

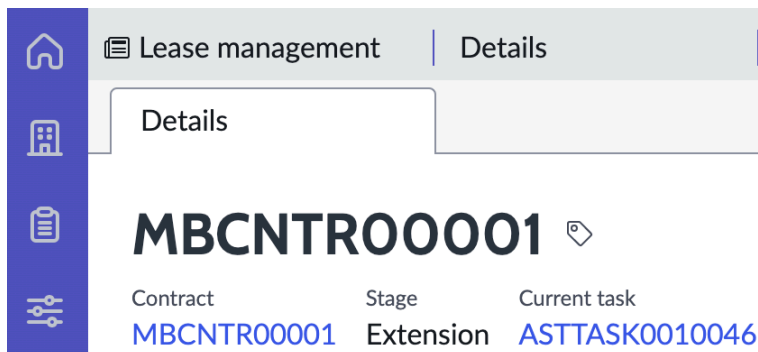

Note:

You must select a lease contract that is in the **Planning** stage.

The lease contract record opens.

3. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Planning** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Planning task opens.

4. On the **Details** tab of the Planning task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number used to identify and track the Planning task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.

Field	Description
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
Lease action	<p>Action that you want to take on the associated enterprise asset. Select one of the following options:</p> <ul style="list-style-type: none"> ○ Return ○ Extend <p>i Note: If you select this option, the Enterprise Asset Management application automatically creates a purchase order and purchase order line for the lease contract extension.</p> <ul style="list-style-type: none"> ○ Buyout <p>i Note: If you select this option, the Enterprise Asset Management application automatically creates a purchase order and purchase order line for the enterprise asset buyout.</p>
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

5. Select Close Task.

Result

The Planning task automatically closes with an updated state of Closed Complete.

What to do next

Based on the action that you selected in the **Lease action** field, complete all necessary tasks to return the associated enterprise asset, buy out the associated enterprise asset, or extend the lease contract.

Return a leased enterprise asset

Return a leased enterprise asset to the asset vendor before the corresponding lease contract expires.

Before you begin

Before you can proceed with returning a leased enterprise asset, you must complete the Planning task for the associated lease contract. See [Complete the Planning task for an expiring enterprise asset lease contract](#) for detailed instructions.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

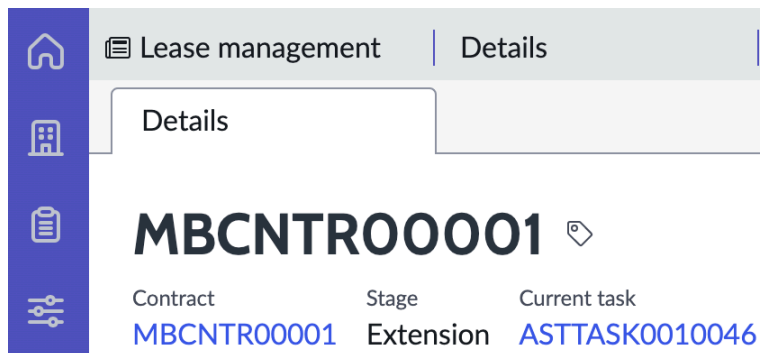

Note:

The sn_eam.enterprise_asset_technician role can also perform the Collection, Preparation, and Shipment tasks. However, this role can perform these tasks only through the **Lease-end tasks** Quick links card that is available on the Enterprise asset overview.

Procedure

1. From the Enterprise Asset Workspace, open the Contract and lease management view.
2. On the **Lease-end assets** tab, select the lease contract for the enterprise asset that you want to return.
The lease contract record opens.
3. Complete and close the Collection task for the lease contract.
To successfully complete and close this task, you must collect the enterprise asset that you want to return.
 - a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Collection** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Collection task opens.

- b. On the **Details** tab of the Collection task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Collection task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.

Field	Description
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Asset collection	
Asset collected	<p>Option that indicates if the associated enterprise asset was collected for return.</p> <p>If you select Yes, the Stockroom field appears next to the Asset collected field. In the Stockroom field, search for and select the stockroom that the associated enterprise asset was collected from.</p> <p>If you select No, the Action change field appears next to the Asset collected field. In the Action change field, select an option to change your lease action to either an enterprise asset buyout or lease contract extension.</p>
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Collection task automatically closes with an updated state of Closed Complete.

If you set the **Asset collected** field to **Yes**, the **Substate** field changes to **Pending transfer** in the asset record for the associated enterprise asset.

If you set the **Asset collected** field to **No**, proceed with one of the following options:

- If you changed your lease action to an enterprise asset buyout, proceed to [Buy out a leased enterprise asset](#).
- If you changed your lease action to a lease contract extension, proceed to [Extend the lease contract for an enterprise asset](#).

4. Complete and close the Preparation task for the lease contract.

To successfully complete and close this task, you must prepare the enterprise asset for return.

a. On the Contract Asset Tasks tab of the lease contract record, select the task number for the Preparation task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Preparation task opens.

b. On the **Details** tab of the Preparation task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Preparation task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select **Close Task**.

The Preparation task automatically closes with an updated state of Closed Complete.

5. Complete and close the Shipment task for the lease contract.

To successfully complete and close this task, you must ship the enterprise asset back to the asset vendor.

- a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Shipment** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Shipment task opens.

- b. On the **Details** tab of the Shipment task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Shipment task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Shipment	
Carrier	Shipping carrier through which you shipped the associated enterprise asset.
Ship date	Date on which you shipped the associated enterprise asset.

Field	Description
Tracking number	Tracking number that enables you to track the status and location of the shipment.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

The Shipment task automatically closes with an updated state of Closed Complete.

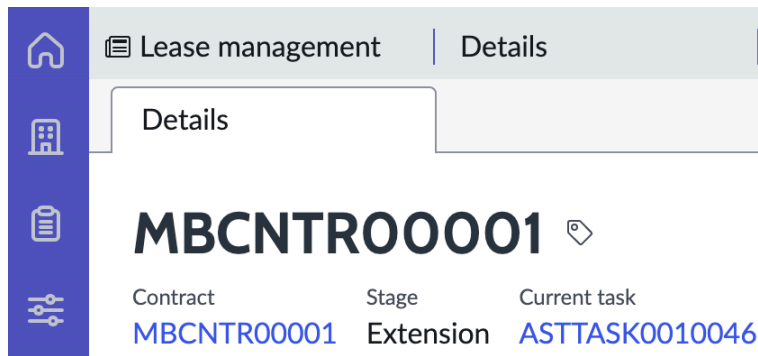

In the asset record for the associated enterprise asset, the **State** field changes to **In transit**.

6. Complete and close the Return confirmation task for the lease contract.

To successfully complete and close this task, the asset vendor must confirm if they received the enterprise asset that you returned. The asset vendor must also inform you of any settlement payouts that you are receiving for the returned enterprise asset.

a. On the Contract Asset Tasks tab of the lease contract record, select the task number for the Return confirmation task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Return confirmation task opens.

b. On the Details tab of the Return confirmation task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Return confirmation task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.

Field	Description
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Return details	
Return confirmation	Option that indicates if the associated enterprise asset was returned successfully. To complete the Return confirmation task, you must set this field to Yes .
Settlement	Option that indicates if you are receiving a settlement payout for the enterprise asset that you returned. If you select Yes , the Settlement amount field appears below the Settlement field. In the Settlement amount field, enter the total amount of money that you are receiving from the settlement payout. The Enterprise Asset Management application can then use this information to automatically create a purchase order and purchase order line for the settlement payout. Note: You can set the Settlement amount field to any currency of your choice.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

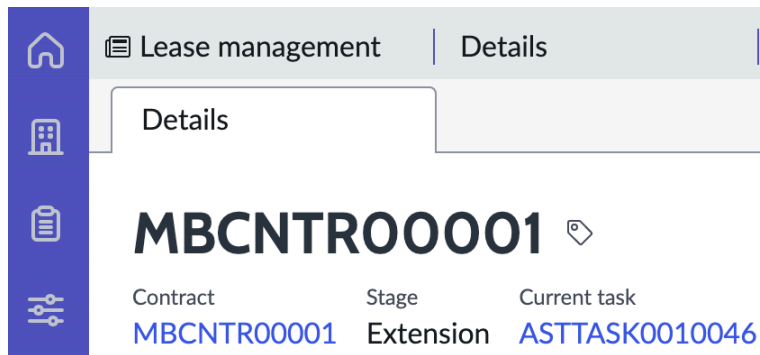

c. Select Close Task.

The Return confirmation task automatically closes with an updated state of Closed Complete.

- 7.** If you set the **Settlement** field to **Yes** in the Return confirmation task, complete and close the corresponding Return settlement task.
To successfully complete and close this task, the asset vendor must reimburse you the amount that was specified in the settlement payout.

a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Return settlement** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Return settlement task opens.

Note:

Aside from the **State** field, all editable fields in the Return settlement task are pre-populated based on the corresponding fields that you filled out in the Return confirmation task. The **Purchase order** and **Purchase order line** fields are pre-populated with the purchase order and purchase order line that the Enterprise Asset Management application automatically created for the settlement payout in [step 7](#).

- b.** In the Return details section of the **Details** tab, select the Open Record icon (🔗) in the **Purchase order** field.
The purchase order record opens.
- c.** Select **Order**.
- d.** After the page reloads, select **Receive**.
The form closes and you automatically return to the purchase order record, which now has a status of Received.
- e.** Close the purchase order record to return to the Return settlement task.
- f.** Select **Close Task**.
The Return settlement task automatically closes with an updated state of Closed Complete.

Result

After you successfully return the leased enterprise asset, the **State** and **Substate** fields change to **Retired** and **Lease Return** in the corresponding asset record.

Buy out a leased enterprise asset

Buy out a leased enterprise asset before the corresponding lease contract expires.

Before you begin

Before you can proceed with buying out a leased enterprise asset, you must complete the Planning task for the associated lease contract. See [Complete the Planning task for an expiring enterprise asset lease contract](#) for detailed instructions.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

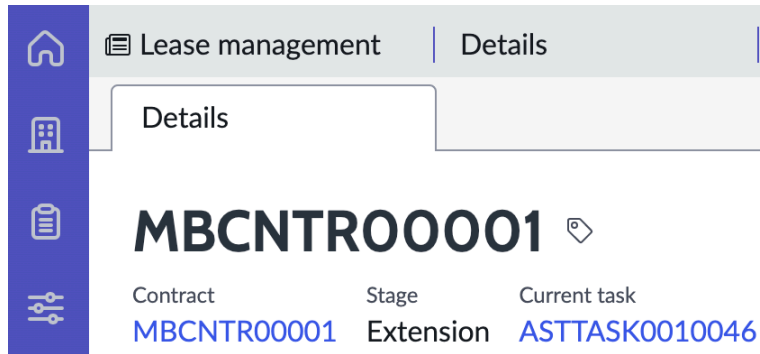

- 1.** From the Enterprise Asset Workspace, open the Contract and lease management view.
- 2.** On the **Lease-end assets** tab, select the lease contract for the enterprise asset that you want to buy out.
The lease contract record opens.

3. Complete and close the Buyout task for the lease contract.

To successfully complete and close this task, you must confirm a buyout date and amount with the asset vendor.

- a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Buyout** task.**

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Buyout task opens.

- b. On the **Details** tab of the Buyout task, fill in the fields.**

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Buyout task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Buyout details	
Buyout date	Date on which you are buying out the associated enterprise asset.

Field	Description
Buyout amount	Cost to buy out the associated enterprise asset. Note: You can set this field to any currency of your choice.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

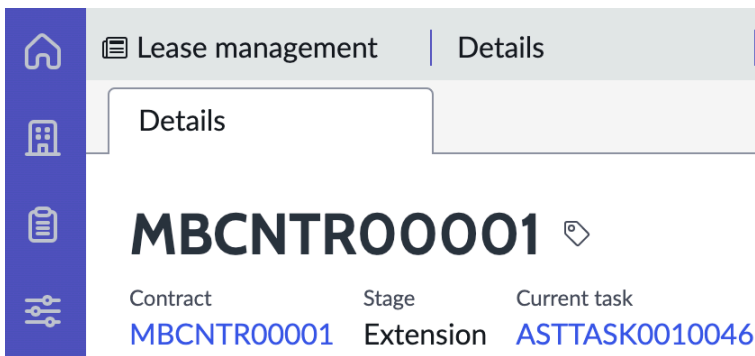

The Buyout task automatically closes with an updated state of Closed Complete.

4. Complete and close the Buyout confirmation task for the lease contract.

To successfully complete and close this task, you must pay the asset vendor the confirmed buyout amount on or before the confirmed buyout date.

a. On the Contract Asset Tasks tab of the lease contract record, select the task number for the Buyout confirmation task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Buyout confirmation task opens.

Note:

Aside from the **State** field and the additional **Buyout confirmation** field, all editable fields in the Buyout confirmation task are pre-populated based on the corresponding fields that you filled out in the Buyout task. The **Purchase order** and **Purchase order line** fields are pre-populated with the purchase order and purchase order line that the Enterprise Asset Management application automatically created for the enterprise asset buyout in the [Planning task](#).

b. In the Buyout details section of the Details tab, set the Buyout confirmation field to Yes.

This field indicates if you bought out the enterprise asset successfully.

c. In the same section, select the Open Record icon (i) in the Purchase order field.

The purchase order record opens.

d. Select Order.

e. After the page reloads, select Receive.

The form closes and you automatically return to the purchase order record, which now has a status of Received.

- f. Close the purchase order record to return to the Buyout confirmation task.
- g. On the Buyout confirmation task, select **Close Task**.
The Buyout confirmation task automatically closes with an updated state of Closed Complete.

Result

After you successfully buy out the enterprise asset, the **Date removed** field on the lease contract record automatically updates with the date on which you completed all buyout tasks. Following this date, you can no longer track the enterprise asset through this lease contract record.

Extend the lease contract for an enterprise asset

Extend the lease contract for an enterprise asset before it expires.

Before you begin

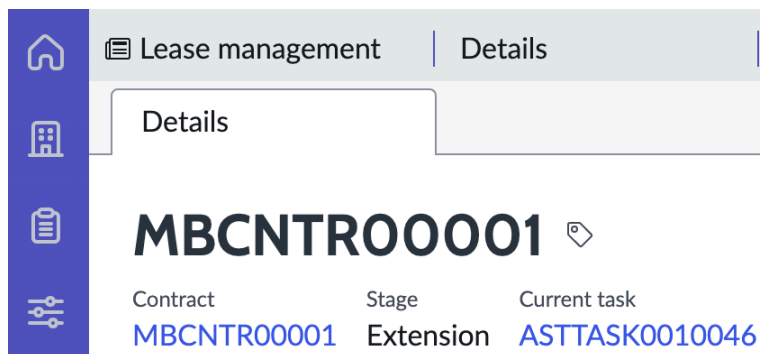

Before you can proceed with extending a lease contract, you must complete the associated Planning task. See [Complete the Planning task for an expiring enterprise asset lease contract](#) for detailed instructions.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Contract and lease management view.
 2. On the **Lease-end assets** tab, select the lease contract that you want to extend.
The lease contract record opens.
 3. Complete and close the Extension task for the lease contract.
To successfully complete and close this task, you must confirm the lease contract extension details with the asset vendor. These details include the start date, end date, and cost of the lease contract extension.
- a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Extension** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Extension task opens.

- b. On the **Details** tab of the Extension task, fill in the fields.

Details tab

Field	Description
Contract Asset Task	
Number	Task number that is used to identify and track the Extension task. This field populates automatically.
Contract	Lease contract that the task is associated with. This field populates automatically.
Asset	Enterprise asset that is associated with the lease contract. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically.
State	State of the task.
Assignment group	Group to which the task is assigned.
Assigned to	User to which the task is assigned.
Work notes list	Users who receive notifications when work notes are added to the task.
Short description	Brief description of the task.
Description	Detailed description of the task.
Extension details	
Extension start date	Date on which you want to start the lease contract extension.
Extension end date	Date on which you want to end the lease contract extension.
Extension cost	Cost to extend the lease contract. Note: You can set this field to any currency of your choice.
Notes	
Work notes	Notes about the task that are visible to all users within your organization.

c. Select Close Task.

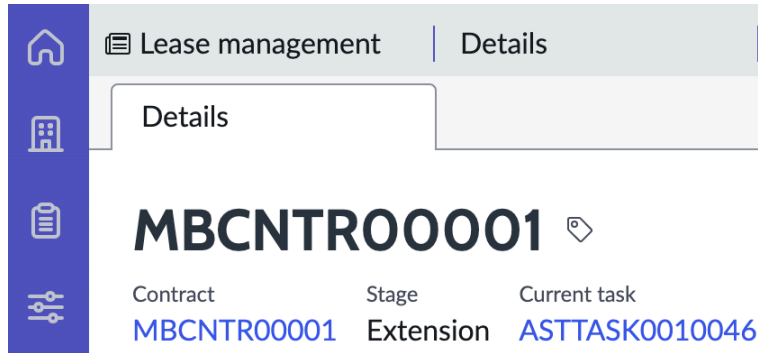

The Extension task automatically closes with an updated state of Closed Complete.

4. Complete and close the Extension confirmation task for the lease contract.

To successfully complete and close this task, you must pay the asset vendor the amount that was specified in the extension cost.

- a. On the **Contract Asset Tasks** tab of the lease contract record, select the task number for the **Extension confirmation** task.

Alternatively, select the task number that is displayed in the **Current task** field of the lease contract record header.

The Extension confirmation task opens.

Note:

Aside from the **State** field and the additional **Extension confirmation** field, all editable fields in the Extension confirmation task are pre-populated based on the corresponding fields that you filled out in the Extension task. The **Purchase order** and **Purchase order line** fields are pre-populated with the purchase order and purchase order line that the Enterprise Asset Management application automatically created for the lease contract extension in the [Planning task](#).

- b. In the Extension details section of the **Details** tab, set the **Extension confirmation** field to **Yes**.

This field indicates if the lease contract was extended successfully.

- c. In the same section, select the Open Record icon (i) in the **Purchase order** field. The purchase order record opens.

- d. Select **Order**.

- e. After the page reloads, select **Receive**.

The form closes and you automatically return to the purchase order record, which now has a status of Received.

- f. Close the purchase order record to return to the Extension confirmation task.

- g. On the Extension confirmation task, select **Close Task**.

The Extension confirmation task automatically closes with an updated state of Closed Complete.

Result

After you successfully extend the lease contract, the **Expiration** field on the lease contract record changes to **Expired**. The Enterprise Asset Management application then creates a new record for the extended lease contract, which is named **EXT_<expired-lease-contract>**. The new lease contract record covers all of the same enterprise assets that were covered in the original lease contract record.

Managing work orders for your enterprise assets

Create and manage work orders for your enterprise assets.

Overview of managing work orders

Create and manage work orders for your enterprise assets by performing the following tasks.

Task	Role required	Resource
Create a work plan for your enterprise assets		Create a work plan for your enterprise assets
Create a maintenance plan for your enterprise assets		Create a maintenance plan for your enterprise assets
Create a work order for your enterprise assets		Create a work order for an enterprise asset
Manage work through work orders and work tasks for your enterprise assets		Managing work for your enterprise assets
Create templates for your enterprise assets		Create a template for your Enterprise Asset Management work orders
Use Drop off tasks to manage delivery of your enterprise assets		Delivering enterprise assets in your personal stockroom through Drop off tasks

Edit Field Service Management configurations for the Work management view

Edit your Field Service Management configurations as needed so that you can access and use the Work management view in the Enterprise Asset Workspace.

Before you begin

Role required: admin

About this task

See [Global domain configurations](#)  for more information on Field Service Management configurations.

Procedure

1. Navigate to **All > Field Service > Administration > Configuration**.
2. Edit the following configurations on the **Business Process** tab:

Business Process tab

Configuration	Setting
Lifecycle	
Process lifecycle	Set this configuration to task-driven (subtasks are required) .
Approval for new request required	Disable this configuration.
Qualification is required for new requests	Disable this configuration.

Configuration	Setting
Agent must accept or reject the assigned task	Disable this configuration.
Track agent travel time	Disable this configuration.
Work notes are required to close or cancel a request or task	Enable this configuration.
Copy task work notes to request	Disable this configuration.
Apply Work Order template in draft status	Enable this configuration.
Catalog and Request Creation	
Create or update requests by inbound email	Disable this configuration.
Create requests using catalog and form or form only	Set this configuration to regular form only .
Templates create a dedicated catalog item	Disable this configuration.

3. Edit the following configurations on the **Assignment** tab:

Assignment tab

Configuration	Setting
Assignment Methods	
Assignment method for tasks	Set this configuration to manually .
Dispatch Queue and Group Coverage	
Use dispatch queue	Disable this configuration.
Assign requests or tasks based on assignment group coverage areas	Disable this configuration.
Assign tasks based on assignment group product models	Disable this configuration.
Assign tasks based on assignment group skills	Disable this configuration.
Scheduling	
Use agent or task scheduling	Disable this configuration.
Auto-selection of agents will consider time zone for tasks	Disable this configuration.
Enable priority assignment	Disable this configuration.
Additional Factors	
Auto-selection of agents will consider location of agents	Disable this configuration.
Auto-selection of agents for tasks requires them to have skills	Set this configuration to None .
Auto-selection will attempt to assign the same agent to all tasks in a request	Disable this configuration.

4. Edit the following configurations on the **Add-ons** tab:

Add-ons tab

Configuration	Setting
Part Requirements	
Part requirements are needed by agents	Enable this configuration.
Reserve parts in agent stockroom	Disable this configuration.
Cancel open Transfer Orders	Disable this configuration.
Edit associated models	Disable this configuration.
Documentation	
Enable a dedicated knowledge base	Disable this configuration.
Enable managed documents	Disable this configuration.
Enable task activities	Disable this configuration.
Associated Task Tables	
Edit associated task tables	Leave this configuration empty.
Maps	
Enable maps	Disable this configuration.

5. Select **Save**.

Create a work plan for your enterprise assets

Create and manage work plans to specify how and when the work should be performed for any activity.

About this task

Use the Planned Work Management application's functionality to create work plans from within the Enterprise Asset Workspace. This enables managers to create work orders for the future and allocate them to technicians so that the technicians can review and plan their work accordingly.

Note:

Ensure that you have activated the Planned Work Management plugin [sn_fsm_planned_wm] plugin.

A work plan consists of an effective start and end date that determines the period for which the plan can be scheduled for execution. Each work plan must have at least one or more records associated with it for which you want to apply the work plan.

Before you begin

Role required: sn_fsm_planned_wm.planned_work_admin

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. On the **Maintenance plans** tab, select **New** to open the *Select target asset table* pop-up window.
3. Select **Work plan** from the **Plan type** list.
4. Select a table from the **Asset table** list.

The Enterprise asset table is selected by default.

5. Select **Create.**

6. On the Create New Work Plan page, fill in the details.

For a detailed description of all the work plan fields, see [Work plan fields for Enterprise Asset Management](#).

7. Select **Save.**

The page closes and you're automatically redirected to the new work plan record.

You can further configure your work plan by creating [planned work schedules](#), planned work records, and work orders.

You can view all your work plan records in the list view in the **Maintenance plans** tab. Every work plan record is prefixed with **WP**.

Create a planned work schedule for your work plan

Create a planned work schedule to specify when you want the work plan to run and how frequently the schedule should run. You can apply one or more planned work schedules to a single work plan.

Before you begin

Before you create a planned work schedule, ensure that you have [created a work plan](#).

Role required: sn_fsm_planned_wm.planned_work_admin

Procedure

1. On the **Planned Work Schedules tab of the work plan record, select **New**.**

2. On the Create New Planned Work Schedule form, fill in the fields.

For a detailed description of the planned work schedule fields, see [Work plan schedule fields for Enterprise Asset Management](#).

3. Select **Save.**

The form closes and you're automatically redirected to the new planned work order schedule record.

4. Select the **More Actions ellipsis icon and then select **Associate schedule with filtered records** to associate the schedule with the assets that the work plan is applied to.**

A confirmation message appears, indicating that the enterprise assets are now associated with the planned work plan schedule. You can verify that the association is successful using the **Planned Work Records** tab on either the planned work plan schedule record or the work plan record.

5. Apply a planned work schedule template to the work plan schedule.

Planned work schedule templates enable the Enterprise Asset Management application to automatically populate information, generate appropriate requests and tasks, and create part requirements for your work plans each time the planned work schedule runs.

a. On the **Planned Work Schedule Templates tab of the work plan schedule record, select **New**.**

The Create New Planned Work Schedule Template form opens.

b. On the form, fill in the fields.

Create New Planned Work Schedule Template form

Field	Description
Model	Model of the work order template.
Schedule	Planned work schedule to which you're applying the work order template. This field populates automatically.
Table	Table that is associated with the corresponding work plan of this planned schedule. This field is automatically set to the table name selected for the work plan.
Conditions	Filter conditions to determine the work order template to be used to create work orders based on the planned schedule.
Notes	Any work notes regarding the template.

- c. Select **Save**.
 - d. Close the form to return to the planned work plan schedule record.
6. On the planned work plan schedule record, select the **More Actions** ellipsis icon and then select **Run on demand** to create work orders for each asset.
Work orders are created for each asset. You can view the work orders in the **Work Orders** tab.

Create a maintenance plan for your enterprise assets

Create a maintenance plan to manage and schedule routine maintenance for your enterprise assets, linear assets, and linear segments. You can run maintenance on-demand or based on a set of specific criteria.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. On the **Maintenance plans** tab, select **New**.
3. Select **Maintenance plan** from the **Plan type** list.
4. Select a table from the **Asset table** list.
The Enterprise asset table is selected by default.
5. Select **Create**.
6. On the Create New Maintenance Plan page, fill in the details.
For a detailed description of all the maintenance plan fields, see [Maintenance plan fields for Enterprise Asset Management](#).
7. Select **Save**.

The page closes and you're automatically redirected to the new maintenance plan record.

You can further configure your maintenance plan by creating [maintenance schedules](#), work orders, and work order tasks. You can view all your maintenance plan records in the list view in the **Maintenance plans** tab. Every maintenance plan record is prefixed with **MP**.

Create a maintenance schedule

Create a maintenance schedule to specify when you want the maintenance to run using criteria such as time intervals or field values and apply a work order template to the schedule. You can apply one or more maintenance schedules to a single maintenance plan.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. On the **Maintenance Schedules** tab of the maintenance plan record, select **New**.
2. On the Create new Maintenance Schedule form, fill in the fields.

See [Maintenance schedule fields for Enterprise Asset Management](#) for a detailed description of each field.

3. Select **Save**.
The form closes and you're automatically redirected to the new maintenance schedule record.
4. Apply a work order template to the maintenance schedule.
Work order templates enable the Enterprise Asset Management application to automatically populate information, generate appropriate requests and tasks, and create part requirements for your work orders each time the scheduled maintenance runs.

- a. On the **Schedule Templates** tab of the maintenance schedule record, select **New**.

The Create New Schedule Template form opens.

- b. On the form, fill in the fields.

Create New Schedule Template form

Field	Description
Model	Model of the work order template.
Schedule	Maintenance schedule to which you're applying the work order template. This field populates automatically.

- c. Select **Save**.
- d. Close the form to return to the maintenance schedule record.
5. On the maintenance schedule record, select the **More Options** ellipsis icon and then select **Associate records** to associate the maintenance schedule with the enterprise assets that the maintenance plan is applied to.
A confirmation message appears, indicating that the enterprise assets are now associated with the maintenance schedule. You can verify that the association is successful using the **Maintenance Plan Records** tab on either the maintenance schedule record or maintenance plan record.

Result

Maintenance runs automatically based on the schedule that you set for the maintenance plan. You can also run maintenance on-demand by selecting **Run on demand** on the maintenance schedule record.

Each time maintenance runs, the Enterprise Asset Management application automatically creates a corresponding work order for every enterprise asset that the maintenance plan is

applied to, given that the asset isn't already associated with an existing work order. You can use these work orders to track and manage all the work that you need to perform on the specified enterprise assets. See [Managing work for your enterprise assets](#) for more information on work orders.

Create a work order for an enterprise asset

Create a work order to track and manage work for an enterprise asset, linear asset, or linear segment.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Note:

Starting with Enterprise Asset Management version 10.0, work orders can be created for asset groups, enabling technicians to execute a single work order for an entire group of related assets.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. On the **Work orders** tab, select **New**.

Note:

If you created a maintenance plan to manage and schedule maintenance for your enterprise assets, the Enterprise Asset Management application automatically creates a corresponding work order for each asset to which the maintenance plan is applied.

For more information on maintenance plans, see [Create a maintenance plan for your enterprise assets](#).

3. On the Create New Work Order form, fill in the fields.

Create New Work Order form

Field	Description
Work Order	
Company	Company that you are creating the work order for.
Contract	Contract that defines the lease details of the associated enterprise asset.
Asset	<p>Asset that you want to manage work for through this work order.</p> <p>Starting with Enterprise Asset Management version 10.0, you can select an asset group.</p> <p>Note: You can also select linear assets and linear segments from this field.</p>
Location	Current location of the associated enterprise asset.

Field	Description
	<p>Note:</p> <p>If you select a linear asset, a pencil icon [] appears to enable you to choose the work order location between the Start marker and End marker. This option is available with Enterprise Asset Management version 9.0 and later. To select a location, follow these steps:</p> <ol style="list-style-type: none"> a. Select the Work order linear asset location icon []. <p>A Map location form appears, showing the start and the end markers on the map.</p> <ol style="list-style-type: none"> b. Select a location on the map between the start and end markers. c. In the Name field, enter the name for the work order location. d. Select Submit.
Start marker	<p>Start point of the linear asset or the linear segment.</p> <p>Note:</p> <p>This field only appears if you select Linear asset or linear segment from the Asset field.</p>
End marker	<p>End point of the linear asset or the linear segment.</p> <p>Note:</p> <p>This field only appears if you select linear asset or linear segment from the Asset field.</p>
Priority	Priority of the work order.
Template	<p>Work order template that you want to apply to this work order. Work order templates enable you to automatically populate information, generate appropriate tasks, and create part requirements for your work orders. See Create a template for your Enterprise Asset Management work orders for more information on work order templates.</p> <p>To apply a template to a work order in the draft state and view the work order tasks and part requirements generated from the template, the <code>sn_eam.enterprise_asset_manager</code> role must ensure that the Apply Work Order template in draft status field in the Field Service Management application is enabled. To accomplish this, navigate to All > Field Service > Administration > Configuration and enable the Apply Work Order template in draft status field in the Business Process tab.</p>
Closed	Date and time at which the work order is closed and complete.
Short description	Brief description of the work order.
Description	Detailed description of the work order.
Work notes	Notes about the work order that are visible to all users within your organization.
Scheduling	

Field	Description
Due date	Date and time at which the work order must be completed.

4. Select **Save**.

- The work order is created in the Draft state.
- Work order tasks and parts requirements associated with the work order automatically appear on the **Work Order Tasks** and the **Part Requirements** tabs.
- Assets associated with the work order are listed on the **Affected assets** tab. If you selected an asset group, assets from parent asset groups and subgroups are also listed.

Note:

The Affected assets tab is available with Enterprise Asset Management version 10.0 and later.

5. To add additional work order tasks, select **New** in the **Work Order Tasks** tab.

See [Create a work order task for an Enterprise Asset Management work order](#) for detailed instructions.

6. To track all items that you must complete for your work order or an associated work order task, create a checklist.

See [Create a checklist for an Enterprise Asset Management work order or work order task](#) for detailed instructions.

7. If the enterprise asset that is associated with your work order is missing a required asset or part, create a part requirement.

See [Create a part requirement for an Enterprise Asset Management work order or work order task](#) for detailed instructions.

8. Specify any upstream or downstream task dependencies for the associated work order tasks.

See [Create dependencies for an Enterprise Asset Management work order task](#) for detailed instructions.

9. Select **Ready to Work** to initiate work for the given work order

What to do next

Work with the assigned agent to complete and close all subsequent tasks for your work order.

Create a work order task for an Enterprise Asset Management work order

Create a work order task to track and manage an individual task for your Enterprise Asset Management work order.

Before you begin

Role required: wm_agent

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. On the **Work orders** tab, select the work order to which you want to add a work order task. The work order record opens.
3. Select the **Work Order Tasks** tab and select **New**.
4. On the Create New Work Order Task form, fill in the fields.

Create New Work Order Task

Field	Description
Work Order Task	
Assignment group	Agent group to which the work order task is assigned.
Assigned to	Agent to whom the work order task is assigned.
Work type	Type of work that the assigned agent must perform on the associated enterprise asset. The options are Break Fix, Install, Planned Maintenance, Asset condition, Shutdown, Startup, and Calibration. Note: The Shutdown and Startup work types are available with Enterprise Asset Management version 10.0 and later.
Asset	Enterprise asset that the assigned agent is performing work on. This field populates automatically.
Location	Current location of the associated enterprise asset. This field populates automatically. Note: If you select a linear asset, the Work order linear asset location [] appears to enable you to choose the work order location between the Start marker and End marker. This option is available with Enterprise Asset Management version 9.0 and later. To select a location, follow these steps: a. Select the pencil icon []. A Map location form appears, showing the start and the end markers on the map. b. Select a location on the map between the start and end markers. c. In the Name field, enter the name for the work order location. d. Select Submit .
Start marker	Start point of the linear asset or the linear asset. Note: This field only appears if you select Linear asset or linear segment from the Asset field.
End marker	End point of the linear asset or the linear segment. Note: This field only appears if you select linear asset or linear segment from the Asset field.
Short description	Brief description of the work order task.
Description	Detailed description of the work order task.

Field	Description
Work notes	Notes about the work order task that are visible to all users within your organization.
Scheduling	
Window start	Estimated start date and time of the work order task.
Window end	Estimated completion date and time of the work order task.
Estimated work duration	Amount of time that you estimate it will take to complete the work order task.
Actual work start	Actual start date and time of the work order task.
Actual work end	Actual completion date and time of the work order task.

5. Select **Save**.

Result

- The work order task is created in the **Draft** state.
- Assets associated with the work order are added to the work order task and listed on the **Affected assets** tab.

Note:

The Affected assets tab is available with Enterprise Asset Management version 10.0 and later.

Create a checklist for an Enterprise Asset Management work order or work order task

Create a checklist of all items that you must complete for your work order or work order task.

Before you begin

Role required: sn_eam.enterprise_asset_manager or wm_agent

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. Open the record for either the work order or work order task that you want to create a checklist for.
 - To open a work order record, select the **Work orders** tab. From the list of available work orders, select the work order that you want to create a checklist for.
 - To open a work order task record, select the **Work order tasks** tab. From the list of available work order tasks, select the work order task that you want to create a checklist for.
3. On the work order or work order task record, select the **Checklist items** tab.
4. Use one of the following options to create a checklist.
 - Create a checklist by adding individual checklist items:
 - a. Select **New**.
 - b. On the Create New Checklist Item form, fill in the fields.

Create New Checklist Item form

Field	Description
Name	Name of the checklist item.
Order	Order in which you must complete the checklist item. For example, a value of 1 indicates that the given checklist item is the first item you must complete within your checklist.
Checklist	Checklist that the checklist item is included in.
Complete	Option that indicates if the checklist item has been completed.

c. Select **Save**.

d. Repeat steps a to c for every checklist item that you want to add to your checklist.

- Create a checklist by applying a checklist template:

a. Select **Apply template**.

The Apply Template dialog box opens.

b. In the dialog box, select the checklist template that you want to apply to your work order or work order task.

c. Select **OK**.

The dialog box closes and you return to the **Checklist items** tab.

d. Select the Refresh List icon () to populate the list of checklist items that were added based on the selected checklist template.

Create a part requirement for an Enterprise Asset Management work order or work order task

If the enterprise asset that is associated with your work order or work order task is missing a required asset or part, create a part requirement to track and verify the missing asset or part.

Before you begin

Role required: sn_eam.enterprise_asset_manager or wm_agent

Note:

You can use the wm_agent role to create part requirements only for assigned work order tasks.

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. Open the record for either the work order or work order task that you want to create a part requirement for.
 - To open a work order record, select the **Work orders** tab. From the list of available work orders, select the work order that you want to create a part requirement for.
 - To open a work order task record, select the **Work order tasks** tab. From the list of available work order tasks, select the work order task that you want to create a part requirement for.
3. On the **Part Requirements** tab of the work order or work order task record, select **New**.

- On the Create New Part Requirement form, fill in the fields.

Create New Part Requirement form

Field	Description
Model	Enterprise model of the missing asset or part.
Service order task	Work order task that the part requirement is associated with.
Required quantity	Quantity of the asset or part that is required. Note: This field is applicable to consumable assets and parts only.
Required by date	Date and time by which the missing asset or part must be sourced and delivered.
Short description	Brief description of the part requirement.
Mandatory	Option that indicates if the missing asset or part is required.

- Select **Save**.

Select descendant models of multi-component assets to create part requirements

For work orders and work order tasks that have multi-component assets, select descendant models to create part requirement records.

Before you begin

Role required: sn_eam.enterprise_asset_manager or wm_agent

Note:

You can use the wm_agent role to create part requirements only for assigned work order tasks.

Procedure

- Navigate to **Enterprise Asset Workspace > Work management**.
- Open the record for either the work order or work order task that you want to create a part requirement for.
 - To open a work order record, select the **Work orders** tab. From the list of available work orders, select the work order that you want to create a part requirement for.
 - To open a work order task record, select the **Work order tasks** tab. From the list of available work order tasks, select the work order task that you want to create a part requirement for.
- On the **Part Requirements** tab of the work order or work order task record, select **Add to Asset**.
The Add parts requirement dialog box opens.
- Select a work order task in the **Service order task** field.
The **Service order task** field is visible only if you access the Add parts requirement dialog box from the work order form.
- Select the models.

6. Select OK.

The new part requirement records are created and appear in the Part Requirements page.

Create dependencies for an Enterprise Asset Management work order task

If your work order task requires any upstream or downstream task dependencies, add them to your work order task.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. On the **Work order tasks** tab, select the work order task that you want to create dependencies for.
The work order task opens.
3. Select one of the following tabs to create either an upstream or downstream task dependency:
 - To create an upstream task dependency, select the **Depends on** tab.
 - To create a downstream task dependency, select the **Dependents** tab.
4. Select **New**.
5. In the **Upstream task** or **Downstream task** field of the Create New Service Order Task Dependency form, search for and select the task that you want to add as a dependency.
6. Select **Save**.

Manage assets in a work order task

Add, remove, or move enterprise assets across work order tasks to manage the work performed on specific assets.

Before you begin**i Important:**

The Affected assets tab and the associated asset actions are available with Enterprise Asset Management version 10.0 and later.

The work order task must be in one of the following states:

- Draft
- Pending assignment
- Accepted

Before you move assets to another work order task, consider the following points:

- You can't move all assets out of a work order task.
- The **Move to cloned task** option isn't available if the work order task has only one asset.

Role required: sn_eam.asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Work order tasks**.
3. Select the work order task for which you want to manage assets.

4. Select the **Affected assets** tab.
5. Perform the required asset action.

Note:

You can also add and remove assets from the work order by using the **Add asset(s)** and **Remove** options.

Result

- Add assets: The asset appears in the **Affected assets** tab.
- Remove: The asset is removed from the Affected assets list. If the work order is associated with an asset group, the asset is removed from the Affected assets list only, not from the asset group.
- Move to cloned task: A new work order task is created for the same work order, and the asset is moved to that task. The asset no longer appears in the Affected assets list of the original work order task.

Shut down enterprise assets for maintenance activities

Move enterprise assets of a shutdown work order task to the shutdown state to indicate that the assets are unavailable for use during maintenance.

Before you begin

Important:

The Affected assets tab, Shutdown work type, and **Shutdown** option are available with Enterprise Asset Management version 10.0 and later.

The shutdown work order task must be in the Work in progress state before you can shut down assets. The assets must be in the In use or In maintenance state.

Role required: sn_eam.asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Work order tasks** tab.
3. Select the work order task of the Shutdown work type that has the assets that you want to shut down.
4. Select **Start Work**.
5. Select the **Affected assets** tab.
6. Select the assets that you want to shut down, and then select **Shutdown**.
7. In the Confirm asset state change dialog box, select **Confirm**.

Result

The substate of the assets that are shut down changes to Is shutdown.

Start up enterprise assets after maintenance activities

Move assets of a startup work order task to the In use state to indicate that the assets are available for use after maintenance.

Before you begin**i Important:**

The Affected assets tab, Startup work type, and **Start up** option are available with Enterprise Asset Management version 10.0 and later.

The startup work order task must be in the Work in progress state before you can start up assets.

Role required: sn_eam.asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Work order tasks** tab.
3. Select the work order task of the Startup work type that has the assets that you want to start up.
4. Select **Start Work**.
5. Select the **Affected assets** tab.
 - The State and Substate of the assets are In use and Is shutdown.
6. Select the assets that you want to start up, and then select **Start up**.
7. In the Confirm asset state change dialog box, select **Confirm**.

Result

The Substate of the asset is empty and the asset is back in use.

Move enterprise assets to maintenance state

Move assets of a break fix or planned maintenance work order task to the In maintenance state to indicate that the assets are under maintenance.

Before you begin**i Important:**

The Affected assets tab and **Move to maintenance** option are available with Enterprise Asset Management version 10.0 and later.

The break fix or planned maintenance work order task must be in the Work in progress state before you can move assets to the In maintenance state.

Only assets in the following states and substates can be moved to the In maintenance state:

- In use
- In use and Pending repair
- In use and In repair
- In use and Is shutdown

Role required: sn_eam.asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Work order tasks** tab.
3. Select the work order task of the Break Fix or Planned Maintenance work type that has the assets that you want to move to maintenance.
4. Select **Start Work**.
5. Select the **Affected assets** tab.

6. Select the assets that you want to mark as in maintenance, and then select **Move to maintenance**.
7. In the Confirm asset state change dialog box, select **Confirm**.

Result

The State of the assets changes to In maintenance.

Managing work for your enterprise assets

You can track and manage work for your enterprise assets and linear assets by using work orders and work order tasks. Supported asset actions for your work orders include asset deployment, swapping, removal, and calibration.

Source parts for an Enterprise Asset Management work order or work order task

If the enterprise asset that is associated with your work order or work order task is missing any required assets or parts, source them using a catalog request.

Before you begin

Role required: sn_eam.enterprise_asset_manager or wm_agent

Important:

Although you can use either the sn_eam.enterprise_asset_manager or wm_agent role to create catalog requests, you can use only the sn_eam.enterprise_asset_manager role to source those requests.

About this task

You can verify which assets or parts are missing using the **Part Requirements** tab on the work order or work order task. For more information on part requirements, see [Create a part requirement for an Enterprise Asset Management work order or work order task](#).

You can specify parts requirements that you want to source instead of sourcing all parts requirements.

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. Open the record for either the work order or work order task that you want to source parts for.
 - To open a work order record, select the **Work orders** tab. From the list of available work orders, select the work order that you want to source parts for.
 - To open a work order task record, select the **Work order tasks** tab. From the list of available work order tasks, select the work order task that you want to source parts for.
3. On the work order or work order task record, select **Source Parts Request**.
The Source parts request dialog box opens. All part requirement models that have still not been requested are listed and selected by default.
4. Enter the quantity that you want to request in the **Request quantity** field.
The quantity you enter can be greater than the required quantity.
5. Select **OK**.
A confirmation message appears, indicating that a corresponding catalog request has been created only for the selected parts requirement.
6. From the left navigation menu of the Enterprise Asset Workspace, open the Asset operations view.
7. On the **Lists** tab of the Asset operations view, navigate to **Procurement > Requests**.

8. Select the request for the assets or parts that you need to source.
The catalog request record opens. You can verify the assets or parts that you need to source by using the **Requested Items** tab of the catalog request record.
9. On the **Catalog Tasks** tab of the catalog request record, select the task number for the Source Request Items catalog task.
The Source Request Items catalog task opens.
10. Select **Source request**.
You are automatically redirected to the corresponding source request.
11. Source the required assets or parts using one or more of the following options:

Note:

The source request displays all assets and parts that need to be sourced. However, you must source each asset and part separately.

- **Local stock:** Option to consume assets or parts from a local stockroom.

To use this option, click **Consume** on the Local stock widget. When prompted, specify the consumption details for the source request.

- **Transferable stock:** Option to transfer assets or parts between available stockrooms or to a location where the requester can receive those assets or parts.

To use this option, click **Transfer** on the Transferable stock widget. When prompted, specify the transfer details for the source request.

- **Vendor purchase:** Option to purchase additional assets or parts from a supported asset vendor.

To use this option, click **Purchase** on the Vendor purchase widget. When prompted, specify the purchase details for the source request.

12. Select **Submit**.
The Source Request dialog box opens.
13. In the dialog box, select **OK**.
The dialog box closes and you automatically return to the catalog request record.

Complete and close the Confirm asset task for a serialized enterprise asset

If your work order is associated with a serialized enterprise asset, complete and close the Confirm asset task for that asset.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Before an agent can perform work on an enterprise asset, it must be picked up from its designated stockroom. If you want an agent to perform work on a serialized enterprise asset, you must first confirm which asset needs to be picked up by using the Confirm asset task. For all other enterprise asset types, skip the Confirm asset task and proceed directly to the [Pickup task](#).

Procedure

1. From the Enterprise Asset Workspace, open the Enterprise asset estate view.
2. On the **Asset tasks** tab, select the **Confirm** task for the serialized enterprise asset that is associated with your work order.
The Confirm task opens.
3. On the **Details** tab of the Confirm task, modify the fields as needed.

Details tab

Field	Description
Asset	Serialized enterprise asset that is associated with your work order.
Model	Model of the serialized enterprise asset.
State	State of the Confirm task.
Stockroom	Stockroom that the serialized enterprise asset is located in.
Short description	Brief description of the Confirm task.
Description	Detailed description of the Confirm task.

4. Select **Close Task**.

Result

The state of the Confirm task changes from Open to Closed Complete. The Enterprise Asset Management application then generates a subsequent Pick Up task for the enterprise asset.

What to do next

The agent who is assigned to the associated work order must complete and close the Pick Up task.

Complete and close the Pick Up task for an enterprise asset

Complete and close the Pick Up task for the enterprise asset that is associated with your assigned work order.

Before you begin

Role required: wm_agent

About this task

Before you can begin working on an enterprise asset, it must be picked up from its designated stockroom.

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. On the **My asset pickup tasks** tab, select the enterprise asset that was picked up.
The Pick Up task opens.
3. On the **Details** tab of the Pick Up task, modify the fields as needed.

Details tab

Field	Description
Asset	Enterprise asset that was picked up.

Field	Description
Assigned to	Person that the Pick Up task is assigned to.
State	State of the Pick Up task.
Quantity	Quantity of the enterprise asset that was picked up.
 Note: This field is applicable to consumable enterprise assets only.	
Short description	Brief description of the Pick Up task.
Description	Detailed description of the Pick Up task.

4. Select **Close Task**.

Result

The state of the Pick Up task changes from Open to Closed Complete.

What to do next

Complete all required work for the enterprise asset so that you can close the work order.

Complete and close a work order for an enterprise asset

Close an assigned work order by completing all work that is required for the associated enterprise asset.

Before you begin

Role required: wm_agent

About this task

When working on an enterprise asset, you can choose to deploy, swap, or remove any required assets or parts. Similarly, you can deploy a discrete asset to a linear asset, swap a discrete asset associated with a linear asset, or remove a discrete asset associated with a linear asset. You can also choose to calibrate the enterprise asset. After you complete all work for the asset, you can close the associated work order.

Note:

Starting with Enterprise Asset Management version 10.0, a work order can be associated with more than one asset or an asset group.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. On the **Work order tasks** tab, select the work order task for the work order that you want to complete and close.
The work order task opens.
3. Select **Start Work**.
The work order task reloads with an updated State of Work In Progress.
4. Complete all work that is required for the work order task.

- If you want to deploy, swap, or remove any required assets or parts, follow these steps:
 - a. Select the **Asset Usages** tab.
 - b. Select the action that you're taking on an asset or part that is required for the associated enterprise asset.

Available actions

Action	Description
<p>Remove Asset</p>	<p>Option to remove an asset or part. You can also remove a discrete asset associated with a linear asset.</p> <p>Note: You can remove assets or parts that have a state of In use, In maintenance, and Consumed only.</p> <p>i. In the Remove asset field, select the asset or part that you want to remove.</p> <p>Note: In Enterprise Asset Management version 10.0 and later, the assets available in this field depend on whether the Affected assets list is populated.</p> <ul style="list-style-type: none"> ▪ If the Affected assets list is populated, only assets in the list and their descendants with the Required field set to false are available. ▪ If the Affected assets list is empty — for example, when the work order and work order task are based on a location — assets associated with the work order task location and descendant locations are available. Descendant assets are included only if the Required field is set to false. <p>ii. Select OK.</p> <p>Result</p> <ul style="list-style-type: none"> ▪ The asset or part that is removed appears on the Asset Usages tab. The removed asset or part is assigned to your personal stockroom. Execute all subsequent disposal tasks to complete the removal. ▪ The State and Substate of the asset change to In stock and Pending disposal. ▪ The Location field is empty. ▪ If the work order task is based on an asset group, the removed asset is also removed from the asset group. <p>Note: Starting with Enterprise Asset Management version 10.0, a work order can be associated with more than one asset or an asset group.</p>
<p>Swap Asset</p>	<p>Option to swap an asset or part. You can also swap a discrete asset associated with a linear asset with another discrete asset</p> <p>In the Deploy asset dialog box, perform the following steps:</p>

Action	Description
	<p data-bbox="408 170 1374 233">i. In the Asset to swap out field, select the asset or part that you want to swap out.</p> <p data-bbox="443 264 571 300">Note:</p> <p data-bbox="488 304 1358 367">In Enterprise Asset Management 10.0 and later, the assets available in this field depend on whether the Affected assets list is populated.</p> <ul data-bbox="488 384 1374 632" style="list-style-type: none"> <li data-bbox="488 384 1374 447">▪ If the Affected assets list is populated, only assets in the list and their descendants with the Hot swappable field set to true are available. <li data-bbox="488 464 1374 632">▪ If the Affected assets list is empty – for example, when the work order and work order task are based on a location – assets associated with the work order task location and descendant locations are available. Descendant assets are included only if the Hot swappable field is set to true. <p data-bbox="400 674 1286 709">ii. In the Replacement Asset field, select the replacement asset or part</p> <p data-bbox="443 737 571 772">Note:</p> <p data-bbox="488 777 1262 812">The replacement asset or part must meet the following criteria:</p> <ul data-bbox="488 846 1374 1283" style="list-style-type: none"> <li data-bbox="488 846 1374 1003">▪ The State field in the corresponding asset record is set to In stock. If the asset or part is associated with a multi-component enterprise model that has hot-swappable model components, this field can also be set to In use. <li data-bbox="488 1037 1374 1100">▪ The asset or part is either displayed on the Asset Usages tab or located in your personal stockroom. <li data-bbox="488 1117 1374 1283">▪ The asset or part is associated with either the same enterprise model as the existing asset or part or a substitute enterprise model that is supported by the existing asset or part. For more information on substitute enterprise models, see Add a substitute model for an enterprise model. <p data-bbox="395 1325 568 1360">iii. Select OK.</p> <p data-bbox="432 1371 520 1407">Result</p> <p data-bbox="488 1434 826 1467">After the swap is complete:</p> <ul data-bbox="488 1497 1294 1787" style="list-style-type: none"> <li data-bbox="488 1497 1294 1560">▪ Both the swapped-out asset or part and the replacement asset or part appear on the Asset Usages tab. <li data-bbox="488 1577 1294 1671">▪ In Enterprise Asset Management version 10.0 and later, the replacement asset is automatically added to the Affected assets list. <li data-bbox="488 1688 1294 1787">▪ If the work order task is based on an asset group, the swapped-out asset is removed from the asset group, and the replacement asset is added to it. <p data-bbox="523 1818 651 1854">Note:</p> <p data-bbox="568 1858 1270 1921">Starting with Enterprise Asset Management version 10.0, work orders can be created for asset groups.</p>

Action	Description
<p>Deploy Asset</p>	<p>Option to deploy an asset or part. You can also deploy a discrete asset to a linear asset.</p> <p>Note: You can deploy assets or parts that are displayed on the Asset Usages tab and have a status of Not Used. You can deploy assets or parts from your personal stockroom that have a state of In stock and a substate of either Available or Reserved.</p> <p>i. In the Asset to deploy field, select the asset or part that you want to deploy.</p> <p>Note: If you select a consumable asset or part, you must also specify the quantity that you want to deploy in the Quantity field.</p> <p>ii. (Optional) In the Assign to user field, select the user to whom you want to assign the asset or part.</p> <p>iii. (Optional) In the Add to asset field, select the parent asset or part to which you want to add the asset or part.</p> <p>iv. Select OK.</p> <p>Result</p> <ul style="list-style-type: none"> ▪ The deployed asset with a status of Used appears in the Asset Usages tab. ▪ If the work order task has an asset group and Affected assets list, the deployed asset is added to the asset group and to the Affected assets list. <p>Note: Starting with Enterprise Asset Management version 10.0, work orders can be created for asset groups.</p> <ul style="list-style-type: none"> ▪ If the work order task has an affected assets list but no asset group selected, the deployed asset is added to the Affected assets list only. <p>Note: The Affected assets tab is available with Enterprise Asset Management version 10.0 and later.</p> <p>To deploy a discrete asset to a linear asset, in the Deploy asset dialog box, select a discrete asset from your stockroom, and then choose one of the following options:</p> <ul style="list-style-type: none"> ▪ Add to discrete asset: Select the discrete asset to which you want to add the selected asset as a child asset. ▪ Add to existing location: Select an existing location ▪ Add to new location: Use the location picker to mark the new location on the geo map.

c. Repeat step b for every asset or part that you want to deploy, swap, or remove.

- If you want to calibrate the associated enterprise asset, use the following steps:

a. Navigate to the calibration playbook.

- In Enterprise Asset Management version 10.0 and later, perform these steps:

i. Select the **Calibrations** tab.

The Calibrations tab displays a calibration event for each asset in the Affected assets tab that has a calibration attribute defined. The number of calibration events depends on the work order association:

- If the work order is associated with an asset, one calibration event is created, provided the asset has a calibration attribute defined and no other assets are added to the Affected assets list.
- If the work order is associated with an asset group, one calibration event is created for each asset from the asset group that is added to the Affected assets list and has a calibration attribute defined.

ii. Select the calibration event for the asset that you want to calibrate.

The Service event details page opens.

iii. Select the **Calibration** tab.

- In Enterprise Asset Management versions prior to 10.0, select the **Calibration** tab.

Result

The Calibration event playbook opens.

Note:

Each lane in the side panel of the playbook represents an activity that you must complete as part of the calibration event workflow.

b. In the work area of the Details lane, fill in the fields.

Details lane

Field	Description
Name	Name of the calibration event.
Temperature	Temperature of the environment in which you're performing the calibration.
Temperature unit	Unit of temperature that you're using to measure the environmental temperature.
Humidity (%)	Relative humidity level of the environment in which you're performing the calibration.

c. Select **Mark as complete**.

The Details lane is marked as Complete and you automatically progress to the Calibration Lines lane.

d. In the work area of the Calibration lines lane, select the calibration line that you want to complete or skip.

Each calibration line corresponds with a calibration attribute on the associated enterprise asset. If any calibration attribute contains multiple points at which you can measure accuracy, the Enterprise Asset Management application creates a separate calibration line for each point. You can choose to complete or skip each calibration line as needed. For more details on calibration attributes, see [Add calibration attributes to an enterprise asset](#) or [Add calibration attributes to an enterprise model](#).

- e. On the calibration line record, use one of the following options to complete or skip the calibration line:
 - To complete the calibration line, fill in the fields and then select **Submit**.

Calibration line fields

Field	Description
Details	
Instrument	Instrument that you’re using to perform the calibration. If you specified an instrument model in the Instrument model field of the corresponding calibration attribute, the options in this field are filtered based on the specified instrument model.
Calibration date	Date and time at which you’re performing the calibration. This field populates automatically based on the date and time at which the Details lane was marked as complete. You can overwrite this field if needed.
Readings	
Expected value	Value that you are measuring tolerance conformance against. This field populates automatically based on the expected value that you specified in the calibration attribute. Note: This field appears only if you set the Value type of the calibration attribute to either Accuracy % full scale, Accuracy % point, or True/false.
As found value	Value that you measure prior to the calibration.
As left value	Value that you measure after the calibration.
Comment	Additional comments about the calibration.

- To skip the calibration line, select **Skip**.

The calibration line record closes and you automatically return to the playbook.

- f. Repeat steps d and e for each calibration line in the Calibration lines lane.

Note: If any of your calibration lines have a Result of Failed, you can remediate the entire calibration event by initiating a new work order and corresponding work order tasks. See [Remediate an unsuccessful enterprise asset calibration](#) for detailed instructions.

- g. Select **Mark as complete**.

The lane is marked as Complete.

- h. If there are multiple calibration events, repeat steps a through g for each calibration event in the Calibrations tab.

Note:

Multiple calibration events are supported in Enterprise Asset Management version 10.0 and later.

5. After you complete all required work, select **Close Complete** on the work order task. The state of both the work order task and associated work order changes from Work In Progress to Closed Complete.

Bulk closure of work order tasks

Close multiple work order tasks in one go.

Before you begin

Role required: enterprise_asset_technician

Procedure

1. Navigate to **Enterprise Asset Workspace > Work Management**.
2. Select the Work order tasks tab.
All work order tasks, assigned to the assignment group of the logged in technician, are listed.
3. Select **Bulk close tasks**.
All work order tasks, that can be closed by the logged in technician, are listed.
4. Select the check boxes for the work order tasks that you want to close.
5. Select **Add details and close**.
The Bulk close tasks dialog box opens.
6. Fill in the details in the Bulk close tasks dialog.
7. Select **Save**.
The selected work orders tasks are closed.

Remediate an unsuccessful enterprise asset calibration

Remediate a failed enterprise asset calibration event by initiating a new work order and corresponding work order tasks for that event.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace**.
2. From the Enterprise Asset Workspace, open the Work management view.
3. Select the **Calibrations and conditions** tab.
4. In the Calibration overview section, select either the **All calibration events** widget or the **Calibration pending verification** widget.
5. From the list of available calibration events, select the event that you want to remediate.
The corresponding service event record opens.

6. Initiate the creation of a new work order by selecting **Remediate**.
7. In the Select template to begin remediation dialog box, search for and select the template that you want to apply to the new work order.

Note:

The dialog box lists only the work order templates that have at least one work order task with a Work type of Calibration.

8. Select OK.

The dialog box closes and you are automatically redirected to the Create New Work Order form. The form is auto-populated with the following information:

- The asset that you want to calibrate
- The location of the asset
- The original work order
- All other mandatory fields

9. Optional: Fill out any additional fields in the Create New Work Order form and then select **Save**.

See [Create a work order for an enterprise asset](#) for a detailed description of each field.

10. Optional: Add additional work order tasks to the new work order.

See [Create a work order task for an Enterprise Asset Management work order](#) for detailed instructions.

11. Optional: Create a checklist of all items that must be completed for the new work order or the associated work order tasks.

See [Create a checklist for an Enterprise Asset Management work order or work order task](#) for detailed instructions.

12. Optional: Specify any upstream or downstream dependencies for the associated work order tasks.

See [Create dependencies for an Enterprise Asset Management work order task](#) for detailed instructions.

13. Select Ready for Work to initiate work for the new work order.

What to do next

Work with the assigned agent to complete and close all subsequent tasks for the new work order.

See [Managing work for your enterprise assets](#) for detailed instructions.

Schedule condition evaluations for enterprise models or assets

Schedule a condition evaluation by creating a work order for it.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Work management**.
2. On the **Work orders** tab, select **New**.
3. Select **Asset condition work order** in the **Template** field.
For more details on creating a work order, see [Create a work order for an enterprise asset](#).
4. After you have entered the details in the work order, select **Save**.
The work order is created in the draft state.

5. Select **Ready to Work**.

A work order task gets created for the work order in the **Work Order Tasks** tab.

Additionally, a service event gets created along with condition lines. Depending on the number of templates linked to the asset, an equivalent number of assessment lines are generated.

Only a single service event gets created per asset.

6. Open the work order task and assign it to an enterprise technician.

A service event gets created along with condition lines. Depending on the number of attributes created on the asset, an equivalent number of condition lines are generated. Only a single service event gets created per work order task. The technician must log in to begin work on the work order task.

Review the asset condition results

After the enterprise technician has completed the condition evaluation, the enterprise asset manager reviews the condition evaluation and views the reports in the Work management dashboard.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **All > Enterprise Asset Workspace > Work management > work order tasks**.
2. In the Condition lines tab, select a service event.
The Service event details page opens.
3. Select **Accept** or **Remediate**.
If you accept the condition event, the status of the event changes to **Accepted**. If you choose to remediate the event, the status of the service event changes to **Pending remediation**.
4. View the asset condition reports by navigating to the **Work management > Calibrations and conditions**.
5. On the dashboard, scroll down to view the asset condition overview.

Create a template for your Enterprise Asset Management work orders

Create a work order template to automatically populate information, generate appropriate tasks, and create asset or part requirements for your work orders.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

Work order templates are added to the Field Service Catalog, which is part of the ServiceNow® Field Service Management application. You can access the Field Service Catalog by navigating to **All > Field Service > Catalog and Knowledge**. See [Field Service Management](#)  for more information on the Field Service Management application.

Note:

The Field Service Management application is automatically activated when you request and install the Enterprise Asset Management application from the ServiceNow Store. See [Install Enterprise Asset Management](#) for more details.

Procedure

1. From the Enterprise Asset Workspace, open the Work management view.
2. On the **Work order templates** tab, select **New**.
The Work Order Templates form opens in a new browser tab.
3. On the form, fill in the fields.

Work Order Templates form

Field	Description
Name	Name of the work order template.
Short Description	Brief description of the work order template.
Description	Detailed description of the work order template.
Checklist template	Checklist template of all items that you must complete as part of a work order.
Workflow	Workflow for work orders that this template is applied to.
<p> Note: This field appears only if you select the Add icon () next to the Name field.</p>	

4. Add required tasks to the work order template.
 - a. Select **Add Task**.
 - b. On the Task information form, fill in the fields.

Task information form

Field	Description
Task type	Type of task that you want to create. This field is automatically set to Work Order Task .
Name	Name of the task.
Description	Detailed description of the task.
Parts and quantities	Asset or part that is required for completing the task. If you select a consumable asset or part, you must also specify the quantity that is required for completing the task. You can add multiple assets or parts to a single task. <p> Note: Select the Mandatory check box for every asset or part that is required for completing the task.</p>
Dispatch group	Group of agents to whom the task is assigned.
Depends on	Other tasks that must be completed before this task initiates.

Field	Description
Checklist template	Checklist template of all items that you must complete as part of the task.
Work type	Type of work that an agent must perform to complete the task. The options include Break Fix , Calibration , Install , and Planned Maintenance .

- c. Repeat steps a and b for each additional task that you want to add to the work order template.
- 5. Attach related knowledge base articles to the work order template.**
 If your work order template is related to any knowledge base articles with useful reference information, attach the articles to the template.
- a. In the Model Knowledges related list, select **New**.
 - b. On the Model Knowledge form, select the Lookup using list icon (🔍) in the **Knowledge** field to search for and select the knowledge base article that you want to attach to the work order template.
 - c. Select **Submit** in the Model Knowledge form header.
 - d. Repeat steps a to c for each knowledge base article that you want to attach to the work order template.
- 6. Select **Submit**.**
 The Publish Template dialog box opens.
- 7. In the dialog box, fill in the fields.**

Publish Template dialog box

Field	Description
Category	Field Service Catalog category to which you want to assign the work order template.
Availability	Supported Field Service Catalog format for the work order template. The options are Desktop Only , Mobile Only , and Desktop and Mobile .

- 8. Select **Publish**.**

Result

The work order template is added to the Field Service Catalog.

Create a checklist template for your Enterprise Asset Management work orders

Create a checklist template for your work orders that gets added as a work order template.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

You can either copy from an existing checklist template and edit and add more checklist items or you can create a template.

Procedure

1. Navigate to **Enterprise Asset Workspace > Work Management > Checklist templates.**
2. Select **New.**
3. In the **Create checklist template** dialog box, fill in the fields.
4. Select **OK.**

Result

The checklist template is created and appears in the Checklist templates list. After a checklist template is created, it can't be edited and can be used by other applications too.

Delivering enterprise assets in your personal stockroom through Drop off tasks

As an enterprise asset technician, manage the delivery of enterprise assets that you have in your personal stockroom to any other warehouse stockroom by creating Drop off tasks. The asset manager of the destination stockroom receives the assets that you dropped off, verifies the asset, and completes the Receive and Drop off tasks.

You can drop off enterprise assets that aren't reserved and not part of any Enterprise Asset Management workflows.

As an enterprise asset technician, you can create drop off tasks in the Enterprise Asset Workspace or through the Mobile Agent application.

You should perform the following tasks to deliver assets to any stockroom:

i Important:

The Drop off and Receive tasks in the Mobile Agent application are available with Enterprise Asset Management version 9.0 and later.

Tasks to deliver assets to any stockroom

Interface	Tasks
Enterprise Asset Workspace	<ol style="list-style-type: none"> 1. Create a Drop off task. 2. Drop off the assets at the destination stockroom.
Mobile Agent application	Create a Drop off task for enterprise assets using the Mobile Agent application.

The Drop off task that you submitted completes only when the asset manager of the destination stockroom completes the following tasks in the Enterprise Asset Workspace or through the Mobile Agent application.

Tasks to receive assets at a stockroom

Interface	Tasks
Enterprise Asset Workspace	<ol style="list-style-type: none"> 1. Verify the received assets. 2. Close the Receive task.

Tasks to receive assets at a stockroom (continued)

Interface	Tasks
Mobile Agent application	Verify the enterprise assets received through a Drop off task using the Mobile Agent application.

Create a Drop off task for enterprise assets

Create a Drop off task to return the enterprise assets in your personal stockroom to any other stockroom.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **My stockroom assets** tab.
The list of enterprise assets in your personal stockroom is displayed.
3. Select **Schedule drop off**.
4. On the form, fill in the fields.

Create New Drop Off task form

Field	Description
Stockroom	Stockroom at which you want to drop off the assets. This field is required.
Delivery by date	Date by when you want to deliver the assets to the destination stockroom. This field is required.
Assignment group	Assignment group to which you want to assign the drop off task.
Assigned to	Person from the assignment group who is primarily responsible for the drop off task.

5. Select **Save**.

Result

A Drop off task in the Open state is created and listed in the **Asset tasks** tab.

What to do next

[Drop off enterprise assets at a stockroom.](#)

Drop off enterprise assets at a stockroom

Add enterprise assets to a Drop off task and deliver the assets to the required stockroom.

Before you begin

Role required: sn_eam.enterprise_asset_technician

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Asset tasks** tab.
3. From the list of asset tasks, select the drop off task for which you want to add enterprise assets.
4. Select the **Drop off Assets** tab.
5. Select **Add**.
6. In the **Add assets** dialog box, select the assets and select **Add**.
You can only add enterprise assets that are in your personal stockroom and that aren't reserved and aren't part of any workflows.

The assets added to the drop off task are listed in the Drop off Assets tab.

7. Drop off the assets at the required stockroom.
8. Select **Drop off**.

Result

- A Receive task is created and assigned to the asset manager of the stockroom where you dropped off the assets.
- The state of the Drop off task changes to Work in Progress.

Verify the enterprise assets received through a Drop off task

As an asset manager, confirm that you received the enterprise assets that were delivered to your stockroom and complete the Receive task.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Asset tasks** tab.
3. From the list of asset tasks, select the Receive task for which you want to verify the assets received.
4. Select the **Drop off Assets** tab.
The list of assets that were dropped off at your stockroom is displayed.

Note:

The **Asset received** flag is set to **false** before an asset is verified.

5. Select an asset.
6. Select **Verify**.
 - The **Asset received** flag changes to **true**.
 - The **Receive date** is updated with the date on which you verified the asset.
7. After you verify all the assets, select **Close task**.

Result

The state of the Receive task and its Drop off task changes to Closed Complete.

Record time worked on Drop off and Receive tasks for enterprise assets

Manage and record time worked on Drop off and Receive asset tasks in the Enterprise Asset Workspace. After you start work on a task, you can pause and resume work. You can also record the time worked manually.

Record time worked on a Drop off task or Receive task manually

Create an entry for the time worked on a Drop off or a Receive task manually in the Enterprise Asset Workspace.

Before you begin

Role required:

- To record time worked on a Drop off task: sn_eam.enterprise_asset_technician
- To record time worked on a Receive task: sn_eam.enterprise_asset_manager

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Asset tasks** tab.
3. From the list of asset tasks, select the task for which you want to record time manually.
4. Indicate that you started work on the task by selecting **Start Work**.
The **Start Work** option changes to **Start Timer** and **Record Time** automatically.
5. Select **Record Time**.
6. In the **Record Time** dialog box, enter the details of the time worked.
 - a. Enter the time duration that you worked on the task in the **Days**, **Hours**, and **Minutes** fields.
 - b. **Optional:** Provide any additional information in the **Comments** field.
7. Select **Save**.

Result

The Time Worked form is saved and the time card is added to the Time Worked tab of the task.

Pause a Drop off task or Receive task for enterprise assets

Record a break from a Drop off or Receive task in the Enterprise Asset Workspace if you're not continuing to work on it.

Before you begin

You can pause a Drop off or Receive task that is in the Work in Progress state. The option to pause the task is available only after you perform the following actions:

1. Indicate that you have started working on the task by selecting **Start Work**.
2. Start recording the time by selecting **Start Timer**.

Role required:

- To record time worked on a Drop off task: sn_eam.enterprise_asset_technician
- To record time worked on a Receive task: sn_eam.enterprise_asset_manager

About this task

You can resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
2. Select the **Asset tasks** tab.
3. From the list of asset tasks, select the task that you want to pause.
4. Select **Pause Work**.
The **Pause Work** changes to **Resume Work**.
5. Select **Resume Work** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time Worked tab.

Perform condition evaluation from the Enterprise Asset Workspace

Perform condition evaluation to calculate the score and result of the condition attributes from the Enterprise Asset Workspace.

Before you begin

Role required: sn_eam.asset_technician

About this task

These steps detail the process of performing the condition evaluation from the Enterprise Asset Workspace. Condition evaluation can also be performed from the Mobile application. For details, see [Perform condition evaluation from the Mobile Agent application](#).

Note:

Starting with Enterprise Asset Management version 10.0, a work order can be associated with more than one asset or an asset group.

Procedure

1. Navigate to **Workspaces > Enterprise Asset Workspace > Work management > Work order tasks**.
2. Select the condition work task assigned to you.
3. Select **Accept** and then select **Start work**.
The status of the work order task changes to **Work in Progress**
4. Select the **Condition lines** tab.
In Enterprise Asset Management version 10.0 and later, the Condition lines related list displays condition lines for all assets in the Affected assets list. A condition evaluation is created for each asset, and you must complete all condition lines to complete and close the task.
5. Select the condition evaluation for the condition line that you want to assess.
6. Enter a value for the questions in the sections.
7. Select **Submit**.
8. In the confirmation box, select **Submit**.

After you submit the condition evaluation, refresh the **Condition lines** page to view the score and result for the condition line.
9. In Enterprise Asset Management version 10.0 and later, repeat steps 5 through 8 for each condition line in the **Condition lines** tab.

10. Select **Close Complete in the Condition work task page.**

The Enterprise asset manager can review the asset condition results and view the reports in the Work management dashboard. For more details, see [Review the asset condition results](#).

Perform condition evaluation from the Mobile Agent application

Perform condition evaluation to calculate the score and result of the condition attributes from the Mobile Agent application.

Before you begin

An asset condition work order task for an asset must be created and assigned to the technician.

Role required: sn_eam.asset_technician

About this task** Note:**

Starting with Enterprise Asset Management version 10.0, work order task can be associated with multiple assets, either through an asset group or by assets added to the Affected assets list. When a work order task has multiple assets, the technician must assess the condition of each asset within the same work order task. After completing all condition evaluations, the condition results are recorded for each asset and are available for the enterprise asset manager to review.

These steps detail the process of performing the condition evaluation from a mobile application. Condition evaluations can also be performed from the Enterprise Asset Workspace. For details, see [Perform condition evaluation from the Enterprise Asset Workspace](#).

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen opens with the list of tasks assigned to you.
3. Tap the work order task for which you want to take action.
4. On the **Details** tab, tap **Start Work**.
5. Tap the **View asset conditions** tab to see all the condition lines associated with the asset.

In Enterprise Asset Management version 10.0 and later, the **Assessment lines** screen opens and shows condition lines for all assets in the Affected assets list. A condition evaluation is created for each asset, and you must complete all condition lines to complete and close the task. The asset associated with the condition line is shown.

- The **Open** tab displays all condition lines associated with the assets that are not yet completed.
- The **Completed** tab displays all completed asset condition lines.

Initially all the condition lines are in an open state and each condition line is associated with a template.

6. Tap a condition line record.
The mobile UI of the condition evaluation that is associated with the corresponding condition line opens.
7. Tap **Next** and answer the questions.
8. Tap **Submit** once you have answered all the questions.

The score gets calculated and populated on the condition line record that moves to the completed state, and a pass or fail determination is made based on the scores. If the pass and fail criteria wasn't defined on a condition line, then the score displays as NA.

- In Enterprise Asset Management version 10.0 and later, repeat steps 6 through 8 for each condition line for all assets in the work order task.

After all condition lines are completed, the **Close** button appears on the work order task.

- Tap **Close** to close the work order task.

Manage asset-centric work tasks using work order plans

Increase operational efficiency by organizing complex asset-centric work tasks such as shutdown, maintenance, and calibration, by using work order plans.

Important:

Work order plan templates and work order plans are available with Enterprise Asset Management version 10.0 and later.

Create reusable work order plan templates and use them when creating work order plans. For more details, see [Asset work order plans in Enterprise Asset Management](#).

Create a work order plan template

Create a reusable work order plan template to use when creating work order plans.

Before you begin

Role required: sn_eam.asset_manager

Procedure

- Navigate to **Workspaces > Enterprise Asset Workspace > Work management**.
- Select the **Work order plan templates** tab.
- Select **New**.
- On the form, fill in the fields.

Create New work order plan template form

Field	Description
Name	Name of the work order plan template.
Description	Description of the work order plan.
Primary target	Asset or asset group for which the work order plan template is created. When you select an asset group, all assets in the asset group are automatically added to the Affected assets list.  Note: This field is required.
Location	Location of the primary target. This field is automatically populated when you select a primary target.

Field	Description
	<p>Note: If you select a location first, the Primary target and Additional assets fields are filtered to show only assets in that location.</p>
Additional assets	<p>Assets to include in the work order plan template along with the primary target. Additional assets must be in the same location as the primary target.</p>
Work order template	<p>Work order template that defines the collection of tasks to be performed on the primary target and any additional assets.</p>

5. Select **Save**.

Result

The work order plan template is created and appears in the **Work order plan templates** tab.

What to do next

Use this work order plan template when you [create a work order plan](#).

Create a work order plan for enterprise assets

Create and manage a work order plan to organize, assign, schedule, and track complex asset tasks for enterprise assets and asset groups.

Before you begin

In the **Field Service Configuration** module, the **Apply Work Order template in draft status** setting must be enabled.

Role required: sn_eam.asset_manager

About this task

A work order plan can be created for individual enterprise assets and asset group.

Procedure

1. Create a work order plan.

2. In the **Create work order plan** dialog box, complete the fields.

a. Optional: In the **Work order plan template** field, select the work order plan template that you want to apply to the work order plan.

Note:

If you're creating a work order plan from an asset group, only the work order plan templates associated with that asset group are shown.

b. In the **Plan name** field, enter a name for the work order plan.

Note:

If you selected a work order plan template, the **Plan name** field is automatically populated with the template name. You can update the name if needed.

c. Select **OK**.

The Work order plan playbook displays the following activities that you must complete in the sequence:

- a. **Details**
- b. **Review affected assets**
- c. **Review work order tasks** including **Review assignments** and **Review schedule**
- d. **Track status**

All the activities are in Pending status before you start working on them.

3. In the **Details** activity, complete the work order plan details.

Note:

If you selected a work order plan template, the following fields on the Details form are automatically populated from the template:

- o **Description**
- o **Location**
- o **Primary target**
- o **Work order template**
- o **Additional assets**

a. On the Details form, review and update the fields as needed.

Details form

Field	Description
Name	Name of the work order plan.
Description	Description of the work order plan.
Location	Location of the primary target. Note: If you select a location first, the Primary target and Additional assets fields are filtered to show only assets in that location.
Primary target	Asset or asset group for which the work order plan is created.
Work order template	Work order template that defines the collection of tasks to be performed on the assets included in the work order plan.
Additional assets	Additional assets to include in the work order plan along with the primary target.
Due date	Date and time by which the work order plan must be completed.

Note:

Name, Location, Primary target, and Work order template fields are required.

b. **Optional:** Select **Save as template** to save the work order plan configuration as a template for future use.

c. **Optional:** Select **Update** to save your changes and continue editing.

d. Select **Mark complete** to save your changes and move to the next activity in the playbook.

4. In the **Review affected assets** activity, confirm the assets to include in the work order plan.

- To remove an asset, select the asset and then select **Remove**.
- To confirm the assets and proceed to the next activity, select **Mark complete**.

5. In the **Review work order tasks** activity, assign the work order tasks to technicians and schedule the tasks.

a. In the **Review assignments** activity, assign an assignment group to each work order task.

i. In the **Assignment group** field, select the assignment group.

 **Note:**

To assign multiple work order tasks to the same assignment group, select the tasks and then select the assignment group.

ii. (Optional) In the **Assigned to** field, select the technician to whom you want to assign the work order task.

 **Note:**

All work order tasks must have an assignment group specified before you can complete this activity. The **Assigned to** field is optional; however, the schedule is populated for work order tasks in the Review schedule activity only when a technician is specified in the Assigned to field.

iii. Select **Mark complete** to proceed to the next activity.

b. In the **Review schedule** activity, schedule the work order tasks.

i. ▪ To schedule a task manually, inline edit the **Scheduled start** field directly. The **Estimated end** field is automatically populated based on the Estimated work duration.

▪ To schedule a task using the calendar view, the task must have a technician assigned in the Review assignments activity.

▪ Select **Calendar view** to schedule tasks visually by dragging the edges of a work order task to adjust the scheduled start and estimated end times.

▪ Reposition the task on the calendar view as needed.

▪ Double-click a work order task to open the corresponding record for detailed review.

 **Note:**

Tasks appear in the calendar view only when assigned to a technician. If only an assignment group is specified, the task isn't displayed. The calendar view also displays active tasks from other work orders, maintenance plans, incidents, and ad hoc work orders.

ii. Select **Ready for work** so that technicians can begin working on the work order tasks.

Note:

After you select **Ready for work**, the scheduled start and end times can't be modified.

iii. Select **Mark complete** to proceed to the **Track status** activity.

6. In the **Track status** activity, monitor the progress of the work order tasks.

The following fields are updated automatically based on the technician's actions:

- o **State:** Current state of the work order task.
- o **Actual work start:** Date and time at which the technician started the task.
- o **Actual work end:** Date and time at which the technician closed and completed the task.

Note:

Select **Calendar view** to get a visual overview of the scheduled work order tasks. The calendar view displays only tasks that are in the Work in progress state. Completed tasks aren't displayed.

You can track the status of the work order tasks at any time through the associated work order plan.

Using Service Catalog for Enterprise Asset Management requests and flows

Use the Service Catalog application to create catalog requests for the Enterprise Asset Management application.

Overview of using Service Catalog

Use the Service Catalog for creating catalog requests for Enterprise Asset Management flows.

Task	Role required	Resource
Deploy, source, and request catalog items for the Enterprise request flow		Use an enterprise asset request flow
Track and replace assets by using the Enterprise Asset refresh flow		Request an enterprise asset refresh
Resell your assets using the Asset resale flow.		Create an asset resale flow
Onboard multiple assets at one go		Create a catalog request for onboarding multiple assets
Reclaim enterprise assets		Create a catalog request to reclaim enterprise assets

Use an enterprise asset request flow

Use an enterprise asset request flow for requesting, sourcing, and deploying catalog items from the Service Catalog application.

Before you begin

Before requesting for an enterprise asset, ensure that you have already created a model for that asset in the Enterprise Asset Workspace and published that model to the Service Catalog application.

Role required:

- catalog_admin
- procurement_admin
- sn_eam.enterprise_asset_manager
- sys_admin

About this task

Create a request for an enterprise catalog item from the Service Catalog application. Associate the catalog item with the Standard Enterprise Asset Request flow to trigger the flow.

The Workflow Studio application is used to create the Standard Enterprise Asset Request flow to take you through the process of sourcing, procuring, and deploying your enterprise catalog items. As the flow takes you through the various stages, the asset details are automatically updated. You can open the Standard Enterprise Asset Request flow to view the status of the stages in the flow.

Procedure

1. Log in with credentials for the role of catalog_admin and navigate to **Service Catalog > Maintain Items**.
2. Open the enterprise catalog item and in the **Flow** field, select **Standard Enterprise Asset Request**.
If the **Flow** field is not visible, add it to the form layout by right-clicking the menu icon and navigating to **Configure > Form layout**.
3. Select **Save**.
The Standard Enterprise Asset Request flow is now associated with the enterprise catalog item.
4. Navigate to the Service Catalog application.
5. Login with credentials for the role of sys_admin role and add the **Enterprise Assets** catalog. The **Enterprise Assets** catalog is not on the Service Catalog page by default. To add this catalog, select the Add Content icon () beside the search catalog bar and then select **Enterprise Assets**.
6. Login with credentials for the role of sn_eam.enterprise_asset_manager and select the **Enterprise Assets** catalog.
The Enterprise Assets page opens.
7. Select your catalog item from the list.
The catalog item page opens.
8. In the **Location** field, select the location in which you want to deploy the catalog item.
9. Select **Order Now**.
10. Log in with credentials for the role of procurement_admin and open the new request.
11. In the Requested Items related list, select the request item.
12. Select the **Catalog Tasks** related list to view the sourcing task for the request.
13. Open the catalog task and select **Source Request**.

14. In the Source Request form layout, select **Add Transfer Order** or **Add Purchase Order** to source the request via a transfer order or a purchase order.
After you procure the catalog item, the Asset pick task is created for the Requested item only if the asset is sourced from the stockroom that has the Asset pick task enabled. Otherwise the Deployment task is created for the Requested item without the Asset pick task. For details, see [Enable the Asset pick task for your stockroom in the Hardware Asset Workspace](#).
15. Select the Requested items related list and select the requested item.
16. Select the **Catalog Tasks** related list.
 - If the Pick task is enabled for the source stockroom, complete the Asset pick task first and then complete the Deploy task.
 - If the Pick task isn't enabled, complete the Deploy task.
17. Complete the Asset pick task using the Mobile Agent application.
For details on completing this step, see [Manage enterprise asset pick tasks using the Mobile Agent application](#).
The Deployment task is created for the requested item.
18. Enter a value in the **Assigned to** field, and select **Deploy Asset**.
If it's a serialized asset, it's marked as **In use** state. If it's a consumable asset, it's marked as **Consumed** state. In the Standard Enterprise Asset Request flow, the action that is associated with deploying the assets is now complete.

Request an enterprise asset refresh

Use the Enterprise Asset Refresh flow to track the assets that are nearing the end of their life cycle and replace them with new assets.

Before you begin

Role required: inventory_user

About this task

When assets get old, their maintenance costs and risks of failure increase, while their performance decreases. You can choose to replace old assets with the same or different models of newer assets. After your Enterprise Asset Refresh request is approved, the Enterprise Asset Refresh flow takes you through sourcing and triggers the Enterprise Asset Refresh Line flow. The Enterprise Asset Refresh Line flow uses Refresh Line tasks to take you through the steps of preparing the new asset, scheduling it for delivery, deploying it, and reclaiming the aged asset.

The Workflow Studio application is used to create the Enterprise Asset Refresh flow and the Enterprise Asset Refresh Line flow.

Procedure

1. Navigate to the Service Catalog application.
2. Login with credentials for the role of sys_admin role and add the **Enterprise Asset Lifecycle** catalog.
The **Enterprise Asset Lifecycle** catalog is not on the Service Catalog page by default. To add this catalog, select the Add Content icon () beside the search catalog bar and then select **Enterprise Asset Lifecycle**.
3. Login with credentials for the role of sn_eam.enterprise_asset_manager and select the **Enterprise Asset Lifecycle** catalog.
The Enterprise Asset Lifecycle page opens.
4. Navigate to **Service Catalog > Enterprise Asset Lifecycle**.

The **Enterprise Asset Lifecycle** catalog is not on the Service Catalog page by default. To add this category, select the add content icon () beside the search catalog bar and then select **Enterprise Asset Lifecycle**.

5. Open Enterprise Asset Refresh Order.

6. If you want to replace all the aged enterprise assets with the same model of new enterprise assets, do the following:

a. Select **Single model** from the **Type of refresh list** field.

b. On the form, fill in the fields.

Enterprise Asset Refresh form

Field	Description
Location	Physical location of the aged enterprise assets.
Replacement model	New enterprise asset model that you want to replace the aged enterprise assets with. Note: For single and multi-model refresh orders, the OT manager can edit the replacement model even after the refresh order has been created in the OTAM workspace
Assets	Aged enterprise assets that you want to replace. You can use a filter to search for enterprise assets that you want to replace.
Available	Displays only those assets for which the Eligible for Refresh check box on the Asset page is selected. To view all assets that are nearing their end of life, execute the condition <code>Eligible for refresh is false</code> . Note: For details on the Eligible for Refresh check box, see Asset fields for enterprise assets .

7. If you want to replace the aged hardware assets with different models of new hardware assets, do the following:

a. Select **Multi model** from the **Type of refresh** field.

b. Select **Add**.

- c. For each new enterprise asset that you want to use, add a row to enter the enterprise model.

Note:

You can create 50 rows. You cannot create multiple rows for the same aged hardware asset that you want to replace.

8. Select Order Now.

An Order status page appears and displays the details of the order. A request is created to source the new enterprise assets and to replace the aged enterprise assets. The Request form shows the total price of all the new enterprise asset models.

Replace aged enterprise assets

Replace aged enterprise assets by sourcing new enterprise assets.

Before you begin

Role required: inventory_user

About this task

When refreshing enterprise assets, you don't have to manually update the asset records. When closing the enterprise asset refresh lines, the asset records and the assets are automatically updated. Close each task to go to the next task, complete the refresh, and reclaim the aged assets.

After sourcing the new assets, asset refresh is completed through the following stages:

- Prepare asset task: Prepare the new asset before you hand it over to the user. For example, install any software that's required.
- Schedule refresh task: Schedule a date to hand over the asset to the requester.
- Deploy new asset: Hand over the asset to the requester or install the asset at the requester's location if necessary.
- Reclaim aged asset: Collect the aged asset.

Procedure

1. Select the hardware asset refresh request.

After your enterprise asset refresh request is approved, the following events happen:

- The Source Request flow is triggered to source new assets.
- In the **Catalog Tasks** tab, a catalog task is created for the procurement of the new enterprise asset.

2. Under the Requested Item related list, open a requested item.

After your enterprise asset request is approved, the Source Request flow is triggered. Under the Catalog tasks related list, a catalog task is created for the procurement of the new enterprise assets.

3. Source items in the request.

You can source items in the request by consuming the local stock, through purchase orders, or through transfer orders.

For more details on sourcing items, see [Sourcing items in a service catalog request](#).

After the new asset is received, the following events happens:

- The Enterprise Asset Refresh Line flow is triggered for the asset.
- The Enterprise Asset Refresh Line tab is displayed next to the Asset Tasks tab on the requested item form.
- The Asset pick task is created under the Refresh Line Tasks only if the requested item is consumed from the local stockroom for which the Asset pick task is enabled. Otherwise the Prepare asset task is created directly without the Pick task. For details, see [Enable the Asset pick task for your stockroom in the Enterprise Asset Workspace](#).

4. Select the **Enterprise Asset Refresh Line** tab.

5. Select the enterprise asset refresh line.

6. Select the **Refresh line tasks** tab.

7. Complete the Asset pick task by using the Mobile Agent application.

For details on completing this step, see [Locate and pick the enterprise assets in your stockroom using the Mobile Agent application](#).

8. Prepare the asset.

a. Select the **Prepare asset** task.

b. In the **Asset** field, select the enterprise asset that you want to replace.

c. Select **Save**.

d. Select **Close Task**.

- A Schedule refresh task is created under the Refresh Line Tasks.
- The state of the Replacement asset changes to In stock.
- The substate changes to Reserved.
- The **Reserved for** field is populated with the requester details.

9. Complete the Schedule refresh task.

a. Select the **Schedule refresh** task.

b. In the **Scheduled deployment date** field, select the date on which the new asset will be deployed.

c. Select **Close Task**.

- The Deploy new asset task is created under the Refresh Line Tasks.
- The state of the Replacement asset changes to In stock and the substate changes to Pending install.

10. Complete the Deploy new asset task.

a. Select the **Deploy new asset** task.

b. Confirm if you have reclaimed the old asset in the **Is reclaimed** list.

- If you've collected the aged asset, select **Yes**.
- If you didn't collect the aged asset, select **No**.

c. Select **Close task**.

 **Note:**

If you select **Yes** from the Is reclaimed list, then the Reclaim aged asset task is also closed by default.

- Reclaim aged asset task is created under the Refresh Line Tasks.
- The state of the replacement asset changes to In use.
- The allocations are transferred from the aged asset to the replacement asset.

11. Complete reclaiming the aged assets.

- a. Select the **Reclaim aged asset** task.
- b. Confirm if you have reclaimed the old asset in the **Is reclaimed** list.
 - If you've collected the aged asset, select **Yes**.
 - If you didn't collect the aged asset, select **No**.
- c. Select **Close task**.

Note:

You can cancel the enterprise asset Refresh Line either by selecting **Cancel** or by changing the **State** field to **Closed Incomplete** in the Refresh Line task.

Result

After the aged enterprise asset is reclaimed, the following changes happen on the asset form:

- The state of the aged asset changes to In stock.
- The substate changes to Pending disposal.

Create an asset resale flow

Create an asset resale flow for an asset to be resold in order to reduce waste and save cost.

Before you begin

Role required: sn_eam.enterprise_asset_manager

About this task

The asset vendor must confirm which assets can be resold and how much they are worth.

Only assets that are in a non-terminal state, which is any state in which the asset can transition into a different state, can be resold through a enterprise resale order. Each asset must also be associated with either an enterprise model or pallet model. You can add simple assets; multi-component assets, which include pre-assembled and user-assembled assets; and pallet assets with children to an enterprise resale order.

Note:

If you are adding a pallet asset with children to a resale order, any changes that you make to the pallet asset are automatically applied to all child assets.

Procedure

1. Navigate to the **Service Catalog > Enterprise Asset Lifecycle**.
2. Select Enterprise Resale Order.
3. On the form, fill in the fields.
4. Add assets and submit the order.

Once the asset resale request is submitted, you can fulfill the request by navigating to the Enterprise Asset Workspace.

5. Navigate to **Inventory > Resale orders**.
6. Next go through each task.
7. Select **Verify Asset** to select assets and verify them.
Before completing the **Verify Asset** task, you can add or remove assets from the disposal order. You can also edit the quantity of consumables.
8. Select **Close** task.
The next task in the workflow, **Schedule pickup**, is automatically created and appears in the **Enterprise Asset Resale Tasks** tab
9. Select **Schedule Pickup** to specify when the asset can be picked up from the stockroom as well as the vendor details
10. Select **Close** task.
The stage changes to **in transit** and the **Asset departure** task is created.
11. Select the **Asset departure** task and select each asset departing for resale as well as pickup contact details,
12. Select **Close** task.
The stage changes to **confirmation** and the **Vendor confirmation** task is created.
13. Select the **Vendor confirmation** task once the vendor confirms that the assets were received.
14. Select **Close** task.
The stage changes to **documentation** and a **Resale Documentation** task is created.

Create a catalog request for onboarding multiple assets

Create a catalog request for onboarding multiple assets on a single model.

Before you begin

Role required: enterprise_asset_technician

About this task

A minimum of one asset is required to submit a catalog request. Each catalog request may include a maximum of 50 assets.

Procedure

1. Navigate to **Service Portal > Request Something > Enterprise Asset Lifecycle**.
You can also navigate to the **Enterprise Asset Lifecycle** via the Service Catalog.
2. Select **Assets Onboarding**.
The Asset Onboarding page opens.
3. On the form, fill in the fields.
4. Select **Submit**.
After the catalog request is submitted, a requested item is created. An asset onboarding task is also created associated to the requested item which triggers the multi-asset playbook.

What to do next

The enterprise_asset_manager role can launch the multi-asset playbook from the Enterprise Asset Workspace.

Create a catalog request to reclaim enterprise assets

Create a catalog request to efficiently reclaim enterprise assets when an employee leaves an organization or moves to a different role.

Before you begin

Role required: any employee in your organization.

Procedure

1. Navigate to the Service Catalog application.
2. On the Service Catalog page, enter **Reclaim asset** in the Search catalog field on the right-hand side of the page.
3. Select **Reclaim Asset**.
4. On the form, fill in the fields.

Reclaim Asset form

Fields	Description
Requested by	The role of the person who is creating this request. Select from the following options: <ul style="list-style-type: none"> ○ HR ○ Manager ○ User ○ Asset Manager (only if the request is being created by the enterprise_asset-manager role or the asset role)
Requested for	Name of the person for who you are submitting the catalog request. Note: This field is not mandatory if the request is being created by the enterprise_asset_manager role.
Employee separation	Whether the person for who you are submitting the asset reclamation is leaving the organization or moving to a different role.
Asset	Assets assigned to the person for who you are submitting the asset reclamation.
Reclaim date	The date by which you want the asset reclaimed by. You can enter today's date or a date in the future.
Reclaim method	The method you intend to use to collect the assets from the departing employee. You can pick up the assets, the employee can drop them off, or ship them to the organization.
Legal hold method	If the assets need to be kept on hold because of any legal reasons.
Notes/Special instructions	Any instructions that you may want to mention.

5. Select **Submit**.

The enterprise asset reclamation request is created. Once the request is created, the enterprise_asset_technician role navigates to the Enterprise Asset Workspace to view the reclamation line and complete the tasks. For more details, see [Close an enterprise asset reclamation request](#).

Managing enterprise assets and tasks using the Mobile Agent application

Create and manage enterprise assets, asset tasks, and work order tasks using the intuitive Mobile Agent application.

Overview of the Mobile Agent application

Use the Mobile Agent application to perform the following tasks.

Task	Role required	Resource
Create and lookup enterprise asset		<ul style="list-style-type: none"> • Create an enterprise asset in the Mobile Agent application • Look up enterprise assets using the Mobile Agent application
Scan enterprise assets for stockroom and location inventory audits		<ul style="list-style-type: none"> • Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app • Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app
Verify and depart your enterprise assets as part of the disposal process		Verify and depart your enterprise assets for disposal using the Mobile Agent application
Manage your work order tasks and asset tasks		Manage an Enterprise Asset Management task using the Mobile Agent application
Manage the repair of your enterprise assets		Manage enterprise asset repair tasks using the Mobile Agent application
Manage the asset pick tasks assigned to you.		Manage enterprise asset pick tasks using the Mobile Agent application

Create an enterprise asset in the Mobile Agent application

Use the ServiceNow[®] Mobile Agent application to create a serialized or multi-component enterprise asset.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

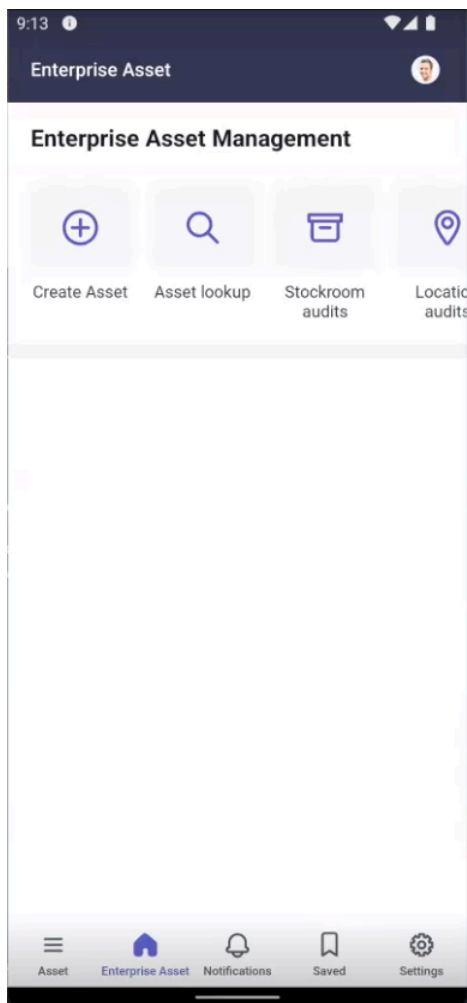

About this task

i Important:

The enterprise assets that you create through the Mobile Agent application can be associated only with enterprise models that are classified through the Enterprise good model [sn_ent_model] class within the Configuration Management Database (CMDB) class hierarchy. See [Expanded Model and Asset Classes Store application](#) for more information on enterprise model classes.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
The navigation bar displays tabs for the ServiceNow applications and applets that you have access to through the Mobile Agent application. The navigation bar also displays tabs for your Mobile Agent application settings and notifications.
The home screen for the Enterprise Asset Management application opens.

3. Tap **Create Asset**.

The Serial Number screen opens.

4. **Optional:** If your enterprise asset contains a serial number, scan or enter the serial number to verify if the asset already exists.

If you want to skip this verification, tap the back arrow at the top left corner of the screen to proceed directly to the Create Asset form. You can then proceed either to [step 5](#) to verify the asset existence based on asset tags or to [step 6](#) to skip both verifications and continue with the asset creation process.

- a.** Use the camera on your mobile device to scan the serial number.
You can also enter the serial number manually in the **Serial Number** field.
- b.** Depending on whether the enterprise asset exists or not, proceed with one of the following options:
 - If the enterprise asset already exists, verify the asset details in the corresponding asset record:
 - i.** Return to the home screen for the Enterprise Asset Management application.
 - ii.** (Optional) Tap **Asset lookup**.
The Asset lookup screen opens.
 - iii.** Use the camera on your mobile device to scan the asset tag of the enterprise asset.
 - iv.** (Optional) Tap **Submit**.
 - v.** (Optional) From the list of corresponding asset records, tap the asset record through which you want to verify the asset details.
The asset record opens.
 - vi.** Verify all asset details for the given enterprise asset.
 - vii.** Update any asset details if needed.
 - If the enterprise asset does not already exist, proceed to [step 7](#) to continue with the asset creation process.

5. Optional: If your enterprise asset contains an asset tag, scan the asset tag or enter the asset tag value to verify if the asset already exists.
If you want to skip this verification, proceed directly to [step 6](#) to continue with the asset creation process.

- a.** On the Create Asset form, tap the **Asset Tag** field.
- b.** Use the camera on your mobile device to scan the asset tag.
You can also enter the asset tag value manually in the **Asset Tag** field.
- c.** Depending on whether the enterprise asset exists or not, proceed with one of the following options:
 - If the enterprise asset already exists, verify the asset details in the corresponding asset record:
 - i.** Return to the home screen for the Enterprise Asset Management application.
 - ii.** (Optional) Tap **Asset lookup**.
The Asset lookup screen opens.

- iii. Use the camera on your mobile device to scan the asset tag of the enterprise asset.
 - iv. (Optional) Tap **Submit**.

The list of corresponding asset records opens.
 - v. (Optional) Tap the asset record through which you want to verify the asset details.

The asset record opens.
 - vi. Verify all asset details for the given enterprise asset.
 - vii. Update any asset details if needed.
 - If the enterprise asset does not already exist, proceed to [step 7](#) to continue with the asset creation process.
6. On the Create Asset form, tap **Submit**.

The complete list of your enterprise assets opens.
 7. Tap the more options menu at the top right corner of the screen.
 8. When the menu opens, tap **Create Asset**.

The Asset Tag screen opens.
 9. Depending on whether your enterprise asset does or does not contain an asset tag, proceed with one of the following options:
 - If your enterprise asset contains an asset tag, use the camera on your mobile device to scan the tag. You can also enter the asset tag value manually in the **Asset Tag** field. After you successfully scan the asset tag or enter the asset tag value, tap the back arrow at the top left corner of the screen to proceed to the Create Asset form. The **Asset Tag** field on the Create Asset form automatically updates with the asset tag value that you scanned or entered.
 - If your enterprise asset does not contain an asset tag, tap the back arrow at the top left corner of the screen to skip the asset tag scan and proceed directly to the Create Asset form.
 10. If your enterprise asset contains a serial number, scan or enter the serial number.
 - a. On the Create Asset form, tap the **Serial Number** field.

The Serial Number screen opens.
 - b. Use the camera on your mobile device to scan the serial number.

You can also enter the serial number manually in the **Serial Number** field.
 - c. Tap the back arrow at the top left corner of the screen to return to the Create Asset form.

The **Serial Number** field on the Create Asset form automatically updates with the serial number that you scanned or entered.
 11. Associate the enterprise asset with an enterprise model.
 - a. On the Create Asset form, tap the **Model** field.

The Model screen opens.
 - b. From the list of available enterprise models, select the model that you want to associate the enterprise asset with.

The screen closes and you return to the Create Asset form.

The **Model** field on the Create Asset form automatically updates with the enterprise model that you selected.

12. Specify the state of the enterprise asset.

a. On the Create Asset form, tap the **State** field.
The State screen opens.

b. From the list of available states, select the current state of the enterprise asset.
The screen closes and you return to the Create Asset form.

The **State** field on the Create Asset form automatically updates with the state that you selected. Based on this selected state, additional fields appear on the Create Asset form.

13. Based on the enterprise asset state that you specified in [step 11](#), fill in the additional fields that appear on the Create Asset form.

14. Tap **Submit**.

The form closes and you automatically return to the home screen for the Enterprise Asset Management application.

Result

The enterprise asset is created along with a corresponding configuration item (CI).

Look up enterprise assets using the Mobile Agent application

Use the ServiceNow[®] Mobile Agent application to look up asset records so that you can view or update your enterprise asset details.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

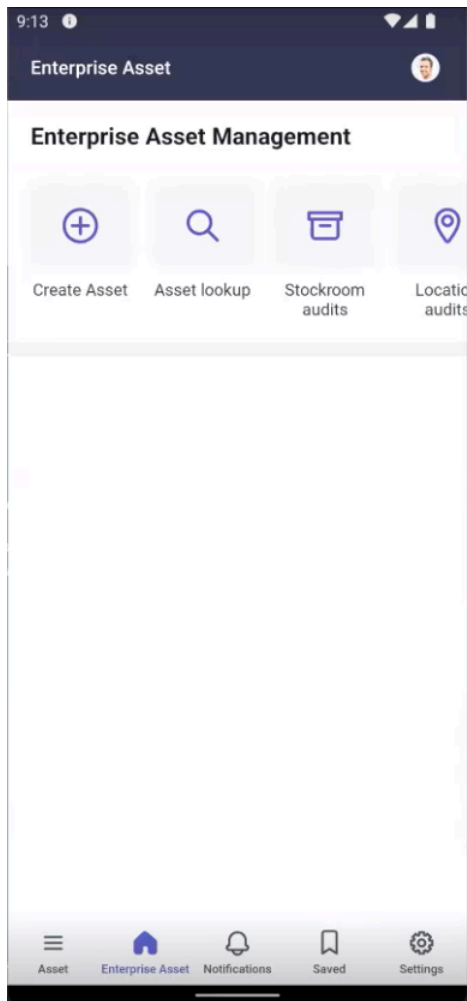

Procedure

1. From your mobile device, launch the Mobile Agent application.

2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.

The navigation bar displays tabs for the ServiceNow applications and applets that you have access to through the Mobile Agent application. The navigation bar also displays tabs for your Mobile Agent application settings and notifications.

The home screen for the Enterprise Asset Management application opens.

3. Tap **Asset lookup**.

The Asset lookup screen opens.

4. Use the camera on your mobile device to scan the asset tag of the enterprise asset that you want to look up.

You can also enter the asset tag value manually in the **Asset tag** field.

5. Tap **Submit**.

The list of corresponding asset records opens.

6. Tap the asset record that you want view or update.

The asset record opens.

7. View or update the asset details as needed.

Manage enterprise asset inventory audit using the ServiceNow Agent app

Use the ServiceNow Agent application to scan the enterprise assets that you want to include in your stockroom inventory audits. After you scan all enterprise assets, you can complete the audit on your ServiceNow instance.

i **Important:**

The audit enhancements features are available with Enterprise Asset Management version 10.0.0 onwards.

Create an enterprise audit record using the ServiceNow Agent app

Create an inventory audit record using the ServiceNow Agent app.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
3. Select the audit that you want to perform.

4. On the form, fill in the fields.

New stockroom audit form or New location audit form

Field	Description
Stockroom  Note: This field appears if you're creating a stockroom audit.	Stockroom where you want to perform the audit.
Location  Note: This field appears if you're creating a location audit.	Location where you want to perform the audit.
Aisle and space  Note: This field appears if you're creating a stockroom audit.	Aisle and space for which you want to perform the audit.
Include child locations  Note: This field appears if you're creating a location audit.	Option to include child locations in the audit.
Model category	Model category for which you want to perform the audit.
Include consumables  Note: This field appears if you're creating a stockroom audit.	Option to include consumable assets in the inventory audit. The available options are: <ul style="list-style-type: none"> <input type="radio"/> Yes <input type="radio"/> No The default populated value for this field is derived using the <code>sn_itam_common.set_default_include_consumables</code> system property.

Field	Description
	<ul style="list-style-type: none"> ○ When this system property value is set to yes, the default value for the Include consumables field is set to Yes. ○ When this system property value is set to no, the default value for the Include consumables field is set to No. <div style="background-color: #e1f5fe; padding: 5px; margin-top: 10px;"> <p>i Important: This field is available with Enterprise Asset Management version 10.0.0 onwards.</p> </div>
<p>Scan method</p>	<p>Scan method to be used to scan the assets. The available options are:</p> <ul style="list-style-type: none"> ○ Single scan ○ Multi scan <ul style="list-style-type: none"> ○ When the Include consumables field is set to Yes, the Scan method field value is automatically set to Single Scan and can't be edited. ○ When the Include consumables field is set to No, the Scan method field becomes editable, enabling you to select the scan type. <p>Depending on the selected scan method for the audit record, you can scan the assets in the inventory using the ServiceNow Agent app.</p> <ul style="list-style-type: none"> ○ To complete asset scanning for the single scan audit record, see Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app. ○ To complete asset scanning for multi scan audit records, see Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app. <div style="background-color: #e1f5fe; padding: 5px; margin-top: 10px;"> <p>i Important: This field is available with Enterprise Asset Management version 10.0.0 onwards.</p> </div>

5. Tap Submit.

Result

- An audit record is created and listed on the **Open** tab.
- The audit result fields are displayed on the audit **Details** tab.

For a detailed description of the audit result field values, see [Audit results](#).

What to do next

Scan the assets in the inventory using the ServiceNow Agent app.

[Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app](#)

Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app

Scan your inventory assets by using the ServiceNow Agent app for single scan audit records.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

About this task

Important:

This feature is available with Enterprise Asset Management version 10.0.0 onwards.

Procedure

1. From your mobile device, launch the ServiceNow Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

Note:

This button appears only for the location audit.

5. Select **Scan**.
The Asset scan page is displayed.
6. In the **Asset tag/Serial number/Model barcode** field, enter or scan the asset tag, serial number, or model barcode of the asset.
7. Tap **Next**.
8. **Optional:** Select an **Aisle and space**.
9. Select **Submit**.
The List of assets and models screen is displayed, showing the scanned asset record.

Note:

When the scanned asset record doesn't exist in your ServiceNow instance, the List of assets and models screen is empty. You can create an asset record for the new asset in the inventory. For more information, see [Create an enterprise asset from the inventory audit screen](#).

10. On the List of assets and models screen, slide the scanned asset record to the left side.
The Audit option is displayed on the screen.

← List of assets and models  

available	1
Samsung Galaxy A11 - black - 4G - 32 GB	
Category Mobile Device	
Location Primary	

11. Tap Audit.

The **Details** tab screen is displayed. The audit result field values are automatically updated when you scan the stockroom assets.

12. After you're finished scanning assets, mark the audit as complete.

a. Tap the three dots icon in the navigation bar.

b. Tap Complete.

A confirmation message appears on the audits page.

 Note:

You can start a new scan as many times as you need while the audit is in progress. After you mark the audit as **Complete**, you can't scan any more assets.

Result

The audit result field values are updated on the **Details** tab screen. For a detailed field description, see [Audit results](#).

What to do next

- Review the inventory audit result.
- Tap the audit result field values to view the detailed list of the assets.

[Create an enterprise asset from the inventory audit screen](#)

Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app

Scan your inventory assets by using the ServiceNow Agent app for the multi scan audit records.

Before you begin

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From your mobile device, launch the ServiceNow Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

 Note:

This button appears only for the location audit.

5. Select Scan.

The Asset scan screen is displayed.

6. Scan or enter the asset tag in the Asset Tag field.

You can scan or enter the asset tag for one or more assets.

7. Optional: Select the Review tab to review the list of scanned assets.

On the review screen, you can delete assets if needed. However, Enterprise Asset Management automatically removes duplicates for assets that you accidentally scan twice.

8. Tap Next.

9. Optional: Select an Aisle and space.

10. Select **Submit**.

The Stockroom audit **Details** tab screen is displayed.

i Note:

If the scanned asset record doesn't exist in your ServiceNow instance, a new asset record is created using the provided Asset tag. The new asset record is created with an unknown product model and an unknown model category value. Additionally, an asset remediation task is also created to notify you that an asset record has been created with an unknown model category and an unknown product model. Open the asset remediation task from the Hardware Asset Workspace and update the **Model category** and **Model** fields value for the asset. For more information, see [Close an enterprise asset remediation task](#).

11. After you're finished scanning assets, mark the audit as complete.

a. Tap the three dots icon in the navigation bar.

b. Tap **Complete**.

A confirmation message appears on the audits page.

i Note:

You can start a new scan as many times as you need while the audit is in progress. After you mark the audit as **Complete**, you can't scan any more assets.

[Close an enterprise asset remediation task](#)

Create an enterprise asset from the inventory audit screen

Create an enterprise asset record for the scanned asset that doesn't exist in your ServiceNow instance and that is detected when auditing inventory.

Before you begin

Role required: asset, and sn_itam_common.asset_audit_admin, or sn_itam_common.asset_audit_user

About this task

i Important:

This feature is available with Enterprise Asset Management version 10.0.0 onwards.

When scanning an asset in the inventory, if a new asset is detected that doesn't exist in your ServiceNow[®] instance, you can create a record for it. You can add the asset directly from the audit screen in the ServiceNow Agent app.

i Note:

This procedure applies when you scan assets for a single scan audit record.

Procedure

1. From your mobile device, launch the ServiceNow Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
3. Select the stockroom or location audit record.
4. Tap **Start audit**.

i Note:

This button appears only for the location audit.

5. Select Scan.

The Asset scan page is displayed.

6. In the Asset tag/Serial number/Model barcode field, enter or scan the asset tag, serial number, or model barcode of the asset.**7. Tap Next.****8. Optional: Select an Aisle and space.****9. Select Submit.**

The List of assets and models screen is displayed.

**10. Tap the three dots icon****11. Tap Create new asset.**

The Create asset from audit screen is displayed.

12. On the form, fill in the following fields.

Create asset from audit screen

Model	The product model of the asset.
Stockroom	The stockroom where the asset is available.
State	The State field value is automatically set to In stock . Change this value as needed.
Substate	The Substate field value is automatically set to Available . Change this value as needed.
Asset Tag	Alphanumeric information assigned by your organization to help track the asset.
Serial Number	Serial number of this asset.
MAC address	MAC address of the mobile device

Note:

Depending on the IRE rule configured for the selected **Model** field value, either **Asset Tag**, **Serial Number**, or **MAC address** field value is required to save the audit record.

For more details on these field descriptions, see [Asset fields for enterprise assets](#).

13. Tap **Submit**.

A confirmation message is displayed on the screen, and the asset record is created.

Result

In the audit results, the **New** field value is incremented for each new asset scanned in the inventory.

Verify and depart your enterprise assets for disposal using the Mobile Agent application

Use the ServiceNow[®] Mobile Agent application to complete the verification and departure of any enterprise assets that you want to dispose of.

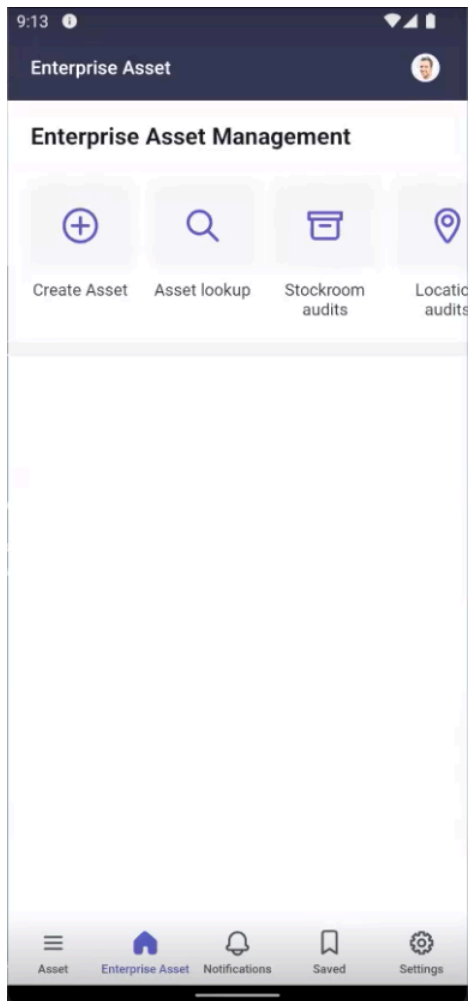

Before you begin

Before you can complete the verification or departure of an enterprise asset, create a disposal order for that asset. See [Create a disposal order in the Enterprise Asset Workspace](#) for detailed instructions.

Role required: sn_eam.enterprise_admin or sn_eam.enterprise_asset_manager

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **Enterprise Asset** tab.
The navigation bar displays tabs for the ServiceNow applications and applets that you have access to through the Mobile Agent application. The navigation bar also displays tabs for your Mobile Agent application settings and notifications.
The home screen for the Enterprise Asset Management application opens.

3. Tap **Asset disposal.**

The Asset disposal screen opens, where you can view all open verification and departure tasks for your enterprise asset disposal orders.

4. If the enterprise assets that are associated with a disposal order require verification, complete the verification task for that disposal order.

a. On the **Verifications tab, tap the verification task that you want to complete.**
The Verifications screen opens.

b. Tap the **Not verified field to view the complete list of enterprise assets that require verification through this verification task.**

c. Tap the back arrow at the top left corner of the screen to return to the Verifications screen.

d. Tap **Scan.**
The Scan and verify assets screen opens.

e. Use the camera on your mobile device to scan the asset tag of the enterprise asset that you want to verify.
You can also enter the asset tag value manually in the **Asset Tag** field.

f. Tap the Enter key on the keyboard of your mobile device.

The enterprise asset is automatically added to the **Review** tab of the Scan and verify assets screen.

- g.** Repeat steps e and f for every enterprise asset that you want to verify.
- h.** After you scan or enter the asset tag value for all desired enterprise assets, go to the **Review** tab to verify the complete list.

If you want to remove any enterprise assets from the list, tap the Delete icon () for that enterprise asset.

- i.** Tap **Submit**.

The Scan and verify assets screen closes and you automatically return to the Verifications screen. On the Verifications screen, the **Expected**, **Verified**, and **Not verified** fields update based on the enterprise assets that you just scanned or entered the asset tag value for.

- j.** Tap **Complete**.

The Verifications screen closes and you automatically return to the Asset disposal screen.

- 5.** If the enterprise assets that are associated with a disposal order require departure, complete the departure task for that disposal order.

- a.** On the **Departures** tab, tap the departure task that you want to complete.
The Departures screen opens.

- b.** Tap the **Not departed** field to view the complete list of enterprise assets that require departure through this departure task.

- c.** Tap the back arrow at the top left corner of the screen to return to the Departures screen.

- d.** Tap **Scan**.

The Scan and depart assets screen opens.

- e.** Use the camera on your mobile device to scan the asset tag of the enterprise asset that you want departed.

You can also enter the asset tag value manually in the **Asset Tag** field.

- f.** Tap the Enter key on the keyboard of your mobile device.

The enterprise asset is automatically added to the **Review** tab of the Scan and depart assets screen.

- g.** Repeat steps e and f for every enterprise asset that you want departed.

- h.** After you scan or enter the asset tag value for all desired enterprise assets, go to the **Review** tab to verify the complete list.

If you want to remove any enterprise assets from the list, tap the Delete icon () for that enterprise asset.

- i.** Tap **Submit**.

The Scan and depart assets screen closes and you automatically return to the Departures screen. On the Departures screen, the **Expected**, **Departed**, and **Not departed** fields update based on the enterprise assets that you just scanned or entered the asset tag value for.

- j.** Tap the **Pickup contact name** field.
The Pickup contact name screen opens.
- k.** In the **Pickup Contact Name** field, enter the name of the person who is picking up the enterprise assets for departure.
- i.** Tap **Submit**.
The Pickup contact name screen closes and you automatically return to the Departures screen. On the Departures screen, the **Pickup contact name** field updates with the name that you entered.
- m.** Tap **Complete**.
The Departures screen closes and you automatically return to the Asset disposal screen.

What to do next

Complete the remaining disposal order tasks on your ServiceNow instance. See [Enterprise asset disposal order stages](#) for more information on enterprise asset disposal order tasks.

Manage an Enterprise Asset Management task using the Mobile Agent application

Manage all your work order tasks and asset tasks using the intuitive Mobile Agent application.

View your tasks using the Mobile Agent application

View your work order tasks, asset tasks, and asset repair tasks using the Mobile Agent application.

Before you begin

Role required: sn_eam.enterprise_admin, sn_eam.enterprise_asset_manager, or sn_eam.enterprise_asset_technician

Procedure

- 1.** From your mobile device, launch the Mobile Agent application.
- 2.** On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
- 3.** View all the tasks assigned to you by selecting **See all**.
- 4. Optional:** Filter your tasks by field values.
 - a.** Tap the Filter icon ().
 - b.** Enter values in the fields by which you want to filter your task: **Due Date, Asset, Location, or Priority**.
- 5. Optional:** Sort your tasks.
 - a.** Tap the Filter icon ().
 - b.** Tap **Sort by**.
 - c.** Select the fields by which to sort your tasks.

Assign a group task to yourself using the Mobile Agent application

Claim tasks to work on from the tasks assigned to your assignment group through the Mobile Agent application.

Before you begin

Role required:

- To work on a work order task: `wm_agent` and `sn_eam.enterprise_asset_technician`
- To work on Pick Up Asset task: `sn_eam.enterprise_asset_technician`

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with a **My group task** link and the first few tasks in the list of tasks assigned to you displayed.
3. View the list of tasks assigned to your group by tapping **My group task**.
4. Tap the task that you want to assign to yourself and then tap **Assign to me**.

Result

The assigned task is shown in your My Tasks list.

Start working on tasks using the Mobile Agent application

Indicate in the Mobile Agent application when you start work on a task assigned to you. When you start working on the task, the start time is automatically recorded.

Before you begin

Role required:

- To work on a work order task: `wm_agent` and `sn_eam.enterprise_asset_technician`
- To work on Pick Up Asset task: `sn_eam.enterprise_asset_technician`

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the task that you want to start.
6. On the **Details** tab, tap **Start Work**.

Result

- In the **Details** tab, the **Start Work** link changes to **Complete Work** automatically.
- The more actions icon () with the **Pause work** and **Record time** options is displayed in the top-right corner of the screen.
- The start time is automatically recorded.

Record time worked on a task using the Mobile Agent application

Manage and record time worked on work order tasks and asset tasks. After you start working on a task, you can pause and resume work. You can also record the time worked manually.

Pause a task using the Mobile Agent application

Record a break from a work order task or asset task in the Mobile Agent application if you're not continuing to work on it. Resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Before you begin

The `work.management.allow.auto.timecard` system property must be enabled for the time cards to be automatically created when you start working on a task.

Role required:

- To work on a work order task: `wm_agent` and `sn_eam.enterprise_asset_technician`
- To work on Pick Up Asset task: `sn_eam.enterprise_asset_technician`

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task you want to pause isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the task record that you want to pause.
6. Tap the more actions icon () at the top right corner of the screen and then tap **Pause work**.
On the **Details** tab, the **Close complete** option changes to **Resume work**.
7. Tap **Resume Work** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time worked time card.

Record time worked for a task manually using the Mobile Agent application

Record time worked on a work order task or asset task manually and provide any additional comments on the task using the Mobile Agent application.

Before you begin

Role required: wm_agent or sn_eam.enterprise_asset_manager

About this task

You can record time for a work order task or an asset task that is in progress.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task for which you want to record time isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the task record for which you want to record time.
6. Navigate to **Record time** from the more actions icon () or the **Details** tab.
 - Tap the more actions icon () at the top right corner of the screen and then tap **Record time**.
 - On the **Details** tab, tap **Record time**.
7. On the Record time screen, specify the details of the task.
 - a. Specify the date in the **Work Date** field.
By default, this field is set to the current date.
 - b. Enter the time duration that you worked on the task in the **Time worked (Hours)** and **Time worked (Minutes)** fields.
 - c. **Optional:** Provide any additional information in the **Comments** field.
8. Tap **Done** and then tap **Submit**.

Result

The Time worked form is saved and the time card is added to the Time worked list.

Initiate a request to source parts for work order tasks using the Mobile Agent application

Initiate a request to source the missing parts of an enterprise asset associated with a work order task by using the Mobile Agent application.

Before you begin

Role required: sn_eam.enterprise_asset_manager or wm_agent

About this task

You can work on part requirements associated with a work order task in the Mobile Agent application but you can't create a part requirement.

You can only initiate the sourcing workflow using the Mobile Agent application. The sourcing flow can be completed only in the Enterprise Asset Workspace.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task for which you want to create a source parts request is not displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the task for which you want to request to source missing parts.
6. Tap the **Parts** tab.
The Part Requirements section shows a list with the first few part requirement records associated with the work order task.
7. If the part for which you want to create a source parts request isn't displayed, tap **See all**.
8. **Optional:** Update the required quantity of parts that you want to source.
 - a. Tap the part requirement record.
 - b. On the Part requirements form, enter the quantity in the **Required quantity** field.
 - c. Tap **Submit**.
9. Tap **Source Parts Request**.

Result

- A catalog request is created for sourcing the parts.
- The status of the part requirements record changes from Not requested to Requested.
- In the Requested items list, an open work order parts request is created automatically.

What to do next

You must complete the sourcing of the requested parts in the Enterprise Asset Workspace. For more information, see [Source parts for an Enterprise Asset Management work order or work order task](#).

Close a Pick Up Asset task using the Mobile Agent application

Complete and close the Pick Up Asset task for the enterprise asset that you have picked up from the designated stockroom for your assigned work order using the Mobile Agent application.

Before you begin

The status of the Pick Up Asset task must be Work in progress.

Role required: wm_agent or sn_eam.enterprise_asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task you want to close isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the work order task for which you want to close the associated Pick Up Asset task.
6. Tap the **Parts** tab.
The Pick Up Asset Tasks section shows the first few Pick Up Asset tasks in the list of tasks associated with the work order task assigned to you.
7. If the task you want to complete isn't displayed, tap **See All**.
8. Tap the Pick Up Asset task that you want to complete and then tap **Close complete**.

Result

- The state of the Pick Up Asset task changes from Open to Closed Complete.
- A record is created in the Asset Usages section with the Status of Not Used and State of In stock.

Note:

For a consumable asset, the State changes to Consumed.

What to do next

Take necessary asset action on the enterprise asset associated with the work order. For details, see [Take action on an enterprise asset using the Mobile Agent application](#).

Take action on an enterprise asset using the Mobile Agent application

Deploy, remove, or swap any assets or parts that are required for an enterprise asset by using the Mobile Agent application. You can also use the application to calibrate your enterprise assets.

Before you begin

Role required: wm_agent

About this task

Note:

Starting with Enterprise Asset Management version 10.0, a work order can be associated with more than one asset or an asset group.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.

3. If the task you want to work on isn't displayed, tap **See all**.

4. **Optional:** Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the work order task for which you want to take action.

6. Complete all the work that is required for the work order task.

- If you want to deploy, swap, or remove any required assets or parts, use the following steps:

a. Tap the **Parts** tab of the work order task.

By default, the Asset Usages list displays only the first few assets and parts that are associated with the work order task. If the asset or part that you want to take action on isn't displayed, tap **See all**.

b. On the Asset Usages list, choose the action that you want to take on the asset or part.

 **Note:**

If you want to filter the displayed assets or parts, tap the Filter icon () and enter the values to use as a filter in the **Quantity, State, Substate, or Display name** fields.

Available actions

Action	Description
Deploy an asset or part	<p>The asset or part must have a status of Not Used.</p> <p>You can also deploy assets or parts from your personal stockroom that have a state of In stock and a substate of either Available or Reserved.</p> <ol style="list-style-type: none"> i. Select the asset. ii. Tap Deploy. iii. On the Deploy asset screen, tap the asset that you want to deploy. iv. On the Deploy asset execute screen, in the Quantity field, select the quantity of parts that you want to deploy. v. Add the asset or part as a child of another asset or part by tapping Add to asset and then selecting the required asset from the asset list. vi. Assign the asset or part to a specific user by tapping Assign to user and then selecting the user from the list of users. vii. Tap Deploy. <p>Result</p> <ul style="list-style-type: none"> ▪ The Asset Usages list reloads to display the deployed asset or part with a Status of Used and State of In use. The Status of a consumable asset changes to Consumed.

Action	Description
	<ul style="list-style-type: none"> ▪ If the work order task has an asset group and affected assets list, the deployed asset is added to the asset group and to the Affected assets section in the Related list. <p>Note: The Affected assets tab is available with Enterprise Asset Management version 10.0 and later.</p> <ul style="list-style-type: none"> ▪ If the work order task has an affected assets list but no asset group selected, the deployed asset is added to the Affected assets list only.
<p>Remove an asset or part</p>	<p>The asset or part must have a state of In use, In maintenance, or Consumed.</p> <ol style="list-style-type: none"> i. Select the asset or part. ii. Tap Remove. iii. On the Remove asset screen, tap the asset or part that you want to remove. iv. Tap Remove. <p>Result</p> <ul style="list-style-type: none"> ▪ The Asset Usage section reloads to display the removed asset or part, which now has the Status of Removed and State of In stock. ▪ If the work order task is based on an asset group, the removed asset is also removed from the asset group.
<p>Swap an asset or part with a replacement part</p>	<ol style="list-style-type: none"> i. Tap Swap. ii. On the Select asset to swap screen, tap the asset or part that you want to swap. iii. On the Swap assets screen, in the Swap in asset field, select the replacement part that you want to swap in from the asset list. <p>Note: The replacement part must have a State of In stock and a substate of Available.</p> <p>Result</p> <ul style="list-style-type: none"> ▪ The Asset Usages list reloads and displays the updated asset statuses: <ul style="list-style-type: none"> ▪ The Swap out asset has a status of Removed. ▪ The Swap in asset has a status of Used. ▪ The replacement asset is automatically added to the Affected assets section in the Related list.

Action	Description
	<p>Note: The Affected assets section is available with Enterprise Asset Management version 10.0 and later.</p> <ul style="list-style-type: none"> If the work order task is based on an asset group, the swapped-out asset is removed from the asset group, and the replacement asset is added to the asset group.

- If you want to calibrate the associated enterprise asset, use the following steps:

a. Navigate to the calibration playbook.

- In Enterprise Asset Management version 10.0 and later, perform these steps:

i. Tap **View calibrations on the work order task.**

Note:

The **View calibrations** button is only visible when the work order task is in the Work in progress state. If the work order task is associated with an asset group that has no calibration attributes defined for the assets, the **View calibrations** button is not visible.

The Calibration events screen opens with two tabs: **Open** and **Completed**.

- The **Open** tab displays all calibration events that are not yet completed.
 - The **Completed** tab displays all completed calibration events.
- ii. Tap the calibration event that you want to complete.**
- In Enterprise Asset Management versions prior to 10.0, tap **Calibrate** on the work order task.

Result

The Calibration event playbook opens.

Note:

Each lane in the playbook represents an activity that you must complete as part of the calibration event workflow.

b. Expand the Calibration event playbook.

c. Expand the Details lane and then tap **Calibration event details.**

d. On the Calibration event details screen, fill in the fields.

Calibration event details screen

Field	Description
Name	Name of the calibration event.
Environmental conditions	
Temperature	Temperature of the environment in which you are performing the calibration.

Field	Description
Temperature unit	Unit of temperature that you are using to measure the environmental temperature.
Humidity (%)	Relative humidity level of the environment in which you are performing the calibration.

e. Tap **Mark as complete.**

The Details lane is marked as Complete and you automatically progress to the Calibration Lines lane.

f. On the Calibration lines screen, select the calibration line that you want to complete or skip.

Each calibration line corresponds with a calibration attribute on the associated enterprise asset. If any calibration attribute contains multiple points at which you can measure accuracy, the Enterprise Asset Management application creates a separate calibration line for each point. You can choose to complete or skip each calibration line as needed. For more details on calibration attributes, see [Add calibration attributes to an enterprise asset](#) or [Add calibration attributes to an enterprise model](#).

g. On the Calibration line record, use one of the following options to complete or skip the calibration line:

- To complete the calibration line, tap **Edit**. On the Edit calibration line screen, fill in the fields and then tap **Submit**.

Edit calibration line screen

Field	Description
Instrument	Instrument that you are using to perform the calibration. If you specified an instrument model in the Instrument model field of the corresponding calibration attribute, the options in this field are filtered based on the specified instrument model.
Expected value	Value that you are measuring tolerance conformance against. This field populates automatically based on the expected value that you specified in the calibration attribute. Note: This field appears only if you set the Value type of the calibration attribute to either Accuracy % full scale, Accuracy % point, or True/false.
As found value	Value that you measure prior to the calibration.
As left value	Value that you measure after the calibration.
Comment	Additional comments about the calibration.

- To skip the calibration line, tap **Skip**.

h. Return to the Calibration lines screen.

- i. Repeat steps f to h for each of your calibration lines.

Note:

If any of your calibration lines have a Result of Failed, you can remediate the entire calibration event by initiating a new work order and corresponding work order tasks. See [Remediate an unsuccessful enterprise asset calibration](#) for detailed instructions.

- j. Tap **Mark as complete**.

The Calibration lines lane is marked as Complete.

- k. Repeat steps b through j for each calibration event in the **Open** tab.

What to do next

Close the work order associated with the enterprise asset. For details, see [Close a work order for an enterprise asset using the Mobile Agent application](#).

Close a work order for an enterprise asset using the Mobile Agent application

Close an assigned work order by marking all the required work for the associated asset as complete using the Mobile Agent application.

Before you begin

Role required: wm_agent

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task you want to close isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields to sort your tasks.
5. Tap the work order task that you want to close.
6. On the **Details** tab of the work order task, tap **Close Complete**.
7. In the **Work notes** field, enter your closure comments.
8. Tap **Done**.
9. Tap **Submit**.

Result

The state of the work order task changes from Work In Progress to Closed Complete.

Create a checklist for work order tasks using the Mobile Agent application

Manage your work order tasks by creating a checklist of all items that you must complete for a work order or work order task using the Mobile Agent application.

Before you begin

Role required: wm_agent

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task for which you want to create a checklist is not displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () , enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon () , tap **Sort by**, and select the fields to sort your tasks.
5. Tap the work order task for which you want to create a checklist.
6. Tap the **Related** tab.
The Checklist section of the Related tab shows the existing checklists for the work order task. The checklists marked as complete are displayed at the bottom of the list.
7. In the **Checklist** section, tap **Add item**.
8. On the **Add checklist** screen, in the **Name** field, enter the name of the checklist.
9. In the **Order** field, enter the order in which the checklist item should be completed.
For example, a value of 1 indicates that the given checklist item is the first item you must complete.
10. Tap **Done** and then tap **Submit**.

Result

The checklist is displayed in the specified order in the Checklist section.

View knowledge articles related to work order tasks in the Mobile Agent application

View helpful and relevant knowledge articles attached to work order tasks in the Mobile Agent application.

Before you begin

Role required: wm_agent

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task you want is not displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () , enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon () , tap **Sort by**, and select the fields to sort your tasks.

5. Tap the work order task for which you want to view the knowledge articles.
6. Tap the **Related** tab.
7. View relevant knowledge articles.
 - To view a knowledge article related to the work order task, tap the article link in the **Attached Knowledge** section.
 - To view knowledge articles related to the parts associated with the work order task, tap the article link in the **Parts Knowledge** section.
 The selected article is displayed.

Note:

You can provide feedback on a knowledge article by rating the article, marking the article as helpful or not helpful, or posting comments for the article.

Create work notes about the work order tasks using the Mobile Agent application

Add notes with details about work order task to the task record using the Mobile Agent application.

Before you begin

Role required: wm_agent

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens with the first few tasks in the list of tasks assigned to you displayed.
3. If the task to which you want to add a work note isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields to sort your tasks.
5. Tap the work order task for which you want to add a work note.
6. Tap the **Activity** tab.
All the work notes related to the work order tasks are listed.
7. Tap **Compose**.
8. On the Compose screen, type your comments related to work order task.
9. Tap **Post**.

Result

The posted work note is shown in the **Activity** tab of the work order task record.

Set enterprise assets to the shutdown state using the Mobile Agent application

Move assets of a shutdown work order task to the shutdown state in the Mobile Agent application to indicate that the assets are unavailable for use during maintenance.

Before you begin

Important:

The Affected assets tab, Shutdown work type, and **Shutdown** option are available with Enterprise Asset Management version 10.0 and later.

The shutdown work order task must be in the Work in progress state before you can shut down assets. The assets must be in the In use or In maintenance state.

Role required: sn_eam.enterprise_asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens, displaying the first few tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the work order task of the **Shutdown** work type that has the assets that you want to shut down.
6. On the **Details** tab, tap **Start Work**.
7. Tap the **Related** tab.
The **Affected assets** section shows all the assets associated with the work order.
8. Tap **Shutdown**.
9. In the **Select assets to shutdown** screen, select the assets that you want to shut down.
10. Tap **Submit**.

Result

In the Affected assets list, the substate of the assets that are shut down changes to Is shutdown.

Start up enterprise assets after maintenance activities using the Mobile Agent application

Move assets of a startup work order task to the In use state in the Mobile Agent application to indicate that the assets are available for use after maintenance.

Before you begin

Important:

The Affected assets tab, Startup work type, and **Start up** option are available with Enterprise Asset Management version 10.0 and later.

The startup work order task must be in the Work in progress state before you can start up assets.

Role required: sn_eam.asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.

The home screen of the My Tasks application opens, displaying the first few tasks assigned to you.

3. If the task you want to start isn't displayed, tap **See all**.

4. Optional: Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
- To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the work order task of the **Startup** work type that has the assets that you want to start up.

6. On the **Details** tab, tap **Start Work**.

7. Tap the **Related** tab.

The **Affected assets** section shows all the assets associated with the work order.

8. Tap **Start up**.

9. In the **Select assets to start up** screen, select the assets that you want to start up.

10. Tap **Submit**.

Result

In the Affected assets list, the state of the assets that are started up changes to In use.

Move enterprise assets to maintenance state using the Mobile Agent application

Move assets of a break fix or planned maintenance work order task to the In maintenance state in the Mobile Agent application to indicate that the assets are under maintenance.

Before you begin

Important:

The Affected assets tab and Move to maintenance UI option are available with Enterprise Asset Management version 10.0 and later.

The break fix or planned maintenance work order task must be in the Work in progress state before you can move assets to the In maintenance state.

Only assets in the following states and substates can be moved to the In maintenance state:

- In use
- In use and Pending repair
- In use and In repair
- In use and Is shutdown

Role required: sn_eam.asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.

2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.

The home screen of the My Tasks application opens, displaying the first few tasks assigned to you.

3. If the task you want to start isn't displayed, tap **See all**.

4. Optional: Filter or sort the task view.

- To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the work order task of the Break fix or Planned maintenance work type that has the assets that you want to move to the In maintenance state.
 6. On the **Details** tab, tap **Start Work**.
 7. Tap the **Related** tab.
The **Affected assets** section shows all the assets associated with the work order.
 8. Tap **Move to maintenance**.
 9. In the **Select assets to move to maintenance** screen, select the assets that you want to move to the **In maintenance** state.
 10. Tap **Submit**.

Result

In the Affected assets list, the state of the assets changes to In maintenance.

Manage enterprise asset repair tasks using the Mobile Agent application

Manage all the repair tasks associated with the defective enterprise assets in your stockroom using the intuitive Mobile Agent application.

Start working on a enterprise asset repair task using the Mobile Agent application

Indicate in the Mobile Agent application when you start work on a repair task assigned to you.

Before you begin

Role required: sn_eam.enterprise_asset_technician

About this task

You can work on the repair tasks that belong to the following task types:

- Asset troubleshoot task
- Asset repair task
- Asset evaluate task

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.

5. Tap the repair task that you want to start.

6. On the **Details** tab, tap **Start work**.

Result

On the **Details** tab, the **Start work** link changes to **Start timer**, **Record time**, and **Close** automatically.

Record time worked on an enterprise asset repair task using the Mobile Agent application

Manage and record time worked on Troubleshoot asset, Repair asset, and Evaluate asset tasks using the Mobile Agent application. After you start working on a task, you can pause and resume work. You can also record the time worked manually.

Pause an enterprise asset repair task using the Mobile Agent application

Record a break from a repair task for the enterprise assets using the Mobile Agent application if you're not continuing to work on it. Resume the task when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Before you begin

After you start work on the repair task, make sure to start recording the time by tapping the **Start Timer** in the **Details** tab.

Role required: asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to pause isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon () , tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the task record that you want to pause.
6. In the **Details** tab, tap **Pause**.
On the **Details** tab, the **Pause** option changes to **Resume**.
7. Tap **Resume** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the repair task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time worked section of the Related tab.

Record time worked on an enterprise asset repair task manually using the Mobile Agent application

Record time worked on an enterprise asset repair task manually and provide any additional comments on the task using the Mobile Agent application.

Before you begin

Make sure you have indicated that you started working on the repair task by tapping **Start work** in the **Details** tab.

Role required: asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task for which you want to record time isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the repair task record for which you want to record time.
6. On the **Details** tab, tap **Record time**.
7. On the Record time screen, specify the details of the task.
 - a. Enter the time duration that you worked on the task in the **Time worked (Hours)** and **Time worked (Minutes)** fields.
 - b. **Optional:** Provide any additional information in the **Time worked comments** field.
8. Tap **Done** and then tap **Submit**.

Result

The Record time form is saved and the time card is added to the Time worked section of the Related tab.

Close an enterprise asset repair task using the Mobile Agent application

Complete an assigned enterprise asset repair task and mark the task as closed using the Mobile Agent application.

Before you begin

Role required: sn_eam.enterprise_asset_technician

About this task

You can close any task that belongs to the following task types:

- Troubleshoot asset task
- Repair asset task
- Evaluate asset task

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.

3. If the task you want to close isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields to sort your tasks.
5. Tap the repair task that you want to close.
6. On the **Details** tab of the repair task, tap **Close**.
7. On the Repair task input form screen, enter the result of your task.
8. In the **Work notes** field, enter your closure comments.
9. Tap **Done** and then tap **Submit**.

Result

The state of the repair task changes to Closed Complete.

Manage enterprise asset pick tasks using the Mobile Agent application

Work on the Asset pick tasks assigned to you by using the Mobile Agent application.

Start working on an enterprise asset pick task using the Mobile Agent application

Indicate in the Mobile Agent application when you start work on an asset pick task assigned to you.

Before you begin

Role required: inventory_user

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the Asset pick task that you want to start.
Use the details provided in the following fields on the **Details** tab to start work on the assigned asset pick task:
 - **Asset:** Asset that you should pick.
 - **Stockroom:** Stockroom from which you should pick the asset.
 - **Pick location:** Aisle and space within the stockroom from where you should pick the asset.
6. On the **Details** tab, tap **Start work**.

Result

On the **Details** tab, the **Start work** link changes to **Start timer**, **Locate**, and **Scan asset** automatically.

What to do next

Complete the asset pick task assigned to you. For details, see [Locate and pick the enterprise assets in your stockroom using the Mobile Agent application](#).

Record time worked on an enterprise asset pick task using the Mobile Agent application

Manage and record time worked on enterprise asset pick tasks by using the Mobile Agent application. After you start working on a task, you can pause and resume work.

Pause an enterprise asset pick task using the Mobile Agent application

Record a break from an enterprise asset pick task by using the Mobile Agent application if you're not continuing to work on it.

Before you begin

After you start work on the enterprise asset pick task, start recording the time by tapping **Start timer** in the **Details** tab.

Role required: inventory_user

About this task

After you pause a task, you can resume when you start working on it again. The system automatically tracks and calculates the actual time taken to complete the task even though the work was interrupted.

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to pause isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date**, **Asset**, **Location**, or **Priority** fields.
 - To sort your tasks, tap the Filter icon () , tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the asset pick task record that you want to pause.
6. In the **Details** tab, tap **Pause**.

Note:

The **Pause** option is displayed only after you tap **Start timer**.

On the **Details** tab, the **Pause** option changes to **Resume**.

7. Tap **Resume** when you're ready to work on the activity again.

Result

Each time you pause or resume work on the asset pick task, the actual time you worked on the task is automatically calculated. An entry for the time worked is created in the Time worked section of the Related tab.

Locate and pick the enterprise assets in your stockroom using the Mobile Agent application

Locate an enterprise asset placed in a specific aisle and space in the stockroom by using indoor maps. After locating the asset, pick and drop off the asset to another location within the stockroom using the Mobile Agent application.

Before you begin

You should explicitly install Indoor Mapping for Assets (com.sn_ima) application from the ServiceNow Store. When you install this application, Indoor Mapping (sn_map_core) and Indoor Mapping component (sn_map_component) are also installed.

Role required: inventory_user

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying only the first few tasks in the list of tasks assigned to you.
3. If the task you want to start isn't displayed, tap **See all**.
4. **Optional:** Filter or sort the task view.
 - To filter your tasks, tap the Filter icon () and enter the values to use as a filter in the **Due Date, Asset, Location, or Priority** fields.
 - To sort your tasks, tap the Filter icon (), tap **Sort by**, and select the fields by which to sort your tasks.
5. Tap the Asset pick task for which you have started work.
6. To locate the enterprise asset in the stockroom, on the **Details** tab, tap **Locate**.
 - The exact location of the enterprise asset in the stockroom is displayed on the map.
 - The **Get directions** option is displayed.
7. Get directions to the asset location in the stockroom.
 - a. Tap **Get directions**.
 - b. Choose the start location on the map.
 - c. Tap **Save**.
 - The following details are displayed on the map:
 - Path from the start location to the asset location
 - Approximate time required for you to reach the asset location
 - **View steps** and **Scan asset** options are displayed.
8. **Optional:** To view the route to the asset location, tap **View steps**.
9. After reaching the asset location, pick the asset.
10. Complete the Asset pick task.
 - a. Tap **Scan asset**.
 - b. Provide the asset tag information.
 - To provide the information through a scan, scan the asset tag of the asset.
 - To provide the information manually, enter a value in the **Asset tag** field.

c. Optional: In the **Drop off location** field, select the space within the stockroom where you want to drop off the asset that you picked.

d. Select Close complete.

- The state of the Asset pick task changes to Closed complete.
- The **Location** field of the asset is updated with the drop off location only if you have specified the drop off location.
- The Enterprise Asset request flow and Enterprise Refresh Request flow proceed to the next stage.

Manage Drop off tasks for enterprise assets using the Mobile Agent application

As an enterprise asset technician, manage the delivery of enterprise assets that you have in your personal stockroom to any other warehouse stockroom by creating Drop off tasks in the Mobile Agent application. The asset manager of the destination stockroom receives the assets that you dropped off, verifies the asset, and completes the Receive and Drop off tasks in the Mobile Agent application.

i Important:

The Drop off and Receive tasks in the Mobile Agent application are available with Enterprise Asset Management version 9.0 and later.

You can also manage Drop off tasks in the Enterprise Asset Workspace. For details, see [Delivering enterprise assets in your personal stockroom through Drop off tasks](#).

Create a Drop off task for enterprise assets using the Mobile Agent application

Create a Drop off task using the Mobile Agent to return the enterprise assets in your personal stockroom to any other warehouse stockroom.

Before you begin

Role required: sn_eam.asset_technician

Procedure

1. From your mobile device, launch the Mobile Agent application.
2. On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens displaying the following sections:
 - **My group task**
 - **My Tasks** with the list of tasks assigned to you.
3. In the My group task section, tap the **Create Drop Off Task** () icon.
4. On the Get Drop-Off Task Details screen, fill in the schedule details to create the drop off task.
 - a. In the **Delivery by date** field, select the date by when you want to deliver the assets to the destination stockroom.
 - b. In the **Destination stockroom** field, select the stockroom at which you want to drop off the assets.
 - c. Tap **Submit**.
The drop off task is created in the Open state and listed under My Tasks.
5. From the My Tasks list, tap the drop off task to add the assets.

You can only add enterprise assets that are in your personal stockroom and that aren't reserved and aren't part of any workflows.

- The asset that you added is listed under the Assets tab of the drop off task.
- The **Start Work** option appears for the drop off task.

6. After adding the required assets to the drop off task, tap **Start Work**.

On the **Details** tab, the **Start work** link changes to **Start timer, Record time,** and **Drop off** automatically.

7. Drop off the assets at the required stockroom.

8. Tap **Drop off**.

Result

- A Receive task is created and assigned to the asset manager of the stockroom where you dropped off the assets.
- The state of the Drop off task changes to Work in Progress.

Verify the enterprise assets received through a Drop off task using the Mobile Agent application

As an asset manager, confirm that you received the enterprise assets that were delivered to your stockroom and complete the Receive task using the Mobile Agent application.

Before you begin

Role required: sn_eam.enterprise_asset_manager

Procedure

- 1.** From your mobile device, launch the Mobile Agent application.
- 2.** On the navigation bar at the bottom of the screen, tap the **My Tasks** tab.
The home screen of the My Tasks application opens, showing you a list of your assigned tasks.
- 3.** Tap the Receive drop off task that you want to verify and complete.
The Details tab shows the following fields:
 - **Expected:** The number of assets that are expected to be received.
 - **Received:** The number of assets that have been scanned and received.
 - **Not received:** The number of assets that couldn't be received.

Note:

Before you start working on the task, the **Expected** and **Not received** fields will show the same number of assets.

4. Tap **Start work**.

On the **Details** tab, the **Start work** link changes to **Start timer, Scan,** and **Close Task** automatically.

5. Scan the enterprise assets that you physically received at your stockroom.

a. Tap **Scan**.

b. Provide the asset tag information.

Follow any of these steps for each enterprise asset that you received at your stockroom:

- Scan the asset tag of the enterprise asset that you received using the camera on your mobile device.
- Enter a value in the **Asset tag** field and tap the Enter key on the keyboard of your mobile device.

The enterprise assets are automatically added to the **Review** tab.

6. Acknowledge the receipt of the enterprise assets that you scanned.

a. Tap **Receive**.

The Receive screen opens and the **Asset tag** field displays the count of assets that you scanned.

b. Tap **Submit**.

The **Received** field in the Details tab shows the count of assets that you received.

When you receive all the enterprise assets, the value in the **Expected** field matches the value in the **Received** field.

7. After receiving all the enterprise assets, tap **Close Task**.

Result

The state of the Receive drop off task and the associated Drop off task changes to **Closed Complete**.

Manage enterprise asset put away using the ServiceNow Agent application

Scan and put away the assets from the receiving bay in the designated aisle-space using the ServiceNow Agent application.

Important:

Asset put away feature is available with Enterprise Asset Management version 9.0 onwards.

Put away enterprise assets using the ServiceNow Agent application

Scan available assets in the inventory and perform asset put away in the designated scanned drop-off location.

Before you begin

Role required: inventory_user

About this task

The inventory user can scan the available assets in the inventory and put them away in the scanned aisle-space in the stockroom. The Enterprise Asset Management application checks the existence of an active put away task for the asset and makes the required update in the Enterprise Asset Workspace.

- If an active Asset put away task exists, the task is closed when the asset is placed in the designated stockroom location.
- If an active Asset put away task doesn't exist for the asset, then a task is created and closed when the asset is placed in the designated stockroom location.

Procedure

1. From your mobile device, launch the Now Mobile Agent application.
2. On the navigation bar, tap the **Asset put away** menu.

Result

A confirmation message appears on the mobile screen showing the number of put away tasks closed.

Procuring enterprise assets

You can use the ServiceNow[®] Procurement application to source and receive requested enterprise assets so that you can fulfill service catalog requests.

Overview of procuring enterprise assets

With the Procurement application, you can

- track and manage service catalog requests,
- create and manage purchase orders,

- create and manage transfer orders,
- and receive assets.

See [Procurement](#)  for more information on procuring assets.

Source requests from Enterprise Asset workspace

You can create a request in the Service Catalog application and source that request from the Enterprise Asset Workspace.

Before you begin

You can source a request by using assets from the requester's local stockroom, if stock is available in the local stockroom. If stock is unavailable in the local stockroom, you can get the assets transferred from other stockrooms or create a purchase order.

Role required: `proc_user`

Procedure

1. Navigate to **Enterprise Asset Workspace > Procurement > Catalog tasks**.
2. Open the sourcing task for the request and select **Source request**.
3. On the Sourcing page, select either of these three options:
 - **Consume**: If the stock is available in your local stockroom.

If the Asset pick task is enabled for the source stockroom, the task is added to the Enterprise Asset Refresh Request and Enterprise Asset Request flows.

- **Transfer**: If the stock isn't available in your local stockroom and you want to source the request via a transfer order.

Note:

If you create a transfer order and want the local stockroom to be included in the list of stockrooms to choose from, the admin must turn on the `glide.asset.procurement.sourcing.local_stock_transfer` property.

- **Purchase**: If the stock isn't available in your local stockroom and you want to source a request via a purchase order.
4. Fill in the required fields based on the option that you choose.
 5. Select **Submit**.

A task for transfer order line or purchase order line is created if you selected **Transfer** or **Purchase**. You can open the request to view the task.

Enterprise Asset Management reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Enterprise Asset Management.

Domain separation and Enterprise Asset Management

Domain separation is supported in Enterprise Asset Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see [Application support for domain separation](#) .

Overview

Domain separation support in the product enables service providers to offer managed services for enterprise asset management to their customers. This feature also caters to large organizations who manage their subsidiaries as independent domains.

How domain separation works in Enterprise Asset Management

In Enterprise Asset Management, domain separation occurs in two stages: data separation and process separation. There are two system properties that are used to enable or disable the separation. In the Tokyo release, both data and process are domain-separated.

Note:

The [Recommended practice](#)  is to avoid customizing the base system domain configuration record.

Required plugins

- Domain separation extension (com.glide.domain.msp_extensions.installer)
- Performance Analytics – Domain Support (com.snc.pa.domain_support)
- Work management (com.snc.work_management)

Other supported plugins

- Service Catalog – Domain Separation (com.glideapp.servicecatalog.domain_separation)
- Procurement (com.snc.procurement)

To learn more, see [Domain separation explained](#) , [Contains queries and domain access](#) , and [Importance of Default domain](#) .

Enterprise Asset Management roles

The following roles help you to configure and use the Enterprise Asset Management application to manage the life cycle of your assets, parts, and their hierarchical relationships.

After access has been granted to a role, all the groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

Enterprise Asset Management roles

Role title	Contains roles	Description
Enterprise asset manager [sn_eam.enterprise_asset_manager]	<ul style="list-style-type: none"> • wm_initiator • sn_eam.enterprise_mobile_user • sn_eam.enterprise_asset_creator • sn_eam.enterprise_asset_technician • sn_eam.asset_manager • inventory_user • contract_manager • procurement_user • cmdb_query_builder • cmdb_read • plan_maint_admin • wm_task_initiator 	This role has access to all Enterprise Asset Management features except administrative functions.
Enterprise admin [sn_eam.enterprise_admin]	<ul style="list-style-type: none"> • inventory_admin • catalog_manager • report_user • sn_eam.enterprise_asset_manager • asset • procurement_admin • sn_ent.classification_manager • sn_otam.ot_asset_manager 	This role has full access to the Enterprise Asset Management application as well as the OT Asset Workspace.
Enterprise technician [enterprise_asset_technician]	<ul style="list-style-type: none"> • sn_eam.enterprise_mobile_user • sn_eam.enterprise_asset_editor • sn_ent.classification_reader • canvas_user 	<p>This role is for users who perform work tasks and update asset records as part of the asset lifecycle. This role has access to the following enterprise asset tasks:</p> <ul style="list-style-type: none"> • all RMA tasks except the Prepare task • all recall tasks • all disposal tasks • all loaner tasks except the Prepare task

Role title	Contains roles	Description
		<ul style="list-style-type: none"> enterprise asset audit lease-end Collection, Preparation, and Shipment tasks
Enterprise mobile user [sn_eam.enterprise_mobile_user]	none	This role has access to scan assets from a mobile application as well as dispose assets from a mobile application.
Agent [wm_agent]	none	<p>This role is for users who perform work on enterprise assets and record details in the corresponding work orders and work order tasks.</p> <p>Note: The wm_agent role must contain an additional role such as enterprise_asset_manager, enterprise_asset_technician, or any other role to log into the Enterprise Asset Workspace.</p>

OT Asset Workspace roles

The following roles help you to manage the OT Asset Management application.

Access to the OT Asset Workspace depends on the role assigned to you.

- OT asset manager [sn_otam.ot_asset_manager]: Provides full access to the OT Asset Workspace.
- OT asset technician [sn_otam.ot_asset_technician]: Provides limited access to the OT Asset Workspace.

Asset fields for enterprise assets

A detailed description of all asset fields in the Enterprise Asset Management application.

Asset Details

Field	Description
Display name	Name of the asset as it appears in record lists. Automatically set when asset is created, based on Asset Tag and Model fields.
Model	Specific product model of the asset.

Asset Details (continued)

Field	Description
	<p>Note: If you are creating a consumable asset, you can select any product model that meets the following criteria:</p> <ul style="list-style-type: none"> • The Model type is set to Consumable. • The product model falls under the Enterprise good model [sn_ent_model] class or any of its child classes.
Model category	Model grouping of the asset. Based on the model category selected, the asset can be linked to a configuration item.
Parent	Parent asset of the asset. When a parent link is defined, the fields related to assignment and state of the child assets is set to read-only and are populated based on the parent assignment and state fields.
Asset type	<p>Type of multi-component asset. The following are the types of multi-component assets:</p> <ul style="list-style-type: none"> • Pre-assembled • User-assembled • Simple • Simple with add-on • Pre-assembled with add-on • User-assembled with add-on
Asset tag	Alphanumeric information assigned by your organization to help track the asset.
Configuration item	CI automatically created when this asset is created. The name that appears in this field is based on Serial number and Model . Point to the reference icon to see the configuration item details inherited from the asset record.
Serial number	Serial number of this asset.
State	<p>The current state of the asset. By default, the newly created asset is in Build state. Once you configure the asset and its components, you can change the status of the model.</p> <p>The other state options are:</p> <ul style="list-style-type: none"> • On order • In stock • In transit

Asset Details (continued)

Field	Description
	<ul style="list-style-type: none"> • In use • In maintenance • Retired • Missing
Substate	Current substate of the asset, such as Available or Reserved . The values in the Substate list change based what you select from the State list.
Asset function	Function as which the asset is used such as Primary, Secondary, Shared, or Loaner.
Stockroom i Note: This field appears only if you set the State field to In stock .	Stockroom that the asset is located in.
Aisle and space	Aisle and space details of the asset within the stockroom. This field appears only when the state of the asset is In stock or Build .
Reserved for i Note: This field appears only if you set the State field to In stock or In transit .	User who the asset is reserved for.
Quantity	Number of items this asset represents. An asset always has a quantity of one unless one or more of these points are true. <ul style="list-style-type: none"> • It is a consumable. Quantity is unrestricted because consumables are tracked in groups. • It is pre-allocated. Quantity is unrestricted when Model category and Model are defined and Substate is set to Pre-allocated.
Eligible for refresh	Indicates whether or not the asset is eligible for a refresh. If the date in the Installed field is in the past, this check box is shown. This check box is selected automatically two months before the number specified in the model's Useful life (months) field. When the EAM- Calculate Asset Refresh Eligibility weekly scheduled

Asset Details (continued)

Field	Description
	job runs, it calculates all of the assets that are eligible for refresh.
Location	<p>Current physical location of the asset.</p> <p>Note:</p> <p>If you set the location to a specific building, floor, or place, and then set the <code>sn_itam_common.sn_enable_indoormap_for_a</code> system parameter to true on your ServiceNow instance, the Enterprise Asset Management application automatically populates a corresponding location hierarchy of up to three levels, including the campus, building or structure, and floor that the asset is currently located in. The location hierarchy depicts the hierarchical relationship between the specified location and the corresponding parent locations. You can view the location hierarchy in the Location Hierarchy section of the asset record, which is generated after you fill in all fields and save the form.</p> <p>Note:</p> <p>If you set the location to a specific place and then set the <code>sn_itam_common.sn_enable_indoormap_for_a</code> system parameter to true on your ServiceNow instance, the asset record, which is generated after you fill in all fields and save the form, includes an interactive map that shows the real-time location of the asset. This map is still included in the asset record when you open the record from an associated work order task or stockroom record.</p> <p>The map does not display by default. To display the map, select the Location map icon () on the sidebar of the asset record.</p>
Assigned to	Person using or primarily responsible for this item. This field is visible when the asset state is In Use .
Assigned	Date on which the asset was assigned to a user.

Asset Details (continued)

Field	Description
Managed by	Person who maintains the asset. This can be different from the person in the Owned by field.
Installed	Date on which the asset was assigned to the person mentioned in the Assigned to field.
Owned by	Person who has financial ownership of the asset. This can be different from the person in the Managed by field.
Warranty expiration	The date the warranty expires.
Company	Company or organization to which this asset belongs.
Department	Department to which the asset belongs.
RFID tag	<p>Real-time radio-frequency identification (RFID) tag that is associated with the asset. See Zebra MotionWorks RFID integration for Enterprise Asset Management for more information on RFID tags.</p> <p>Note: If this asset is a child of another asset and does not contain its own RFID tag, the RFID tag field populates with the RFID tag of the parent asset. If you remove the parent asset, the RFID tag field is cleared for this asset.</p>
MAC address	<p>MAC address of the asset.</p> <p>Important: From the Yokohama release onward, the value in this field is populated based on the MAC address [mac_addr] field in the Asset [alm_asset] table. The MAC address [mac_address] field in the Hardware [alm_hardware] table is deprecated.</p> <p>This field isn't shown on the asset form for consumables and pallets.</p>
Support group	<p>Group responsible for maintaining and managing the asset.</p> <p>The support group can belong to any of the following group types:</p> <ul style="list-style-type: none"> • Asset managers • Asset techs

Asset Details (continued)

Field	Description
Supported by	Specific individual from the support group who is assigned to support the asset.
Comments	Message to add if any.

Financial form

Field	Description
Vendor	Vendor from which the asset was purchased. For assets automatically created from purchase orders in Procurement, the default value of the Vendor field is the vendor specified on the purchase order.
Opened	Date on which the requested item record was opened. The system automatically populates the field when a request line is specified.
Invoice number	Number of the invoice.
GL account	General ledger account number with which the asset is associated.
Request line	Requested item to which the asset is linked.
Cost	Price at which the asset was purchased.
Cost center	Cost center under which the asset was billed.
Acquisition method	How the asset was acquired. Base system choices are Purchase, Lease, Rental, Loan, and RMA Replacement . For assets automatically created from purchase orders in Procurement, the default value is Purchase
PO number	Purchase Order under which the asset was billed.

Depreciation form

Field	Description
Depreciation	Depreciation method that is applied. Base system choices are Declining Balance and Straight Line . The depreciation value is defaulted from the associated Model.
Residual date	Number of days that have passed since the Depreciation effective date .
Depreciation effective date	Date on which the specified depreciation method begins.

Depreciation form (continued)

Field	Description
Residual value	Value in the Cost field with the depreciation method applied.
Salvage value	Estimated value of an asset at the end of its useful life. This value must be less than or equal to the Cost of the asset.
Depreciated amount	Amount the asset has depreciated.

Lease Contract

Field	Description
Lease contract	Name of the lease contract that applies to the asset.
Lease expiration date	Date on which the lease contract expires
Lease term (months)	Length of the lease contract, in months.
Monthly lease payment	Amount that you must pay monthly for the lease contract. Note: You can set this field to any currency of your choice.

Disposal form

Field	Description
Disposal order number	A unique number assigned to the asset disposal order.
Disposal vendor	The vendor assigned to carry out the asset disposal order.
Scheduled retirement	Scheduled date on which the asset is retired.
Retired date	Actual date on which the asset was retired.
Vendor disposal order ID	Order number assigned by the vendor assigned to carry out the asset disposal order.
Resale price	Value of the asset when it is retired. For example, if the asset is donated, the value used when reporting taxes.
Disposal date	The date when the asset disposal order process is completed.

Disposal form (continued)

Field	Description
Beneficiary	Organization that receives the asset when it is retired.

Asset Audit

Field	Description
Audit number	Audit number of the asset.
Audit type	Type of audit that was carried out on the asset.
Last audit date	Date on which the last audit was done.
Last audit state	State of the last audit.
Audited by	Person who performed the last audit.

RFID

Note:
If this asset is a child of another asset, the RFID location data that is mapped to and populated in these RFID form section fields is based on the RFID tag to which the asset is associated.

- **If this asset contains its own RFID tag, all RFID location data is based on that RFID tag.**
- **If this asset does not contain its own RFID tag, all RFID location data is based on the RFID tag of the parent asset. If you remove the parent asset, all RFID location data is cleared from the RFID form section fields for this asset.**

Field	Description
RFID tag	Real-time radio-frequency identification (RFID) tag that is associated with the asset. For more information on RFID tags, see Zebra MotionWorks RFID integration for Enterprise Asset Management .
Type	Type of RFID tag that is associated with the asset.
Tag source	Source of the asset's RFID location data that is stored and transferred through the RFID tag.
Serial number	Serial number of the asset.
Last blink time	Time at which the RFID tag was last scanned.
Last blink elapsed time	Amount of time that has passed since the RFID tag was last scanned.
Latitude	Latitudinal value of the asset.

RFID

Note:
If this asset is a child of another asset, the RFID location data that is mapped to and populated in these RFID form section fields is based on the RFID tag to which the asset is associated.

- **If this asset contains its own RFID tag, all RFID location data is based on that RFID tag.**
- **If this asset does not contain its own RFID tag, all RFID location data is based on the RFID tag of the parent asset. If you remove the parent asset, all RFID location data is cleared from the RFID form section fields for this asset.**

(continued)

Field	Description
Longitude	Longitudinal value of the asset.
Active	Option that indicates if the RFID tag is active. RFID location data can be mapped to the asset only if you select this option.
Site name	Name of the site that the asset is located in.
Zone group	Interrogation zone group that the asset belongs to.
Zone group dwell	Amount of time for which the asset belongs to the specified interrogation zone group.
Zone	Interrogation zone that the asset is located in.
Zone dwell	Amount of time for which the asset is located in the specified interrogation zone.
Grid-x	X coordinate of the asset within the designated RFID grid. The RFID system uses the XYZ coordinates to pinpoint the location of the asset.
Grid-y	Y coordinate of the asset within the designated RFID grid. The RFID system uses the XYZ coordinates to pinpoint the location of the asset.
Grid-z	Z coordinate of the asset within the designated RFID grid. The RFID system uses the XYZ coordinates to pinpoint the location of the asset.
Status	Status of mapping RFID location data to the asset. If the data is successfully mapped to the asset, this field is set to Matched . If the data is not mapped to the asset, this field is set to Unmatched .
<p>Important: RFID location data can be mapped to the asset only if you select the Active option in the RFID form section.</p>	

RFID

Note: If this asset is a child of another asset, the RFID location data that is mapped to and populated in these RFID form section fields is based on the RFID tag to which the asset is associated.

- If this asset contains its own RFID tag, all RFID location data is based on that RFID tag.
- If this asset does not contain its own RFID tag, all RFID location data is based on the RFID tag of the parent asset. If you remove the parent asset, all RFID location data is cleared from the RFID form section fields for this asset.

(continued)

Field	Description
	<p>Tip: You can view and take action on the asset records that have an RFID Status of Unmatched by using the Unmatched RFID tags important action that appears on the Overview tab of the Enterprise asset estate view. For more information on the Enterprise asset estate view, see Enterprise asset estate overview for Enterprise Asset Workspace.</p>

Activities

Field	Description
Work notes	<p>Work notes are updated for the following cases:</p> <ul style="list-style-type: none"> • Updates to Assigned To, Managed To State, Substate, and Reserved fields of asset. The columns for these fields are audited by default and any update is recorded in the work notes. • Work notes are updated when asset is received by a purchase order and transfer order. These work notes help in tracking life cycle of the asset.

Device as a Service

Field	Description
DaaS asset	Option that indicates if the given asset is a Device as a Service (DaaS) asset.
DaaS account	DaaS account that the asset is leased to.

Asset audit fields for enterprise assets

Create New Asset Audits form and related fields description.

Create New Asset Audits form

Create New Enterprise Asset Audit

Field	Description
Audit number	Audit reference number.
Assignment group	Group to which you want to assign the audit.
Assigned to	Person responsible for the audit.
Type	Type of the audit. The available values are <ul style="list-style-type: none"> • Location • Stockroom
Status	Current status of the audit.
Location i Note: This field appears only if you set the Type field to Location .	Location in which you want to perform the audit.
Include child locations i Note: This field appears only if you set the Type field to Location .	Option to include child locations in the audit.
Stockroom i Note: This field appears only if you set the Type field to Stockroom .	Stockroom in which you want to perform the audit.
Model category	Model category that you want to audit.
Aisle and space i Note: This field appears only if you set the Type field to Stockroom .	Aisle and space within the stockroom where you want to perform the audit.
Scheduled date	Date on which you want to perform the audit.
Scan date	Date on which you want to scan the assets.

Create New Enterprise Asset Audit (continued)

Field	Description
<p>Include consumables</p>	<p>Option to include consumable assets in the stockroom audit. The available options are:</p> <ul style="list-style-type: none"> • Yes: When this field is set to Yes, consumable assets are included in the inventory audit. • No: When this field is set to No, consumable assets aren't included in the inventory audit. <p>Note: You can include consumable assets only for stockroom audit. When the Type field is set to Stockroom, this field is activated. When the Type field is set to Location, this field is automatically set to No and inactive.</p> <p>The default populated value for this field is derived using the <i>sn_itam_common.set_default_include_consumables</i> system property.</p> <ul style="list-style-type: none"> • When this system property value is set to yes, the default value for the Include consumables field is set to Yes. • When this system property value is set to no, the default value for the Include consumables field is set to No. <p>Important: This field is available with Enterprise Asset Management version 10.0.0 onwards.</p>
<p>Scan method</p>	<p>Type of scan method for scanning the assets. The available options are:</p> <ul style="list-style-type: none"> • Single scan • Multi scan <p>Depending on the value of the Include consumables field, the default selection for the scan method is automatically determined.</p> <ul style="list-style-type: none"> • When the Include consumables field is set to Yes, the Scan method field value is automatically set to Single Scan and can't be edited. • When the Include consumables field is set to No, the Scan method field becomes editable, enabling you to select the desired scan type. <p>Depending on the selected scan method for the audit record, you can scan the assets in the inventory using the ServiceNow Agent app.</p>

Create New Enterprise Asset Audit (continued)

Field	Description
	<ul style="list-style-type: none"> To complete asset scanning for the single scan audit record, see Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app. To complete asset scanning for multi scan audit records, see Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app. <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: This field is available with Enterprise Asset Management version 10.0.0 onwards.</p> </div>

i Note:

The audit result fields such as **Expected, Not expected and location corrected, Missing, New, and Excluded from licensing** can't be edited. When the asset is scanned in the inventory using the ServiceNow Agent app, values are automatically updated in these fields. For more information about scanning assets, see [Complete a single scan enterprise asset inventory audit using the ServiceNow Agent app](#) and [Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app](#).

[Complete multi scan enterprise asset inventory audit using the ServiceNow Agent app](#)

Audit results

The Audit results shows the status of the assets when the scheduled or blind audits of asset stockrooms and other locations is complete.

The audit results are generated by comparing the assets scanned at the physical location or stockroom and the asset records present in the ServiceNow instance.

i Important:

This following audit result fields are available with Enterprise Asset Management version 10.0.0 onwards.

Asset audit result

Description	Description
Expected	Number of expected assets that were scanned.
Not expected and location corrected	Number of assets that were scanned but weren't expected.
Missing	Number of expected assets that weren't scanned.
New	Number of assets that were scanned but don't have a record in your ServiceNow instance.

Asset audit result (continued)

Description	Description
	<p>Note: If the audit record's Scan method is set to Multi scan, a new asset record is created using the provided Asset tag. The new asset record is created with unknown product model and unknown model category value. Additionally, an asset remediation task is also created to notify you that an asset record is created with unknown model category and unknown product model. Open the asset remediation task from the Hardware Asset Workspace and update the Model category and Model fields value for the asset. For more information, see Close an enterprise asset remediation task.</p>
<p>Excluded from licensing</p>	<p>Number of scanned assets that are excluded from licensing. When you scanned a hardware asset that is considered as an excluded from licensing asset, if your ServiceNow® instance doesn't have an Hardware Asset Management license.</p>
<p>Found but not in audit scope</p>	<p>The number of scanned assets that are not within the scope of the current audit record. For example, if the audit is created to scan assets located in Aisle and Space 001 of the stockroom, but an asset belonging to Aisle and Space 002 in the stockroom is scanned, that asset cannot be categorized as an unexpected asset for the stockroom. Since the asset is still an expected asset for the stockroom, it is categorized as found but not in audit scope asset.</p>

Reference fields validation

The values entered in the following columns should exist in the database:

- PO Number
- Assigned To
- Department
- Company
- Cost Center
- Asset Depreciation
- Aisle Space Location

Normalization status for enterprise models

Description of the normalization statuses for enterprise models.

Status	Description
New	The model is created and has not yet run through the normalization process.
Normalized	After normalization, values for normalized manufacturer, product, model name, model number and model type are populated.

Status	Description
	Under specific conditions, certain fields that are typically read-only can be edited.
Partially Normalized	After normalization, values are populated for normalized manufacturer, product, and model type and the model number is blank.
Manufacturer Normalized	After normalization, values for normalized manufacturer is populated and the rest of the columns are blank after normalization.
Match Not Found	<p>The normalization process could not match any of the fields of the model.</p> <p>Match Not Found status could occur if a normalization rule for the software does not exist.</p>

Model fields for Enterprise Asset Management

A detailed description of all model fields in the Enterprise Asset Management application.

Model Details

Field	Description
Display name	Name of the model. A system property called <i>glide.cmdb_model.display_name.shorten</i> controls how software model display names are generated.
Manufacturer	The company that built the model.
Name	The manufacturer-assigned name of the model or abstract name specified by the model manager, such as Field Agent Laptop .
Short description	A brief description of the model.
Model categories	The category to which the model belongs to. This is a read-only field.
Model type	<p>Type of multi-component model. The following are the options to choose from:</p> <ul style="list-style-type: none"> • Simple • Consumable • Pre-assembled • User-assembled
Asset tracking strategy	<p>Process that is used to track the asset. Options are Leave to category, Create consumable asset, Don't create assets.</p>

Field	Description
<p>i Note: This field doesn't appear if you're creating a pallet model.</p>	
Asset tracking unit	Unit that is used to measure the asset. Options are Individual Unit and Fixed Fee .
Acquisition method	The method for purchasing the model. Options are Both , Buy , or Lease .
Model number	The specific model number assigned to the item by the manufacturer.
Barcode	The barcode number assigned to the model. Barcodes are assigned by the manufacturer.
Owner	The person responsible for the model.
Status	The status of the model. By default, the newly created model is in Build status. Once you define the model and its components, you can change the status of the model. The other status options are In Production , Retired , and Sold .
Picture	An image that represents the model. Select the Attach image link to choose and attach an image. Once you attach the image, the link changes to View image .
Certified	The option that determines whether the model is approved for use.
Comments	Information about the model that would be helpful for others to know.
Calculated lifecycle template	Lifecycle template to calculate lifecycle dates. This template can be assigned to models
Calculated lifecycle start date	Start date from which the Phase start date and Phase end date are calculated for each lifecycle phase defined in the Calculated lifecycle template that you selected.

Financials

Field	Description
Cost	The cost of a single unit of the model.
TCO benchmark cost	Specify a TCO benchmark cost for the model.
TCO benchmark threshold	The TCO benchmark threshold is a percentage of the TCO benchmark cost where you want to be alerted that the cost is approaching the benchmark. By default the percentage is 75%. For example, if the TCO benchmark cost is \$100 then the TCO benchmark threshold is \$75.

Field	Description
	<p>If you set the TCO benchmark cost, this field is automatically calculated.</p> <p>You can change the percentage in the <i>asset_tco_benchmark_threshold_percentage</i> system property.</p>
Average assets TCO	<p>Indicates the average Asset TCO value for all assets in the report source. For example, if you have 10 assets in a report source, and adding up all of the Asset TCO values for all assets totals 100,000, then the average asset TCO is 10,000.</p>
Expenditure type	<p>The type of expenditure. Choose from the following:</p> <ul style="list-style-type: none"> • Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. • Opex: Operational expenditure is an ongoing expenditure. For example, toners for the photocopier.
Useful life (months)	<p>The number of months that the model can be used for.</p>
Depreciation	<p>The depreciation scheme for the model.</p>
Salvage value	<p>The estimated value that an asset realizes upon its sale at the end of its useful life. This value must be less than or equal to the cost of the asset.</p>

Failure Risk

Values in the **Likelihood** and **Impact** fields appear only if the configuration records for risk likelihood and risk impact are frozen.

Field	Description
Failure likelihood	<p>The likelihood values for the risk score.</p> <p>The configuration values that you created for risk likelihood appear as options in this field. The options appear in the format of <code>value - label</code>. For example, <code>1 - Low</code> where 1 is the value and Low is the label. For details, see Create configuration values for risk likelihood.</p>
Failure impact	<p>The impact values for the risk score.</p> <p>The configuration values that you create for risk impact appear as options in this field. The options appear in the format of <code>value - label</code>. For example, <code>2 - Medium</code></p>

Field	Description
	where 2 is the value and Medium is the label. For details, see Create configuration values for risk impact .
Failure risk score	The risk score is automatically populated based on the likelihood and impact values.

Normalization

Field	Description
Normalized manufacturer	Normalized name of the manufacturer.
Normalized model name	Normalized name of the model.
Normalized model number	Normalized number of the model.
Normalization status	Current normalization status of the model.
Normalized model type	Normalized type of the model.
Exclude from sharing with content service	Option that excludes specific content from being shared with the Enterprise Asset Management Content Service. This option is applicable only if you have opted in to the Enterprise Asset Management Content Service.

Product Catalog

Note:

The Product Catalog fields only appear for consumable models.

Field	Description
Catalog Item	Name of the catalog item.
Description	Description of the catalog item.
Picture	Picture depicting the product model.

Model Components tab

Use this tab to create model components. One or more than one model components is required to create a multi-component model.

Note:

The Model components tab is visible only if the model is a multi-component model. If the **Multi-component** field on the Model page has either of the two values: **Pre-assembled** or **User-assembled**, the Model Components tab is visible. If the **Multi-component** field has the value **Not Applicable**, the Model Components tab is not visible.

Field	Description
Model category of component	Model category of the component.
Component	Component of the model. Only model components that belong to the model category you selected appear in this list.
Required	If the check box is selected, the model component is required for the complex model to work and can't be permanently removed.
Hot swappable	By default, this check box is selected. Indicates that the model component can be swapped while the multi-component model is operational. This check box is selected by default.
Repairable	Indicates that the model component can be repaired. This check box is selected by default.

Enterprise Model Lifecycles tab

Use this tab to specify life cycle information for the enterprise model.

Field	Description
Model	Name of the model.
Lifecycle type	Type of lifecycle. <ul style="list-style-type: none"> • Internal • Publisher
Lifecycle phase	Phase of the life cycle for a enterprise model. <ul style="list-style-type: none"> • General Availability: The date when the enterprise model becomes generally available through the manufacturer’s sales channels, including its worldwide subsidiaries, affiliates, and country distributors. The enterprise model is considered current/active and receiving support from the manufacturer. • End of Sale:The last date to order the enterprise model through the manufacturer’s sales channels, including its worldwide subsidiaries, affiliates, and country distributors. After end of sale date, the enterprise model is no longer available for sale. • End of Support: The last date upon which the manufacturer provides standard/regular support for the enterprise model as entitled by active service contracts. After this date, the manufacturer may continue to provide active support for certain issues in a limited capacity, the scope of which may vary across different manufacturers according to their lifecycle and/or support policies. • End of Extended Support: Up until this date, the manufacturer extends limited support for the enterprise model (after standard/regular support expires), for a defined period according to manufacturer policy. • End of Life:The date which indicates the enterprise model is at the end of its useful life (from the manufacturer’s point of view). The manufacturer stops marketing, selling, or sustaining the enterprise model.
Source	Source of the lifecycle of the model.

Field	Description
Description	Description of the lifecycle.
Phase start date	Date the lifecycle phase starts.
Phase end date	Date the lifecycle phase ends.
Risk	Risk associated with the lifecycle. <ul style="list-style-type: none"> • Very High • High • Moderate • Low • None
Active	Indicates that the lifecycle of the model is active.

Vendor Catalog Items tab

Note:

The Vendor Catalog Items tab appears only for consumable models.

Field	Description
Name	Display name of the vendor catalog item.
Vendor	Name of the product vendor.
Product Model	Product model associated with the vendor catalog item.
Out of Stock	Option that indicates if the product is out of stock.
Application	Application that contains the product record.
Product ID	Manufacturer product ID.
List Price	List price of the product before any discounts are applied.
Vendor Price	Vendor price of the product.
Rank tier	Vendor rank tier.
Short Description	Description of the product.
General	
Product Catalog Item	Product catalog item that was created when the item was published.
UPC	Universal Product Code (UPC) of the product.
Description	Description of the product.
Picture	Picture of the product.
Active	Option that indicates if the product is active or not.
Information	
Specifications	Product specifications that come from the vendor.

Field	Description
Features	Product features that come from the vendor.

Contract fields for Enterprise Asset Management

A detailed description of all contract fields in the Enterprise Asset Management application.

Contract

Field	Description
Vendor	Vendor that is associated with the lease contract.
Contract number	Unique number that is used to identify and track the lease contract. You can obtain this number from the vendor.
Name	Name of the lease contract.
Parent contract	Parent contract that the lease contract is associated with.
Start date	Date on which the lease contract begins.
End date	Date on which the lease contract ends.
Contract administrator	User who manages the lease contract and communicates with the vendor.
Approver	User who approves or rejects the lease contract.
Business owner	User who manages the lease contract from a business perspective.
Description	Description of the lease contract.

Financial

Field	Description
Invoice payment terms	Terms that describe how and when you must make payments for the lease contract.
Payment schedule	Frequency at which you must make each lease contract payment.
Payment amount	Amount that you must pay for each lease contract payment. Note: You can set this field to any currency of your choice.
Applicable taxes	Taxes that are applied to the lease contract. Select one of the following options: <ul style="list-style-type: none"> • Exempt: The lease contract is exempt from taxes. • Sales: Sales taxes are applied to the lease contract.
Lease term (months)	Length of the lease contract, in months.

Field	Description
Vendor account	Vendor account to which you must make each lease contract payment.
Purchase order	Purchase order that is associated with the lease contract.
Cost center	Cost center that is financially responsible for the lease contract.
Has rate card	Option that indicates if the lease contract has an associated contract rate card, which provides detailed cost information for the contract. See Create a contract rate card  for more information on contract rate cards.

Maintenance plan fields for Enterprise Asset Management

A detailed description of all maintenance plan fields in the Enterprise Asset Management application.

Maintenance Plan

Field	Description
Active	Option that indicates if the maintenance plan is active.
Name	Name of the maintenance plan.
Short description	Brief description of the maintenance plan.

Target Assets

Field	Description
Table	Target Enterprise Asset Management table that lists the enterprise assets that you want to apply the maintenance plan to. The default table is Enterprise asset .
Filter conditions	Filter conditions that enable you to apply the maintenance plan to only specific subsets of enterprise assets. You can add multiple filter conditions to a single maintenance plan using the following options: <ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that an enterprise asset can meet to have the maintenance plan applied to it. • and: Enables you to specify all the conditions that an enterprise asset must meet to have the maintenance plan applied to it. • + New condition set: Enables you to specify additional sets of conditions that an enterprise asset can meet to have the maintenance plan applied to it.
Apply to new matching records	Option to apply the maintenance plan to any subsequent enterprise assets that are added to the target Enterprise Asset Management table and meet the specified filter conditions.

Field	Description
Task creation policy	<p>Policy that specifies what action you want to take when the maintenance plan is applied to an enterprise asset that is already under maintenance.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Leave alone: Prevents the creation of tasks for the new maintenance plan and the deletion of tasks that are associated with the existing maintenance plan. • Cancel existing: Deletes all tasks that are associated with the existing maintenance plan. • Add to existing: Adds both new tasks and existing active tasks to the new maintenance plan.

Maintenance schedule fields for Enterprise Asset Management

A detailed description of all maintenance schedule fields in the Enterprise Asset Management application.

Maintenance Schedule

Field	Description
Name	Name of the maintenance schedule.
Short description	Brief description of the maintenance schedule.
Trigger	<p>Trigger that specifies the type of conditions that must be met for the maintenance to run.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Duration: Triggers the maintenance to run based on time. If you select this option, the Duration Details form section appears, where you can specify more details about the trigger. • Meter: Triggers the maintenance to run based on a specific enterprise asset field value. If you select this option, the Meter Details form section appears, where you can specify more details about the trigger. • Condition: Triggers the maintenance to run based on filter conditions. If you select this option, the Condition Details form section appears, where you can specify more details about the trigger. • Script: Triggers the maintenance to run based on advanced script criteria. If you select this option, the Script Details form section appears, where you can specify more details about the trigger. • Duration or Meter: Triggers the maintenance to run based on time or a specific enterprise asset field value, whichever comes first. If you select this option, the Duration Details and Meter Details form sections appear, where you can specify more details about the trigger.
Active	Option that indicates if the maintenance schedule is active.

Duration Details

Note:

This form section appears only if you set the **Trigger** field to **Duration** or **Duration or Meter** in the Maintenance Schedule form section.

Field	Description
Trigger type	<p>Frequency at which you want the maintenance to run.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Interval: Runs the maintenance at a specified time interval. If you select this option, the Days, Hours, Minutes, and Seconds fields appear, where you can specify the amount of time that must pass before the maintenance runs again. • Weekly: Runs the maintenance once a week. If you select this option, the Due day of week and Due time fields appear, where you can specify the day and time at which you want the maintenance to run each week. • Monthly: Runs the maintenance once a month on a specific date. If you select this option, the Due day of month and Due time fields appear, where you can specify the date and time at which you want the maintenance to run each month. • Annually: Runs the maintenance once a year on a specific date and month. If you select this option, the Due month, Due day of month, and Due time fields appear, where you can specify the month, date, and time at which you want the maintenance to run each year. • Week in Month: Runs the maintenance once a month during a specific week of the month. If you select this option, the Due week in month and Due time fields appear, where you can specify the week and time at which you want the maintenance to run each month. • Day in Week in Month in Year: Runs the maintenance once a year on a specific day, week, and month. If you select this option, the Due month, Due week in month, Due day of week, and Due time fields appear, where you can specify the month, week, day, and time at which you want the maintenance to run each year.
Lead time	Number days required for the scheduled maintenance work.

Meter Details

Note:

This form section appears only if you set the **Trigger** field to **Meter** or **Duration or Meter** in the Maintenance Schedule form section.

Field	Description
Field	Enterprise asset field that you want to match against to trigger the maintenance to run.
Every	Field value that an enterprise asset must match to trigger the maintenance to run.

Condition Details

Note:

This form section appears only if you set the **Trigger** field to **Condition** in the Maintenance Schedule form section.

Field	Description
Filter Condition	<p>Filter conditions that trigger the maintenance to run</p> <p>You can add multiple filter conditions to the trigger using the following options:</p> <ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that an enterprise asset can meet to trigger the maintenance to run. • and: Enables you to specify all the conditions that an enterprise asset must meet to trigger the maintenance to run. • + New condition set: Enables you to specify additional sets of conditions that an enterprise asset can meet to trigger the maintenance to run.

Script Details

Note:

This form section appears only if you set the **Trigger** field to **Script** in the Maintenance Schedule form section.

Field	Description
Script	Script specifying the advanced criteria that triggers the maintenance to run.

Work plan fields for Enterprise Asset Management

A detailed description of all work plan fields in the Enterprise Asset Management application.

Work Plan

Field	Description
Number	Unique number for the work plan.
Name	Name of the work plan.
Short description	Brief description of the work plan.
Effective start	Effective start date from when the work plan is active.
Effective end	Effective end date until when the work plan is active.
Active	Option that indicates if the work plan is available to use.
Forecast work orders	Option to specify if this work plan is applicable to estimate and generate the upcoming work orders.

Field	Description
	If this option is selected, you can view the Generate work orders option by selecting the More Actions ellipsis icon. This generates a work order for the schedule per asset.

Conditions

Field	Description
Table	Target Enterprise Asset Management table that the work plan is associated with. The default table is Enterprise asset .
Category	Determine whether the work plan is applicable for either category: original equipment scheduling (OEM) or alternative equipment scheduling (AEM).
Apply to new matching records	Option to apply the work plan to any subsequent enterprise assets that are added to the target Enterprise Asset Management table and meet the specified filter conditions.
Task creation policy	Specify what to do when a work plan runs based on a schedule occurrence that is already in progress. Select one of the following options: <ul style="list-style-type: none"> • Leave alone: Prevents the creation of tasks for the new work plan and the deletion of tasks that are associated with the existing work plan. • Cancel existing: Deletes existing tasks associated with the plan and creates tasks to replace them. • Add to existing: Allows new tasks to replace the existing active tasks for the specific schedule occurrence of a plan.
Filter conditions	Filter conditions that enable you to apply the work plan to specific subsets of enterprise assets. You can add multiple filter conditions to a single work plan using the following options: <ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that an enterprise asset can meet to have the maintenance plan applied to it. • and: Enables you to specify all the conditions that an enterprise asset must meet to have the maintenance plan applied to it. • + New condition set: Enables you to specify additional sets of conditions that an enterprise asset can meet to have the maintenance plan applied to it.

Work plan schedule fields for Enterprise Asset Management

A detailed description of all the work plan schedule fields in the Enterprise Asset Management application.

Planned Work Schedule

Field	Description
Name	Name of the work plan schedule.

Field	Description
Short description	Brief description of the work plan schedule.
Trigger	<p>Trigger that specifies the type of conditions that must be met for the work plan to run.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Duration: Triggers the work plan to run based on time. If you select this option, the Duration Details form section appears, where you can specify more details about the trigger. • Meter: Triggers the work plan to run based on a specific enterprise asset field value. If you select this option, the Meter Details form section appears, where you can specify more details about the trigger. • Condition: Triggers the work plan to run based on filter conditions. If you select this option, the Condition Details form section appears, where you can specify more details about the trigger. • Script: Triggers the work plan to run based on advanced script criteria. If you select this option, the Script Details form section appears, where you can specify more details about the trigger. • Duration or Meter: Triggers the work plan to run based on time or a specific enterprise asset field value, whichever comes first. If you select this option, the Duration Details and Meter Details form sections appear, where you can specify more details about the trigger.
Active	Option that indicates if the work plan schedule is active.

Duration Details

Note:

This form section appears only if you set the **Trigger** field to **Duration** or **Duration or Meter** in the Planned Work Schedule form section.

Field	Description
Trigger type	<p>Frequency at which you want the work plan to run.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Interval: Runs the work plan at a specified time interval. If you select this option, the Days, Hours, Minutes, and Seconds fields appear, where you can specify the amount of time that must pass before the work plan runs again. • Weekly: Runs the work plan once a week. If you select this option, the Due day of week and Due time fields appear, where you can specify the day and time at which you want the work plan to run each week. • Multiple days of the week: Runs the work plan multiple days in a week. If you select Multiple days of the week, the Due days of week field appears so you can specify on which days in a week the planned work should be performed. • Monthly: Runs the work plan once a month on a specific date. If you select this option, the Due day of month and Due time fields appear, where you can specify the date and time at which you want the work plan to run each month.

Field	Description
	<ul style="list-style-type: none"> • Annually: Runs the work plan once a year on a specific date and month. If you select this option, the Due month, Due day of month, and Due time fields appear, where you can specify the month, date, and time at which you want the work plan to run each year. • Week in Month: Runs the work plan once a month during a specific week of the month. If you select this option, the Due week in month and Due time fields appear, where you can specify the week and time at which you want the work plan to run each month. • Day in Week in Month in Year: Runs the work plan once a year on a specific day, week, and month. If you select this option, the Due month, Due week in month, Due day of week, and Due time fields appear, where you can specify the month, week, day, and time at which you want the work plan to run each year.
Lead time	Number of days required for the scheduled work plan.
Preserve calculated interval	<p>Option to restart the interval calculation from the time when the work order was completed.</p> <p>This check box appears when Interval, Monthly, or Annually is selected for Trigger type and Fixed is selected for the Monthly type and Annually type field.</p>

Meter Details

Note:

This form section appears only if you set the **Trigger** field to **Meter** or **Duration or Meter** in the Planned Work Schedule form section.

Field	Description
Field	Enterprise asset field that you want to match against to trigger the work plan to run.
Every	Field value that an enterprise asset must match to trigger the work plan to run.
Preserve calculated meter	Option to restart the meter calculation based on the value defined in the Every field.

Condition Details

Note:

This form section appears only if you set the **Trigger** field to **Condition** in the Planned Work Schedule form section.

Field	Description
Filter Condition	<p>Filter conditions that trigger the work plan to run</p> <p>You can add multiple filter conditions to the trigger using the following options:</p>

Field	Description
	<ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that an enterprise asset can meet to trigger the work plan to run. • and: Enables you to specify all the conditions that an enterprise asset must meet to trigger the work plan to run. • + New condition set: Enables you to specify additional sets of conditions that an enterprise asset can meet to trigger the work plan to run.

Script Details

i Note:

This form section appears only if you set the **Trigger** field to **Script** in the Planned Work Schedule form section.

Field	Description
Script	Script specifying the advanced criteria that trigger the work plan to run.

Effectivity Details

Field	Description
Start planned schedule on	<p>Option based on which the planned work schedule should determine its start date.</p> <ul style="list-style-type: none"> • Date • Field Value • Schedule
Effective Start	Effective start date from when the planned work is scheduled to work.
Effective start reference	<p>Field value that should be used to determine the start date of the planned work. Effective start reference displays the list of fields from the table that is selected to create conditions for the work plan. For example, Printer [cmdb_ci_printer].</p> <p>This field appears only when Field Value is selected from Start planned schedule based on.</p>
Schedule	<p>Name of the schedule that should be used to calculate the start date of the work plan.</p> <p>This field appears only when Schedule is selected from Start planned schedule based on.</p>
End planned schedule based on	<p>Determines the end date of a planned work schedule.</p> <ul style="list-style-type: none"> • Date • Field Value • Frequency

Expense line fields for Enterprise Asset Management

A detailed description of all expense line fields in the Enterprise Asset Management application.

Expense Line

Field	Description
Number	Unique number that is used to identify and track the expense line. This field populates automatically.
Date	Date on which you are creating the expense line. This field is automatically set to the current date.
Inherited	<p>Option that indicates if the expense line is inherited from a parent expense line.</p> <p>If you enable this option, the Parent field appears below the Inherited field. In the Parent field, search for and select the parent expense line that this expense line is inherited from. The following fields are then inherited from the parent expense line and can no longer be modified:</p> <ul style="list-style-type: none"> • Source ID • Asset • Contract • User • Configuration Item • Task • Cost center
Source ID	Enterprise asset that you want to associate with the expense line. Based on the enterprise asset that you select, the corresponding fields in the Source form section populate automatically.
Amount	<p>Cost of the enterprise asset that you want to associate with the expense line. To indicate that you have received a credit towards the enterprise asset, enter a negative number.</p> <p>Note: You can set this field to any currency of your choice.</p>
Process date	Date and time at which the expense line is processed.
State	State of the expense line.
Summary type	<p>Expense line category. Select one of the following options:</p> <ul style="list-style-type: none"> • Grow Business: Expense lines for enterprise assets that are used to help your business grow. • Run Business: Expense lines for enterprise assets that are used to help your business run. • Transform Business: Expense lines for enterprise assets that are used to help transform your business.

Field	Description
Short description	Brief description of the expense line.

Source

Field	Description
Asset	Enterprise asset that you want to associate with the expense line.
Fixed asset	Fixed asset that contains the selected enterprise asset. A fixed asset is a container that holds one or more individual assets. If the enterprise asset that you selected in the Asset field is contained within a fixed asset, the Fixed asset field populates automatically.
Contract	Contract that the selected enterprise asset is associated with.
User	User who the selected enterprise asset is assigned to.
Configuration item	Configuration item (CI) that is associated with the expense line.
Task	Task that is associated with the expense line.
Cost center	Cost center that is financially responsible for the selected enterprise asset.

Fields inherited from a parent asset group to a sub group

A list of all the fields that are inherited from the parent asset group to a subgroup.

Column label	Inherited from parent?	Appears on asset group form
Assigned	Yes, if empty; can be edited.	Yes
Assigned to	Yes, if empty; can be edited.	Yes
Company	Yes, if empty; can be edited.	Yes
Cost Center	Yes, if empty; can be edited.	No
Department	Yes, if empty; can be edited.	Yes
Life cycle stage	Yes	No
Life cycle stage status	Yes	No
Location	Yes, if empty; can be edited but must be a location that descends from the parent group's location.	Yes
Managed by	Yes, if empty; can be edited.	Yes
Owned by	Yes, if empty; can be edited.	Yes
Retired date	Yes	Yes
State	Yes, can be edited.	Yes
Sub state	Yes; can be edited.	Yes

Column label	Inherited from parent?	Appears on asset group form
Support group	Yes, if empty; can be edited.	Yes
Supported by	Yes, if empty; can be edited.	Yes

Enterprise asset disposal order stages

An enterprise asset disposal order goes through various stages in the disposal process before it's completed. With each stage, the task that's associated with that stage changes too.

Closing a task in the asset disposal process completes that task and automatically creates the next task in the process. For example, after you close the Schedule Pickup task, the state for that task changes to Closed Complete and the next task, Asset Departure, is created. This process continues until you close all the tasks required for disposing of the selected assets. After you close all the tasks, the disposal order is completed.

Enterprise asset disposal order stages

Enterprise disposal stages	Task	Description
Draft	Verify Assets	Asset disposal record is created.
Scheduling	Schedule Pickup	Scheduling details for the asset disposal order.
Transit	Asset Departure	Verified assets are ready for departure.
Confirmation	Vendor Confirmation	Asset disposal order is confirmed by the vendor.
Documentation	Disposal Documentation	Documentation for the disposal record is attached.
Completed	None	Asset disposal record request is completed.
Cancelled	None	Disposal order can be canceled only until the transit stage.

Terminology for linear assets

Terms commonly used for linear assets in the Enterprise Asset Management application.

Linear asset terms and their description

Term	Description
Linear asset	<p>An asset that has a physical length or dimension, such as roads, railways, pipelines, and power transmission lines.</p> <p>Linear assets have a series of geopoints; at least a start and end point and have segments with different attributes.</p>

Term	Description
Geo point	<p>Geo points, or graphical coordinates, are a way of expressing a location on the earth's surface using a set of numerical values.</p> <p>Geo points consists of latitudes, longitudes, and altitudes and can be visualized on a map. In the Enterprise Asset Management application, geo point latitude and longitude refer to the coordinate format defined by WGS 84 and uses signed#decimal degrees.</p>
Route	<p>Geo points of a linear asset form a route. Routes can be plotted and visualized on a map.</p>
Boundary width	<p>Maximum width of the linear asset. It's used to validate whether a cmn_location is on-route or not.</p>
Marker	<p>A point location that can be identified on or near a linear asset. A marker should contain a geo point so it can be visualized on a map. If the geo point is on the route of the linear asset, then it's an on-route marker.</p>
Segment	<p>A section of a linear asset with certain attributes. A segment consists of a start point and an end point, or a start point and length.</p>
Discrete asset	<p>Discrete assets are enterprise assets and consumables. Discrete assets can be associated to a linear asset and be managed as part of the linear asset.</p>
Overlap asset	<p>A linear asset relationship where two or more linear assets are in close proximity and within the boundary width. For example, a northbound and a southbound highway. A linear asset can be defined for a northbound highway and another linear asset for a southbound highway.</p>
Intersect asset	<p>A linear asset relationship where linear assets have an intersect point. For example, intersecting roads, where two or more roads meet or cross each other.</p>
Continue asset	<p>A linear asset relationship for linear assets that have a start and an end marker. For example, a highway that after a particular point changes into another highway.</p>

Installed with Enterprise Asset Management for Healthcare

The user role components, plugins, and applications are installed with activation of the com.sn_eamhc plugin.

Roles installed

Role title [name]	Description	Contains roles
Medical asset manager [sn_eamhc.medical_asset_manager]	Manages healthcare-specific models and assets in Enterprise Asset Workspace	sn_eam.enterprise_asset_manager
Medical asset technician [sn_eamhc.medical_asset_technician]	Performs tasks related to healthcare-specific assets.	sn_eam.enterprise_asset_technician

Plugins installed

Name	Description
Asset Management (com.snc.asset_management)	Provides functionalities to integrate the physical, technological, contractual, and financial aspects of information technology assets.
Procurement (com.snc.procurement)	Provides the capability to source and receive requested assets so that you can fulfill service catalog requests.
Enterprise model normalization (com.sn_eam_core)	Provides information related to normalization such as normalization status, model content service download, and life-cycle overview.
Asset Management Workspace - Recommendations (com.sn_itam_recomm)	Provides actionable recommendations for users in configurable workspaces.
SM Planned Maintenance (com.snc.planned_maintenance)	Provides the capability to manage regular preventative maintenance of assets.
Work Management (com.snc.work_management)	Provides the capability to manage your work orders, work order tasks, maintenance plans, and other relevant work order information.
Performance Analytics (com.snc.pa)	Provides dashboards containing actionable data visualizations that help you improve your business processes and practices.
Playbook Experience (com.glide.playbook_experience.config)	Provides a step-by-step guidance for setting up your assets with important information.
Playbooks for App Engine (com.glide.pad.license)	Provides a simplified and task-oriented view of processes.

Name	Description
Cost Management (com.snc.cost_management)	Provides options to plan and control business costs.

Applications installed

Name	Description
ServiceNow Enterprise Asset Management (com.sn_eam)	Manages the complete life cycle of your enterprise connected and non-connected assets.
Expanded Model and Asset Classes (com.sn_ent)	Adds enterprise model and asset classes that extend out-of-the-box product model and asset classes within the CMDB class hierarchy. In addition, creates model categories that associate these enterprise model and asset classes with CMDB configuration item (CI) classes.
CMDB CI Class Models (com.sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships.
Asset Management Common (com.sn_itam_common)	Provides features that are common to the Hardware Asset Management, Software Asset Management, and Enterprise Asset Management applications, including the catalog item to request asset reclamation.
Physical Assets (sn_phy_assets)	Marker that aligns features for physical asset-based applications, including the Hardware Asset Management and Enterprise Asset Management applications.
Risk Heat Map (com.sn_risk_heatmap)	Provides a heatmap component that enables you to visualize the risk posture of your organization.
Geo Map Component (com.sn_geo_map)	Provides the capability to track the location of the assets using indoor maps.

Installed with OT Asset Management

The user role components, plugins, and applications are installed with activation of the com.sn_otam plugin.

Roles installed

Role title [name]	Description	Contains roles
OT asset manager [sn_otam.ot_asset_manager]	Manages Operational Technology-specific models and assets in the OT Asset Workspace.	sn_eam.asset_manager
OT asset technician [sn_otam.ot_asset_technician]	Performs tasks related to Operational Technology-specific assets in the OT Asset Workspace.	sn_eam.asset_technician

Plugins installed

Name	Description
Asset Management (com.snc.asset_management)	Provides functionalities to integrate the physical, technological, contractual, and financial aspects of information technology assets.
Procurement (com.snc.procurement)	Provides the capability to source and receive requested assets so that you can fulfill service catalog requests.
Enterprise model normalization (com.sn_eam_core)	Provides information related to normalization such as normalization status, model content service download, and life-cycle overview.
Asset Management Workspace - Recommendations (com.sn_itam_recomm)	Provides actionable recommendations for users in configurable workspaces.
SM Planned Maintenance (com.snc.planned_maintenance)	Provides the capability to manage regular preventative maintenance of assets.
Work Management (com.snc.work_management)	Provides the capability to manage your work orders, work order tasks, maintenance plans, and other relevant work order information.
Performance Analytics (com.snc.pa)	Provides dashboards containing actionable data visualizations that help you improve your business processes and practices.
Playbook Experience (com.glide.playbook_experience.config)	Provides a step-by-step guidance for setting up your assets with important information.
Playbooks for App Engine (com.glide.pad.license)	Provides a simplified and task-oriented view of processes.
Cost Management (com.snc.cost_management)	Provides options to plan and control business costs.

Applications installed

Name	Description
Enterprise Asset Management (com.sn_eam)	Manages the complete life cycle of your connected and non-connected enterprise assets.
Expanded Model and Asset Classes (com.sn_ent)	Adds enterprise model and asset classes that extend out-of-the-box product model and asset classes within the CMDB class hierarchy. In addition, creates model categories that associate these enterprise model and asset classes with CMDB configuration item (CI) classes.
CMDB CI Class Models (com.sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships.
Hardware Asset Management (sn_hamp)	Provides advanced workflow, automation, and mobile capabilities that enable you to manage the complete life cycle of your organizational assets, including hardware and consumable assets.

Name	Description
Asset Management Common (com.sn_itam_common)	Provides features that are common to the Hardware Asset Management, Software Asset Management, and Enterprise Asset Management applications, including the catalog item to request asset reclamation.
Physical Assets (sn_phy_assets)	Marker that aligns features for physical asset-based applications, including the Hardware Asset Management and Enterprise Asset Management applications.
Risk Heat Map (com.sn_risk_heatmap)	Provides a heatmap component that enables you to visualize the risk posture of your organization.
Geo Map Component (com.sn_geo_map)	Provides the capability to track the location of the assets using indoor maps.

Components installed with Enterprise Asset Management for Data Center and Network Asset Management (DCNAM)

Several types of components are installed with activation of the com.sn_eam_dcnam plugin, including user roles, plugins, and applications.

Roles installed

Role title [name]	Description	Contains roles
DCNAM asset manager [sn_eam_dcnam.dcnam_asset_manager]	Manages critical facility-based enterprise models and assets for telecommunications networks. In addition, manages linear assets for telecommunications networks.	sn_eam.asset_manager
DCNAM asset technician [sn_eam_dcnam.dcnam_asset_technician]	Performs asset and work tasks related to critical facility-based enterprise assets and linear assets for telecommunications networks.	sn_eam.asset_technician

Plugins installed

Name	Description
Asset Management (com.snc.asset_management)	Provides functionalities to integrate the physical, technological, contractual, and financial aspects of information technology assets.
Procurement (com.snc.procurement)	Provides the capability to source and receive requested assets so that you can fulfill service catalog requests.

CMDB CI Class Models (com.sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships.
Asset Management Common (com.sn_itam_common)	Provides features that are common to the Hardware Asset Management, Software Asset Management, and Enterprise Asset Management applications, including the catalog item to request asset reclamation.
Physical Assets (sn_phy_assets)	Marker that aligns features for physical asset-based applications, including the Hardware Asset Management and Enterprise Asset Management applications.
Risk Heat Map (com.sn_risk_heatmap)	Provides a heatmap component that enables you to visualize the risk posture of your organization.
Geo Map Component (com.sn_geo_map)	Provides capabilities to track asset locations using indoor maps.

Components installed with Enterprise Asset Management for Providers

Several types of components are installed with activation of the com.sn_eam_provider plugin, including user roles, applications, and tables.

Roles installed

Role title [name]	Description	Contains roles
Provider asset manager [sn_eam_provider.provider_asset_manager]	Manages all DaaS-related activities, including the fulfillment of Return Merchandise Authorization (RMA) requests.	<ul style="list-style-type: none"> sn_eam.asset_manager sn_eam_provider.provider_asset_technician
Provider asset technician [sn_eam_provider.provider_asset_technician]	Performs tasks related to DaaS assets.	sn_eam.asset_technician

Applications installed

Name	Description
ITAM Common forDaaS (sn_daas_common)	Provides asset management services to DaaS providers, vendors, and manufacturers to support their DaaS offerings.

Tables installed

Table	Description
RMA response [sn_daas_common_rma_response_order]	Information about your RMA response orders, including the originating account and the delivery address.
RMA response order line [sn_daas_common_rma_response_orderline]	Information about each asset that is associated with your RMA response orders, including the model of the asset.
Inbound asset order [sn_itam_common_inbound_asset_order]	Information about your inbound asset orders, including the originating account and the delivery address.
Inbound asset order line	Information about each asset that is associated with your inbound asset orders, including the model of the asset.

Table	Description
[sn_itam_common_inbound_asset_orderline]	

Scheduled jobs and tables installed with normalization of firmware models

Scheduled jobs that run during the normalization of firmware models embedded into Operational Technology (OT) assets and tables that store firmware normalization details are installed with the OT Asset Management application.

Scheduled jobs for Firmware normalization

Scheduled job	Description
Firmware Content Upload	<ul style="list-style-type: none"> • Uploads data from the firmware tables to the CDS Client Staging [cds_client_staging] table. • Skips the upload if Content Data Service (CDS) hasn't pulled all data. • Uses the Firmware configuration [sn_itam_firmware_configuration] table to identify the firmware tables from which the content should be pushed. • Skips the upload if normalization hasn't run after the latest pull.
Firmware Content File Manager	Triggers during on-premise content import and export actions.
Firmware – Daily Job	<ul style="list-style-type: none"> • Sets the time when the data is pulled by the Content Data Service (CDS). • Sets current life-cycle phase of model life cycles.
Firmware – Apply latest content changes	Processes changes in the content tables after content pull.
Firmware - Generate Lifecycles	Updates firmware model records with the recently updated content life-cycle details. This is a weekly job.
Firmware Normalization	Normalizes firmware models using the newly downloaded content.

Tables installed with firmware model normalization

Table	Description
Firmware model normalization [sn_itam_firmware_model_norm]	Stores the normalization rule and hash used to perform normalization of firmware models.
Firmware product [sn_itam_firmware_product]	Stores firmware product records.
Custom firmware product [sn_itam_cust_firmware_product]	Stores custom firmware product records.
Firmware product version [sn_itam_firmware_product_version]	Stores firmware product version records.

Tables installed with firmware model normalization (continued)

Table	Description
Custom firmware product version [sn_itam_cust_firmware_product_version]	Stores version records of custom firmware products.
Firmware publisher [sn_itam_firmware_publisher]	Stores firmware publisher records.
Custom firmware publisher [sn_itam_cust_firmware_publisher]	Stores custom firmware publisher records.
Firmware lifecycle definition [sn_itam_firmware_lifecycle_def]	Stores the life-cycle phase of firmware models. Also stores the start and end date of each life-cycle phase.
Firmware model lifecycle [sn_itam_firmware_model_lifecycle]	Stores life-cycle definitions of firmware models.
Firmware normalization map [sn_itam_firmware_norm_mapping]	Stores the hash values that are used to normalize discovered firmware models.
Firmware CPE mapping [sn_itam_firmware_cpe_mapping]	Stores details of mapping between firmware and CPE.
Custom firmware CPE mapping [sn_itam_cust_firmware_cpe_mapping]	Stores custom firmware and CPE mapping details.
Firmware content audit [sn_itam_firmware_content_audit]	Stores content values that changed.
Manage firmware library [sn_itam_firmware_manage_library]	Stores import and export content data.
Firmware configuration [sn_itam_firmware_configuration]	Stores opt-in and opt-out data.

Asset put away task fields

Fields on the Asset put away task form help you create a put away task for the in stock assets.

Create New Asset put away task form

Field	Description
Number	This field is automatically set to the Asset put away task number.
State	Displays the current state of the Asset put away task. When a new task is created, this field is automatically set to Open .
Asset	Asset for which the put away task is created. All the in stock assets are listed.
Task name	This field is automatically set to Put away .
Stockroom	This field is automatically populated when the asset is selected.
Assignment group	Assignment group to which you want to assign the Asset put away task.

Create New Asset put away task form (continued)

Field	Description
Drop off location	Aisle and space in the stockroom where you want to put away the hardware asset. This value is required to close the Asset put away task.
Assigned to	Person from the assignment group who is primarily responsible for the Asset put away task.
Due date	Date by which the Asset put away task should be closed.
Notes	The Short description and Description field values are automatically populated.

Enterprise Asset Management for Data Center and Network Asset Management (DCNAM)

Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) is a licensable application that enables you to manage the life cycles of your mission-critical facility-based enterprise assets and linear assets for telecommunications networks.

The Enterprise Asset Management for DCNAM (com.sn_eam_dcnam) application is a specialized offering within the suite of Enterprise Asset Management solutions. The application provides the functionalities, features, and workflows of Enterprise Asset Management but for mission-critical facility-based enterprise assets and linear assets only.

When you install the application on a ServiceNow instance, the Enterprise Asset Management application is also installed automatically. For more information on installing the application, see [Install Enterprise Asset Management for Data Center and Network Asset Management \(DCNAM\)](#).

Install Enterprise Asset Management for Data Center and Network Asset Management (DCNAM)

You can install the Enterprise Asset Management for DCNAM application (com.sn_eam_dcnam) if you have the admin role. The application installs related ServiceNow[®] Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the [Enterprise Asset Management for DCNAM](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Enterprise Asset Management for DCNAM:

- Plugins
- Store applications
- Roles

For more information, see [Components installed with Enterprise Asset Management for Data Center and Network Asset Management \(DCNAM\)](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Enterprise Asset Management for DCNAM application (com.sn_eam_dcnam) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

A list of the versions available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Critical Environment Asset Workspace

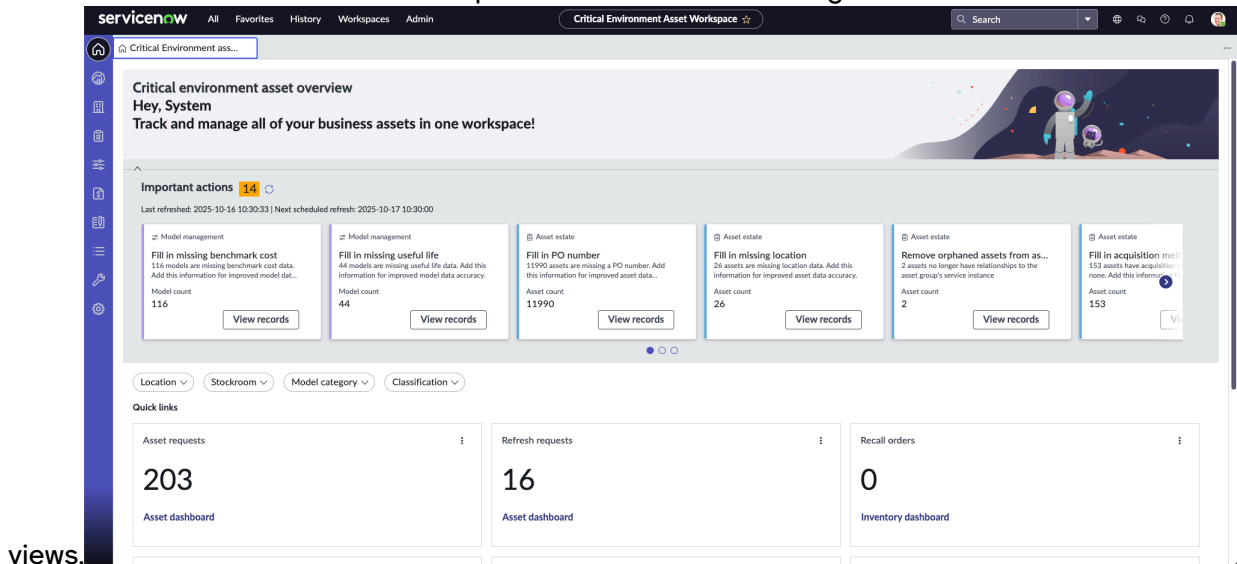

The Critical Environment Asset Workspace is the intuitive and streamlined user interface of the Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application.

Critical Environment Asset Workspace landscape

The Critical Environment Asset Workspace is a unified medium with multiple views. These views give you comprehensive visibility into your mission-critical facility-based enterprise assets and linear assets so that you can manage them effectively throughout their life cycles.

Critical Environment Asset Workspace views

The Critical Environment Asset Workspace consists of the following

views.

Critical Environment Asset Workspace views

View	Description	Available tabs or lists
Critical Environment asset overview	View important actions and quick links for active tasks.	None
Asset analytics	Track the Total Cost of Ownership (TCO) and overall performance of your facility-based enterprise assets and linear assets.	<ul style="list-style-type: none"> • Overview • Asset TCO • Asset performance • Data Visualizations
Inventory	View and manage the inventory and stockrooms for your facility-based enterprise assets and linear assets.	<ul style="list-style-type: none"> • Overview • All stockrooms • Stock rules • Transfer orders • Asset audits • Loaner asset orders • RMA orders • RMA order lines • Repair orders • Recall orders • Reclamation requests • Resale orders • Disposal orders
Critical Environment asset estate	View, create, and manage facility-based enterprise assets and linear assets.	<ul style="list-style-type: none"> • Overview • Asset indoor map <p>Note: This tab appears only under the following conditions:</p> <ul style="list-style-type: none"> ○ You've installed the Indoor Mapping for Assets application on your ServiceNow instance. ○ You've configured the option to display the tab. <p>For more information, see Track assets using indoor maps in the Enterprise Asset Workspace.</p> <ul style="list-style-type: none"> • Asset groups

Critical Environment Asset Workspace views (continued)

Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) licensing

The Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application supports a unit-based subscription licensing model in which you must pay a recurring fee for assets to use the application. You can determine the licensing requirements and costs for these assets based on their resource categories and corresponding subscription unit ratios.

Resource categories group specific types of assets together and enable them to use the features and workflows of an application. Each resource category is associated with a corresponding subscription unit ratio, which you can use to group the given assets against a standardized cost. You can use this information to determine the total licensing requirements and costs for assets within each resource category. For example, a ratio of 25:1 indicates that one subscription is required for every 25 assets within a given resource category. If one subscription costs \$100 and you have 50 assets within that resource category, you must purchase two subscriptions for a total of \$200.

The Enterprise Asset Management for DCNAM application supports the following resource categories.

 Note:

These resource categories are automatically enabled when you activate the Enterprise Asset Management for DCNAM application on your ServiceNow instance.

Enterprise Asset Management for DCNAM resource categories

Resource category	Subscription unit ratio	Supported asset model categories
Critical environment asset	10:1	<p>This resource category supports assets that are associated with the following model categories:</p> <ul style="list-style-type: none"> • Automatic Transfer Switch • AV Displays • AV Equipment • Cameras • Circuit Breaker • Electrical • Facility General • Fuel Tank • Fuse Alarm Panel • HVAC • Inverter • Maintenance Bypass Panel • Plumbing • Power Generator • Power Panel • Rectifier • Remote Power Panel • Security • Service Industry Equipment • Structure • Switchgear • Transformer • UPS • Facilities
Linear asset	2:1	N/A
Linear asset segment	4:1	N/A

Note:

These resource categories support serialized assets only. You are not charged for any consumable assets.

You can view subscription consumption information for the Enterprise Asset Management for DCNAM application by using the ITAM Licensing Resource Counts [itam_licensing_resource_counts] table. For more details, see [View your subscription](#)

consumption for the Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application.

View your subscription consumption for the Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application

Use the ITAM Licensing Resource Counts [itam_licensing_resource_counts] table to gain insight into your subscription consumption for the Enterprise Asset Management for Data Center and Network Asset Management (DCNAM) application.

Before you begin

Role required: sn_eam.enterprise_admin

About this task

The EAM Populate Licensing Data scheduled job runs every Sunday to generate subscription consumption information for the application. Any changes to your subscription consumption are reflected only after the weekly scheduled job runs.

Procedure

1. On the page header of your ServiceNow instance, select **All**.
2. In the menu navigation filter, enter `itam_licensing_resource_counts_list.do`. The ITAM Licensing Resource Counts [itam_licensing_resource_counts] table opens.
3. In the table, locate all entries for the Enterprise Asset Management for DCNAM application.

Application	Resource Category	Resource Subcategory	Resource Total Count	Subscription Unit Ratio	Total Subscription Units Consumed
Enterprise Asset Management for DCNAM	Critical environment asset		1	10:1	1
Enterprise Asset Management for DCNAM	Linear asset segment		0	4:1	0
Enterprise Asset Management for DCNAM	Critical environment asset		2	10:1	1
Enterprise Asset Management for DCNAM	Critical environment asset		1,582	10:1	159
Enterprise Asset Management for DCNAM	Linear asset		5	2:1	3

If the table includes multiple applications, you can locate all entries for the Enterprise Asset Management for DCNAM application by using any of the following options:

- If you want to sort the table by application, use the following steps:
 - a. Select the Column options icon  next to the Application column name.

Alternatively, right-click the Application column name.
 - b. Select an option to sort the applications in either ascending or descending alphabetical order.
 - To sort the applications in ascending alphabetical order, select **Sort (a to z)**.
 - To sort the applications in descending alphabetical order, select **Sort (z to a)**.
 You can then locate all entries for the Enterprise Asset Management for DCNAM application.
- If you want to group the table by application, use the following steps:
 - a. Select the Column options icon  next to the Application column name.

Alternatively, right-click the Application column name.
 - b. Select **Group By Application**.

You can then expand the **Application: Enterprise Asset Management for DCNAM** group to view all entries for the application.

- If you want the table to display only the Enterprise Asset Management for DCNAM application, use the following steps:
 - a. On the table header, set the search filter to **Application**.
 - b. In the corresponding search box, enter `Enterprise Asset Management for DCNAM`.
 - c. Press the Enter key.

Alternatively, you can right-click the Enterprise Asset Management for DCNAM application name in the table and then select **Show Matching**.

4. View the following subscription consumption information for the application.

i Note:

Subscription consumption information is generated and grouped by resource category. For more information on resource categories, see [Enterprise Asset Management for Data Center and Network Asset Management \(DCNAM\) licensing](#).

Subscription consumption information

Field	Description
Application	Name of the application.
Resource Category	Resource category that is supported by the application.
Resource Subcategory	Subcategory of the given resource category.
Resource Total Count	Total number of assets within the given resource category and subcategory.
Subscription Unit Ratio	Predefined ratio that indicates how many assets within the given resource category require a subscription. For example, a ratio of 25:1 indicates that one subscription is required for every 25 assets within the resource category.
Total Subscription Units Consumed	Total number of subscriptions that you have consumed for the given resource category and subcategory. The ITAM licensing module calculates this value by applying the Subscription Unit Ratio to the Resource Total Count.

Enterprise Asset Management for Providers

Enterprise Asset Management for Providers is a licensable application that enables Device as a Service (DaaS) providers, vendors, and manufacturers to manage all DaaS-related activities, including the fulfillment of Return Merchandise Authorization (RMA) requests, from a single location.

The Enterprise Asset Management for Providers (com.sn_eam_provider) application is a specialized offering within the suite of Enterprise Asset Management solutions. The application adds DaaS provider-based functionalities and workflows to the Enterprise Asset Management application, including the capabilities to create and manage provider-based RMA response orders and inbound asset orders.

You can install and use the application only if you've already installed the Enterprise Asset Management (com.sn_eam) application or one of the following Enterprise Asset Management-dependent applications on your ServiceNow instance:

- OT Asset Management (com.sn_otam)
- Enterprise Asset Management for Healthcare (com.sn_eamhmc)
- Enterprise Asset Management for Facilities (com.sn_eamfam)
- Enterprise Asset Management for Data Center and Network Asset Management (com.sn_eam_dcnam)

Install Enterprise Asset Management for Providers

You can install the Enterprise Asset Management for Providers application (com.sn_eam_provider) if you have the admin role. The application installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the [Enterprise Asset Management for Providers](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Install the Enterprise Asset Management (com.sn_eam) application or one of the following Enterprise Asset Management-dependent applications on your ServiceNow instance:

Note:

For instructions on how to install the Enterprise Asset Management application, see [Install Enterprise Asset Management](#).

- OT Asset Management (com.sn_otam)

For instructions on how to install this application, see [Install OT Asset Management](#).

- Enterprise Asset Management for Healthcare (com.sn_eamhmc)

For instructions on how to install this application, see [Install Enterprise Asset Management for healthcare](#).

- Enterprise Asset Management for Facilities (com.sn_eamfam)

- Enterprise Asset Management for Data Center and Network Asset Management (com.sn_eam_dcnam)

For instructions on how to install this application, see [Install Enterprise Asset Management for Data Center and Network Asset Management \(DCNAM\)](#).

Role required: admin

About this task

The following items are installed with Enterprise Asset Management for Providers:

- Roles
- Store applications
- Tables

For more information, see [Components installed with Enterprise Asset Management for Providers](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Enterprise Asset Management for Providers application (com.sn_eam_provider) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

A list of the versions available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Managing Return Merchandise Authorization (RMA) response orders for defective Device as a Service (DaaS) assets

If you are a DaaS provider, vendor, or manufacturer, you can fulfill RMA requests from your customers by creating and managing provider-based RMA response orders.

To successfully fulfill an RMA request, you must perform the following tasks in the RMA response order workflow:

1. [Create an RMA response order](#)
2. [Create corresponding RMA response order lines](#)
3. [Complete the RMA response order](#)

Create a Return Merchandise Authorization (RMA) response order for defective Device as a Service (DaaS) assets

Create an RMA response order to track and manage the process of repairing or replacing the defective DaaS assets that are associated with an RMA request.

Before you begin

Role required: sn_eam_provider.provider_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the navigation menu of the Asset operations view, navigate to **Provider > Provider RMA response order**.
3. Select **New**.
4. On the form, fill in the fields.

Create New RMA response form

Fields	Description
External RMA number	Customer-provided reference number for the RMA request that you want to fulfill. You can use this reference number to track the source of the RMA response order.
DaaS account	DaaS account of the customer who submitted the RMA request. You can use this information to determine which assets are leased to the account.
Contact Email	Email address of the customer who submitted the RMA request.
Delivery address	Address of the customer who submitted the RMA request.
Requested for	Name of the customer who submitted the RMA request.
Customer mobile number	Mobile phone number of the customer who submitted the RMA request.
Device location	Geographic location of the assets that are associated with the RMA request.
RMA justification	Customer-provided justification for the RMA request.

5. Select **Save**.

What to do next

Create corresponding RMA response order lines for the DaaS assets that you want to repair or replace. For detailed instructions, see [Create a Return Merchandise Authorization \(RMA\) response order line for a defective Device as a Service \(DaaS\) asset](#).

Create a Return Merchandise Authorization (RMA) response order line for a defective Device as a Service (DaaS) asset

Create an RMA response order line for each defective DaaS asset that you want to repair or replace through an RMA response order. Use each order line to track and manage the tasks that you must complete to repair or replace the given asset.

Before you begin

Role required: sn_eam_provider.provider_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the RMA response order lines list.
3. Select **New**.
4. On the form, fill in the fields.

Create New RMA response order line form

Field	Description
Model	Model of the asset that you want to repair or replace.
Assigned to	User who is assigned to repair or replace the specified asset.
Asset	<p>Asset that you want to repair or replace.</p> <p>Note: The list of available assets is automatically filtered to display only the assets that meet the following criteria:</p> <ul style="list-style-type: none"> ○ The asset is associated with the model specified in the Model field. ○ The DaaS asset option is enabled on the corresponding asset record. ○ The DaaS account field on the corresponding asset record matches the DaaS account specified in the associated RMA response order.

5. Select **Save**.

Result

- The RMA response order line is added to the associated RMA response order.
- An RMA assessment task is automatically generated for the RMA response order line.

What to do next

Perform all tasks that are required for completing the RMA response order line so that you can complete and close the associated RMA response order. For detailed instructions, see [Completing a Return Merchandise Authorization \(RMA\) response order for defective Device as a Service \(DaaS\) assets](#).

Completing a Return Merchandise Authorization (RMA) response order for defective Device as a Service (DaaS) assets

After you create an RMA response order with corresponding RMA response order lines, you must perform various tasks to complete and close the order.

Based on the action that you want to take on your defective DaaS assets, you must complete a specific set of tasks for each RMA response order line within an RMA response order. After you complete all tasks for an order line, it moves to the Completed stage. After every order line reaches the Completed stage, the order is closed.

Tasks for supported RMA actions

Supported RMA action	Tasks
On-site repair	<ol style="list-style-type: none"> 1. RMA assessment task to assess the defective DaaS asset. 2. Schedule task to schedule a visit to the customer site. 3. Evaluate RMA asset task to evaluate the defective DaaS asset. 4. Repair asset task to repair the defective DaaS asset.

Tasks for supported RMA actions (continued)

Supported RMA action	Tasks
	<ol style="list-style-type: none"> 5. Evaluate asset task to evaluate the repaired DaaS asset. 6. The customer redeploys or disposes of the repaired DaaS asset.
On-site replacement	<ol style="list-style-type: none"> 1. RMA assessment task to assess the defective DaaS asset. 2. Schedule task to schedule a visit to the customer site. 3. Evaluate RMA asset task to evaluate the defective DaaS asset. 4. Ship task to have the customer ship the defective DaaS asset to you. 5. Receive asset task to verify that you received the defective DaaS asset from the customer. 6. Complete an inbound asset order to provide the customer with a new DaaS asset.
Off-site repair	<ol style="list-style-type: none"> 1. RMA assessment task to assess the defective DaaS asset. 2. Ship task to have the customer ship the defective DaaS asset to you. 3. Receive asset task to verify that you received the defective DaaS asset from the customer. 4. Evaluate RMA asset task to evaluate the defective DaaS asset. 5. Repair asset task to repair the defective DaaS asset. 6. Evaluate asset task to evaluate the repaired DaaS asset. 7. Ship task to ship the repaired DaaS asset back to the customer. 8. Receive asset task to verify that the customer received the repaired DaaS asset. 9. The customer redeploys or disposes of the repaired DaaS asset.
Off-site replacement	<ol style="list-style-type: none"> 1. RMA assessment task to assess the defective DaaS asset. 2. Ship task to have the customer ship the defective DaaS asset to you. 3. Receive asset task to verify that you received the defective DaaS asset from the customer. 4. Evaluate RMA asset task to evaluate the defective DaaS asset. 5. Complete an inbound asset order to provide the customer with a new DaaS asset.

Complete the RMA assessment task for a defective Device as a Service DaaS asset

Complete the RMA assessment task for a defective DaaS asset by assessing the asset and determining the action that you want to take on it. You can choose to repair it, replace it, or reject the associated RMA request.

Before you begin

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the RMA assessment task that you want to complete.
4. On the **Details** tab of the RMA assessment task, fill in the fields.

Details tab

Field	Description
Assessment action	Action that you want to take on the asset. Select one of the following options: <ul style="list-style-type: none"> ○ On site: Option to repair or replace the asset at the customer site. ○ Off site: Option to repair or replace the asset at your organization's site. ○ Denied: Option to reject the RMA request.
Assignment group	Group that the task is assigned to.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The RMA assessment task closes with an updated state of Closed Complete.
- If you set the **Assessment action** field to **On site**, a corresponding Schedule task is automatically generated.
- If you set the **Assessment action** field to **Off site**, a corresponding Ship task is automatically generated.
- If you set the **Assessment action** field to **Denied**, the associated RMA response order line moves to the Rejected stage.

What to do next

- If you set the **Assessment action** field to **On site**, complete the corresponding Schedule task by scheduling a visit to the customer site. For detailed instructions, see [Complete the Schedule task for a defective Device as a Service DaaS asset](#).
- If you set the **Assessment action** field to **Off site**, complete the corresponding Ship task by having the customer ship the asset to you. For detailed instructions, see [Complete the Ship task for a defective Device as a Service DaaS asset](#).

Complete the Schedule task for a defective Device as a Service DaaS asset

If you want to perform an on-site repair or replacement for a defective DaaS asset, complete the Schedule task for the asset by scheduling a visit to the customer site.

Before you begin

Before you can begin the Schedule task, you must complete the preceding RMA assessment task by assessing the asset and selecting the option to perform an on-site repair or replacement. For detailed instructions, see [Complete the RMA assessment task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Schedule task that you want to complete.
4. On the **Details** tab of the Schedule task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task.
Scheduled date	Date and time at which you plan to visit the customer site.
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Schedule task closes with an updated state of Closed Complete.
- A corresponding Evaluate RMA asset task is automatically generated.

What to do next

Complete the corresponding Evaluate RMA asset task by going to the customer site and evaluating the asset. For detailed instructions, see [Complete the Evaluate RMA asset task for a defective Device as a Service DaaS asset](#).

Complete the Evaluate RMA asset task for a defective Device as a Service DaaS asset

Complete the Evaluate RMA asset task for a defective DaaS asset by evaluating the asset and determining whether you want to repair or replace it.

Before you begin

Before you can begin the Evaluate RMA asset task, you must complete the preceding task.

- If you are performing an on-site repair or replacement, you must complete the preceding Schedule task by scheduling a visit to the customer site. For detailed instructions, see [Complete the Schedule task for a defective Device as a Service DaaS asset](#).
- If you are performing an off-site repair or replacement, you must complete the preceding Ship task by having the customer ship the asset to you. For detailed instructions, see [Complete the Receive asset task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Evaluate RMA asset task that you want to complete.
4. On the **Details** tab of the Evaluate RMA asset task, fill in the fields.

Details tab

Field	Description
Assignment group	Group that the task is assigned to.
Evaluation result	Result of the evaluation. Select one of the following options: <ul style="list-style-type: none"> ○ Repairable: The asset can be repaired. ○ Replace: The asset is unrepairable and must be replaced.
Issue identified	Reason that the asset is defective.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Evaluate RMA asset task closes with an updated state of Closed Complete.
- If you set the **Evaluation result** field to **Repairable**, a corresponding Repair asset task is automatically generated for both on-site and off-site repairs.
- If you set the **Evaluation result** field to **Replace** and you are performing an on-site replacement, a corresponding Ship task is automatically generated.
- If you set the **Evaluation result** field to **Replace** and you are performing an off-site replacement, a corresponding inbound asset order is automatically created.

What to do next

- If you set the **Evaluation result** field to **Repairable**, complete the corresponding Repair asset task by repairing the asset. For detailed instructions, see [Complete the Repair asset task for a defective Device as a Service DaaS asset](#).
- If you set the **Evaluation result** field to **Replace** and you are performing an on-site replacement, complete the corresponding Ship task by shipping the asset to your organization. For detailed instructions, see [Complete the Ship task for a defective Device as a Service DaaS asset](#).
- If you set the **Evaluation result** field to **Replace** and you are performing an off-site replacement, complete the corresponding inbound asset order to provide the customer with a new asset. For detailed instructions, see [Completing an inbound asset order for requested Device as a Service \(DaaS\) assets](#).

Complete the Repair asset task for a defective Device as a Service DaaS asset

Complete the Repair asset task for a defective DaaS asset by repairing the asset either on-site or off-site.

Before you begin

Before you can begin the Repair asset task, you must complete the preceding Evaluate RMA asset task by evaluating the asset and indicating that it is repairable. For detailed instructions, see [Complete the Evaluate RMA asset task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Repair asset task that you want to complete.
4. On the **Details** tab of the Repair asset task, fill in the fields.

Details tab

Field	Description
Assignment group	Group that the task is assigned to.
Repair result	Result of the repair. Select one of the following options: <ul style="list-style-type: none"> ○ Repaired: The asset was repaired. ○ Unrepairable: The asset is unrepairable and must be replaced.
Issue identified	Reason that the asset is unrepairable. Fill in this field only if you set the Repair result field to Unrepairable .
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Repair asset task closes with an updated state of Closed Complete.
- If you set the **Repair result** field to **Repaired**, a corresponding Evaluate asset task is automatically generated.
- If you set the **Repair result** field to **Unrepairable**, a corresponding Ship task is automatically generated.

What to do next

- If you set the **Repair result** field to **Repaired**, complete the corresponding Evaluate asset task by evaluating the repaired asset and determining if it can be redeployed. For detailed instructions, see [Complete the Evaluate asset task for a defective Device as a Service DaaS asset](#).
- If you set the **Repair result** field to **Unrepairable**, complete the corresponding Ship task by having the customer ship the asset to you for replacement. For detailed instructions, see [Complete the Ship task for a defective Device as a Service DaaS asset](#).

Complete the Evaluate asset task for a defective Device as a Service DaaS asset

After you repair a defective DaaS asset, complete the Evaluate asset task by evaluating the asset and determining if it can be redeployed.

Before you begin

Before you can begin the Evaluate asset task, you must complete the preceding Repair asset task by repairing the asset. For detailed instructions, see [Complete the Repair asset task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Evaluate asset task that you want to complete.
4. On the **Details** tab of the Evaluate asset task, fill in the fields.

Details tab

Field	Description
Assignment group	Group that the task is assigned to.
Evaluation result	Result of the evaluation. Select one of the following options: <ul style="list-style-type: none"> ○ Redeployable: The repair was successful, so the asset can be redeployed. ○ To be disposed: The repair was unsuccessful, so the asset must be disposed of.
Issue identified	Reason that the repair was unsuccessful. Fill in this field only if you set the Evaluation result field to To be disposed .
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Evaluate asset task closes with an updated state of Closed Complete.
- If you set the **Evaluation result** field to **Redeployable** and you performed an on-site repair, the RMA response order line moves to the Completed stage. The customer can redeploy the asset at any time.
- If you set the **Evaluation result** field to **Redeployable** and you performed an off-site repair, a corresponding Ship task is automatically generated.

What to do next

- If you set the **Evaluation result** field to **Redeployable** and you performed an off-site repair, complete the corresponding Ship task by shipping the repaired asset back to the customer so that it can be redeployed. For detailed instructions, see [Complete the Ship task for a defective Device as a Service DaaS asset](#).
- If you set the **Repair result** field to **Unrepairable**, the customer must dispose of the asset. For detailed instructions, see [Create a disposal order in the Enterprise Asset Workspace](#).

Complete the Ship task for a defective Device as a Service DaaS asset

If you want to perform a replacement or an off-site repair for a defective DaaS asset, you must complete the associated Ship task by having the customer ship the asset to you. If you choose to repair the asset, you must complete the associated Ship task by shipping the asset back to the customer after a successful repair.

Before you begin

Before you can begin the Ship task, you must complete the preceding task.

- If you are performing an on-site replacement, you must complete the preceding Evaluate RMA asset task by evaluating the asset and indicating that it must be replaced. For detailed instructions, see [Complete the Evaluate RMA asset task for a defective Device as a Service DaaS asset](#).
- If you are performing an off-site repair or replacement, you must complete the preceding RMA assessment task by assessing the asset and indicating that it must be repaired or replaced off-site. For detailed instructions, see [Complete the RMA assessment task for a defective Device as a Service DaaS asset](#).
- Before you can ship a repaired asset back to a customer, you must complete the preceding Evaluate asset task by evaluating the asset and verifying that it was repaired successfully. For detailed instructions, see [Complete the Evaluate asset task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.

3. From the list of available tasks, select the task number for the Ship task that you want to complete.
4. On the **Details** tab of the Ship task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task. Note: This field is editable only if you are shipping the asset to the customer.
Shipping carrier	Shipping carrier through which you are shipping the asset. For example, DHL .
Ship from	Geographic location that you are shipping the asset from.
Ship date	Date and time at which you shipped the asset.
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to. Note: This field is editable only if you are shipping the asset to the customer.
Tracking number	Tracking number that you can use to track the status and location of the asset shipment.
Ship to	Geographic location that you are shipping to asset to.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select Close Task.

- Note:**
 If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Ship task closes with an updated state of Closed Complete.
- A corresponding shipment record is automatically created for the asset shipment. A reference to the shipment record is populated in the **Shipment order** field of the Ship task. You can view and manage the shipment record from the Shipments list of the Asset operations view. For detailed instructions, see [View and add enterprise asset shipments](#).
- A corresponding Receive asset task is automatically generated.

What to do next

Complete the corresponding Receive asset task by confirming that the shipped asset was received. For detailed instructions, see [Complete the Receive asset task for a defective Device as a Service DaaS asset](#).

Complete the Receive asset task for a defective Device as a Service DaaS asset

After a customer ships a defective DaaS asset to you for repair or replacement, or after you ship a repaired DaaS asset back to a customer, complete the Receive asset task by verifying that the asset was received successfully.

Before you begin

Before you can begin the Receive asset task, you must complete the preceding Ship task by having the customer ship the asset to you or by shipping the asset back to the customer. For detailed instructions, see [Complete the Ship task for a defective Device as a Service DaaS asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Receive asset task that you want to complete.
4. On the **Details** tab of the Receive asset task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task. Note: This field is editable only if you are verifying that a customer received the asset.
Asset	Asset that was shipped.
Asset received	Option that indicates if the asset was received. Select either Yes or No .
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to. Note: This field is editable only if you are verifying that a customer received the asset.
Tracking number	Tracking number that you can use to track the status and location of the asset shipment.
Stockroom	Stockroom that the asset was added to.
Short description	Brief description of the task.

Field	Description
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Receive asset task closes with an updated state of Closed Complete.
- If you successfully received a defective DaaS asset from a customer for an on-site replacement, the RMA response order line moves to the Completed stage. A corresponding inbound asset order is automatically created.
- If you successfully received a defective DaaS asset from a customer for an off-site repair or replacement, a corresponding Evaluate RMA asset task is automatically generated.
- If a customer successfully received a DaaS asset that you repaired, the RMA response order line moves to the Completed stage.

What to do next

- If you successfully received a defective DaaS asset from a customer for an on-site replacement, complete the corresponding inbound asset order to provide the customer with a new asset. For detailed instructions, see [Completing an inbound asset order for requested Device as a Service \(DaaS\) assets](#).
- If you successfully received a defective DaaS asset from a customer for an off-site repair or replacement, complete the corresponding Evaluate RMA asset task by evaluating the asset and determining whether you want to repair or replace it. For detailed instructions, see [Complete the Evaluate RMA asset task for a defective Device as a Service DaaS asset](#).

Managing inbound asset orders for requested Device as a Service (DaaS) assets

If you are a DaaS provider, vendor, or manufacturer, you can create and manage provider-based inbound asset orders to provide your customers with the DaaS assets that are requested through your Return Merchandise Authorization (RMA) response orders.

To successfully fulfill a request, you must perform the following tasks in the inbound asset order workflow:

1. [Create an inbound asset order](#)
2. [Create corresponding inbound asset order lines](#)
3. [Complete the inbound asset order](#)

Create an inbound asset order for requested Device as a Service (DaaS) assets

Create an inbound asset order to track and manage the process of providing your customers with the DaaS assets that are requested through your Return Merchandise Authorization (RMA) response orders.

Before you begin

Role required: sn_eam_provider.provider_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. From the navigation menu of the Asset operations view, navigate to **Provider > Provider inbound orders**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Inbound asset order form

Field	Description
External request reference	Customer-provided reference number for the asset request that you want to fulfill. You can use this reference number to track the source of the inbound asset order.
DaaS account	DaaS account of the customer who submitted the asset request. You can use this information to determine which assets are leased to the account.
Delivery address	Address of the customer who submitted the asset request.
Requested for	Name of the customer who submitted the asset request.
Estimated delivery date	Estimated delivery date of the assets that you are sending to the customer.

5. Select **Save**.

What to do next

Create corresponding inbound asset order lines for the DaaS assets that you want to provide to your customers through the inbound asset order. For detailed instructions, see [Create an inbound asset order line for a requested Device as a Service \(DaaS\) asset](#).

Create an inbound asset order line for a requested Device as a Service (DaaS) asset

Create an inbound asset order line for each DaaS asset that you want to provide to your customers through an inbound asset order. Use each order line to track and manage the tasks that you must complete to provide the given asset to the customer.

Before you begin

Role required: sn_eam_provider.provider_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Inbound asset order lines list.
3. Select **New**.
4. On the form, fill in the fields.

Create New Inbound asset order line form

Field	Description
Model	Model of the asset that you want to provide to the customer.
Assigned to	User who is assigned to provide the asset to the customer.

5. Select **Save**.

Result

- The inbound asset order line is added to the associated inbound asset order.
- An Asset selection task is automatically generated for the inbound asset order line.

What to do next

Perform all tasks that are required for completing the inbound asset order line so that you can complete and close the associated inbound asset order. For detailed instructions, see [Completing an inbound asset order for requested Device as a Service \(DaaS\) assets](#).

Completing an inbound asset order for requested Device as a Service (DaaS) assets

After you create an inbound asset order with corresponding inbound asset order lines, you must perform various tasks to complete and close the order.

You must complete the following tasks for each inbound asset order line within an inbound asset order:

1. [Asset selection task to select the DaaS asset that you want to provide to the customer.](#)
2. [Asset pick task to pick the DaaS asset from the specified stockroom.](#)
3. [Asset prepare task to prepare the DaaS asset for shipment.](#)
4. [Asset ship task to ship the DaaS asset to the customer.](#)
5. [Receive task to verify that the customer received the DaaS asset.](#)

After you complete all tasks for a given order line, it moves to the Completed stage. After every order line reaches the Completed stage, the order is closed.

Complete the Asset selection task for a requested Device as a Service (DaaS) asset

Complete the Asset selection task for a requested DaaS asset by selecting an asset that matches the criteria specified in the associated inbound asset order line.

Before you begin

Role required: sn_eam_provider.provider_asset_manager

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Asset selection task that you want to complete.
4. On the **Details** tab of the Asset selection task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task.
Stockroom	Stockroom that you are selecting the asset from.
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Asset	<p>Asset that you are selecting for the inbound asset order line. Select an asset that meets the following criteria:</p> <ul style="list-style-type: none"> ○ Matches all criteria specified in the order line. ○ The DaaS asset option is enabled in the corresponding asset record. ○ An account is specified in the DaaS account field of the corresponding asset record. <p>Note: For more information on the DaaS asset and DaaS account fields, see Asset fields for enterprise assets.</p>
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about that task that are visible to all users within your organization.

5. Select Close Task.

Note:
If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Asset selection task closes with an updated state of Closed Complete.
- A corresponding Asset pick task is automatically generated.

What to do next

The provider asset technician must complete the corresponding Asset pick task by picking the asset that you selected for the inbound asset order line. For detailed instructions, see [Complete the Asset pick task for a requested Device as a Service \(DaaS\) asset](#).

Complete the Asset pick task for a requested Device as a Service (DaaS) asset

Complete the Asset pick task for a requested DaaS asset by picking the asset that a provider asset manager selected for an inbound asset order line. You must pick the asset from the stockroom that the provider asset manager specified when selecting the asset.

Before you begin

Before you can begin the Asset pick task, a provider asset manager must complete the preceding Asset selection task by selecting an asset for the inbound asset order line. For

detailed instructions, see [Complete the Asset selection task for a requested Device as a Service \(DaaS\) asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available asset tasks, select the task number for the Asset pick task that you want to complete.
4. On the **Details** tab of the Asset pick task, fill in the fields.

Details tab

Field	Description
Asset pick task	
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Due date	Date and time at which you must complete the task.
Drop off location	Location where the asset must be delivered.
Notes	
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Asset pick task closes with an updated state of Closed Complete.
- A corresponding Asset prepare task is automatically generated.

What to do next

Complete the corresponding Asset prepare task by preparing the picked asset for shipment. For detailed instructions, see [Complete the Asset prepare task for a requested Device as a Service \(DaaS\) asset](#).

Complete the Asset prepare task for a requested Device as a Service (DaaS) asset

Before you ship the DaaS asset that you picked for an inbound asset order line, complete the Asset prepare task for it by completing any necessary pre-shipment checklists and by inspecting it for defects.

Before you begin

Before you can begin the Asset prepare task, you must complete the preceding Asset pick task by picking the asset from the stockroom that the provider asset manager specifies. For detailed instructions, see [Complete the Asset pick task for a requested Device as a Service \(DaaS\) asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Asset prepare task that you want to complete.
4. On the **Details** tab of the Asset prepare task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task.
Stockroom	Stockroom that the asset is located in.
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Asset prepare task closes with an updated state of Closed Complete.
- A corresponding Asset ship task is automatically generated.

What to do next

Complete the corresponding Asset ship task by shipping the prepared asset to the customer that the asset is requested for. For detailed instructions, see [Complete the Asset ship task for a requested Device as a Service \(DaaS\) asset](#).

Complete the Asset ship task for a requested Device as a Service (DaaS) asset

After you prepare the DaaS asset that you picked for an inbound asset order line, complete the Asset ship task for it by shipping it to the customer that it is requested for.

Before you begin

Before you can begin the Asset ship task, you must complete the preceding Asset prepare task by preparing the asset for shipment. For detailed instructions, see [Complete the Asset prepare task for a requested Device as a Service \(DaaS\) asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Asset ship task that you want to complete.
4. On the **Details** tab of the Asset ship task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task.
Shipping carrier	Shipping carrier through which you are shipping the asset. For example, DHL .
Ship from	Geographic location that you are shipping the asset from.
Ship date	Date and time at which you shipped the asset.
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Tracking number	Tracking number that you can use to track the status and location of the asset shipment.
Ship to	Geographic location that you are shipping to asset to.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes (Private)	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Asset ship task closes with an updated state of Closed Complete.
- A corresponding shipment record is automatically created for the asset shipment. A reference to the shipment record is populated in the **Shipment order** field of the Asset ship task. You can

view and manage the shipment record from the Shipments list of the Asset operations view. For detailed instructions, see [View and add enterprise asset shipments](#).

- A corresponding Receive task is automatically generated.

What to do next

Complete the corresponding Receive task by verifying that the customer successfully received the shipped asset. For detailed instructions, see [Complete the Receive task for a requested Device as a Service \(DaaS\) asset](#).

Complete the Receive task for a requested Device as a Service (DaaS) asset

After you ship the DaaS asset that you prepared for an inbound asset order line, complete the Receive task for it by verifying that the customer received it successfully.

Before you begin

Before you can begin the Receive task, you must complete the preceding Asset ship task by shipping the asset. For detailed instructions, see [Complete the Asset ship task for a requested Device as a Service \(DaaS\) asset](#).

Role required: sn_eam_provider.provider_asset_technician

Procedure

1. From the Enterprise Asset Workspace, open the Asset operations view.
2. Open the Asset tasks list.
3. From the list of available tasks, select the task number for the Receive task that you want to complete.
4. On the **Details** tab of the Receive task, fill in the fields.

Details tab

Field	Description
Due date	Date and time at which you must complete the task.
Asset	Asset that was shipped to the customer.
Asset received	Option that indicates if the customer received the asset. Select either Yes or No .
Assignment group	Group that the task is assigned to.
Assigned to	User who the task is assigned to.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Notes about the task that are visible to all users within your organization.

5. Select **Close Task**.

Note:

If you want to save your progress and close the task at a later time, select **Save** instead. You can return to the task at any time.

Result

- The Receive task closes with an updated state of Closed Complete.
- The inbound asset order line moves to the Completed stage.
- The state of the asset changes to In Transit.

Cloud Cost Management

ServiceNow® Cloud Cost Management application (formerly known as Cloud Insights) gives you visibility and control of your cloud usage and costs and helps you to discover all of your cloud resources, breaks down cloud spend by cost center, business service, and other entity, provides recommendations on how to reduce cloud spend, and automates repetitive cost optimization tasks.

Overview

Watch this short video for an introduction to the Cloud Cost Management application.

i Important: Cloud Cost Management version 8.0.0 and below are in the Planned Deprecation phase (see [Deprecation Process](#) for more details). These versions will not be available on the ServiceNow Store for download and installation for new deployments, but will continue to be supported for existing deployments.

Get started

<p>Explore</p>  <p>Learn the key features and business value that the Cloud Cost Management application offers.</p>	<p>Configure</p>  <p>Activate Cloud Cost Management supporting plugins, features, and assign roles to enable additional setup activities.</p>
<p>Using</p>  <p>Automate and streamline manual processes by automating cloud tasks.</p>	<p>Reference</p>  <p>Get details about the roles, domain separation, and service categories in Cloud Cost Management.</p>

Exploring Cloud Cost Management

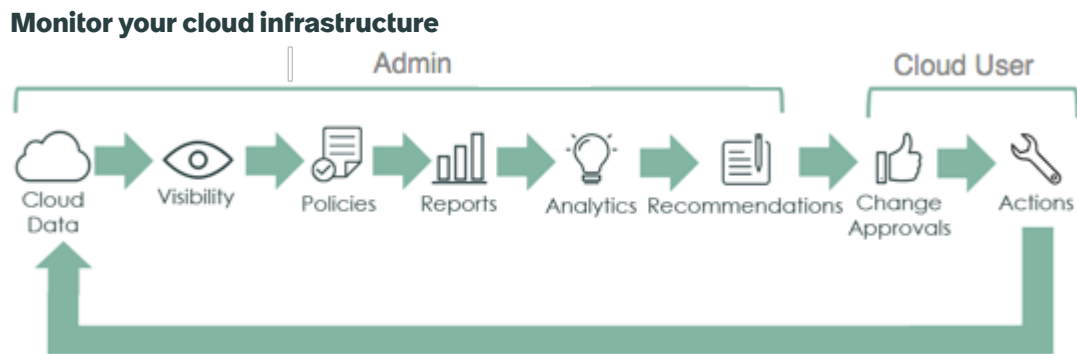

Learn more about Cloud Cost Management with a sample workflow and reviewing the benefits that it can provide for different users in your organization.

Cloud Cost Management overview

Cloud Cost Management helps you analyze the full range of costs related with cloud assets so you can identify and act on chances to save money and optimize operations.

Cloud Cost Management workflow

Cloud Cost Management continuously monitors your cloud infrastructure to analyze costs so you can identify and act on resources to save money and optimize operations.

Cloud Cost Management benefits

Benefit	Feature	Users
Optimize cloud costs and usage by gaining complete visibility of your cloud spend and usage through an intuitive and streamlined user interface.	Cloud Cost Management Workspace	Executives/FinOps Practitioners/Cloud Managers/Cloud Administrators
Rightsize cloud resources by getting automated recommendations on how to reduce cloud costs by correctly dimensioning cloud resources to match usage.	Rightsizing resources	Cloud Administrators/ Application owners
Decrease costs by the conversion of on-demand payment plans to reservation plans for your cloud resources.	Reservation or Saving plans	Cloud Administrators/ Application owners
Identify cost optimizations targets by analyzing areas of high spend and stranded cloud assets.	Unused resources	Cloud Administrators/ Application owners

Benefit	Feature	Users
Turn off resources when not in use by identifying cloud resources that aren't used outside normal working hours and automatically turn them off and on.	Business hours	Cloud Administrators/ Application owners
Allocate budgets	Cloud budgets	FinOps Practitioners/ Cloud Administrators
Automate optimization approvals by integrating cloud optimization tasks into your existing change management processes.	Change Management 	FinOps Practitioners/ Cloud Administrators

Cloud Cost Management Workspace

Use the Cloud Cost Management Workspace, the intuitive and streamlined user interface of the Cloud Cost Management application, to analyze the full range of costs that are associated with cloud resources. You can identify and act on opportunities to save money and optimize operations.

The Cloud Cost Management Workspace is a unified medium with multiple views. The views let you analyze costs, spend, budget of your cloud resources, and provides insight into how IT supports business application and services through various dashboards.

The Cloud Cost Management Workspace contains the following views:

- [Cloud Cost Management overview](#): Use the Cloud Cost Management Workspace through this simplified overview page and get insights into your cloud resources.
- [Budget view](#): Reduce cloud spend by proactively understanding the budget compliance of your cloud resources.
- [Spend dashboard view](#): Analyze and understand the spend on your cloud resources.
- [Operations view](#): View and manage recommendations, cost usage tags, and admin-related operations.
- [Admin view](#): Install, set up, and configure Cloud Cost Management through a guided experience.

Note:

You can view the reports and data based on your role. For more information, see [Cloud Cost Management roles](#).

Cloud Cost Management overview

Enhance your experience by using the modernized and user-friendly Cloud Cost Management overview. This simplified overview page helps you use the Cloud Cost Management application more effectively by reducing complexity.

Important:

If you have the `insights_owner` role, only the accounts that are assigned to you appear in the filters and data.

Use the Cloud Cost Management overview to,

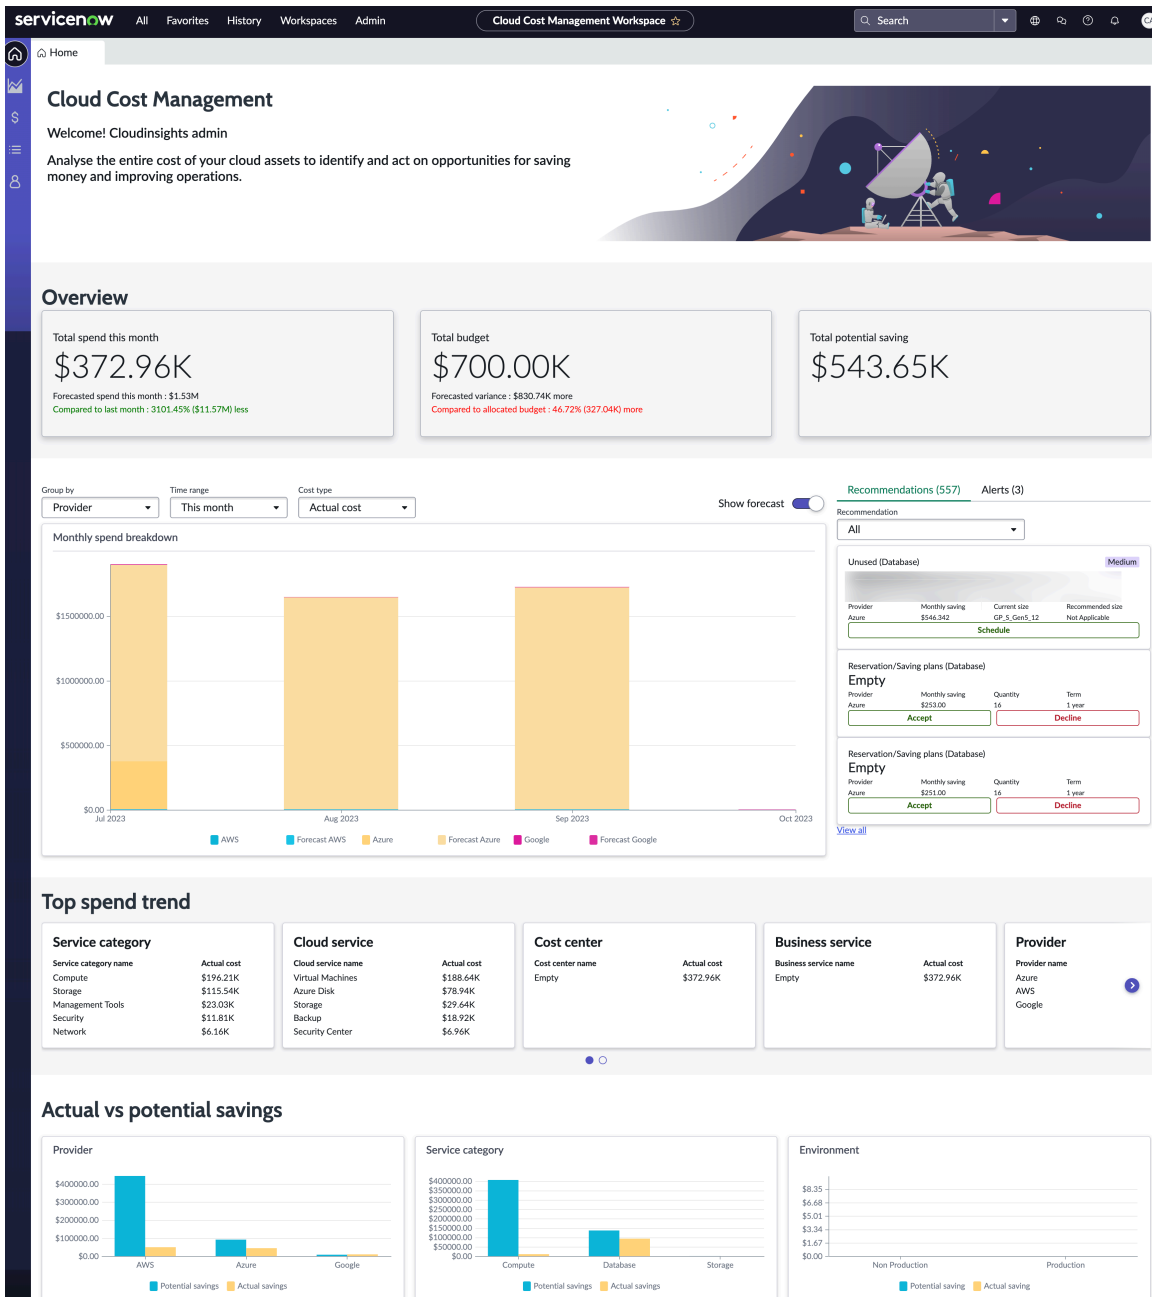

- Understand how you currently spend on cloud resources or service accounts for the last 30 days.
- Gain insights into key metrics such as the total budget and potential savings for your cloud resources.

- Analyze your spend breakdown and group your results by provider, service category, service account, cloud service, or purchase option. You can also sort your results by months past such as 3, 6, 9, or 12 months, actual cost or amortized cost, and by hiding or showing the future cost.

Note:

You can view the forecast grouped only by provider or service account.

- View cloud spending analytics based on provider, service category, and cloud service.
- Get information about the top spend trends that are grouped by service category, cloud service, cost center, business service, and provider.
- Understand your savings breakdown by viewing your potential and actual saving.
- Get actionable insights into your cloud resources through alerts and recommendations.

Overview

Report	Description
Total spend this month	<p>Actual spend on your service accounts or cloud resources for the last 30 days.</p> <p>The Forecasted spend this month amount displays the total future spends for all your cloud assets.</p> <p>The Compared to last month percentage amount shows the spend difference of the current month and last month.</p>
Total budget	<p>Total budget of your service accounts or cloud assets where the current date falls between the start date and end date of the budget.</p> <p>For a budget owner, the budget for only the created policies is displayed.</p> <p>The Forecasted variance amount shows the budget amount based on the spend on your cloud resources, which is</p> <div style="border: 1px solid gray; padding: 5px; margin: 10px 0;"> $\frac{\text{Forecasted spend this month} - \text{Total budget}}{\text{Total budget}}$ </div> <p>.</p>
Total potential saving	<p>Total saving for your cloud assets based on all the recommendations that you haven't acted on.</p>
Monthly spend breakdown	<p>Monthly spend breakdown grouped by provider, service category, service account, cloud service, or purchase option. The results can be sorted by time range and cost type. Use the Show forecast toggle switch for hiding or showing the future cost.</p> <p>Selecting a monthly spend breakdown bar navigates you to the Spend analytics page. For more information, see Spend analytics.</p>

Top spend trend

Report	Description
Top spend trend	<p>Spend trend or actual cost grouped by service category, cloud service, cost center, business service, and provider.</p>

Actual vs potential savings

Report	Description
Actual vs potential savings grouped by provider, service category, and environment	<p>Actual vs potential savings grouped by provider, service category, and environment.</p> <p>Note: To view the Actual vs potential savings grouped by environment chart, you must create tag categories as Production and Non Production. For more information about creating a tag category, see Create and update a tag category.</p> <p>Potential saving indicates the total spend on your cloud resources that could be optimized by the recommendations.</p> <p>Actual saving indicates the total savings achieved by following the recommendations to optimize your cloud resources.</p>

Alerts

Note:
The alerts that you view on the **Cloud Cost Management Overview** page are for the last one week.

Alert	Description
Last <provider> billing download job failed	The billing download job that downloads organizes, and stores billing data for your payer account has failed.
Last <provider> price sheet download job failed	The price sheet download job that download and stores price sheet data for your cloud provider has failed.
Scheduled jobs failed	One or more scheduled jobs, which automate processes for cloud providers have failed.
<Number> declined recommendations	Number of recommendations that you've declined, which indicates potential savings.
<Number> failed recommendations	Number of recommendations that have failed, which indicates potential savings for your cloud resources.

Recommendations

Recommendation	Description
All	Displays all the recommendations that Cloud Cost Management provides for your cloud assets.
Business hour	The Business hour recommendation helps you identify resources that are running when they should be powered off.
Reservation/Saving plans	The reservation and saving recommendation helps you identify resources that would save you money with reservation plans or saving plans. You can accept or decline the reservation and saving recommendation.
Rightsizing	The Rightsizing recommendation helps you identify the users, user groups, or locations that are wasting money by running over-provisioned or underused resources. You can schedule the rightsizing processes and specify the amount of potential rightsizing savings that triggers notifications.
Unused	The Unused recommendation helps you identify the unused resources. You can schedule unused machines to be powered off or terminated.

Spend analytics

The Spend analytics page helps you gain visibility to your cloud costs by displaying your cloud, Kubernetes, and shared resources spend over a time range or a cost type that you specify.

Important:

If you have the `insights_owner` role, only the accounts that are assigned to you appear in the filters and data.

Use the Spend analytics page to view the following:

- Cloud spend analytics
- Kubernetes spend analytics
- Shared cost analytics

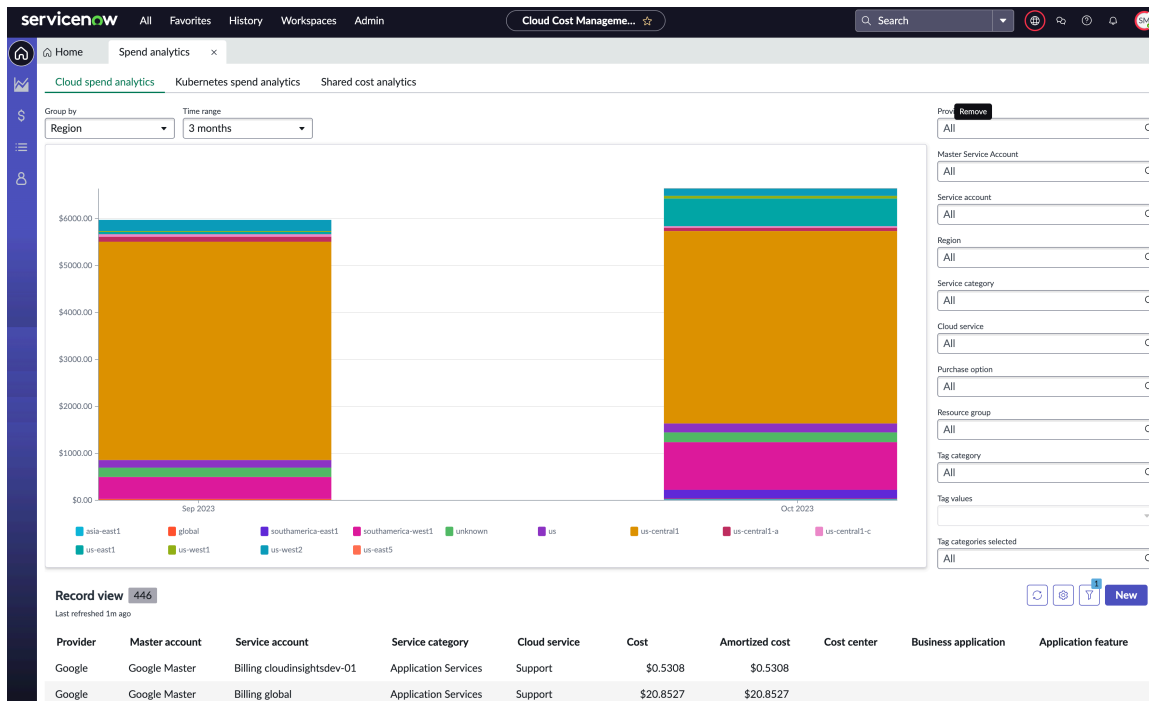

Note:

You can't view the spend of your resources for nested tag values. For example, `{"name": "test", "created-by": "xyz", "prod": "false", "shared_resource": "false"}`.

Cloud spend analytics

Select the **Cloud spend analytics** tab to do the following tasks:

- Understand how you currently spend on cloud resources for a period that you can select in the **Time range** field.
 - Group the cloud spend analytics by using either of the following values:
 - Provider
 - Purchase option
 - Region
 - Service account
 - Service category
 - Cloud service
 - Resource group
 - Tag category
 - Sort your cloud spend results by the current month or select a time range such as 3, 6, 9, or 12 months.
 - Get a better picture of your results by searching and selecting values through the following filters:
 - Provider
 - Master Service Account
 - Service account
 - Region
 - Service category
 - Cloud service

- Tag values
 - Tag categories selected

Kubernetes spend analytics

Select the **Kubernetes spend analytics** tab to do the following tasks:

- Understand how you currently spend on Kubernetes on the cloud for a period that you can select in the **Time range** field.
- Group the Kubernetes spend analytics by using either of the following values:
 - Kubernetes cluster
 - Kubernetes namespace
 - Tag category
- Select the cost type as Actual cost or Amortized cost.
 - Actual cost: Each billing period, your organization pays for direct cloud services.
 - Amortized cost: Your organization pays the effective cost of the upfront and monthly reservation fees spread across the billing period. The amortized cost type is described in detail on the provider site.
- Sort your Kubernetes spend results by the current month or select a time range such as 3, 6, 9, or 12 months.
- Get a better picture of your results by searching and selecting values through the following filters:
 - Provider
 - Master Service Account
 - Service account
 - Region
 - Kubernetes cluster
 - Kubernetes namespace
 - Purchase option
 - Resource group

- Tag category

Note:

For more information about tag categories and the list of default tag categories, see [Tags and tag categories](#) and [List of default tag categories](#).

- Tag value
- Tag categories selected
- View details of cost per Kubernetes cluster and cost per Kubernetes namespace.

Shared cost analytics

Select the **Shared cost analytics** tab to do the following tasks:

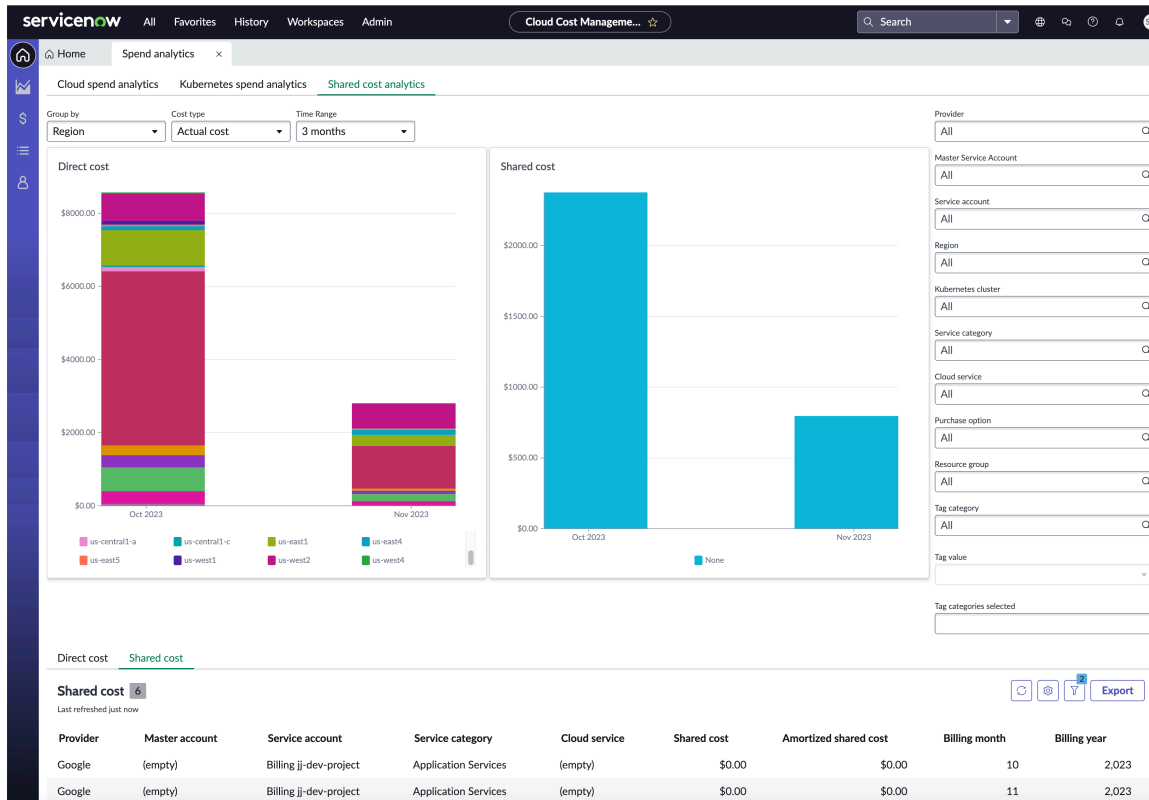

- Understand how you currently spend on shared cloud resources for a period that you can select in the **Time range** field.
- Group the Shared cost analytics by using either of the following values:
 - Provider
 - Purchase option
 - Region
 - Service account
 - Service category
 - Cloud service
 - Resource group
 - Tag category
- Select **Cost type** as Actual cost or Amortized cost.

- Actual cost: Each billing period, your organization pays for direct cloud services.
- Amortized cost: Your organization pays the effective cost of the upfront and monthly reservation fees spread across the billing period. The amortized cost type is described in detail on the provider site.
- Sort your shared resources cost results by the current month or select a time range such as 3, 6, 9, or 12 months.
- Get a better picture of your results by searching and selecting values through the following filters:
 - Provider
 - Master Service Account
 - Service account
 - Region
 - Service category
 - Cloud service
 - Purchase option
 - Resource group
 - Tag category

 Note:

For more information about tag categories and the list of default tag categories, see [Tags and tag categories](#) and [List of default tag categories](#).

- Tag value
- Tag categories selected
- View details of the direct cost and shared cost of your cloud resources.

Budget view

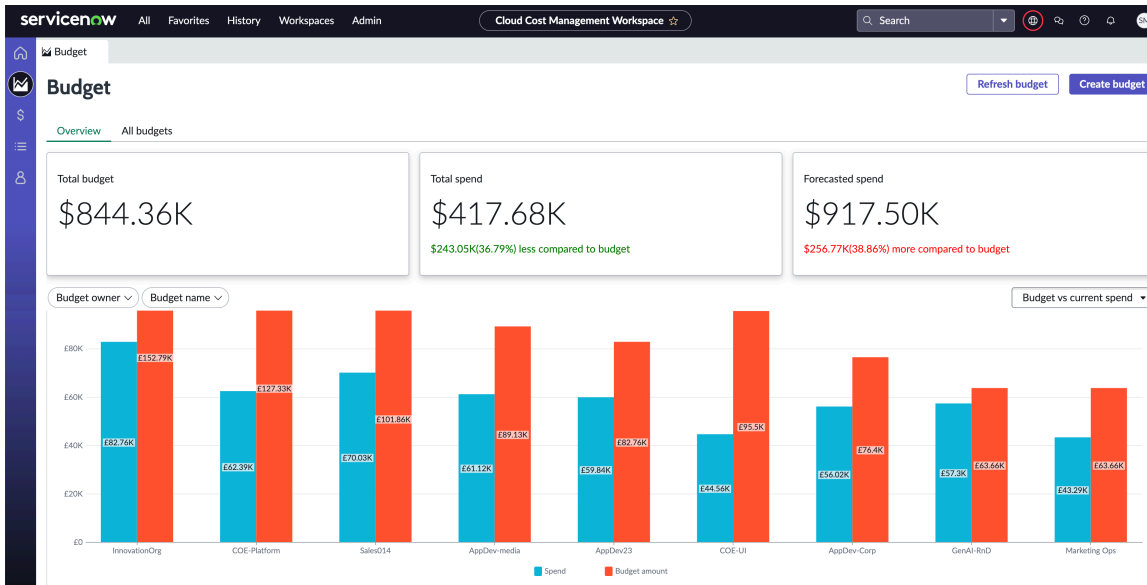

Understand budget compliance by groups and service accounts can significantly improve oversight and reduce cloud spend.

i Important:

If you have the insights_owner role, only the accounts that are assigned to you appear in the filters and data.

Use the Budget view to:

- View your total budget and spend on your cloud assets.
- Analyze your future spend and understand if you are within or over the budget.
- Manage your cloud spend, you can define and monitor custom Budget plans.
- Create and manage a budget policy. For more information, see [Create or update a budget policy](#).

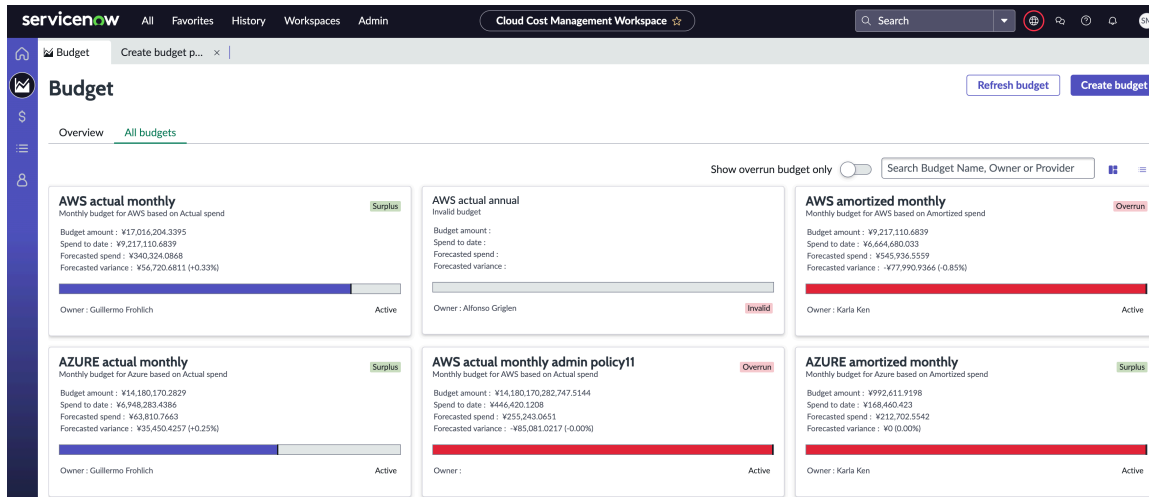

Budget overview

Report	Description
Total budget	Valid budget of your cloud assets for the current period.
Total spend	Total spend on your cloud assets for the current month. Indicates if your current spend is within or has exceeded the budget.
Forecasted spend	Forecasted spend based on the total spend on your cloud resources. Indicates if your forecasted spend is within or has exceeded the budget.
Budget vs Spend	Comparison between budget and current or forecasted spend of each budget policy. You can filter the data by: <ul style="list-style-type: none"> • Budget owner • Budget name • Budget vs current spend • Budget vs forecasted spend

All budgets

After you create or modify a budget policy, the policies get displayed on the **All Budgets** page. Find the details of the budget such as overrun, surplus, or invalid budgets. You can view only the overrun budgets by toggling the **Show overrun budget only** toggle button. Search a budget by its name, owner, or provider.

Spend dashboard view

Ensure accurate spend reporting by using the Spend view in the Cloud Cost Management Workspace.

Important:

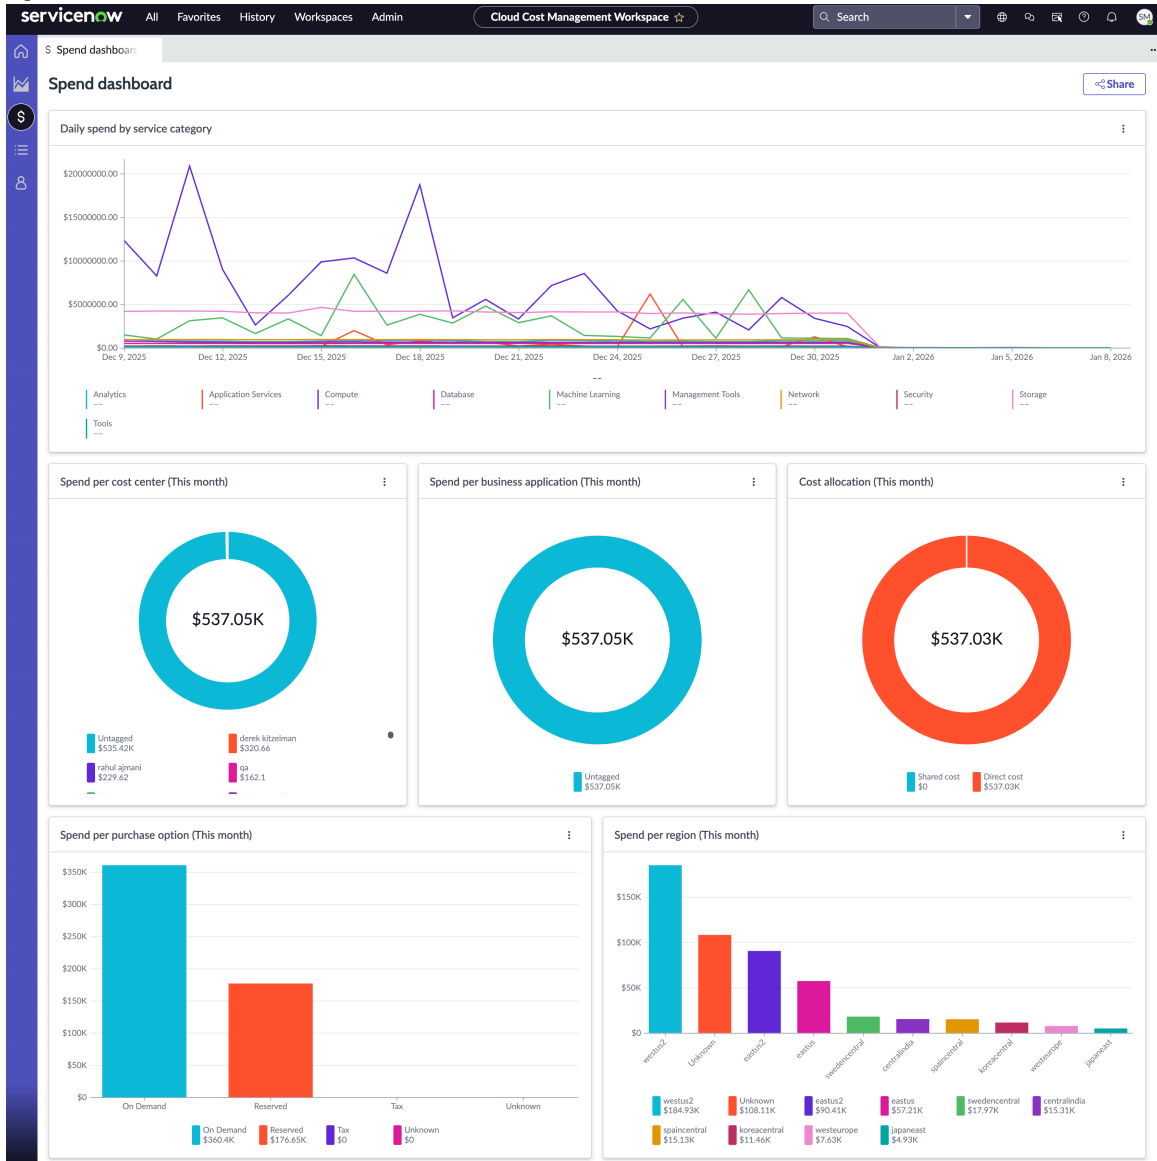

If you have the insights_owner role, only the accounts that are assigned to you appear in the filters and data.

Use the Spend view to analyze and understand the spend on your assets that are grouped by various categories:

- Daily spend by service category
- Spend per cost center (This month)
- Spend per purchase option (This month)
- Spend per business application (This month)
- Cost allocation, displaying shared and direct cost
- Spend per region (This month)

The Spend view displays detailed reports for the listed categories. You can select a report to view the cloud resource spend and fields in the list view. For more information on these reports, see [Spend dashboard](#). You can access the Spend view by navigating to **Workspaces > Cloud Cost Management Workspace > Spend**.

Spend dashboard

Spend dashboard

Report	Source	Description
Daily spend by service category	Spend Report Daily Aggregated Cost [sn_cld_spend_core_daily_aggregated_cost]	Service category-wise daily spend on cloud resources.
Spend per cost center (This month)	Spend Report Monthly Cost [sn_cld_spend_core_monthly_aggregated_cost]	Cost center-wise spend on cloud resources for the current month.
Spend per purchase option (This month)	Spend Report Monthly Cost [sn_cld_spend_core_monthly_aggregated_cost]	Purchase option-wise spend on cloud resources for the current month.
Spend per business application (This month)	Spend Report Monthly Cost [sn_cld_spend_core_monthly_aggregated_cost]	Business application-wise spend on cloud resources for the current month.

Spend dashboard (continued)

Report	Source	Description
Cost allocation	This report fetches data from the Spend analytics dashboard.	Cost allocated for cloud resources including direct cost and shared cost.
Spend per region (This month)	Spend Report Monthly Cost [sn_cld_spend_core_monthly_aggregated_cost]	Region-wise spend on cloud resources for the current month.

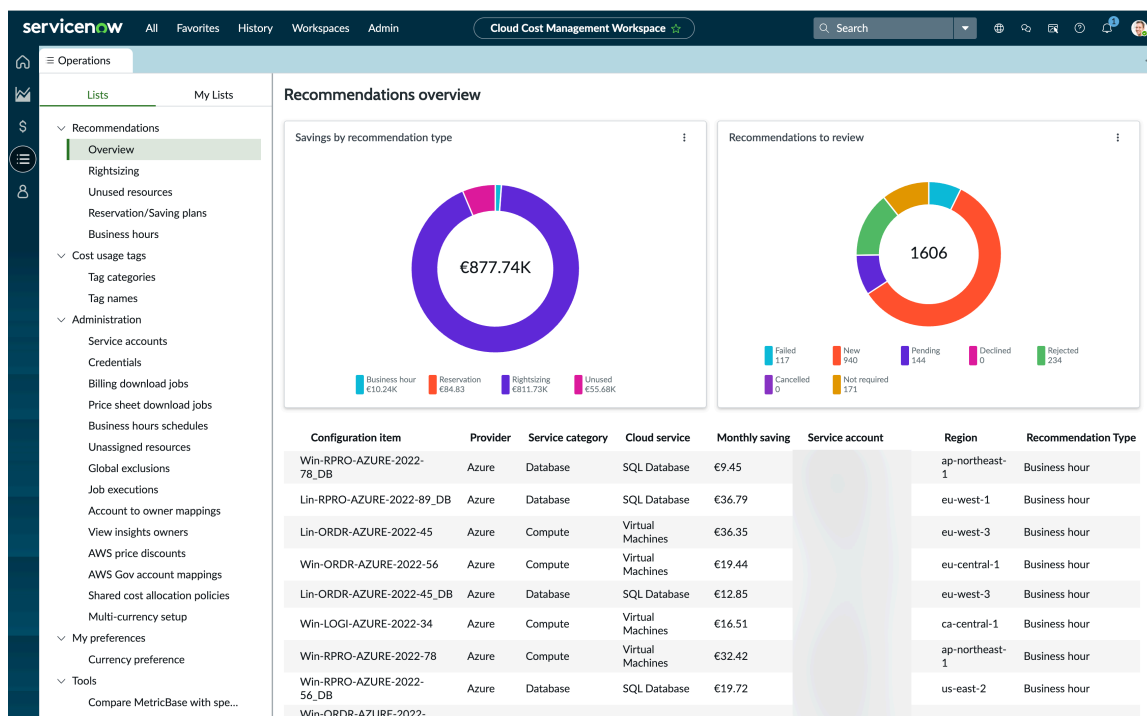

Operations view

Use the Operations view in the Cloud Cost Management Workspace to view and manage recommendations, cost usage tags, and administration-related operations.

i Important:

If you have the insights_owner role, only the accounts that are assigned to you appear in the filters and data.

You can access the Operations view by navigating to **Workspaces > Cloud Cost Management Workspace > Operations**.

The Operations view includes the following categories of tasks:

- **Overview:** View your total savings by recommendation type and the number of recommendations to review, which are grouped by their state.
- **Recommendations:** View the savings of your cloud assets by recommendation type such as Rightsizing, Unused resources, Reservation/Saving plans, and Business hours. Select the recommendation type to view detailed reports and act accordingly:
 - **Rightsizing:** View the total potential savings by service category, total potential savings by change group, number of resources that are scheduled, completed, declined, failed, and excluded for rightsizing. You can also exclude or schedule resources for rightsizing

resources, configure the rightsize settings, and create service category metrics. For more information, see [Resize resources with Rightsizing](#).

- **Unused resources:** View the total potential savings by service category, total potential savings by change group, number of unused resources that are scheduled, completed, declined, failed, and excluded. You can also exclude or schedule unused resources to identify resources that are wasting money because they aren't used, configure the unused settings, and create unused recommendations. For more information, see [Manage unused resources](#).
- **Reservation/Saving plans:** View upfront cost to reserve, overall RI utilization percentage, potential savings by service category. You can accept or decline the recommendations for reserved instances. For more information, see [Reduce resource cost with Reservation Plans](#)
- **Business hours:** View the total potential savings by service category, total potential savings by change group, business hour against non-business hour spend, and number of resources that are scheduled, completed, declined, failed, and excluded from business hour policies. You can also exclude resources from the policies. For more information, see [Improve resource usage with Business hours](#).
- **Cost usage tags:** Associate resource usage with particular business entities. For more information, see [Tags and tag categories](#).
 - **Tag categories:** Create and update tag categories.
 - **Tag names:** Create tag names for the tag categories. For more information, see [Create and update a tag category](#).
- **Administration**
 - **Service accounts:** Create service accounts for AWS, Azure, and Google to store the credentials and access information for your account.
 - [Add an AWS service account](#)
 - [Add a Microsoft Azure government service account](#)
 - [Add a Google Cloud service account](#)
 - **Credentials:** Create credentials for accessing AWS, Azure, and Google accounts.
 - [Set up access to AWS billing and usage data](#)
 - [Set up access to Microsoft Azure billing and usage data](#)
 - [Set up access to Google Cloud billing and usage data](#)
 - **Billing download jobs:** View, manage, and schedule the jobs that download billing data for AWS, Azure, and Google.
 - [Schedule and manage the jobs that download AWS billing data](#)
 - [Schedule and manage the jobs that download Azure billing data](#)
 - [Schedule and manage the jobs that download Google Cloud billing data](#)
 - **Price sheet download jobs:** View, manage, and schedule the jobs that download the price sheet for AWS, Azure, and Google.
 - [Schedule and manage the Cloud Cost Management jobs that download AWS price sheets](#)
 - [Schedule and manage the Cloud Cost Management jobs that download Microsoft Azure price sheets](#)
 - [Schedule and manage the Cloud Cost Management jobs that download Google Cloud price sheets](#)
 - **Business hours schedules:** Create a schedule for business hours. For more information, see [Create Business hours schedule](#).

- **Unassigned resources:** View list of unassigned resources and details of the resources such as provider, region, CMDB CI, service account and category, and SyS ID.
- **Global exclusions:** Exclude resources for ensuring that cost data for a particular resource doesn't appear in a report. For more information, see [Exclude a resource from all Cloud Cost Management reports](#).
- **Job executions:** View the job execution details of the following:
 - Billing download
 - Price sheet download
 - Spend
 - Budget
 - Rightsizing/Unused
 - Business hour
 - Unassigned
 - Reservation plan
- **Account to owner mappings:** Set up or update ownership of service accounts. For more information, see [Assign service accounts to an insights_owner](#) and [Update or reassign insights_owner privileges](#).
- **View insights owners:** View the list of insights owner and also create a cloud service account. For more information, see [View the service accounts owned by an insights_owner](#).
- **AWS price discounts:** View and specify the provider discount rate for each service account. For more information, see [Specify rate discounts to enable accurate pricing for Rightsizing recommendations](#).
- **AWS Gov account mappings:** Create mapping of AWS Gov account to a linked service account. For more information, see [Create AWS Gov accounts mapping](#).
- **Shared cost allocation policies:** Create, update, and view shared cost allocation policies with different allocation types to split the cost of shared cloud resources among various business lines. For more information, see [Create or update a shared cost allocation policy](#).
- **Multi-currency setup:** Set up or update the currency options for Cloud Cost Management users to view their cloud cost and usage data in their preferred currency. For more information, see [Set up or update preferred currency options](#).

Note:

This option is available with Cloud Cost Management version 10.0.0 or later.

- **My preferences - Currency preference:** Set up your preferred display currency for the dashboard widgets, recommendations (rightsizing, business hours, unused resources, reservation, and savings plan), budgets, and billing data. For more information, see [Choose preferred currency for cost and usage data](#).

Note:

This option is available with Cloud Cost Management 10.0.0 or later.

- **Tools - Compare MetricBase with Spend data:** Compare MetricBase (Clotho) data with your Spend data for Amazon Web Services (AWS), Azure, and Google Cloud Platform (GCP)

and easily diagnose and troubleshoot Cloud Cost Management billing issues. For more information, see [Compare MetricBase data with spend data](#).

Note:

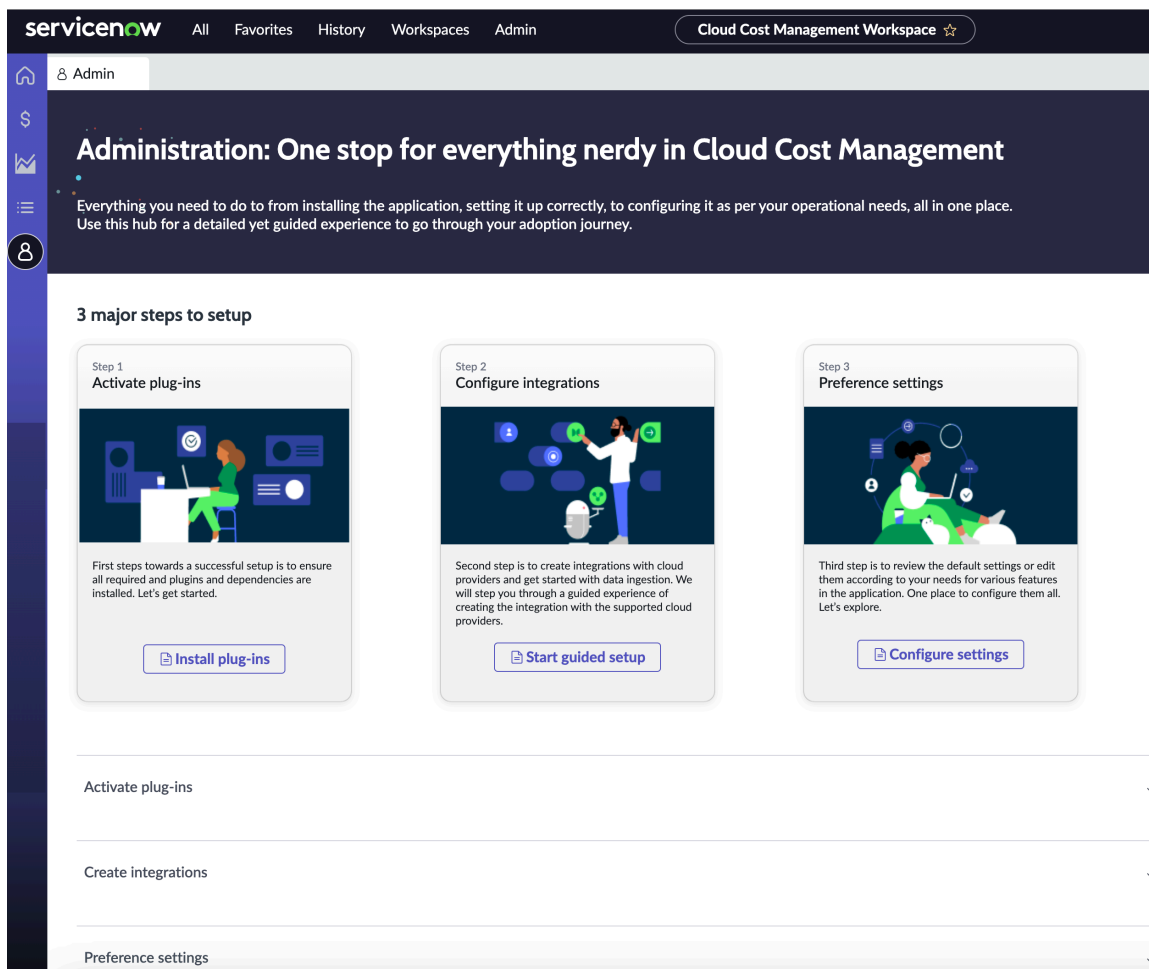

This option is available with Cloud Cost Management version 8.0.0 or later.

Admin view

Use the Admin view in the Cloud Cost Management Workspace that enables you to install, set up, and configure the application through a guided experience.

The Admin view lets you to:

- Get to value faster by using Guided Setup for configuring Cloud Cost Management for AWS, Azure and GCP. Guided Setup provides a prescriptive guidance on the tasks that you must perform for completing the configuration. This Guided Setup organizes configuration activities into various categories for ease of use.
- Watch a tutorial to familiarize with Cloud Cost Management.
- View helpful resources and related products or features.

Using Guided Setup to implement Cloud Cost Management

Guided Setup provides a sequence of tasks that help you configure Cloud Cost Management on your ServiceNow instance.

To open Cloud Cost Management Guided Setup for AWS, Microsoft Azure, and GCP, navigate to **Workspaces > Cloud Cost Management Workspace > Admin > Create integrations > Integrate**.

For more information, see [Guided Setup](#) .

Find the following steps on the Admin view for Guided Setup:

- **Activate plug-ins:** Verify that all required plugins and dependencies are installed.

 **Note:**

You must add the Guided Setup 2.1.2 version.

- **Configure integrations:** Create integrations with cloud providers such as Amazon Web Services AWS, Microsoft Azure, and Google Cloud Platform (GCP).
- **Preference settings:** Review the default settings or edit them according to your needs for various features in the application.

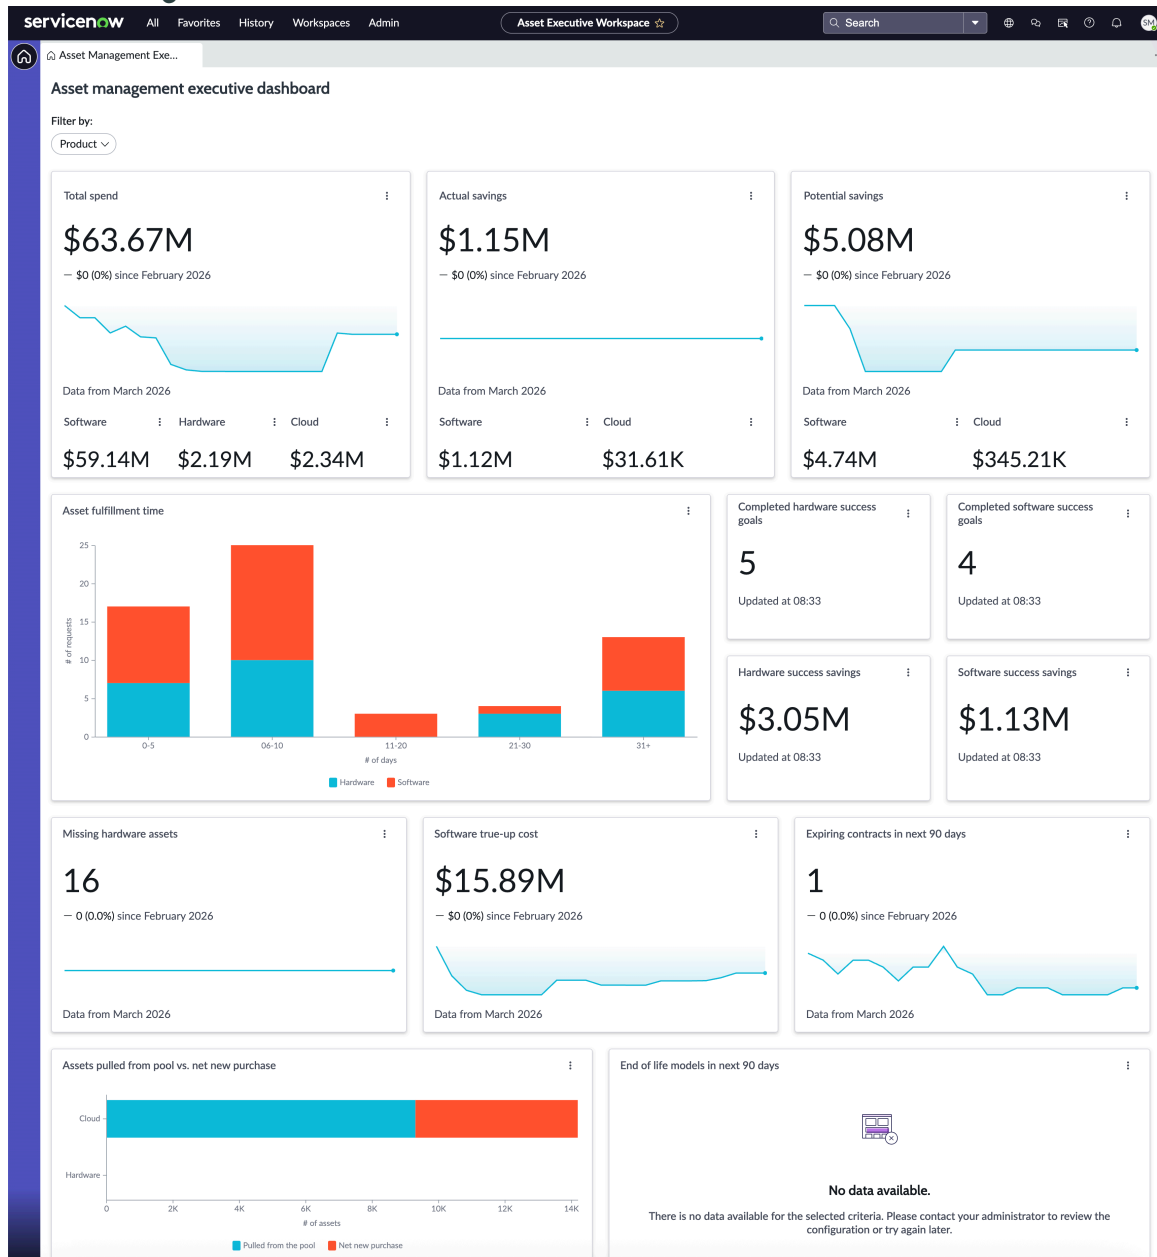

Visibility into Cloud Cost Management KPIs using the Asset Management Executive Dashboard

Use the Asset Management Executive Dashboard to gain visibility into critical KPIs for Hardware Asset Management, Software Asset Management, and Cloud Cost Management applications via a single dashboard.

To access the Asset Management Executive dashboard, you must either have Software Asset Management or Hardware Asset Management in your ServiceNow instance.

To view the Asset Management Executive dashboard, navigate to **Asset Executive Workspace > Asset Management Executive Dashboard**. A user with the role of `sn_itam_common.asset_exec` can access the dashboard.

Asset Management Executive Dashboard

You can filter the results in the dashboard by product, domain, or by both product and domain. If you filter by domain, the filter gets applied to all the widgets. If you filter by product, since some widgets are applicable for certain products, the filter isn't applied to all the widgets.

After you select a filter, a blue box gets displayed on the right side of each widget displaying one of the numbers:

- 0: Indicates that no filter is applied to a widget.
- 1: Indicates that only one filter is applied to a widget.
- 2: Indicates that both the filters are applied to a widget.

Note:

To use the domain filter, you must activate the plugins: `com.glide.domain.msp_extensions.installer` and `com.snc.pa.domain_support`.

The schedule job, *Asset Management - Populate KPI aggregate table*, runs daily to update the data on the dashboard. To view the latest data for a widget, select the widget to display the list view page.

The dashboard widgets vary depending on the application plugins that you've activated in your instance. The widgets available with each application are listed in the following table:

Asset Management Executive Dashboard widgets

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
Total spend	<p>Total cost of all entitlements for all products.</p> <p>Source table: License Metric Results [samp_license_metric_result].</p>	<p>Total cost of all hardware assets whose status is either In stock, In use, In maintenance, or In transit</p> <p>Source table: Hardware [alm_hardware].</p>	<p>Total active cost of all cloud resources.</p> <p>Source table: Spend Report Daily Aggregated Cost [sn_cld_spend_core_daily_aggregated_cost].</p>
Actual savings	<p>Total yearly savings for all products. This value is calculated as the total savings from closed complete reclamation candidates.</p> <p>Source table: Removal Candidate [samp_sw_reclamation_candidate].</p>	Not applicable	<p>This value is calculated as the monthly savings on cloud resources.</p> <p>Note: This widget gets displayed only if you have the Software Asset Management application installed on your instance.</p> <p>Source table: Cloud Insights Rightsizing Recommendation Automatics (sn_clin_core_rs_recommendation_automatic) where State = Completed.</p>
Potential savings	<p>Cost saved if removal candidates are reclaimed.</p> <p>Source table: Removal Candidate [samp_sw_reclamation_candidate].</p>	Not applicable	<p>Total of potential savings on a monthly basis on cloud rightsizing, cloud unused machines, cloud reservations, and cloud business hours.</p> <p>Note: This widget appears only if you have the Software Asset Management application installed on your instance.</p> <p>Source tables:</p>

Asset Management Executive Dashboard widgets (continued)

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
			<ul style="list-style-type: none"> • Cloud Insights Rightsizing Recommendation Automatics [sn_clin_core_rs_recommendation_automatic]. • Cloud Insights Unused Recommendation [sn_clin_core_rs_unused_recommendation]. • Reserved Instance Recommendation [sn_clin_core_ri_recommendation].
<p>Assessment fulfillment time</p>	<p>Fulfillment time bar graph of software requests from the Service Catalog. The graph shows the number of requests and the number of days taken to close those requests in the ranges of 0-5, 6-10, 11-20, 21-30, 31+ days.</p> <p>Source table: Asset fulfillment time [asset_fulfillment_time]</p>	<p>Fulfillment time bar graph of hardware requests from the Service Catalog. The graph shows the number of requests and the number of days taken to close those requests in the ranges of 0-5, 6-10, 11-20, 21-30, 31+ days.</p> <p>Source table: Asset fulfillment time [asset_fulfillment_time].</p>	<p>Not applicable</p>
<p>Completed software success goals</p>	<p>Number of success goals completed for the Software Asset Management application.</p> <p>Source table: SAM Success Goal [samp_success_goal].</p> <p>i Note: This widget is available only when the Software Asset Workspace (com.sn_sam_workspace) plugin is installed.</p>	<p>Not applicable</p>	<p>Not applicable</p>

Asset Management Executive Dashboard widgets (continued)

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
Completed hardware success goals	Not applicable	<p>Number of success goals completed for the Hardware Asset Management application.</p> <p>Source table: HAM Success Goal [sn_hamp_success_goal]</p> <p>Note: This widget is available only when Hardware Asset Management (sn_hamp) is installed.</p>	Not applicable
Software success savings	<p>Actual savings from completed success goals.</p> <p>Source table: SAM Success Goal [sampsuccess_goal].</p> <p>Note: This widget is available only when the Software Asset Workspace (com.sn_sam_workspace) plugin is installed.</p>	Not applicable	Not applicable

Discovering your cloud resources for use

Select the service accounts to discover, the credentials for accessing the accounts, and the MID Servers that scan the resources. If you use the Discovery application, the Discovery Manager wizard simplifies the configuration process for discovering cloud attributes. If you use a different method for discovering resources, you can skip this configuration operation.

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Initial set up from the home page

i Important:

This configuration process applies only if you use the Discovery application to discover cloud resources. You skip this configuration operation if you use a different method such as Service Graph Connector for AWS to discover resources. For more information about this method, see [Service Graph Connector for AWS](#).

During initial installation, on the home page, when you select the **Set up Discovery Schedule** button in the Configure and Run Discovery section, the Discover Schedules form opens. For detailed instructions, see:

- [Amazon AWS Cloud Discovery](#)
- [Azure Cloud Discovery](#)
- [Google Cloud Platform Discovery](#)

About Cloud Discovery

The Cloud Discovery plugin includes the necessary components from Cloud Provisioning and Governance to perform Cloud Discovery. See [Cloud Discovery](#).

Related topics

[Discovery basics](#)

Reservation or Saving plans

The Reservation or Saving plans feature recommends resources that could decrease costs by the conversion of on-demand payment plans to reservation plans. These plans are also called committed-use discounts, committed-use savings plans, or reserved instance plans.

Note:

Azure Managed Disk reserved instance to save over your on-demand costs is supported.

How the Reservation/Saving plans feature works

1. Each time that billing and usage data are updated, the system collects the list of resources that the provider recommends would cost less under reservation plans over the planned lifetime.
2. The Reservation or Saving plans feature sorts the resources by estimated savings and displays the list on the **Reservation/Saving plans** page. You can navigate to **Cloud Cost Management Workspace > Operations > Recommendations > Reservation/Saving plans** to view the list.

For more information, see [Reduce resource cost with Reservation Plans](#).

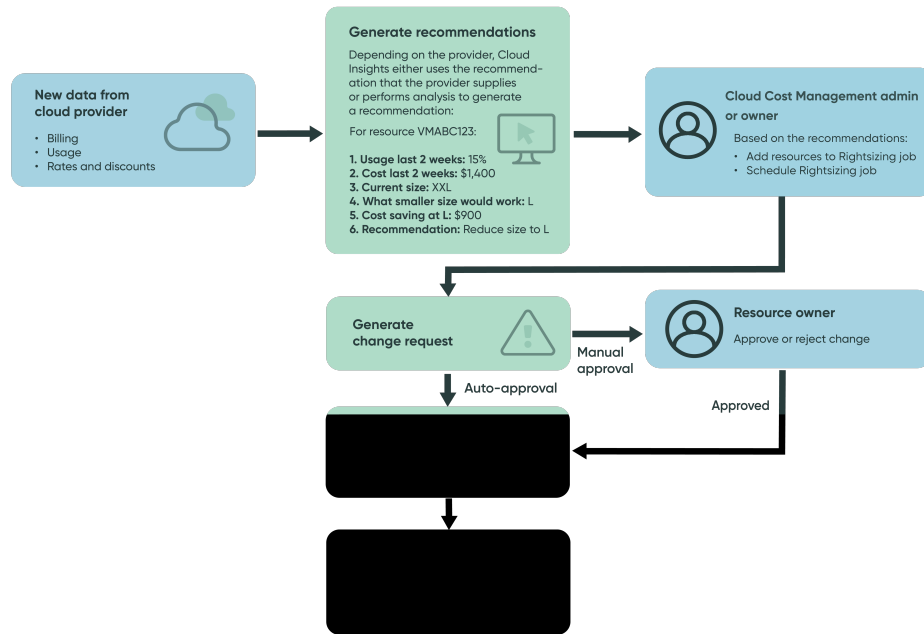

3. The **Reserved Instances** page has three tabs such as **New**, **Accepted**, and **Declined**. You can use the tabs to sort the recommendations into categories for action. If you change your mind, you can move a resource from any tab to any other tab.

Rightsizing resources

The Rightsizing feature analyzes resource usage to recommend better sizes for resources that are wasting money by being over-provisioned or underused. A confidence rating and predicted savings support each recommendation. Schedule Rightsizing jobs to resize the resources you specify.

How Rightsizing works

Cloud Cost Management Rightsizing

The system updates Rightsizing recommendations each time that billing and usage data are updated.

Follow this process to define a Rightsizing job:

1. On the Rightsizing recommendations page, select the resources to rightsize based on your analysis of the recommendations. For more information, see [Resize resources with Rightsizing](#).
2. Add the resources to a Rightsizing job. The job can be a new or an already-defined one.
3. Specify the date and time for the job to run.
4. Specify the type of approval required for the Rightsizing action.

Rightsizing operations are directly integrated with the ServiceNow Change Management feature.

- **Auto-approval:** Generates a Standard Change request and the change request is auto-approved.
- **Manual approval:** Generates a Normal Change request and the appropriate user approves the change request.

5. Save the job.

When you save the job, the system immediately generates the change requests. Later, at the scheduled time, the system runs the job. The job performs the following operations:

- For each approved change, resize the resource. For a resource in the *ON* state, stop the resource, resize it, and then restart it. If the attempt to resize fails, perform a rollback. For more information, see [AWS only – Rollback on failed Rightsizing attempts](#).
- Update the Rightsizing reports with new recommendations and with approved, successful, pending, rejected, and failed changes.

For pending, rejected, and failed change requests, you can reschedule the resources into another job.

Note:

Rightsizing operation on a stopped AWS Relational Database Service (RDS) database isn't supported from the AWS provider. If you try to perform Rightsizing on stopped databases, the resize operation fails with the error `InvalidDBInstanceState - You can't modify a stopped DB instance. Start the DB instance, and then modify it..`

How Cloud Cost Management generates Rightsizing recommendations

Cloud Cost Management uses a process that is optimized for each provider.

- [Rightsizing analysis for AWS](#)
- [Rightsizing analysis for Microsoft Azure](#)
- [Rightsizing analysis for Google Cloud](#)

Recommendations

The Cloud Cost Management application can generate recommendations for Virtual Machines (AWS, Azure, GCP), SQL Databases (Azure, GCP), and RDS Databases (AWS). CPU, memory, and network usage metrics are used to generate database rightsizing recommendations for the database resources.

The Cloud Cost Management application generates recommendations for storage volumes for AWS and Azure providers:

- Cloud category - AWS Elastic Block Store for Storage Volumes: Service category is storage.
- Cloud category - Azure Disk for Storage Volumes: Service category is storage.

Confidence levels in recommendations

Each recommendation that the system makes to rightsize a resource has an associated confidence level. You consider the confidence level while deciding whether to rightsize a resource. Confidence levels reflect the following factors:

- High confidence requires the following conditions:
 - The system has 10 or more days of usage data for the resource.
 - The current and recommended family/generation are identical.
- Medium confidence requires the following conditions:
 - The system has less than 10 days of usage data for the resource.
 - The current and recommended family/generation are identical.
- Low confidence: The current and recommended family/generation are different.

Rightsizing analysis for AWS

Cloud Cost Management uses a process that is optimized for each provider. For AWS, Cloud Cost Management compares the calculated potential costs to actual billed costs and then generates recommendations.

How Rightsizing resources analysis works for AWS

To generate accurate Rightsizing resources recommendations, Cloud Cost Management follows this procedure every time billing data is updated:

- Obtain costs from the updated billing data tables.
- Collect the CPU and memory usage data for each resource for the preceding 14 days.

i Important:

- To enable Rightsizing, you must define memory metrics to obtain memory usage data. For more information, see [Define a metric threshold](#).
- Recommendations are generated only for CPU usage data.

- Obtain rates for resource types and sizes from the price sheet data tables.
- If available, obtain percentage discount rates from the discount tables and apply the appropriate discounts to the rates on the price sheet.
- Compare the calculated potential costs to the actual billed costs and then generate recommendations.
 - If the average top 20% of CPU usage is less than 1%, then the resource is recommended for Unused resources processes.
 - If the average top 20% of CPU usage is greater than 1% but less than 40%, then the resource is recommended for Rightsizing processes. The recommended memory size is calculated so that the peak usage during the analysis period would be no more than 80% of the recommended size. For example, a resource currently has 16 GB and the available sizes are 4 GB, 8 GB, and 16 GB. If the resource used a peak of 3.99 GB over the analysis period, then the recommendation would be 8 GB.

i Important:

If you have installed the Cloud Cost Management Infra Stack application, for AWS Rightsizing recommendations to work accurately, you must use the *GetCostAndUsageWithResources* API to retrieve the cost and usage metrics with resources for your account from your provider (through AWS Portal). For more information, see *GetCostAndUsageWithResources* API Reference topic in the AWS Billing and Cost Management Documentation.

Resources that aren't considered

Resources with the following AWS attributes aren't considered for Rightsizing recommendations:

- Members of an Auto Scaling group (ASG)
- Burstable
- Not in a VPC
- Not backed by an EBS root volume
- Don't have enhanced network support
- Virtualization type isn't HVM
- Spot instance

AWS only – Rollback on failed Rightsizing attempts

AWS only: If a Rightsizing action fails, the system immediately performs a rollback to return the resource to its original size, restarts the resource if needed, updates the change request with full details, and updates Rightsizing report data.

Note:

This description of rollback operations applies only to AWS environments. Cloud Cost Management performs rollback operations for AWS environments.

Cloud Cost Management doesn't perform rollback for Microsoft Azure environments. Instead, the Azure Update service performs rollback.

Rollback operations (AWS only)

In a successful Rightsizing job, the system resizes each resource that has an approved change request. If a resource is in the *ON* state, the process stops the resource, resizes (modifies) it, and then restarts it. If a resource is in the *OFF* state, the process resizes the resource but doesn't start it.

A resource might fail to restart, for example, when the new size would exceed the quota limit for a resource type or for a constrained availability zone.

A Rightsizing job proceeds in batches of resources, grouped by provider/service account/region. If any modified resource in a batch fails to restart, then each resource in the batch is rolled back to its original size and then restarted. The system then updates the change requests for the resources and sets the **Rightsizing recommendation** status on Rightsizing reports to **Failed**.

Resources in a batch that were in the *OFF* state aren't rolled back or marked as failed.

Rightsizing analysis for Microsoft Azure

Cloud Cost Management uses an optimized Rightsizing process for each provider.

How Rightsizing analysis works for Microsoft Azure

The Azure Advisor service generates the recommendations that appear in the Rightsizing reports. Cloud Cost Management displays the recommendations that the Azure Advisor service generates. Cloud Cost Management updates the reports whenever billing data is updated.

For details on how the values are generated, see the Azure Advisor documentation at [Microsoft Learn](#).

Rightsizing analysis for Google Cloud

Cloud Cost Management uses an optimized Rightsizing process for each provider.

How Rightsizing analysis works for Google Cloud

The Google Cloud compute engine generates the recommendations that appear in the Rightsizing reports. Cloud Cost Management displays the recommendations that the Google Cloud compute engine generates. Cloud Cost Management updates the reports whenever billing data is updated.

For details on how the values are generated, see [Google Cloud documentation](#).

Note:

The Google Cloud console may show the same resources for both Unused resources and Rightsizing recommendations. If the same resources are displayed, Cloud Cost Management shows the information in Unused resources and excludes it from the Rightsizing recommendations with the reason, Recommendation already present in unused.

Roles required for Google Insights modules

To get the recommendations from the Google Cloud console and perform start, stop, resize, and delete operations, you need the following roles.

- compute.autoscalers.get compute.autoscalers.list compute.disks.delete
- compute.disks.get compute.disks.getIamPolicy compute.disks.list compute.disks.resize

Unused resources

The Unused resources feature analyzes usage data to identify resources that are wasting money because they aren't used. Schedule Unused resources jobs to power off or terminate the resources that you specify.

Recommendations

For AWS and GCP, database recommendations are fetched from the provider. For Azure, Cloud Cost Management generates recommendations for idle databases.

Storage volume recommendations are fetched for AWS, Azure, and GCP from the providers:

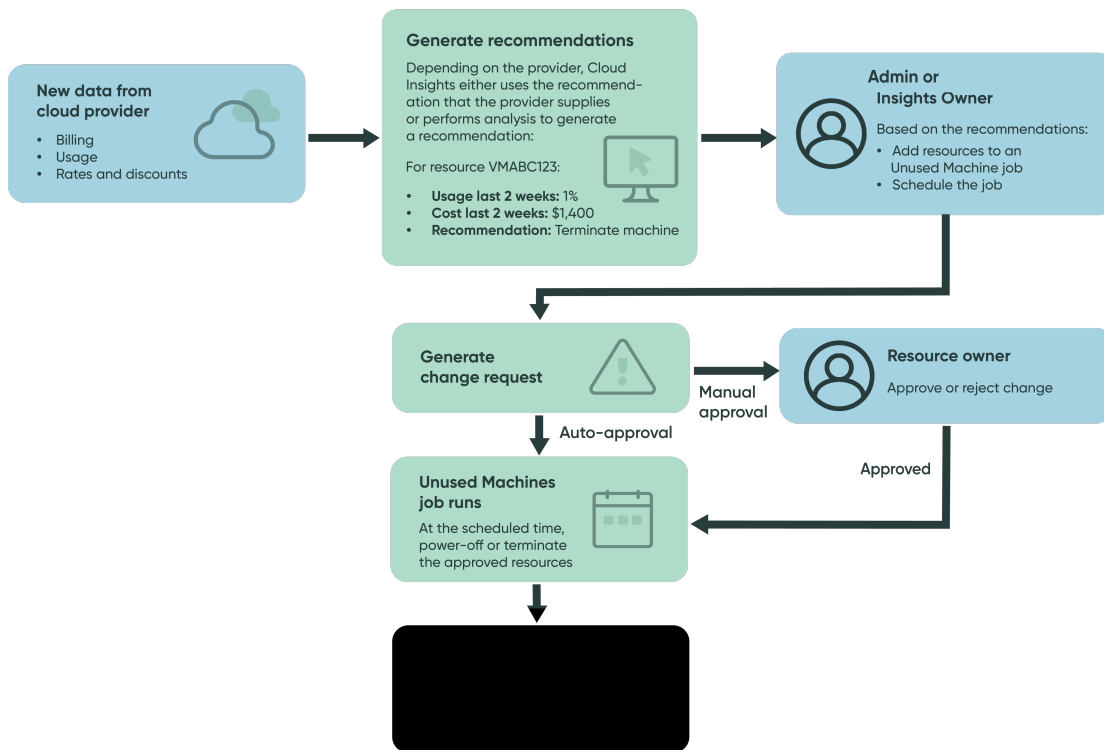

- AWS (AWS Elastic Block Store for Storage Volumes)
- Azure (Azure Disk for Storage Volumes)
- GCP (Persistent Disk for Storage Volumes)

Cloud Cost Management generates aged snapshot recommendations for the following providers:

- AWS (Amazon EBS Snapshot)
- Azure (Azure Snapshot for Storage Snapshots)
- GCP (GCP Snapshot for Storage Snapshots)

How the Unused resources feature works

Unused Machines

1. On the Unused resources recommendations page, select the resources to terminate or power off based on your analysis of the recommendations. For more information, see [Manage unused resources](#).
2. Add the resources to an Unused resources job, either a new job or an already-defined job.
3. Specify the date and time for the job to run.
4. Specify the action to take on the selected resources:
 - Power off the resource.
 - Terminate the resource.
 - Terminate the resource and delete storage. Only root or primary storage is deleted.
5. Specify the type of approval required for the specified action. Unused resources operations are directly integrated with the ServiceNow Change Management feature.
 - **Auto-approval:** Generates a Standard Change request and the change request is auto-approved.
 - **Manual approval:** Generates a Normal Change request and the appropriate user approves the change request.

6. Specify the Change template to use when generating the change requests.

7. Save the job.

The system immediately generates the change requests. Later, at the scheduled time, the system runs the job to power off or terminate all resources for which the changes are approved. The instance updates Unused resources reports with new recommendations and with approved, successful, pending, rejected, and failed changes. For resources that failed power off or termination, you can reschedule the resources into another job.

How Cloud Cost Management generates Unused resources recommendations

Cloud Cost Management uses an optimized process for each provider.

- [Unused resources analysis for AWS](#)
- [Unused resources analysis for Microsoft Azure](#)
- [Unused resources analysis for Google Cloud](#)

Related topics

[Schedule unused resources to be powered off or terminated](#)

[Change Management](#) 

[Exclude a resource from all Cloud Cost Management reports](#)

Unused resources analysis for AWS

Cloud Cost Management uses an optimized Unused resources process for each provider. For AWS, Cloud Cost Management compares the calculated potential costs to actual billed costs and then generates recommendations.

How Unused resources analysis works for AWS

To generate accurate Unused resources recommendations, Cloud Cost Management follows this procedure every time billing data is updated:

- Obtain costs from the updated billing data tables.
- Collect the CPU and memory usage data for each resource for the preceding 14 days.
- Obtain rates for resource types and sizes from the price sheet data tables.
- If available, obtain percentage discount rates from the discount tables and apply the appropriate discounts to the rates on the price sheet.
- Compare the calculated potential costs to the actual billed costs and then generate recommendations.
 - If the average top 20% of CPU usage is less than 1%, then the resource is recommended for Unused resources processes.
 - If the average top 20% of CPU usage is greater than 1% but less than 40%, then the resource is recommended for Rightsizing processes. The recommended memory size is calculated so that the peak usage during the analysis period would be no more than 80% of the recommended size. For example, a resource currently has 16 GB and the available sizes are 4 GB, 8 GB, and 16 GB. If the resource used a peak of 3.99 GB over the analysis period, then the recommendation would be 8 GB.

Resources that aren't considered

Resources with the following AWS attributes aren't considered for Unused resources recommendations:

- Members of an Auto Scaling group (ASG)
- Burstable
- Not in a VPC
- Not backed by an EBS root volume
- Don't have enhanced network support
- Virtualization type isn't HVM
- Spot instance

Unused resources analysis for Microsoft Azure

Cloud Cost Management uses an optimized Unused resources process for each provider.

How Unused resources analysis works for Microsoft Azure

The Azure Advisor service generates the recommendations that appear in the Unused resources reports. Cloud Cost Management displays the recommendations that the Azure Advisor service generates. Cloud Cost Management updates the reports whenever billing data is updated.

For details on how the values are generated, see the Azure Advisor documentation at [Microsoft Learn](#).

Unused resources analysis for Google Cloud

Cloud Cost Management uses an optimized Unused resources process for each provider.

How Unused resources analysis works for Google Cloud

The Google Cloud compute engine generates the recommendations that appear in the Unused resources reports. Cloud Cost Management displays the recommendations that the Google Cloud compute engine generates. Cloud Cost Management updates the reports whenever billing data is updated.

Note:

The Google Cloud console may show the same resources for both Unused resources and Rightsizing recommendations. If the same resources are displayed, Cloud Cost Management shows the information in Unused resources and excludes it from the Rightsizing recommendations with the reason, Recommendation already present in unused.

Roles required for Google Insights modules

To get the recommendations from the Google Cloud console and perform start, stop, resize, and delete operations, you need the following roles.

- `compute.autoscalers.get` `compute.autoscalers.list` `compute.disks.delete`
- `compute.disks.get` `compute.disks.getIamPolicy` `compute.disks.list` `compute.disks.resize`
- `compute.disks.update` `compute.instances.delete` `compute.instances.getIamPolicy`
- `compute.instances.setDiskAutoDelete` `compute.instances.start` `compute.instances.stop`

- compute.instances.update recommender.computeAddressIdleResourceInsights.get
- recommender.computeAddressIdleResourceInsights.list
- recommender.computeAddressIdleResourceRecommendations.get
- recommender.computeAddressIdleResourceRecommendations.list
- recommender.computeDiskIdleResourceInsights.get
- recommender.computeDiskIdleResourceInsights.list
- recommender.computeDiskIdleResourceRecommendations.get
- recommender.computeDiskIdleResourceRecommendations.list
- recommender.computeImageIdleResourceInsights.get
- recommender.computeImageIdleResourceInsights.list
- recommender.computeImageIdleResourceRecommendations.get
- recommender.computeImageIdleResourceRecommendations.list
- recommender.computeInstanceGroupManagerMachineTypeRecommendations.get
- recommender.computeInstanceGroupManagerMachineTypeRecommendations.list
- recommender.computeInstanceIdleResourceRecommendations.get
- recommender.computeInstanceIdleResourceRecommendations.list
- recommender.computeInstanceMachineTypeRecommendations.get
- recommender.computeInstanceMachineTypeRecommendations.list
- recommender.locations.get recommender.locations.list
- resourcemanager.projects.get resourcemanager.projects.list

Business hours

A Business hours job applies policies to identify resources that are running when they should be powered off, reports them, and can start and stop them on a schedule that you specify. Running only during specified business hours can significantly reduce your cloud spend.

The insights_admin role can create policies for AWS and GCP databases.

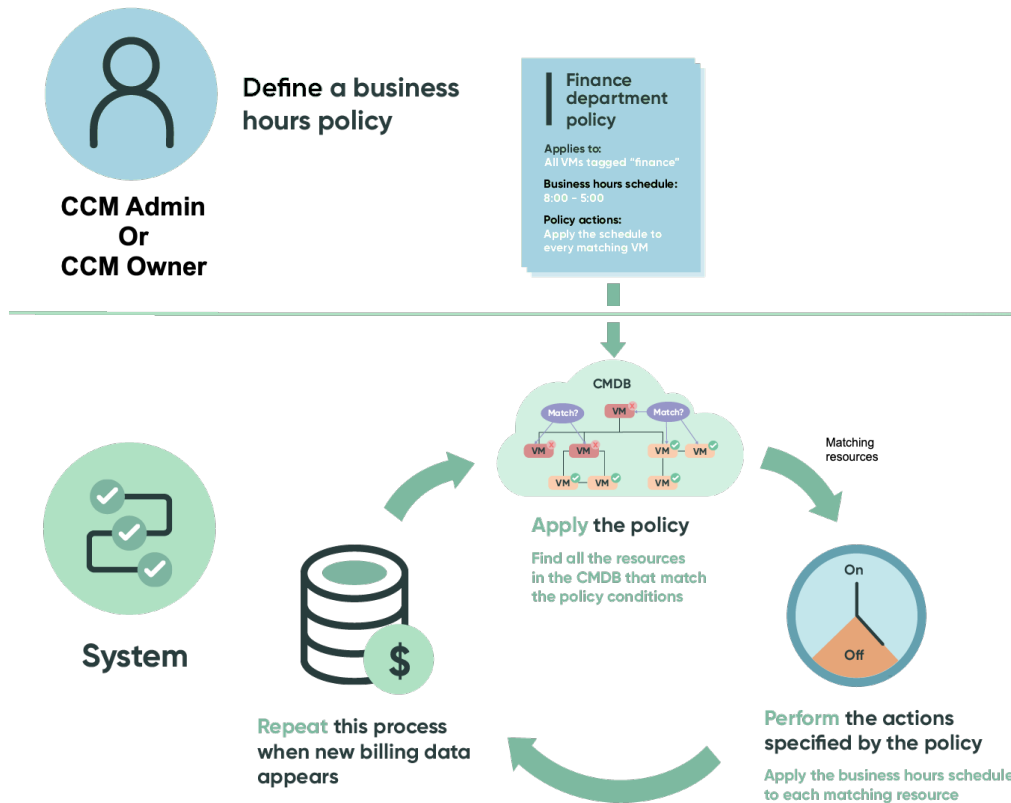

Note:

Azure only supports compute, not database.

How the Business hours feature works

Each successful execution of a Billing Download job triggers the Budget Forecast, Business Hours, Reservation Plans, Rightsizing, and Unused resources jobs to analyze the spend and usage data and to update the actionable recommendations in the reports. Business Hours jobs follow this process.

How the Business Hours feature works

1. For each Business hours policy, examine the CMDB to identify resources that match the policy criteria.
2. For each resource that matches a policy, update Business hours reports that show spend for business hours and non-business hours usage for the last 30 days.
3. Business hours operations are directly integrated with the ServiceNow[®] Change Management feature. For Manual Approval or Auto-approval policy types, generate change requests to enforce the on/off schedule that is defined in the policy. Either of the following, depending on policy settings:
 - Generate a change request for each resource that matches a policy.
 - Generate a single change request that applies to all CIs that match the policy.
4. When a change request is approved, schedule the on/off actions for the associated resources as specified in the policy.
5. Repeat the process whenever billing data is updated.

i Important:

AWS only:

- AWS Auto Scaling group (ASG) operations act to maintain minimum capacity for ASG-member resources. To avoid conflicts with ASG operations, the Cloud Cost Management app excludes all instances that are part of an Auto Scaling group from Business Hours operations.
- You can view ASG-member resources on the **Excluded Resources** tab for Business Hours.

Google Cloud only: The instance can be defined as a Managed instance groups (MIGs). MIGs let you operate applications on multiple identical VMs. You can make your workloads scalable and highly available by taking advantage of automated MIG services, including: auto-scaling, auto-healing, regional (multiple zone) deployment, and automatic updating.

Example: Business hours policy

Policy name:
Finance department

Policy is:
Active

Approval type:
Manual approval (Normal change)

Business hours schedule:
8:00 AM to 5:00 PM

Power-on flow:
VM Instance Launch Start

Power-off flow:
VM Instance Launch Stop

Resource criteria:

Service Accounts

Specify the accounts to apply the policy to.

Providers

* Service accounts

Resources

Specify the tags that determine which resources match the policy.

* This condition must be met

is

The Finance department policy example has the following settings:

- The policy is active, which is applied every time billing and usage data is updated.
- The approval type is Manual approval (Normal Change), which means that, after a qualified user approves the change request, the schedule for resources that match the policy is adjusted.
- The Business hours (on/off) schedule is **ON** from 8:00 AM to 5:00 PM.
- The power-on and power-off flows are specified.
- Only resources that meet the following resource criteria match the policy:
 - The cloud provider is **AWS** and the service account is **Billing 15970**.
 - The resource has a tag with the name *Department* with the value **Finance**.

After the policy is applied, for each resource that matches the policy and where the change request was approved, the system starts the resource at 8:00AM and stops it at 5:00PM. The actual start and stop times vary slightly due to changes in system demand and the time that it takes for the resource to start and stop.

Business hours approval types

For each resource that matches the policy criteria, the actions that the policy takes depend on the approval type:

Auto-approval (Standard Change) approval type

- Generate a recommendation to apply the specified business hours and add the resource to the Business hours reports.
- Generate and then auto-approve a change request for the change group.
- Add the resource to the Business hours reports.
- Apply the Business hours schedule to the resource.

Manual approval (Normal Change) approval type

- Generate a recommendation to apply the specified business hours schedule and add the resource to the Business hours reports.
- Generate a change request for members of the change group.
- Add the resource to the Business hours reports.
- Any member of the group with the sn_change_write role can approve the change request.
- When approved, apply the Business hours schedule to the resource.

Report-only approval type

- Generate a recommendation to apply the specified business hours.
- Add the resource to the Business hours reports.

[Change Management](#) 

[Exclude a resource from all Cloud Cost Management reports](#)

Unassigned resources

Unassigned resources policies help you to identify the resources that aren't associated with a change group and to assign them appropriately. When a resource is assigned to the correct group, the resource can be appropriately governed even as it goes through stages such as patching, upgrading, and reconfiguring.

The Cloud Cost Management application can generate compute and database recommendations for AWS, Azure, and GCP. The latest data is fetched every day at midnight.

How Unassigned resources processes work

For cloud billing information to be accurate, it must include all resources in your managed cloud infrastructure. An Unassigned resources policy analyzes all resources to identify resources that aren't assigned to a change group. The policy can then auto-assign the appropriate change group to the resources. Unassigned resources jobs follow this

Unassigned Resources

Requirements and limitations

- The Discovery process triggers Unassigned Resources analysis and updates recommendations in reports.
- For AWS, the Unassigned Resources feature supports AWS EC2 instances only.

- Terminated, retired, or canceled resources aren't considered.
- Data appears on reports only when at least one policy is active.

Cloud budgets

To manage your cloud spend, you can define and monitor custom budget plans. The system compares the plans with billing data to calculate and report on how well budgets are being met. Understanding budget compliance by groups and service accounts can significantly improve oversight and reduce cloud spend.

How budget analysis works

Each successful Billing download triggers budget refresh automatically. Budget refresh is also triggered manually when a new Budget policy is created.

Budget Forecast jobs use the cost forecast data from the providers and follow this process:

1. Apply each budget plan to billing data. For more information about plans, see are described in [Create or update a budget policy](#).
2. Update all Budget Forecast reports.
3. Repeat the process whenever billing data is updated or a user requests budget reanalysis.

Note:

If there's a large number of users, the users may not load correctly or may fail to load to the [Budget view](#). See the Knowledge article for more information [KB0866547](#).

Cloud service categories in Cloud Cost Management

Provider services are grouped into service categories in Cloud Cost Management. This grouping enables you to use filters to focus your analysis on particular types of service.

To perform targeted analysis, you can filter for particular services within a service category. For example, Amazon ElastiCache or Azure Database for PostgreSQL are services in the Database category.

Here are the supported cloud service categories in Cloud Cost Management:

- [Cloud service categories in Cloud Cost Management for Microsoft Azure services](#)
- [Cloud service categories in Cloud Cost Management for Amazon AWS Cloud services](#)
- [Cloud service categories in Cloud Cost Management for Google Cloud services](#)

Tags and tag categories

Tag categories in the Cloud Cost Management application enable grouping multiple tag names under a single category, making it simpler to track costs against specific business entities. In the provider portal, you can define cost tags to associate resource usage with specific business entities. For example, the Application, Test, and QA tags represent cost centers.

Overview of tag categories

The Cloud Cost Management application enables you to enhance your cost management capabilities and ensure that the cost reports accurately reflect the business entities. For example, different users might create various tag names like "App", "AppService", and "appl" to represent applications. By creating a tag category named "Application", you can ensure that costs associated with these different tag names are correctly assigned to the application

category. You can add multiple tag names to a category during or after its creation. For more information, see [Create and update a tag category](#).

Key points and considerations

- Tag categories help in organizing and consolidating cost data from different sources.
- Tag categories also enable more accurate cost reporting by grouping related tags together.
- Cost categories are updated with new cost tag values each time billing data is downloaded through a Billing Download job.
- Recent updates to tag category definitions might not be immediately reflected in cost reports.
- To apply the latest tag category definitions to cost data without waiting for the next Billing Download job, you can manually reapply the categories. To reapply tag categories, navigate to *Cloud Cost Management Workspace* > **Operations** > **Cost usage tags** > **Tag categories** > **Reapply tag categories**.

Cloud Cost Management Infra Stack

Use the Cloud Cost Management Infra Stack application to process and download billing files with improved data processing speed. The Cloud Cost Management Infra Stack application also supports high transaction volumes.

Overview of the Cloud Cost Management Infra Stack application

The Cloud Cost Management Infra Stack application is an optional plugin that can be installed alongside Cloud Cost Management version 8.1 and later from the ServiceNow Store. Installing this plugin also activates the Glide Fenix (com.glide.fenix) plugin.

i Important:

If you have activated the Cloud Cost Management Infra Stack application, you can't deactivate it later.

Provider-specific credential aliases are installed by default with the Cloud Cost Management Infra Stack application.

Provider	Credential alias
AWS	ccm_aws_alias
Microsoft Azure	ccm_azure_alias
Google Cloud	ccm_google_alias

For the billing download job to complete successfully, you should map the alias that's applicable to your cloud provider with the corresponding credentials.

Benefits of the Cloud Cost Management Infra Stack application

The Cloud Cost Management Infra Stack application offers several key benefits for more efficient and effective cloud cost management. These benefits enable organizations to optimize their cloud resources and reduce overall costs.

Improved data processing speed

The application significantly improves data processing speed, which enables faster processing and analysis of billing files.

Support for high transaction volumes

It's designed to handle high transaction volumes efficiently, making it suitable for large-scale cloud environments.

Enhanced performance with Kubernetes

The application uses a cost-aware Kubernetes cluster that helps it process billing data with cost efficiency and manage complex cloud infrastructures effectively.

Better cloud cost management

By providing frequent insights and faster data processing, the Cloud Cost Management Infra Stack application enables organizations to manage their cloud costs effectively and make informed decisions.

Requirements for processing billing jobs using the Cloud Cost Management Infra Stack application

The framework of the Cloud Cost Management Infra Stack application enables parallel processing of billing files, resulting in faster processing of large files. The application processes billing jobs using a Kubernetes cluster that's outside Cloud Cost Management Glide but within ServiceNow datacenters.

You must fulfill these requirements to process billing jobs.

- Map all the provider-specific credentials of your billing download jobs to the corresponding credential alias. For example, if you have two AWS credentials, map them to `ccm_aws_alias` so that the billing download job completes successfully. For more details on mapping credentials to aliases, see [Credential aliases for Discovery](#) .

Note:

If you're upgrading from an earlier version to Cloud Cost Management version 10.0 and have installed the Cloud Cost Management Infra Stack application, the mapping of credentials to alias happens automatically for all active billing download jobs. However, for any new job, you should do the mapping manually.

- Make sure to have enough storage on your Cloud Cost Management Glide database for storing the attachments of the AWS billing job with Assume role authentication temporarily until the billing download job is processed. After the job is complete, these temporary attachments are deleted from the Glide database. The storage that you should have depends on the size of data on AWS. For more details, see [Processing AWS billing jobs with Assume role authentication](#).

Configuring Cloud Cost Management

Plan and configure Cloud Cost Management to gain visibility into your total cloud consumption, reduce costs, and optimize the operations of your cloud platforms.

Configuration overview

Here's an overview of the process for configuring Cloud Cost Management.

Configure Cloud Cost Management

Step	Action	Resource
 <p>Install Cloud Cost Management</p>	<p>Get the Cloud Cost Management application from the ServiceNow Store.</p>	<p>Install Cloud Cost Management</p>

Install Cloud Cost Management

You can install the Cloud Cost Management application (sn_clin) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the [Cloud Cost Management](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Discovery (com.snc.discovery) and Discovery and Service Mapping Patterns (sn_itom_pattern) must be installed.

Role required: admin

About this task

The following items are installed with Cloud Cost Management:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see [Components installed with Cloud Cost Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Cloud Cost Management application (sn_clin) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you're displayed.
3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

i Important:

- If you don't load the demo data during installation, it's unavailable to load later.
- If you install demo data, Cloud Cost Management features might not work properly.

6. Select *Install*.**Install Cloud Cost Management Infra Stack**

You can install the Cloud Cost Management Infra Stack application (sn_cld_infra_stack) if you have the admin role. The application includes installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the Cloud Cost Management Infra Stack application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Cloud Cost Management Infra Stack:

- Plugins
- Store applications

The tables, scheduled jobs, and system properties aren't installed with the Cloud Cost Management Infra Stack application. Instead, the components specific to Cloud Cost Management Infra Stack are installed with the Cloud Cost Management application. For more information, see [Components installed with Cloud Cost Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Cloud Cost Management Infra Stack application (sn_cld_infra_stack) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

i Important:

- If you don't load the demo data during installation, it's unavailable to load later.
- If you install demo data, Cloud Cost Management features might not work properly.

6. Select Install.

Upgrade Cloud Cost Management

You upgrade Cloud Cost Management on the System Applications page.

Before you begin

Role required: sys_admin

Procedure

1. Navigate to **System Applications > All Available Applications > Installed**.
2. In the search box, enter `sn_clin`.
3. Find the **Cloud Cost Management** app.
4. In the selection list, select **Update** for version **9.0**.
You can also update to the 9.0 version from 8.1 onwards.
5. When the update is complete, clear the browser cache.
6. Clear the server cache: `<instanceIP>/cache.do`

Configure Cloud Cost Management for AWS

The Cloud Cost Management application is available on the ServiceNow Store.

For more information, see [Configuring Cloud Cost Management](#).

General requirements and limitations

- Cloud Cost Management isn't supported on mobile devices.
- Values in reports might vary slightly from provider billing values due to currency conversion or rounding.

Requirements and limitations for AWS

- You must have AWS administrator permissions to work in the AWS Management console.
- The Business hours, Unassigned resources, Unused resources, and Rightsizing recommendations features support Amazon Elastic Compute Cloud (EC2) virtual machine (VM), storage (volume and storage snapshots), and database resources.

Configuring access to CI data on your AWS account

To ensure secure and reliable communications, the Discovery process communicates with your cloud provider accounts and cloud resources through one or more MID Servers. You can set up the MID Servers on your network or in one of your cloud networks.

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Requirements

i Important:

This configuration process applies only if you use the Discovery application to discover cloud resources. Skip this process if you use a different method for discovering resources.

AWS: There must be an internal network connection between the MID Servers and the AWS Cloud API endpoints: *.amazonaws.com.

Detailed instructions

See [Amazon AWS Cloud Discovery](#).

MID Server settings for Cloud Cost Management

i Note:

MID Server minimum memory size should be 4 GB.

Setting	Value
Supported Applications	Cloud Actions
Capabilities	<p>The ALL setting includes all required applications and capabilities. Alternatively, you can specify the following settings:</p> <p>i Note: You can specify the following settings for any number of MID Servers. If you specify multiple MID Servers, then Discovery, billing data download operations, and actions that are recommended by Cloud Cost Management are assigned to one of the MID Servers at random.</p> <p>Option 1: To use this MID Server only for AWS, specify both of the following values:</p> <ul style="list-style-type: none"> • Cloud Actions • AWS <p>Option 2: To use this MID Server for all providers, specify the following values:</p> <ul style="list-style-type: none"> • Cloud Actions • AWS • Azure

Using a proxy server

You can use a proxy server for the Cloud Cost Management MID Server. See [Proxy server configuration for your Cloud Cost Management MID Server](#).

Related topics

[MID Servers](#) 

[Install a MID Server on Windows](#) 

[Install a MID Server on Linux](#) 

Proxy server configuration for your Cloud Cost Management MID Server

You can configure any MID Server to use a proxy server for Cloud Cost Management operations. Proxy servers support all cloud-based activities such as running Discovery, Billing Download jobs, and Price Sheet Download jobs.

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Detailed instructions

[Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance](#) 

Proxy server limitations

- Only Windows or Linux platforms are supported.
- The Google Cloud integration is not supported.
- The VMware integration is not supported.
- Remote PowerShell scripts cannot be executed.
- Custom APIs might not work.

Supported proxy server authentication for Cloud Cost Management

Proxy Server type	Authentication type
HTTP/HTTPS	No authentication
SOCKS5	No authentication
HTTP/HTTPS	Basic authentication
SOCKS5	Basic authentication
HTTP/HTTPS	NTLM

Supported Proxy server configurations

Supported configuration settings

Configuration	Operating system	Proxy server	Authentication mode
Configuration 1	Linux	None	Not Applicable

Supported configuration settings (continued)

Configuration	Operating system	Proxy server	Authentication mode
Configuration 2	Windows	Squid (HTTPS)	None
Configuration 3	Linux	Squid (HTTPS)	Local
Configuration 4	Windows	Squid (HTTPS)	Active Directory

Add an AWS service account

Add an AWS service account to store the credential and access information.

Before you begin

You must perform these tasks:

- Set up download jobs for billing and price sheet data for the service account.
- [Configure the MID Server for AWS IAM role](#) .
- Role required: sn_clin_core.insights_admin

About this task

A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account can include multiple service accounts – even service accounts from different providers. For each service account, you specify which datacenters to include in the cloud account.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Service accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account

Field	Description
Name	Unique and meaningful name for this service account.
Account Id	12-digit user account number. Expand the list under the AWS account name on the AWS Management Console to view the number. <div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #cfe2f3;">  Important: Remove the hyphen characters (-) from the number. </div>

Field	Description
Discovery credentials	<p>The credentials needed for ServiceNow applications to access this account. You can configure this field at a later stage, while configuring access to AWS accounts.</p> <ul style="list-style-type: none"> ○ If you configured AWS credentials at ServiceNow AI Platform, select the name of the relevant AWS credential. ○ To use other AWS accounts to access this account, leave the field empty. For example, you don't need to specify the AWS credentials for accounts assuming IAM roles or member accounts using their management account for access.
Datacenter URL	<p>URL of the datacenter.</p> <p>This field is required only for AWS GovCloud (US) accounts. For example, <code>https://\$service.us-gov-west-1.amazonaws.com/</code>.</p>
Datacenter Type	<p>Type of the datacenter where the account is hosted.</p> <p>Select AWS datacenter.</p>
Datacenter discovery status	<p>Status and timestamp of the last execution of Discovery on the datacenter.</p> <p>This value is generated automatically.</p>
Is Billing Account	<p>Option for enabling the account to access billing data.</p>

4. Select Save.

Result

The service account that you created gets listed on the **Service accounts** page.

Create an AWS IAM user policy for Cloud Cost Management

If you manage users with IAM, you must create an IAM user profile that enables access to AWS data.

Before you begin

You must know how to create an IAM user and set up a user policy. See the [AWS documentation on IAM](#)  for details.

Use an auto-generated access key. You need the key information when you configure AWS credentials in the instance.

Roles required:

On the AWS Management Console: AWS Management Console administrator.

Cloud Cost Management: insights_admin [sn_clin_core.insights_admin] or admin.

About this task

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

1. Log in to the AWS Management Console and create a user in IAM.
2. Save the Access Key ID and Secret Access Key.
3. Attach permissions to the IAM user using either of the following methods:
 - Grant administrator access to the user by attaching the Administrator Access policy.
 - Create an IAM policy with a descriptive name and use the following JSON for billing, cloud watch, forecast, and actions.

Billing

```
{
  "Version": "2012-10-17",
  "Statement": [

      "autoscaling:DescribeAutoScalingGroups"
    ],
    "Resource": "*"
  }]
}
```

Use this policy for the AWS trusted advisor roles

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "support:DescribeTrustedAdvisorCheckRefreshStatuses",
        "support:DescribeTrustedAdvisorCheckResult",
        "support:DescribeTrustedAdvisorChecks",

```

```

"support:DescribeTrustedAdvisorCheckSummaries" ,

"support:RefreshTrustedAdvisorCheck" ,

        "trustedadvisor:Describe*"

    ],

    "Resource": "*"

}

]

}

```

Add an AWS GovCloud service account

A cloud_admin can add an AWS GovCloud service account. Be sure to set up download jobs for billing and price sheet data for the service account.

Before you begin

Role required: sn_cmp.cloud_admin

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

Follow the instructions at [Create a service account for AWS GovCloud](#) .

Related topics

[Schedule and manage the jobs that download AWS billing data](#)

[Schedule and manage the Cloud Cost Management jobs that download AWS price sheets](#)

Create AWS Gov accounts mapping

Create an AWS GovCloud account mapping with an associated standard AWS account for billing and support.

Before you begin

Role required: sn_cmp.cloud_admin

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **AWS Gov account mappings**.
2. Select **New**.
3. On the form, fill in the fields.

AWS Gov Accounts Mapping

Field	Description
Gov account	The AWS Gov account that you want to map to the standard AWS account.
Linked account	Standard AWS account that you want to link to the AWS Gov account.

4. Select **Save**.

Result

The mapping you created gets displayed on the AWS Gov account mapping page with details such as Sys ID, tags.

Set up access to AWS billing and usage data

Set up access to AWS billing and usage data by following the steps.

1. [Create AWS credentials](#)
2. [Create a record of AWS credentials in Cloud Cost Management](#)
3. [Enable cost allocation in AWS for Kubernetes cluster](#)
4. [Schedule and manage the jobs that download AWS billing data](#)
5. [Add an AWS CI class type to ensure accurate billing data](#)

Related topics

[Cancel an AWS Billing download job](#)

Create AWS credentials

Create credentials in the AWS Management Console to specify the credentials of the user when you configure the MID Servers that communicate with your AWS account.

Before you begin

Role required: AWS Management Console administrator

You should be familiar with AWS policies. If you use IAM, you must know how to create an IAM user and set up a user policy. For more information about IAM, see [AWS documentation](#).

Procedure

1. On the AWS Management Console, enter IAM in the AWS services search box to open the Identity and Access Managements (IAM) service.
2. On the IAM Resources portal, select **Users**.
3. Select **Add user**.
4. On the Details page, configure the user settings as shown and then select **Next**.

Field	Value
User name	Name for the programmatic user, for example, servicenowcloud.
Access type	Programmatic access.

5. On the Permissions page, configure the following settings and then select **Next**.

Field	Value
Set permissions for <username>	Attach existing policies directly.
Attach one or more policies	<p>The appropriate policy.</p> <p>Note: The AdministratorAccess policy has the most powerful permission level, including permission to provision cloud resources.</p> <p>You might instead prefer to create a policy or combine multiple policies to grant the appropriate permission level. For more information, see Create an AWS IAM user policy for Cloud Cost Management.</p>

6. On the Review page, verify your selections and then select **Create user**.

7. On the Complete page, select **Download .csv** to save a CSV backup file that contains the username, Access key ID, and the Secret access key value.

You can create the file as a backup in case that you lose those values. Verify that the file was created and then store the file securely.

What to do next

Create a record of the AWS credentials in Cloud Cost Management.

Create a record of AWS credentials in Cloud Cost Management

Create a record of the AWS credentials in Cloud Cost Management.

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin] or admin

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Administration > Credentials**.
2. On the Cloud API credentials page, select **AWS credentials**.
3. Select **New**.
4. On the form, fill in the fields.

AWS Credentials

Field	Description
Name	Unique and descriptive name for the AWS credentials.
Active	Option to use the credential.

Field	Description
Access Key ID	The Access key ID that you generated on the AWS Management Console.
Secret Access Key	The Secret access key that you generated on the AWS Management Console.

5. Select **Save**.

Enable cost allocation in AWS for Kubernetes cluster

Enable cost allocation for a Kubernetes cluster in AWS Management Console before you run a AWS Billing download job to view the Kubernetes spend.

Before you begin

Role required: AWS Management Console administrator

- You should be familiar with AWS policies.
- Install Discovery and Service Mapping Patterns application (sn_itom_pattern) 1.10.2 or higher. For more information, see [Install Discovery and Service Mapping Patterns](#).
- Install CMDB CI Class Models (sn_cmdb_ci_class) version 1.53.1 or higher. For more information, see [CMDB CI Class Models](#).
- To set up Kubernetes discovery, see [Kubernetes discovery using patterns](#).

Procedure

1. Log in to the [AWS Management Console](#).
2. Search for and select **Cost Allocation Tags**.
3. Select the **User-defined cost allocation tags** tab.
4. Activate the following Kubernetes tags to appear in the billing data:
 - Static Tag key
 - aws:eks:cluster-name
 - user:eks:cluster-name
 - eks:cluster-name
 - Dynamic Tag key
 - kubernetes.io/cluster/<Cluster-Name>: shared/owned
 - alpha.eksctl.io/cluster-name: <Cluster-Name>

Result

The cost allocation for the selected Kubernetes cluster is enabled and you can view the Kubernetes spend.

Schedule and manage the jobs that download AWS billing data

Billing Download jobs download, organize, and store billing data for your payer account on the schedule that you specify. The system analyzes the data to generate reports and to make recommendations for changes in your cloud operations that can lead to cost savings.

Before you begin

Role required: Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin]

Ensure that your system has 8 GB Clotho memory and 4 GB mid memory.

Enable cost allocation for each Kubernetes cluster before you run an AWS Billing download job to view the Kubernetes spend. For more information, see [Enable cost allocation in AWS for Kubernetes cluster](#).

About this task

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

During billing download, all the resources are pulled into the system. AWS Redshift resources are placed in the [cmdb_ci_cloud_database] table. After the 4.0 upgrade, make sure that the billing download is executed with `reimport true`.

i Note:

From Cloud Cost Management version 8.1 onwards, the default time for billing download jobs has changed from 12:00 to 01:00 (UTC). Also, schedule or run Cloud Cost Management jobs only during off-business hours and when there's no other heavy operations or jobs running on the ServiceNow instance.

If you have installed the Cloud Cost Management Infra Stack application, then toward the end of a job, significant database update, and insert operations are performed based on your Cloud CIs and spend data volume. Thus, any other job that impacts database performance shouldn't be run during this time alongside Cloud Cost Management jobs.

- Billing Download jobs can't be in the Global scope.
- If the Cloud Provisioning and Governance application is installed on your instance: Both Cloud Provisioning and Governance and Cloud Cost Management download billing data. The two download jobs are separate processes and they don't interfere with each other.
- You can create only one Billing Download job for each account (enrollment).
- Configure AWS Billing download for the main account otherwise the spend doesn't generate.
- To ensure accurate reporting and recommendations for some providers, make sure that Discovery runs before the scheduled execution.
- Each successful execution of a Billing Download job triggers the Budget Forecast, Business hours, Reservation/saving plans, Rightsizing, and Unused resources jobs to analyze spend and usage data and to update the actionable recommendations in reports.
- Each successful execution of a Billing Download job updates tagged costs. Recent updates that you make to tag category definitions (for example, adding a tag name to a category) might not be reflected in cost reports. To apply the latest tag category definitions to cost data without running a Billing Download job, select *Cloud Cost Management Workspace* > **Operations** > **Cost usage tags** > **Tag categories** and then select **Re-Apply Categories**.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.
- Cost categories are updated with new cost tag values each time billing data is downloaded. (You define cost tags in the provider portal to associate usage data with a particular business entity. For example, the Cost Center category might include the tags `development`, `testing`, and `QA`. The User category might include the names of your users.)
- Billing data is downloaded in reverse chronological order by month. For example, if the range is from March to June, data for June is downloaded first.

- To ensure meaningful results for the first billing data download, the app downloads data for at least 30 days. For example, if today is June 10 and you specify June for download, the system downloads data for both May and June to ensure at least 30 days of data for analysis.
- You can download data only for the most recent twelve months.

For AWS.

- You can create only one Billing Download job for each service account.
- Only costs of the unblended type are supported.
- The Billing Download job updates the billing node data table [sn_cld_intg_aws_cost_usage] with the CIs in the CMDB that correspond to each resource ID.
- The CI placement process associates downloaded cost and usage data with the appropriate CIs in the CMDB. See [Add an AWS CI class type to ensure accurate billing data](#) for the details.

Procedure

1. Review the settings to verify that the settings on the report meet the requirements for Cloud Cost Management when you have an existing AWS Cost and Usage Report (CUR).
2. On the AWS Management Console, define an AWS CUR as follows:

Note:

You must configure Legacy CUR because Cloud Cost Management supports the legacy version only.

- a. Follow the instructions in the [Creating Cost and Usage Reports](#)  topic and use the following settings:
 - Select the **Include resource IDs** check box.
 - Select the **Automatically refresh your Cost and Usage Report when** check box.
 - Report path prefix: optional
 - Set **Time granularity** to either **Daily** or **Hourly** as needed. The **Hourly** setting generates a larger, more granular data set.
 - Set **Report versioning** to **Create new report version**.
 - Set **Compression type** to **GZIP** or **ZIP**. Cloud Cost Management doesn't support Parquet.
 - b. Track the following values because you enter them into a Cloud Cost Management form in a moment.
 - Report name
 - Report prefix
 - Name of the S3 bucket that is the data storage area for the daily detailed billing records on the AWS account.
3. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
 4. Select the **AWS** tab.
 5. Select **New**.
 6. On the form, fill in the fields:

AWS Billing Download Job

Field	Description
Name	Meaningful name for the scheduled execution of the Billing Download job.
Last successful execution	The timestamp of the most recent successful execution.
Notify users/groups	<p>The users or groups to be notified by email about the status of the job execution (for example, download failure). The system doesn't send a notification for success.</p> <p>Users or groups with the Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin] role are well suited to handle these issues.</p> <p>To update the email template, navigate to System Notification > Email > Notifications and open the Notify on billing job execution error template. For information on configuring the email, see Create an email template.</p>
Active	Option for activating the job. Only active jobs are executed.
Run	<p>Frequency with which to execute the Billing Download job.</p> <p>Note:</p> <ul style="list-style-type: none"> For AWS, Billing Download jobs collect data once per day, even if AWS collects hourly usage data. Depending on the value that you select, additional fields appear. <p>This field is automatically set to Daily.</p>
Time	Time of day to execute the job.
Latest execution status	The status of the most recently executed job.
Latest execution details	Execution details of the most recently executed job.
AWS Settings	
Service account	The AWS service account.
Bucket	Amazon S3 bucket that is the data storage area for the detailed hourly billing records on the AWS account.
Report name	The report-name value that appears in your AWS Cost and Usage Report.

Field	Description
Report prefix	The report - prefix value that appears in your AWS Cost and Usage Report.

7. Select **Save**.

8. On the **Billing download jobs** page, select the created job.

9. Select **Test connection**.

The Test Connection workflow uses the settings that you configured to attempt to access the provider account. The system displays a progress pop-up and a success/error message that suggests actions to fix the configured settings.

10. Select **Execute now** to execute the job after the connection succeeds.

11. In the **Download billing data** dialog box, fill in the fields.

Field	Description
Start month	Starting month for downloading the billing data. Note: Data is downloaded for the specified months. If fewer than 30 days of data for analysis is received, data for the preceding month is also downloaded.
End month	Ending month for downloading the billing data.
Re-import data	Option for overwriting data from an earlier download attempt.

12. Select **Download**.

An AWS billing download job goes through the following states during the job execution:

- a. Ready:** The job is in the queue. For example, when a job is created to download billing data for a few months, the jobs for all months except the latest month are in Ready state.
- b. Requested:** The job is fetched and processed immediately. For example, the job that's created to download billing data for a month is in the Requested state. Also, when a job is created to download billing data for more than a month, the latest month job is also in the Requested state.

Note:

If you have installed the Cloud Cost Management Infra Stack application, it takes some time for the job to change from Ready to Requested state for AWS billing download job with Assume role authentication. This is because it takes time for the files to be downloaded to Cloud Cost Management MID Server. For details, see [Processing AWS billing jobs with Assume role authentication](#).

- c. Reserved:** Job is picked by the Kubernetes cluster for processing. The Kubernetes cluster also sends the Job Id to Cloud Cost Management Glide to show which Kubernetes job is processing the billing job.

i Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

d. In Progress: Billing data is being processed.

e. Sink Begin: Kubernetes cluster sends some part of the processed billing data to the tables such as Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost on Cloud Cost Management Glide. The records in these tables are in the Generating state. The job remains in the Sink Begin state until the entire billing data is sent to Cloud Cost Management Glide.

In the Sink Begin state, the CI placement also starts and the Status of the CI Placement Stage changes from Ready to In Progress.

i Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

f. Sink Complete: All the processed billing data is sent to Cloud Cost Management Glide from the Kubernetes cluster.

i Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

g. Finished: Status after Sink Complete when all the billing files are sent to the Glide database.

i Note:

The following changes happen when the job is marked Finished:

- The state of the records in the Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost tables change from Generating to Active. Also, existing records are marked inactive.
- The billing account for which the billing file was downloaded is automatically set as a Master account in the Service Accounts table.

h. Success: Job is completed successfully.

Result

The following events happen when the job executes:

- While downloading the data, Cloud Cost Management updates the billing node data table [sn_cld_intg_<provider>_cost_usage] with the CIs in the CMDB that correspond to each resource ID. If a CI doesn't exist, the system generates a placeholder CI. On subsequent discovery, the system reconciles the placeholder CI.
- Cloud Cost Management generates a log entry for each stage of the execution on the Billing Download Executions page.

Add an AWS CI class type to ensure accurate billing data

Specify the details of a new CI or CI type to enable the CI placement process to assign cost and usage data correctly. The process is a part of Billing Download job execution. The CI placement process associates downloaded cost and usage data with the appropriate CIs.

Before you begin

Role required: Cloud Insights Admin [sn_clin_core.insights_admin]

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Billing Download jobs store downloaded billing data in the billing node table. The Class Type table holds CI type definitions for the cost usage table. Cloud Cost Management executes the CI placement process to associate the billing and usage data with CIs in the CMDB. The CI placement process queries the billing node table using the CI type definitions that reside in the CI placement type table. For a new CI (or a CI type from a new provider), you specify the parameters that uniquely define the CI, a CI type definition, and a class type table to store the CI type definition.

Important:

If the Cloud Cost Management Infra Stack application is installed, you can't add a new AWS CI class type. However, you can use the existing CI class types.

The CI placement type table for AWS [sn_cld_intg_aws_ci_placement_type] inherits from the Core CI placement type table (sn_cld_intg_core_ci_placement_type).

Important:

If the Discovery patterns application is not installed, then CIs in the following class types are not placed: cmdb_ci_cloud_gateway, cmdb_ci_dynamodb_table, cmdb_ci_cloud_object_storage, and cmdb_ci_cloud_function.

Procedure

1. Go to the CI placement type table and select **New**.

AWS class types in the Core CI placement type table [sn_cld_intg_core_ci_placement_type]

Name	Class Type	Query params	Query table
Amazon Volume	cmdb_ci_storage_volume	product_code=AmazonEC2^operationSTAR	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AmazonApiGateway	cmdb_ci_cloud_gateway	product_code=AmazonApiGateway^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AmazonDynamoDB	cmdb_ci_dynamodb_table	product_code=AmazonDynamoDB^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AmazonRDS	cmdb_ci_cloud_database	product_code=AmazonRDS^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AmazonS3	cmdb_ci_cloud_object_storage	product_code=AmazonS3^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AmazonVPC	cmdb_ci_network	product_code=AmazonVPC^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
AWSLambda	cmdb_ci_cloud_function	product_code=AWSLambda^EQ	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]
EC2	cmdb_ci_vm_instance	product_code=AmazonEC2^operationSTAR	AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]

2. Fill in the form.

The screenshot shows the 'CI Placement Type Information' form. The 'Class Type' field is populated with 'cmdb_ci_network'. The 'Name' field is empty. The 'Query table' is set to 'Cost And Usage Bill Data [sn_cld_intg_..._cost_usage]'. Under 'Query params', there is a filter condition: 'lineltem/ProductCode' is '...' with 'AND' and 'OR' options. 'Update' and 'Delete' buttons are at the bottom left.

CI Placement Type Information form

Field	Description
Class type	CMDB class type table that this type of CI is stored in. New CIs of this type are added to the table.
Name	Name of the CI type.
Query table	Billing node table that the CI placement process queries to find instances of the CI type. The Query table is sn_cld_aws_cost_usage and cannot be changed.
Query params	Parameter values in the billing node table that uniquely define the CI type.

- After you add a class type, you must reimport billing and usage data to ensure that CIs are correctly placed into the new type.
See [Schedule and manage the jobs that download AWS billing data](#).

Note: The supported CIs are placed after the Cumulus Unsupported CI Placement scheduled job runs daily. For more information, see [Supported CI class types for Amazon AWS Cloud services](#).

Cancel an AWS Billing download job

A Billing download job obtains billing and usage data from each payer account for AWS. The Rightsizing, Unused resources, and Business hours processes use billing and usage data when generating recommendations. You can cancel any Billing download job individually.

Before you begin

Role required: Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin]

About this task**i Important:**

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
2. Select the **AWS** tab.
3. Select either a currently running or scheduled job that you want to cancel.
4. On the AWS Billing Download page, select **Cancel execution**.

Processing AWS billing jobs with Assume role authentication

Use the Cloud Cost Management Infra Stack application to process and download the AWS billing files with Assume role authentication at a better speed.

When you have installed the Cloud Cost Management Infra Stack application, the processing of all billing download jobs happens completely on the Kubernetes cluster. However, for AWS billing jobs with Assume role authentication the processing of billing data is partially done via Cloud Cost Management MID Server.

AWS billing download job (with Assume role) workflow

1. The Cloud Cost Management MID Server connects to AWS and downloads the billing data files.
2. The billing data files are sent to Cloud Cost Management Glide as an attachment.

i Note:

If the default configuration for maximum attachment size is changed and it's less than the billing data file, it might have an impact on billing. To keep the default configuration or a value higher than the billing file size, see the knowledge base article [KB0718101](#).

3. The attachments are stored temporarily in the Attachment table in the Glide database.
4. After all the attachments are stored in the Glide database, the Kubernetes job fetches details of the billing download jobs that are in the Requested state.

i Note:

The temporary attachments are deleted from the Glide database after the billing job is completed.

5. Kubernetes job fetches the attachment files from the Glide database via an API and processes the files on the Kubernetes cluster.
6. The processed billing data is sent to Glide and finally stored in the Glide database.

For AWS Assume Role Billing Download, the Flow Launcher Job Configuration settings determine the parallel processing of multiple download threads. These settings are stored in the AWS Assume Role Billing Download record in the Flow Launcher Job Configuration [sn_cld_intg_core_flow_launcher_job_config] table. The value in the Concurrency field of the AWS Assume Role Billing Download record is the number of billing files downloaded in parallel.

Performance is optimal when the Concurrency field is set to the default value 2. However, if you experience any slowness, you can set the **Concurrency** field to **1** with the admin role.

Schedule and manage the Cloud Cost Management jobs that download AWS price sheets

A Price Sheet Download job downloads and stores price sheet data. The Rightsizing and Unused resources processes use price sheet data when generating recommendations.

Before you begin

For each provider, run Discovery on each service account.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

- You create a scheduled Price Sheet Download job for each provider.
- Each execution of a Price Sheet Download job runs multiple execution items. Each execution item imports and stores the price sheet for one region.
- To ensure accurate reporting and recommendations for some providers, make sure that Discovery runs before the scheduled execution.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select **New**.
3. On the form, fill in the fields.

Price Sheet Download Job

Field	Value
Name	Meaningful name for the Price Sheet Download job.
Provider	Name of the cloud provider.
Last successful execution	Timestamp of the most recent execution of the job.
Download Price Sheet For	Price sheet downloads for different services. <ul style="list-style-type: none"> ○ AWS <ul style="list-style-type: none"> ▪ Compute and Storage ▪ Database ▪ All ○ Azure <ul style="list-style-type: none"> ▪ Compute ▪ Database ▪ Storage

Field	Value
	<ul style="list-style-type: none"> ○ Google <ul style="list-style-type: none"> ▪ Compute and Storage ▪ Database ▪ All
Active	Option for activating the Price Sheet Download Job. Only active jobs are executed.
Run	<p>Frequency to execute the job.</p> <p>i Note: Depending on the value that you select, additional fields appear. For example, if you select a Run value of Monthly, a Day field appears. A value of 3 would mean the third day of the month.</p> <p>This field is automatically set to Monthly.</p>
Time	Time of day to execute the job.
Current execution status	Status of the execution that is currently running.
Current execution details	Details for the execution that is currently running.

4. Select **Save.**

5. Select **Execute to execute the job.**

During execution, Cloud Cost Management downloads and stores the data. You can find the execution ID, status, and execution logs in the **Price Sheet Executions** tab. If there’s no new data, the execution is marked **Skipped**. If the download process is stuck, the execution is marked as **Canceled**.

Cancel an AWS Price sheet download job in Cloud Cost Management

An AWS Price sheet download job downloads price sheet data from AWS. You can cancel any Price sheet download job individually.

Before you begin

For each provider, run Discovery on each service account.

Make sure to have the proper credentials and service account setup.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

Cloud Cost Management downloads price sheet data from each provider one region at a time. If you cancel a running price sheet download job, the current region finishes downloading and

the system cancels download for the remaining regions. If you delete a scheduled job execution, then all regions are marked as canceled.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select either a currently running or scheduled job that you want to cancel.
3. On the Price Sheet Download job page, select **Cancel execution**.

Configure Cloud Cost Management for Microsoft Azure

The Cloud Cost Management application is available on the ServiceNow Store.

General requirements and limitations

- Cloud Cost Management isn't supported on mobile devices.
- Values in reports might vary slightly from provider billing values due to currency conversion or rounding.

Requirements and limitations for Microsoft Azure

You must have Microsoft Azure console administrator permissions to work in the Microsoft Azure console

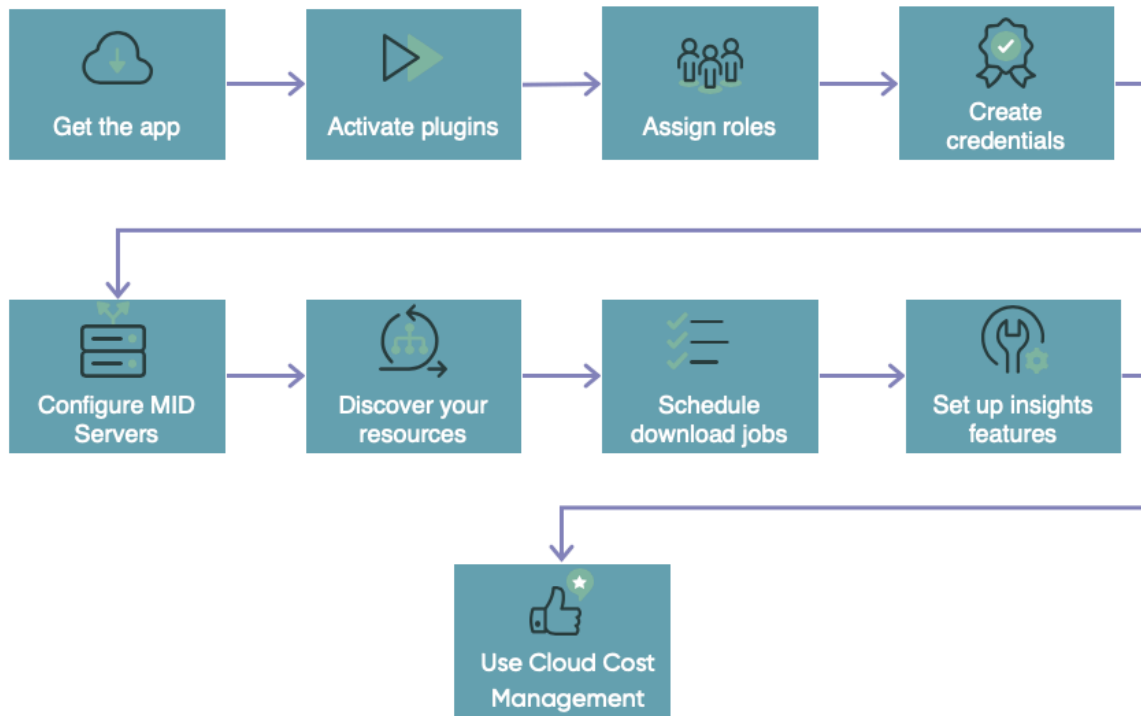

Download and activate Cloud Cost Management

Role required: sys_admin.

Step	Description	Do this
 Get the app.	Get the Cloud Cost Management app from the ServiceNow Store.	Visit the ServiceNow Store website to get the Cloud Cost Management app and supporting apps.
 Activate all supporting plugins and applications.	Activate the plugins listed on the ServiceNow Store page for Cloud Cost Management. You might need to request some of the plugins from your ServiceNow representative.	For instructions, see: <ul style="list-style-type: none"> • Request as plugin • Activate a plugin

Overview: Setting up Cloud Cost Management

Here's an overview of your set up process. Detailed instructions appear in the table that follows.

When you first open the app, the home page enables you set up a provider and to assign the insights_owner role.

After you set up a provider and assign the insights_owner role, the page displays additional setup activities.

Note:

The Configure and Run Discovery card appears only if you use the Discovery application to discover cloud resources.

Connect to <provider>

Perform these tasks to connect Cloud Insights to <provider>

<p>Configure and Run Discovery</p> <p>Identify your service accounts and configure the Discovery process to download CI data for all resources in your cloud infrastructure.</p> <p>Set up and Run Discovery</p>	<p>Download Billing and Usage Data</p> <p>Specify how and when to download, organize, and store billing data for each account.</p> <p>Set up Billing Download</p>	<p>Download Price Sheets</p> <p>To ensure accurate recommendations, set up the schedule for downloading price sheets.</p> <p>Set up Price Sheet Download</p>
---	--	---

- When you select the **Set up and Run Discovery** button in the Configure and Run Discovery section, the Discover Schedules form opens.
- When you select the **Set up Billing Download** button in the Download Billing and Usage Data section, the Billing Download Jobs form opens.
- When you select the **Set up Price Sheet Download** button in the Download Price Sheets section, the Price Sheets Download Jobs form opens.

After you finish all configuration, the page will show overview data and give quick access to reports.

 <p>Schedule and manage the Cloud Cost Management jobs that download price sheets</p>	<p>When you select the Set up Price Sheets Download button in the Download Price Sheets section, the Price Sheets Download Jobs form opens. A Price Sheet Download job downloads and stores price sheet data. The Rightsizing and Unused resources processes use price sheet data when generating recommendations.</p>	<p>Schedule and manage the Cloud Cost Management jobs that download Microsoft Azure price sheets</p>
 <p>Configure the insights features:</p> <ul style="list-style-type: none"> • Rightsizing • Unused Machines • Business Hours • Unassigned Resources 	<ul style="list-style-type: none"> • The Rightsizing feature analyzes resource usage to recommend better sizes for resources that are wasting money by being over-provisioned or underused. A confidence rating and predicted savings support each recommendation. You schedule Rightsizing jobs to resize the resources you specify. • The Unused Machines feature analyzes usage data to identify resources that are wasting money because they are not used. You schedule Unused Machines jobs to power-off or terminate the resources that you specify. • A Business Hours job applies policies to identify resources that are running when they should be powered off, reports them, and can start and stop them on a schedule that you specify. Running only during specified business hours can significantly reduce your cloud spend. 	<ul style="list-style-type: none"> • Rightsizing resources • Unused resources • Business hours • Unassigned resources

Step	Description	Do this
	<ul style="list-style-type: none"> Unassigned Resources policies help you to identify the resources that are not associated with a change group and to assign them appropriately. When a resource is assigned to the correct group, the resource can be appropriately governed even as it goes through stages such as patching, upgrading, and reconfiguring. 	

Configuring access to CI data on your Microsoft Azure account

To enable Discovery to communicate with your Microsoft Azure account, you specify your Service Principal credentials while configuring the MID Servers that communicate with your Microsoft Azure account.

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Detailed instructions

See [Azure Cloud Discovery](#).

i Important:

This configuration process applies only if you use the Discovery application to discover cloud resources. Skip this process if you use a different method for discovering resources.

MID Server settings for Cloud Cost Management

i Note:

MID Server minimum memory size should be 4 GB.

Setting	Value
Supported Applications	Cloud Actions
Capabilities	<p>The ALL setting includes all required applications and capabilities. Alternatively, you can specify the following settings:</p> <p>i Note: You can specify the following settings for any number of MID Servers. If you specify multiple MID Servers, then Discovery, billing data download operations, and actions that are recommended by Cloud Cost Management are assigned to one of the MID Servers at random.</p> <p>Option 1: To use this MID Server only for Azure, specify both of the following values:</p> <ul style="list-style-type: none"> Cloud Actions Azure

Setting	Value
	<p>Option 2: To use this MID Server for all providers, specify the following values:</p> <ul style="list-style-type: none"> • Cloud Actions • AWS • Azure • Google Cloud

Using a proxy server

You can use a proxy server for the Cloud Cost Management MID Server. See [Proxy server configuration for your Cloud Cost Management MID Server](#).

Proxy server configuration for your Cloud Cost Management MID Server

You can configure any MID Server to use a proxy server for Cloud Cost Management operations. Proxy servers support all cloud-based activities such as running Discovery, Billing Download jobs, and Price Sheet Download jobs.

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Detailed instructions

See [Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance](#) .

Proxy server limitations

- Only Windows or Linux platforms are supported.
- The Google Cloud integration is not supported.
- The VMware integration is not supported.
- Remote PowerShell scripts cannot be executed.
- Custom APIs might not work.

Supported proxy server authentication for Cloud Cost Management

Proxy Server type	Authentication type
HTTP/HTTPS	No authentication
SOCKS5	No authentication
HTTP/HTTPS	Basic authentication
SOCKS5	Basic authentication

Proxy Server type	Authentication type
HTTP/HTTPS	NTLM

Supported Proxy server configurations

Supported configuration settings

Configuration	Operating system	Proxy server	Authentication mode
Configuration 1	Linux	None	Not Applicable
Configuration 2	Windows	Squid (HTTPS)	None
Configuration 3	Linux	Squid (HTTPS)	Local
Configuration 4	Windows	Squid (HTTPS)	Active Directory

Add a Microsoft Azure service account

Add a Azure service account to store the credential and access information.

Before you begin

Role required: sn_cmp.cloud_admin

Set up download jobs for billing and price sheet data for the service account.

About this task

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account can include multiple service accounts – even service accounts from different providers. For each service account, you specify which datacenters to include in the cloud account.

i Note:

The service account must have Discovery credentials to get the Azure forecast data.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Service accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account

Field	Description
Name	Unique and meaningful name for this service account.
Account Id	<p>The Azure Account ID value that you copied from the Azure portal into the text file.</p> <p>The value in this field changes based on the type of account that you set.</p> <ul style="list-style-type: none"> o For billing service accounts, the Account ID is the Enrollment ID. o For other service accounts, the Account ID is the Subscription ID.
Discovery credentials	<p>The credentials needed for ServiceNow applications to access this account. You might configure this field at a later stage, while configuring access to Azure accounts.</p> <ul style="list-style-type: none"> o If you configured Azure credentials at ServiceNow AI Platform, select the name of the relevant Azure credential. o To use other Azure accounts to access this account, leave the field empty.
Datacenter URL	<p>URL of the datacenter.</p> <p>This field is required only for Azure GovCloud (US) accounts.</p> <p>.</p>
Datacenter Type	Type of the datacenter where the account is hosted.

Field	Description
	Select Azure datacenter .
Datacenter discovery status	Status and timestamp of the last execution of discovery on the datacenter. This value is generated automatically.
Is Billing Account	Option for enabling the account to access billing data. This option is available only when Cloud Integrations Azure scope is used. For the existing billing accounts, this check box is selected by default.
Is Management Group	Option for enabling the account for running Discovery. This option is available only when Cloud Integrations Azure scope is used. For the existing accounts where Discovery is run, this check box is selected by default.

4. Select Save.

Result

The service account that you created gets listed on the **Service accounts** page.

Set up access to Microsoft Azure billing and usage data

Set up access to Microsoft Azure billing and usage data depending on your agreement type.

You can access the billing and usage data, by assigning an appropriate role to the Microsoft Azure service principal, depending on your agreement type: Enterprise Agreement (EA), Microsoft Customer Agreement (MCA), or Microsoft Partner Agreement (MPA). Accordingly, some of the following steps might be optional for you.

Important:

The support for MCA accounts is available from Cloud Cost Management version 9.0 and later.

1. [Create a Microsoft Azure service principal](#)
2. For EA accounts - [Add the Enrollment Reader role to the Microsoft Azure service principal](#)
3. For MCA accounts - [Add the Billing Profile Reader role to the Microsoft Azure service principal](#)

4. [Create a record of Microsoft Azure credentials in Cloud Cost Management](#)
5. [Schedule and manage the jobs that download Azure billing data](#)

Related topics

- [Create exports on the Azure portal](#)

Create a Microsoft Azure service principal

Give Cloud Cost Management access to Microsoft Azure billing and usage data by creating a Microsoft Azure service principal.

Before you begin

Microsoft Azure Role required: Azure Cloud admin

About this task

Cloud Cost Management supports Microsoft Azure billing and cost usage data for multiple types of billing agreements: Enterprise Agreement (EA), Microsoft Customer Agreement (MCA), and Microsoft Partner Agreement (MPA). There are specific roles that you must assign to the service principal depending on your billing agreement type. For more information on agreement types, see [Billing information for Microsoft Azure](#).

Procedure

1. From a web browser, open the [App Registrations page](#) of the Microsoft Entra ID portal.
2. Log in using your global administrator credentials.
3. In the **Name** field of the Register an application form, enter a name for the application.
4. In the **Supported account types** field, select **Accounts in any organizational directory (Any Microsoft Entra ID – Single tenant)**.
5. Select **Register**.
The application is registered and you're redirected to the Overview page of the new application.
6. On the Overview page, copy the values in the **Application (client) ID** and **Directory (tenant) ID** fields.
Save them in a secure location for later use.
7. Generate a Client secret for your application.
 - a. From the side navigation menu, navigate to **Manage > Certificates & secrets**.
 - b. In the Client secrets section, generate a client secret for the application by selecting **New client secret**.
 - c. In the dialog box, fill in the fields.

Add a client secret dialog box

Field	Description
Description	Description of the client secret.
Expires	Expiration of the client secret.

Field	Description
	<p>Note: Your organization might apply policies to restrict client secret durability. Select an appropriate expiration period.</p>

- d. Select **Add**.
 - e. Copy the client secret that is generated and save at a secure location for later use.
- 8. Get **Subscription ID** to enable the service principal to work with various Azure subscriptions.**
- a. Navigate to **Subscriptions**.
 - b. Select the **Subscription ID** to which the service principal needs access.
 - c. Copy the **Subscription ID** from the Subscription Overview page.
- 9. Assign access roles and permissions to the service principal depending on your billing agreement type.**
Refer to the table for required roles and permissions for the service principal.

Roles and permissions for Azure service principal

Billing agreement type	Role required	Permissions
Enterprise Agreement (EA)	<ul style="list-style-type: none"> o Enrollment Reader o Storage Blob Data Reader 	These permissions are required for the service principal for all billing agreement types.
Microsoft Customer Agreement (MCA)	<ul style="list-style-type: none"> o Billing Account Reader o Both Billing Profile Reader and Billing Reader o Storage Blob Data Reader 	<ul style="list-style-type: none"> o Microsoft.Compute/virtualMachines/instanceView/read
Microsoft Partner Agreement (MPA)	<ul style="list-style-type: none"> o Billing Reader o Storage Blob Data Reader 	<ul style="list-style-type: none"> o Microsoft.Compute/virtualMachines/deallocate/action o Microsoft.Compute/virtualMachines/start/action o Microsoft.Compute/virtualMachines/delete o Microsoft.Compute/virtualMachines/write o Microsoft.Compute/virtualMachines/read o Microsoft.Compute/locations/usages/read o Microsoft.Advisor/recommendations/read

Billing agreement type	Role required	Permissions
		<ul style="list-style-type: none"> ○ Microsoft.Advisor/generateRecommendations/read ○ Microsoft.Advisor/generateRecommendations/action ○ Microsoft.Compute/disks/delete ○ Microsoft.Compute/disks/read ○ Microsoft.CostManagement/forecast/read ○ Microsoft.Compute/locations/diskOperations/read ○ Microsoft.Insights/Metrics/Read ○ Microsoft.Compute/locations/operations/read ○ Microsoft.Sql ○ Microsoft.DBforMariaDB ○ Microsoft.DBforMySQL

Related topics

[Add the Enrollment Reader role to the Microsoft Azure service principal](#)

[Add the Billing Profile Reader role to the Microsoft Azure service principal](#)

Add the Enrollment Reader role to the Microsoft Azure service principal

Assign the Enrollment Reader role to the Azure service principal for your Enterprise Agreement (EA) account to retrieve billing, purchase, and pricing data. You can assign this role using a Microsoft API.

Before you begin

Role required: Enterprise administrator (EA)

About this task

Enrollment reader roles can view subscription charges related data at the enrollment, department, and account scopes. They can also view the Azure prepayment balance linked with the enrollment. Enrollment reader role is required only for EA accounts.

Procedure

1. Navigate to the [Role Assignments - Put](#) page in the Microsoft Azure documentation.
2. Run the API by selecting the **Try It** button.
3. Select **Sign in**.

4. On the login page, enter your Microsoft Azure account credentials to sign in to the tenant.
5. On the API request parameters form, fill in the fields.

Role Assignments API request parameters

Field	Description
billingAccountName	<p>The Azure EA billing account ID.</p> <p>You can find the billing account ID on the Azure portal on the Cost Management + Billing overview page.</p>
billingRoleAssignmentName	<p>A unique ID to identify the name of the role that you want to assign.</p> <p>You can use a GUID generator website to generate a unique ID.</p>
Body	<p>The request body with parameters in JSON code. Enter the following JSON code in the body.</p> <pre>{ "properties": { "principalId": "{enterprise-application (or SPN) object-id}", "principalTenantId": "{tenant-id}", "roleDefinitionId": "/providers/Microsoft.Billing/ billingAccounts/{ea-account-id}/ billingRoleDefinitions/ 24f8edb6-1668-4659- b5e2-40bb5f3a7d7e" } }</pre> <p>In this code:</p> <ul style="list-style-type: none"> ○ principalId: object ID of the EA account ○ principalTenantId: tenant (directory) ID of the EA account ○ roleDefinitionId: ID of the role definition, for example, 24f8edb6-1668-4659-b5e2-40bb5f3a7d7e is the role definition ID of the enrollment reader role <p>For details on the object ID and tenant ID, see Microsoft documentation.</p> <div style="background-color: #e1f5fe; padding: 10px; border: 1px solid #cfcfcf;"> <p>Important: Replace only the <code>ea-account-id</code> string with the actual EA billing account ID.</p> </div>

Note:

You must not change the values in the **api-version** and **Content-Type** fields.

6. Complete the role assignment for the Azure EA account by selecting **Run**.

What to do next

[Schedule and manage the jobs that download Azure billing data](#)

Add the Billing Profile Reader role to the Microsoft Azure service principal

Assign the Billing Profile Reader role to the Azure service principal for your Microsoft Customer Agreement (MCA) account to download Azure price sheet data.

Before you begin

Role required: Azure Cloud admin

About this task

The Billing Profile Reader role provides the required permissions to download price sheet data at the profile scope only for MCA accounts. For more information on Azure roles, see [Microsoft documentation](#).

Important:

The support for MCA accounts is available from Cloud Cost Management version 9.0 and later.

Procedure

1. Log in to the [Azure portal](#) and search for **Cost Management + Billing**.
2. Select **Billing scopes**.
3. Select **Access Control (IAM)** at the billing profile scope to which you're assigning the billing profile reader role.
4. Select **+Add**.
5. In the Add role assignment window, select **Billing profile reader** in the **Role** field.
6. In the **Users, groups, or apps** field, select the service principal to which you're assigning the role.
7. Complete the role assignment for the Azure MCA account by selecting **Add**.

What to do next

[Schedule and manage the jobs that download Azure billing data](#)

Related topics

[Schedule and manage the Cloud Cost Management jobs that download Microsoft Azure price sheets](#)

Create a record of Microsoft Azure credentials in Cloud Cost Management

Securely store your Microsoft Azure credentials in the ServiceNow AI Platform credentials store. You must create a service account that accepts billing data for Cloud Cost Management.

Before you begin

Role required: sn_clin_core.insights_admin or admin

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Administration > Credentials**.
2. On the Cloud API credentials page, select **Azure service principal**.
3. Select **New**.
4. On the form, fill in the fields.

Azure Service Principal form

Field	Description
Name	Name of the service principal to register with the instance. For example, <code>CloudInsights - SP</code> .
Tenant ID	An unique identifier or alias for the tenant. Copy and paste the Tenant ID value from the <code>Azure - Credentials . txt</code> file.
Client ID	Unique identifier of an application created in Active Directory. Copy and paste the Tenant ID value from the <code>Azure - Credentials . txt</code> file.
Authentication Method	Select Client Secret . The Secret key field appears when you select Client Secret. Note: Client Assertion isn't supported.
Secret key	Azure client secret key. Copy and paste the Tenant ID value from the <code>Azure - Credentials . txt</code> file.
Active	Option to enable the credentials for use.

5. Select **Save**.

What to do next

[Schedule and manage the jobs that download Azure billing data](#)

Create exports on the Azure portal

Create exports for your Azure service account to download Azure billing data.

Before you begin

Roles required:

- For Enterprise Agreement (EA): Enterprise administrator, Storage Account Contributor
- For Microsoft Customer Agreement (MCA): Billing account owner or contributor, Storage Account Contributor
- For Subscriptions (EA/MCA/MPA): contributor, Storage Account Contributor

About this task

Important:

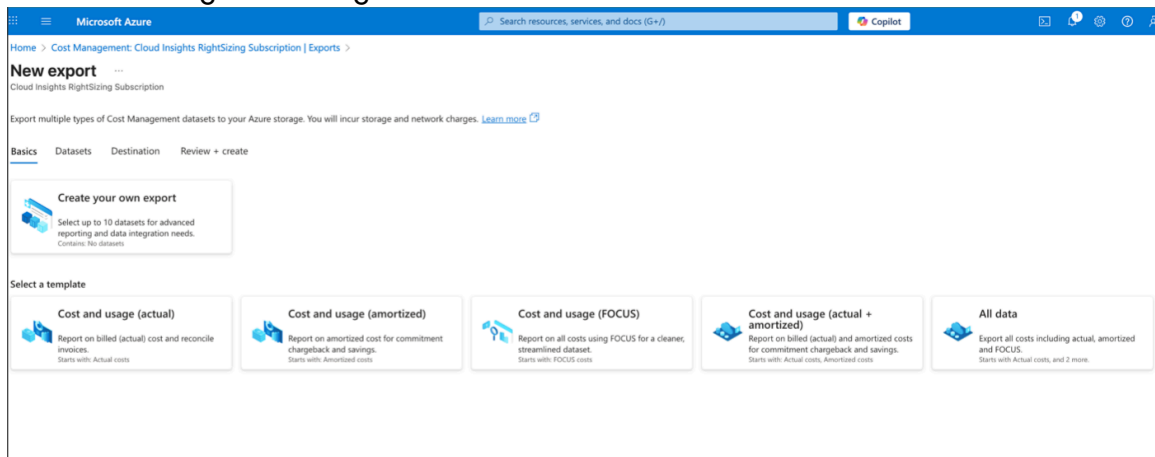

The support for Azure Exports method is available from Cloud Cost Management version 9.0 and later.

When you're using the Azure Export method to download billing data, you must create an export for your service account on the Azure portal to export billing data to your ServiceNow storage account.

Cloud Cost Management 10.0 and later versions support the FOCUS billing format in addition to the Cloud Native billing format. You must create exports for your Azure service account with the appropriate cost template.

Procedure

1. Log in to the [Azure portal](#) and search for **Cost Management**.
2. Select a billing account scope.
3. Select **Exports**.
4. Select **+ Create**.
5. On the Basics tab, select one of the following templates.
 - For the Cloud Native billing format, create exports with the **Cost and usage (actual)** and **Cost and usage (amortized)** templates to ensure accuracy of billing data.
 - For the FOCUS billing format, create exports with the **Cost and usage (FOCUS)** to ensure efficient billing data management.

6. Select **Next**.
7. On the Datasets tab, enter **Export prefix** to customize your export name.
8. Select the edit icon  next to the export name that you want to edit.
9. In the Edit export window, fill in the fields.

Edit export window fields

Field	Description
Type of data	The type of billing data for the export.
Export name	A unique name for the export.
Dataset version	<p>The version of the dataset.</p> <p>Note: Because other dataset versions might have different requirements, you should select 2024-08-01 as the dataset version.</p>
Frequency	<p>The option to export data at an interval that meets your requirement.</p> <p>Select Daily export of month-to-date costs for the daily export of your data.</p> <p>Important: The Billing Download job must run at least 30–60 minutes after the export of billing data to ensure that the latest data is included in the download.</p>
Compression	<p>Mode of compressing the export data.</p> <p>You can select None or Zip depending on your preference.</p>
Export description	A brief description of the export.

10. Select **Next**.

11. On the Destination tab, select the field values that meet your requirement.

Note:

Select **CSV** in the **Format** field because Cloud Cost Management 9.0 and later versions currently supports the CSV format only. The **Overwrite data** check box should be cleared so that the previously downloaded data doesn't get overwritten with the latest downloads.

12. Select **Next**.

13. On the Review + create tab, review your export configuration and change if necessary.

Result

The export that you have created appears in the list of exports.

Related topics

[Schedule and manage the jobs that download Azure billing data](#)

Schedule and manage the jobs that download Azure billing data

Billing Download jobs download, organize, and store billing data for your payer account on the schedule that you specify. The system analyzes the data to generate reports and to make recommendations for changes in your cloud operations that can lead to cost savings.

Before you begin

Ensure that your system has 8 GB Clotho memory and 4 GB mid memory.

Role required: Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin]

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

- To ensure accurate reporting and recommendations for some providers, make sure that Discovery runs before the scheduled execution.
- You can create only one Billing Download job for each service account.
- Only costs of unblended type are supported.
- Each successful execution of a Billing Download job updates tagged costs. Recent updates that you make to tag category definitions (for example, adding a tag name to a category) might not be reflected in cost reports. You should map tag values to tag categories after the first run because populating tag values needs at least one successful run. For more information on applying the latest tag category definitions to cost data without running a Billing Download job, see [Create and update a tag category](#).
- When a Billing Download job successfully completes, it triggers the Budget Forecast, Business hours, Reservation/saving plans, Rightsizing, and Unused resources jobs to analyze spend and usage data. This action also updates the actionable recommendations in reports.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.
- Cost categories are updated with new cost tag values each time billing data is downloaded. For example, the Cost Center category might include the tags development, testing, and QA. The User category might include the names of your users.
- Billing data is downloaded in reverse chronological order by month. For example, if the range is from March to June, data for June is downloaded first.
- To ensure meaningful results for the first billing data download, the app downloads data for minimum 30 days. For example, if today is June 10 and you specify June for download, the system downloads data for both May and June to ensure a minimum 30 days of data for analysis.
- You can download data only for the most recent 12 months.
- Whenever you provision a Kubernetes cluster, one default resource group gets created as *MC_myResourceGroup_myAKSCluster_eastus*. For example, if you provision a Kubernetes cluster with a resource group name as *TestResourceGroup*, Azure uses this resource group name and provisions another resource group as *MC_<name of the resource group>_<name of the cluster>_<location of the cluster>*.

All resources of the Kubernetes cluster are included in the resource group provided by Azure. When you run a Billing Download job, the list of resources included in the resource group with this naming convention *MC_<name of the resource group>_<name of the cluster>_<location of the cluster>* is checked.

- A tag `sn_ccm_k8_cluster_name` is added to the Kubernetes cluster when the billing download job runs.
- A tag `sn_ccm_k8_cluster_name` is added to the resources of the Kubernetes cluster present in the resource group when the Spend job runs.

Note:

- If you provide your own name to the asset or resources of a resource group, you can't view the spend for Kubernetes clusters.
 - Install Discovery and Service Mapping Patterns application (sn_itom_pattern) 1.10.2 or higher. For more information, see [Install Discovery and Service Mapping Patterns](#).
 - Install CMDB CI Class Models (sn_cmdb_ci_class) version 1.53.1 or higher. For more information, see [CMDB CI Class Models](#).
 - To set up Kubernetes discovery, see [Kubernetes discovery using patterns](#).
- If you have installed the Cloud Cost Management Infra Stack application along with Cloud Cost Management version 8.1, bill processing only happens on the Kubernetes cluster outside the Glide but within the ServiceNow datacenter. This framework supports parallel processing of data in chunks, making the billing file download faster.

After you submit a request for Azure billing data, the blobs are generated based on the chunk size. You can use the system property `sn_cld_intg_azure.billing_chunk_duration` to set the chunk size. For details, see [Configure the chunk size of Microsoft Azure billing blob](#). Consider an example where you want to download 30 days of billing data and you have set the chunk size to 3, then the billing data is available in 10 blobs. After all the blobs are generated, the state of the job changes from Ready to Requested. These blobs are stored in some blob storage on the Azure portal. The Kubernetes framework then downloads and processes the generated blobs from Azure.

Note:

If you have installed the Cloud Cost Management Infra Stack application, then toward the end of a job, significant database update, and insert operations are performed based on your Cloud CIs and spend data volume. Thus, any other job that impacts database performance shouldn't be run during this time alongside Cloud Cost Management jobs.

- From Cloud Cost Management version 8.1 onwards, the default time for billing download jobs has changed from 12:00 to 01:00 (UTC). Also, schedule or run Cloud Cost Management jobs only during off-business hours and when there's no other heavy operations or jobs running on the ServiceNow instance.
- Cloud Cost Management version 10.0 and later versions support the FinOps Open Cost and Usage Specification (FOCUS), the industry standard for delivering billing and usage data.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
2. Select the *Azure* tab.
3. Select **New**.
4. On the form, fill in the fields:

Azure Billing Download Job

Field	Description
Name	Meaningful name for the scheduled execution of the Billing Download job.
Last successful execution	The timestamp of the most recent successful execution.
Notify users/groups	<p>The users or groups to be notified by email of the status of the job execution (for example, download failure). The system doesn't send a notification for success.</p> <p>Users or groups with the Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin] role are well suited to handle these issues.</p> <p>To update the email template, navigate to System Notification > Email > Notifications and open the Notify on billing job execution error template. For information on configuring the email, see Create an email template.</p>
Active	Option for activating the job. Only active jobs are executed.
Run	<p>Frequency with which to execute the Billing Download job.</p> <p>This field is automatically set to Daily.</p> <p>Note: Depending on the value that you select, additional fields appear.</p>
Time	Time of day to execute the job.
Latest execution status	The status of the most recently executed job.
Latest execution details	Execution details of the most recently executed job.
Azure Settings	
Azure Service account	The Azure service account.
Use Exports	<p>Option for selecting the Azure Export method.</p> <p>The Use Exports check box is selected by default. If you don't want to use the Exports method, you must clear this check box.</p>
The following fields appear when the Use Exports check box is selected.	
Billing Account Id Type	<p>Level of billing account ID.</p> <p>Values include:</p>

Field	Description
	<ul style="list-style-type: none"> ○ Account: When the billing is done on account level ○ Subscription: When the billing is done on subscription level <p>Note: Select Account when the account ID is selected in the Azure Service Account field.</p>
Billing format	<p>The type of billing format.</p> <p>Values include:</p> <ul style="list-style-type: none"> ○ Cloud Native ○ Focus
The following fields are visible when you select Cloud Native in the Billing format field.	
Actual Cost Export Name	<p>Name of the actual cost export configured on the Azure portal.</p> <p>For more information, see Create exports on the Azure portal.</p>
Amortized Cost Export Name	<p>Name of the amortized cost export configured on the Azure portal.</p> <p>For more information, see Create exports on the Azure portal.</p>
The following field is visible when you select Focus in the Billing format field.	
Focus Export Name	Name of the export as configured for the FOCUS billing format.

Azure Settings

Azure Service Account *

Use Exports

Billing Account ID Type *

Account

Billing Format *

Cloud Native

Focus

Amortized Cost Export Name *

5. Select **Save**.

6. On the **Billing download jobs** page, select the created job.

7. Select **Test connection**.

The Test Connection workflow uses the settings that you configured to attempt to access the provider account. The system displays a progress pop-up and a success/error message that suggests actions to fix the configured settings.

8. Select **Execute now** to execute the job after the connection succeeds.

9. In the **Download billing data** dialog box, fill in the fields.

Field	Description
Start month	Starting month for downloading the billing data. Note: Data is downloaded for the specified months. If fewer than 30 days of data for analysis is received, data for the preceding month is also downloaded.
End month	Ending month for downloading the billing data.
Re-import data	Option for overwriting data from an earlier download attempt. Note: The complete billing download occurs on the fourth day or on the billing finalization date for the previous month, irrespective of the Re-import data option setting.

10. Select **Download**.

An Azure billing download job goes through the following states during the job execution:

a. Ready: Job is in the queue. For example, when a job is created to download billing data for a few months, the jobs for all months except the latest month are in Ready state.

Note:

If you have installed the Cloud Cost Management Infra Stack application, the Azure blob URLs are generated in the Ready state. For details, see [Configure the chunk size of Microsoft Azure billing blob](#). Only when all the blobs are generated, the state changes to Requested.

b. Requested: Job is fetched immediately. For example, the job that's created to download billing data for a month is in the Requested state. Also, when a job is created to download billing data for more than a month, the latest month job is also in the Requested state.

c. Reserved: Job is picked by the Kubernetes cluster for processing. The Kubernetes cluster also sends the Job Id to the Glide side to show which Kubernetes job is processing the billing job.

Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

d. In Progress: Billing data is being processed.

- e. Sink Begin:** Kubernetes cluster sends some part of the processed billing data to the tables such as Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost on the Glide. The records in these tables are in the Generating state. The job remains in the Sink Begin state until the entire billing data is sent to Cloud Cost Management Glide.

In the Sink Begin state, the CI placement also starts and the Status of the CI Placement Stage changes from Ready to In Progress.

Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

- f. Sink Complete:** All the processed billing data is sent to Cloud Cost Management Glide from the Kubernetes cluster.

Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

- g. Finished:** Status after Sink Complete when all the billing files are sent to the Glide database.

Note:

The following changes happen when the job is marked Finished:

- The state of the records in the Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost tables change from Generating to Active. Also, existing records are marked inactive.
- The status of the Azure EA to SA mapping execution stage changes from Ready to In Progress. In this execution stage, Enterprise account is mapped to the Service account.

- h. Success:** Job is completed successfully.

Result

The following events happen when the job executes:

- While downloading the data, Cloud Cost Management updates the billing node data table [sn_cld_intg_<provider>_cost_usage] with the CIs in the CMDB that corresponds to each resource ID. If a CI doesn't exist, the system generates a placeholder CI. On subsequent discovery, the system reconciles the placeholder CI.
- Cloud Cost Management generates a log entry for each stage of the execution on the Billing Download Executions page.

Note:

The supported CIs are placed after the Cumulus Unsupported CI Placement scheduled job runs daily. For more information, see [Supported CI class types for Microsoft Azure services](#).

Cancel an Azure Billing download job in Cloud Cost Management

A Billing download job obtains billing and usage data from each payer account for Azure. The Rightsizing, Unused resources, and Business hours processes use billing and usage data when generating recommendations. You can cancel any Billing download job individually.

Before you begin

Role required: Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin]

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
2. Select the **Azure** tab.
3. Select either a currently running or scheduled job that you want to cancel.
4. On the Azure Billing Download page, select **Cancel execution**.

Configure the chunk size of Microsoft Azure billing blob

Reduce the time required to download Azure billing files by defining the chunk size of a blob.

Before you begin

Role required: admin

About this task

Important:

This task is applicable only if you have installed the Cloud Cost Management Infra Stack application along with Cloud Cost Management version 8.1.

A single Azure billing blob can be large, resulting in performance issues during the download. If you have installed the Cloud Cost Management Infra Stack application, bill processing only happens on the Kubernetes cluster that's outside Cloud Cost Management Glide but within ServiceNow datacenters. This new framework with Kubernetes cluster supports parallel processing of multiple chunks of blobs, making the billing file download faster. You can also set the system property `sn_cld_intg_azure.billing_chunk_duration` to specify the duration in number of days for which the billing data will be included in each chunk.

Procedure

1. Open the System properties table by entering `sys_properties.list` in the application filter.
2. Filter the list to open the `sn_cld_intg_azure.billing_chunk_duration` property. The default value is 3, which means that each blob contains three days billing data.
3. Modify the value as needed.

Note:

Performance improves by setting the property to a value below 3.

4. Save the property.

Schedule and manage the Cloud Cost Management jobs that download Microsoft Azure price sheets

A Price Sheet Download job downloads and stores price sheet data. The Rightsizing and Unused resources processes use price sheet data when generating recommendations.

Before you begin

Run the Discovery application on each service account.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

- You create a scheduled Price Sheet Download job for Microsoft Azure.
- Each execution of a Price Sheet Download job runs multiple execution items. Each execution item imports and stores the price sheet for one subscription or billing profile.
- To ensure accurate reporting and recommendations for some providers, make sure that Discovery runs before the scheduled execution.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.
- Cloud Cost Management version 9.0 supports price sheet download for both Azure Enterprise Agreement (EA) and Microsoft Customer Agreement (MCA) accounts.
- Cloud Cost Management version 10.0 supports price sheet download for Microsoft Partner Agreement (MPA) accounts in addition to the Azure Enterprise Agreement (EA) and Microsoft Customer Agreement (MCA) accounts.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select **New**.
3. On the form, fill in the fields.

Price Sheet Download Job form fields

Field	Description
Name	A unique and meaningful name for the Price Sheet Download job.
Provider	Name of the cloud provider.
Download retail price sheet	Option to download retail price sheet without the need to provide account details and credentials required for the download.
Azure Service Account	Name of the Azure service account.
Download Price Sheet For	Price sheet downloads for different services. <ul style="list-style-type: none"> ○ Compute ○ Database ○ Storage
Last successful execution	Timestamp of the most recent execution of the job.
Active	Option for activating the Price Sheet Download Job. Only active jobs are executed.
Run	Frequency to execute the job.

Field	Description
	<p>Note: Depending on the value that you select, additional fields appear. For example, if you select a Run value of Monthly, a Day field appears. A value of 3 would mean the third day of the month.</p> <p>This field is automatically set to Monthly.</p>
Time	Time of the day to execute the job.
Current execution status	Status of the execution that is currently running.
Current execution details	Details for the execution that is currently running.

4. Select **Save.**

5. Select **Execute to execute the job.**

During execution, Cloud Cost Management downloads and stores the data. You can find the execution ID, status, and execution logs in the **Price Sheet Executions** tab. If there's no new data, the execution is marked **Skipped**. If the download process is stuck, the execution is marked as **Canceled**.

Cancel an Azure Price sheet download job in Cloud Cost Management

An Azure Price sheet download job downloads price sheet data from Azure. You can cancel any Price sheet download job individually.

Before you begin

For each provider, run Discovery on each service account.

Make sure to have the proper credentials and service account setup.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

Cloud Cost Management downloads price sheet data from each provider one region at a time. If you cancel a running price sheet download job, the current region finishes downloading and the system cancels download for the remaining regions. If you delete a scheduled job execution, then all regions are marked as canceled.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select either a currently running or scheduled job that you want to cancel.
3. On the Price Sheet Download job page, select **Cancel execution**.

Configure Cloud Cost Management for Google Cloud

The Cloud Cost Management application is available on the ServiceNow Store.

General requirements and limitations

- Cloud Cost Management isn't supported on mobile devices.
- Values in reports might vary slightly from provider billing values due to currency conversion or rounding.

Requirements and limitations for Google Cloud

You must have Google Cloud administrator permissions to work in the Google Cloud Console

Download and activate Cloud Cost Management

Role required: sys_admin.

Step	Description	Do this
 Get the app.	Get the Cloud Cost Management app from the ServiceNow Store.	Visit the ServiceNow Store website to get the Cloud Cost Management app and supporting apps.
 Activate all supporting plugins and applications.	Activate the plugins listed on the ServiceNow Store page for Cloud Cost Management. You might need to request some of the plugins from your ServiceNow representative.	For instructions, see: <ul style="list-style-type: none"> • Request as plugin • Activate a plugin

Overview: Setting up Cloud Cost Management

Here's an overview of your set up process. Detailed instructions appear in the table that follows.

When you first open the app, the home page enables you set up a provider and to assign the insights_owner role.

After you set up a provider and assign the insights_owner role, the page displays additional setup activities.

Note:

The Configure and Run Discovery card appears only if you use the Discovery application to discover cloud resources.

Connect to <provider>

Perform these tasks to connect Cloud Insights to <provider>

<p>Configure and Run Discovery</p> <p>Identify your service accounts and configure the Discovery process to download CI data for all resources in your cloud infrastructure.</p> <p>Set up and Run Discovery</p>	<p>Download Billing and Usage Data</p> <p>Specify how and when to download, organize, and store billing data for each account.</p> <p>Set up Billing Download</p>	<p>Download Price Sheets</p> <p>To ensure accurate recommendations, set up the schedule for downloading price sheets.</p> <p>Set up Price Sheet Download</p>
---	--	---

- When you select the **Set up and Run Discovery** button in the Configure and Run Discovery section, the Discover Schedules form opens.
- When you select the **Set up Billing Download** button in the Download Billing and Usage Data section, the Billing Download Jobs form opens.
- When you select the **Set up Price Sheet Download** button in the Download Price Sheets section, the Price Sheets Download Jobs form opens.

After you finish all configuration, the page will show overview data and give quick access to reports.

Add a Google Cloud service account

Add a Google Cloud service account to store the credential and access information.

Before you begin

Role required: sn_cmp.cloud_admin

Set up download jobs for billing and price sheet data for the service account.

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider

account to get data on each resource in each specified datacenter. A cloud account can include multiple service accounts — even service accounts from different providers. For each service account, you specify which datacenters to include in the cloud account.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Service accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account

Field	Description
Name	Unique and meaningful name for this service account.
Account Id	The project_ID value from the associated JSON key file.
Discovery credentials	The credentials needed for ServiceNow applications to access this account. You may configure this field at a later stage, while configuring access to Google Cloud accounts. <ul style="list-style-type: none"> ○ If you configured Google Cloud credentials at ServiceNow AI Platform, select the name of the relevant Google Cloud credential. ○ To use other Google Cloud accounts to access this account, leave the field empty.
Datacenter URL	URL of the datacenter. This field is required only for Google Gov Cloud accounts.
Datacenter Type	Type of the datacenter where the account is hosted. Select <i>Google Cloud Platform datacenter</i> .
Datacenter discovery status	Status and timestamp of the last execution of Discovery on the datacenter. This value is generated automatically.
Is Billing Account	Option for enabling the account to access billing data.

4. Select **Save**.

Result

The service account that you created gets listed on the **Service accounts** page.

Setup roles for Google Cloud billing download

To perform billing download for Google Cloud, you need specific roles and permissions for various features.

Before you begin

Roles required:

- On the Google Cloud Console: Google Cloud administrator.
- Cloud Cost Management: insights_admin [sn_clin_core.insights_admin] or admin.

About this task

Procedure

1. Add the following required permissions for the Billing module in the Google Cloud provider console.

Function and feature	APIs and permission
<p>Cost analysis and reporting</p> <ul style="list-style-type: none"> ○ Cost allocation and tracking ○ Cost trend analysis ○ Budget monitoring ○ Spend forecasting ○ Custom cost reports 	<p>Note: These permissions enable retrieving billing and spend data for cost analysis.</p> <p>BigQuery (Billing data)</p> <ul style="list-style-type: none"> ○ bigquery.jobs.create: Create jobs to query billing data ○ bigquery.jobs.list: List query jobs ○ bigquery.tables.getData: Read billing export data <p>Resource manager</p> <ul style="list-style-type: none"> ○ resourcemanager.projects.get: Get project cost context ○ resourcemanager.projects.list: List projects for cost aggregation
<p>Recommendations</p> <ul style="list-style-type: none"> ○ Identify under-used resources ○ Suggest optimal instance types ○ Recommend disk size adjustments ○ Cost optimization opportunities 	<p>Note: These permissions enable viewing the cost-saving recommendations. You must grant the permissions for retrieving billing and spend data before viewing the recommendations.</p> <p>BigQuery</p>

Function and feature	APIs and permission
	<ul style="list-style-type: none"> ○ bigquery.jobs.list: List BigQuery jobs ○ bigquery.tables.getData: Access table data for cost analysis <p>Cloud SQL</p> <ul style="list-style-type: none"> ○ cloudsql.instances.get: Retrieve Cloud SQL instance details ○ cloudsql.instances.list: List all Cloud SQL instances ○ cloudsql.databases.get: Get database details ○ cloudsql.databases.list: List databases <p>Compute engine</p> <ul style="list-style-type: none"> ○ compute.instances.get: Retrieve VM instance details ○ compute.instances.list: List all VM instances ○ compute.instances.getIamPolicy: Get IAM policies for instances ○ compute.disks.get: Retrieve disk details ○ compute.disks.list: List all disks ○ compute.autoscalers.get: Get autoscaler configurations ○ compute.autoscalers.list: List autoscalers ○ compute.regions.list: List available regions ○ compute.snapshots.get: List all snapshot <p>Recommender - Compute Instance Recommendations</p> <ul style="list-style-type: none"> ○ recommender.computeInstanceMachineTypeRecommendations.get ○ recommender.computeInstanceMachineTypeRecommendations.list ○ recommender.computeInstanceMachineTypeRecommendations.delete ○ recommender.computeDiskIdleResourceRecommendations.get ○ recommender.computeDiskIdleResourceRecommendations.list ○ recommender.computeDiskIdleResourceRecommendations.delete ○ recommender.computeInstanceIdleResourceRecommendations.get ○ recommender.computeInstanceIdleResourceRecommendations.list ○ recommender.computeInstanceIdleResourceRecommendations.delete <p>Recommender - Cloud SQL Recommendations</p> <ul style="list-style-type: none"> ○ recommender.cloudsqlIdleInstanceRecommendations.get ○ recommender.cloudsqlIdleInstanceRecommendations.list

Function and feature	APIs and permission
	<ul style="list-style-type: none"> ○ recommender.cloudsqlIdleInstanceRecommendations.upda ○ recommender.cloudsqlOverprovisionedInstanceRecommen ○ recommender.cloudsqlOverprovisionedInstanceRecommen ○ recommender.cloudsqlOverprovisionedInstanceRecommen <p>Recommender - General</p> <ul style="list-style-type: none"> ○ recommender.locations.get: Get recommender location details ○ recommender.locations.list: List available recommender locations
<p>Resource Lifecycle Management</p> <ul style="list-style-type: none"> ○ Start/stop instances on schedule ○ Delete unused resources ○ Resize resources based on recommendations ○ Automated cost optimization actions 	<p>Note: These permissions enable active resource management to act on cost-saving measures across your cloud environments. You must grant the permissions for retrieving billing and spend data and viewing recommendations before granting permissions for resource management.</p> <p>Compute engine - Lifecycle operations</p> <ul style="list-style-type: none"> ○ compute.instances.start: Start stopped instances ○ compute.instances.stop: Stop running instances ○ compute.instances.delete: Delete unused instances ○ compute.instances.update: Update instance configurations ○ compute.instances.setDiskAutoDelete: Configure disk auto-delete ○ compute.disks.delete: Delete unused disks ○ compute.disks.update: Update disk configurations ○ compute.snapshots.create: Create a new snapshot <p>Cloud SQL - Lifecycle operations</p> <ul style="list-style-type: none"> ○ cloudsql.instances.restart: Restart Cloud SQL instances ○ cloudsql.instances.delete: Delete unused SQL instances ○ cloudsql.instances.update: Update SQL instance configurations

Function and feature	APIs and permission
	<ul style="list-style-type: none"> ○ <code>cloudsql.databases.delete</code>: Delete unused databases ○ <code>cloudsql.databases.update</code>: Update database configurations

2. Set the roles at the Google Cloud organization level so that it is applicable for all the projects under that level.

The following APIs should be enabled on the Google Cloud Console for each project.

- Compute Engine API
- Recommender API
- BigQuery API
- BigQuery Data Transfer API
- Cloud Resource Manager API
- Cloud SQL Admin API
- Batch API

3. For details on policy creation see [Google Cloud docs](#) .

Set up access to Google Cloud billing and usage data

Create a Google Cloud billing account

Create a billing account, project, and BigQuery dataset in the Google Cloud Console.

Before you begin

You must be familiar with Google Cloud policies.

Role required: Google Cloud administrator

Procedure

1. Under the Google Cloud billing account, create a project that can store the billing data in a BigQuery dataset.

Note:

Charges associated with BigQuery usage are based on billing plans.

- a. Create a service account under the project and create a key. See the Create service accounts and Manage service accounts sections in [Google Cloud docs](#)  for more information.
 - b. Configure the service account to have access to all projects. You must have the Viewer role to all the projects.
 - c. Download the key file (JSON file) which contains the required credentials.
2. In the Google Cloud, enable Detailed usage costs to use Google Cloud Billing

Download.

 **Note:**

If you're configuring the billing download BigQuery dataset for the first time, read the Data availability section in the [Understand the Cloud Billing data tables in Big Query](#)  topic from [Google cloud documentation](#) .

Create Google API credentials

To access data securely on your provider account, the Discovery process must be present with appropriate credentials.

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin] or admin

About this task

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

1. In Cloud Cost Management, navigate to **Cloud Cost Management Workspace > Operations > Administration > Credentials**.
2. Select **Google API credentials**.
3. Select **New**.
4. On the form, fill in the fields.

Google API Credentials

Field	Description
Name	Unique and descriptive name for the Google Cloud credentials.
Active	Option to use the credential.
Type	Provider name, GCP.
Applies to	Indicates the MID Servers. If all, type All MID Servers.
E-Mail	Billing service account email.
Secret Key	Secret key that you generated on the Google Cloud Console.

5. Select **Save**.

[Cloud credentials](#) 

Enable cost allocation in Google Cloud for Kubernetes cluster

Enable cost allocation for each Kubernetes cluster before you run a Google Cloud Billing download job to view the Kubernetes spend.

Before you begin

Role required: Google Cloud administrator

- You should be familiar with Google Cloud policies.
- Install Discovery and Service Mapping Patterns application (sn_itom_pattern) 1.10.2 or higher. For more information, see [Install Discovery and Service Mapping Patterns](#) .

- Install CMDB CI Class Models (sn_cmdb_ci_class) version 1.53.1 or higher. For more information, see [CMDB CI Class Models](#).
- To set up Kubernetes discovery, see [Kubernetes discovery using patterns](#).

About this task

- For identifying resources for Kubernetes clusters during billing download, the tag `sn_ccm_k8_cluster_name` is added to the resources, which already have **goog-k8s-cluster-name** tags.
- You must enable cost allocation for each individual Kubernetes cluster.

Procedure

1. Log in to the [Google Cloud Console](#).
2. Select the hamburger icon ()
3. Select **Kubernetes Engine**.
4. Select **Clusters**.
5. In the Overview section, select a cluster name.
6. In the Features section, enable Cost Allocation.

Result

The cost allocation for the selected Kubernetes cluster is enabled and you can view the Kubernetes spend.

Schedule and manage the jobs that download Google Cloud billing data

Billing Download jobs download, organize, and store billing data for your payer account on the schedule that you specify. The system analyzes the data to generate reports and to make recommendations for changes in your cloud operations that can lead to cost savings.

Before you begin

- Ensure that your system has 8 GB Clotho memory and 4 GB mid memory.
- You must set up required roles to perform billing download. For more information, see [Setup roles for Google Cloud billing download](#).
- Enable cost allocation for each Kubernetes cluster before you run a Google Cloud Billing download job to view the Kubernetes spend. For more information, see [Enable cost allocation in Google Cloud for Kubernetes cluster](#).

Roles required:

- On the Google Cloud Console: Google Cloud administrator.
- Cloud Cost Management: insights_admin [sn_clin_core.insights_admin] or admin.

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

During the billing download, all the resources are pulled into the system. GCP SQL databases are placed in the [cmdb_ci] table.

Note:

From Cloud Cost Management version 8.1 onwards, the default time for billing download jobs has changed from 12 a.m. to 1 a.m. (UTC). Also, schedule or run Cloud Cost Management jobs only during off-business hours and when there's no other heavy operations or jobs running on the ServiceNow instance.

If you have installed the Cloud Cost Management Infra Stack application, then toward the end of a job, significant database update, and insert operations are performed based on your Cloud CIs and spend data volume. Thus, any other job that impacts database performance shouldn't be run during this time alongside Cloud Cost Management jobs.

- A Billing Download job creates and updates the billing node data table [sn_cld_intg_gcp_cost_usage] with billing line items from the BigQuery dataset.

Note:

Charges associated with BigQuery usage are based on billing plans.

- The CI placement process associates downloaded cost and usage data with the appropriate CIs in the CMDb. See [Add a Google Cloud CI class type to ensure accurate billing data](#) for details.
- Billing Download jobs can't be in the Global scope.
- You can create only one Billing Download job for each account.
- To ensure accurate reporting and recommendations for some providers, make sure that Discovery runs before the scheduled execution.
- Each successful execution of a Billing Download job triggers the Budget Forecast, Business hours, Reservation/saving plans, Rightsizing, and Unused resources jobs to analyze spend and usage data and to update the actionable recommendations in reports.
- Each successful execution of a Billing Download job updates tagged costs. Recent updates that you make to tag category definitions (for example, adding a tag name to a category) might not be reflected in cost reports. To apply the latest tag category definitions to cost data without running a Billing Download job, select *Cloud Cost Management Workspace* > **Operations** > **Cost usage tags** > **Tag categories** and then select **Re-Apply Categories**.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.
- Cost categories are updated with new cost tag values each time billing data is downloaded. (You define cost tags in the provider portal to associate usage data with a particular business entity. For example, the Cost Center category might include the tags development, testing, and QA. The User category might include the names of your users.)
- Billing data is downloaded in reverse chronological order by month. For example, if the range is from March to June, data for June is downloaded first.
- To ensure meaningful results for the first billing data download, the app downloads data for at least 30 days. For example, if today is June 10 and you specify June for download, the system downloads data for both May and June to ensure at least 30 days of data for analysis.
- You can download data only for the most recent twelve months.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
2. Select the *Google* tab.

3. Select **New**.

4. On the form, fill in the fields.

Google Billing Download Job

Field	Description
Name	Meaningful name for the scheduled execution of the Billing Download job.
Last successful execution	The timestamp of the most recent successful execution.
Notify users/groups	<p>The users or groups to notify by email of the status of the job execution (for example, download failure). The system doesn't send a notification for success.</p> <p>Users or groups with the Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin] role are well suited to handle these issues.</p> <p>To update the email template, navigate to System Notification > Email > Notifications and open the Notify on billing job execution error template. For information on configuring the email, see Create an email template .</p>
Active	Option for activating the job. Only active jobs are executed.
Run	<p>Frequency with which to execute the Billing Download job.</p> <p>This field is automatically set to Daily.</p> <p>Note: Depending on the value that you select, additional fields appear.</p>
Time	Time of day to execute the job.
Latest execution status	The status of the most recently executed job.
Latest execution details	Execution details of the most recently executed job.
Google Settings	
Billing account	<p>Account to access for billing data. Every account for which the Is Billing account setting is true appears in the selection list. For more information about the Is Billing account field, see Add a Google Cloud service account.</p> <p>For example, the Billing account ID must be in the 0XX0A - AXX9 - 6XXXA format.</p>

Field	Description
BigQuery project Id	The project ID, which contains the BigQuery dataset.
BigQuery dataset name	The name of the BigQuery dataset where the billing data is getting stored on an hourly basis.

5. Select Test Connection.

The Test Connection workflow uses the settings that you configured to attempt to access the provider account. The system displays a progress pop-up and a success/error message that suggests actions to fix the configured settings.

6. Select Execute now to execute the job after the connection succeeds.

7. In the Download billing data dialog box, fill in the fields.

Field	Description
Start month	Starting month for downloading the billing data. Note: Data is downloaded for the specified months. If fewer than 30 days of data for analysis is received, data for the preceding month is also downloaded.
End month	Ending month for downloading the billing data.
Re-import data	Option for overwriting data from an earlier download attempt.

8. Select Download.

A Google Cloud billing download job goes through the following states during the job execution:

- a. Ready:** Job is in queue. For example, when a job is created to download billing data for a few months, the jobs for all months except the latest month are in Ready state.
- b. Requested:** Job will be fetched and processed immediately. For example, the job that's created to download billing data for a month is in the Requested state. Also, when a job is created to download billing data for more than a month, the latest month job is also in the Requested state.
- c. Reserved:** Job is picked by the Kubernetes cluster for processing. The Kubernetes cluster also sends the Job Id to Cloud Cost Management Glide to show which Kubernetes job is processing the billing job.

Important:
This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

- d. In Progress:** Billing data is being processed.

- e. Sink Begin:** Kubernetes cluster sends some part of the processed billing data to the tables such as Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost on the Glide. The records in these tables are in the Generating state. The job remains in the Sink Begin state until the entire billing data is sent to Glide.

In the Sink Begin state, the CI placement also starts and the Status of the CI Placement Stage changes from Ready to In progress.

i Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

- f. Sink Complete:** All the processed billing data is sent to Cloud Cost Management Glide from the Kubernetes cluster.

i Important:

This state is applicable only if you have installed the Cloud Cost Management Infra Stack application.

- g. Finished:** Status after Sink Complete when all the billing files are sent to the Glide database.

i Note:

The following changes happen when the job is marked Finished:

- The state of the records in the Spend Report Daily Aggregate Cost and Spend Report Monthly Aggregate Cost tables change from Generating to Active. Also, existing records are marked inactive.
- All the sub accounts are mapped to the parent account.

- h. Success:** Job is completed successfully.

Result

The following events happen when the job executes:

- While downloading the data, Cloud Cost Management updates the billing node data table [sn_cld_intg_<provider>_cost_usage] with the CIs in the CMDB that correspond to each resource ID. If a CI doesn't exist, the system generates a placeholder CI. On subsequent discovery, the system reconciles the placeholder CI.
- Cloud Cost Management generates a log entry for each stage of the execution on the Billing Download Executions page.

Add a Google Cloud CI class type to ensure accurate billing data

Specify the details of a new CI or CI type to enable the CI placement process to assign cost and usage data correctly. The process is a part of Billing Download job execution. The CI placement process associates downloaded cost and usage data with the appropriate CIs.

Before you begin

Role required: Cloud Cost Management Admin [sn_clin_core.insights_admin]

About this task

i Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Billing Download jobs store downloaded billing data in the billing node table. The Class Type table holds CI type definitions for the cost usage table. Cloud Cost Management executes the CI placement process to associate the billing and usage data with CIs in the CMDB. The CI placement process queries the billing node table using the CI type definitions that reside in the CI placement type table. For a new CI (or a CI type from a new provider), you specify the parameters that uniquely define the CI, a CI type definition, and a class type table to store the CI type definition.

The CI placement type table for Google Cloud [sn_cld_intg_gcp_ci_placement_type] inherits from the Core CI placement type table (sn_cld_intg_core_ci_placement_type).

Procedure

1. Go to the CI placement type table and select **New**.

Google Cloud class types in the Core CI placement type table [sn_cld_intg_core_ci_placement_type]

	Name	Active	Class Type	Query params
<input type="checkbox"/>	Compute Engine	true	cmdb_ci_vm_instance	Resource global name contains compute.go
<input type="checkbox"/>	Disk	true	cmdb_ci_storage_disk	Resource global name contains disk

2. Fill in the form.

CI Placement Type Information form

Field	Description
Class type	CMDB class type table that this type of CI is stored in. New CIs of this type are added to the table.

Field	Description
Name	Name of the CI type.
Query table	<p>Billing node table that the CI placement process queries to find instances of the CI type.</p> <p>Query table is sn_cld_gcp_cost_usage and cannot be changed.</p>
Query params	Parameter values in the billing node table that uniquely define the CI type.

- After you add a class type, you must reimport billing and usage data to ensure that CIs are correctly placed into the new type.

Note:

The supported CIs are placed after the Cumulus Unsupported CI Placement scheduled job runs daily. For more information, see [Supported CI class types for Google Cloud services](#).

Cancel a Google Cloud Billing download job

A Billing download job obtains billing and usage data from each payer account for Google Cloud. The Rightsizing, Unused resources, and Business hours processes use billing and usage data when generating recommendations. You can cancel any Billing download job individually.

Before you begin

Roles required:

About this task

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Procedure

- Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Billing download jobs**.
- Select the **Google** tab.
- Select either a currently running or scheduled job that you want to cancel.
- On the Google Billing Download page, select **Cancel execution** or **Cancel**.

Schedule and manage the Cloud Cost Management jobs that download Google Cloud price sheets

A Price Sheet Download job downloads and stores price sheet data.

Before you begin

Ensure that you have the proper credentials and service account setup.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

- You create a scheduled Price Sheet Download job for each provider.
- A single API fetches the Price Sheet details for all regions at once.
- When the scheduled time arrives, job execution happens in multiple stages (for example, connect to the provider, download the data, perform the post-import sort, and so on). The system logs status and results on the Price Sheet Executions page for each stage.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select **New**.
3. On the form, fill in the fields.

Price Sheet Download Job

Field	Value
Name	Meaningful name for the Price Sheet Download job.
Provider	Name of the cloud provider.
Last successful execution	Timestamp of the most recent execution of the job.
Download Price Sheet For	Price sheet downloads for different services. <ul style="list-style-type: none"> ○ AWS <ul style="list-style-type: none"> ▪ Compute and Storage ▪ Database ▪ All ○ Azure <ul style="list-style-type: none"> ▪ Compute ▪ Database ▪ Storage ○ Google <ul style="list-style-type: none"> ▪ Compute and Storage ▪ Database ▪ All
Active	Option for activating the Price Sheet Download Job. Only active jobs are executed.
Run	Frequency to execute the job.

Field	Value
	<p>Note: Depending on the value that you select, additional fields appear. For example, if you select a Run value of Monthly, a Day field appears. A value of 3 would mean the third day of the month.</p> <p>This field is automatically set to Monthly.</p>
Time	Time of day to execute the job.
Current execution status	Status of the execution that is currently running.
Current execution details	Details for the execution that is currently running.

4. Select **Save.**

5. Select **Execute to execute the job.**

During execution, Cloud Cost Management downloads and stores the data. You can find the execution ID, status, and execution logs in the **Price Sheet Executions** tab. If there's no new data, the execution is marked **Skipped**. If the download process is stuck, the execution is marked as **Canceled**.

Related topics

[Rightsizing resources](#)

Cancel a GCP Price sheet download job in Cloud Cost Management

An GCP Price sheet download job downloads price sheet data from Google Cloud Platform (GCP). You can cancel any Price sheet download job individually.

Before you begin

For each provider, run Discovery on each service account.

Make sure to have the proper credentials and service account setup.

Role required: insights_admin [sn_clin_core.insights_admin].

About this task

Cloud Cost Management downloads price sheet data from each provider one region at a time. If you cancel a running price sheet download job, the current region finishes downloading and the system cancels download for the remaining regions. If you delete a scheduled job execution, then all regions are marked as canceled.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Price sheet download jobs**.
2. Select either a currently running or scheduled job that you want to cancel.
3. On the Price Sheet Download job page, select **Cancel execution**.

Using Cloud Cost Management

Use Cloud Cost Management to rightsize, identify, assign, manage, and analyze usage data of your cloud resources.

Reduce resource cost with Reservation Plans

View the Reserved Instances (RI) report, implement recommendations, and configure processes to convert on-demand payment plans to reservation plans, and save the cost of your resources.

You can filter by payment option, term, and look back period to view specific results for the Reserved Instances report.

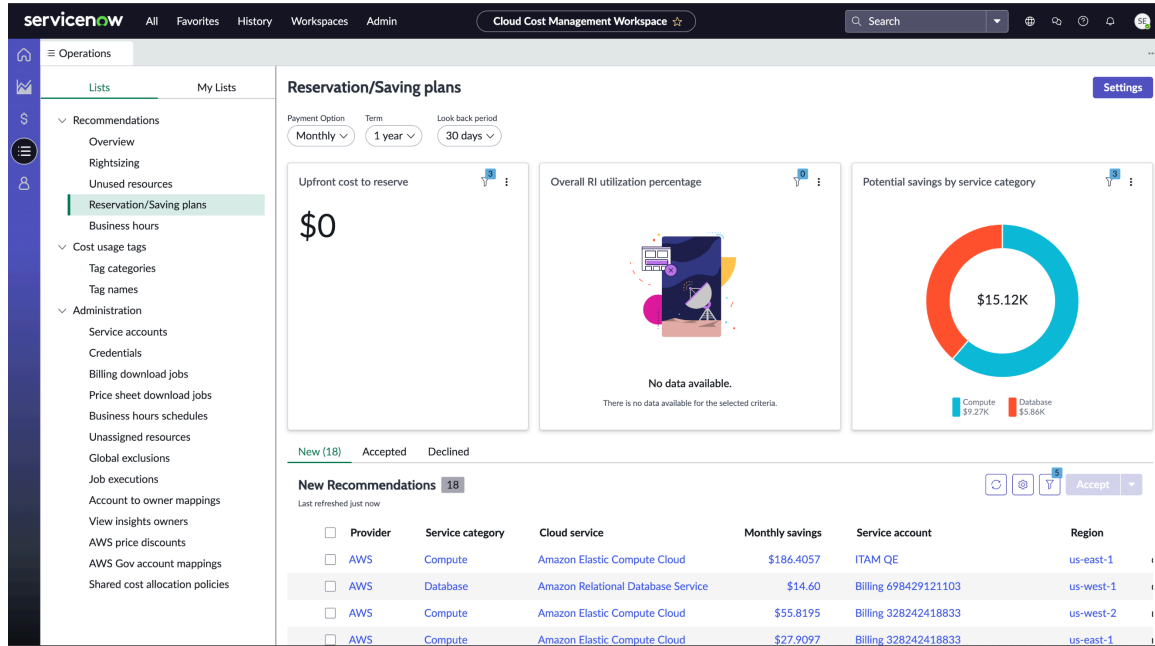

Chart	Description
Upfront cost to reserve	Upfront cost if all Reservation/Saving plans recommendations were applied.
Overall RI utilization percentage	Percentage of resources on reservation plans that were used and that weren't used in the last 30-day period.
Potential savings by service category	Monthly savings to expect when all Reservation/Saving plan recommendations are applied.

Recommendation tab	Description	Available selections on selected recommendations
New	Resources that would benefit most in reservation plans. Review the list and decide the conversion to reservation plans by moving a resource to one of the other tabs by	<ul style="list-style-type: none"> Accept Decline

Recommendation tab	Description	Available selections on selected recommendations
	selecting the appropriate action.	
Accepted	Resources that are converted to reservation plans. After a resource is moved to the Accepted Recommendations tab, it won't reappear on the New Recommendations tab.	Decline
Declined	Resources that aren't converted to reservation plans. After a resource is moved to the Declined Recommendations tab, it won't reappear on the New Recommendations tab.	Accept

i Important:

When you move a resource to the **Accepted Recommendations** or **Declined Recommendations** tab, the Cloud Cost Management application doesn't perform any action. You can change payment plans on the provider management interface.

Google Cloud recommendations are updated periodically and might not show the latest suggestions until the console is manually refreshed. In contrast, Cloud Cost Management fetches recommendations via API, ensuring it has the most current data. This difference can sometimes cause Google Cloud RI recommendations in Cloud Cost Management to diverge from what's shown in the Google Cloud console. A manual refresh is required to see the latest recommendations.

You can also [configure Reservation/Saving plans operations](#) by selecting **Settings**.

Configure Reservation/Saving plans operations

Configure Reservation/Saving plans processes and specify the amount of potential savings that triggers notifications.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Role required: insights_admin and insights_owner

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Recommendations > Reservation/Saving plans**.
2. On the Reserved Instances page, select **Settings**.
3. On the form, fill in the fields:

Reserved Instance Settings

Field	Description
Enable Reserved Instance	<p>Option for enabling Reserved Instance activities. Clearing the check box disables Reservation/Saving plans operations.</p> <p>Default: Enabled</p>
Notify when potential reserved instance savings exceed (%) of total spends	<p>Percentage of overall cloud spends for potential savings on reserved savings that should trigger an email notification to the users or groups that you specify.</p> <p>The value is calculated using the amount that could be saved if all the Reservation/Saving plans recommendations are followed.</p> <p>The default value of 15 means that notifications are sent only when the savings for potential reserved instances are greater than 15% of total costs.</p>
Do not recommend if savings are below threshold	<p>Minimum cost, as calculated over the Lookback period, to use when deciding whether to recommend a Reservation/Saving plan for a resource.</p> <p>For example, a setting of ¥100 means that the app should ignore any Reservation/Saving plan recommendation that would result in less than ¥100 in savings.</p>
Notify groups/Notify users	<p>Users or groups to notify by email when the spend for potential reserved instance savings exceed the specified percentage of overall cloud spend. For information on configuring the email, see Create an email template.</p>
Default Filter Settings	
Payment option	Sets the selected payment option as the default filter on the Reservation/Savings Plan page.
Term	Sets the selected term as the default filter on the Reservation/Savings Plan page.
Look back period	Sets the selected look back period as the default filter on the Reservation/Savings Plan page.

4. Select **Save**.

What to do next

To view the changes, rerun the Billing Download job.

Resize resources with Rightsizing

Gain better visibility of resource usage by identifying your over-provisioned or underused resources, configuring rightsizing operations, implementing rightsizing recommendations, and performing various rightsizing operations.

You can [configure Rightsizing operations](#) by selecting **Settings**.

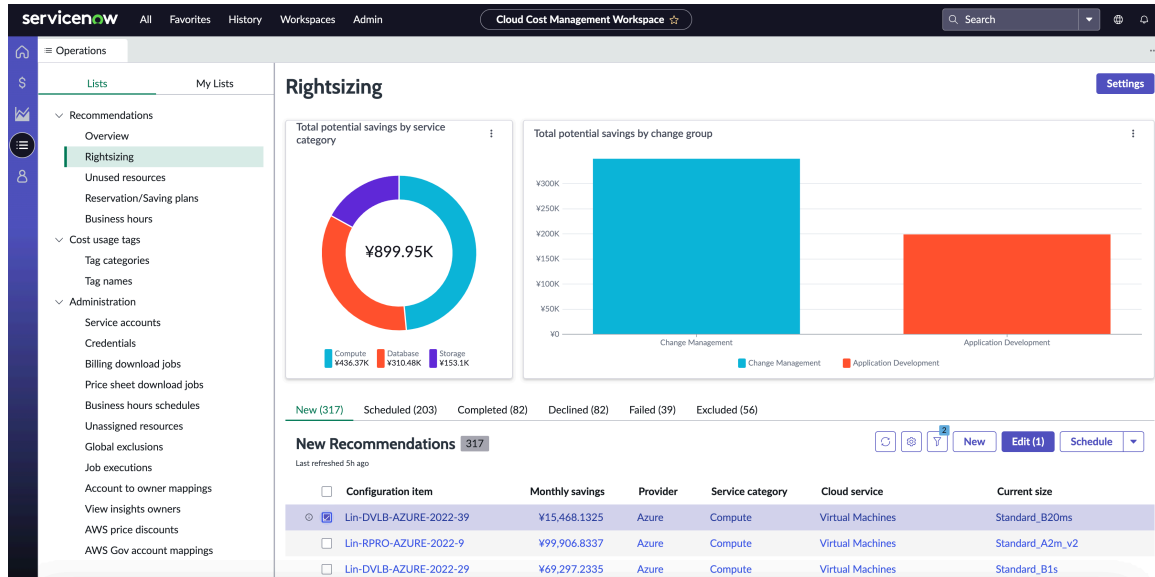

Chart	Description
Total potential savings by service category	Total savings to expect if all rightsizing recommendations are applied by service category such as Compute, Database, and Storage.
Total potential savings by change group	Total savings to expect if all rightsizing recommendations are applied by change group such as Change Management and Application Development.

Recommendations tab	Description	Available actions on selected recommendations
New	Resources that are candidates for Rightsizing. Each successful execution of a Billing Download job triggers the Rightsizing jobs to analyze spend and usage data and to update the actionable recommendations in reports.	<ul style="list-style-type: none"> Exclude Schedule

Recommendations tab	Description	Available actions on selected recommendations
Scheduled	Resources that are scheduled in Rightsizing jobs.	<ul style="list-style-type: none"> Reschedule Remove
Declined	Resources that owners didn't want to resize (declined the change request).	<ul style="list-style-type: none"> Exclude Reschedule
Completed	Resources that were rightsized by the Rightsizing job.	None
Failed	Resources for which the Rightsizing operation wasn't successful. For failed attempts, the Rightsizing operation performs a rollback as described in AWS only – Rollback on failed Rightsizing attempts .	<ul style="list-style-type: none"> Exclude Reschedule
Excluded	Resources that are configured not to be considered for Rightsizing.	Remove from exclusion

Columns on the New, Scheduled, Declined, Completed, and Failed Recommendations tabs

Column	Description
Configuration item	Unique identifier of the resource.
Monthly savings	Potential savings if the resource is resized to the Recommended size.
Provider	The provider that hosts the resource.
Service category	Lists all service categories from the instance sorted by name.
Cloud service	Lists all cloud categories sorted by #name.
Current size	Size of the resource that was analyzed for Rightsizing, the size that you're currently paying for.

Columns on the New, Scheduled, Declined, Completed, and Failed Recommendations tabs (continued)

Column	Description
Recommended size	<ul style="list-style-type: none"> • AWS: The size that is operationally and cost-wise most appropriate for the resource, based on the analysis of provisioning and usage levels over the last 14 days. • Microsoft Azure: Recommendation from the Azure Advisor service.
Override size	Size to use instead of the recommended size. By default, the system uses the Recommended size when Rightsizing. Specify a different size by specifying an Override size.
Rationale	<p>The reason that the system recommends resizing.</p> <ul style="list-style-type: none"> • AWS: Based on Cloud Cost Management analysis of provisioning and usage levels over the last 14 days. • Microsoft Azure: Recommendation from the Azure Advisor service.
Confidence	<p>The confidence level in a recommendation.</p> <ul style="list-style-type: none"> • High confidence requires the following conditions: <ul style="list-style-type: none"> ○ The system has at least 10 days of usage data for the resource. ○ The current and recommended family or generation is identical. • Medium confidence requires the following conditions: <ul style="list-style-type: none"> ○ The system has less than 10 days of usage data for the resource. ○ The current and recommended family or generation is identical. • Low confidence: The current and recommended family/generation are different.
Account	The service account that includes the resource. A service account represents a group of related regions in your provider account.
Region	If appropriate for the provider, region in the service account that hosts the resource.
Owned by	Owner of the resource.

Columns on the New, Scheduled, Declined, Completed, and Failed Recommendations tabs (continued)

Column	Description
Change group	Change group for the resource.
Source	Source of the recommendations. <ul style="list-style-type: none"> • AWS / Azure / GCP: Provider-generated recommendations • ServiceNow: Custom-generated recommendations
State	For resources that match an Auto-approval (Standard Change) approval type, status of the change request.
Job	Name of the Rightsizing job that the resource is part of.
Planned date	Date that the job is scheduled to run.
Change request	The change request that is associated with the recommendation.

Configure Rightsizing operations

Configure Rightsizing processes and specify the amount of potential rightsizing savings that triggers notifications.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin or insights_owner

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Recommendations > Rightsizing**.
2. Select **Settings**.
3. On the form, fill in the fields.

Rightsizing Settings

Field	Value
Enable Rightsizing	Option for enabling Rightsizing activities. Clearing the check box disables Rightsizing. Default: Enabled This field is automatically enabled.

Field	Value
After resize, exclude resource for (days)	<p>Number of days to place a resized resource in the Excluded Resources list. During this monitoring period, you can't remove the resource from the Excluded Resources list.</p> <p>Cloud Cost Management monitors resized resources for the specified period to verify that the new size is appropriate. When the period expires, the resource is removed from the list and rightsizing analysis resumes.</p> <p>Note: Microsoft Azure only: The Azure Advisor service begins to analyze usage and may again recommend resizing after seven days regardless of this setting. If you specify a value greater than seven days, the Cloud Cost Management doesn't report the Azure Advisor recommendation for the time period that you specify.</p> <p>Minimum value: 7</p>
Do not recommend if savings are below threshold	<p>Minimum cost over a 30-day period to use when deciding whether to rightsize.</p> <p>For example, a setting of ¥100 means that Cloud Cost Management ignores any rightsizing recommendation that would result in less than ¥100 in savings over 30 days.</p>
Notify when potential rightsizing savings exceed (%) of total spend	<p>Percentage of overall cloud spend for resources that are sized incorrectly that should trigger an email notification to the users or groups that you specify.</p> <p>The value is calculated using the amount that could be saved if all rightsizing recommendations are followed.</p> <p>Default: 15%</p> <p>The default value of 15 means that notifications are sent only when the cost of non-rightsized resources is greater than 15% of total costs.</p>
Notify users / Notify groups	<p>Users or groups to notify by email when the spend for incorrectly sized resources exceeds the specified percentage of overall cloud spend. For information on configuring the email, see Create an email template.</p>

Field	Value
Advanced	Option for specifying non-default change templates for generating change requests.
Auto-approval (Standard Change)	
Script include	This field appears only when the Advanced check box is selected. CLINRSSstandardChangeRequestUtil: The Change group is derived from the Standard Change template and can't be overridden.
Manual Approval (Normal Change)	
Script include	This field appears only when the Advanced check box is selected. CLINRSNormalChangeRequestUtil: Manual approval or Normal Change policies.

4. Select Save.

Specify rate discounts to enable accurate pricing for Rightsizing recommendations

To generate an accurate Rightsizing recommendation, the system analyzes usage data for the last 14 days, obtains prices from the price sheet data tables, and then applies appropriate discounts. To enable the calculations, specify the provider's discount rate for each service account.

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin]

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **AWS price discounts**.
2. Select **New**.
3. On the form, fill in the fields.

AWS Price Discount

Field	Description
Service account	The service account that the specified discount applies to.
Discount (%)	The percentage discount for the selected service account.

4. Select Save.

What to do next

View the provider's discount rate for each service account by navigating to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **AWS price discounts**.

Related topics

[Schedule and manage the Cloud Cost Management jobs that download AWS price sheets](#)

Define a metric threshold

To enable accurate memory usage data for use in generating Rightsizing recommendations, you first define memory metrics in your account. You then define a custom memory metric in Cloud Cost Management.

Before you begin

Role required: `insights_admin` [`sn_clin_core.insights_admin`] or `insights_owner` [`sn_clin_core.insights_owner`]

- Run Discovery on each service account.
- Verify that the Billing Download and Price Sheet Download job has been completed successfully.

About this task

Note:

You can configure the memory threshold for AWS and Azure only.

AWS doesn't automatically collect memory metric statistics. On the AWS Management Console, you specify the statistics to collect and push the data to Amazon CloudWatch. Cloud Cost Management accesses the data through CloudWatch, and verifies that the combination of namespace and metric name is defined correctly. To recommend resources for Rightsizing, Cloud Cost Management analyzes the memory usage data for the custom metric. If no data is returned, the analysis uses the maximum memory of the resource.

Procedure

1. Navigate to **Cloud Cost Management Workspace** > **Operations** > **Recommendations** > **Rightsizing**.
2. Select **Settings**.
3. Select the **Service category metric** tab.
4. Select **New**.
5. On the form, fill in the fields.

Create New Metrics Configuration

Field	Description
Provider	Name of the service provider. <ul style="list-style-type: none"> ○ AWS ○ Azure
Service Category	Service category for the provider. <ul style="list-style-type: none"> ○ Compute ○ Database

Field	Description
	<p>Note:</p> <ul style="list-style-type: none"> For AWS, recommendations are generated only on CPU usage (Compute). For Azure, recommendations are generated based on CPU, Memory, and Network usage (Compute and Database).
Service Accounts	Service accounts for the selected provider.
Aggregation Type	<p>Metric statistics received in time intervals.</p> <ul style="list-style-type: none"> Avg Min Max
Metric Type	<p>Type of the metric statistic.</p> <ul style="list-style-type: none"> CPU Memory Network
Threshold (%)	<p>Threshold value used while generating Rightsizing recommendations.</p> <p>Note: If Provider is selected as AWS, Service Category is selected as Database, and Metric Type is selected as Network, the value shows up as an integer.</p>

6. Select Save.

Schedule resources to be rightsized

To rightsize a resource, add it to a Rightsizing job and specify when the job should run. You can also move resources out of one scheduled job into a different job or remove a resource from a job.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin or insights_owner

About this task

When you change the resources that are included in a job, Cloud Cost Management checks for the following conditions:

- A resource in the job is owned by another user (as when a insights_admin updates a job that was created by an insights_owner or an insights_owner updates a job that was created by a different insights_owner).
- The job was created by another user.

If either condition is met, the app sends an email notification to the owner of the resource or the creator of the job.

Note:

If a recommendation to rightsize a Google Cloud resource is dismissed from the Google Cloud management portal, the resource doesn't appear in Rightsizing recommendations.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Rightsizing**.
2. In the list on the appropriate tab, select the check boxes for the resources to rightsize.
 - To create a Rightsizing job for resources that are new candidates for rightsizing: On the **New Recommendations** tab, select resources and then select **Schedule**.
 - To create a new job for resources that had previously been scheduled but were not resized: On the **Declined Recommendations** tab or the **Failed Recommendations** tab, select resources and then select **Reschedule**.
3. In the dialog box, fill in the fields.

Schedule job

Field	Value
Job type	Type of job action. Select Schedule job .
Job name	Unique and descriptive name for the Rightsizing job.
Schedule	Date and time to run the Rightsizing job.
Approval type	Type of change request to use. <ul style="list-style-type: none"> ○ Auto approval: Generates and auto-approves a change request to resize the resource. The system also sends the approved change request to the change group. The resource is added to the list of resources that the job will resize. ○ Manual approval: Generates a change request (Normal Change type) for a member of the change group to resize the

Field	Value
	<p>resource and continues to list the resource in the appropriate Rightsizing reports.</p> <p>Note:</p> <p>The Short description, Description, Assignment group, and Affected CIs fields are auto populated. For more information, see Create a change request.</p>
Change template	<p>This field appears only when the Approval type is selected as Auto approval.</p> <p>Change request template (Standard Change type) to be used. If no template appears in the list, you must create one. See Create a change request template.</p>

4. Select Submit.

Result

The Rightsizing job is created and will run at the scheduled time.

- Until a member of the change group approves or rejects the change, the resource state is set to **Pending**, the resource remains listed on reports, and no other action is taken.
- If a member of the change group approves the request, the state is set to **Approved** and the resource is added to the list of resources that the job will resize.
- If a member of the change group rejects the request, the resource state is set to **Declined**, the resource remains listed on reports, and no action is taken.

Move a resource to a different Rightsizing job

You can add resources to a currently scheduled job, move resources from one job to another, or remove resources from a job.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin or insights_owner

About this task

When you change the resources that are included in a job, the app checks for the following conditions:

- A resource in the job is owned by another user (as when a insights_admin updates a job that was created by an insights_owner or an insights_owner updates a job that was created by a different insights_owner).
- The job was created by another user.

If either condition is met, the app sends an email notification to the owner of the resource or the creator of the job.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Rightsizing**.
2. In the list on the appropriate tab, select the check boxes for the resources to rightsize.
 - On the **New Recommendations** tab, select **Schedule**.
 - On the **Declined Recommendations** tab or the **Failed Recommendations** tab, select **Reschedule**.
3. In the dialog box, fill in the fields.

Schedule job

Field	Value
Job type	Type of job action. Select Add to job .
Job name	Unique and descriptive name for the Rightsizing job.
Schedule	Date and time to run the Rightsizing job.
Approval type	Type of change request to use. <ul style="list-style-type: none"> ○ Auto approval: Generates and auto-approves a change request to resize the resource. The system also sends the approved change request to the change group. The resource is added to the list of resources that the job will resize. ○ Manual approval: Generates a change request (Normal Change type) for a member of the change group to resize the resource and continues to list the resource in the appropriate Rightsizing reports.
Change template	This field appears only when the Approval type is selected as Auto approval . Change request template (Standard Change type) to be used. If no template appears in

Field	Value
	the list, you must create one. See Create a change request template  .

4. Select **Submit**.

Exclude a resource from Rightsizing analysis

To ensure that a particular resource is not considered or recommended for Rightsizing, add the resource to the Excluded Resources list. The system continues to collect cost and usage data but does not consider the resource for Rightsizing.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin or insights_owner

About this task

When you change the resources that are included in a job, the app checks for the following conditions:

- A resource in the job is owned by another user (as when a insights_admin updates a job that was created by an insights_owner or an insights_owner updates a job that was created by a different insights_owner).
- The job was created by another user.

If either condition is met, the app sends an email notification to the owner of the resource or the creator of the job.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Rightsizing**.
2. On the New, Declined, or Failed tabs, select the resources that you want to exclude from rightsizing analysis.
3. Select **Exclude**.
The resources are added to the Excluded Resources list. To remove a resource from the list, select the resources from the **Excluded** tab and then select **Remove From Exclusion**.

Configure Unused resources operations

The Unused resources feature recommends termination or power-off for resources that are wasting money because they aren't being used. Configure Unused resources processes and specify the potential savings that trigger notifications.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner].

About this task

Note:

Microsoft Azure only: The Azure Advisor service generates the recommendations that appear in Rightsizing and Unused resources reports. Cloud Cost Management doesn't generate the recommendations.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Unused resources**.
2. Select **Settings**.
3. On the form, fill in the fields.

Unused Machine Settings

Field	Value
Enable Unused Machines	<p>Option for enabling Unused resources activities.</p> <p>This field is automatically enabled.</p>
Advanced	Option to specify non-default change templates.
Auto pause interval	Indicates the minimum idle time for the Azure SQL database in minutes.

Field	Value
	Default: 60 minutes
Maximum age for snapshots in AWS/Azure/Google (days)	Age of the snapshot. The snapshot data is displayed in the Rationale column in the Recommendations tab. Default: 90 days
Notify when potential unused savings exceed (%) of total spend	Percentage of overall cloud spend on unused resources that triggers an email notification to the users or groups that you specify. The value is calculated using the amount that could be saved if all Unused resources recommendations are applied. Default: 15% The default value of 15 means that notifications are sent only when the cost of operation for unused resources is greater than 15% of total costs.
Notify users / Notify groups	Users or groups to notify by email when the spend for unused resources exceeds the specified percentage of overall cloud spend. For information on configuring the email, see Create an email template .
Auto-approval (Standard Change)	
Script include	This field appears only when the Advanced check box is selected. CLINRSSstandardChangeRequestUtil Script include to use for change requests when a resource matches a policy of the specified type. The Change group is derived from the Standard Change template and can't be overridden.
Manual approval (Normal Change)	
Script include	This field appears only when the Advanced check box is selected. CLINRSNormalChangeRequestUtil

Schedule unused resources to be powered off or terminated

To terminate or power off an unused resource, add it to an Unused resources job, specify whether to terminate or power off, and specify when the job should run. You can also move resources from one scheduled job to a different job.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner]

About this task

i Important:

After an Unused resources job powers off or terminates a machine, the machine is added to the Excluded Resources list for Business Hours. This process ensures that the resource isn't started again in the future because it matches a Business Hours policy. The exclusion reason on the Business Hours **Excluded Resources** tab indicates that the resource is an unused resource.

When you change the resources that are included in a job, the app checks for the following conditions:

- A resource in the job is owned by another user (as when an insights_admin updates a job that was created by an insights_owner or an insights_owner updates a job that was created by a different insights_owner).
- The job was created by another user.

If either condition is met, the app sends an email notification to the owner of the resource or the creator of the job.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Unused resources**.

2. In the list on the appropriate tab, select the check boxes for the resources to terminate.
- To create an Unused resources job for resources that are new candidates for termination: On the **New Recommendations** tab, select the resources and then select **Schedule Job**.
 - To create a job for resources that had previously been scheduled but the action wasn't completed successfully: On the **Declined Recommendations** tab or the **Failed Recommendations** tab, select the resources and then select **Reschedule**.

i Note:

Microsoft Azure only: The Azure Advisor service generates the recommendations that appear in Rightsizing and Unused resources reports. Cloud Cost Management doesn't generate the recommendations.

3. In the dialog box, fill in the fields.

Field	Value
Job Type	Type of job action.

Field	Value
	Select Schedule job .
Job name	Unique and descriptive name for the Unused resources job.
Action	<p>The action to take on the selected resources:</p> <ul style="list-style-type: none"> ○ Power off machine: Power off triggers a Microsoft Azure process called deallocation to set the resource as Stopped (Deallocated). ○ Terminate machine: Terminated machines can't be recovered. ○ Terminate machine and delete storage: If the root volume isn't automatically deleted when the VM is terminated, the job deletes the root volume. No other volumes are deleted. <p>Note: Terminated resources or deleted volumes can't be recovered.</p>
Schedule	Date and time to run the Unused resources job.
Approval type	<p>Type of change request to use. Unused Machines operations are directly integrated with the ServiceNow[®] Change Management feature.</p> <ul style="list-style-type: none"> ○ Auto approval (Standard Change): Generates and auto-approves a change request to terminate or stop the resource. The system also sends the approved change request to the change group. The resource is added to the list of resources that the job terminates or stops. ○ Manual approval (Normal Change): Generates a change request (Normal Change type) for a member of the change group to terminate or stop the resource and continues to list the resource in the appropriate Unused resources reports. <ul style="list-style-type: none"> ▪ Until a member of the change group approves/rejects the change, the resource state is set to Pending, the resource remains listed on reports, and no other action is taken.

Field	Value
	<ul style="list-style-type: none"> ▪ If a member of the change group approves the request, the state is set to Approved and the resource is added to the list of resources that the job terminates or stops. ▪ If a member of the change group rejects the request, the resource state is set to Declined, the resource remains listed on reports, and no action is taken. <p>Note:</p> <p>The Short description, Description, Assignment group, and Affected CIs fields are auto populated. For more information, see Create a change request.</p>
Change template	<p>This field appears only when the Approval type is selected as Auto approval.</p> <p>Change request template (Standard Change type) to be used. If no template appears in the list, you must create one. See Create a change request template.</p>

4. Select Submit.

Result

The Unused resources job is created and runs at the scheduled time.

Move a resource to a different Unused resources job

You can add resources to a currently scheduled job, move resources from one job to another, or remove resources from a job.

Before you begin

Run Discovery on each service account.

Ensure that the Billing Download job has completed for each provider.

Ensure that the Price Sheet Download job has completed for each provider.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner].

About this task

When you change the resources that are included in a job, the app checks for the following conditions:

- A resource in the job is owned by another user (as when a insights_admin updates a job that was created by an insights_owner or an insights_owner updates a job that was created by a different insights_owner).
- The job was created by another user.

If either condition is met, the app sends an email notification to the owner of the resource or the creator of the job.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Unused resources**.
2. In the list on the appropriate tab, select the check boxes for the resources to terminate.
 - To create an Unused resources job for resources that are new candidates for termination: On the **New Recommendations** tab, select the resources and then select **Schedule Job**.
 - To create a job for resources that had previously been scheduled but weren't resized: On the **Declined Recommendations** tab or the **Failed Recommendations** tab, select the resources and then select **Reschedule**.

Note:

Microsoft Azure only: The Azure Advisor service generates the recommendations that appear in Rightsizing and Unused resources reports. Cloud Cost Management doesn't generate the recommendations.

3. In the dialog box, fill in the fields.

Configure Business hours operations

You can choose to use or to disable Business Hours features and specify the amount of non-business hour spend that triggers notifications to users or groups. Controlling unnecessary resource use can help reduce costs.

Before you begin

A cloud account (parent account) that has at least one service account and associated datacenters is required.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner] for owned service accounts.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Business hours**.
2. Select **Settings**.
3. On the form, fill in the fields.

Business Hours Settings

Field	Description
Enable business hours	Option for enabling the Business hours feature. All active policies are applied when data becomes available. Deselect the check box to disable the Business hours feature. No policies are applied regardless of the Active setting for a policy.

Field	Description
	<p>Note: When you disable the Business hours feature, all schedules that were applied by policies are deactivated and resources return to their original schedules.</p>
Precedence	<p>The role that should have precedence when policies are applied. Select one of the following:</p> <ul style="list-style-type: none"> ○ Admin Policies ○ Owner Policies <p>Precedence determines the order in which batches of policies are applied. Each batch is based on the role of the user who created the policy – insights_admin or insights_owner. After a match, no other policy is applied to the resource.</p> <p>Default: Admin Policies (The set of policies that were created by users with the insights_admin role.)</p>

Field	Description
	<pre> graph TD Start([Start]) --> A[Apply all policies that have precedence (in Run order)] A --> M1{Match?} M1 -- Yes --> C[Collect matching resources] M1 -- No --> B[Apply all other policies (in Run order)] B --> M2{Match?} M2 -- Yes --> C M2 -- No --> Stop([Stop]) C --> D([Generate reports, make recommendations, and perform policy actions on matches]) </pre>
Advanced	<p>Option to generate a single change request that applies to all CIs that match a policy (default setting) or a separate change request for each CI.</p> <p>Some attributes of the change request template have static/constant values that cannot be changed. Some attributes (for example, risk and work_notes) have dynamic values that you can set using a script include.</p>
Auto-approval (Standard Change)	
Single change request	<p>Option for enabling the system to generate a single change request, which applies to all CIs that match the policy.</p>
Script include	<p>This field appears only when the Advanced check box is selected.</p> <p>CLINBHStandardChangeRequestUtil</p>

Field	Description
	The Change group is derived from the Standard Change template and cannot be overridden.
Manual approval (Normal Change)	
Single change request	Option for enabling the system to generate a single change request, which applies to all CIs that match the policy.
Script include	This field appears only when the Advanced check box is selected. CLINBHNormalChangeRequestUtil
Notify when non-business hour spend exceeds (%) of total spend	Percentage of overall cloud spend on resources during business hours that triggers email notification to the users or groups that you specify. Default: 15 The value is calculated using the amount that could be saved if all Business hours recommendations are applied. The default value of 15 means that notifications are sent only when the cost of operation during non-business hours is greater than 15% of total costs.
Notify when unassigned resources exceed (%) of total CIs	The percentage of overall cloud spend for non-business hour usage that triggers email notification of the users or groups that you specify. The default value of 15 means that notifications are sent only when the cost of operation during non-business hours is greater than 15% of total costs.
Notify users / Notify groups	The users or groups to notify by email when the non-business hour spend exceeds the specified percentage of overall cloud spend. If you do not specify users or groups, then no notification is sent.
Maximum CIs per change	This field appears only when the Single change request check box is selected in the Manual approval (Normal Change) section. Maximum number of resources to associate with a single change request. If the maximum is reached, the system generates a new change request.

Field	Description
	Default value: 1000

4. Select **Save**.

Create Business hours schedule

Create and apply a Business hours schedule to the cloud resources for enforcing the on/off schedule.

Before you begin

Role required: insights_admin or insights_owner

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Business hours schedules**.
2. Select **New**.
3. On the form, fill in the fields.

Schedule

Field	Description
Name	Unique name for the schedule.
Time zone	Time zone for the schedule. Default value: Floating, which means that the time zone is relative to whatever process is accessing the item at the time. When a schedule is defined in a time zone, users in different time zones see the schedule with their own time zone applied.
Parent	Parent schedule that constraints the new schedule.
Application	Application scope of the schedule. Default value: Cloud Insights Core
Type	Text label that describes the purpose of the schedule.
Description	Description of the schedule.

4. Select **Save**.

Define or update a Business hours policy

A Business hours job applies policies to identify resources that are running when they should be powered off, reports them, and can start and stop them on a schedule that you specify. Running only during specified business hours can significantly reduce your cloud spend.

Before you begin

Required: A cloud account (parent account) that has at least one service account or project that has associated datacenters.

A Billing Download job must be defined.

Role required: `insights_admin` [`sn_clin_core.insights_admin`] or `insights_owner` [`sn_clin_core.insights_owner`] for owned service accounts.

About this task

Important:

A resource matches the policy if all criteria in the Service Account and Resource Criteria section are met.

- You must select one of the Cloud Cost Management application scopes to create or update a Business hours policy.
- You can create as many policies as needed.
- You can't change the provider while editing an existing policy.
- When you deactivate a Business Hours policy, the resources that met the policy criteria might match a different policy (the matching policy with lowest run order) and therefore move to another schedule. In this case, the system generates a new change request. If a resource no longer meets any policy, the system attempts to power on the resource using the specified **Power-on flow** setting.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Recommendations** > **Business hours**.
2. Select **Policies**.
When a policy is created or updated with changes other than to its name or description, a notification appears on the tab. Select **Apply policies** to apply the updated policy and recalculate the reported data.
3. Select **New/Edit** to create a policy.
You can edit an existing policy by selecting a policy name from the **Business Hours Policies** list.
4. On the form, fill in the fields.

Business Hours Policy Creation form

Field	Value
Select business hours policy to edit	The business hour policy that you want to edit.
Active	The option to apply the policy. Selecting the Active check box enables Business hours analysis whenever billing data is updated.

Field	Value
Policy name	A unique name that describes the policy for other users.
Description	A brief description of the policy.
Run order	<p>The order in which to apply policies. Each policy must have a unique value. The system applies policies in low-to-high run order and performs the actions for the first policy that matches. After a match, no other policy is applied to the resource.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: The system applies two batches of policies in the precedence order that you specify: Policies created by Admins and policies created by Insights Owners. See the Precedence setting in Configure Business hours operations.</p> </div> <p>Run order values for Unassigned Resources policies and Business hours policies don't interfere with each other.</p>
Provider	<p>The cloud provider to apply the policy to.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Note: You can't change the provider while editing an existing policy.</p> </div>
Service category	List of all service categories that the policy applies to.
Service accounts	<p>The service accounts to apply the policy to.</p> <p>For Google Cloud only, this field is called Projects.</p>
Tag Values Condition	
Tag Name	List of tag names that you can add by selecting Add .
Tag Value	List of tag values in a new line.
Approval type	<p>The action to take on each resource that matches the policy. Business Hours operations are directly integrated with the ServiceNow Change Management feature.</p> <p>Auto-approval (Standard Change):</p>

Field	Value
	<ul style="list-style-type: none"> ○ Generate a recommendation to apply the specified business hours and add the resource to the Business hours reports. ○ Generate and then auto-approve a change request for the change group. ○ Add the resource to the Business hours reports. ○ Apply the Business hours schedule to the resource. <p>Manual approval (Normal Change):</p> <ul style="list-style-type: none"> ○ Generate a recommendation to apply the specified business hours schedule and add the resource to the Business hours reports. ○ Generate a change request for members of the change group. ○ Add the resource to the Business hours reports. ○ Any member of the group with the <code>sn_change_write</code> role can approve the change request. ○ When approved, apply the Business hours schedule to the resource. <p>Report-only:</p> <ul style="list-style-type: none"> ○ Generate a recommendation to apply the specified business hours. ○ Add the resource to the Business hours reports.
Business hour schedule	<p>The schedule that specifies the days of the week and times of day that the resource should be powered on.</p> <p>Select a schedule from the list or define a schedule by navigating to <i>Cloud Cost Management Workspace</i> > Operations > Administration > Business hours schedules. For more information, see Create Business hours schedule.</p>

5. Select Submit.

Result

- The created policy appears on the **Business Hours Policies** tab.
- When the Discovery and Billing Download job executions finish, the system applies active policies to identify matching resources and then performs the policy actions on the resources.

What to do next

After you create or update a policy, select **Apply policies** to apply the created policy to a resource. This action also notifies you if enough recent billing data for AWS, Azure, or Google doesn't exist to apply the policy.

Manage cloud budgets

Define and monitor custom budget plans for managing your cloud spend by using the Budget view in the Cloud Cost Management Workspace.

Create or update a budget policy

Create budget policy to specify a budgeted amount, cost type, reset period, and other aspects of the budget. In addition, specify who can view budget data and who is notified of variances from the budgeted amount.

Before you begin

- A cloud account (parent account) that has at least one service account and associated datacenters is required.
- A Billing Download job must be defined.

Note:

For Microsoft Azure, you must first execute a Billing Download job before defining a budget plan.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner] for owned service accounts.

About this task

You must select one of the Cloud Cost Management application scopes to create or update a budget policy.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Budget**.
2. Select **Create budget**.
3. On the Budget policy creation form, fill in the fields.
For a description of the field values, see [List of Budget policy creation fields](#).
4. Select **Submit**.

Result

After you create or modify a budget policy, the policies get displayed on the **All Budgets** page in the Budgets view. Find the details of the budget such as overrun, surplus, or invalid budgets. You can view only the overrun budgets by toggling the **Show overrun budget only** toggle button. Search a budget by its name, owner, or provider.

Assign service accounts to an insights_owner

Assign ownership of one or more service accounts and, optionally, the related CIs to users that have the insights_owner role. An insights_owner can define jobs and policies and can view data for owned service accounts.

Before you begin

Before you assign service accounts, you might want to view the list of current insights_owner and their owned accounts. For more information, see [View the service accounts owned by an insights_owner](#).

Role required: insights_admin [sn_clin_core.insights_admin]

About this task

The insights_owner role spreads responsibility for Cloud Cost Management activities to persons who have good knowledge of operations in the service accounts. For more information about the insights_owner role, see [Cloud Cost Management roles](#).

A service account is a secure record on your instance that holds the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter.

Tip:

When you assign service accounts to a user, the user is auto-granted the insights_owner role.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Account to owner mappings**.
2. Select **Assign accounts that currently have no owner**.
3. On the form, fill in the fields.

Set up or update ownership of service accounts

Field	Description
Insights Owner	User to whom the service account has to be assigned.
Service accounts	Service accounts to be assigned to the insight_owner.
Change template	Change template to use to create the change request for this task. The system uses a Standard Change to alert the insights_owner of the change for the task to be auto-approved. If no change request template appears in the list, navigate to Service Catalog > Standard Changes to create a template.

4. Specify how to populate the **Owner** field for CIs in service accounts.

Option	Description
<p>Assign insights_owners only to CIs with no owner</p>	<p>For newly created CIs and for CIs in the service accounts that have no value for the <i>Owner</i> property, assign the new insights_owner.</p> <p>Note: A daily scheduled job sets the Owner field of each newly discovered CI to the Owner setting for the associated service account.</p>
<p>Assign insights_owners to all CIs</p>	<p>For the <i>Owner</i> property of every CI in the specified service accounts, assign the new insights_owner.</p> <p>Note: A daily scheduled job sets the Owner field of each newly discovered CI to the Owner setting for the associated service account.</p>
<p>Do not update any CIs</p>	<p>Make no changes to CIs in the specified service accounts.</p>

- The affected service accounts are removed from policies that were created with the insights_owner role. The affected service accounts aren't removed from policies that were created with the insights_admin role.
- The new insights_owner must create and manage new policies for the affected service accounts.
- The new account owner takes ownership of Rightsizing and Unused Machines jobs that include resources from all transferred service accounts.

5. Optional: Add any additional details to your request such as delivery address and special instructions.

6. Select **Submit.**

Update or reassign insights_owner privileges

Assign ownership of one or more service accounts and, optionally, the related CIs to users that have the insights_owner role. An insights_owner can define jobs and policies and can view data for owned service accounts.

Before you begin

Before you assign service accounts, you might want to view the list of current insights_owner and their owned accounts. See [View the service accounts owned by an insights_owner](#) for details.

Role required: insights_admin [sn_clin_core.insights_admin]

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Account to owner mappings**.
2. Select **Change the owner for one or more accounts**.
3. On the form, fill in the fields.

Set up or update ownership of service accounts

Field	Description
Original Insights Owner	Owner to transfer the ownership of service accounts from.
New Insights Owner	User to transfer the ownership of service accounts to.
Service accounts	Service accounts to be assigned to the insights_owner.
Change template	Change template to use to create the change request for this task. The system uses a Standard Change to alert the insights_owner of the change for the task to be auto-approved. If no change request template appears in the list, navigate to Service Catalog > Standard Changes to create a template.

4. Specify how to populate the **Owner** field for CIs in service accounts.

Option	Description
Assign insights_owners only to CIs with no owner	For newly created CIs and for CIs in the service accounts that have no value for the <i>Owner</i> property, assign the new insights_owner. Note: A daily scheduled job sets the Owner field of each newly discovered CI to the Owner setting for the associated service account.
Assign insights_owners to all CIs	For the <i>Owner</i> property of every CI in the specified service accounts, assign the new insights_owner. Note: A daily scheduled job sets the Owner field of each newly discovered CI to the Owner setting for the associated service account.

Option	Description
Do not update any CIs	Make no changes to CIs in the specified service accounts.

- The affected service accounts are removed from policies that were created with the insights_owner role. The affected service accounts aren't removed from policies that were created with the insights_admin role.
- The new insights_owner must create and manage new policies for the affected service accounts.
- The new account owner takes ownership of Rightsizing and Unused Machines jobs that include resources from all transferred service accounts.

5. Optional: Specify whether to transfer policies to the new owner.

This setting applies when the selected service accounts are currently owned by a different insights_owner. Transferring the policies enables the new insights_owner to own (view, update, or delete) policies that are associated with the specified service accounts.

i Important:
Policies owned by users with the insights_admin role aren't changed in any way.

Option	Description
Yes	<p>The following process runs:</p> <ol style="list-style-type: none"> a. The instance clones all affected policies that are owned by Insights Owners. b. The instance removes appropriate service accounts from each affected policy and moves the accounts to the new clone policy. Each clone policy contains only the affected service accounts. <ul style="list-style-type: none"> ▪ If service accounts remain in the original policy, then the original owner retains ownership of the original policy. ▪ If an original policy has no service accounts after all affected accounts are removed, then the clone isn't used. Instead, the new insights_owner becomes the owner of the original policy. c. The instance assigns ownership of the new policies to the new insights_owner. d. The instance sends email notifications to both the original and new owners.
No	<ul style="list-style-type: none"> ○ The instance removes the affected service accounts from all policies owned by Insights Owners. If no service accounts re

Option	Description
	<p>main in a policy, then the policy is set to the Invalid state.</p> <ul style="list-style-type: none"> ○ The new insights_owner must create and manage the new policies for the affected service accounts.

6. Select **Submit.**

View the service accounts owned by an insights_owner

View the list of users that have the insights_owner role and the service accounts that each owner owns.

Before you begin

Role required: sn_clin_core.insights_admin or sn_clin_core.insights_owner

About this task

A service account is a secure record on your instance that holds the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **View insights owners**.
2. Select the name of any user to view the details of the owned service accounts.

Exclude a resource from all Cloud Cost Management reports

To ensure that cost data for a particular resource doesn't appear in a report, you exclude the resource by adding it to the Excluded Resources list.

Before you begin

A cloud account (parent account) that has at least one service account and related datacenters is required.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner] for owned service accounts.

About this task

- Excluding a resource from a report means that the resource doesn't get displayed in the report. This setting doesn't affect analysis of data for the resource.
- At any time, you can remove a resource from the Excluded Resources list.
- An insights_owner can exclude resources and remove a resource from the Excluded Resources list only in owned service accounts.
- Production resources are examples of resources that you might exclude. Because production resources must always be active, you might, for example, want to exclude production resources from Business Hours reports.
- You can exclude a resource either from a single report type or from all reports. You can select a resource and select **Exclude** for excluding the resource from the current report. The resource you exclude gets added to the **Excluded Resources** list for the report.

Procedure

1. Navigate to *Cloud Cost Management Workspace* > **Operations** > **Administration** > **Global exclusions**.
2. Select **New**.
3. On the form, fill in the fields.

Excluded Resources

Field	Value
Resource	The resource to exclude. Only virtual machine resources appear in the list.
Description	The reason for excluding the resource.

4. Select **Save**.

Result

The resource is excluded from all reports. After you submit the record, you can open it to update the reports from which to exclude the resource.

Remove a resource from the Excluded Resources list

You can remove a resource from the Excluded Resources list.

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner] for owned service accounts.

About this task

When you remove a resource from the Excluded Resources list, the resource appears in the appropriate reports.

Procedure

1. Navigate to **Cloud Cost Management** > **Operations** > **Administration** > **Global exclusions**.
2. Select the resources to remove.
3. In the Actions on selected rows list, select **Delete**.

Create and update a tag category

Create a tag category to enable multiple tag names for representing costs against a single business entity. For example, multiple users might independently have created the tag names "App", "AppService", and "appl" to indicate applications. With a tag category of "Application", any costs for items tagged App, AppService, or appl are correctly assigned as costs against an application.

Watch this short video to learn how to create and update a tag category.

https://player.vimeo.com/video/1136169557?h=447f9cfac5&badge=0&autoplay=0&player_id=0&app_id=58479

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin]

About this task

This procedure describes the process as performed from the user interface. Alternatively, to speed the process, you can edit the affected tables directly.

- Tag Category [sn_cld_intg_core_tag_category]
- Tag Name-Category [sn_cld_intg_core_tag_name_category]

Note:

Each successful execution of a Billing Download job updates tagged costs. Recent updates that you make to tag category definitions might not reflect on the cost reports. To apply the latest tag category definitions to cost data without running a Billing Download job, select **Reapply categories** by navigating to **Cloud Cost Management Workspace > Operations > Cost usage tags > Tag categories**.

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Cost usage tags > Tag categories**.
2. On the Tag Categories list, select **New**.
For the list of default tag categories, see [List of default tag categories](#).

Note:

In this step, you add a single tag name to the category to create the initial category record. You can add any number of tag names to the category later.

3. On the form, fill in the fields.

Tag Category form

Field	Description
Name	A unique and meaningful name for the category.
Active	The option to add the category to the Tag Category filter list on spend reports.
Enable grouping	Option to add a <i>category: value</i> option for this category to the list of Group by choices on spend reports. Note: A category must be active to appear in the Group by list.
Tag names	The list of tag names that you can add to the category. a. Select the Lookup icon  to open the list of tag names that came with the latest Billing Download Job. All tag names appear on the Tag Names list. b. Select tag names from the drop-down list.

4. Select **Save** to create the category.
The new category appears in the Tag Categories list.

5. In the Tag Categories list, select the category that you just added.
The Tag Category form reopens and the tag name that you added appears in the **Tag names** list.
6. **Optional:** On the **Tag names** list, select the Lookup icon  to add multiple tag names.

Add or update a tag value for an AI Service tag category

Associate a tag name with its corresponding tag value whenever a new AI service or a category within an existing AI service is introduced for Amazon Web Services (AWS), Microsoft Azure, or Google Cloud Platform (GCP).

Before you begin

Role required: insights_admin [sn_clin_core.insights_admin]

About this task

Important:

This feature is available with the Cloud Cost Management 8.0.0 version or later.

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Cost usage tags**.
2. Select **Tag categories**.
3. On the Tag categories page, select the **AI Service** tag category.
4. On the AI Service page, select the **Tag name value** tab.
5. Select **Add/Update tag values**.
6. In the **Add/Update AI Service tag values** dialog box, select the **Create** tab.
7. Select the service provider tag name and provide a tag value.
 - For AWS, add the lineltem/ProductCode as the tag value against the AWS AI service tag name **sn_ccm_aws_ai_service**.
 - For Azure, add the Meter Category name as the tag value against the Azure AI service tag name **sn_ccm_azure_ai_service**.
 - For GCP, add the Service description name as the tag value against the GCP AI service tag name **sn_ccm_gcp_ai_service**.
8. Select **Submit**.
9. **Optional:** If you want to update the tag value of an AI service that you have created, select **Add/update tag values**.

Note:

You can't update the tag values for the default cloud categories for managing AI services. To view the default cloud categories for managing AI services within the Machine Learning service category, see [List of default Cloud categories for AI services](#).

- a. Select the **Update** tab.
- b. Select the provider tag name.
For example, select **sn_ccm_aws_ai_service**.

- c. Select the tag value that you want to update.
For example, select **Amazon Test**.
- d. Provide a new tag value for it.
For example, change the existing tag value to **Amazon Test 2**.
- e. Select **Submit**.

Result

After a tag name is associated with its corresponding tag value, you can view the spend data of the AI service you added on the Spend analytics page. For more information, see [Spend analytics](#).

What to do next

After you add a tag value for an AI Service tag category, you must reimport the billing data to generate the spend for the added tag.

Create or update a shared cost allocation policy

Create a shared cost allocation policy with different allocation types to split the cost of shared cloud resources among various business lines.

Before you begin

- A cloud account (parent account) that has at least one service account and associated datacenters is required.
- A Billing Download job must be created and the billing data must be pulled.
- For Kubernetes, you must enable the cost allocation tag on your provider console for each Kubernetes cluster before you execute the Billing Download job.

Role required: insights_admin [sn_clin_core.insights_admin] or insights_owner [sn_clin_core.insights_owner] for owned service accounts.

About this task

- You must select one of the Cloud Cost Management application scopes to create or update a shared cost allocation policy.
- You can create as many policies as needed.
- If Kubernetes Service is selected as Service Category, you can't edit the Service Category, Resource Type, Kubernetes Cluster fields while editing a policy.
- When you deactivate a shared cost allocation policy, allocations get updated with the latest policy match.

Procedure

1. Navigate to **Workspaces > Cloud Cost Management Workspace > Operations > Administration**.
2. Select **Shared cost allocation policies**.
3. Select **New/Edit**.
4. On the Shared Cost Allocation Policy Creation form, fill in the fields.
For a description of the field values, see [List of Shared cost allocation policy fields](#).
5. Select **Submit**.

Result

After you create or modify a shared cost allocation policy, the policy gets displayed on the **Shared Cost Allocation Policies** page. Find the details of the policy such as the name, allocation type, business unit, and cloud service.

When the Discovery and Billing Download job executions finish, the system applies active policies to identify matching resources and then performs the policy actions on the resources.

What to do next

After you create or update a shared cost allocation policy, select **Reapply policies** to apply the created policy to a resource.

Set up or update preferred currency options

Set up or update the preferred currency options for your cloud cost and usage data to gain reporting flexibility. These currency options become available for Cloud Cost Management users to choose from.

Before you begin

Role required: insights_admin

About this task

Setting up currency options enables Cloud Cost Management users to choose from the list of available currencies. Costs are calculated using the exchange rates specified by cloud service providers. These exchange rates are automatically applied to ensure cost reporting accuracy across regions.

Note:

If you haven't set up the preferred currency options earlier, all the billing and usage data is displayed in the default currency.

Procedure

1. Navigate to **Workspaces > Cloud Cost Management Workspace > Operations > Administration > Multi-currency setup**.
2. Select a currency code from the **Currency Option 1** drop-down list

Multi-currency setup

The screenshot shows the 'Multi-currency setup' page in the ServiceNow interface. The page has a dark blue header with 'servicenow' and navigation tabs like 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. The main content area is titled 'Multi-currency setup' and contains a form with the following fields:

- Reference currency:** Currency code is 'JPY', Status is 'Ready' (Active).
- Currency option 1:** Currency code is 'USD', Status is 'Ready' (Active).
- Currency option 2:** Currency code is '-- None --', Status is 'Not mapped' (Inactive).
- Currency option 3:** Currency code is '-- None --', Status is 'Not mapped' (Inactive).
- Currency option 4:** Currency code is '-- None --', Status is 'Not mapped' (Inactive).

A 'Save' button is located in the top right corner of the form area.

3. Select the **Active** check box for **Currency Option 1** to activate the currency. The **Status** field is currently set to **Not mapped**.

4. Select **Save**.

The **Status** field changes to **Awaiting processing**. After the processing starts, the **Status** field changes to **In progress** and a message is displayed on the screen that shows the progress in percent. The **Save** button remains unavailable until the status changes to **Ready**.

5. Repeat step 2, 3, and 4 to select additional currency options and activate them.

At any given time, you can see a total of five active currencies that includes one reference currency plus four additional currencies.

Result

After the **Status** field changes to Ready, the selected currencies become available for selection in the **Currency preference** list on the Operations view.

Choose preferred currency for cost and usage data

Choose your preferred currency from the available options that will be shown for all the billing and usage data. The currency that you choose becomes the display currency on all the dashboard widgets, recommendations (rightsizing, business hours, unused resources, reservation/savings plan), budgets, and billing data.

Before you begin

Role required: insights_admin, insights_owner or insights_user

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > My preferences > Currency preference**.
2. Select your preferred display currency from the **Currency display preference** drop-down list. The list shows only those currencies that were previously set up and activated in the Multi-currency setup by the insights_admin.
3. Select **Save**.

Result

The preferred currency is shown as the display currency in all dashboard widgets, recommendations, budgets, and billing data of the Cloud Cost Management Workspace.

Compare MetricBase data with spend data

Compare MetricBase (Clotho) data with your Spend data for Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP) to diagnose and troubleshoot Cloud Cost Management billing issues.

Before you begin

Role required: Cloud Insights Admin [sn_clin_core.insights_admin]

Request the MetricBase [com.snc.clotho] plugin. For more information, see [Requesting the MetricBase product](#) .

Verify that the Billing Download job has been completed successfully for the cloud provider.

About this task

 **Important:**

This feature is available with the Cloud Cost Management 8.0.0 version or later.

Procedure

1. Navigate to **Cloud Cost Management Workspace > Operations > Tools**.
2. Select **Compare MetricBase with spend data**.
3. On the form, fill in the fields.

Compare MetricBase with spend data form

Field	Description
Provider	Cloud provider for which you want to compare MetricBase (Clotho) data with your Spend data. <ul style="list-style-type: none"> ○ AWS ○ Azure ○ GCP
Cost type	Contractual payment agreement with the provider. <ul style="list-style-type: none"> ○ Actual: Each billing period, your organization pays for direct cloud services. ○ Amortized: Your organization pays the effective cost of the upfront and monthly reservation fees spread across the billing period. The amortized cost type is described in detail on the provider's site.
Billing month	Months for which billing data is available based on the provider you select. This field is populated only with those months for which billing data is available.

4. Select **Submit**.

Result

A request with a unique number gets created and a CSV file is attached to the request item, which lists the comparison data. The process to generate the CSV file runs in the background and the file is attached to the request item when the processing is complete.

If there are any errors, the **Work notes** field of this request item is updated and Cloud Cost Management doesn't generate the CSV file.

What to do next

Select the **Requested Items** tab and then select the Requested Items number to navigate to the CSV file. In the Attachments section, you can find the CSV file. Download this file to analyze any mismatch in the cost values from both of the sources. You can also filter the data according to your requirements.

Cloud Cost Management reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Cloud Cost Management.

Domain separation and Cloud Cost Management

Domain separation is unsupported for Cloud Cost Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see [Application support for domain separation](#) .

Related topics

[Domain separation for service providers](#) 

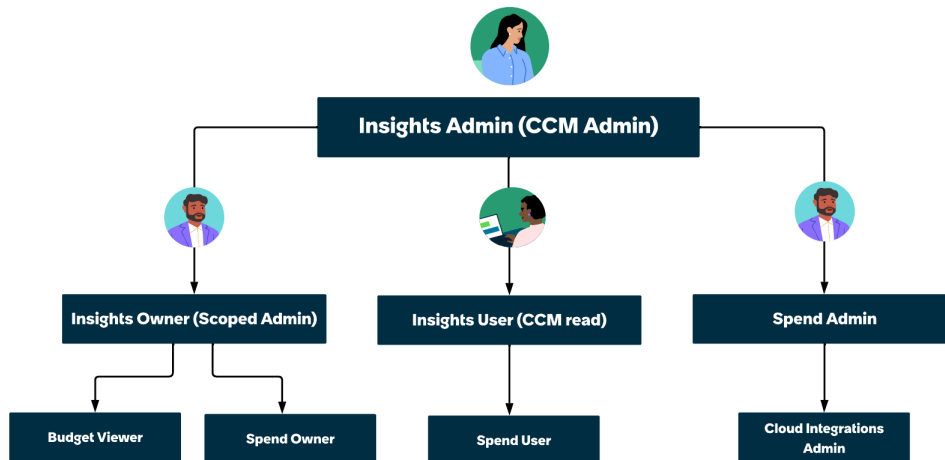

Cloud Cost Management roles

You assign Cloud Cost Management roles to user groups and to individual users based on user activities and responsibilities.

Important:

This information applies to both the Cloud Cost Management and Cloud Insights Billing apps. All references to Cloud Cost Management also apply to Cloud Insights Billing.

Role relationships in Cloud Cost Management

Primary Roles

Role title [name]	Permissions	Contains roles
Cloud Insights Admin [sn_clin_core.insights_admin]	<p>The role is in the Cloud Cost Management Core plugin. You typically assign the role to the person who is financially responsible.</p> <ul style="list-style-type: none"> • Assign ownership of one or more service accounts and, optionally, the related CIs to users that have the insights_owner role. • Define Business hours and Unassigned resources policies. • Define and view Budget plans. • View spend optimization reports. • Add report extensions. • Perform the actions that Cloud Cost Management recommends. 	<ul style="list-style-type: none"> • insights_owner • spend_admin • cloud_integrations_admin • budget_viewer • [pa_admin] • [schedule_admin] • [itil]

Role title [name]	Permissions	Contains roles
Cloud Insights Owner [sn_clin_core.insights_owner]	<p>The role is in the Cloud Cost Management Core plugin. The role spans only the Cloud Cost Management application.</p> <ul style="list-style-type: none"> • Define jobs and policies. • View data for owned service accounts. <p>For more information, see Assign service accounts to an insights_owner.</p>	insights_user
Cloud Insights User [sn_clin_core.insights_user]	<p>The role is in the Cloud Cost Management Core plugin. The role spans only the Cloud Cost Management application.</p> <p>View the Cloud Cost Management Workspace home page.</p>	– none –

Secondary roles

The roles in this section are contained in the insights_admin role. These roles enable integration with platform (Performance Analytics, MetricBase/Clotho) to execute Cloud Cost Management flows.

Role title [name]	Permissions	Contains roles
Cloud Spend Admin [sn_cld_spend_core.spend_admin]	<p>The role is in the Cloud Spend Reports Core plugin.</p> <p>Edit the Cloud Billing dashboards.</p>	<ul style="list-style-type: none"> • cloud_integrations_admin • [sn_capi.cloud_developer]
Cloud Integrations Admin [sn_cld_intg_core.cloud_integrations_admin]	<p>The role is in the Cloud Integrations Core plugin.</p> <p>Configure Billing Download jobs and Price Sheet Download jobs.</p>	<ul style="list-style-type: none"> • [api_integrator] • [discovery_admin] • [flow_operator]
API Integrator [sn_cld_intg_core.api_integrator]	<p>The role is in the Cloud Integrations Core plugin.</p> <p>Used by the MID Server to access</p>	[clotho_rest_put]

Role title [name]	Permissions	Contains roles
	REST endpoints that are related to the Cloud Integrations, Cloud Integrations AWS applications, and Cloud Integrations Azure applications.	
Cloud Budget Viewer [sn_clin_core.budget_viewer]	The role is in the Cloud Cost Management Core plugin. The role spans only the Cloud Cost Management application. View Budget Forecast reports and policies.	— none —
PA Admin [pa_admin]	See Performance Analytics roles .	— none —
Clotho Put [clotho_rest_put]	Role that is used by the MID Server to send the billing data to the instance and store the data in MetricBase / Clotho.	— none —

Components installed with Cloud Cost Management

Several types of components are installed with activation of the Cloud Cost Management application, including tables, user roles, and scheduled jobs.

Scheduled jobs installed

Scheduled job	Description
Price Sheet Table Cleaner	Cleans up AWS price sheet records.

Scheduled job	Description
Resource Group Table Cleaner	Cleans up Azure resource group records that are no longer required.
CCM CleanUp Inactive Aggregated Spend Records	Cleans up inactive aggregated spend records.
Cloud Insights Historical Data Collection	Collects GCP spend data.
Cloud Insights Saving Daily Data Collection	Collects potential savings and realized savings for spend.
Cloud Insights Spend Saving Data Collection	Collects cloud spend potential saving percentage.
Execute Tasks	Executes tasks associated with AWS billing download.
Flow Launcher and Hierarchical Flow Launcher Keep Alive	Cancels stale flow jobs.
GCP Price Sheet Table Cleaner	Cleans up GCP Price sheet table
Tag Categories Based Recommendation	Generates Tag Category based recommendations.
<p>i Important: The following scheduled jobs are used only when the Cloud Cost Management Infra Stack application is installed in addition to Cloud Cost Management version 8.1.</p>	
Cumulus- Cancel stuck job	Monitors scheduled billing jobs and cancels the jobs that are stuck. This enables billing jobs in the queue to be processed.
Unsupported CI Type Placement	Places the CI types that aren't used for daily recommendations.
CCM - Daily job	Performs daily maintenance activities such as cleanup of left-out attachments of AWS billing job (with assume role authentication).

Tables installed

Table	Description
CI Placement Extension Progress Calculation [sn_cld_intg_aws_ci_placement_extension_progress_calculation]	Configuration Items placement progress for AWS. Contains number of records to be processed by the AWS extension.
CI Placement Stats [sn_cld_intg_aws_ci_placement_stats]	Status of bookmarks created during the

Table	Description
	Configuration Items placement for AWS.
AWS CI Placement Type Information [sn_cld_intg_aws_ci_placement_type]	All types of Configuration Items deployed by Cloud Cost Management for AWS.
AWS Cost And Usage Bill Data [sn_cld_intg_aws_cost_usage]	Cost and billing data for AWS.
Cost Usage Bookmarks [sn_cld_intg_aws_cost_usage_bookmarks]	Time stamp bookmarks created for the ingested Cloud Cost Management placement records.
CloudWatch Metric Association [sn_cld_intg_aws_cw_metric_association]	Custom metrics created by user.
AWS CloudWatch Metric Definition [sn_cld_intg_aws_cw_metric_definition]	Definitions for various AWS cloud watch metrics.
CloudWatch Metric Definition to Account [sn_cld_intg_aws_cw_metric_definition_account_m2m]	Metric to service account mapping information.
AWS Baseline Performance for EC2 Burstable Instances [sn_cld_intg_aws_ec2_burstable_baseline_perf]	Baseline performance percentage for AWS EC2 burstable instances.
AWS Gov Accounts Mapping [sn_cld_intg_aws_gov_account_mapping]	AWS Gov accounts and linked accounts details.
AWS Instance details [sn_cld_intg_aws_instance_detail]	Details for various AWS instances present.
AWS Instance Price details [sn_cld_intg_aws_instance_price_detail]	Pricing and rate details for AWS instances.
AWS Offer Term [sn_cld_intg_aws_offer_term]	Offer term details based on configurations of AWS products.
AWS Price Discount [sn_cld_intg_aws_price_discount]	Price discounts for AWS service accounts.
AWS Price Sheet Information [sn_cld_intg_aws_price_sheet_info]	Price sheet details for AWS.
AWS Product Details Base [sn_cld_intg_aws_product_details]	All product details or specifications for AWS.
AWS Product Details EC2 [sn_cld_intg_aws_product_details_ec2]	EC2 product details or specifications for AWS.
AWS Product Details RDS [sn_cld_intg_aws_product_details_rds]	RDS product details or specifications for AWS.
AWS Resource Hourly Usage Last Downloaded [sn_cld_intg_aws_resource_hourly_usage_last_downloaded]	Hourly usage download status for AWS resources.

Table	Description
AWS Resource Rate [sn_cld_intg_aws_resource_rate]	Resource rates for AWS product SKUs.
AWS Billing Download Job [sn_cld_intg_aws_schedule]	Billing download jobs and their status for AWS.
AWS Storage Price Details [sn_cld_intg_aws_storage_price_detail]	Storage price sheet information for AWS.
Azure CI Placement Type Information [sn_cld_intg_azure_ci_placement_type]	Defines all types of Configuration Items deployed by Cloud Cost Management for Azure.
Azure Cost And Usage Bill Data [sn_cld_intg_azure_cost_usage]	Cost and billing data for Azure.
Azure Database Price Sheet [sn_cld_intg_azure_db_price_sheet]	Price sheet details for Azure database.
Azure Database retail price detail [sn_cld_intg_azure_db_retail_price]	Retail price information for Azure database.
Azure Enrollment To Service Account Mapping [sn_cld_intg_azure_ea_sa_mapping]	Mapping information for enrollment account to the service accounts used by Cloud Cost Management.
Azure Instance Details [sn_cld_intg_azure_instance_detail]	Details of various Azure instances present.
Azure Instance Price Details [sn_cld_intg_azure_instance_price_detail]	Pricing and rate details for Azure instances.
Azure Instance Series To Family Mapping [sn_cld_intg_azure_instance_series_family_mapping]	Instance family to instance series mapping information for Azure.
Azure Instance Size Details [sn_cld_intg_azure_instance_size_detail]	Details about various Azure instances sizes & their functionalities.
Azure Normalized Region [sn_cld_intg_azure_normalized_region]	Resource location to a generic normalized location mapping information.
Azure Price Sheet Version [sn_cld_intg_azure_price_sheet_version]	Price sheet status and version for Azure.
Azure Product Details [sn_cld_intg_azure_product_details]	All product details or specifications for Azure.
Azure Product Details VM [sn_cld_intg_azure_product_details_vm]	Virtual Machine product details or specifications for Azure.
Azure Product Offering VM [sn_cld_intg_azure_product_offering_vm]	Offer term details for Azure Virtual Machine service.

Table	Description
Azure Product Details Instance Type Map [sn_cld_intg_azure_prod_dtls_inst_type_map]	Product details for various instance types for Azure.
Azure Advisor Subscription Queue [sn_cld_intg_azure_recommendation_subscription_queue]	Stores the states of generate, get generate status and list recommendations flow launcher jobs, for provider based recommendations of Azure.
Azure resource hourly usage last downloaded [sn_cld_intg_azure_resource_hourly_usage_last_downloaded]	Hourly usage download status for Azure resources.
Azure Resource Rate [sn_cld_intg_azure_resource_rate]	Resource rates for Azure meter IDs.
Azure Billing Download Job [sn_cld_intg_azure_schedule]	Billing download jobs and their status for Azure.
Azure Software Cost Details [n_cld_intg_azure_software_cost_detail]	Hourly cost details for Azure software.
Azure Storage Price Details [sn_cld_intg_azure_storage_price_detail]	Storage price sheet information for Azure.
Azure Storage Size Details [sn_cld_intg_azure_storage_size_detail]	Various Azure storage sizes & their functionalities.
Cloud Action Execution [sn_cld_intg_core_action_exec]	Execution details for various cloud actions.
Cloud Alias [sn_cld_intg_core_alias]	List of defined aliases.
Cloud Alias Mapping [sn_cld_intg_core_alias_mapping]	Alias mapping to the script or action flow.
Cloud API Request [sn_cld_intg_core_api_request]	API request & parameters sent to the provider.
Cloud API Request Error [sn_cld_intg_core_api_request_error]	Error responses for failed request items.
Cloud API Request Item [sn_cld_intg_core_api_request_item]	API request item details sent to the provider.
Cloud API Response [sn_cld_intg_core_api_response]	API responses for the API calls made to providers.
Cloud Availability Zones [sn_cld_intg_core_availability_zone]	Availability zones for various providers.
Billing Report Information [sn_cld_intg_core_billing_report_info]	Billing summary reports for billing download jobs.

Table	Description
Billing Import Progress [sn_cld_intg_core_bill_imp_progress]	Import information for various extensions under billing download job.
CI Placement Stats [sn_cld_intg_core_ci_placement_stats]	Status of bookmarks created during Configuration Items placement.
CI Placement Status [sn_cld_intg_core_ci_placement_status]	Configuration Items placement status for extensions executed.
CI Placement Type Information [sn_cld_intg_core_ci_placement_type]	All types of Configuration Items deployed by our product for all providers.
Cost Tags [sn_cld_intg_core_cost_tags]	Mapping information of tag category to cost hash.
Execution [sn_cld_intg_core_execution]	Execution details for all types of running IH flows.
Execution Batch [sn_cld_intg_core_execution_batch]	Execution batches for running the flows.
Execution To Batch Map [sn_cld_intg_core_execution_batch_map]	Mapping information of execution jobs to the respective batches.
Execution Log [sn_cld_intg_core_execution_log]	Log messages for all the executions.
Execution Metric [sn_cld_intg_core_execution_metric]	Metrics for executions.
Execution Monitor [sn_cld_intg_core_execution_monitor]	Live status of the ongoing execution.
Extension [sn_cld_intg_core_ext]	All the available extensions and their details.
Extension Type [sn_cld_intg_core_ext_type]	Types of extensions defined.
Flow Launcher Execution [sn_cld_intg_core_flow_launcher_execution]	Flow launcher job execution details.
Flow Launcher Job [sn_cld_intg_core_flow_launcher_job]	List of flow launcher jobs and their status.
Flow Launcher Job Configuration [sn_cld_intg_core_flow_launcher_job_config]	Configurations for flow launcher jobs.
Flow Launcher Workload [sn_cld_intg_core_flow_launcher_workload]	Workload information for flow launcher executions.

Table	Description
Flow Map [sn_cld_intg_core_flow_map]	Mapping information of input parameters to the flow workloads.
Flow Reflection [sn_cld_intg_core_flow_reflection]	Flow reflection link in flow designer for given context.
Hierarchical Flow Launcher Execution [sn_cld_intg_core_hierarchical_flow_launcher_execution]	Hierarchical flow launcher job execution details.
Imported Date Range [sn_cld_intg_core_imported_date_range]	Imported date range of data during billing download execution.
Instance Family [sn_cld_intg_core_instance_family]	Instance families available for various providers.
Cloud Instance Types [sn_cld_intg_core_instance_type]	Instance types & details for various providers.
Cloud Instance Type Family [sn_cld_intg_core_instance_type_family]	Instance family types available for various providers.
Billing Line Item Types [sn_cld_intg_core_line_item_type]	Types of billing charges for various providers.
Associated Flow Execution [sn_cld_intg_core_m2m_ext_exec_flow_exec]	Mapping information of extension execution to flow execution.
M2m Profile Exec Metrics Profile Table Metrics [sn_cld_intg_core_m2m_profile_exec_metrics_profile_table_metrics]	Mapping information of profile execution to profile table metrics.
Pipeline Stage Extension Type Map [sn_cld_intg_core_map_pp_stage_ext_type]	Mapping information of extension types to their respective stages.
Cloud Operating Systems [sn_cld_intg_core_os_type]	Operating system details for various providers.
Pipeline Execution [sn_cld_intg_core_pp_exec]	Contains all the pipeline executions for billing download.
Execution Stage [sn_cld_intg_core_pp_exec_stage]	Contains all the pipeline executions for each billing download stage.
Extension Execution [sn_cld_intg_core_pp_exec_stage_ext_log]	Pipeline execution logs.
Execution Stage Log [sn_cld_intg_core_pp_exec_stage_log]	Pipeline execution logs for each stage.
Import Stage [sn_cld_intg_core_pp_import_stage]	Executions details for the import state of billing download.

Table	Description
Cloud Price Sheet Version [sn_cld_intg_core_price_sheet_version]	Price sheet status and version for providers.
sn_cld_intg_azure_storage_ps	Store azure storage price sheet details.
Cloud Product Regions [sn_cld_intg_core_product_region]	List of product regions for various providers.
Profile Execution Metrics [sn_cld_intg_core_profile_execution_metrics]	Execution metrics for performance profiling.
Profile Flow Launcher Job Metrics [sn_cld_intg_core_profile_flow_launcher_job_metrics]	Flow launcher execution metrics for performance profiling.
Profile Flow Metrics [sn_cld_intg_core_profile_flow_metrics]	Flow metrics for performance profiling.
Profile Table Metrics [sn_cld_intg_core_profile_table_metrics]	Table metrics for performance profiling.
Cloud Provider Service [sn_cld_intg_core_provider_service]	List of services provided by various cloud providers & their end points.
Cloud Provider Service Action [sn_cld_intg_core_provider_service_action]	Script include actions for the cloud services provided.
Price Sheet Execution [sn_cld_intg_core_ps_download_request]	Price sheet job status and summary.
Execution Item [n_cld_intg_core_ps_download_request_items]	List of items fetched for every price sheet execution.
Price Sheet Download Execution [sn_cld_intg_core_ps_execution]	Price sheet execution and download information for all scheduled job.
Price Sheet Download Job [sn_cld_intg_core_ps_schedule]	List of the price sheet download jobs created.
Cloud Purchase Options [n_cld_intg_core_purchase_option]	Various purchase options available for providers.
Cloud Regions [sn_cld_intg_core_region]	List of cloud regions available for various providers
Resource Group [sn_cld_intg_core_resource_group]	List of resource groups.
RS Metrics Configuration [sn_cld_intg_core_rs_metrics_configuration]	Metric configurations for rightsizing.
Cloud Billing Schedule [sn_cld_intg_core_schedule]	List of billing download jobs created.

Table	Description
Billing Download Execution [sn_cld_intg_core_scheduled_exec]	Billing download execution and download information for all scheduled jobs.
Cloud Integration Action Schedule Job [sn_cld_intg_core_schedule_job]	Scheduled jobs for invoking cloud actions.
Cloud Integration Action Schedule Trigger [sn_cld_intg_core_schedule_trigger]	Triggers for invoking cloud actions scheduled jobs
Storage Details Base [sn_cld_intg_core_storage_detail]	Available storage details for providers.
Storage Option [sn_cld_intg_core_storage_option]	Available storage options for providers
Tag Category [sn_cld_intg_core_tag_category]	List of tag categories having various tags under them.
Tag Name [sn_cld_intg_core_tag_name]	Tag names from the billing data or user generated names.
Tag Name-Category [sn_cld_intg_core_tag_name_category]	Mapping of tag name to category.
Tag Name-Value [sn_cld_intg_core_tag_name_value]	Mapping of tag name to value.
Tag Resource [sn_cld_intg_core_tag_resource]	Tag value pairs associated with a resource.
Tag Value [sn_cld_intg_core_tag_value]	Tag values from the billing data or user generated values.
Test Connection Execution [sn_cld_intg_core_test_connection_execution]	Test connection execution details
Variable [sn_cld_intg_core_variable]	Local variables for integrations core.
GCP CI Placement Type Information [sn_cld_intg_gcp_ci_placement_type]	All types of Configuration Items deployed by Cloud Cost Management for Google Cloud Platform (GCP).
GCP Cost And Usage Bill Data [sn_cld_intg_gcp_cost_usage]	Cost and billing data for GCP.
GCP Product Details [sn_cld_intg_gcp_product_details]	All product details or specifications for GCP.
Google Billing Download Job [sn_cld_intg_gcp_schedule]	Billing download jobs and their status for GCP.
GCP Services [sn_cld_intg_gcp_services]	List of services provided by GCP.

Table	Description
AWS Spend Report Finalization Information [sn_cld_spend_aws_report_finalization_info]	Spend reports finalization status for AWS.
Spend Report Daily Aggregated Cost [sn_cld_spend_core_daily_aggregated_cost]	Spend report on daily basis aggregated on resources.
Spend Report Daily Cost [sn_cld_spend_core_daily_cost]	Spend report for resource usage on daily basis.
Spend Report Forecast Cost [n_cld_spend_core_forecast_cost]	Forecasted spend information.
Spend Report Monthly Cost [sn_cld_spend_core_monthly_cost]	Monthly spend report for resource usage. <div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #ccc;"> <p>i Important: From Cloud Cost Management version 8.1 onward, if you have installed the Cloud Cost Management Infra Stack application, this table won't be populated.</p> </div>
Spend Report Execution Info [sn_cld_spend_core_report_info]	Spend report execution details.
AWS Rightsizing Analytics Report [sn_clin_aws_rs_analytics_report]	Rightsizing report for AWS.
AWS Rightsizing Skipped Instance Families [sn_clin_aws_rs_skipped_instance_family]	AWS instance families that are not considered in rightsizing recommendations.
Azure Rightsizing Analytics Report [sn_clin_azure_rs_analytics_report]	Rightsizing report for Azure.
Cloud Insights Aggregated Cost Saving Snapshot [sn_clin_core_aggregated_cost_saving_snapshot]	Snapshot of aggregated cost for different service accounts.
Cloud Insights Aggregated Potential Saving Snapshot [sn_clin_core_aggregated_potential_saving_snapshot]	Snapshot of aggregated potential savings from various recommendations.
Cloud Insights Aggregated Realized Saving Snapshot [sn_clin_core_aggregated_realized_saving_snapshot]	Snapshot of the actual realised aggregated savings.
Business Hours Cost [sn_clin_core_bh_cost]	Business hours vs non business hours cost for a resource.

Table	Description
Business Hours Policy [sn_clin_core_bh_policy]	List of policies configured for business hours.
Business Hours Policy Execution [sn_clin_core_bh_policy_execution]	Business hours policy execution information.
Business Hours Policy Match [sn_clin_core_bh_policy_match]	Policy matches for various resources in the Business hours cost table.
Business Hours Policy Summary [sn_clin_core_bh_policy_summary]	Information summary for the business hour policies.
Cloud Insights Business Hour Recommendations [n_clin_core_bh_recommendation]	Recommendations for business hours.
Business Hours Settings [sn_clin_core_bh_settings]	Settings record for Business hours module.
Budget [sn_clin_core_budget_policy]	List of budget policies & details.
Budget Report Forecast Cost [sn_clin_core_budget_report_forecast_cost]	Spend calculation for the budget.
Budgets Policy Summary [sn_clin_core_budget_summary]	Summaries of budget policies with stats.
Cloud Insights realized saving snapshot [sn_clin_core_daily_realized_saving_snapshot]	Snapshot of the actual realised daily savings.
Excluded Resources Report Mapping [sn_clin_core_exclusion_mapping]	Excluded resource mapping to the type report or recommendation it belongs to.
Excluded Resources [sn_clin_core_excl_res]	List of excluded resources from the Cloud Cost Management modules for different service accounts and providers.
Insights Alias [sn_clin_core_insights_alias]	List of defined aliases for Cloud Cost Management scope.
Insights Alias Mapping [sn_clin_core_insights_alias_mapping]	Alias mapping to the script or action flow for Cloud Cost Management scope.
Insights Execution [sn_clin_core_insights_execution]	Execution details for all Cloud Cost Management executions.

Table	Description
Insights Type [sn_clin_core_insights_type]	List of insights types available for Cloud Cost Management.
M2m Insights Exec Profile Flow Metrics [sn_clin_core_m2m_insights_exec_profile_flow_metrics]	Insights execution to profile flow metrics.
Cloud Insights Policy Action [sn_clin_core_policy_action]	Actions and flows to be executed for a policy.
Policy Change Request Templates [sn_clin_core_policy_change_request_template]	Change request templates for business hours and unassigned recommendations.
Cloud Insights Policy Match [sn_clin_core_policy_match]	Policy matches for various resources and modules.
Policy Summary [sn_clin_core_policy_summary]	Summary of all the policies available
Policy [sn_clin_core_pol_policy]	Policies to be applied on various modules.
Cloud Insights potential saving snapshot [sn_clin_core_potential_saving_snapshot]	Snapshot of the actual realised savings.
Cloud Insights Recommendations [sn_clin_core_recommendation]	Recommendations for Cloud Cost Management modules.
Recommendation Action Job Execution [sn_clin_core_recommendation_action_job_execution]	Job execution status for recommendations.
Reserved Instance Settings [sn_clin_core_reserved_instance_settings]	Settings record for Reserved Instance module.
Reserved Instance Recommendation [sn_clin_core_ri_recommendation]	Recommendations for reserved instances modules.
Rightsizing Analytics Report [sn_clin_core_rs_analytics_report_base]	Potential resources for rightsizing recommendations.
Cloud Insights Job [sn_clin_core_rs_job]	List of jobs for rightsizing or unused machines module.
Cloud Insights Rightsizing Recommendation Automatic [sn_clin_core_rs_recommendation_automatic]	Rightsizing recommendations.
Cloud Insights Rightsizing Recommendation [sn_clin_core_rs_recommendation_base]	Parent table for rightsizing or unused recommendations.
Rightsizing Settings [sn_clin_core_rs_settings]	Settings record for Rightsizing module.

Table	Description
Cloud Insights Unused Recommendation [sn_clin_core_rs_unused_recommendation]	Unused resources recommendations.
Service Account Owner Update Policy [sn_clin_core_sa_owner_policy]	Policies to update the service account owners.
Insights Settings[sn_clin_core_settings]	Settings for various Cloud Cost Management modules.
Tag key [sn_clin_core_tag_key]	Tag keys derived from billing data as well as user generated keys.
Unassigned Resources Count [sn_clin_core_unassigned_count]	Count of unassigned resources for various service accounts.
Cloud Insights Unassigned Policies [sn_clin_core_unassigned_policy]	Policies available for unassigned resources.
Policy CI View [sn_clin_core_unassigned_policy_ci_view_list]	Used for generating unassigned resources count. Contains information about the table to be queried and the encoded query and the columns to be queried in the specified table. The records in this table are manually hardcoded.
Unassigned Policy Summary [sn_clin_core_unassigned_policy_summary]	Policy summaries available for unassigned resources.
Unassigned Recommendations [sn_clin_core_unassigned_recommendation]	Unassigned recommendations with assignment group, generated based on matched policies.
Unassigned Report [sn_clin_core_unassigned_report]	Reports or policy match for various unassigned resources.
Unassigned Resources [sn_clin_core_unassigned_resource]	List of unassigned resources on which policies can be applied.
Unassigned Resource Settings [sn_clin_core_unassigned_settings]	Settings record for Unassigned resources module.
Unused Machine Settings [sn_clin_core_unused_settings]	Settings record for Unused machines module.

Table	Description
Spend Report Monthly Aggregated Costs [sn_cld_spend_core_monthly_aggregated_cost]	Stores spend for all resources over a time range or a cost type.
Multi currency setups [sn_cld_spend_core_multi_currency_setup]	Stores currency options for the Multi-currency setup.
<p>i Important: The following tables are used only when the Cloud Cost Management Infra Stack application is installed in addition to Cloud Cost Management version 8.1.</p>	
Resource Average Costs [sn_cld_intg_core_resource_avg_cost_list]	Average daily cost of the resource. This average daily cost is used to calculate savings for unused recommendations.
Google Policy Usage Last Downloaded [sn_cld_intg_gcp_resource_usage_last_downloaded]	Usage last downloaded timestamp of the resources. This helps in downloading only the delta usage for Business hours.
AWS billing job files [sn_cld_intg_aws_billing_files]	Reference and status of the attachments of billing CSV files downloaded for a corresponding billing job of AWS assume role setup.
Azure billing Job chunk blob detail [sn_cld_intg_azure_job_chunk_blob_detail]	Tracking and download URLs of Azure billing CSV data for a given date range corresponding to a billing job. Blobs are generated on Glide and download URLs are passed to the backend.
Resource Latest Usage sn_cld_intg_core_resource_latest_usage	Latest usage date and corresponding pivot key of the supported resources like VM, DB, storage, and snapshots for a specific provider. Resources used on the

Table	Description
	previous day are used for license calculation.
Spend Report Monthly Provider Agg Cost sn_cld_spend_core_monthly_provider_agg_cost	Cloud Cost Management Workspace loads data from these tables when a user logs in with the insights_admin role. These tables contain monthly aggregated spend data based on various categories such as Provider and Region.
Spend Report Monthly Master Account Agg Cost sn_cld_spend_core_monthly_master_account_agg_cost	
Spend Report Monthly Service Account Agg Cost sn_cld_spend_core_monthly_service_account_agg_cost	
Spend Report Monthly Purchase Option Agg Cost sn_cld_spend_core_monthly_purchase_option_agg_cost	
Spend Report Monthly Region Agg Cost sn_cld_spend_core_monthly_region_agg_cost	
Spend Report Monthly Cloud Category Agg Cost sn_cld_spend_core_monthly_cloud_category_agg_cost	
Spend Report Monthly Service Category Agg Cost sn_cld_spend_core_monthly_service_category_agg_cost	
Spend Report Monthly Resource Group Agg Cost sn_cld_spend_core_monthly_resource_group_agg_cost	
Spend Report Monthly Tag Agg Cost sn_cld_spend_core_monthly_tag_agg_cost	

System properties for Cloud Cost Management

These system properties are available for the Cloud Cost Management application.

Access system properties by navigating to **All > System properties > All properties..** You can set some property values on the System Properties form, but other lesser-used properties are available only on the System Property [sys_properties] table.

System properties for Billing Download jobs

System property	Description
sn_cld_intg_core.ci_placement_threads_number	<p>Number of threads that are used by CI placement flow to create CIs in the billing process.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 4
sn_cld_intg_aws.max_unprocessed_records_for_placement	<p>Maximum number of records to read in one batch from the AWS Cost And Usage Bill Data table for CI Placement.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 300000
sn_cld_intg_aws.min_unprocessed_records_for_placement	<p>Minimum number of records to read in one batch from the AWS Cost And Usage Bill Data table for CI Placement.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 100000

System properties for Spend analysis

System property	Description
sn_cld_spend_core.metricbase_transform_limit	<p>Maximum number of Billing records to use in one Metric Base transform.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 20000
sn_cld_spend_core.spend_report_flow_launcher_chunk_size	<p>Number of non-empty CI chunks to send to the spend flow launcher.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 40
sn_cld_spend_core.spend_report_per_chunk_workload_size	<p>Number of workloads (CI ranges and metadata) for each chunk in the spend flow launcher.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 500
sn_cld_spend_aws.num_months_forecast	<p>Number of future months after the current month for which the AWS Forecast spend is retrieved during every execution of the Spend job.</p>

System properties for Spend analysis (continued)

System property	Description
	<ul style="list-style-type: none"> • Type: integer • Default value: 2

System properties for Business Hours

Note: The collection of data for a single download of billing or price sheet data is called a workload. Data in a workload is held in sets of data called chunks. You can specify the size of each chunk and the number of chunks in a workload.

System property	Description
sn_clin_core.bh_report.batch_size	<p>The number of resources to include in a Business Hours report batch.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 5000
sn_clin_core.bh_recom_max_chunk_size	<p>Number of records used to create workload chunks of rightsizing recommendations. If you set a value greater than glide.db.max_view_records, then the glide.db.max_view_records value is used instead. A smaller number means more chunks and a larger number means fewer chunks.</p> <p>Records considered in one execution of generating recommendations = (number of chunks) * (data records/chunk)</p> <ul style="list-style-type: none"> • Type: integer • Default value: 10000
sn_clin_core.bh_recom_num_chunks_per_workload	<p>Number of chunks per workload. This value times the value of sn_clin_core.bh_recom_max_chunk_size is the total number of records per workload when generating rightsizing recommendations.</p> <p>Records considered in one execution of generating recommendations = (number of chunks) * (data records/chunk)</p>

System properties for Business Hours

Note: The collection of data for a single download of billing or price sheet data is called a workload. Data in a workload is held in sets of data called chunks. You can specify the size of each chunk and the number of chunks in a workload.

List of Budget policy creation fields

Fields on the Budget policy creation form help you create a budget policy to specify a budgeted amount, cost type, reset period, and other aspects of the budget.

Budget policy creation

Field	Description
Budget policy	List of created budget policies. If you want to update a budget policy, search and select a created budget policy from the drop-down list. After you select a budget, all the relevant fields get automatically populated.
Active	Option to apply the policy, which executes Budget Forecast analysis whenever billing data is updated.
Name	A unique name that describes the policy for other users.

Budget policy creation (continued)

Field	Description
Description	A unique description that describes the policy for other users.
Cost type	<p>Contractual payment agreement with the provider.</p> <ul style="list-style-type: none"> • Amortized: Your organization pays the effective cost of the upfront and monthly reservation fees spread across the billing period. The amortized cost type is described in detail on the provider site. • Actual: Each billing period, your organization pays for direct cloud services.
Start month	Month from which the plan applies.
End month	Month until when the plan applies.
Start day	Date from which the plan applies.
End day	Date until when the plan applies.
Start year	Year from which the plan applies.
End year	Year until when the plan applies.
Currency	Currency type of the policy.
Amount	<p>Total spend that is budgeted for the time period that is specified by the Granularity value.</p> <p>Calculated</p> <p>Behaves in the same way as the default currency field type. Whenever conversions are performed, the system uses the latest currency conversion rates. The amount appears in the session currency for the user.</p> <p>Fixed</p> <p>The amount displays in the currency code that you used when you entered the Amount value. Conversions use the latest currency conversion rates.</p> <p>Multiple</p> <p>Enables you to enter multiple amounts using a different currency for each amount. The field value is the value entered in the user's session currency. Otherwise, the first value entered converts to the user's session currency. Conversions use the latest currency rates.</p>

Budget policy creation (continued)

Field	Description
	<p>Note: The first amount entered is used during display. The other values aren't used to perform calculations.</p> <p>The session currency for the instance determines the numbers that a user sees on budget reports. If the currency you specify in the Budget plan differs from the session currency, then the amount displays in the reports in two fields:</p> <ul style="list-style-type: none"> • Budgeted amount: The money amount expressed in the currency used in the plan. • Converted budget amount: The same money amount, expressed in the session currency.
Granularity	<p>Reset period for the budget.</p> <ul style="list-style-type: none"> • Annual: The Amount value applies to a one-year period. • Monthly: The Amount value applies to a one-month period.
Account and Resource criteria	
Parent account	<p>The primary account with which the service accounts are associated.</p> <p>Note: While editing a policy, changing the parent account can change the provider.</p>
Service accounts	<p>The service accounts to apply the plan to. Move all appropriate service accounts to the Selected list.</p> <p>For Google Cloud only, this field is called Projects.</p>
Tag category condition	<p>Add tag category by selecting a tag category from the drop-down list and by adding tag values separated by comma.</p>
Budget Viewer and Notifications	
Viewer (user)	<p>User that can view this Budget policy.</p>

Budget policy creation (continued)

Field	Description
	<p>Note: Regardless of this selection, only users that also have the Cloud Budget Viewer [sn_clin_core.budget_viewer] role have viewing access.</p>
Viewer (group)	User group that can view this Budget policy.
Notification frequency	The recurrence of email to users as described in Users to notify.
User to be notified	<p>Users to notify by email when the following conditions occur:</p> <ul style="list-style-type: none"> • Budget is forecast to be exceeded. • Budget is exceeded. • Budget is invalid.

List of Shared cost allocation policy fields

Fields on the Shared cost allocation policy creation form help you create a shared cost allocation policy.

Shared cost allocation policy creation form

Field	Description
Select shared cost policy to edit	The shared cost policy that you want to edit.
Active	The option to apply the policy. Selecting the Active check box enables shared cost allocation whenever billing data is updated.
Name	A unique name that describes the policy for other users.
Description	A brief description of the policy.
Run order	The order in which to apply policies. Each policy must have a unique value. The system applies policies in low-to-high run order and performs the actions for the first policy that matches. After a match, no other policy is applied to the resource.
Start month	<p>The start month from when the monthly spend records are processed. This field is automatically set to the current month.</p> <p>Note: The Start month must be before the End month.</p>

Shared cost allocation policy creation form (continued)

Field	Description
End month	<p>The month till when the monthly spend records are processed.</p> <p>Note: The End month must be after the Start month.</p>
Start year	<p>The start year from when the monthly spend records are processed. This field is automatically set to the current year.</p> <p>Note: The Start year must be before the End year.</p>
End year	<p>The year till when the monthly spend records are processed.</p> <p>Note: The End year must be after the Start year.</p>
Provider	<p>The cloud provider to apply the policy to.</p> <p>Note: You can't change the provider while editing an existing policy.</p>
Service category	<p>List of all service categories that the policy applies to.</p>
Service accounts	<p>The service accounts to apply the policy to.</p> <p>For Google Cloud only, this field is called Projects.</p>
Cloud service	<p>Cloud service that the policy applies to.</p> <ul style="list-style-type: none"> All Specific
Select cloud service	<p>The cloud service that the policy you want to apply to.</p> <p>This field appears only when Specific is selected from Cloud Service.</p>
Resource type	<p>Resource type of the Kubernetes service category.</p> <ul style="list-style-type: none"> Cloud resource Kubernetes cluster

Shared cost allocation policy creation form (continued)

Field	Description
	This field appears only when Kubernetes Service is selected from Service category .
Region	Region of the resource that the policy applies to. <ul style="list-style-type: none"> • All • Specific
Select region	The region of the resource that the policy you want to apply to. This field appears only when Specific is selected from Region .
Purchase option	Purchasing options for your cloud resources. <ul style="list-style-type: none"> • On demand • Reserved • Savings plans • Tax • Unknown
Select the tag	
Business unit	Business unit of the resource to which the policy applies to. <ul style="list-style-type: none"> • All • Specific
Select business unit	The business unit of the resource that the policy you want to apply to. This field appears only when Specific is selected from Business unit .
Department	The department of the resource that the policy you want to apply to. <ul style="list-style-type: none"> • All • Specific
Select department	The department of the resource that the policy you want to apply to. This field appears only when Specific is selected from Department .

Shared cost allocation policy creation form (continued)

Field	Description
Division	The department division of the resource that the policy you want to apply to. <ul style="list-style-type: none"> • All • Specific
Select division	The department division of the resource that the policy you want to apply to. This field appears only when Specific is selected from Division .
Cost center	Cost center of the resource that the policy is applied to. <ul style="list-style-type: none"> • All • Specific
Select cost center	The cost center of the resource that the policy you want to apply to. This field appears only when Specific is selected from Cost center .
Allocation type	Allocation type to be used while defining the shared cost allocation policy. <ul style="list-style-type: none"> • Fixed: The allocation percentage is specified in the Cost distribution section for each group. #For example, if the cost of a cloud service is shared with two other groups, specify the allocation percentage for each group. • Even: The allocation is split across the allocation groups evenly. #For example, if the cost of a cloud service is shared with two other groups, the allocation percentage is automatically populated evenly among these groups. • Proportional: Policy for cloud services and service categories, or both, is defined. #The combination of these attributes is considered for shared cost allocation. #For example, if a policy is defined for the following combination, then all costs associated with this combination would be considered for shared cost.

Shared cost allocation policy creation form (continued)

Field	Description
	<ul style="list-style-type: none"> ○ Service category: Database and Cloud service: Amazon#DocumentDB ○ Service category: Database and Cloud service: Empty <p>Here, all Database category cloud services are considered as shared cost.</p> <p>The allocation percentage is automatically populated based on the direct cost of the resources.</p> <p>Note:</p> <ul style="list-style-type: none"> • The sum of allocation percentages across the groups must be 100%. • The allocation percentage can't be negative. • The combination of groups must be unique.
Cost distribution	Add Business unit, Division, Department, Cost center, and Allocation percentage to distribute the resource costs among various business lines by selecting Add .
Namespace Distribution	<p>For Kubernetes, add Namespace and Allocation percentage to distribute the resource costs among various business lines by selecting Add.</p> <p>This field appears only when Kubernetes Service is selected from Service category and Kubernetes cluster is selected from Resource type.</p> <p>Note: The allocation type that you can define can be only Fixed and Even.</p>
Allocation percentage	Percentage of the shared cost allocation for each cloud resource.

List of default tag categories

View the list of default tag categories on the Tag categories page. A tag category helps you to enable multiple tag names for representing costs against a single business entity.

You can view the list of default categories by navigating to *Cloud Cost Management Workspace > Operations > Cost usage tags > Tag categories*.

Supported CI class types for Amazon AWS Cloud services

Supported CI class types for AWS enable assigning cost and usage data correctly using the CI placement process. The CI placement process places a subset of CIs into corresponding CI tables that are used in the recommendation generation process for Cloud Cost Management.

Note:

All the supported CI class types are placed after the Cumulus Unsupported CI Placement scheduled job runs daily. Some of the CI class types are placed immediately after Billing Download job execution.

Contract Management

Manage and track contracts with the ServiceNow[®] Contract Management application.

A contract is a binding agreement between two parties. In the ServiceNow platform, contracts contain detailed information such as the following:

- Contract number
- Contract start and end dates

- Active status
- Terms and conditions statements
- Documents
- Renewal information
- Financial terms

Contract Management is active by default. If the Cost Management plugin is activated, the Contract Management application integrates with the Cost Management plugin to associate contracts with costs and determine the total cost of ownership. You can track recurring expenses with expense lines. An administrator can activate the Cost Management plugin.

If you are using the Software Asset Management plugin, use the Software Licenses option.

Use the Asset Contract Overview module

You can view information about your contract status in the Contract Management Overview module.

Before you begin

Role required: asset, contract_manager

About this task

Because the Contract Management Overview module is a type of homepage, you can add, delete, and rearrange reports on the page.

Procedure

1. Navigate to **All > Contract > Overview**.
2. Click elements within the reports to obtain more information.

Example

For example, click any of the colored bars in the **Contract Expenditure by Type** bar chart to see detailed information.

Components installed with Contract Management

Several types of components are installed with Contract Management.

Demo data is available.

Tables installed with Contract Management

Tables are added with Contract Management.

Table	Description
Asset Covered [clm_m2m_contract_asset]	Lists the assets covered by a contract. An asset can be covered by multiple contracts and a contract can have multiple assets. Note: The contract_manager, itil, inventory_admin, or procurement_user role can only access the reports. You must activate the Procurement (com.snc.procurement) plugin for the procurement_user role and the Hardware Asset Management Professional (com.sn_hamp) plugin for the itil and inventory_admin roles.
Asset Covered [clm_m2m_rate_card_asset]	Lists the rate cards that apply to an asset.
Condition [clm_condition_checker]	Lists the conditions and values for each condition checker.

Table	Description
Condition Checks [clm_condition_check]	Stores conditions and values that modify specified condition fields.
Contract [ast_contract]	Stores contract information.
Contract History [clm_contract_history]	Stores a copy of the contract when the start date, end date, or terms and conditions change.
Terms and Conditions [clm_terms_and_conditions]	Lists the terms and conditions used by contracts.
Terms and Conditions [clm_m2m_contract_and_terms]	Lists all terms and conditions available for use with contracts.
Users Covered [clm_m2m_contract_user]	Lists the users covered by contracts.

User roles installed with Contract Management

A user role is added with Contract Management.

Role	Contains Role	Description
contract_manager	financial_mgmt_user	Manages the contract life cycle. Can create, edit, and delete contracts.

Script includes installed with Contract Management

Script includes are added with Contract Management.

Name	Description
ConditionChecks	Checks for matching conditions, such as for contract expirations and license compliance, defined in the Condition Checks [clm_condition_check] table.
ContractManagementUtils	Utilities that manage contract management actions, such as state transitions.

Client scripts installed with Contract Management

Client scripts are added with Contract Management.

Name	Table	Description
Calculate Tax Cost - Base cost	Contract [ast_contract]	Calculates the Tax cost field and the Total cost field on the Contract form when the Payment amount field changes.
Calculate Tax Cost - Sales tax	Contract [ast_contract]	Calculates the Tax cost field and the Total cost field on the Contract form when the Sales tax field changes.
Calculate Tax Cost - Tax rate	Contract [ast_contract]	Calculates the Tax cost field and the Total cost field on the Contract form when the Tax rate field changes.
Ensure discount is valid percent	Contract [ast_contract]	Ensures that the Discount field does not contain a value less than zero or greater than 99.

Name	Table	Description
Renew Cost Adjustment	Contract [ast_contract]	Sets the Percentage field on the Contract form to zero if the user sets a dollar amount for the cost adjustment.
Renew Cost Percentage	Contract [ast_contract]	Sets the Amount field on the Contract form to zero if the user enters a percentage for the cost adjustment.
Tax exempt/rate	Contract [ast_contract]	Changes all tax-related fields on the Contract form to read-only if the Tax Exempt check box is selected.
Tax rate/exempt	Contract [ast_contract]	Changes all tax-related fields on the Contract form to writeable if the Sales Tax check box is selected.

Business rules installed with Contract Management

Business rules are added with Contract Management.

Name	Table	Description
Calculate projected costs (Reports)	Contract [ast_contract]	Calculates the projected monthly and annual costs for a contract when costs or payment schedule changes.
Calculate totals with tax	Contract [ast_contract]	Calculates the Tax cost and Total cost fields for a contract when the contract is created or updated.
Contract history	Contract [ast_contract]	Stores history when the start, end, or terms and conditions of a contract change.
Create approval record	Contract [ast_contract]	Updates contract Terms and Conditions and starts the contract approval workflow when a contract is sent for review.
Flag terms and conditions	Terms and Conditions [clm_m2m_contract_and_terms]	Sets the Use flag on a Terms and Conditions record to true after the record is associated with a contract or to false after the record is disassociated from a contract.
Activate count for manual licenses	Software License Instance [ast_license_software_instance]	Calculates and updates the number of computers a particular license is installed on when a software license instance is created or deleted.
Manage contract lifecycle	Contract [ast_contract]	This business rule: <ul style="list-style-type: none"> • Updates the end date of a contract when a contract extension has been approved. • Renews the contract, updating its start date, end date, and base cost (if cost adjustments must be applied) when a contract renewal has been approved and the renewal has reached its start date. • Runs the condition checks to evaluate if dates need to be changed when a contract

Name	Table	Description
		is approved, or an extension or renewal is approved, or the start or end dates have changed.
Post outage to news	Service [cmdb_ci_service]	Posts a news article on the knowledge table when there is an outage.
Update contract cost per asset	Asset Covered [clm_m2m_contract_asset]	Updates the cost per unit value based on the total cost and number of assets associated to the contract.
Update contract lifetime cost	Contract Rate Card [fm_contract_rate_card]	Calculates the lifetime cost of the contract by calculating the sum of the contract expense lines.
Updates after contract dates change	Contract [ast_contract]	Updates the Date added and Date removed fields for all assets and users associated with a contract if the contract end date changes.
Updates after rate card dates change	Contract Rate Card [fm_contract_rate_card]	Updates the related contract assets and users linked to the rate card when the end date is changed.
Verify contract's start and end dates	Contract [ast_contract]	Validates contract start and end dates and contract renewal start and end dates.
Verify purchase agreement discount price	Contract [ast_contract]	For contracts with the contract model Purchase Agreement , the business rule validates that the Discount field does not contain a value less than zero or greater than 99.

Contract renewal workflow

Use the contract renewal workflow to renew contracts that are nearing their expiry date or are already expired. This workflow enables you to renew contracts through a streamlined and managed process.

Renew your contracts by creating, validating, approving, and activating a contract record that references the original contract. This workflow enables you to manage related entities like hardware assets, software entitlements, terms and conditions, and rate cards.

i Note:

The contract renewal workflow supports Software license, Subscription contract, Maintenance, and Warranty contract models.

Complete the following tasks in the contract renewal workflow to renew your contracts:

1. **Contract renewal request:** Create a contract renewal request for contracts that are nearing their expiry date or are already expired.
2. **Contract selection:** Renew multiple child contracts under the parent contract.
3. **Build renewal:** Supply the contract renewal information.
4. **Asset selection:** Add or remove hardware or enterprise assets from the contract renewal process, and view the assets carried over to the new contract.
5. **Software assets selection:** Add or remove software entitlements that you want to include in the contract renewal process, and view the entitlements carried over to the new contract.
6. **Terms and conditions:** Update the terms and conditions in your new contract, and view the terms and conditions carried over to the new contract.
7. **Rate cards:** Add rate card details to the new contract to track contract expenses.
8. **Renewal confirmation:** Review the renewal details after completing all the details of a contract.
9. **Renewal approval:** Approve or reject a contract renewal request for all Contract Renewal Request Lines.
10. **Renewal purchase order:** Receive the purchase order for assets covered in the contract.

Note:

- You can't edit a task after you close it.
- You can cancel a contract renewal process for a Contract, Contract Renewal Request, Contract Renewal Request Lines, and Contract Renewal tasks. For more information, see [Results of canceling a contract renewal process](#).

Prerequisites

Before using the contract renewal workflow, you must complete the following prerequisites:

- Activate the Software Asset Management Professional (com.snc.samp) plugin on your ServiceNow instance.

If you want to manage hardware or enterprise asset contracts, request and install the Hardware Asset Management or Enterprise Asset Management application from the [ServiceNow Store](#)  instead.

- Enable the `sn_contract_enable_renewal_flow` system property.

Note:

If you're already using Software Asset Management, Hardware Asset Management, or both, this system property is set to false. If you're a new user, this system property is set to true.

Domain separation

Domain separation with data separation is supported for the contract renewal workflow with the following requirements:

- The request is created in the domain of the contract that initiated the renewal process.
- Request lines are in the domain of the contract of the request line.
- Tasks are created in the domain of the contract being renewed.

The `sn_contract_enable_renewal_flow` system property also supports domain separation.

Create a contract renewal request

Create a contract renewal request for contracts that are nearing their expiry date or are already expired.

Before you begin

Role required: `asset_contract_manager` (core UI and Hardware Asset Workspace only), `sn_eam.enterprise_admin` (Enterprise Asset Workspace only), or `sn_eam.enterprise_asset_manager` (Enterprise Asset Workspace only)

About this task

You can create a renewal request only for Maintenance, Warranties, Subscriptions, and Software Licenses. If you have installed only the Software Asset Management application, you can renew Subscriptions, Maintenance, and Software Licenses contracts. If you have installed only the Hardware Asset Management application, you can renew Maintenance and Warranties contracts. If you have installed only the Enterprise Asset Management application, you can renew Maintenance and Warranties contracts.

Procedure

1. Open the list of contracts that you want to renew.

- If you are using the core UI, navigate to **All > Contracts > Contract Renewal**.
- If you are using the Hardware Asset Workspace, open the Contract management view and then select the **Overview** tab. In the Contract overview section, locate the Expiring contract widget.

Alternatively, open the Contract management view and then select a tab for a contract type, such as **All** or **Maintenance**.

- If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **Overview** tab. In the Contract overview section, locate the Expiring contract widget.

Alternatively, open the Contract and lease management view and then select a tab for a contract type, such as **All** or **Maintenance**.

2. Select the contract that you want to renew with a type of either Maintenance, Warranties, Subscriptions, Software Licenses, or Service.

3. Click **Renew** for the selected contract.

4. Submit the contract renewal request.

- If you are using the core UI or Hardware Asset Workspace, click **OK**.

The contract renewal request includes the following information:

- An auto-generated unique number
- The Stage indicating the type of task in the contract renewal process
- Reference to the contract for which you have requested the renewal
- Date and time when the request was created

- If you are using the Enterprise Asset Workspace, the Renew the Contract dialog box appears. In the dialog box, fill in the fields and then click **Submit for review**.

Renew the Contract dialog box

Field	Description
Approver	User who approves or rejects the contract renewal request.
Options	Duration of the contract renewal.
Renewal start date	Date on which the contract renewal begins.
Renewal end date	Date on which the contract renewal ends.
Cost adjustment type	Type of cost adjustment that is applied to the contract. The options are Fixed , Manual , and CPI (consumer price index).
Cost adjustment percentage	Percentage increase or decrease in the contract price. To indicate a decrease in price, enter a negative percentage. i Note: You can specify either a cost adjustment percentage or cost adjustment amount on a contract renewal request. You cannot specify both.
Cost adjustment amount	Numerical increase or decrease in the contract price. To indicate a decrease in price, enter a negative number. i Note: You can specify either a cost adjustment percentage or cost adjustment amount on a contract renewal request. You cannot specify both.

- 5. Optional:** Select the **Contract Renewal Request Lines** tab to view the parent Contract Renewal Request Line or existing and valid child contracts under the parent contract. A contract renewal request line is created for each contract that is being renewed.
- 6. Optional:** View all open contract renewal flow tasks and the details of each contract renewal task by selecting the **Open Tasks** tab.
- 7. Optional:** View all contract renewal flow tasks and the details of each contract renewal task by selecting the **All Tasks** tab.

Result

The substate of the contract that is being renewed is set to **Renewal in process**.

What to do next

If the parent contract doesn't have child contracts, select the [Build renewal task](#).

If the parent contract has child contracts, select the [Contract selection task](#).

Renew multiple child contracts

Renew multiple child contracts under the parent contract by using the Contract selection task.

Before you begin

Role required: asset, contract_manager

About this task

This task is created only when the contract that you want to renew has valid child contracts supported by the contract renewal workflow that are not already renewed or in draft state.

Procedure

1. On the Contract form, select the **Contract Renewal Requests** tab in the Related Links section to view the list of contract renewal requests.
2. Select a renewal request.
3. View all the child contracts linked to the selected contract by selecting the **Renewal contracts** tab on the Contract Renewal Task form.
4. Indicate the child contracts you want to renew.
 - a. Open the record by selecting the preview icon ⓘ besides a child contract.
 - b. Choose whether to include child contracts for renewal by entering Yes or No in the **Renewal Decision** field.
You must provide a value for the **Renewal decision** field for each child contract.
5. Select **Update**.
The Renewal decision column in the **Renewal contracts** tab displays your decision.
6. Select **Close Task**.

Result

The contract renewal request lines for parent and child contracts are listed in the Contract Renewal Request Lines tab. Each contract request line has its own flow of tasks.

What to do next

[Supply contract renewal information](#)

Supply contract renewal information

Supply the contract renewal information by completing the Build renewal task.

Before you begin

Role required: asset, contract_manager

About this task

Each contract renewal request line has its own flow of tasks.

Procedure

1. On the Contract Renewal Request Line form, select the Build renewal task number.
2. On the Contract Renewal Task form, select the **Renewal contract details** tab.
3. Provide the contract renewal information.

You must fill in all the required fields before you close the task. If you are renewing the child contract, you must provide the end date and start date within the range of the start date and end date of the parent contract.

Note:

The Contract approver field is displayed only for the parent contract. The same Contract approver value is filled in automatically for any child contracts.

4. Select Close Task.**Result**

New draft contracts are created.

What to do next

[Add or remove assets for a contract renewal](#)

Add or remove assets for a contract renewal

Add or remove hardware or enterprise assets from the contract renewal process. You can also view the hardware or enterprise assets carried over to the new contract.

Before you begin

To add or remove hardware assets from the contract renewal process, request the Hardware Asset Management application from the [ServiceNow Store](#) . To add or remove enterprise assets from the contract renewal process, request the Enterprise Asset Management application from the [ServiceNow Store](#) .

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

The active and valid assets from the contract that are being renewed are carried over to the new contract, and are listed in the Assets Covered tab. Valid hardware and enterprise assets are the assets that are not removed from the contract before the end date, and are in the following states or substates:

- State
 - In stock
 - In transit
 - In maintenance
 - In use
- Substate
 - Available
 - Reserved
 - Pending transfer
 - None
 - Pending repair
 - Pending install

Invalid assets are not carried over to the draft contract and you must add them manually.

Procedure

1. Open the assets selection task or contract for which you want to add assets.
 - If you are using the core UI or Hardware Asset Workspace, select the assets selection task number on the Contract Renewal Request Line form.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view. Select the **All contracts** tab and then open the contract that you want to add assets to.
2. Select the **Assets Covered** tab.
3. If you are using the core UI or Hardware Asset Workspace, click **Edit**.
4. Update the hardware or enterprise assets in the contract.
5. Select **Save**.
6. Edit the renewal cost of the assets.

i Note:

This step is applicable only if you are using the core UI or Hardware Asset Workspace.

- a. Select the asset that you want to update the renewal cost for.
 - b. In the **Renewal cost** field, update the renewal cost of the asset.
 - c. Click **Update**.
7. Click **Save**.
 8. If you are adding assets through the asset selection task on the Contract Renewal Request Line form, click **Close Task**.

Result

The Payment amount field in the Financial tab of the draft contract shows the total renewal cost of the hardware or enterprise assets you selected.

What to do next

[Add or remove entitlements for a contract renewal](#)

Add or remove entitlements for a contract renewal

Add or remove software entitlements that you want to include in the contract renewal process by using the Software assets selection task. You can also view the entitlements carried over to the new contract.

Before you begin

The Software Asset Management Professional (com.snc.samp) plugin must be activated.

Role required: sam_user, contract_manager

About this task

The entitlements with the following license types are carried over to the new contract:

- Perpetual and maintenance
- Perpetual and software assurance
- Only perpetual

Procedure

1. On the Contract Renewal Request Line form, select the Software assets selection task number.
2. Create an entitlement if you don't have any entitlements carried over to the draft contract.

a. On the Contract Renewal Task form, select **Create Entitlement** in the **Planned Entitlements** tab.

b. On the Software Entitlement form, fill in the required fields.

For more information, see [Software entitlement fields](#).

c. Select **Save**.

You can publish this entitlement after you complete the renewal request because this entitlement is associated with an existing renewal process.

The entitlement is now listed in the Planned Entitlements list.

3. **Optional:** Update the existing entitlements for the draft contract.

4. Select **Save**.

5. Select **Close Task**.

What to do next

[Update terms and conditions](#)

Update terms and conditions

Update the terms and conditions in your new contract. You can also view the terms and conditions carried over to the new contract.

Before you begin

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the task or contract for which you want to add terms and conditions.
 - If you are using the core UI or Hardware Asset Workspace, select the Terms and conditions task number on the Contract Renewal Request Line form. Select the **Renewal contracts terms** tab and then click **Edit**.
 - If you are using the Enterprise Asset Workspace, navigate to the Contract and lease management view and then select the **All contracts** tab. Open the enterprise asset contract that you want to add terms and conditions to and then select the **Terms and Conditions** tab.
2. Update the terms and conditions in the contract.
3. Select **Save**.
4. If you are adding terms and conditions through the Terms and conditions task on the Contract Renewal Request Line form, click **Close Task**.

Result

Multiple terms and conditions are displayed in the **Terms and Conditions** tab of the contract.

What to do next

[Add rate cards to the new contract](#)

Add rate cards to the new contract

Add rate card details to the new contract by using the Rate cards task to track contract expenses.

Before you begin

The Cost Management (com.snc.cost_management) plugin must be active.

Role required: asset, contract_manager

About this task

The rate card details aren't carried over to the new contract.

Adding rate card details to a contract isn't a required procedure. You can close this task if you do not need to add a rate card to the draft contract.

Procedure

1. On the Contract Renewal Request Line form, select the Rate cards task number.
2. On the Contract Renewal Task form, select the **Renewal rate cards** tab.
3. Select **New**.
4. On the Contract Rate Card form, fill in the financial details.
For a description of the field values, see [Contract Rate Card form](#).
5. Select **Submit**.
6. Select **Close Task**.

Result

The rate card is attached to the draft contract.

What to do next

[Review contract renewal details](#)

Review contract renewal details

Review the renewal details after completing all the details of a contract by using the Renewal confirmation task. You can then either approve them or mark the details for further review.

Before you begin

Role required: asset, contract_manager

About this task

This task must be completed before the contract renewal request is eligible for approval.

Procedure

1. On the Contract Renewal Request Line form, select the Renewal confirmation task number.
2. On the Contract Renewal Task form, verify the renewal details.
3. **Optional:** Review the list of entitlements in the draft contract by accessing the **Planned Entitlements** tab.
4. Determine whether to close this task.

5. Select **Close Task**.

Result

When you have closed the task, the Contract Renewal Request Line processing is complete because all the contract renewal tasks are closed. The stage of the Contract Renewal Request Line is set to Awaiting approval. After all the Contract Renewal Request Lines are processed for a contract renewal request, the Approval task is created under Contract Renewal Requests.

What to do next

[Approve or reject a contract renewal request](#)

Approve or reject a contract renewal request

Approve or reject a contract renewal request for all Contract Renewal Request Lines.

Before you begin

The Renewal approver field must contain a value. If you need to change the approver, navigate to the parent contract and adjust the value there.

Role required: `asset_manager` (core UI and Hardware Asset Workspace only), `contract_manager` (core UI or Hardware Asset Workspace only), `sn_eam.enterprise_admin` (Enterprise Asset Workspace only), or `sn_eam.enterprise_asset_manager` (Enterprise Asset Workspace only)

Procedure

1. Verify your contract renewal details.

- If you are using the core UI or Hardware Asset Workspace, select the **Open Tasks** tab on the Contract Renewal Request form. Select the contract renewal request number to view the contract renewal details and then click **Close Task**.
- If you are using the Enterprise Asset Workspace, open the Contract and lease management view. Select the **All contracts** tab and then open the enterprise asset contract that you want to renew. View the contract renewal details in the Renewal section of the **Details** tab.

An approval request is triggered and the substate of the draft contract changes to Under review.

2. Open the list of contract and contract renewal requests.

- If you are using the core UI or Hardware Asset Workspace, navigate to **All > Contract > My Approvals**.
- If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **My contract approvals** tab.

3. Select the contract renewal request waiting for approval.

4. Evaluate any contract renewal request lines and contract renewal tasks.

5. Either approve or reject the contract renewal request.

6. **Optional:** Go to the **Approval History** tab to view the approval or rejection history of the contract and child contracts.

What to do next

[Receive a purchase order for contract assets](#)

Receive a purchase order for contract assets

Receive the purchase order for assets covered in the contract by using the Renewal purchase order task. This task is available if you have added at least one hardware asset, created an entitlement, or selected an existing entitlement that is in the Build state.

Before you begin

This task is not created if you haven't selected or added any hardware assets or entitlements or the Procurement plugin (com.snc.procurement) is not active. You must instead manually track the financial expenses.

Role required: procurement_user

Procedure

1. On the Contract Renewal Request form, select the **Open Tasks** tab.
2. Select the contract renewal request number.
3. Select the **Purchase orders** tab.
4. Select the purchase order number to capture the financial transactions of the contract.

For every asset record covered under a contract, a purchase order line item is created. The cost of each purchase order is the renewal cost of each asset covered.

The purchase order line items are created for the entitlements that are in the Build state. Each entitlement added in the Planned Entitlements tab corresponds to a unique purchase order line.

5. Select **Order**.
6. Select **Receive** to receive the purchase order for assets covered by the contract.
Receiving the purchase order only updates the assets and does not create an entitlement.

Result

The draft entitlement is published and the status is set to In use.

The purchase order receipt is listed in the **Receiving Slips** tab.

The status of the purchase order and purchase order line items shows as Received. The state of the Renewal purchase order task automatically changes to Closed Complete. The contract renewal request flow is complete.

The substate of the old contract is set to Renewed. A contract history record is created that displays the start and end dates of the old contract and the renewed contract, and the renewal date. You can view the entire history of the contract by selecting the Contract History tab in the Related Links section.

After you receive the purchase order, the state of the renewal contract is no longer Draft and the contract becomes active. If the start date of the renewed contract has been reached but the purchase order has not been received, the status of the contract renewal request remains set to Draft. After the new contract becomes active, the old contract becomes expired and the covered assets have an end date.

Results of canceling a contract renewal process

Cancelling a contract renewal process results in a change in the state of Contract, Contract Renewal Request, Contract Renewal Request Lines, and Contract Renewal tasks.

Contract cancellation results

Canceled item	Result
Contract Renewal Request	<ul style="list-style-type: none"> • The entire renewal request is canceled. • The substate of the contract that is being renewed is cleared. • All the draft contracts are canceled.
Contract Renewal Request Line	<ul style="list-style-type: none"> • The Contract Renewal Request Line is canceled. • When all Contract Renewal Request Lines are canceled, the Contract Renewal Request is canceled. • The renewal of immediate child draft contracts is canceled.
Contract Renewal Task	<ul style="list-style-type: none"> • The Contract Renewal Task and the Contract Renewal Request Line are canceled. <ul style="list-style-type: none"> ◦ If the Contract Renewal Request has only one Contract Renewal Request Line, the stage of the Contract Renewal Request changes to Canceled. ◦ If the Contract Renewal Request has multiple Contract Renewal Request Lines, the stage of the Contract Renewal Request doesn't change. • The renewal of immediate child draft contracts is canceled. • The state of the draft contract changes to Canceled. • The state of the tasks that are already closed does not change. • The state of the open tasks changes to Closed Incomplete. • Rate cards are attached to the draft contract become inactive. • The state of the contract that was being renewed moves to the original state and the substate is cleared. • The associated entitlements with the Contract Renewal Task are removed.

Contract cancellation results (continued)

Canceled item	Result
Contract	<ul style="list-style-type: none"> • The renewal of immediate child contracts is canceled when child contracts are included in the Contract Renewal Request. • The Contract Renewal Request Line is canceled. • Any initiated Contract Renewal Request by this contract is canceled. • The purchase order of the contract and immediate child contracts is canceled.

Contract Management use

Users with the `contract_manager` role can use the Contract Management application to create various types of contracts, such as leases, warranties, maintenance, and service.

You can add the following information to contracts.

- Assets covered by the contract
- Users covered by the contract
- Terms and conditions associated with the contract
- Other documents related to the contract

Track the various stages of a contract from draft to closure by viewing contract history and running reports. Adjust, extend, and renew active contracts.

Contract life cycle

From creation until closure, contracts follow a life cycle that determines which fields can be edited.

When a contract is in **Draft** state, almost all fields on the contract record can be edited. After a contract moves past the **Draft** state, certain date, renewal, extension, and financial fields become read-only. The **State** field and **Substate** field are read-only.

The **Contract Compliance Checks** schedule job runs on the Contract [`ast_contract`] table automatically each night. For more information about the scheduled job, see [Use Condition Check Definitions](#). The scheduled job performs the following actions:

- Changes the contract state to **Active** if the contract is approved and reaches the specified start date.
- Renews the contract if the contract is approved for renewal and reaches the specified start date.
- Changes the contract state to **Expired** if the contract state is **Active** and reaches the end date.

The system property `contract_compliance_check_job.enable_override` enables the Contract Compliance Checks job to override checks in a hierarchy. By default, this system property is set to **True**. When checks are defined on the same field of the parent and child tables, the Contract Compliance Checks job performs the following:

- For the records on the parent table, the condition check on the table sets the field with the value specified in the condition.
- For the records on the child table, the condition check on the child table overrides the parent table condition and sets the field value on the child table accordingly.

For example, when a check is defined on the Description field of the Contract (parent) and Lease (child) tables, the field on the Lease table is set to the value specified in the child table condition. To disable the contract compliance check override functionality, set the system property `contract_compliance_check_job.enable_override` to **False**.

Expense lines are only generated from contracts that are active or expired.

Contract states

State	Description
Draft	User adds information about the contract and specifies an approver.
Active	Contract was approved and has reached the specified start date.
Expired	Contract reached the specified end date. Expired contracts with an active renewal workflow that are waiting for approval have a substate of Awaiting Review . Expired contracts with an active renewal workflow where the renewal was approved, but the renewal date hasn't yet passed, have a substate of Renewal Approved . Expired contracts with no active renewal or extension pending workflow have an empty substate.
Canceled	Contract was discontinued and is no longer active.

In addition to a state, a contract can also have a substate.

Contract substates

Substate	Description
Awaiting Review	Contract is being prepared for review.
Under Review	Contract sent to the approver and the approver is reviewing the contract.
Approved	Contract reviewed and accepted by the approver.
Rejected	Contract reviewed and declined by the approver.
Renewal Approved	Contract renewal approved by the approver.
Renewal Rejected	Contract renewal rejected by the approver.
Renewal in process	Contract renewal is in progress through the contract renewal workflow.
Renewed	Contract renewal is complete through the contract renewal workflow.
Extension Approved	Contract extension approved by the approver.
Extension Rejected	Contract extension rejected by the approver.
None	No substate is specified.

Contracts

A contract is a binding agreement between two parties.

In the ServiceNow AI Platform, contracts contain detailed information such as contract number, start and end dates, active status, terms and conditions statements, documents, renewal information, and financial terms.

Working with contracts includes the following tasks and processes.

Create a contract

Create a contract with various contract models, which would act as a binding agreement between the two parties.

Before you begin

Role required:

- For Core UI and Hardware Asset Workspace: admin, contract_manager
- For Enterprise Asset Workspace: sn_eam.enterprise_admin, sn_eam.enterprise_asset_manager
- For Software Asset Workspace: sam_admin, sam_user

About this task

If a contract has one or more associated rate cards, the fields on the Contract form can't be edited.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you're using the Core UI, navigate to **All > Contract** and select a contract type, such as **Insurance, Maintenance, or Service**, or select **All**.
 - If you're using Hardware Asset Workspace, navigate to the **Contract management** view and then select the **All contracts** tab.
 - If you're using Enterprise Asset Workspace, open the **Contract and lease management** view and then select the **All contracts** tab.
 - If you're using Software Asset Workspace, navigate to **License operations > Contracts > Software contracts** and select **New**.
2. Select **New**.
3. On the form, fill in the fields.
Not all fields appear on all contract type forms.

Contract or Create New Contract form

Field	Description
Contract model	Model the contract is assigned to. For example Lease, Maintenance, Warranty, Service Contract Software License, or Subscription .
Vendor	Vendor responsible for the contract. This field is required when Purchase Agreement or NDA is selected from Contract model .
Contract number	Number assigned to the contract by the vendor (required).
Name	Name of the contract.

Field	Description
Parent contract	Parent contract of the new contract, if applicable. You can select a parent contract from the contract lookup list.
Start date	Date on which the contract takes effect. This field is required when Purchase Agreement or NDA is selected from Contract model .
End date	Date on which the contract expires. Leave the end date empty to create an open-ended contract. This field is required when Purchase Agreement or NDA is selected from Contract model .
State	Current state of the contract. <ul style="list-style-type: none"> ○ Draft ○ Active ○ Expired ○ Canceled
Substate	Current substate of the contract. <ul style="list-style-type: none"> ○ Awaiting Review ○ Under Review ○ Approved ○ Rejected
Contract administrator	Person responsible for managing the contract and interacting with the vendor.
Approver	User who approves or rejects the contract. This list is filtered to only show users with the itil role.
Business owner	User who manages the contract from a business perspective.
Agreement type	Agreement type of license: <ul style="list-style-type: none"> ○ Enterprise ○ SaaS ○ Subscription This field appears only when Maintenance and Software License is selected from Contract model .
Commitment	Amount committed to spend with this vendor during this time period, from the start to the end of the contract. This field appears only when Purchase Agreement is selected from Contract model .
Discount	Discount the vendor has agreed to provide.

Field	Description
	This field appears only when Purchase Agreement is selected from Contract model .
Process non-contractual SLAs	Option to process both contractual and non-contractual Service Level Agreements (SLAs). This field appears only when Service Contract is selected from Contract model .
Description	Detailed description of the contract.
Financial section	
Invoice payment terms	Terms that explain how to pay the contract. For example, Net Monthly Account or Net 30 .
Payment schedule	Schedule that defines when to make payments. For example, Monthly or Annually .
Payment amount	Amount that has been paid on the contract to date.
Applicable taxes	Indicates if the contract is exempt from taxes or subject to sales tax.
Effective tax rate	Effective tax rate to apply to the total cost, if applicable. Effective tax rate is usually the average tax rate charged. This field appears only when Sales is selected from Applicable taxes .
Tax cost	Total cost of the tax. This field appears only when Sales is selected from Applicable taxes .
Total cost	Final cost of the contract after adjustments have been applied. If a contract has one or more rate cards, this field shows the combined value of all rate cards. This field appears only when Sales is selected from Applicable taxes .
Vendor account	Vendor account associated with the contract.
PO Number	Purchase order number assigned to the contract.
Cost center	Cost center that is financially responsible for the asset.
Has rate card	Check box to indicate whether the contract has an associated rate card.
Renewal section	
Automatically renew	Indicates if the contract can be renewed or extended at the end of its term.
Options	Duration of the contract renewal or extension. For example, 1 year.

Field	Description
Renewal start date	Date on which the contract renewal or extension takes effect.
Renewal end date	Date on which the contract renewal or extension ends.
Cost adjustment type	Type of cost adjustment applied to the contract. <ul style="list-style-type: none"> ○ Fixed ○ Manual ○ CPI (Consumer Price Index)
Cost adjustment amount	Numerical increase or decrease in price of contract. To indicate a decrease in price, enter a negative number. Either a Cost adjustment or Cost adjustment percentage can be specified, but not both.
Cost adjustment percentage	Percentage increase or decrease in price of contract. To indicate a decrease in price, enter a negative percentage. Either a Cost adjustment or Cost adjustment percentage can be specified, but not both.
Terms and Conditions section	
Terms and conditions	Specific legal information in the contract.

4. Save the form.

- If you're using Core UI, right-click the form header and select **Save**.
- If you're using Hardware Asset Workspace, Software Asset Workspace, or Enterprise Asset Workspace, select **Save**.

5. Continue entering information in the related lists or tabs that appear.

Contract form related lists or tabs

Related list or tab	Description
Assets Covered	Lists all assets covered by this contract.
Users Covered	Lists all users covered by this contract.
Contract used by	Lists all configuration items (CI) used in this contract.
Terms and Conditions	Lists all terms and conditions of this contract.
Expense Lines	Lists all expense lines in this contract.
Contract History	Displays the changes to the start and end dates of this contract and changes to the terms and conditions.
Approval History	Lists all approvals for this contract.
Service Offerings	Lists all service offerings from this vendor. Activate Service Portfolio Management to see this related list.
Service Commitments for Contracts	Lists all service commitments for this vendor's offerings. Activate Service Portfolio Management to see this related list.

6. Perform one of the following actions.

- Select **Update** to save and exit the contract.
- Select **Submit for Review** to send a notification to the approver.

Create a software maintenance contract example

One common use case for the Contract Management application is creating a contract to track maintenance payments for enterprise software. You can use this example to learn how to create a software maintenance contract.

Before you begin

Role required: contract_manager or admin

About this task

The goal of this example is to create a contract that shows the total amount of maintenance that must be paid for the software application, independent of different license purchases made over time. The Software Asset Management plugin must be activated to use this example.

Procedure

1. Create an [application model](#), adding a **Name** and specifying **Software License** in **Model categories**.
2. Create a [software model](#), adding a **Name** and **Model Number**, and selecting the application model created in step 1.
3. Create a new software entitlement by selecting the software model created in step 2.
4. Navigate to **Contract > Contracts > Maintenance**.
5. Click **New** and enter the following information.

Option	Description
Agreement Type	Select Enterprise .
Application Model	Select the application model created in step 1.

6. Right-click the form header and click **Save**.
A number of related lists and sections appear.
7. In the **Asset Covered** related list, click **New** and enter the following information.

Option	Description
Asset	Select the software license created in step 3.
Date added	Enter the value.

8. Click **Submit**.

9. Continue completing the form with the following information.

Option	Description
Payment schedule	Select Annually .
Payment amount	Enter the value.

10. Complete the other fields as appropriate.

11. Click **Update**.

12. [Submit the contract for review](#).

[Software Asset Management](#)

Add an asset to a contract

You can associate contracts with specific assets, including software licenses.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

Linking a contract with assets clarifies what the contract legally covers.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract Management > Contract > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add assets to the contract.
 - If you are using the core UI, use the following steps:
 - a. In the **Assets Covered** related list, click **New**.
 - b. In the **Asset** field, select a specific asset that is covered by the contract.
 - c. In the **Date added** field, select the date the asset was added to the contract.

The date can be in the past, the present, or the future.
 - d. (Optional) In the **Date removed** field, select the date the asset was, or will be, removed from the contract.

Specifying the **Date added** and **Date removed** fields is useful for reporting.

- e. Click **Submit**.
- o If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:
 - a. In the **Assets Covered** tab, click **New**.
 - b. In the dialog box, select the check box for each asset that you want to add to the contract.
 - c. Click **Add**.

Add a user to a contract

A contract can cover specific users. For example, you may use a contract to hire a group of temporary workers.

Before you begin

Role required: contract_manager or admin

Procedure

1. Navigate to **Contract Management > Contract > All**.
2. Select a contract.
3. In the **Users Covered** related list, click **New**.
4. In the **User** field, select a specific user covered by the contract.
5. In the **Date added** field, select the date the user was added to the contract.
The date can be in the past, the present, or the future.
6. **Optional:** In the **Date removed** field, select the date the user was, or will be, removed from the contract.
Specifying the **Date added** and **Date removed** fields can be useful for reporting.
7. Click **Submit**.

Add a configuration item to a contract

Contracts can be associated with configuration items. You can link a contract with configuration items to clarify what the contract legally covers.

Before you begin

Role required: admin or contract_manager

Procedure

1. Navigate to **Contracts > All**.
2. Select a contract.
3. **Optional:** In the **CIs Covered** related list, select **New** to create a configuration item.
4. In the **CIs Covered** related list, select **Edit**.
5. In the **Collection** configuration items list on the left, double-click a configuration item name.
The item is added to the **CIs Covered List** on the right.
6. Select **Save**.

Add a document to a contract

Contracts can be associated with documents. Linking a contract to related documents helps keep all relevant information about a contract together and easily accessible.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **All > Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add a document to the contract.
 - If you are using the core UI, use the following steps:
 - a. Click the Manage Attachments () icon on the form header.
 - b. In the Attachments dialog box, click **Choose file** to search for and select the document that you want to add to the contract.
 - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:
 - a. Click the Attachment () icon on the sidebar of the contract record.
 - b. In the Attachments window, click **Select** to search for and select the document that you want to add to the contract.

Adjust a contract

After creating a contract, you can change the start date, end date, or payment amount for a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

To adjust a contract, the **State** should be **Active**. If the end date of a contract changes, the end date of any associated assets changes to match the new end date.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract in the **Active** state.
3. Click **Adjust**.
4. In the Adjust the Contract dialog box, fill in the fields.

Adjust the contract fields

Field	Description
Contract Start Date	Date on which the contract takes effect.
Contract End Date	Date on which the contract expires.
Contract Payment Amount	Total amount paid for the contract. If the contract has one or more rate cards, this field shows the total of all rate card base costs.

5. Click **Submit Adjustments**.

Renew a contract

After you have created a contract or the contract has expired, you can renew the contract.

Before you begin

Role required: admin, contract_manager (core UI or Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

- When a contract is renewed, a new contract isn't created. Instead, the same contract is updated with renewal information.
- The changes to the start date and end date of a contract is captured in the Contract History tab.
- Contract information and history is retained when a contract is renewed. If the end date of the contract changes, the end date of any associated assets changes to match. You can renew a contract that meets the following conditions.
 - **State** is **Active** or **Expired**
 - **Substate** is **None** or **Rejected**
- If the system property *sn_contract_enable_renewal_flow* is enabled, the contract renewal workflow is available for maintenance & warranty contracts. For more information, see [Contract renewal workflow](#).

Procedure

1. Open the list of contracts that are used across your deployment.

- If you are using the core UI, navigate to **Contract > Contracts > All**.
- If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.

Alternatively, select the **Overview** tab of the Contract management view. In the Contract overview section, locate the Expiring contract widget to view the list of contracts that are expiring.

- If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.

Alternatively, select the **Overview** tab of the Contract and lease management view. In the Contract overview section, locate the Expiring contract widget to view the list of contracts that are expiring.

2. Select a contract in the **Active** or **Expired** state.

3. Click **Renew**.

4. On the Renew the Contract form (core UI) or dialog box (Hardware Asset Workspace and Enterprise Asset Workspace), fill in the fields.

Renew the Contract fields

Field	Descriptions
Approver	User who approves or rejects the contract.
Options	Length of time for the renewal, in years.
Renewal start date	Date on which the renewed contract takes effect.
Renewal end date	Date on which the renewed contract expires.
Cost adjustment type	Type of cost adjustment applied to the renewed contract: None, Fixed, Manual, or CPI .
Cost adjustment percentage	Percentage increase or decrease in price of the renewed contract. To indicate a decrease in price, enter a negative percentage. A Cost adjustment amount or Cost adjustment percentage can be specified, but not both.
Cost adjustment amount	Numerical increase or decrease in price of the renewed contract. To indicate a decrease in price, enter a negative number. A Cost adjustment amount or Cost adjustment percentage can be specified, but not both.

5. Perform one of the following steps.

- To save all entered data and change the substate to **Under Review**, click **Submit for Review**. The contract is sent to the specified **Approver**.
- To save all entered data and change the substate to **Awaiting Review**, click **Save**. The **Renew** button is available to submit the renewed contract for review later.

6. Change any information on the **Contract** form, as necessary.

7. Click **Update**.

What to do next

If you selected the **Save** option, ensure that you click **Renew** when you are ready to submit the contract renewal for approval.

Cancel a contract

You can cancel a contract when the **State** is **Active**.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

After a contract is canceled, the following process occurs.

- The contract **State** changes to **Canceled**.
- Condition checkers are changed to inactive.
- **Renew** and **Extend** buttons become inactive.
- Contract rate cards become inactive.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Click **Cancel Contract**.
4. Click **Yes** to confirm the contract cancellation.

Verify contract administrator assignment for notification

An event runs automatically each night to send reminders to contract administrators about contract expiration dates so they can renew or renegotiate the contract. You can verify that the right contract administrator is assigned to the contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

When the contract.expiration event runs on the Contract [ast.contract] table each night, an email message is sent to the person identified as the contract administrator. This email is sent at the following times.

- 90 days ahead of the contract expiration date
- 60 days ahead of the contract expiration date

- 30 days ahead of the contract expiration date
- On the contract expiration date

A user with the admin role can edit the contract.expiration condition check that processes contract notifications.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Check that the **Contract administrator** field contains the correct name.
A single name can be specified.

Related topics

[Condition check definitions](#)

[Email and SMS notifications](#) 

Send the contract for approval

You can send a contract that is in **Draft** state for approval.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract in the **Draft** state and **Awaiting Review** substate.
3. Select an **Approver** for the contract.
4. Click **Submit For Review**.
An email message is sent to the selected approver and the contract **Substate** changes to **Under Review**.

Approve or reject a contract

If you are the contract manager, you can approve or reject a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contract and contract renewal requests.
 - If you are using the core UI, navigate to **All > Contract > My Approvals**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **My approvals** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **My contract approvals** tab.
2. Select a contract in the **Requested** state.
3. Approve or reject the contract.
 - Approve the contract.
 - To approve the contract in the core UI, click **Approve**. The contract **Substate** changes to **Approved**.
 - To approve the contract in the Hardware Asset Workspace or Enterprise Asset Workspace, set the **State** field to **Approved**.
 - Reject the contract.
 - To reject the contract in the core UI, click **Reject** and enter a rejection reason in the **Comments** field. The contract **Substate** changes to **Rejected**.
 - To reject the contract in the Hardware Asset Workspace or Enterprise Asset Workspace, set the **State** field to **Rejected**.
4. Click **Update** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).
 - A contract with the state set to **Draft** and a start date set in the future is kept in **Draft** until the start date is reached. If the contract has a **Substate** of **Approved**, the system changes the **State** to **Active** and removes the **Substate** value.
 - When a contract with a **State** of **Draft** and a **Start Date** set to a date in the past is approved, the contract **State** is automatically set to **Active** and **Substate** is left blank.

View approval history on contracts

You can view the approval history for a contract in the Approval History related list on the Contract form.

Before you begin

Role required: workflow_admin, admin, or sn_eam.enterprise_admin (Enterprise Asset Workspace only)

About this task

After a contract is sent to an approver for review, the approver name cannot be changed. If the approver rejects a contract, the same approver or a different approver can be specified before the contract is sent for approval again. Once the contract has been reviewed and approved, approval history records are automatically listed in the Approval History related list on the Contract form.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Select the **Approval History** tab.
4. Click a record to view the approval details.

Terms and conditions

You can add terms and conditions to a contract to keep all documentation that is relevant to a contract in one location.

The terms and conditions can be searched and used in reports. If multiple terms and conditions records are added to a single contract, set an order for the records so they appear in a specific sequence. The terms and conditions fields become read-only after a contract is sent for approval.

Users with the contract_manager role can read contract history and add terms and conditions.

There are three procedures involved in adding terms and conditions to a contract:

Create a terms and conditions record

You can create a terms and conditions record to add to a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of terms and conditions for your contracts.
 - If you are using the core UI, navigate to **All > Contract > Contracts > Terms & Conditions**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **Terms and conditions** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **Terms and conditions** tab.
2. Click **New**.
3. On the Terms and Conditions form (core UI) or Create New Terms and Conditions form (Hardware Asset Workspace and Enterprise Asset Workspace), fill in the fields.

Terms and Conditions or Create New Terms and Conditions form

Field	Description
Number	Unique ID used for the terms and conditions. This field is automatically generated.

Field	Description
Name	Name for the terms and conditions.
Contract	Link to the contract.
Used	Check box to indicate if the terms and conditions are associated with contract.
Description	Details of the terms and conditions.

4. Click **Submit** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).

Add terms and conditions to a contract

After you create a terms and conditions record, add the record to a contract that is in the Awaiting Review, Rejected, Renewal Rejected, or Extension Rejected substate.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

Terms and Conditions can only be added to a contract when it is being created. After the contract is approved, the terms and conditions cannot be changed.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add terms and conditions to the contract.
 - If you are using the core UI, use the following steps:
 - a. In the **Terms and Conditions** related list, double-click **Insert a new row**.
 - b. Click the reference lookup icon and select a terms and conditions record from the list.
 - c. (Optional) Enter a number in **Order** to specify the sequence in which the record should appear in the terms and condition document.

Note:

If you attempt to enter a duplicate terms and conditions record for a contract and save the record, an error message appears and the new duplicate record is not added.

- If you are using the Hardware Asset Workspace, use the following steps:
 - a. On the **Terms and Conditions** tab, click **Add**.
 - b. When prompted, provide the required information.
- If you are using the Enterprise Asset Workspace, use the following steps:

- a. On the **Terms and Conditions** tab, click **Add**.
- b. In the dialog box, select the check box for each term and condition that you want to add.
- c. Click **Add**.

Build a terms and conditions document within a contract

After adding one or more terms and conditions records to a contract, you can build a terms and conditions document within the contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

The terms and conditions records are added in the sequence specified in the **Order** field.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract Management > Contract > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Verify that one or more terms and conditions records have been added to the **Terms and Conditions** tab.
4. On the **Terms and Conditions** tab, build the terms and conditions for the contract.
 - If you are using the core UI, click the **Build Terms and Conditions** related link.
 - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, click **Build Terms and Conditions**.

All records from the Terms and Conditions list are added to the Terms and Conditions for the contract.
5. Click **Update**.

Create a contract rate card

You can create rate cards to track contract expenses. Rate cards help to record and allocate costs.

Before you begin

You must activate the Cost Management plugin to use rate cards.

Role required: financial_mgmt_user, asset, or contract_manager

About this task

A contract rate card provides detailed price information for a contract and enables you to generate expense lines for recurring expenses automatically. There can be multiple rate cards for the same contract.

Consider the following case: an organization has a contract with a third-party company, which oversees technical operations in the organization's data centers. The contract costs to use a

specific server model in the New York data center are different from using the same server model in the Madrid data center. There are two rate cards to detail these costs separately.

Procedure

1. Navigate to **Contract Management > Contract > All**.
2. Select a contract.
3. In the **Contract Rate Cards** related list, click **New**.
4. On the Contract Rate Card form, fill in the fields.
For a description of the field values, see [Contract Rate Card form](#).
5. Click **Submit**.

Contract Rate Card form

The Contract rate card form enables you to generate expense lines for recurring expenses automatically by providing detailed price information for a contract. There can be multiple rate cards for the same contract.

Field	Description
Number	Contract rate card number.
Contract	Internal contract number.
Summary type	Contract rate card type. Categorizing rate cards can be useful for reporting. Select Grow Business, Run Business, or Transform Business .
Name	Descriptive name for the contract rate card.
Active	Option that indicates whether the rate card is available for use.
Short description	Brief description of the contract rate card.
Start date	Date on which the contract rate card becomes active. Expense lines are generated for the costs incurred beginning on the date specified. For financial calculations to work, the date cannot be before the start date of the contract.
End date	Date on which the contract rate card becomes inactive. For financial calculations to work, the date cannot be after the end date of the contract. If no value is entered, the date is automatically set to the end date of the contract if the contract has an end date. No expense lines are generated for costs incurred after the end date.
Interval	The amount of time between rate card charges. For example, Monthly, Quarterly, or Annually .
Cost center	The cost center financially responsible for the rate card.
Last processed	The most recent date on which the rate card was charged.
Next process	The next date on which the rate card will be charged.

Field	Description
Description	Detailed information about the rate card.
Sales tax	Option that indicates whether to apply sales tax to the total cost.
Tax rate	The effective tax rate to apply to the total cost. This tax rate is usually the average tax rate charged.
Distribute cost	The method for distributing the amount listed in the Base cost field and generating expense lines.
Value	Type of value to use when Allocate and distribute cost based on value is selected in the Distribute cost field.
Base cost	The amount that must be paid before taxes.
Tax cost	Total cost of the tax.
Total cost	Final cost of the rate card after adjustments such as taxes have been applied.

Create a new expense line

Typically, expense lines are automatically generated based on assets or users, but you can create a new expense line manually if needed.

Before you begin

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract Management > Contract > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. In the **Expense Lines** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace), click **New**.
4. Complete the form.

Expense line table

Field	Description
Number	The unique number identifying the expense line.
Date	The date on which the expense line was created.
Rate Card	The identification number of the rate card to which the expense line is associated.
Rate type	The rate type that is considered during the expense line generation. This field is read-only.

Field	Description
Source ID	The identification number of the item associated with the expense line. If this field is filled in, corresponding information is automatically added to the Source fields on this form.
Amount	The monetary value of the item specified in the Source ID field. Enter a negative value to indicate a credit.
Process date	The date the expense line is processed.
Inherited	Check box that indicates whether the expense line is on another expense line.
State	The current state of the expense line, either Pending or Processed .
Summary type	The expense line category: Grow Business , Run Business , or Transform Business . Categorizing expense lines can be useful for reporting.
Short description	A brief description of the expense line.
Asset	The identification number of the asset associated with the expense line, if any.
Fixed asset	Fixed asset that contains the asset in this expense line. A fixed asset is a container that holds one or more individual assets, including hardware or software assets. The system auto-populates this field with the appropriate fixed asset if the named Asset is contained within that fixed asset.
Contract	The identification number (not the contract number) of the contract associated with the Asset , if any.
User	The name of the user associated with the Asset , if any.
Configuration Item	The name of the configuration item associated with the expense line, if any.
Task	The identification number of the task associated with the expense line, if any.
Cost center	The cost center financially responsible for the item identified in Source ID , if any.

5. Click **Submit** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).

Generating expense lines based on assets or users

An expense line is an expense amount at a given point in time and the record that incurred or generated the expense. You can generate expense lines based on assets or users assigned to the contract.

Before you begin

Role required: financial_mgmt_user, asset, or contract_manager

About this task

Generating expense lines is a three-step procedure.

Procedure

Add a user or asset to a contract

You can add a user or asset to a contract to generate expense lines.

Before you begin

Role required: `asset`, `financial_mgmt_user` (core UI and Hardware Asset Workspace only), `contract_manager` (core UI and Hardware Asset Workspace only), `sn_eam.enterprise_admin` (Enterprise Asset Workspace only), or `sn_eam.enterprise_asset_manager` (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract Management > Contract > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add assets or users to the contract.
 - If you are using the core UI, use the following steps:
 - a. In the **Assets Covered** or **Users Covered** related list, click **New**.
 - b. Specify an **Asset** or **User**.
 - c. Specify a **Date Added**.
 - d. Click **Submit**.
 - e. (Optional) Repeat the previous steps to add more assets or users to the contract.
 - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:

Note:

You cannot add users to a contract in the Enterprise Asset Workspace.

- a. In the **Assets Covered** or **Users Covered** tab, click **New**.
- b. In the dialog box, select the check box for each asset or user that you want to add to the contract.
- c. Click **Add**.

Create a rate card and assign a user or asset

You can assign a user or asset when you create a rate card. You can only assign the user or asset that is assigned to the contract.

Before you begin

Role required: `financial_mgmt_user`, `asset`, or `contract_manager`

Procedure

1. Navigate to **Contract Management > Contract > All**.
2. Select a contract with an assigned user or asset.
3. In the **Contract Rate Cards** related list, click **New**.
4. Specify a **Start date**.
 - For financial calculations to work, the date cannot be before the start date of the contract.
5. Right-click the header bar and select **Save**.

6. In the **Asset Covered** or **Rate Card Users** related list, click **New**.
7. Select the **Asset** or **User** who is assigned to the contract.
Only assets and users associated with the parent contract are listed.
8. Specify a **Date Added**.
9. Click **Submit**.

Configure rate card expense generation

After assets or users are added to the rate card, you can use the **Distribute cost** field in the Financial section of the contract to generate rate card expenses.

Before you begin

Role required: financial_mgmt_user, asset, or contract_manager

Procedure

1. Navigate to **Contract > Contracts > All**.
2. Select the contract to generate expenses.
3. In the **Contract Rate Card** related list, select a rate card.
4. In **Distribute cost**, select one of the following options to distribute the amount listed in **Base cost**.

Option	Description
<p>Split expense lines evenly across assets</p>	<p>Select Allocate and distribute cost per asset.</p> <p>For example, with a \$100 Base cost and two assets, two expense lines for \$50 are created.</p>
<p>Split expense lines across assets based on asset value</p>	<p>Select Allocate and distribute cost based on value:</p> <p>The Value field displays with Cost and Residual Cost options. The cost is derived from the Cost or Residual Cost field on an asset record. If there are multiple assets on the rate card, the cost or residual cost is distributed based on the value of the assets.</p> <p>For example, if you select the Cost option with a \$100.00 Base cost, one asset worth \$70, and one asset worth \$30, two expense lines are created, one for \$70 and one for \$30.</p>
<p>Split expense lines evenly across users</p>	<p>Select Allocate and distribute cost per user.</p> <p>For example, with a \$100 Base cost and two users on the contract, two expense lines for \$50 are created.</p>
<p>Allocate the cost to the contract instead of the individual assets</p>	<p>Select Allocate cost to contract.</p>

5. Select **Update**.

Expense lines are automatically generated by a scheduled job for costs incurred between the rate card **Start date** and **End date**. The scheduled job, *Process FM Costs*, runs on the Contract [ast_contract] table once per day. This scheduled job runs forward and generates additional records from the Next Process [next_process] time. Expense lines are only generated from contracts with the **Active** or **Expired** state. You may want to generate expense lines for expired contracts to track previous expenses.

Related topics

[Contract life cycle](#)

View contract expense lines

Use the **Expense Lines** related list or tab to view and audit all the expenses recorded for a given contract.

Before you begin

Role required: asset, financial_mgmt_user (core UI and Hardware Asset Workspace only), contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Select the **Expense Lines** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace).
4. Select an expense line record to view.

Information such as expense line details, total cost of the contract, and the contract current value is listed.

Monitor a contract

You can monitor contracts by viewing contract history and creating contract reports.

Before you begin

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

If changes are made to a contract start date, end date, or terms and conditions, a copy of the contract is automatically saved and placed in contract history. This is useful for tracking changes to a contract and keeping an audit trail. Configure the **Contract History** related list or tab to include columns for creation and update so you can easily see who edited the contract.

Procedure

1. Open the list of contracts that are used across your deployment.
 - If you are using the core UI, navigate to **Contract > Contracts > All**.
 - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
 - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. View the **Contract History** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace) and perform one of the following actions.
 - If earlier versions of the contract exist, click a date in the **Contract Starts** column to view a version.
 - If an earlier version of the contract does not exist, change the contract's **Start date** or **End date**. Right-click in the header bar and select **Save**. In the **Contract History** related list, click a date in the **Contract Starts** column to view the earlier version.

Run a contract report

A variety of contract reports are available to help track and manage contracts.

Before you begin

Role required: contract_manager or admin

Procedure

1. Navigate to **All > Reports > View / Run**.
2. Select one of the following reports to run.

Contract reports

Report	Description
Active Contracts by Cost Per Unit	All active contracts grouped in ascending order by average cost per unit.
Active Contracts by Lifetime Cost	All active contracts with an associated rate card grouped in ascending order by total cost. Total cost is measured from the beginning of the contract to the report run date.
Active Contracts by Monthly Cost	All active contracts grouped in ascending order by cost per month.
Active Contracts by Vendor	All active contracts alphabetically by vendor.
Active Contracts by Yearly Cost	All active contracts grouped in ascending order by cost per year.
All Contracts by State	Contracts grouped by state, such as Draft , Active , or Expired , in bar chart format

Report	Description
Asset Contracts by Type	All active contracts for assets grouped by type, in pie chart format.
Asset Contracts List	All active contracts for assets by contract number.
Contract Expenditure by Type	Total contract expenses by type, such as lease, maintenance, or warranty, in bar chart format.
Contract Expenditure by Vendor	Total costs of all contracts associated with a specific vendor, in bar chart format.
Contract Pipeline Report	All contracts with a state of Draft , Active , or Expired and a substate of Awaiting Review or Under Review , in bar chart format.
Expiring Contracts	All contracts expiring in the next 90 days.

Condition check definitions

Condition check definitions enable you to define logical conditions that indicate when to change a field value in a record.

A scheduled job, called *Contract Compliance Checks* in **System Scheduler > Scheduled Jobs**, evaluates these condition check definitions daily by running the condition checker. When this job is run, the ConditionChecks Script Include is triggered that runs the Condition Check Definitions. Use this condition checker to check start dates and end dates and to set expiration levels for contracts.

For example, a contract has a start date of March 1. When the condition checker runs on March 1, it verifies that the contract **Substate** is **Approved** and sets the contract **State** to **Active** based on the **Start Date** field.

The daily condition checker sets the appropriate expiration level for active contracts based on the contract **End Date**. The expiration level can be viewed in the Contracts list. Knowing the expiration level can help contract managers renew or extend a contract before it expires.

Define a condition check

You can define a condition check to change values in a contract when the *Contract Compliance Checks* scheduled job runs each night.

Before you begin

Role required:

- admin/contract_manager/contract_system_admin: Read access
- admin: Write access

Procedure

1. Navigate to **All > Contract > Administration > Condition Check Definitions**.
2. Click **New**.
3. Complete the form.

Condition check definition fields

Field	Description
Table	The table to which the condition applies. For a contract check definition, select Contract [ast.contract] .
Category	The category for the condition check. Select Contract or None . The category is used for organizing information and reporting.
Condition field	The field to be updated, typically Expiration level or State .
Event name	The name for the event to be fired when this condition changes the value of the field. Create a name using this syntax: <table_name>.<condition_field>, for example, <code>contract.validation</code> .
Order	The order in which the conditions are evaluated.

4. Right-click the header bar and click **Save**.
The **Conditions** related list appears.
5. In the **Conditions** related list, click **New**.
6. Complete the form.

Conditions fields

Field	Description
Name	The value the field is set to, if the expiration conditions are met.
Condition check	The associated condition check.
Table	The table associated with the condition check.
Event name	The name of the event this condition triggers.
Expiration Condition	The condition that must be true for the Condition check field to be set to this value (the Name). Add as many conditions as are needed.
Compliant state	System field. Do not use.
Order	The order in which the conditions are evaluated. The first condition that is found to match, where the Expiration Condition is true, is used, and no others are checked.

7. Click **Submit**.
The Condition Checks form reopens with the new condition listed in the related list.
8. **Optional:** Continue adding conditions as needed, following the steps above.

Domain separation and Contract Management

Domain separation is unsupported in Contract Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see [Application support for domain separation](#) .

Related topics

[Domain separation for service providers](#) .

Procurement

Procurement managers can use the ServiceNow[®] Procurement application to create purchase orders and to obtain items for fulfilling service catalog requests.

Procurement offers the ability to perform the following functions.

- Track service catalog requests
- Create and manage purchase orders
- Create and manage transfer orders
- Receive assets

Procurement roles

The Procurement application uses the following roles.

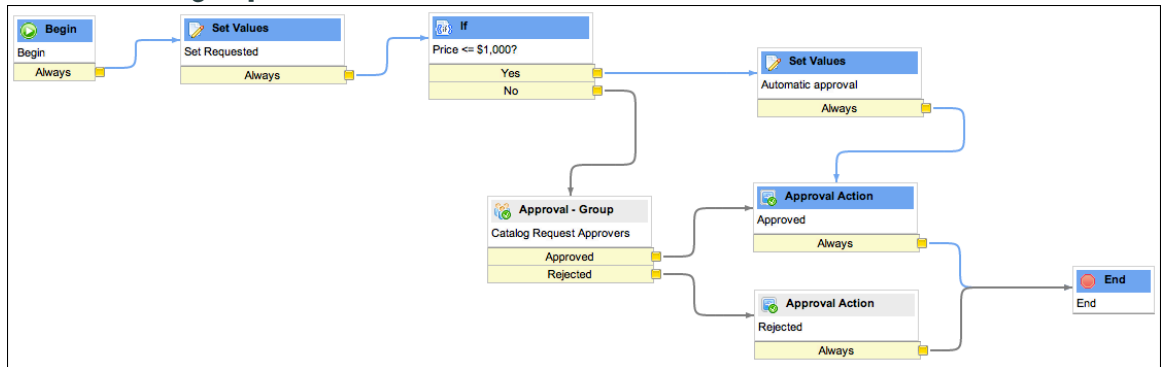

Role	Contains roles	Description
procurement_admin	procurement_user	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can refresh, add, delete, and rearrange gauges in the Procurement Overview module.
procurement_user	financial_mgmt_user, model_manager	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can view and refresh gauges in the Procurement Overview module.

Procurement workflows

Procurement uses the following workflows.

- In the Service Catalog Request workflow, items ordered from the service catalog that cost over one thousand dollars require approval.

Service catalog request workflow

- In the Source Request workflow, catalog tasks are created so that a procurement manager can source the item by creating a transfer order or purchase order.

Source request workflow

These workflows are provided in the base system. You can edit these workflows in the graphical Workflow Editor or create a workflow to better fit your organization's procurement needs.

Related topics

[Workflows](#)

Use the Procurement Overview module

Use the gauges on the Procurement Overview homepage to help you track and manage requests, purchase orders, and other important aspects of the procurement process.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All > Procurement > Overview**.
2. Click elements within the gauges to obtain more information.

Example

For example, click a request number to view the request record.

Activate Procurement

You can activate the Procurement plugin that provides core procurement capabilities.

Before you begin

Role required: procurement_admin, procurement_user

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Procurement plugin (com.snc.procurement) using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

i Note:

When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>`.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#) .

Components installed with Procurement

Several types of components are installed with Procurement.

Demo data is available with Procurement. The demo data provides sample requests, purchase orders, purchase order line items, and receiving slips.

Business rules installed with Procurement

Procurement plugin adds the following business rules.

Business rule	Table	Description
Adjust remaining quantity	Purchase order line items [proc_po_item]	Calculates the remaining quantity of items ordered on a purchase order line items by subtracting the amount received from the amount ordered.
Can request be sourced	Request [sc_request]	Checks if a request can be sourced.
Cancel Procurement Orders	Request [sc_request]	Cancels all unreceived purchase orders and unshipped transfer order lines associated with the request's items if the request state changes to Closed Cancelled .
Check if req item is sourced	Requested Item [sc_req_item]	Sets the Sourced field on the parent request to true if all requested items have been sourced.
Check if request is sourceable	Requested Item [sc_req_item]	Checks if the request associated with a requested item can be sourced (obtained from a transfer order or by creating a purchase order to a vendor).
Create Assets	Receiving Slip Line [proc_rec_slip_item]	If the purchase order line item is available, creates the assets for a receiving slip line when the slip line assets are received.

Business rule	Table	Description
Handle roll up states and assets removal	Purchase order line items [proc_po_item]	Manages purchase order line items if they are canceled or received. If a purchase order line is canceled, this business rule deletes any pre-created assets. This business rule also checks the status of other purchase order lines that share the same purchase order and, if necessary, updates the status of the purchase order. For example, when the last purchase order line is received, the status of the purchase order changes to Received .
Redirect TOL to existing TO-Procurement	Transfer Order Line [alm_transfer_order_line]	Attaches a transfer order line to an existing transfer order if the transfer order is in the Draft stage and has the same From stockroom and To stockroom values as the transfer order line.
Shipping Cost Changes	Purchase Order [proc_po]	Recalculates the total cost of the purchase order if the shipping rate changes.
State Change	Transfer Order Line [alm_transfer_order_line]	Marks the requested item as Received if the state of the associated transfer order line changes to Received .
State Change	Purchase order line items [proc_po_item]	Sets the time at which the purchase order line item is ordered and updates the original requested item when the purchase order line item is received.
State Change PO	Purchase Order [proc_po]	Changes the purchase order line item status when the status of the associated purchase order changes.
Total Cost	Purchase order line items [proc_po_item]	Calculates the total order cost based on the cost of individual items and the quantity ordered. When you receive a purchase order line item, this business rule also takes the following steps. <ul style="list-style-type: none"> • Populates the List price field with the value from the Cost field unless you enter a different value. • Calculates the Total list price field value by multiplying the List price and Ordered quantity values.
Update expected delivery date for PO	Purchase order line items [proc_po_item]	Sets the Expected delivery date for purchase orders to the latest purchase order line Expected delivery date .
Update expected delivery date for POLs	Purchase Order [proc_po]	Sets the Expected delivery date of associated purchase order lines to the purchase order's Expected delivery date if at least one of the following conditions is true.

Business rule	Table	Description
		<ul style="list-style-type: none"> The purchase order line has no expected delivery date. The purchase order line's expected delivery date is later than the purchase order's expected delivery date. The purchase order line's expected delivery date is the same as the purchase order's previous delivery date.
Update Ordered Date	Purchase Order [proc_po]	Sets the Ordered date field to the date and time at which the status of the purchase order is set to Ordered .
Update PO	Purchase order line items [proc_po_item]	Updates the purchase order if the cost of any purchase order line item changes.
Update Purchase Order Line	Receiving Slip Line [proc_rec_slip_item]	Updates the Quantity received field on the associated purchase order line item when a receiving slip item is received.
Update Request Item CI	Hardware [alm_hardware]	Sets the Configuration item field on the catalog task and requested item to the related hardware CI created during the procurement process.

Script includes installed with Procurement

Procurement plugin adds the following script include.

Script include	Description
ProcurementUtils	Provides utilities for Procurement.

Tables installed with Procurement

Procurement plugin adds the following tables.

Table	Description
Purchase Order [proc_po]	Stores information about items ordered, cost of items ordered, and users that require the items for orders placed with a vendor. Note: The asset, procurement_user, inventory_admin, or contract_manager role can only access the reports. You must activate the Hardware Asset Management Professional (com.sn_hamp) plugin for the contract_manager and inventory_admin role.
Purchase order line items [proc_po_item]	Stores information about items and quantity ordered on purchases orders. Note: The asset, procurement_user, inventory_admin, or contract_manager role can only access the reports. You must activate the Hardware Asset Management Professional (com.sn_hamp) plugin for the contract_manager and inventory_admin roles.
Receiving Slip [proc_rec_slip]	Stores receiving information for items ordered with a purchase order. Can reference multiple receiving slip lines.
Receiving Slip Line [proc_rec_slip_item]	Stores receiving information for items ordered on a specific purchase order line, such as the items ordered, quantity ordered, and who ordered them.

User roles installed with Procurement

Procurement plugin adds the following user roles.

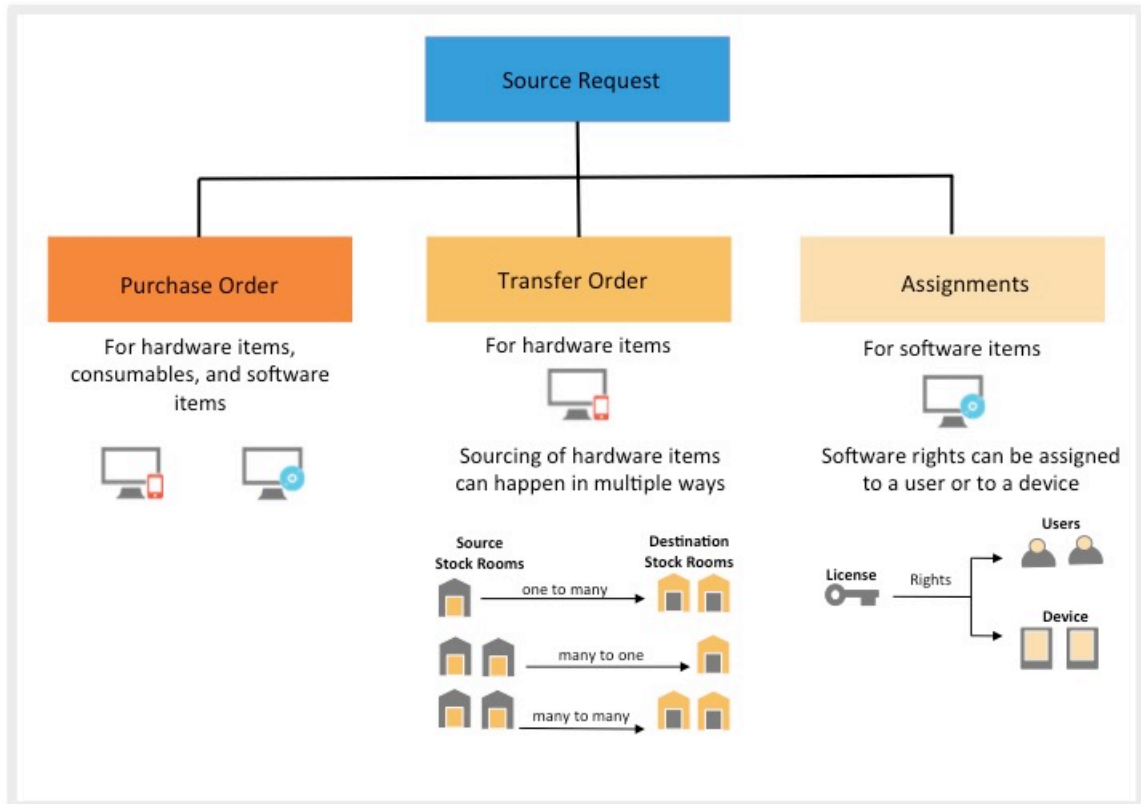

Role	Contains roles	Description
procurement_admin	procurement_user	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can refresh, add, delete, and rearrange gauges in the Procurement Overview module.
procurement_user	financial_mgmt_user, model_manager	Can create purchase orders without a request. Can view requests and requested items. Can

Role	Contains roles	Description
		view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can view and refresh gauges in the Procurement Overview module.

Sourcing items in a service catalog request

A service catalog request can contain multiple items that must be sourced.

Methods of sourcing requested items

Note:

Only items with an assigned model can be sourced. You can't source bundles.

Sourcing requested items from local stockrooms

You can use the assets available in the requester's local stockroom to fulfill a service catalog request. The assets that are in stock are reserved and a fulfillment task is created to source and fulfill the request.

Sourcing requested items from other stockrooms

When the requested items aren't in stock, you can create a purchase order to deliver the items from other source stockrooms to your local stockroom. You can request multiple items in a purchase order.

After creating a purchase order, you can create hardware assets and reserve it for the requester either before or after you receive the requested items. You can't create or assign software licenses to the requester before you receive the software licenses.

Sourcing requested hardware items

You can source requested hardware items by creating a transfer order. You can transfer hardware assets from a source stockroom to multiple destination stockrooms.

When a source stockroom doesn't have enough items in stock, you can specify multiple source stockrooms in the transfer order so that the hardware items can be transferred to the destination stockrooms.

i Important:

If the Field Service Management application is also activated on your ServiceNow instance, then a workflow in this application processes the transfer orders. For more information, see [Move an asset through the transfer process](#).

Sourcing requested software licenses

To source a requested software license, you must assign the rights of the software license to a user or a device so that they're authorized to use the software.

Related topics

[Manage transfer orders](#)

[Track a request from the service catalog](#)

[Models](#)

[Bundled models](#)

[Source requests from local stockrooms](#)

Create a purchase order from a request

You can create a purchase order directly from a request. This enables procurement managers to obtain items and fulfill requests from the Service Catalog. You can create multiple purchase orders from a request.

Before you begin

Role required: `procurement_admin` or `procurement_user`

Procedure

1. Navigate to **All > Procurement > Requests > Requests**.
2. Select the **Number** of a request that has been approved but not sourced. Look in the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a Source Request Items number.
4. Select **Source Request**. The Source Request screen is displayed with a list of all the requested items.
5. Select **Purchase** in the requested item section.
6. In the **Vendor** list, select the vendor from which the requested item or items should be delivered.
7. Verify if the **Out of Stock** field is set to **false**. If the vendor doesn't have stock, the field value will be **true**.
8. In the **Quantity** field, specify the quantity you want to order.
9. In the **Destination Stockroom** list, select the destination to which the requested item or items should be delivered.

10. Optional: Select the **Consolidate PO** check box to combine the listed items with existing purchase orders.

(Optional) When you check Consolidate Purchase Orders, all items sourced from the same vendor on the same request are placed on the same purchase order. When you select a vendor, the system automatically searches for purchase orders that have been created for the same request, have the same **Vendor** selected, and have the **Requested** status. If the system finds a match, all items are placed on the same purchase order and can be ordered together. If the system does not find a match, a new purchase order is created.

For example, if you are purchasing 25 phones from Apple and an open purchase order already exists for Apple, the 25 phones are added to the open purchase order. If there are no open purchase orders for the selected vendors, new purchase orders are created. Items ordered from the same vendor are grouped together. Different items are shown on separate lines on the purchase order.

11. Select Submit.

Result

- Purchase order is created.
- On the request, the **Sourced** check box is selected

Create a transfer order from a request

You can create a transfer order directly from a request to source hardware items and consumables from stockrooms.

Before you begin

Role required: procurement_admin or procurement_user

Important:

If the Field Service Management application is also activated on your ServiceNow instance, then a workflow in this application processes the transfer orders. For more information, see [Move an asset through the transfer process](#).

Procedure

1. View procurement requests.
2. Select a request that has been approved but not sourced.
Check the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a sourcing task.
4. Select **Source Request**.
The Source Request or Sourcing page appears with a list of all the requested items.
5. Create a transfer order.
6. **Optional:** On the Sourcing page of the Hardware Asset Workspace, select the **Source through distribution channel** check box to source the assets from the inbound distribution channels that support the destination stockrooms.

Note:

The **Source through distribution channel** check box that enables you to source through a distribution channel for Transfer orders appears only in the Hardware Asset Workspace. Your preference of selecting or clearing this check box is saved and is shown when you open the Sourcing page again.

You can associate the location of the requester as a service location with multiple stockrooms for better location coverage. Also, these stockrooms can be associated with multiple inbound stockrooms or distribution channels for optimized transfer of assets between the stockrooms. Distribution channels enable you to source the assets from the stockrooms that you prefer for sourcing based on the rank that you provide to the stockrooms.

For more information, see [Associate a stockroom with service locations](#) and [Link stockrooms into a distribution channel](#).

- In the **Source stockroom** list, select a stockroom from which the hardware item should be sourced.

Note:

In the Hardware Asset Workspace, the Source stockroom list shows only the inbound distribution channels of the stockrooms that support the location of the requester under the following conditions:

- When you've selected the **Source through distribution channel** option.
- When the inbound distribution channels are added to the stockrooms that support the location of the requester.

- In the **Transfer Quantity** field, specify the quantity you want to transfer. The **In stock** column, displays the total stock available with the selected source stockroom.
- In the **Destination stockroom** list, select the destination to which the requested item or items should be delivered.

Note:

In the Hardware Asset Workspace, the Destination stockroom list shows only the stockroom that supports the location of the requester under the following conditions:

- When you've selected the **Source through distribution channel** option.
- When the location of the requester is added as a service location of one or more stockrooms.

- Select **Submit**.

A transfer order is created to move the item or items from the **Source stockroom** location to the **Destination stockroom** location. When you view the request, the **Sourced** check box is selected.

[Manage transfer orders](#) 

Source requests from local stockrooms

Get visibility into local stockrooms at the time of sourcing requests.

Before you begin

You can source a request by using assets from the requester's local stockroom.

- If stock is available in the local stockroom, the asset is reserved and follows the fulfillment task to source the request.
- If the requester's location is supported by another stockroom as part of service locations, the asset can also be sourced from this stockroom.
- If stock in the local stockroom is unavailable, you can get the assets transferred from other stockrooms or create a purchase order.

The Workflow Studio application is used to create the Asset Local Stock subflow to take you through the process of using assets from your local stockroom to source your request. As the subflow takes you through the various stages, the asset details are automatically updated. You can open the Asset Local Stock subflow to view the status of the stages in the subflow.

Note:

Use decision tables to customize the Asset Local Stock subflow. For more details, see [Hardware Asset Management flow customization](#).

Role required:

- procurement_user or procurement_admin
- inventory_user or inventory_admin

Procedure

1. Log in with credentials for the role of procurement_user or procurement_admin.
2. Navigate to **All > Service Catalog** and select **Hardware**.
3. Select the hardware item that you want to source and select **Order Now**
Your request is submitted and the Order Status form layout appears.
4. Select the request number.
5. On the Request form layout, select the **Catalog Tasks** related list to view the sourcing task for the request.
6. Select the sourcing task and select **Source Request**.

Sourcing - SCTASK0010007 Submit

Source through distribution channel Consolidate PO line with open POs

<p>Apple MacBook Pro 15" R11M0010002 Total requested: 2 Requested for: Abel Tuter Location: 615 North Bush Street, Santa Ana, CA</p>	To be sourced: 2	Local stock: 6 <input type="button" value="Consume"/>	Transferable stock: 3 <input type="button" value="Transfer"/>	Vendor purchase: 2 <input type="button" value="Purchase"/>
--	------------------	--	--	---

Local order			
Source stockroom	In stock	Consume quantity	Reserved for
× Southern California Warehouse	5	1	Abel Tuter
× Santa Monica Warehouse	1	1	Abel Tuter

The Sourcing form shows the following hardware sourcing request details:

- **Total requested**- Quantity of the hardware requested.
- **Requested for**- Name of the person for whom the hardware is requested.
- **Location**- Place where the hardware should be deployed.

Trouble?

If the Source Request functionality or button isn't functioning as expected, confirm that the catalog task has both the **Parent** and **Request** fields populated. For more information, see [View and edit a catalog task](#). The Request ID, which is required for the Source Request page to function correctly is derived from the Parent field of the catalog task. If the Parent field is missing and the catalog task was created using Flow Designer, refer to the relevant [Set Parent field when creating Catalog Task from Flow Designer](#)  for further details.

7. Select **Consume** to source the available stock from the local stockroom and from the stockroom that supports your location.
If stock isn't available in your local stockroom and the stockroom that supports your location, select **Transfer** or **Purchase** to source the request via a transfer order or a purchase order. If you create a transfer order and want the local stockroom to be included in the list of stockrooms to choose from, the admin must turn on the `glide.asset.procurement.sourcing.local_stock_transfer` property.
8. Select **Source Stockroom** to select the stockroom from where you want to source the assets. If your location is associated with a stockroom as a service location, you can source from this stockroom along with the local stockroom. Service location capabilities enable a single stockroom to support multiple locations and consume the local stock efficiently. For more information on Service locations, see [Associate a stockroom with service locations](#).

If the Asset pick task is enabled for the source stockroom, then this task is added to the Hardware Asset Refresh Request and Hardware Asset Request flows.

9. In the **Consume Quantity** field, specify the quantity of assets that you want to consume from the stockroom that you selected.
10. Select **Reserved for** to specify a user for whom you want to source the request.
11. To source from multiple stockrooms, repeat steps 7–9.
12. Select **Submit**.
A consume asset task is created. Assets are selected from the stockrooms and are reserved for the user who you selected in the **Reserved for** list. The state of the selected asset moves to in stock and the substate to reserved.
13. Log in with credentials for the role of `inventory_admin` or `inventory_user`.
14. Select the **Requested Items** related list and then select the request item.
15. Select the **Asset Tasks** related list and then select a task to select and assign an asset to the sourcing task.
The Consume Asset Task form layout appears in the Asset Tasks module. Based on the type of asset (hardware or consumable) that is being sourced, fields in the form layout differ. The Assets Tasks module lists all the asset task records.
16. Change that you need and then close the task when you're done.
 - For hardware assets: Assets are auto-assigned to sourcing tasks but you can change an asset by selecting the **Asset** list. After you're done, select **Close Task**.
 - For consumable assets: The model for the asset appears on the form layout instead of the asset. Select **Close Task** or **Consume and Close**. If you select **Consume and Close**, the reserved asset is automatically picked up and assigned to the user. If you select **Close Task**, you must go to the Consumable form layout and assign an asset to the user manually.

Add an assignment from a request

You can add assignments directly from a request to source rights from software licenses.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All > Procurement > Requests > Requests**.
2. Select the request that has been approved but not sourced.
Check the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a number.
4. Select **Source Request**.
5. Select **Add assignments** in the requested software item section.
6. In the **License Name** list, select a license from which the software rights should be sourced.
The **Available Rights** column, displays the total rights available with the selected license.
7. In the **Rights** field, specify the rights you want to assign.
8. From the **Type** list, select whether to assign the rights to a user or device.
9. In the **Assigned\Allocated** list, select the user or device to whom the requested item should be assigned.
10. Select **Submit**.
An assignment is created to assign rights from the **License Name** location to the **Assigned \Allocated** user or device. When you view the request, the **Sourced** check box is selected.
11. Run the counter to make sure that you are in compliance.
You are prompted to run the software counter if the Software Asset Management is active.
12. Select **OK**.
For auditing, the **Assigned Licences** related list in the Request form will provide the details of all the assignments done as part of this request.

Procurement purchase order management for assets

Accurate purchase order information is important for invoice tracking, receiving, and reporting in the ServiceNow platform.

The Procurement application enables users with an appropriate procurement role to manage purchase order information for assets. It also provides direct access to service catalog requests. You can create purchase orders and transfer orders directly from requests.

Before using the Procurement application, create assignment groups for catalog tasks. Assignment groups are sets of users, filtered by location, who can perform catalog tasks.

Related topics

[Manage transfer orders](#) 

[Create a group](#) 

Track a request from the service catalog

The Procurement application lets you track a request that was ordered from the service catalog.

Before you begin

Role required: procurement_admin or procurement_user

About this task

When a user places an order from the service catalog, a request record is created to track the order. Each ordered item becomes a requested item that is listed on the request record. For

example, a single request for one laptop, two monitors, and one keyboard creates the following records.

Request REQ0000001: 4 items

- Requested Item RITM0000001: 1 laptop
- Requested Item RITM0000002: 2 monitors
- Requested Item RITM0000003: 1 keyboard

Procedure

1. Navigate to **All > Procurement > Requests > Requests**.

2. Click a request **Number**.

The **Requested Items** related list displays the items that were ordered. You can view the requested item, or view associated **Purchase Orders**, **Transfer Orders**, and **Assignments** on other related lists. A catalog task is automatically generated for each requested item to identify the source of the item, whether it must be purchased or transferred from a stockroom.

Cancel a request from the service catalog

You can cancel a request from the service catalog if, for example, the item is no longer needed or the request was not approved.

Before you begin

Role required: catalog_admin, procurement_admin, or procurement_user

About this task

When a service catalog request is canceled, the following actions occur automatically.

- Associated purchase orders that have not been received are canceled.
- All procurement tasks are canceled.
- Associated transfer orders are canceled, if all transfer order lines related to the transfer order are also associated with the service catalog request and the transfer order lines have all been canceled. If the transfer order contains transfer order lines that are not related to the service catalog request and those lines have not been canceled, the transfer order is not canceled.

Associated transfer order lines that are in the **In Transit** or **Delivered** stages are not canceled.

Procedure

1. Navigate to **All > Procurement > Requests > Requests**.

2. Click a request **Number**.

3. Click **Cancel Request**.

View and edit a catalog task

Catalog tasks are used to source items and fulfill requests. You can view and edit catalog tasks from a request.

Before you begin

Role required: procurement_admin or procurement_user

About this task

If a request requires approval, a catalog task is created automatically when the request is approved. If a request doesn't require approval, a catalog task is created automatically when the request is created.

Note:

If a request contains one requested item and the item has no model specified, a catalog task isn't created automatically. If a request includes multiple items and only some have a specified model, catalog tasks are automatically created, but only for those items with a model.

Procedure

1. Navigate to **All > Procurement > Requests > Tasks**.
2. Open a catalog task.
3. Edit the fields as necessary.

Catalog task fields

Field	Description
Number	The unique number identifying the catalog task.
Request	The number of the request to which the catalog task is associated. The information in this field is derived from the Number field on the Request form.
Request item	The number of the requested item to which the catalog task is associated. The information in this field is derived from the Number field on the Requested Item form.
Requested for	The name of the person for whom the associated item was requested. The information in this field is derived from the Request or Request item field.
Due date	The date by which the catalog task should be completed.
Configuration item	The configuration item associated with the Request Item .
Approval	The status of catalog task approval: Not Yet Requested, Requested, Approved, or Rejected .
State	The current state of the catalog task: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, or Closed Skipped .
Assignment group	The group from which an individual is selected to complete the catalog task.
Assigned to	The individual assigned to complete the catalog task is selected from the Assignment group .
Work notes list	The list of users to receive email notifications when the work notes on the catalog task are updated.
Short description	A brief description of the catalog task.
Description	A detailed description of the catalog task.
Work notes	Information about how the catalog task is resolved.
Parent	The parent record associated with the task.
Additional comments	Additional information about the catalog task.

4. Select **Update**.

Related topics

[Models](#)

Create a purchase order

You can create a purchase order. Purchase orders specify assets to order from a single vendor.

Before you begin

Role required: procurement_admin or procurement_user

About this task

For example, an organization can create a purchase order to buy 20 laptop computers or 10 servers. Information on a purchase order enables physical and financial tracking of the assets that were ordered.

You can also use a transfer order if an asset is already owned by an organization. A transfer order is used to internally transfer assets from one stockroom to another instead of purchasing the assets. For example, a company stockroom in New York has five laptops that are needed in Boston. You create a transfer order to move the laptops from the New York stockroom to the Boston stockroom.

After you create a purchase order, the **Receiving Slip** related list is available on the Purchase Order form. A receiving slip is created manually or automatically when the item is received. The **Receiving Slip** related list shows all receiving slips related to the purchase order. After a receiving slip is added to a purchase order, all fields on the purchase order record become read-only.

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Click **New**.
3. Complete the form.

Purchase order fields

Field	Description
Number	The unique number identifying the purchase order.
Due by	The date by which the purchase order Total cost must be paid.
Vendor	The supplier to which the purchase order was issued.
Ship to	The stockroom to which the items on the purchase order should be shipped. Note: This field is required but doesn't affect creating requisitions for software on Coupa.
PO date	The date on which the purchase order was created.
Status	The status of the purchase order: Canceled, Ordered, Received, Requested, or Suspended .
Assigned to	The user to whom the purchase order is assigned.
Bill to	The location responsible for paying the purchase order Total cost .

Field	Description
Short description	A brief description of the purchase order.
General section	
Shipping	The delivery method to be used when shipping the items on the purchase order.
Terms	The purchase order payment terms: Credit, Net 30 days , or Net 90 days .
Ship rate	The amount that must be paid for the delivery method specified in the Shipping field.
Total cost	The sum of all item costs on the purchase order and the shipping costs.
Description	A full description of the purchase order contents.
Details section	
Initial request	The record number of the request that requires the items on the purchase order.
Requested by	The user requesting the items on the purchase order. Note: The email ID or email address of the user requesting the items on the purchase order must be the same on both Coupa and ServiceNow Procurement application.
Requested	The date the user in the Requested by field requested the items on the purchase order.
Ordered	The date and time of clicking the Order button on the Purchase Order form.
Expected delivery	The date the items associated with the purchase order are expected to arrive in the stockroom identified in the Ship to field. This field can't be edited when the purchase order has a Status of Received or Canceled . (For more information about this field, see Purchase order expected delivery date .)
Received	The date and time at which the purchase order status changed to Received .
Contract	The record number of the contract with the vendor from which the items on the purchase order are ordered.
Department	The department responsible for paying for the purchase order.
Budget number	The budget number related with the purchase order.
Vendor account	The vendor account related with the purchase order.

4. Click Submit.

What to do next

Add purchase order line items to specify what you are ordering from this vendor.

Related topics

[Manage transfer orders](#) 

Create a purchase order line item

After you save a new purchase order, you create purchase order line item records to specify the individual items to order.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, select **New**.
4. Complete the form.

Purchase order line item fields

Field	Description
Number	The unique number identifying the purchase order line item.
Vendor	The supplier from which this product should be ordered.
Product Model	The model of the purchase order line item.
Product Catalog	The product catalog category to which the product model is assigned. For example, Hardware , Software , or Supplies .
Part number	The identification number assigned to the product model.
Metric group	Each metric group has a set of license metrics that are specific to the software publisher. Note: If you select only a software model in the Product model field, this field gets displayed on the form.
License metric	License metric for the license group that the software license is counted against when reconciliation is run. The options for license metric change based on the Metric group field. Note: <ul style="list-style-type: none"> ○ If you select only a software model in the Product model field, this field gets displayed on the form. ○ If you choose a license metric that isn't available on Coupa, the license metric value is defaulted as each.
Request line	The identification number of the requested item record associated with this purchase order line item.
Ordered	The date and time at which this purchase order line item was ordered.
Expected delivery	The date the purchase order line item is expected to arrive in the stockroom identified in the Ship to field on the purchase order record. This field is automatically filled with the value in the Expected delivery field on the

Field	Description
	<p>purchase order record. This field can be edited when the purchase order line item has a Status of Requested.</p> <p>For more information about this field, see Purchase order expected delivery date.</p>
Received	The date and time at which the purchase order line item status was changed to Received .
Purchase order	The purchase order record number associated with this purchase order line item.
Rights per license pack	Rights associated with each pack that is purchased for Microsoft Per Core or Microsoft Per Core with CAL licenses.
Number of packs	Number of packs for Microsoft Per Core or Microsoft Per Core with CAL licenses.
Status	The current status of the purchase order line item: Canceled, Ordered, Pending Delivery, Received, or Requested .
Ordered quantity	The number of product models that were ordered.
Received quantity	<p>The number of product models that were shipped and received. The vendor may have sent multiple shipments.</p> <p>The received quantity can be larger or smaller than the Ordered quantity. For example, you may have ordered five laptops but the vendor sent six.</p>
Remaining quantity	The number of product models that still need to be received to fulfill the Ordered quantity.
List price	The price at which the item retails, not including discounts. If the system creates the purchase order from the service catalog ordering process, the purchase order line item inherits the list price from the associated vendor catalog item. If the vendor catalog item does not have a list price value and you have not entered a value, this field is automatically populated with the value from the Cost field.
Cost	The cost of a single product model, including discounts. If the system creates the purchase order from the service catalog ordering process, the purchase order line item inherits the cost from the associated vendor catalog item Vendor Price .
Total cost	The cost of a single product model multiplied by the value specified in Quantity .
Non-catalog request	Select this check box to create a requisition for an item that is not present in the product catalog of the organization.

Field	Description
	<p>Note:</p> <ul style="list-style-type: none"> This field isn't visible on the form if you haven't published a procurement integration profile. For more information, see Integrating with external procurement applications. If you select only a software model in the Product model field, this check box gets displayed on the form. If you select an item in the Product Catalog field, the check box gets automatically unchecked. If you haven't selected any item in the Product Catalog field, this check box is automatically checked, which indicates you're submitting a non-catalog request.
Stock Order	<p>Read only and selected if the related request is using the bulk stock order workflow.</p> <p>Note: Appears for all purchase order line items when the Hardware Asset Management application is installed from ServiceNow Store.</p>
Short description	A few words or short phrase describing the purchase order line item.

5. Select **Submit.**

The purchase order reopens with the line item listed. The purchase order and line item are in **Requested** status.

6. Optional: Continue adding purchase order line items for this vendor, as needed.

7. After you initiate the order with the vendor and are ready to show that the order was placed, select **Order.**

The status of the purchase order and line items change to **Ordered**.

Related topics

[Vendor catalog items](#)

Purchase order status

Purchase orders follow a specific life cycle. The **Status** field on the purchase order record is always read-only.

Purchase order status

Status life cycle

Status	Description
Requested	The status is Requested when you create a purchase order.
Ordered	The status changes to Ordered when you add purchase order line items , and click Order .
Pending Delivery	When you create assets before receiving them as a purchase order line item, the status of purchase orders and purchase order line items changes to Pending Delivery status.
Received	When ordered assets arrive in the specified stockroom and you click Receive , the status of purchase orders and purchase order line items changes to Received .
Canceled	You can cancel a purchase order if its status is Requested , Ordered , or Pending Delivery . For more information, see Cancel a purchase order .

Purchase order expected delivery date

The purchase order record and the purchase order line item record both contain the **Expected delivery** date field.

The **Expected delivery** field can be edited on both records. Editing the field on one record can change the field on the other record.

- If you add an expected delivery date to the purchase order and the expected delivery date field on the purchase order line item is blank, the date on the purchase order is added automatically to the purchase order line item.
- If you add an expected delivery date on the purchase order line item and the expected delivery date field on the purchase order is blank, the date on the purchase order line item is added automatically to the purchase order.
- If the purchase order and the purchase order line item have the same expected delivery date and you change the date on the purchase order, the date is changed automatically on the purchase order line item.
- If you change the date on the purchase order line item to a date that is later than the one specified on the purchase order, the date on the purchase order is changed to the new date. The expected delivery date of a purchase order line item cannot be later than the expected delivery date on the associated purchase order.
- If you change the date on the purchase order line item to a date that is earlier than the date specified on the purchase order, the date on the purchase order remains the same.

Cancel a purchase order

You can cancel purchase orders with a status of **Requested**, **Ordered**, or **Pending Delivery**.

Before you begin

Role required: procurement_admin or procurement_user

About this task

Purchase order line items can also be canceled from a purchase order.

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Open a purchase order to cancel.

3. Click **Cancel.**

All associated purchase order line items that have not been received are canceled. Any assets created for the purchase order are deleted.

Cancel a purchase order line item

You can cancel a purchase order line items with a status of **Requested**, **Ordered**, or **Pending Delivery**.

Before you begin

Role required: procurement_admin or procurement_user

About this task

Keep the following in mind when you cancel a purchase order line item.

- When a purchase order line item is canceled, if all other line items are also canceled, the purchase order is canceled.
- After a purchase order line item is canceled, it can be reordered if the associated purchase order has not been canceled or received.
- If you cancel a purchase order line item for which assets were created, the assets are deleted from the system and removed from the purchase order.
- If you reorder the same purchase order line item, the assets are recreated for that line if the line has a status of **Pending Delivery**.

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, select a line item to cancel.
4. Click **Cancel**.

Reorder a purchase order

You can reorder a purchase order that was canceled.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Open a purchase order with a status of **Canceled**.
3. Click **Order**.
The status changes to **Ordered** for the purchase order and all associated purchase order line items.

Reorder a purchase order line item

You can reorder a purchase order line item that was canceled.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, select a line item with a status of **Canceled**.
4. Click **Order**.
The purchase order line item **Status** field changes based on the **Status** field of the associated purchase order. For example, if the purchase order has a status of **Pending Delivery**, the purchase order line item status changes to **Pending Delivery** and the assets for the purchase order line item are created automatically.

Create an asset and reserve it for the requester

Create the asset before they're delivered so that you can create the asset record with an asset tag and serial number early in the process and reserve the asset for the user who requested it. The receiver can only select the assets to be received as assets are pre-created.

Before you begin

Role required: procurement_admin or procurement_user

About this task

Some requests must be approved before items on the request can be sourced. In the base system, requests over \$1,000 require approval. To change the \$1,000 approval threshold and other workflow attributes, edit the Service Catalog Request workflow.

When the asset state is **In stock**, the **Reserved for** field is maintained as the asset is received and placed in a stockroom. When the asset state changes to **In use**, the **Reserved for** field is relabeled **Assigned to**. If there is a name in the **Reserved for** field, the name is retained when the field is relabeled. A user with the asset role can change the name in the **Assigned to** field. Changing the name is helpful, for example, if an IT technician orders 10 laptops and must assign them to individual users.

Note:

If assets are not created prior to delivery, they are automatically created from line items when purchase orders are received. Also you can enter the asset details and receive them when the purchase orders are received.

Procedure

1. Navigate to **All > Procurement > Requests > Tasks**.
2. Open a task with a **State** of **Open** and a **Short description** of **Source Request Items**.
3. Click **Source Request**.
 - If the request is already fulfilled or the items in the request are not sourceable, the **Source Request** button is hidden.
 - If the requested item does not have an assigned model, the item is not listed on the Source the Request dialog box.
 - Any items on the purchase order that have a remaining quantity of **0** are not listed on the Source the Request dialog box.
4. Select a **Destination Stockroom**.
5. Select the **Create PO** option for one or more listed items.
6. For each item requiring a purchase order, select a **Vendor**.
7. Click **OK**.

8. Navigate to **Procurement > Orders > Purchase Orders**.

9. Open the purchase order you just created.

If you created a purchase order for more than one item, multiple purchase orders may have been created.

10. Select **Order**.

After the items are ordered, no additional purchase order line items can be added to the purchase order.

The status of all purchase order line items changes to **Ordered**.

11. Click the **Create hardware assets prior to delivery** related link to automatically create hardware assets for all purchase order line items.

Hardware assets are listed in the **Assets** related list. Click an asset in the list to view the asset record. Except for consumables, the **Reserved for** field contains the name of the user who made the original request.

You can also create assets for individual purchase order line items. On a purchase order, go to the **Purchase order line items** related list and click a specific purchase order line item number. Then, click the **Create hardware assets prior to delivery** related link. Only the hardware assets included on the purchase order line item are created.

[Models](#)

Receive assets

Assets can be received and added to the system when they are delivered to a stockroom.

Users with an appropriate procurement role can receive assets. If one purchase order contains multiple purchase order lines, the lines can be received at different times. This is useful if items arrive at the stockroom in different shipments. The purchase order status does not change to **Received** until all purchase order lines are received.

As an alternative to receiving assets when they arrive, you can create assets [before they arrive](#) and reserve them for the requester.

Receive an asset

When assets are received and delivered to a stockroom, they're added to the system.

Before you begin

Role required: procurement_admin or procurement_user

About this task

When you receive assets:

- If you haven't pre-created hardware assets, you can enter asset details and reserve them for users.
- You can over receive an order wherein, the received quantity can be higher than the ordered quantity.
- If you have ordered multiple items with different receiving stockrooms, you can receive them at the same time.

Procedure

1. View purchase orders.
2. Select a purchase order with a **Status** of **Ordered** or **Pending Delivery**.
3. Select **Receive**.
The Receive Purchase Order screen appears with the list of the products ordered.
4. Select the **Received** check box for the line items that you're receiving.
5. To receive software assets:
 - a. Edit the **Receiving Stockroom** if the items arrived at a different stockroom than the one specified on the purchase order.
 - b. Edit the **Receiving Quantity** if the number of items delivered doesn't match the number ordered.
 - c. Edit the **Unit Cost** if the price changed between the time the item was ordered and the time it arrived at the stockroom.
Enter a number. The number can include decimals.
 - d. Select **Capture Asset tags** to enter asset details.
You can't enter details for assets more than the received rights.
 - e. In the **Capture Asset Tag** dialog box, select **Insert a new row**.
 - f. Enter the asset tag, serial number, rights, and License key.
6. To receive hardware and consumables assets:
 - a. Edit the **Receiving Stockroom** if the items arrived at a different stockroom than the one specified on the purchase order.
Note:
The asset bundle when received creates the asset bundle with the status as **Bundle**.
You must add the individual assets under the asset bundle.
 - b. Edit the **Receiving Quantity** if the number of items delivered doesn't match the number ordered.
 - c. Select the **Reserve** toggle button to reserve the item.
When a reserved item is received, the **State** and **Substate** fields on the corresponding asset record are automatically set to **In stock** and **Reserved**, respectively. If the **Reserve** button isn't selected for an item, the **State** and **Substate** fields on the corresponding asset record are set to **In stock** and **Available**.
Note:
You can't reserve consumables.
 - d. From the **Reserved for** list, select a user you want reserve the asset for.

If a name was specified in the **Requested for** field on the Purchase order line item form, the name is added automatically but can be changed.

You can add multiple users in the **Capture Asset tags** dialog box.

e. Select **Capture Asset tags** to enter asset details.

You can't enter details for assets more than the received quantity. You can also reserve assets for a user.

Note:

If you've pre-created the assets, you must select the ones you want to receive.

f. On the **Capture Asset Tag** dialog box, select **Insert a new row**.

g. Enter the asset tag and serial number.

If you have activated the Enterprise Asset Management or OT Asset Management application, then the **MAC address** fields is also displayed.

h. From the **Reserved for** list, select the user for whom the item was ordered.

If a name was specified in the **Requested for** field on the Purchase order line item form, the name is added automatically, but you can change it.

i. Edit the **Unit Cost** if the price changed between the time the item was ordered and the time it arrived at the stockroom.

Enter a number. The number can include decimals.

7. Select **Submit**.

A confirmation message displays with the details of assets received.

8. Select **OK**.

A receiving slip is automatically created and can be viewed in the **Receiving Slips** related list. If items on a purchase order are received at different times, a new receiving slip is created each time any item on the purchase order is received. For example, if 30 laptop computers were ordered and arrived in three separate shipments, three receiving slips are created.

Different assets are created for each hardware item. If it's a software asset, one single asset is created for each license if you don't split the rights. For consumables, if an asset exists, it's updated, or else, new assets are created.

Create a receiving slip

Receiving slips are created automatically during the process of receiving assets. You can also create receiving slips manually.

Before you begin

Role required: `procurement_admin` or `procurement_user`

About this task

After a receiving slip has been created for a purchase order, all fields on the purchase order record are changed to read-only.

Procedure

1. Navigate to **All > Procurement > Receiving > Receiving Slips**.

2. Click **New**.

A **Number** is assigned automatically. The current date and time is added automatically to the **Received** field.

3. Select a Purchase Order.

Only purchase orders with a status of **Ordered**, **Pending Delivery**, or **Requested** are listed in the selection window. The **Vendor** column lists the vendor specified on the purchase order. The **Ship to** column lists the destination stockroom specified on the purchase order.

4. Select a Receiving Stockroom.

5. Click Submit.

What to do next

Add a receiving slip line to the receiving slip to identify the items from the purchase order that were received.

Create a receiving slip line

When assets arrive at a stockroom and you receive them, a receiving slip is created on the purchase order. You create a receiving slip line to identify the specific assets and quantities that were received.

Before you begin

Role required: procurement_admin or procurement_user

About this task

If the asset already exists, the asset record is updated when you save the receiving slip line. If the asset does not already exist, a new hardware or software asset record is created. The **Model category** and **Configuration item** fields are automatically filled in on the new asset record based on information in the request, purchase order, or receiving slip. If **Asset Tag** and **Serial Number** information exists, it is not overwritten.

Procedure

- 1. Navigate to All > Procurement > Receiving > Receiving Slips** and open a receiving slip.
- 2. In the Receiving Slip Lines related list, select New.**
The following fields are completed automatically.
 - A **Number** is assigned.
 - In **Received**, the current date and time are added.
 - In **Received by**, the currently logged in user is added.
- 3. In Purchase Order Line**, select the reference lookup icon and select a purchase order line. The **Purchase Order Line** field is required if the parent receiving slip has an associated purchase order. Only purchase order lines that are associated with the same purchase order linked to the parent receiving slip are available for selection.
- 4. In Quantity**, enter the number of items received.
For example, five items were ordered, but only two are being received.
- 5. Optional:** Edit the **Received by**, **Requested for**, and **Unit cost** fields, as needed.
- 6. Select Submit.**

Result

The **Receiving stockroom** field on the Receiving Slip record becomes read-only.

Consumable assets

A consumable asset is one that is purchased in quantity and distributed. It is assigned to the consumable model category, and the asset record tracks the quantity that is available and total cost. When consumable assets are received, they are merged into an existing consumable record, if available.

For the records to merge, the consumable cannot be listed on an active transfer order and the **Model, Location, Model Category, Stockroom, Status, and Substatus** fields on the asset record must match.

If consumables are merged into an existing consumable record, the cost of the additional consumables received is added to that of the existing consumables in the record. For example, if 50 computer keyboards arrive and 20 keyboards of the same model exists in the receiving stockroom, the two records are merged showing 70 keyboards in the stockroom with a combined total cost.

If no matching consumable record exists in the receiving stockroom, a record is created. After the consumables are received, the quantity is updated, but individual consumables are no longer tracked within the Procurement application and are not displayed on receiving slip lines.

i Note:

The related list of a purchase order doesn't display consumable asset details. This means that you can't track consumables through a purchase order.

For more details on creating consumable assets, see [Create consumable assets](#).

Integrating with external procurement applications

Manage an end-to-end procurement process by integrating external procurement applications with Software Asset Management and create software requisitions directly on the external procurement applications. Software Asset Management tracks these requisitions and automatically generates entitlements or entitlement import errors after these requisitions are received on the external procurement application.

Integrating Software Asset Management with external procurement applications help you to:

- Gain end-to-end visibility of the entire purchase request to entitlement creation.
- Automate the complete process of creating software requisitions to entitlement creation.
- Reduce errors in entitlement creation.

Before you begin

- Activate the Procurement plugin (com.snc.procurement). For more information, see [Activate Procurement](#).
- Install the Asset Management - Procurement Integration (app-itam-procurement-integration) store application from ServiceNow Store. For more information, see [Install Asset Management - Procurement Integration](#).

Install Asset Management - Procurement Integration

You can install the Asset Management - Procurement Integration application (app-itam-procurement-integration) from the ServiceNow Store.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the [Asset Management - Procurement Integration](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: Now Support

After the Asset Management - Procurement Integration has been entitled, you can reach out to [Now Support](#) to install this application.

About this task

Scheduled jobs and tables are installed with Asset Management - Procurement Integration:

For more information, see [Components installed with Asset Management - Procurement Integration](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Asset Management - Procurement Integration application (app-itam-procurement-integration) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

In a list next to the **Install** button, you see the versions that are available to you.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Components installed with Asset Management - Procurement Integration

Several types of components are installed with activation of the Asset Management - Procurement Integration application, such as tables and scheduled jobs.

Scheduled jobs installed

Scheduled job	Description
ITAM - Sync <procurement_integration_profile_name> purchase orders	Fetches the status of the already created requisitions daily. This scheduled job is automatically created when you publish the integration profile.

Tables installed

Table	Description
Procurement Integration Profile [itam_procurement_integration_profile]	Includes the details of the third-party procurement integrations that are connected to the Procurement application in ServiceNow.
Procurement Integration Jobs [itam_procurement_integration_job]	Includes the mapping information of a procurement integration profile with its associated scheduled jobs.
Integration Scheduled Job Results [itam_procurement_integration_job_log]	Includes the details of the failure of the scheduled job execution.

Domain separation and Asset Management - Procurement Integration

Domain separation is supported for Asset Management - Procurement Integration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Enhanced

- Includes **Basic** and **Standard** levels.
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer can't affect another.
- Tenants of the instance must be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application's normal function.

Sample use case: Tenant-customers of a shared environment must be able to change the impact, urgency, or priority matrix to set priority within their domain.

For more information on support levels, see [Application support for domain separation](#) .

Asset Management - Procurement integration overview

Domain separation is present in all aspects of the Asset Management - Procurement Integration application.

How domain separation works in Asset Management - Procurement Integration

- You can create multiple procurement integration profiles in each domain. You must have only one published and active profile in each domain, including the parent domain.
- For the Purchase Order to create a requisition in your external purchasing application, a published procurement integration profile must exist in the domain of the purchase order.
- All Purchase Orders, Purchase Order Lines, Receiving Slips, Receiving Slip Lines, entitlements, entitlement import errors, and expense line records that you created are stamped with the respective domain of the purchase order.

The Procurement Integration Job [itam_procurement_integration_job] table isn't domain separated.

However, each procurement integration job is associated with a procurement integration profile. The job execution only synchronizes the updates from the external purchasing application to the purchase orders that are stamped with the corresponding procurement integration profile.

Domain separated tables

- Procurement Integration Profile [itam_procurement_integration_profile]
- Procurement Integration Job Log [itam_procurement_integration_job_log]

Required plugins

- Domain separation extension (com.glide.domain.msp_extensions.installer)
- SAMP (com.sn_samp_master)
- Procurement (com.snc.procurement)

Other supported plugins

Service Catalog – Domain Separation (com.glideapp.servicecatalog.domain_separation)

Integrating with Coupa

Integrating Coupa with Software Asset Management helps you create software requisitions directly on Coupa. Software Asset Management tracks these requisitions and automatically generates entitlements or entitlement import errors after these requisitions are received on Coupa.

Note:

This integration doesn't pull requisitions created on Coupa to Software Asset Management.

Before you begin

- Install the Asset Management - Procurement Integration (app-itam-procurement-integration) store application from ServiceNow Store. For more information, see [Install Asset Management - Procurement Integration](#).
- You must have the Software Asset Management Enterprise license.
- Activate the Coupa spoke. For more information, see [Coupa Spoke](#) .
- Activate the Procurement plugin (com.snc.procurement). For more information, see [Activate Procurement](#).

Synchronize reference data

Both ServiceNow Procurement and Coupa have their own set of tables and reference data types. For a smooth and successful integration, you must synchronize the data you would refer. For more information, see [Reference data synchronization](#).

Warning:

If you don't synchronize data, you might encounter a few issues while creating a requisition on Coupa.

Create a Coupa integration profile

Create a Coupa integration profile to verify the status of the procurement-scheduled jobs, entitlements, and entitlement import errors created through this profile.

Before you begin

Role required: sam_admin

Create an OAuth 2.0 connection with Coupa to get the Client ID and Client Secret. For more information, see [OAuth 2.0 Getting Started with Coupa API](#). Save the Client ID and Client Secret in a secure location for later use.

You must set the following scopes while creating an OAuth 2.0 connection with Coupa.

- core.approval.configuration.read
- core.approval.read
- core.approval.write
- core.catalog.read
- core.common.read
- core.contract.read
- core.contract.write
- core.inventory.adjustment.read
- core.inventory.adjustment.write
- core.inventory.asn.read
- core.inventory.common.write
- core.inventory.consumption.read
- core.inventory.consumption.write
- core.inventory.receiving.read
- core.inventory.receiving.write
- core.inventory.return_to_supplier.read
- core.inventory.transfer.read
- core.inventory.transfer.write
- core.invoice.delete
- core.invoice.read
- core.invoice.write
- core.item.read
- core.item.write
- core.legal_entity.read
- core.purchase_order.read
- core.purchase_order.write
- core.requisition.read
- core.requisition.write
- core.sourcing.pending_supplier.read
- core.sourcing.pending_supplier.write

- core.sourcing.read
- core.sourcing.response.award.write
- core.sourcing.response.read
- core.sourcing.response.write
- core.sourcing.write
- core.supplier.read
- core.supplier.write
- core.user.read
- core.user.write

Note:

If these scopes aren't associated with the Client ID and Client Secret, the OAuth token flow fails on ServiceNow.

Procedure

1. Navigate to **Software Asset Workspace > License operations > Purchasing > Procurement integrations**.
2. Select **New**.
3. On the form, fill in the fields.

Create New Procurement Integration Profile

Field	Description
Display name	Name of the procurement integration profile. For example, <code>Coupa integration</code> .
Connection & Credentials	Connection and credential alias for Coupa. This field gets automatically populated to sn_coupa_spoke.Coupa_OAuth .
Profile type	Type of integration profile. Select Coupa integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to Draft. ○ If you've already published the integration profile, this field is automatically set to Published.
Active	This field is visible and set to true only when the integration profile is published. If you set this field to false, the associated requisitions with this integration profile aren't created and tracked.

4. Select **Save**.
5. Select the Preview icon ⓘ next to the Connection & Credentials field.
You get redirected to the Connection & Credential Aliases form.
6. Select **Create New Connection & Credential** in the Related Links section to create connection credential.
7. In the dialog box, fill in the fields.

Create Connection and Credential

Field	Description
Name (Connection)	Name to identify the connection uniquely. For example, Coupa OAuth connection.
Connection URL	URL to make a connection to Coupa. Use the <code>https://<coupa-instance-url></code> format. <ul style="list-style-type: none"> ○ For customer instances, use the <code>https:// {organization_name}.coupahost.com</code> format. ○ For partner and demo instances, use the <code>https:// {organization_name}.coupacloud.com</code> format.
Name (Credential)	Name to identify the credential uniquely. For example, Coupa OAuth credential.
Token URL	URL used to generate OAuth token. Use the <code>https://<coupa-instance-url>/oauth2/token</code> format.
OAuth Client ID	Identifier (Client ID) generated in Coupa.
OAuth Client Secret	Secret (Client Secret) generated in Coupa.

8. Select **Create and Get OAuth Token**.
Your ServiceNow instance creates an OAuth for Coupa and then automatically returns you to the Integration Profile form.
9. **Optional:** Create a child alias that can uniquely identify the connection and credentials for this integration profile.
The first Coupa integration profile that you create uses the default (parent) connection and credential alias for Coupa. Each additional Coupa integration profile that you create needs a unique child alias that helps differentiate the connection and credentials between each integration profile.
 - a. On the Connection & Credential Aliases form, select the link under **Child Aliases > Parentalias=***** to add child aliases.
 - b. Select **New**.
 - c. Enter a name for the child alias in the Name field.

- d. Right-click the form header and then select **Save**.
- e. After the form reloads, select the **Create New Connection & Credential** related link.
- f. Repeat steps 7 and 8.
- g. In the Connection & Credential field of the Integration Profile form, select the lookup icon to locate and select the child alias that you created.
Selecting the child alias associates the alias with the integration profile. Your ServiceNow instance uses this alias to identify the connection and credentials for this integration profile.

10. Select **Publish**.

Result

After you publish the integration profile, the scheduled job *ITAM - Sync Coupa purchase orders* runs daily and fetches the status of the already created requisitions.

Note:

If you haven't created any requisition, the scheduled job doesn't run.

You can view this information by clicking the **Procurement Integration Jobs** tab.

What to do next

Verify if the scheduled job *ITAM - Sync Coupa purchase orders* has run successfully by selecting the **Integration Scheduled Job Results** tab. If the job has failed, you can view the list of errors by following these steps:

1. On the Procurement integration profile form, select the **Procurement Integration Job Log** related list.
2. Open the job log record where the displayed status shows as failed.
3. Select the related list **Asset Job Log Details** to find out the reason for the job failure.

Create software requisitions directly on Coupa through the ServiceNow Procurement application to purchase software.

If you want to delete the Coupa integration profile, see [Deleting an external procurement application integration profile](#).

Create a requisition on Coupa through Procurement application

Create software requisitions directly on Coupa through the ServiceNow Procurement application to purchase software.

Before you begin

To create a requisition on Coupa through ServiceNow Procurement application, you must perform the following tasks.

- Create and publish a Coupa integration profile. For more information see, [Create a Coupa integration profile](#).
- Ensure that the Purchase Order you create has at least one Purchase Order Line, and all Purchase Order Lines must be for software products.
- Synchronize reference data types on both ServiceNow Procurement and Coupa applications. For more information, see [Reference data synchronization](#).

If all these conditions are met, you can create a requisition in Coupa.

If the conditions aren't met, requisitions aren't created on Coupa, and the legacy procurement flow continues on the Procurement application.

Role required: sam_admin and procurement_integrator

Note:

The procurement_integrator role is added to the sam_admin role. The procurement_integrator role enables the SAM admin to view the connections and aliases.

About this task

You can create a requisition on Coupa through the following ways:

- When a user requests software through Service Catalog. For more information, see [Request a catalog item from Service Portal](#).
- If a procurement_user or sam_admin directly creates a Purchase Order on the Procurement application. For more information, see [Create a Purchase Order](#).
- When a sam_user creates a Purchase Order directly from the Remediation Options form. For more information, see [View software model results](#).

Requisitions are of the following types:

- **Catalog request:** A requisition created for an item that is already present in the external purchasing application.
- **Non catalog request:** A requisition created for an item that isn't present in the product catalog of the organization.

For more information about creating a Purchase Order, see [Create a purchase order](#).

Procedure

1. Navigate to **All > Procurement > Orders > Purchase Orders**.
2. Select **New**.
3. On the form, fill in the fields.

Purchase order fields

Field	Description
Number	The unique number identifying the purchase order.
Due by	The date by which the purchase order Total cost must be paid.
Vendor	The supplier to which the purchase order was issued.
Ship to	The stockroom to which the items on the purchase order should be shipped. Note: This field is required but doesn't affect creating requisitions for software on Coupa.
PO date	The date on which the purchase order was created.
Status	The status of the purchase order: Canceled, Ordered, Received, Requested, or Suspended .
Assigned to	The user to whom the purchase order is assigned.

Field	Description
Bill to	The location responsible for paying the purchase order Total cost .
Short description	A brief description of the purchase order.
General section	
Shipping	The delivery method to be used when shipping the items on the purchase order.
Terms	The purchase order payment terms: Credit, Net 30 days, or Net 90 days .
Ship rate	The amount that must be paid for the delivery method specified in the Shipping field.
Total cost	The sum of all item costs on the purchase order and the shipping costs.
Description	A full description of the purchase order contents.
Details section	
Initial request	The record number of the request that requires the items on the purchase order.
Requested by	The user requesting the items on the purchase order. Note: The email ID or email address of the user requesting the items on the purchase order must be the same on both Coupa and ServiceNow Procurement application.
Requested	The date the user in the Requested by field requested the items on the purchase order.
Ordered	The date and time of clicking the Order button on the Purchase Order form.
Expected delivery	The date the items associated with the purchase order are expected to arrive in the stockroom identified in the Ship to field. This field can't be edited when the purchase order has a Status of Received or Canceled . (For more information about this field, see Purchase order expected delivery date .)
Received	The date and time at which the purchase order status changed to Received .
Contract	The record number of the contract with the vendor from which the items on the purchase order are ordered.
Department	The department responsible for paying for the purchase order.
Budget number	The budget number related with the purchase order.
Vendor account	The vendor account related with the purchase order.

4. Right-click on the form and select **Save**.

You can add purchase order line items to specify what you are ordering from this vendor. For more information about creating a purchase order line item, see [Create a purchase order line item](#). A requisition line is created with a unique ID in Coupa.

5. After you've added at least one purchase order line item, select **Order**.

A requisition ID is displayed on your Purchase Order and the corresponding requisition line IDs are displayed on your Purchase Order Lines.

Note:

Wait for some time and then reload the Purchase Order form to view the generated IDs or errors.

Result

After the status of the Purchase Order is **Received** on Coupa, the following activities occur:

- **Assets** and **Receiving Slips** get created and you can find the **Purchase Order Number** on the Purchase Order form.
- The Asset Management - Procurement Integration application automatically generates entitlements.
- On receipt of the assets, the scheduled job *ITAM - Sync Coupa purchase orders* creates a Receiving Slip and Receiving Slip Lines on the ServiceNow Procurement application. This job also pulls the Coupa fields such as Manufacturer part number, Status, and Receiving quantity. The values returned from Coupa through the receiving transactions are used to populate the created entitlements. However, if these values are not available from the receiving slips, then the Asset Management - Procurement Integration application uses the values populated in the Purchase Order of the Procurement application.
- If any discrepancy exists on the Purchase Order, Asset Management - Procurement Integration creates entitlement import errors. You can view the errors by selecting the **Entitlement Import Errors** tab under a Purchase Order, Purchase Order Line item, and Receiving Slip line.

Reference data synchronization

For a successful integration of Coupa with Software Asset Management, you must synchronize the following reference data types on both the ServiceNow Procurement application and Coupa.

Requisition or Purchase Order form

Coupa Requisition field	ServiceNow Procurement Purchase Order field	Description
Requested by	Requested by	The email address that is associated with the Requested by record is used to find the corresponding reference record in Coupa.

Requisition Line or Purchase Order Line Item fields

Coupa Requisition Line fields	ServiceNow Procurement Purchase Order Line Item fields	Description
Supplier	Vendor	The supplier or vendor from which the software product should be ordered.
unit-price	Cost	The cost or price of a single product model, including discounts.
Currency	Cost	Currency is a reference field on Coupa. For a successful integration, verify that the

Requisition Line or Purchase Order Line Item fields (continued)

Coupa Requisition Line fields	ServiceNow Procurement Purchase Order Line Item fields	Description
		currency codes on Coupa and ServiceNow match.
Item	Catalog Item	<p>The Coupa items and ServiceNow Procurement catalog items must share the same display name.</p> <p>Note: This field is only used for catalog requests.</p>
Description	Product Model	<p>The model of the purchase order line item.</p> <p>Note: This field is only used for non-catalog requests.</p>

Deleting an external procurement application integration profile

If you want to stop using an external procurement application for creating software requisitions through Software Asset Management, you can delete the integration profile.

A sam_admin can delete an integration profile by selecting **Delete** on the integration profile record.

When you delete a direct integration profile, all scheduled jobs and the job results associated with the profile gets deleted. The integration profile references are also removed from the Purchase Order records on ServiceNow.

After you delete the integration profile, Software Asset Management doesn't consider any in progress requests. Ensure that all the requests in progress are completed before you delete the integration profile.

Domain separation and Procurement

Domain separation is supported in Procurement processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

The support level is Standard but has some exceptions or special conditions.

- Includes all aspects of **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must be able to configure minimum viable product (MVP) business logic and data parameters. This configuration is done per tenant, as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see [Application support for domain separation](#).

How domain separation works in Procurement

To create or edit Purchase Orders (POs) or PO line items that distinguish the domain, customers must be working in the proper domain. When adjusting any configuration, you should be in the domain where you're doing the work. Use the domain picker to choose the correct domain to work in.

Related topics

[Domain separation for service providers](#)

Product Catalog

The product catalog is a set of information about individual models. Models are specific versions or various configurations of an asset. Asset managers use the product catalog as a centralized repository for model information.

A detailed and well-maintained product catalog can coordinate with service catalog, asset, procurement, request, contract, and vendor information.

Models published to the product catalog are automatically published to the [Service Catalog](#). The service catalog includes information about goods (models) and services. If the model is available from multiple vendors, a model can be listed more than once. Models are included with the Asset Management application.

Keep the following in mind when working with the product catalog.

- A product catalog item can be linked to multiple vendor catalog items or to a single model.
- A model can only have one product catalog item.
- A vendor catalog item can only have a single product catalog item.

Related topics

[Asset and CI management](#)

Components installed with Product Catalog

The following components are installed with the Product Catalog plugin.

Demo data is available with the product catalog. The demo data provides various models, model categories, product catalog items, vendor catalog items, and vendors.

Tables installed with Product Catalog

Product Catalog plugin adds the following tables.

Table	Description
Hardware Catalog [pc_hardware_cat_item]	Stores all hardware catalog items that have been published from the Product Model [cmdb_model] base table. Extends the Product Catalog Item [pc_product_cat_item] table.

Table	Description
Product Catalog Item [pc_product_cat_item]	Stores all information for the product catalog. This table extends the Catalog Item [sc_cat_item] table.
Software Catalog [pc_software_cat_item]	Stores all software catalog items that have been published from the Product Model [cmdb_model] base table. Extends the Product Catalog Item [pc_product_cat_item] table.
Vendor Catalog Item [pc_vendor_cat_item]	Stores all vendor catalog item information.

Roles installed with Product Catalog

Product Catalog plugin adds the following roles.

Role	Description	Contains roles
model_manager	Can create CMDB models.	none
category_manager	Can do everything that model managers can do and can administer model categories.	model_manager

Script includes installed with Product Catalog

Product Catalog plugin adds the following script include.

Table	Description
ProductCatalogUtils	Utilities for creating and maintaining product catalog items derived from vendor catalog items and models.

Client scripts installed with Product Catalog

Product Catalog plugin adds the following client script.

Client script	Table	Script contents
Set Model Fields	[pc_vendor_cat_item]	Adds the description and price, if they do not exist, when a vendor catalog item is added to the product catalog.

Related topics

[Client scripts](#) 

Business rules installed with Product Catalog

Product Catalog plugin adds the following business rules.

Business rule	Table	Description
Clear model	[pc_product_cat_item]	Clears the link on a model when the link is cleared from the product catalog.
Create child product catalog entries	[cmdb_hardware_product_model]	Creates entries in the product catalog for all items in a bundled model when the bundled model is created.
Sync to Product catalog item	[pc_vendor_cat_item]	Updates the corresponding field in the product catalog when a field is updated.
Sync to Product catalog item	[cmdb_model]	Updates the corresponding field in the product catalog when a field is updated.

Models

Models are specific versions or various configurations of an asset. Models are used for managing and tracking assets through various ServiceNow platform asset applications, including Product Catalog, Asset Management, and Procurement.

Model definitions can be based on vendor-provided criteria, for example, the manufacturer name Apple MacBook Pro, or on a custom abstraction, for example, Graphic Designer Workstation. All model information is located in the Product Catalog application.

A model can be in one or more [model categories](#). For example, a laptop can be a computer and a server. Model definitions specify whether the model creates an asset, a configuration item, or both. On a hardware model record, compatible hardware models can be added.

Unless otherwise noted, working with product models requires the model_manager role. This role is contained by other roles, such as sam, category_manager, and asset.

Creating models

Models are created in the **Product Catalog > Product Model > All Models** module.

See [Model form fields](#) for a list of the fields that appear on all models, regardless of the type of model.

Related topics

[Asset Management](#) 

[Procurement](#)

Model form fields

There are fields on the Model form that apply to all types of models.

Field	Description
Display name	Name of the model. A system property called <i>glide.cmdb_model.display_name.shorten</i> controls how software model display names are generated.
Manufacturer	The company that built the model.
Name	Field that Discovery uses to create a model with the value discovered. Model managers can specify a name of their choice when creating a model and can also edit the name of an existing model.
Edition	The edition of the software model, such as Professional .
Short description	A brief description of the model.
Model categories	The categories to which the model is assigned. This field is a glide list and cannot be used to create reports.
Asset tracking strategy	The process by which the model can be tracked. Choose from the following: <ul style="list-style-type: none"> • Leave to Category: model is transparent and the category defines the asset class. • Create Consumable Asset: model forces the asset class to be consumable, regardless of what the category defines as the asset class. • Don't create assets: model blocks asset instantiation, regardless of what the category defines as the asset class.
Acquisition method	The method for purchasing the model. Options are Both, Buy, or Lease .
Cost	The cost of a single unit of the model.
Depreciation	The Use depreciation with fixed assets for the model.
Salvage value	The estimated value that an asset realizes upon its sale at the end of its useful life. This value must be less than or equal to the cost of the asset.
Model number	The specific model number assigned to the item by the manufacturer. Setting the system property <i>glide.cmdb.makeandmodel.use_model_number_lookup</i> to true enables you to lookup the model number of hardware models through the MakeAndModelJS script.
Barcode	The barcode number assigned to the model. Barcodes are assigned by the manufacturer.
Owner	The person responsible for the model.
Status	The status of the model. Options are In Production, Retired, and Sold .
Expenditure type	The type of expenditure. Choose from the following: <ul style="list-style-type: none"> • Capex: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. • Opex: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Certified	The option that determines whether the model is approved for use.

Field	Description
Comments	Information about the model that would be helpful for others to know.
Assets	The assets created from this model. This creation can have any combination of assets and configuration items. For example, with a single hardware model you can have assets and no configuration items, configuration items and no assets, or have both.
Configuration Items	The configuration items created from this model. Can have any combination of assets and configuration items.
Product Catalog	The information about the model as it appears in the product catalog and service catalog. Information only appears if the model has been published to the product catalog.

Create hardware models

Use hardware models to track equipment assets such as servers and racks. You can create a new hardware model.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Hardware Models**.
2. Click **New**.
3. Complete the form.
For general field descriptions, see [Model form fields](#). The hardware model fields listed are found in the Information section of the form.

Model form fields for hardware models

Field	Description
Height (U)	The total height of the hardware item, in inches.
Flow Rate (cfm)	The flow rate of the hardware model, expressed in cubic feet per minute.
Sound Power (bels)	The noise measurement, in bels (1 bel=10 decibels).

4. Click **Update**.

Add compatible models to a hardware model

On a hardware model record, you can add compatible hardware models, giving you a good method for tracking hardware assets that can work together.

Before you begin

Role required: model_manager

About this task

Note:

Hardware models included in bundled models cannot be added as compatibles.

Procedure

1. Navigate to **All > Product Catalog > Product Model > Hardware Models**.
2. Click a hardware model **Name**.
3. Click **Add Compatible**.
4. Select a compatible model.
5. Click **Submit**.

The selected model is listed in the **Compatibles** related list.

Related topics

[Bundled models](#)

Add substitute models to a hardware model

On a hardware model record, you can add substitutes to track what hardware models can be substituted for another hardware model.

Before you begin

Role required: model_manager

About this task

For example, a 19" monitor can be a valid substitute for a 17" monitor. Note that substitutions are directional so, in this case, a 17" monitor is not a substitution for a 19" monitor. Information about valid substitute models is useful when you select models while creating transfer orders.

When you select substitute models, note the following conditions.

- Substitute models can be used with work management transfer orders. Substitute models are not used in procurement part sourcing.
- Hardware models included in bundled models cannot be added as substitutes.

Procedure

1. Navigate to **All > Product Catalog > Product Model > Hardware Models**.
2. Click a hardware model **Name**.
3. Click **Add Substitution**.
4. In the **Collection** list on the left, double-click a hardware model.
The hardware model is added to the **List** on the right.
5. Click **Save**.
The model is listed in the **Substitutes** related list.

Related topics

[Models](#)

[Bundled models](#)

[Manage transfer orders](#) 

[Procurement](#)

Create consumable models

Consumables are items that are tracked as a group, not individually. An example of consumable items is computer keyboards.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Consumable Models**.
2. Click **New**.
3. Complete the form.
For general field descriptions, see [Model form fields](#). There are no fields specific to consumable models.
Any consumable assets you create and assign to the new model are displayed in the **Consumables** related list on the model record.
4. Click **Submit**.

Bundled models

A bundled model is a single model comprised of individual models. For example, a laptop, printer, keyboard, and mouse can be combined into a single bundled model. If you assign any one asset from the bundled model to an individual, that person receives all the components in the bundle.

Bundled model is a template to define the kind of assets that would be a part of asset bundles. To maintain the integrity between asset bundles and bundled models, select the **Bundle assets** check box in the Product Model form layout. Once you select the check box, the status of the bundled model defaults to **Build**. While the status is in build, you can add make changes to the bundled model. Once you change the status to **In Production**, no changes can be made to the bundled model. Now that the bundled model is read-only, you can create asset bundles out of this bundled model. You can change the status of the bundled model back to **Build** only if there are no asset bundles associated with the bundled model.

Note:

The **Bundle assets** check box functionality is available only with the Hardware Asset Management licensable application. Hardware Asset Management is available in the ServiceNow Store. To view more information on the asset bundle functionality, see [asset bundles](#).

Bundled models can be abstract or concrete.

Abstract

Permits use of one model in multiple bundles. The abstract bundle is created as a container. One asset in the bundle is specified as the main component. Model categories define which assets can be included in a bundle. Model categories also define what can be the main component of a bundle.

Add a main component to make it easier to track the bundle components. For example, create an abstract bundle adding a computer as the main component and a mouse and keyboard as additional components. When the bundle is assigned to a user, the asset record for the computer shows the computer, mouse, and keyboard all assigned to the user. Abstract bundles are used more often than concrete bundles.

Concrete

Is a fixed bundle where the main component is an asset. Specify the main component and the other components to create an exact bundle. Concrete bundles do not allow for a many-to-many relationship with models.

Keep the following tips in mind when creating and using bundled models.

- Bundles can be nested inside bundles.
- Any type of model can be used in a bundle.
- When a parent link is defined, the fields related to assignment and state of the child assets are read-only. They are populated based on the parent's assignment and state fields.
- If you make a change to the parent bundle, the children in the bundle are affected. For example, if you assign a bundle to an individual, all child asset records show that same individual as the person assigned.
- You cannot pre-allocate bundles.
- In a bundle, consumables are consumed and assets are set to the same state as the main component.
- Only the bundle, not individual components, can be part of a transfer order.
- You control what can go into a bundle through the model category. For example, the model category **Servers** could be set to never allow servers in bundles.
- To create a collection of software, you must create a suite instead of a bundled model.
- A software license cannot be the main component of a bundle.

To create an abstract model, set the model category to **Bundle** and add the components. To create a concrete model, create a model in the **Product Catalog > Product Model > Bundled Models** module and add components.

Related topics

[Consume consumable assets](#)

[Model categories](#)

Add model components to a bundle

Add model components to a model as needed, for example, when you upgrade a bundle to include additional assets.

Before you begin

Role required: model_manager and asset

Procedure

1. Navigate to **All > Product Catalog > Product Model > Bundled Models**.
2. Open a bundle record.
3. In the **Model Components** related list, click **New**.
4. Select the **Model category** of the component, such as **Computer**.
5. Select the **Component**, such as **Apple Computer MacBook Pro 17"**.
6. Select the **Is main component** check box if this component is the one that other components are attached to.
7. Click **Submit**.
8. Repeat steps 3–7 to add more components to the bundle.

Any components you add to the bundled model are displayed in the **Model Components** related list.

Bundled model components

The screenshot shows the configuration page for a 'Developer workstation bundle' in the Hardware catalog. The 'General' tab is active, displaying fields for 'Display name', 'Manufacturer', 'Name', 'Short description', 'Model categories', 'Asset tracking strategy', 'Acquisition method', 'Cost', 'Depreciation', 'Comments', 'Model number', 'Barcode', 'Owner', 'Status', and 'Certified'. Below the configuration is a 'Related Links' section with a link to 'Publish to Hardware Catalog'.

The 'Model Components' related list is highlighted with a red box. It shows a table with the following data:

Is main component	Component	Model category of component
true	Apple MacBook Pro 15"	Computer
false	Standard input bundle	Bundle
false	Samsung SyncMaster 22" Class BackLight LED	Monitor
false	Samsung SyncMaster 22" Class BackLight LED	Monitor

[Models](#)

Remove model components from a bundle

Remove a component from a bundled model, for example, when you want to replace it with a different component.

Before you begin

Role required: model_manager

About this task

No component history is retained. If you remove a component from a bundled model, no record is saved showing that the component was ever part of a bundle.

Procedure

1. Navigate to **All > Product Catalog > Product Model > Bundled Models**.
2. Open a bundle record.
3. In the **Model Components** related list, select the component you want to remove.

4. In the **Actions** choice list below the list, select **Delete**.

5. Click **OK**.

Publish bundled models to product catalog

You can publish bundled models to the product catalog to make the bundled models available in the service catalog.

Before you begin

Role required: catalog_admin or catalog_manager

About this task

You can publish a bundled model only under the following conditions:

- The model should be created in the cmdb_model table.
- The model shouldn't have an existing catalog item.

Procedure

1. Navigate to **All > Product Catalog > Product Models > Bundled Models**.
2. Open a product model.
3. In **Related Links**, select **Publish to product catalog**.
4. Select a category.
5. Select **OK**.

Software models

Software models are created as part of the asset management process. You can create product models for software from the product catalog, but you cannot administer all aspects of the software models.

Software models are used in software counters. For more information about creating software model, see [Create software models](#).

Create application models

You can create application models that can be managed and tracked within a Scrum development process.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Application Models**.
2. Click **New**.
3. Complete the form.
For general field descriptions, see [Model form fields](#). There are no fields specific to application models.
4. Click **Submit**.

[Agile Development 2.0](#) 

Work order models

When work management is activated, the ServiceNow platform adds the Work Order Models and Work Task Models modules to the product catalog.

Users with the `wm_admin` role can define new model records, which can be used as templates to create work orders for common procedures.

Models created for VMware support and Amazon EC2

When you activate Orchestration for VMware and Amazon EC2, the system creates models automatically.

The system creates the following models:

- A vmware instance for VMware
- An ec2 instance for Amazon

When the virtual machine is terminated, the asset state changes to **Retired**.

Add skills to a model

You can associate skills with any model. Creating associations between skills and models is helpful if you are using work management and want to assign tasks to agents based on their skills with specific models.

Before you begin

Role required: `skill_admin` or `model_manager`

Procedure

1. Navigate to **All > Product Catalog > Product Model > All Models**.
2. Open a product model.
3. In the **Skills** related list, click **Edit**.
4. Add items from the **Collection** list to the **Skills List**.
5. Click **Save**.

Publish models to the hardware or software catalog

You can publish models to the hardware or software catalog to make the models available in the service catalog.

Before you begin

Role required: `catalog_admin`

Procedure

1. Navigate to **All > Product Catalog > Product Model > All Models**.
2. Open a product model.
When you publish a catalog item from a model, the property `glide.model.catalog.item.currency` decides the currency on the catalog item. This property is set to false by default and the value is set to user session currency. If you set this property to true, the value is set to model currency.
3. In **Related Links**, click **Publish to Hardware** or **Publish to Software Catalog**.

4. Select a category.

5. Click **OK**.

Delete models

If a model is no longer needed, you can delete it as long as no assets or configuration items use the model.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > All Models**.
2. Select the check box beside the product model.
3. From the **Actions** choice list below the list, select **Delete**.
4. Click **OK**.

Vendor catalog items

The vendor catalog is a list of goods available from different vendors.

An accurate and complete vendor catalog can make it easier to keep items in stock at the best possible price.

You can link multiple vendor catalog items to a single [product catalog item](#), which allows you to track information about a single item at different vendors.

For example, for an iPhone 5 product catalog item, you can create separate vendor catalog items from Apple and from Amazon. Select the vendor with the best price when you [source](#) an item. Users need the model_manager role to work with vendor catalog items.

Synchronize information

Certain information is synchronized between models, product catalog items, and vendor catalog items.

When working with models, product catalog items, and vendor catalog items, keep the following in mind:

- Changes to model record update vendor catalog items automatically only if the vendor catalog items are published, not linked.
- If a model is linked to a vendor catalog item, any changes to the model do not update the vendor catalog item.
- After publishing a vendor catalog item or model to the hardware or software catalog, some fields become read-only on the vendor catalog item or product catalog item record. Information can only be updated on the model record.

List of synchronized fields:

- Description
- Short description
- Name
- Product ID

- Price
- Vendor
- Specs
- Features
- Model
- UPC
- Model number
- Cost
- Manufacturer

Create a vendor catalog item

Create a vendor catalog item to associate product models with a vendor.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendor Items**.
2. Click **New**.
3. Complete the form.

Vendor Catalog Item fields

Field	Description
Name	The name of the item is built from information in the Product Model, Vendor, and Product ID fields.
Vendor	The supplier that provides the item.
Product model	The specific version or configuration of the item.
Out of stock	The option that indicates whether the item is unavailable for order. This field is important if you are sourcing request items . Clear this check box if the item is available to order.
Product ID	The item identification number assigned by your organization.
List price	The price at which the item retails, excluding vendor discounts.
Vendor price	The price at which the item is available in the vendor catalog. If the vendor offers a discount, the vendor price reflects the discounted price.
Rank tier	Displays the overall ranking for this vendor's products and services, such as Valued Partner or Tactical Supplier. Rank tier expresses your organization's opinion of this vendor's performance. It can be used to decide if the vendor's products should be promoted or discontinued. Users with the vendor_manager role can edit this field.
Short description	A brief description of the item.
General section	

Field	Description
Product catalog item	Name of the product catalog item, if the item has been added to the product catalog. Leave this field empty if you are going to link a vendor catalog item to the hardware catalog.
UPC	The barcode number used to uniquely identify and track items for sale.
Active	Select the check box to list the item in the vendor catalog. Clear this check box to hide the item in the vendor catalog.
Description	A detailed description of the item.
Information section	
Specifications	Facts about the item such as size, weight, version, or speed.
Features	Distinct properties or distinguishing characteristics of the item.

4. Click **Submit.**

Link an item to the hardware catalog

After you create a vendor catalog item, link the item to the hardware catalog for viewing.

Before you begin

Role required: model_manager

About this task

To see the **Link to Hardware Catalog Item** related link on the Vendor Catalog Item form, add a hardware model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendor Items**.
2. Open a vendor catalog item.
3. In **Related Links**, click **Link to Hardware Catalog Item**.
4. Select a **Catalog Item**.
5. Click **OK**.
The page refreshes to the selected hardware catalog item. The vendor catalog item is listed in the **Vendor Catalog Items** related list.

Link an item to the software catalog

After you create a vendor catalog item, link the item to the software catalog for viewing.

Before you begin

Role required: model_manager

About this task

To see the **Link to Software Catalog Item** related link on the Vendor Catalog Item form, add a software model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendor Items**.
2. Open a vendor catalog item.

3. In **Related Links**, click **Link to Software Catalog Item**.

4. Select a **Catalog Item**.

5. Click **OK**.

The page refreshes to the selected software catalog item. The vendor catalog item is listed in the **Vendor Catalog Items** related list.

Publish an item to the hardware catalog

After you create a hardware item for the vendor catalog, publish it to the hardware catalog for viewing. The hardware catalog is a section within the service catalog.

Before you begin

Role required: catalog_admin

About this task

To see the **Publish to Hardware Catalog Item** related link on the Vendor Catalog Item form, add a hardware model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

After you publish a vendor catalog item to the hardware catalog, the **Publish to Hardware Catalog** related link is no longer available. Any changes made on the vendor catalog item record are synchronized with the information in the hardware catalog.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendor Items**.

2. Open a vendor catalog item.

3. In **Related Links**, click **Publish to Hardware Catalog**.

4. Select a **Category**.

5. Select **OK**.

The published item is listed in the **Vendor catalog Items** related list of the Hardware Catalog form.

Publish an item to the software catalog

After you create a software item for the vendor catalog, publish it to the software catalog for viewing. The software catalog is a section within the service catalog.

Before you begin

Role required: model_manager

About this task

To see the **Publish to Software Catalog Item** related link on the Vendor Catalog Item form, add a software model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

After you publish a vendor catalog item to the software catalog, the **Publish to Software Catalog** related link is no longer available. Any changes made on the vendor catalog item record are synchronized with the information in the software catalog.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendor Items**.

2. Open a vendor catalog item.

3. In **Related Links**, select **Publish to Software Catalog**.

4. Select a **Category**.

5. Select **OK**.

The published item is listed in the **Vendor catalog Items** related list of the Software Catalog form.

View a vendor list

You can view a list of vendors from the product catalog.

Before you begin

Role required: model_manager

About this task

The list includes every company that has the **Vendor** option selected on its record.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Vendors**.
2. Click any vendor **Name** for more information.

Product catalog items

Product catalog items are hardware and software that you can track and offer in the service catalog.

The product catalog is an extension of the [Service Catalog](#)  that contains a list of available [Models](#). Users with the catalog_admin role can create, activate, and deactivate product catalog items.

Create a product catalog item

Create hardware and software product catalog items to include in the product catalog and the service catalog.

Before you begin

Role required: catalog_admin

About this task

You must [activate](#) the items separately before they appear in the product catalog or service catalog.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Hardware & Software Items**.
2. Select **New**.
3. Complete the form.
Some of the fields listed do not appear until you save the product catalog item.

Product catalog item fields

Field	Description
Name	Name of the item as you want it displayed in the product catalog.
Catalogs	Catalog this item is listed in.

Field	Description
Vendor	Vendor that supplies the item. If the item is purchased from multiple vendors, use the vendor catalog and leave this field empty.
Rank tier	Overall ranking for the selected vendor's products and services. This field is shown in a Product Catalog Item record when the CI class is Hardware Catalog or Software Catalog .
Model	Specific version or configuration of the item.
Product ID	Item identification number assigned by your organization.
Price	Price at which the item is available in the product catalog. Enter a numerical value and select the appropriate currency.
Recurring price	Item's recurring price. For example, a subscription to a mobile phone contract could cost \$500.00, with an \$30.00 monthly recurring price.
Recurring price frequency	Interval at which the recurring price is accrued.
List Price	Price at which the item retails. This field is shown only when the Class is Hardware Catalog or Software Catalog .
Cost	Price at which the item was purchased from the vendor. The cost could be less than the List Price if your organization received a discount from the vendor. This field is shown in a product catalog item record only when the CI class is Hardware Catalog or Software Catalog .
Omit price in cart	When selected, hides the price when the item is displayed in the service catalog. Clear the check box to show the price in the service catalog. This field is only visible in a product catalog item record when the CI class is Hardware Catalog .
Workflow	Workflow associated with this item. You can view the activities, the conditions, and the stages associated with the workflow by selecting Show Workflow .
Execution plan	Execution plan associated with this item.
Short description	Brief description of the item.
Ordered item link	List of links containing more information about items. The links can be reused across multiple items.
Class	Catalog item class this item belongs to. Select Hardware Catalog or Software Catalog . This field is visible by default. When you save the record as a hardware or software catalog item, the form is retitled Hardware Catalog or Software, respectively.
General section	
Category	Named group of items to which the item belongs.
Delivery time	Amount of time it takes to deliver the item, starting from when it is ordered from the product catalog.
UPC	Barcode number used to identify and track items.

Field	Description
Description	Detailed description of the item. The description is displayed in the product catalog listing.
Product Information section	
Cost	Price at which the item was purchased from the vendor. This field is only visible when the Class is Software Catalog .
Specifications	Facts about the item, such as size, weight, version, or speed.
Features	Distinct properties or distinguishing characteristics of the item.
Images section	
Icon	Small image that appears next to the name when the item is displayed in the service catalog. Supported file types are jpg, png, bmp, gif, and jpeg.
Picture	An image showing the item. Supported file types are jpg, png, bmp, gif, and jpeg.
Related lists	
Includes	More catalog items provided with this item. This related list is for informational purposes only.
Variables	Service catalog variables associated with this item. A service catalog variable captures and passes on information about choices a customer makes when ordering an item from the service catalog.
Vendor Catalog Items	Vendor catalog items associated with this item. Vendor catalog items allow you to track information about this item by its specifications for each vendor.

Example

Hardware catalog item record with an icon and picture of the item.

Hardware catalog item

The screenshot displays the ServiceNow interface for a hardware catalog item. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Admin', and the current record title 'Hardware Catalog - Canon imageCLASS Laser Printer'. A search bar and utility buttons (Update, Copy, Delete) are also visible.

The main record details are as follows:

- Name:** Canon imageCLASS Laser Printer
- Product ID:** LBP-6650DN
- Price:** \$ 499.99
- Recurring price:** \$ 0.00
- Recurring price frequency:** -- None --
- List Price:** \$ 0.00
- Cost:** 499.99
- Omit price in cart:**
- Category:** Printers
- Vendor:** Canon
- Rank tier:** Strategic Partner
- Model:** Canon imageCLASS LBP-6650DN
- Short description:** Canon - imageCLASS LBP-6650DN Laser Printer - Monochrome - 2400 x 600dpi Print - Plain Paper Print -
- Ordered item link:** [Searchable field]

The 'Images' section at the bottom shows two image management options:

- Icon:** [Update][Delete] (with a small printer icon)
- Picture:** [Update][Delete] (with a larger image of the printer)

Utility buttons (Update, Copy, Delete) are located at the bottom of the page.

4. **Optional:** Select **Try It** to preview the item as it appears in the service catalog.

5. Select **Submit** or **Update**.

Activate a product catalog item

Activate a product catalog item to make it available in the product catalog and the service catalog.

Before you begin

Role required: catalog_admin

About this task

You can activate the item from either the list view or the record.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Hardware & Software Items**.
2. Complete one of the following actions.

Option	Description
Activate one or more items from the list view	Select the check box next to one or more items in the record list and select Activate below the list.
Activate from the record	Select Activate under Related Links .

Deactivate a product catalog item

Deactivate a product catalog item to remove it from the product catalog and the service catalog.

Before you begin

Role required: catalog_admin

About this task

You can deactivate the item from either the list view or the record.

Procedure

1. Navigate to **All > Product Catalog > Catalog Definition > Hardware & Software Items**.
2. Complete one of the following steps.

Option	Description
Deactivate from the list view	Select the check box next to one or more items in the record list and click Deactivate below the list.
Deactivate from the record	Select Deactivate under Related Links .

Import a Product Catalog item

Import a hardware and software product catalog item from one ServiceNow instance to another ServiceNow instance to include it in the product catalog.

Before you begin

Role required: admin

About this task

To import hardware or software product catalog items from one ServiceNow instance to another, use the product model and update sets XML file exported from the source ServiceNow instance.

i Note:

Product model records aren't included in update sets. When you import an update set into the target instance, only the catalog item records are transferred. To avoid validation errors, first import the product model records, and then import the catalog item's update set into the target ServiceNow instance.

Procedure

1. In the source ServiceNow instance, export the hardware or software product model record XML file.
2. In the source ServiceNow instance, perform these steps to export the local update set containing the catalog item.
 - a. Navigate to **All > System Update Sets > Local Update Sets**.
 - b. Select the local update set name to open the update set record.
 - c. In the Related Links section, select **Export to XML**.
 - d. Save the exported update set XML file on your local system.
3. In the target ServiceNow instance, import the hardware or software product model record XML file.

The product model has been successfully imported into the target ServiceNow instance and appears on the models page.
4. In the target ServiceNow instance, perform these steps to import the update set XML file that contains the catalog item.
 - a. Navigate to **System Update Sets > Retrieved Update Sets**.
 - b. In the Related Links section, select **Import Update Set from XML**.
 - c. Select **Choose File** and select the update set XML file saved previously in Step 2.
 - d. Select **Upload**.

The imported update set record is available as a retrieved update set with state **Loaded**.
 - e. Open the retrieved update set and select **Preview Update Set**.

Review updates and resolve any errors.

Result

The catalog items are imported into the target ServiceNow instance.

What to do next

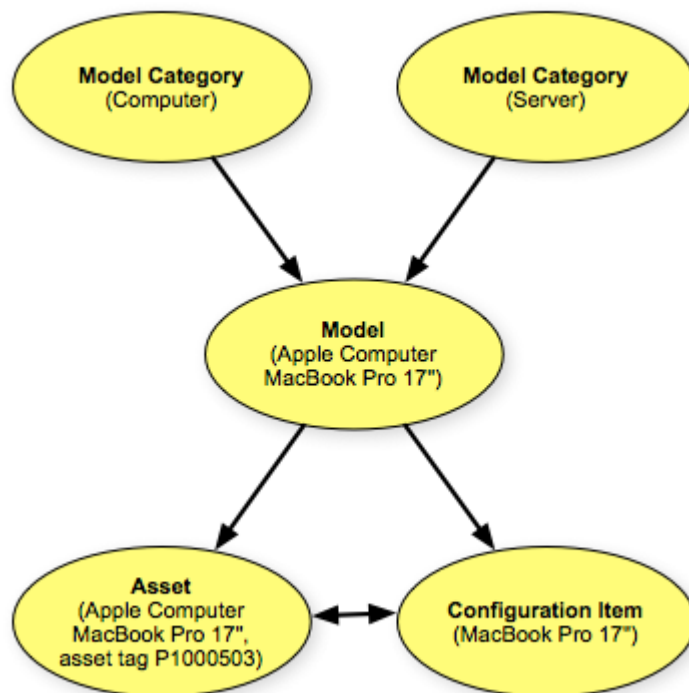

Navigate to the Hardware Models or Software Models page in the target ServiceNow instance, View the imported hardware or software model record, along with its catalog items that are published.

Model categories

Model categories associate CI classes with asset classes. Model categories are part of the Product Catalog application.

The model category configuration determines if the ServiceNow platform creates an asset from a CI, and, if so, what class of asset. Asset classes in the base system are **Hardware**, **Software License**, and **Consumable**. You can associate a model category to many models and a model to many model categories. For example, a specific model of a computer can be a **Computer** and a **Server**.

Models diagram

Any item that is provided as a service or sold to your customer is tracked as an Install Base Item (IBI). The Model category table associates Asset class, CI class, and Install Base Item (IBI) class.

Note:

The Install Base Item class field is available on the Model category form only when the Customer Service Install Base Management [com.snc.install_base] plugin is installed. Currently, only the Medical device install base item [sn_hcls_medical_device_install_base_item] is supported when the Healthcare and Life Sciences Service Management Core application is installed. For more details, see [Medical device install base item table](#). When an IBI class is created, it associates with an asset when the asset exists, otherwise an asset is created.

The fields in the Asset class and the IBI class are synchronized as follows:

1. When an IBI class is updated, the Account, Consumer, Location, and Install date field changes are synchronized with the corresponding fields of the Asset class.
2. When an Asset class is updated, the Location and Install date field changes are synchronized with the corresponding fields of the IBI class.

View model categories

Default model categories are included with product catalog. You can view a list of default categories and the categories that you created.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Model Categories**.
2. Open a model category to view its details.

Create model categories

You can add custom model categories for your instance.

Before you begin

Role required: model_manager

About this task

When you create model categories, keep the following in mind:

- The base system provides a model category for each CI class in the CMDB. As you create *cmdb_ci* classes, create a corresponding row in the model category table for the model table to be used.
- If you select an **Asset class** on any existing model category, the system automatically creates assets for all configuration items associated with the model category, if configured to do so. If an asset is not created automatically, you can create the asset manually. After an asset class is selected for a model category, the asset class cannot be changed.
- The **Allow pre-allocated**, **Allow in bundle**, and **Allow as main** options are only available if an asset class is specified for the model category.
- If you select **Consumable** or **Software License** for the asset class, the **Allow in bundle** option is available, but not **Allow pre-allocation** or **Allow as main**.
- When a CI is created from a model category that requires asset tracking, the system automatically creates an asset record for the asset class specified in the model category. It then links that asset record to the CI. If a model is specified, the model category of the CI is determined by a combination of the CI class and the list of categories supported by the model. Asset tracking is specified on the model record.
- When an asset is created from a model category that requires CI tracking, the system automatically creates a CI record of the class specified by the category and links it to the asset.
- The Model Categories list (**Product Catalog > Product Model > Model Categories**) shows all the CI classes and what asset class is generated on the asset side.

Procedure

1. Navigate to **Product Catalog > Product Model > Model Categories** and select **New**.
2. On the form, fill in the fields.

Model Category fields

Field	Description
Name	A descriptive name for this category.
CI class	If a CI class is needed, it must be specified when you create the model category. You can't add the CI class the model category later.
Asset class	<p>Default options and any new asset classes you've created. Setting the asset class triggers the creation of assets depending on the model category selected. You can add an asset class to the model category later, but can't be changed after it's added. If you select Consumable or Software License, the CI class field becomes read-only because consumables and software licenses don't create CIs. If you specify a CI class and then select Consumable or Software License, the CI class field is changed to None automatically.</p> <ul style="list-style-type: none"> ○ Asset: An item that can be tracked individually. ○ Consumable: An asset not tracked individually, such as keyboards. ○ Hardware: A physical piece of computer equipment, such as a laptop or server. ○ Software License: A legal statement defining the uses of software, such as the number of installations allowed or the terms of distribution.
Install base item class	<p>Class to track the asset as an Install base item.</p> <p>Note: This field is available only when the Customer Service Install Base Management [com.snc.install_base] plugin is installed. Also, currently, only the Medical device install base item [sn_hcls_medical_device_install_base_item] is available when the Healthcare and Life Sciences Service Management Core application is installed.</p>
Product model class	<p>Class table where the models are stored. The default values are:</p> <ul style="list-style-type: none"> ○ Application ○ Consumable ○ Contract ○ Facility ○ Hardware ○ Service ○ Software <p>After you select a value, the table content, form views, and overall functionality of the models created in the model category gets impacted.</p>
Is product instance	Identifies whether the model category is associated with Product Instance, which is a logical grouping of asset, CI, and IBI class.

Field	Description
	<p>Note:</p> <p>This check box is read-only and is supported only for Medical device model category. After you select this option, Product Instance Identifier (PID), a unique identifier for asset, CI, and IBI class is generated whenever you create an asset of that model category. However, for the existing assets, the PID is generated only when any of the asset fields such as Serial number, Model component ID, or Parent is updated.</p>
Allow pre-allocation	Add and track items in this category as Create pre-allocated assets .
Allow in bundle	Use items in this category in bundles .
Allow as main	Use items in this category as the main component in a bundle.
Enforce CI verification	Prevents the system from automatically creating assets in a specific model category when CIs are added manually or found with Discovery. This option enables an administrator to review and verify new CIs before adding them as assets.

3. Select Submit.

[Discovery](#) 

Create assets manually

The ServiceNow AI Platform does not create an asset automatically under certain conditions. You can create an asset manually as needed.

Before you begin

Role required: model_manager

About this task

The conditions under which an asset is not automatically created include the following.

- **Forced CI verification:** If you select the **Enforce CI verification** check box in the **Model Category** form, the system does not create an asset automatically when a CI is created or discovered. When **Enforce CI verification** is enabled, newly created CIs do not trigger an automatic creation of an asset. Instead, these newly created CIs have their **Requires verification** field automatically set to true, which displays the following UI actions for the CI:
 - *Create Asset:* Creates an asset and sets *Requires verification* to false.
 - *Merge CI:* Merges duplicates of a CI. This action is useful if an asset for the CI was created in a separate process, which created an associated CI. Then a second CI was created either manually or via the discovery source - and the duplicate CIs did not properly coalesce.
- **Configuration errors:** In rare cases, the system can fail to create the asset automatically. This failure can occur if you assign the model and model category to the CI in the wrong sequence.

Follow these steps to create an asset manually.

Procedure

1. Navigate to **All > Product Catalog > Product Model > Model Categories**.
2. Open a model category that has no assigned CI class.
3. Click **Create Assets**.
This action creates assets from all CIs deferred for verification in this model category. This option is only available for users with the admin role.

Edit model categories

All default model categories can be edited, except for the Contract model category. You can edit any custom model categories that you created at any time.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All > Product Catalog > Product Model > Model Categories**.
2. Open a model category record.
3. Edit the fields as needed.

Note:

If a CI class is needed, you must specify it when you create the model category. You can't add the CI class to the model category later.

4. Click **Update**.

Delete model categories

If a model category is no longer needed, you can delete it.

Before you begin

Role required: model_manager

About this task

Only model categories that are not referenced by any models can be deleted.

Procedure

1. Navigate to **All > Product Catalog > Product Model > Model Categories**.
2. Select the check box beside the model category **Name**.
3. From the **Actions on Selected Rows** menu below the list, click **Delete**.
4. Click **Delete**.

Domain separation and Product Catalog

Domain separation is supported in the Product Catalog. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see [Application support for domain separation](#) .

How domain separation works in Product Catalog

The domain owner's employees and tenants can use the same processes if the work is done in the correct domain. When adjusting any configuration, you should be in the domain where you're doing the work. Use the domain picker to select the correct domain to work in.

IT Asset Management content request process

The IT Asset Management content services team manages and supports content requests from IT Asset Management customers.

The ITAM Content team reviews content requests and delivers them through the regular weekly content updates.

Examples of content requests include but are not limited to the addition of or update to Publishers, Products, Publisher Part Numbers, Discovery Maps and Lifecycle Dates. While you have the ability to add Custom Data (Publishers, Products, etc.) to your instance, it is recommended that you leverage out-of-box content for ITAM use cases. If you were to create custom data that has since been delivered through the Content Service, references should be updated to the out of box content, and custom data should be deleted.

Content requests fall into the following categories:

- New content: you require content that is not currently in the Content library. You can request new content by [submitting a catalog request](#) through the Now Support portal
- Content correction: you require previously delivered content to be corrected. You can request content update by filing a case with ServiceNow Customer Support through the Now Support portal.

For more details on content requests, see this Knowledge base article on the ServiceNow Now Support https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0790305 .

Create IT Asset Management content request

Create request for new content via the Service Catalog application for the IT Asset Management content service.

Before you begin

Content request can be made for the Software Asset Management content service and the Hardware Asset Management content service.

Role required: customer user or partner user

Procedure

1. Login to the ServiceNow Now Support portal.
2. Navigate to **Automation Store > Service Catalog**.
3. Search and select the catalog item **Asset Management Content Request**.
On the Catalog Item form, the **Catalog Request number (CR)**, **Requested by**, and the **Company** fields populate automatically.
4. Fill in the details on the form.

Field	Description
Title	Summary of your request.
Description	Details of your request.
Selected instance	Instance you are requesting the content for.
Watch list	Add individuals within your organisation to view the progress of this request.
Content category	The content category for your request. You can select the Software Asset Management content service or the Hardware Asset Management content service.
Attachment	Attach an excel sheet with the needed information about the content requested.

5. Click **Submit**.
6. You can view your current content requests by navigating to **Automation Store > Service Catalog > My Content Requests**
The default filter only shows your active requests. If you want to see all your requests (including closed ones), you need to adjust the filter.

Licensing for IT Asset Management

The ServiceNow platform uses a new licensing method where your organization is charged for using the IT Asset Management applications: ServiceNow® Software Asset Management application and ServiceNow® Hardware Asset Management application.

For licensing purposes, CI types are assigned to CI categories. The customer contract for your organization determines the ratios of CI allocation for each CI category. Information from the customer contract is synchronized with the ServiceNow platform. These are the following CI categories:

- Network Gears
- Servers
- End User Computers

Note:

CI types are the same as CI classes.

Depending on the needs of your organization, you can purchase subscriptions for the application separately (a la carte) or together (in bundles). When you purchase subscriptions in bundles, you get the same number of subscriptions for all applications covered by the bundle. For example, for a bundle of 500 that covers the Software Asset Management and Hardware Asset Management applications, your organization receives 500 subscriptions for Software Asset Management and 500 subscriptions for Hardware Asset Management.

Bundle subscriptions cover specific applications. You cannot use bundle subscriptions for other applications, even if these other applications are part of the same bundle. For example, you purchased a bundle of 500 covering Software Asset Management and Hardware Asset Management, and you used up all 500 Software Asset Management subscriptions. You cannot use the spare Hardware Asset Management subscriptions for Software Asset Management.

If your organization consumes more subscriptions than you initially estimated, you can purchase a larger bundle that better suits the needs of your organization. Your organization may consume subscriptions of IT Asset Management applications at different levels. If so, you can purchase a bundle that sufficiently covers most of the required applications and also purchase a la carte subscriptions for the application that consumes more subscriptions.

Subscription summary for IT Asset Management application

You can view how many subscriptions for IT Asset Management applications your organization purchased and allocated.

Review the configuration item (CI) allocation and allocation level to see how your organization uses IT Asset Management application subscriptions and plan upcoming subscription needs.

Navigate to **ITAM Licensing > ITAM Subscription Summary** to view the subscription summary.

View the following statistics on subscriptions purchased a la carte and by bundles:

Name

The name of either subscription bundle or IT Asset Management application, if your organization purchased subscriptions per application separately (a la carte).

Purchased

The number of purchased subscriptions per bundle or application (a la carte).

Allocated

The number of consumed subscriptions from a bundle or application (a la carte). For bundles, this field shows the highest number of consumed subscriptions by applications that are part of the bundle. For example, if Software Asset Management consumed 300 subscriptions and Hardware Asset Management consumed 200 subscriptions, this field shows 300 for the bundle covering these applications.

The color code indicates the percentage of the subscriptions that your organization consumed. By default, the color code threshold is 90%.

- Green – Your organization has used less than 90% of purchased subscriptions.
- Yellow – Your organization has used more than 90%, but less than 100% of purchased subscriptions.
- Red – Your organization has used 100% or more and exceeded the number of purchased subscriptions. Purchased subscriptions are overdrawn.

Start date/End date

The dates for which this subscription is valid.

The licensing module calculates and displays subscription consumption as follows:

Subscriptions by bundle only

When you purchase subscriptions in bundles, you get the same number of subscriptions for all IT Asset Management applications covered by the bundle. For example, for a bundle of 500 that covers Software Asset Management and Hardware Asset Management, your organization receives 500 subscriptions for Software Asset Management and 500 subscriptions for Hardware Asset Management.

The licensing module subtracts the number of consumed subscriptions from the bundle subscriptions for the relevant application. Bundle subscriptions cover specific applications. You cannot use bundle subscriptions for other applications, even if these other applications are part of the same bundle. For example, you purchased a bundle of 500 covering Software Asset Management and Hardware Asset Management, and you used up all 500 Software Asset Management subscriptions. You cannot use the spare Hardware Asset Management subscriptions for Software Asset Management.

If your organization exceeds the number of purchased subscriptions, the bundle size is automatically adjusted to the number of consumed subscriptions. When that happens, the licensing module recalculates levels of consumption for all applications covered by the same bundle.

The Subscriptions window displays the actual number of consumed subscriptions under **Allocated**. The red color dot in **Allocated** indicates that the bundle is overdrawn.

Subscriptions a la carte only

The licensing module subtracts the number of consumed subscriptions from the a la carte subscriptions for the relevant application. The Subscriptions window displays the information for purchased and allocated subscriptions for IT Asset Management applications.

If your organization exceeds the number of purchased subscriptions for an IT Asset Management application, you cannot use unconsumed subscriptions for another application.

If your organization exceeds the number of subscriptions, the Subscriptions window shows the relevant a la carte subscription is overdrawn.

Subscriptions for the same applications both in bundle and a la carte

If you purchased IT Asset Management subscriptions both in bundle and a la carte, the licensing module always subtracts the number of consumed subscriptions from the bundle before deducting from the number of subscriptions purchased a la carte. For example, there is a bundle of 500 subscriptions covering Software Asset Management and Hardware Asset Management. In addition, there are 250 subscriptions for Software Asset Management purchased a la carte. The first 500 subscriptions consumed by Software Asset Management are consumed by the bundle. Only when Software Asset Management exceeds the number of subscriptions in the bundle, the licensing module starts deducting from subscriptions purchased a la carte and shows them as subscriptions allocated to Software Asset Management.

If your organization exceeds the number of subscriptions purchased in bundle and a la carte, the licensing module considers it as overdrawn from the a la carte subscriptions. In this case, the Subscriptions window indicates that the a la carte subscriptions are overdrawn.

View license report for the IT Asset Management application

Resources that the IT Asset Management applications discover, monitor, and provision are configuration items (CIs) stored in the CMDB. The ITAM licensing module combines this information on CIs with the information on subscriptions your organization purchased to produce statistics on subscription use by IT Asset Management applications.

Before you begin

The process of collecting and aggregating information for licensing purposes consists of the following interactions. As a result, you can view the statistics on how your organization uses purchased subscription units.

1. The IT Asset Management applications count CIs and assign them to CI categories daily.
2. The IT Asset Management applications daily report CI count by CI category to the IT Asset Management licensing module. If features of the same application report the same CIs as their resources, the CI count is manipulated to remove the duplication.
3. The licensing module correlates the daily average CI counts for IT Asset Management applications with the licensing information from the customer contract to produce license statistics.

Role required:

- admin
- usage_admin

Procedure

1. Navigate to **All > ITAM Licensing > ITAM License Report**.
2. Select an application to view the subscription for a particular CI category.

Application	Resource Category	Resource Total Count	Subscription Unit Ratio	Total Subscription Units Consumed
Application: Hardware Asset Management (3)				
Hardware Asset Management	Servers	4	1:1	
Hardware Asset Management	End User Computers	27	4:1	
Hardware Asset Management	Network Gear	5	5:1	
				Sum
Application: Software Asset Management (3)				
Software Asset Management	Subscription Users	30	15:1	
Software Asset Management	Servers	1	1:1	
Software Asset Management	End User Computers	18	4:1	
				Sum
				Sum

You can view the following information on CI count and subscriptions purchased for each IT Operations Management application separately (a la carte):

- **Resource Category:** CI categories for IT Asset Management applications.
- **Resource Total Count:** CI count for CIs organized by CI categories, for each IT Asset Management application.
- **Subscription Unit Ratio:** Ratios define how many CIs of a certain CI category require a subscription. The Software Asset Management application has pre-defined values for End User Computers (4:1), for Servers (1:1), for Storage Volumes (3:1), for Databases (3:1), and for Subscription Users (15:1).

- **Total Subscription Units Consumed:** The number of subscriptions per CI category for each IT Asset Management application that your organization consumed. The licensing module calculates this number by applying the subscriptions ratio to the CI count number for each application's CI category.

For licensing purposes, the Software Asset Management application only considers CIs with software installs discovered within the last 90 days or those where the last discovered as empty. Additionally, all CIs are excluded that have a column added to the `cmdb_ci_hardware` table and that column name is referenced in the property labeled *Enter the name of the true/false field added to cmdb_ci_hardware table to exclude software installed on selected devices from Software Asset Management*. For more information on excluding CIs, see [Exclude software assets on CIs](#).
