Field	Description
Context mapping field	Select the field in the Context table to map to the field selected in **Source mapping** field.
Advanced mapping	Select Advanced Mapping and write a script in the **Advanced mapping script** field if the source and context mapping isn't sufficient.

9. Select **Submit**.

Create facets for activity contexts

Create facets to group the data and enable customer service agents to filter and display the data they want to see in the activity feed.

Defining and associating facets to contexts

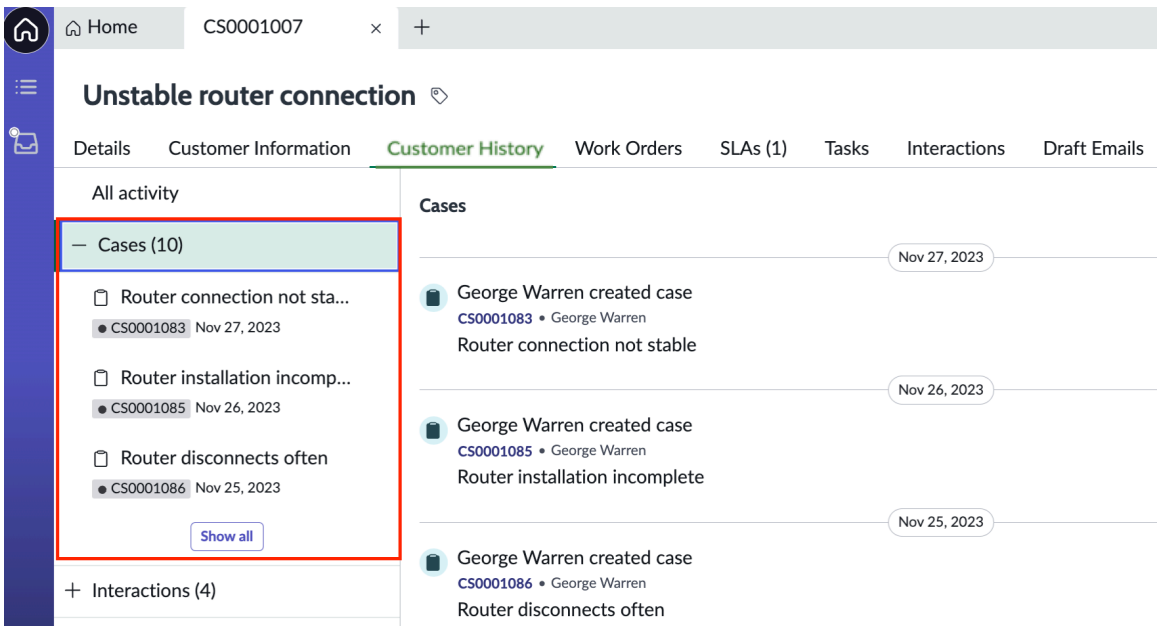
Learn more about configuring facets from the following video tutorial.

Before you begin

- Role required: admin
- Ensure that the application scope is set to Customer Central.

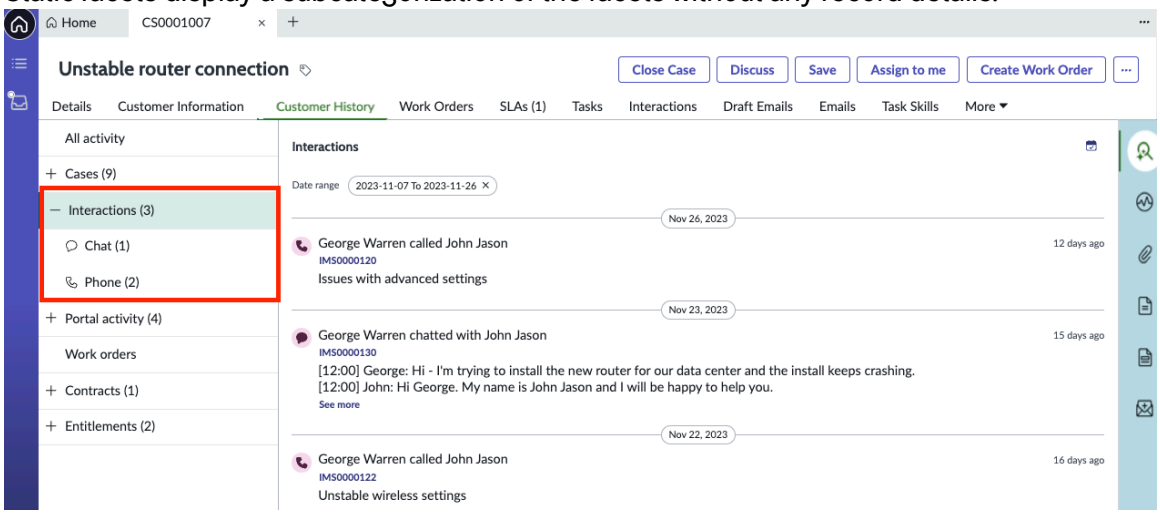
About this task

An activity context is the person or user who is interacting with the customer service agent. There are two predefined activity contexts: consumer and contact. Facets group the data, which enables customer service agents to filter and display the data they want to see in the activity feed. Each facet represents an activity group.
Facets are displayed in the Customer History view in Agent Workspace. Dynamic facets display record details associated with the facet.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Static facets display a subcategorization of the facets without any record details.



Procedure

1. Navigate to **All** > **Customer Central** > **Customer History** > **Guided Setup**.
2. Select **Get Started** under Activity Contexts.

> **Note:**
> The Get Started button becomes active only after you complete all configurations and select Mark as Complete in the previous sections.

3. Select **Configure** beside Facets.
4. Open the contact or consumer record that you want to create facets for.
5. On the Facets related list, select **New**.

> **Note:**
> Ensure that the application scope is set to Customer Central. The New button only appears under this scope.

6. Fill out the fields, as required.

New activity contexts field description

Field	Description
Name	Enter a Name for the facet. This is the name of the facet that appears on the Customer History view.
Activity context group	Add an activity context group for the facet.
Facet type	Select whether the facet is dynamic or static. Dynamic displays record details associated with the facet. Static displays a subcategorization of the facets without any record details. Static facets can also be associated to a facet group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Enter the order the facet should appear in.
Facet group	If you selected facet type Static, associate the facet to a group. If you associate the facet to a facet group, this facet becomes a subcategory of the facet group you selected.
Icon	Select an icon for the facet.
Facet title	If you selected facet type Dynamic, choose the field of the record to display as the facet title.
Facet fields	If you selected facet type Dynamic, select the fields to display for each record.

7. Select **Submit**.

Configure the Customer Service mobile application

Configure the Customer Service mobile application and customize it for agents who use the application instance on their mobile devices.

Before you begin
Role required: admin

About this task
The Customer Service Mobile plugin (com.sn_csm_mobile) enables the Customer Service mobile application.

Procedure

1. Navigate to **All** > **System Applications** > **Studio**.
2. In the **Select Application** pop-up window, click **Customer Service Mobile**.
   The Customer Service mobile application opens in the Studio, which is a guided app creator. For more information about using the Studio, Legacy - ServiceNow Studio.
3. Customize the application to display the desired applets and data and configure agent actions and notifications.

Enable communication channels

Set up multiple communication channels so that customers can contact you through their preferred methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication channels

Configure communication channels, such as email, call, chat, or social media.

Chat Zoom Connector

Use Chat Zoom Connector to enable customers to engage better using video and screen sharing options.

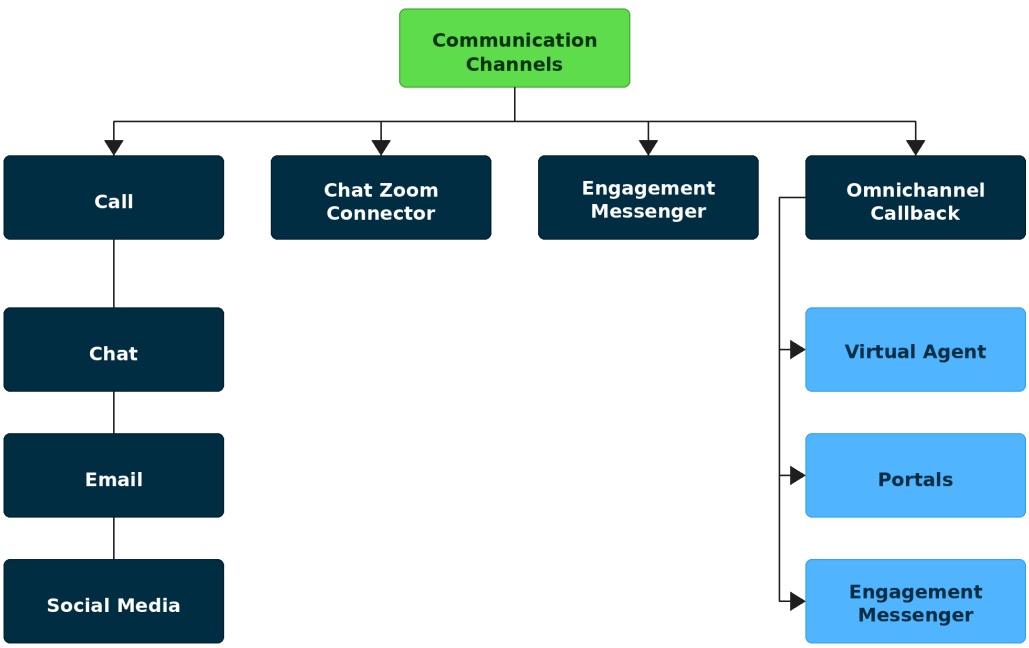
Omnichannel Callback

Set up Omnichannel Callback for Customer Service Management to enable your customers to request a voice or video callback.

Engagement Messenger

Set up Engagement Messenger to enable your users to find the information or service that they need from third-party web applications.

Communication channels overview



Communication channels

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure communication channels for users to email, call, or chat, and integrate social media channels. This ensures users can reach your team through their preferred method for assistance.

Chat Zoom connector

Install and set up the Chat Zoom Connector to enhance customer engagement with video and screen sharing options. This application enables you to start Zoom meetings directly from a chat for more effective communication.

Engagement Messenger

Learn about the stages to set up Engagement Messenger, then install and configure it to access information and services from third-party web applications via your customer portal. This setup helps streamline your workflow and enhance your experience.

Omnichannel Callback

Set up and configure Omnichannel Callback for Customer Service Management to enable customers to request voice or video callbacks. Customize the feature to meet your organization's needs, enhancing customer experience and optimizing case resolution efficiency.

Configure communication channels

Configure communication channels to provide users with options to email, call, or chat with your teams for help. You can also integrate with social media.

Before you begin

Role required: admin

About this task

You have the following options for setting up communication channels:

Procedure

- Set up the Customer Service email channel.
  Customers can send emails to create new cases and update current cases as well as receive email updates from agents as cases progress. Customer Service Management uses the ServiceNow email accounts feature to create and maintain email accounts.
  - Configure one or more email addresses.
  - Configure an email address for a product.
  - Configure an email subject line prefix
  - Set email communication channel properties
  - Create an email client template.
  - Create quick messages.
  - Create rules for incoming emails and create and assign cases.
- Set up the Customer Service phone channel.
  External customers can reach out to customer service agents using the phone communication channel. Customer Service Management uses both Computer Telephony Integration (CTI) and OpenFrame to provide phone support for customers, as well as the Notify application and the Twilio Voice product.

  OpenFrame is included with Customer Service Management. The CTI Softphone plugin (com.snc.cti) and the Customer Service CTI Demo Data (com.snc.customerservice_cti_demo)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

plugin must be activated separately. The Notify plugin (com.snc.notify) is activated as part of the CTI Softphone plugin.

- Set up the phone communication channel.
- Associate a phone number with a workflow.
- Create an OpenFrame configuration.

- Set up the Customer Service chat channel.
  The chat communication channel uses the Connect Support feature to provide chat capability from the Customer Service Portal and Consumer Service Portal. You can also enable Virtual Agent to create or use predefined chatbot topics (conversations) for your users.
  - Configure the customer service chat queue.
  - Add an agent to the chat support assignment group.
  - Activate Virtual Agent for Customer Service Management
  - Activate Customer Service Virtual Agent conversations.
  - Integrate Customer Service Virtual Agent with Facebook Messenger.
- Set up the social media integration feature to support case resolution through social media channels.
  - Create a social media profile for an account, contact, or consumer.
  - Create a social media log entry for a case.

Configuring the chat channel

Configure the chat channel with the ServiceNow® Connect Support feature. You can also enable Virtual Agent to create or use predefined chatbot topics (conversations) for your users. You can also give users the option of switching to a live agent from a virtual agent.

Agents must be added to the Customer Service chat support assignment group before they can receive chat requests. This assignment group is used by the Customer Service chat queue to route the chat requests.

For more information, see Connect Support and Virtual Agent.

Pre-chat surveys

Use pre-chat surveys to capture preliminary information from a customer. From the responses received, Advanced Work Assignment (AWA) routes chat conversations to appropriate queues and groups. Before entering into a chat conversation, the assigned agent can review the context of the issue.

Pre-chat features

Pre-chat surveys provide the following advantages that help agents efficiently handle chat conversations:

Preconfigured pre-chat surveys

Pre-chat surveys determine the pre-chat questions presented to users. Preconfigured surveys are activated by default in the base system, but in order to avoid conflicts with previous configurations, customers who have upgraded have to manually activate them. These preconfigured surveys are:

- CSP Pre-Chat Survey - Collects preliminary information for logged-in customers.
- CSP Anonymous Pre-Chat Survey – Collects preliminary information for users who are not logged in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can define a different survey or modify these predefined surveys. For more information, see Create chat surveys.

Routing chats to the correct queue

Advanced Work Assignment (AWA) leverages information captured through pre-chat surveys to route a chat to the right queue. For more information, see Work item queues.

Identifying topics related to the chat issue

When customers enter a response to the standard pre-chat question "Please briefly describe your issue," Natural Language Understanding can help determine the appropriate Virtual Agent conversation topic. Relevant topics are automatically displayed to end users (requesters) rather than prompting them to choose from a list of conversation topics. For more information, see Define context topic intent configurations.

Configuring Pre-chat if you have upgraded

Some settings need to be configured if you have upgraded your ServiceNow® instance. For more information, see Configure pre-chat after upgrading.

Plugins

You must activate the Consumer Service Portal (com.glide.service-portal.consumer-portal) and Glide Conversation Server (com.glide.cs) plugins. To activate the plugins, see Activate a plugin.

Related topics

Pre-chat from the Consumer Service Portal

Configure the customer service chat queue

Define the customer service agents, default chat messages, schedule, and escalation path for the customer service chat queue.

Before you begin

Role required: admin

About this task

The Customer Service Management chat communication channel uses the ServiceNow Connect Support feature.

Procedure

1. Navigate to **All** > **Collaborate** > **Administration** > **Queues**.
2. Select **Customer Service** from the Chat Queues list.
3. Fill in the fields, as appropriate.

Chat Queue form

Field	Description
Name	Name of the queue.
Active	Not used in Connect.
Assignment group	User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Average wait time	Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.
Confirm problem	Not used in Connect.
Escalate to	Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the **Escalate** option in conversations.
Initial agent response	Message that users see when an agent accepts their chat. For example, **Thank you for contacting support. We are looking into your question now and will be with you shortly.**
Not available	Message that users see when they attempt to start a chat outside the defined queue **Schedule**. You can use HTML to format the message and include links or media.
Question	Initial phrase that users see when they start a new chat in the queue. For example, **How can I help you?**
Schedule	Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.

4. Click **Submit**.

Activate Virtual Agent for Customer Service Management

Activate Virtual Agent for CSM to use the predefined Customer Service Virtual Agent topics (chatbot conversations) designed to help your customers complete common self-service tasks.

Before you begin

The Virtual Agent plugin (com.glide.cs.chatbot) must be activated. If the Virtual Agent isn't currently activated, contact ServiceNow to activate it.

Role required: admin

Procedure

Activate the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent) to access the predefined Customer Service topics.

Customer Service Virtual Agent conversations

Predefined Customer Service Virtual Agent chatbot conversations enable your customers to get help with the product. Integrating Natural Language Understanding (NLU) models with your virtual agent chatbot topics enables chatbots to analyze, understand, and navigate the user to the right topic based on the inferred intent.

A conversation topic defines the dialog between the Virtual Agent (chatbot) and the user to accomplish a specific goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activating Virtual Agent conversations

The system administrator or a virtual agent admin must do the following to enable the chatbot conversations:

- Enable the Glide Virtual Agent plugin (com.glide.cs.chatbot).
- Enable the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).
- Publish the following read-only pre-defined virtual agent chatbot topics and topic blocks:

  Note:
  You can duplicate a topic and then customize it.

  - Check Case Status (Template)

    Users can search cases and check the status of an existing case.

  - Get Help with a Product (Template)

    Users can get help on an issue with a product, search relevant knowledge articles, or create a case for the issue.

  - Get Help (Template)

    This topic is for users who are not logged in and want to chat anonymously. Users can use keywords and search relevant knowledge articles or choose to be transferred to a live agent. You can integrate this topic with the Virtual agent - Facebook messaging integration to enable chat using your messaging application.

  - Get Help with an Order (Template)

    Users can get help on an issue with an existing order, search relevant knowledge articles, or create a case for the issue.

  - Submit Request (Template)

    Users can submit a request for searching and using one of the catalog items.

  - Create Case

    Creates a case from Virtual Agent when no relevant topics for the issue you have are displayed.

  - Update Case

    Users can update a case from Virtual agent.

Your users can run the published topics in your chat support client.

Activating Virtual Agent conversations with NLU

- The Customer Service NLU Model for Virtual Agent Conversations (com.sn_csm.nlu) plugin is automatically enabled when you enable the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).

  After you enable the plugin, you can view the following read-only intents for the Customer Service NLU for VA models in Studio:

  - CheckCaseStatus
  - GetHelp

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- GetHelpWithProduct
- GetHelpWithOrder
- SubmitRequest

Each intent corresponds to a chatbot topic. To customize an intent, you can import an existing intent from the Customer Service NLU for Virtual Agent model and then link the NLU model with the associated intent for the topic.

- Enable ServiceNow NLU in the general settings.

Natural Language Understanding in Virtual Agent

Integrate Customer Service Management Virtual Agent with Facebook Messenger (Legacy)

Integrate the Customer Service Virtual Agent with Facebook Messenger to enable bot conversations in the messenger.

Before you begin

Role required: virtual_agent_admin or admin

- Install the Customer Service (com.sn_customerservice) plugin.
- Install the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).
- Make sure Virtual Agent is integrated with Facebook Messenger.
- Make sure you have the token and secret for the messenger.

For information on integrating the Virtual Agent with Facebook Messenger and for retrieving the messenger token and secret, see Set up Virtual Agent integration for consumer messaging apps.

About this task

With this integration, you can get help using Virtual Agent chatbot conversations. For more information on getting help, see Customer Service Virtual Agent conversations .

Procedure

1. In the application navigator, enter `sys_cs_adapter_configuration_page_messenger_list.do`
2. Select **sample-fb-messenger-app**.
   You have to be in the **Customer Service Virtual Agent Conversations** application to edit the record.
3. In the **Messenger Page ID** field, enter your company's Facebook page ID.
4. Right-click and select **Save**.
5. In the **Provider Auth** field, click the information icon and open the **Message Auth** record:
   - Go to the **Outbound message creation** field, click the information icon and open the **Token Verification** record.
   - In the **Token** field, enter the token for the messenger application.
   - Click **Update**.
6. In the **Message Auth** record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Go to the **Inbound message verification** field, click the information icon, and open the **Hash Message Verification** record.
- In the **Secret** field, enter the app secret for the messenger application.
- Click **Update**.

Configure pre-chat after upgrading

If you have upgraded, some settings need to be configured to use pre-chat effectively.

Before you begin

Role required: admin

About this task

For information about using pre-chat surveys to capture preliminary information from a customer, see Pre-chat surveys. If you have upgraded, you must manually adjust some settings to use Pre-chat most effectively.

Procedure

1. Make the predefined pre-chat surveys active.
   a. Navigate to **Conversational Interfaces** > **Pre-Chat Survey**.
   b. Select the CSP Pre-Chat Survey, which collects preliminary information for logged-in customers.
   c. In the form, select **Active**.
   d. Click **Submit**.
   e. Repeat this process for the CSP Anonymous Pre-Chat Survey, which collects preliminary information for users who are not logged in.
2. Disable the legacy form-based chat widget from appearing in the portal header.
   a. Type *sys_properties_list.do* from your instance.
   b. Search for the *csp.legacy_chat* property.
   c. Set the property value to **true**.
   d. Click **Update**.
   The **Chat** option from the portal header is disabled.
3. Include the chat widget to appear on the Consumer Service Portal page.
   a. Navigate to **Service Portal** > **Agent Chat**.
   b. Click **CSP Chat**.
   c. Select **Active**.
   d. Click **Submit**.
   The Open chat window icon that customers can use to initiate the pre-chat survey and connect with an agent will appear in the portal header.

Configuring the email channel

You can configure an email channel to either create interactions or cases from incoming emails. Email Interaction creates interactions from emails. Email to Case automatically creates cases from emails. The setup process involves configuring email properties, defining flows, and setting up notifications.

Email Interaction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email Interaction creates an interaction from customer email. It associates the email conversation between agent and the customer with the interaction record. If the customer request requires investigation and resolution, a case is created. Subsequently, email communication is tracked through the case record.

Email to case

Email to Case creates cases from incoming customer emails to streamline issue tracking and resolution.

Email Interaction

Like chat and phone channels, Email Interaction enables agents to manage email conversations with customers using interaction records. Agents can create cases when further investigation is needed. This approach reduces unnecessary cases and provides a consistent design for omnichannel interactions.

To enable Email Interaction for Customer Service Management (CSM), configure system properties and define flows for processing incoming emails. These flows determine how emails are converted into interactions and, if necessary, into cases.

Additionally, enabling notifications for interactions helps keep agents informed about email responses received from customer, providing timely responses to customer inquiries.

Activate Email Interaction for CSM

Activate the Email Interaction for CSM plugin (sn_eaai_csm) for new or existing CSM customers. This plugin includes demo data and activates related plugins if they aren't already active.

Before you begin

Role required: admin

About this task

The flows are deployed with Email Interaction for CSM and are enabled by default for new CSM customers. The flows aren't enabled by default for existing CSM customers. To manually activate the flows, Activate a flow for Email Interaction for CSM

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
   The Review Installation Details dialog is displayed.
2. Find the Email Interaction for CSM using the filter criteria and search bar.
   The app is available in the Store applications section.
3. Start the installation process by selecting **Install**.
   The Review Installation Details dialog box is displayed.
4. Review the details of the installation.
5. Verify that the **Install now** option is selected.
6. **Optional:** If you want to get the demo data, select the **Load demo data** check box.
7. Select **Install**.

Result

The Email Interaction for CSM plugin is successfully installed.

View the service channel configured with Email Interaction for CSM

View the service channel configured during the installation of the Email Interaction for CSM application. This service channel facilitates the routing of email interactions through Advanced Work Assignment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Service Channels**.
2. View the **Email** service channel.

Configure Advanced Work Assignment for routing email interactions

Configure Advanced Work Assignment#(AWA) to route email interactions automatically to your agents, based on their availability, capacity, and optionally, skills.

Before you begin
Role required: admin

About this task
The Service channel **Email** is configured during the installation of the Email Interaction for CSM application.#If you want to create service channels for email, follow the procedure.

You can use the#Advanced Work Assignment (AWA) feature to automatically assign work items to users based on their availability and capacity.

AWA assigns work items using assignment groups, so it's important that your users and groups are set up correctly.

- Determine the assignment group to use in the AWA service channel configuration and add users to this group.
- Confirm that the users have at least one of the roles: sn_customerservice.consumer_agent or sn_customerservice_agent.

Setting up a service channel involves multiple steps, which are detailed in the procedure. Once the service channel setup is complete, you can use AWA to assign newly created email interactions that either unassigned or satisfy the conditions specified in the service channel.

Procedure

1. Create the email service channel.

   a. Navigate to#**All** > **Advanced Work Assignment** > **Settings** > **Service Channels** > **New**

   b. Fill in the fields on the Service Channel form.

Service channel form

Field	Description
Name	Name of the service channel that you're configuring. For example, Custom-Email.
Inbox order	Order in which channel items appear in the user inbox. The#**Inbox Order**# field is an integer#field type. This field can store whole numbers.
Application	Name of the application. For the Email Interaction channel, select Email Interaction for CSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option for activating the service channel. When you select this option, the associated queues for the service channel can start accepting work items.
Short description	Brief description of the service channel.
Table	Table that stores the service channel records. To route email interactions, select the Interaction table.
Assign to field	Field that references the user that the item is assigned to. For the Interaction table, this field is the **#Assigned to#field** (assigned_to) field.
Assignment group field	Field that references the assignment group that the item is assigned to. For the Interaction table, this field is the #**Assignment group#field** field.
Advanced condition	Advanced conditions that apply to the channel.
Default work item size	Amount of a user's capacity that is used if this work item is assigned. The default is 1.
Default capacity	Number of items automatically assigned to agents (pending overrides). The default for this field depends on the type of work item.
Utilization condition	Condition that determines what constitutes an active item that counts toward user workload/capacity.

c. Select **Submit**.

The system adds the Email Interaction channel to the Service Channels list. For more information, see#Create or configure a service channel .

2. Configure the layout for the email interaction inbox card.

> **Note:**
> The Inbox layouts are configured during the installation of the Email Interaction for CSM application.

#If you want to create Inbox layouts follow the procedure in Create or modify an inbox layout for **Email** service channel, available by default, or **Custom-Email** service channel.

3. Create a queue for the email interaction service channel.

a. In the Queue related list of the service channel, select#**New**.

b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Queue form

Field	Description
Name	Name of the queue. For example, Email Queue.
Short description	Brief explanation of the queue. For example, "Assign email interactions to front-office users".

For more information about configuring a queue, see#Create a work item queue .

c. Select **Submit**.

4. Create an assignment rule for the queue.

a. Navigate to#**All** > **Advanced Work Assignment** > **Settings** > **Assignment Rules**.

b. Select **New**.

c. On the form, fill in the fields.

New assignment rules field description

Field	Description
Name	Name of the assignment rule.
Short description	Brief description of the assignment rule. For example, Assign the email interactions based on this configuration.
Assign by	Type of assignment. Select **Most Capacity**, which routes a work item to the user who has the greatest availability for handling the work.
Allow agents to reject	Option to enable agents to reject work items in their inbox.

For more information about creating an assignment rule, see#Configure agent assignment rules .

5. Create a group for the queue.

a. Navigate to#**All** > **Advanced Work Assignment** > **Management** > **Groups.**

b. Select **New**.

c. On the Group form, fill in the fields.
For more information about creating a group, see Create or change groups for Advanced Work Assignment queues .

d. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select the group to display the Group form.

f. In the Group Members related list, add users to the group.

The users that you add to the group for the Email Interaction Assignment queue require the roles.

- Customer agent (sn_customerservice_agent)
- Consumer agent (sn_customerservice.consumer_agent)
- AWA agent (awa_agent)

6. Associate the assignment rule with the queue.

a. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Queues**.

b. Select the queue.
For example, Email Queue.

c. In the Assignment Eligibility related list on the Queue form, select **New**.

d. In the **Agent assignment rule** field, select the assignment rule.

e. In the **Groups** field, select the assignment group.

f. Select **Submit**.

7. Activate the service channel.

a. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Presence States**.

b. Select the **Available** presence state.

c. Add the email service channel to the **Selected** column.

d. Select **Update**.

Result

After the service channel is activated, you can use it to assign work items. For more information, see Service channels.

Configure flows for incoming emails that create and update interactions

The default email flows are available once you activate the Email Interaction for CSM application. Enable the email flows to activate email processing for automatic creation and updating interactions.

- **Create Interaction from Email**: Creates an interaction of type Email for each new inbound email from a customer.
- **Update Interaction from Email**: Updates the interaction with the reply email received from the customer.

  If a reply email is received on a closed interaction, a new interaction of type Email is created. It includes the link to the previous closed interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Update Case via Reply for Email**: Updates the case record with the reply email received from Customer on the case.

  This flow creates an interaction of type Email if a reply email is received on the closed case record. The new interaction includes a link to the closed case.

Alternatively, customers can use Inbound Actions to create and update email interactions.

The execution order of the Inbound Flows takes a higher precedence over Inbound Actions meaning that when an email flow executes, it helps prevent execution of Inbound Actions.

Activate a flow for Email Interaction for CSM

Activate flows for customers who have the Email Interaction for CSM application configured, enabling efficient workflow automation.

Before you begin
Role required: admin

About this task
For new CSM customers, the inbound actions are activated by default. Existing CSM customers should activate email interaction related flows and deactivate the case related flows.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Open a flow from the available flows.
   - Create Interaction from Email
   - Update Interaction from Email
   - Update Case via Reply for Eaal
3. Select **AND**.
4. Select the filter condition: **To** contains **customerservice@example.com**.

   Note:
   customerservice@example.com is a sample email address. Specify the actual email address that should be configured as the default for creating email interactions.

5. Activate the selected flow by selecting **Activate**.

Result
All the available flows are activated.

Define a custom flow to create or update email interactions

Define email-related business processes using Workflow Studio. This tool enables you to manage emails along with your customer service processes through a visual interface without having to design or request complex scripts.

Create an interaction

Create an interaction record to capture customer details.

Before you begin
Role required: workspace_admin, awa_agent, sn_customerservice_consumer_agent, or sn_customerservice_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Create a flow.
   a. Select **Flows**.
   b. Select **New**.
   c. Select **Flow**.
   d. In the **Flow name** field, enter the flow name.
   e. Select the application scope from the Application list.
   f. In the **Description** field, enter the description.
   g. Select **Show additional properties**.
   To know more about additional properties, see Create a flow in Workflow Studio.
   h. Select **Build flow**.
3. Create a trigger.
   a. Select **Add a Trigger**.
   b. Search and select **Application**.
   c. Select **Inbound Email**.
   d. Select Email conditions with **AND** operator.
      - Select **Type** is **received**.
      - Select **Receive type** is **New**.
      - Select **To** contains **customerservice@example.com**.

      Note:
      customerservice@example.com is a sample email address. Specify the actual email address that should be configured as the default for creating email interactions.

   e. Leave the Reply Record Type as empty.
   f. Select **Done**.
4. Select **Add an Action, Flow Logic, or Subflow** and select any of the following.
   - Action
   - Flow Logic
   - Subflow

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
After you have created action entries, you can select multiple actions using **Select multiple**.

5. **Optional:** Add error handler.
   a. To enable the error handling, slide the **ERROR HANDLER** toggle switch.
   b. Select **Add an Action, Flow Logic, or Subflow** and select any of the following.
      - Action
      - Flow Logic
      - Subflow
6. Verify the email flow and modify it if necessary.
7. Select **Save**.
8. Select **Activate**.
9. From the confirmation dialog box, select **Activate**.

Related topics

Display the most recent reply in the Activity stream

Configure an ongoing notification for email interactions

Configure an ongoing notification for email interactions. Configure the ongoing menu item on the toolbar in the CSM Configurable workspace for agents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Presence States**.
2. From the Service channels section, from the Available list, select **Email** (or a custom email channel) and **Chat – Asynchronous**.
3. Add the selected items to the Selected list.
4. Select **Update**.

Enable agents to respond to customers with email activity history

Enable agents to respond to customers with email activity history, which is created by embedding a mail script in an email client template.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Email Client** > **Email Client Templates**.
2. Search and select **Email response to customer**.

Note:
If a message appears about the application scope, select **here** to be able to edit the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Body HTML** field, enter `<div id="collapsible-content">${mail_script:get_email_interaction_activity_history_for_reply}</div>`.

   Note:

   - The number of emails in the activity history matches the value set in the system property, number_of_activities_in_notification.
   - You can also create a client template and map it to the Interaction table. For more information, see Create an email client template.

4. Select **Update**.

Result

The get_activity_of_case_and_related_interaction_for_email script retrieves and formats cases and related interaction email history, adding it to the email client in the agent workspace. The content is hidden behind ellipses within a DIV tag with the ID “collapsible-content".

Send case email replies containing interaction emails in activity history

Configure email notifications for an interaction

Set up email notification to determine whether they should be sent to the contact, consumer, or guest.

Before you begin

Role required: admin

About this task

Email notifications that are available by default:

- Interaction created for consumer
- Interaction created for guest
- Interaction created for contact

You can customize the existing notification or create a notification. For more information, see Email and SMS notifications.

Procedure

1. Navigate to **All** > **System Notifications** > **Email** > **Notifications**.
2. Select the Show column search row icon ( ).
3. In the **Name** column, search and select for any of the following notification.
   - Interaction created for consumer
   - Interaction created for guest
   - Interaction created for contact
4. To disable notifications, update **Active** to False.
   a. Select **here**.
   b. Clear the **Active** check box.
   c. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To include different content, update the email template.

   a. Select **What it will contain**.

   b. Remove the exiting template from the **Email template** field.

   c. Search and select the email template.
   Alternatively, in the **Message HTML** field, enter the content for the email template.

   d. Select **Update**.

Configure email reminders for an interaction

Set up automatic email reminders to notify customers to respond to interactions that are in the On Hold state due to pending customer responses.

Before you begin
Role required: admin

About this task
Email notifications that are available by default:

- Email reminder for consumer
- Email reminder for guest
- Email reminder for contact

You can customize the existing notification or create a notification. For more information, see Email and SMS notifications.

Procedure
1. Navigate to **All** > **System Notifications** > **Email** > **Notifications**.
2. Select the Show column search row icon ( ).
3. In the#**Name** column, search and select for any of the following notifications.
   - Email reminder for consumer
   - Email reminder for guest
   - Email reminder for contact
4. To turn off notifications, update **Active** to False.
   a. Select **here**.
   b. Clear the **Active** check box.
   c. Select **Update**.
5. To include different content, update the email template.

   a. Select **What it will contain**.

   b. Remove the exiting template from the **Email template** field.

   c. Search and select the email template.

Alternatively, in the **Message HTML** field, enter the content for the email template.

d. Select **Update**.

Enable Recommended Actions for an email interaction

Help the agent to find relevant resources based on the context of an email by enabling recommended actions.

Before you begin
Role required: admin

About this task
For more information, see Configuring Recommended Actions.

Procedure
1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select **CSM Interaction context**.
3. Set the **Active** column as true.

Customize the email interaction experience

Customize the Email Interaction record page in UI Builder for agents.

Before you begin
Role required: admin

About this task
For more information on UI Builder, see UI Builder.

Procedure
1. Navigate to **All** > **Now Experience Framework** > *UI Builder*.
2. On the UI Builder page, select **Experiences** tab.
3. On the Experiences page, search and select **CSM/FSM Configurable Workspace**.
4. Navigate to **Pages and variants** > **Record** > **Email Interaction Page**.
5. Select the Open menu icon ( ).
6. Select **Duplicate variant**.
   For more information, see Create a page variant.
7. On the Tell us about your variant screen, enter `Custom Email Interaction Page` in the **Name** field.

   Note:
   Don't change the **Conditions** field.

8. Select **Create**.
   The Page variant opens.
9. Select the **Settings** tab.
10. Enter a lower value in the **Order** field.
    For example, -1100.
11. Select **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can customize the page in the UI builder.

Customize the New Activity marker for an email interaction

Customize the New Activity marker in UI Builder to differentiate between the latest activities for agents.

Before you begin
A duplicate variant must be configured by an administrator. If the duplicate variant isn't configured, you can't enable or disable the New Activity marker. For more information, see Customize the email interaction experience.

Role required: admin

About this task
For more information on UI Builder, see UI Builder.

Procedure
1. Navigate to **All** > **Now Experience Framework** > *UI Builder*.
2. On the UI Builder page, select **Experiences** tab.
3. On the Experiences page, search and select **CSM/FSM Configurable Workspace**.
4. Navigate to **Pages and variants** > **Record** > **Email Interaction Page**.

   Note:
   The Email Interaction Page variant is the newly created variant.

5. Select **Editor**.
6. In the Content section, search and select **Activity Stream 1**.
7. In the Activity Stream 1 panel, navigate to **Configure** > **Display**

   Note:
   If a message appears about the application scope, select **here** to be able to edit the record.

8. Turn on the **Show New Activity Marker** toggle switch.
9. Select **Save**.

Result
You can view the New Activity marker in the email conversation within the activity stream.

Customize an email compact header for an email interaction

Customize an email compact header within the UI Builder to view information such as the email subject, sender, and receiver in a compact format.

Before you begin
A duplicate variant must be configured by an administrator. If the duplicate variant isn't configured, you can't enable the email compact header. For more information, see Customize the email interaction experience.

Role required: admin

About this task
For more information on UI Builder, see UI Builder.

Note:
By default, **Show Email Compact Header** is enabled for Email Interaction for CSM.

Procedure

1. Navigate to **All** > **Now Experience Framework** > *UI Builder*.
2. On the UI Builder page, select **Experiences** tab.
3. On the Experiences page, search and select **CSM/FSM Configurable Workspace**.
4. Navigate to **Pages and variants** > **Record** > **Email Interaction Page**.

   Note:
   The Email Interaction Page variant is the newly created variant.

5. Select **Editor**.
6. In the Content section, search and select **Activity Stream 1**.
7. In the Activity Stream 1 panel, navigate to **Configure** > **Display**

   Note:
   If a message appears about the application scope, select **here** to be able to edit the record.

8. Turn on the **Show Email Compact Header** toggle switch.
9. Select **Save**.

Result
You can view information such as the email subject, sender, and receiver in a compact format within the activity stream.

Customize showing a full conversation in UI Builder

Customize the show full conversation feature in UI Builder to display the entire email thread between the customer and agent.

Before you begin
A duplicate variant must be configured by an administrator. If the duplicate variant isn't configured, you can't enable Show full conversation. For more information, see Customize the email interaction experience.

Role required: admin

About this task
For more information on UI Builder, see UI Builder.

Note:
By default, **Enable Email Show full conversation** is enabled for Email Interaction for CSM.

Procedure

1. Navigate to **All** > **Now Experience Framework** > *UI Builder*.
2. On the UI Builder page, select **Experiences** tab.
3. On the Experiences page, search and select **CSM/FSM Configurable Workspace**.
4. Navigate to **Pages and variants** > **Record** > **Email Interaction Page**.

The Email Interaction Page variant is the newly created variant.

5. Select **Editor**.
6. In the Content section, search and select **Activity Stream 1**.
7. In the Activity Stream 1 panel, navigate to **Configure** > **Display**

Note:
If a message appears about the application scope, select **here** to be able to edit the record.

8. Turn on the **Email Show Full Conversation** toggle switch.
9. Select **Save**.

Result
You can view the entire conversation within the activity stream.

Email to case

Set up email addresses that customers can use to submit cases to your team. To help direct cases to specific teams, you can designate email addresses to specific products. While agents work on the cases, they can also email customers with updates and proposed solutions.

Customer Service Management uses the Email Accounts application to create and maintain email accounts. The system administrator can create multiple incoming email addresses that customers can use to communicate with customer service agents. The system administrator can also create one outgoing email address.

After the incoming and outgoing email addresses are created, the system administrator can set the following properties for the email communication channel:

- Establish one of the incoming email addresses to automatically create a case.
- Enable a prefix to include in the subject line of an email to any of the incoming email addresses that automatically creates a case.
- Create cases for customers who are not currently in the system.

The system administrator can also create a channel configuration to associate any of the incoming email addresses with specific products.

Related topics

Email accounts

Configure an email address for a product

Configure an email address that creates a case for a specific product.

Before you begin
Role required: admin

About this task
Create a configuration that links a product to a specific email address. This configuration is created in the Channel Configuration (sn_customerservice_channel_config) table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Channels**.
2. Select **New**.
3. On the Channel Configurations form, fill in the fields.

Channel Configurations form

Field	Description
Name	Name of the email configuration.
Channel Type	Configuration type. Set this field to **Email**
Product	Product model associated with this email configuration.
Active	Option to activate the email configuration.
Email address	Email address for this configuration. Enter one of the incoming email addresses that the administrator created using the Email Accounts application.

4. Select **Submit**.

Configure an email subject line prefix

Configure a prefix to include in an email subject line that creates a case.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. In the **Email subject prefix format for new case** field, enter the prefix.
   The default prefix is **Case:**.
3. Select **Save**.

Customer service email properties

Users with the system administrator role can set several properties for the Customer Service Management email communication channel.

After creating the incoming and outgoing email addresses that customers use to communicate with customer service agents, the system administrator can set the following email-specific properties.

Navigate to **Customer Service** > **Administration** > **Properties** to access these properties.

Customer Service Management email properties

Property	Definition
Case email address [glide.cs.email.case_queue_address]	One of the incoming email addresses that automatically creates a customer service case. For incoming email, the system checks the address to see if it matches the address in the **Case email address** property. If yes, the system creates a customer service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management email properties (continued)

Property	Definition
	case. If it does not match, or if this property is not set, the system then checks the **Email subject prefix format for new case** property.
Email subject prefix format for new case [glide.cs.email.new_case_prefix]	The prefix included in the subject line of an email to any of the incoming email addresses that automatically creates a customer service case. This field is automatically set to **Case:** as the default prefix.
Create case for non matched user [sn_customerservice.email.create_case_for_non_matched_user]	Enable the creation of new customer service cases when emails are received from users with email addresses that do not currently exist in the system.
Number of activities [number_of_activities_in_notification]	Indicates the number of activities (emails and comments) in the activity history that are included in the email notifications and replies. The default value is 3.
Include system emails in email notifications [include_system_emails_in_notification]	Indicates whether system emails are included in email notifications. The default value is false.
Number of activities in reply number_of_activities_in_reply	Number of additional comments and emails included in Reply/Reply-All templates (-1 means all)
Email history notifications	By default, the email history shows the last three messages in the case record. To show all activities on a case record in email replies and email notifications, add this script `${mail_script:get_emails_comments_activity_history` to the email reply system property (reply-received) and the case commented system property (case.commented.for.customer). For more information, refer to Configure email and comment notifications .

Disable email responses from the case activity stream

Disable email responses from the case activity stream. Stop agents from interacting with customers directly.

Before you begin

Role required: admin

About this task

By default, customer service agents can respond to cases using options within a customer email thread instead of having to use another email client. Agents can use the **Reply**, **Reply All**, and **Forward** buttons in the case activity stream to respond to customer emails.

You can disable this feature and hide these buttons from the Agent Workspace or Configurable Workspace application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** and enter `sys_properties.list`.
   The System Properties page opens.
2. Select **New**.
3. Create a system property with the name *`sn_agent_workspace.activity_email_options_enabled`*.
4. Set the value to false.
5. Select **Submit**.

Result

Users with the role sn_customerservice_agent are now unable to reply to or forward emails.

Configure rules for incoming emails that create and assign cases

Create your email-related business processes using Inbound Email Flows. After you receive an email on a specified support email address, you can define rules to create cases and assign the cases to specific teams.

In previous releases, incoming emails were processed through inbound email actions. Admins created separate email actions to support different business flows using scripts.

Inbound Email Flows provide powerful configuration capabilities to manage emails along with your customer service processes through a visual Flow Designer interface. Business managers can define inbound email flows without having to depend on admins or developers to write complex scripts. Email flows use conditional logic to incorporate multiple business processes in one flow.

Note:
The **Email conditions** under the **Inbound Email** trigger are case-sensitive. Review your flow designer conditions and consider lowercase and uppercase options depending on how the sender puts the email address in the headers.

The following example email flows are available by default after you activate the Customer Service Management plugin. Enable the email flows for activating the email processing rules to automatically create and update cases.

- Create case from email
- Update case using Reply

Note:

- The execution order of the inbound email flows takes a higher precedence than inbound actions (that is if an email flow executes, it avoid execution of inbound actions).
- The user who sends an email should have the necessary roles to perform operations specified in the flow, or else the operation stops while executing.

The following example email flows are installed with the platform. These flows aren't required for any of the CSM email processing rules:

- Handle email replies
- Logging a problem

Define rules to process incoming emails

Activate Customer Service Management

Define rules to process incoming emails

Define your email-related business processes using Inbound Email Flows. Manage emails along with your customer service processes through a visual **Flow Designer** interface without having to design or request complex scripts.

Before you begin

Role required: admin, sn_customerservice_manager

About this task

Email flows use conditional logic to incorporate multiple business processes in one flow. When designing inbound email flows, note the following:

- The execution order of the inbound email flows takes a higher precedence than inbound actions.That is, if an email flow executes, it prevents the execution of inbound actions.
- The user who sends an email should have the necessary roles to perform operations specified in the flow or the operation will stop.

Procedure

1. Create an inbound email flow.
   a. Navigate to **All** > **Process Automation** > **Flow Designer**.
   b. Select one of the following flows.
      - **Create Case from Email**: Creates a case when a user sends a new email.
      - **Update Case via Reply**: Updates a case when you use the reply option.
   c. Select **Edit Flow**.
   d. Select the **Inbound Email** trigger.
   e. Modify the default email filter conditions or select **New Criteria** to add conditions.
   f. Select a Reply Record Type table.
   g. Select **Done**.
2. Edit the flow.
   a. Select an existing action and expand it.
   b. Provide information for the action or select the add icon (+) to add a new action, flow logic, or subflow.
   c. Select **Done**.
3. Finalize the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Verify the email flow and modify it if necessary.

b. Select **Save**.

c. Select **Activate**.

4. Select **Activate**.
   The defined inbound email flow is activated.

Result
The defined inbound email flow is activated.

Building custom actions

Configure email and comment notifications

Add a script to the email reply or case comment template to include all activities (emails and comments) on a case record in email replies and in email notifications.

Before you begin
Role required: admin

Procedure

1. Update comment notifications.

   a. Navigate to **All** > **System Notifications** > **Notifications**.

   b. In the **Email template** column, enter `case.commented.for.customer`.

   c. In the *`case.commented.for.customer`* system property, add the following script to the **Message HTML** field: `${mail_script:get_emails_comments_activity_history}`.

   d. Save the field.

2. Update email notifications.

   a. Navigate to **All** > **Email client templates** > **Reply**.

   b. In the *`reply-recieved`* system property, add the following script to the **Body HTML** field: `${mail_script:get_emails_comments_activity_history}`.

   c. Save the field.

Result
All emails and comments are now included in the email replies and notifications.

Send case email replies containing interaction emails in activity history

Include emails from related interactions in agent case email responses to provide full context of prior email communications. The history is created by embedding an email script within an email client template.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Email Client** > **Email Client Templates**.

2. Search and select **reply-for-customer-service**.

Note:
If a message appears about the application scope, select **here** to be able to edit the record.

3. On the Content tab, in the#**Body HTML** field, enter `<div id="collapsible-content">${mail_script:get_activity_of_case_and_related_interaction_for_email}</div>`.

Note:

- The number of emails in the activity history matches the value set in the system properties, *`include_system_emails_in_notification`* and *`number_of_activities_in_reply`*.
- You can also create a client template and map it to the Interaction table. For more information, see Create an email client template.

4. Select **Update**.

Result
The get_activity_of_case_and_related_interaction_for_email script retrieves and formats cases and related interaction email history, adding it to the email client in the agent workspace. The content is hidden behind ellipses within a DIV tag with the ID “collapsible-content".

Create an OpenFrame configuration

This configuration specifies the OpenFrame window settings as well as the URL to be launched within OpenFrame.

Before you begin
Role required: admin

About this task
As part of the OpenFrame configuration, users with the admin role can select one or more user groups. Access to the configuration is limited to the users that have the openframe user role and that belong to the selected groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **OpenFrame** > **Configurations** to display the OpenFrame Configurations list.
2. Click **New**.
3. Fill in the fields, as appropriate.

OpenFrame Configuration form

Field	Description
Name	The name of the OpenFrame configuration.
Title	The title that appears in the OpenFrame window header.
Subtitle	The subtitle that appears in the OpenFrame window header.
Order	The order number for the configuration. If users have multiple OpenFrame configurations, they can only access the configuration with the lowest order number. **Note:** When upgrading, the **Order** field for the existing default OpenFrame configuration is set to 1.
Enable collapsed view	Enables the expand and collapse capability for the OpenFrame window. When collapsed, users can still access call control actions. The default setting is **False**.
Show presence indicator	Enables the indicator that displays agent availability.
User Group	The user groups selected for this configuration. Access to this configuration is limited to the users that have the openframe user role and that belong to the selected groups. **Note:** If you do not select any groups, the configuration is available to all users with the openframe user role.
URL	The URL to be launched within OpenFrame. This URL can be an absolute path or a path that is relative to the ServiceNow instance.
Active	Denotes this configuration as active.
Width	The width of the OpenFrame window.
Height	The height of the OpenFrame window, not including the OpenFrame header height.
Icon Class	The class of icons used for the OpenFrame window (retina-icons.css). Only supports icon-phone and icon-video values.
Title Icon	The icon displayed on the OpenFrame window header.
Configuration	Can be used to store any JSON encoded string.

openFrameAPI - Client

OpenFrame events for work items, agent presence, and interactions

Use OpenFrame events to achieve better integration between Advanced Work Assignment (AWA) and Computer telephony integration (CTI) and aide in improved call routing.

OpenFrame events are enabled by default when your administrator installs the Openframe plugin (com.sn_openframe) and Advanced Work Assignment for CSM plugin (com.sn_csm.awa).

Note:
The Advanced Work Assignment for CSM (com.sn_csm.awa) plugin is automatically installed with the Customer Service plugin (com.sn_customerservice).

As a CTI developer, ensure that you subscribe to the following events by using the subscribe method of the openFrameAPI. For more information, see openFrameAPI - Client.

OpenFrame events

Event	Description
openframe_awa_agent_presence	Events are sent to OpenFrame when an agent's presence state changes.
openframe_awa_workitem_offered	Events are sent to OpenFrame when a work item is offered to an agent.
openframe_awa_workitem_accepted	Events are sent to OpenFrame when a work item is accepted by an agent.
openframe_awa_workitem_rejected	Events are sent to OpenFrame when a work item is rejected by an agent.
openframe_agent_off_interaction	Events are sent to OpenFrame indicating the presence of an agent on chat as off or available.

Add and activate an OpenFrame configuration by navigating to **OpenFrame** > **Configurations**. For more information, see Create an OpenFrame configuration.

Social media integration

Support case resolution through social media communication channels.

When working with customers or consumers to create and resolve cases, agents can select **Social** as the communication channel and add a social profile to the Case form. Any

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

communication with customers or consumers that takes place through social media is recorded on the Case form in the **Social Logs** related list.

Customer service managers can create one or more social profiles for a user by recording a user's social profile information on a specific social media channel such as Twitter or Facebook. Managers can create social profiles for accounts, contacts, and consumers from the **Social Profiles** related list on the entity form. Agents have read-only access to these profiles.

Integration with Customer Service Management

The social media communication channel is integrated with the following Customer Service Management forms: Case, Account, Contact, and Consumer.

On the Case form, the **Channel** field includes the **Social** option. Selecting this option adds the **Social Profile** field to the Case form, in which you can select a specific social media channel. The **Social Logs** related list captures the details of social media conversations.

The Account, Contact, and Consumer forms include the **Social Profiles** related list. Customer service managers can create one or more profiles for each of these entities.

Plugins

The Customer Service Social Integration plugin (com.sn_cs_social) is activated as part of the Customer Service Management plugin.

Tables

The Customer Service Social Media plugin adds the following tables.

Customer Service Management Social Media Plugin Tables

Table	Description
Social Channels [sn_app_cs_social_social_channel]	Stores the social channels, which are brought in by the social integration tool.
Social Profiles [sn_app_cs_social_social_profile]	Stores the social profiles created for each customer contact or consumer.
Social Logs [sn_app_cs_social_social_log]	Stores the details of social media conversations related to cases.

Chat Zoom Connector

Resolve issues quickly and engage better with customers with video and screen sharing options in Zoom using the ServiceNow® Chat Zoom Connector application.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

The Chat Zoom Connector application integrates the chat communication channel with the Notify communication channel by managing and initiating a Zoom meeting directly from a chat. An interaction record is created for each Zoom meeting initiated from a chat.

As an agent, you can use the Chat Zoom Connector application to initiate Zoom meetings from a customer chat and optionally record the meeting.

As an agent manager, you can access an interaction record of type Zoom to view the meeting details such as the meeting URL, participants, and recording.

As a customer, you can join a Zoom meeting with an agent regardless of whether you have a Zoom account.

To get started with the Chat Zoom Connector application, see Configure Chat Zoom Connector.

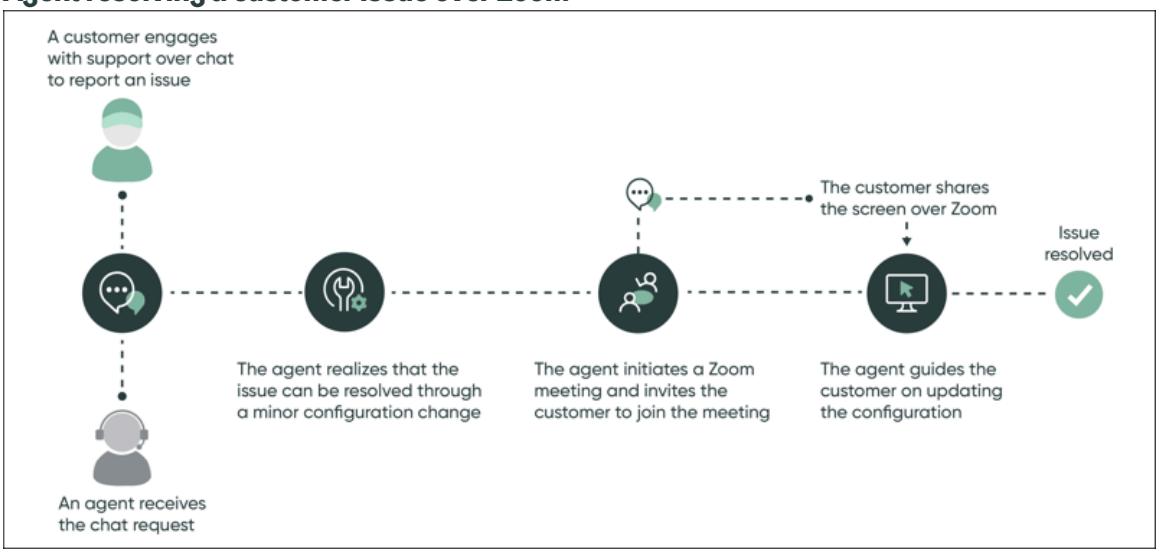
Key features

- Initiate Zoom meetings using the Quick Actions list in chats.
- Track Zoom meetings as interactions on the ServiceNow platform.
- Track participants in Zoom meetings.
- Post the meeting recording to the interaction activity stream.

Example scenario

The following example scenario shows the use of the Chat Zoom Connector application in resolving a configuration issue with an agent initiating a Zoom meeting directly from a customer chat.

Agent resolving a customer issue over Zoom



1. A customer engages with Support over chat to report an issue for a product.
2. An agent receives the chat request and realizes that the issue can be resolved through a minor configuration change.
3. The agent initiates a Zoom meeting using the Quick Actions list in the chat and invites the customer to join the meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The customer does not need a Zoom account to join the meeting.

4. The customer shares the screen over Zoom and the agent guides the customer on updating the configuration and resolves the issue.

Configure Chat Zoom Connector

Install and set up the Chat Zoom Connector application to interact with customers using Zoom meetings initiated from a chat.

Before you begin
Role required: admin

About this task
This task provides general steps to set up the Chat Zoom Connector application for initiating Zoom meetings from a chat.

Procedure

1. Integrate the Zoom account of your company with your ServiceNow instance using the Zoom spoke.
   For more information, see Set up the Zoom spoke.
2. Set up the Notify Zoom connector in Zoom for associating the Notify communication channel with Zoom meetings.
   The conference call details of the Zoom meetings are stored in the Notify Conference Calls [notify_conference_call] table. For more information, see Set up Notify Zoom connector.
3. Install the Chat Zoom Connector application.
   For more information, see Install a ServiceNow Store application.

   Note:
   The Chat Zoom Connector application installs the `CSMZoomInteractionImpl` script include, which is preconfigured for the Customer Service application. It also installs the `sn_chat_zoom.ZoomInteractionExtPoint` extension point, which enables the copying of any application-specific fields from the parent chat interaction record to the Zoom interaction record. For more information, see Configure application-specific field values for Zoom interactions.

4. Activate the Zoom quick action.
   For more information, see Activate the quick action for Zoom meetings.

Related topics

Chat Zoom Connector

Using Chat Zoom Connector

Configure application-specific field values for Zoom interactions

Use scripted extension points to enable the copying of application-specific field values to interaction records for Zoom meetings initiated from chats.

Before you begin
Role required: admin

Install the Chat Zoom Connector application. For more information, see Install a ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can enable the copying of any application-specific fields from a parent chat interaction record to its Zoom interaction record by using the `sn_chat_zoom.ZoomInteractionExtPoint` extension point. The parent chat is the chat from which the Zoom meeting was initiated.

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

An implementation is available in the base system for scripted extension points. You can modify the data and add additional fields.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. In the **API Name** column, search for and select **sn_chat_zoom.ZoomInteractionExtPoint**.
3. On the Extension Point form, select a script include to use the `sn_chat_zoom.ZoomInteractionExtPoint` extension point.
   - Create and register a custom script include.

     For more information, see Registering custom script includes against the scripted extension points.
   - Modify the existing script include by going to the Implementations related list and selecting a script include in the **Class** column. The script includes are displayed in the **Class** column.

     Note:
     By default, the `ZoomInteractionExtPoint` and `CSMZoomInteractionImpl` script includes that use the `sn_chat_zoom.ZoomInteractionExtPoint` extension point are available for Global and Chat Zoom Connector applications.
     - The `ZoomInteractionExtPoint` script include for the Global application copies the field values from the parent chat interaction record to the Zoom interaction record.
     - If the Customer Service application is installed, the `CSMZoomInteractionImpl` script include for the Chat Zoom Connector application copies the value of the **Consumer**, **Account**, and **Contact** fields from the interaction record of the parent chat to the Zoom interaction record. The `CSMZoomInteractionImpl` script include is available only when the Customer Service application is installed.
4. Include application-specific fields by adding the `sn_chat_zoom.ZoomInteractionExtPoint` extension point in the script include. You can create multiple implementations for an extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.
5. On the Extension Point form, select **Update**.

Activate the quick action for Zoom meetings

Activate the Zoom quick action to initiate Zoom meetings using the quick action from a chat.

Before you begin

Install the Chat Zoom Connector application. For more information, see Install a ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

By default, the Zoom quick action is inactive. Activate this quick action to enable agents to initiate Zoom meetings from a chat.

Procedure

1. Navigate to **All** > **Quick Actions** > **Actions**.
2. In the **Name** column, search for and select **Zoom**.
3. On the Quick Action form, select the **Active** check box.
4. Click **Update**.

Result

By default, the Zoom quick action is associated with chats when the Chat Zoom Connector application is installed. In addition, if the Conversational SMS service channel application is installed, the quick action is also associated with SMS conversations. For more information, see Conversational SMS service channel and Quick actions .

Set up Engagement Messenger

Understand the stages involved in setting up Engagement Messenger before you add it to your customer service web portal.

After you install the Engagement Messenger application in your instance, you're ready to configure it. You can also watch the academy video to understand the overall functionality of Engagement Messenger.

The configuration process involves the following tasks:

1. Install the Engagement Messenger application from the ServiceNow® Store.
2. Create Engagement Messenger module.
   - Configure the theme and styling of how Engagement Messenger appears to your customers
   - Configure how Engagement Messenger behaves when your customer uses it
   - Configure how Engagement Messenger works for your customers

   For more information, see Configure Engagement Messenger.
3. Create identity providers to enable an authenticated user experience. See Create an identity provider (IdP) for Engagement Messenger.

   If you want to enable only a guest user experience for your customer service portal, you can ignore this step and move on to step 4.
4. Create cross-origin resource sharing (CORS) rules for the REST API. See Configure a CORS rule for Engagement Messenger.
5. Add HTTP response headers for your Engagement Messenger. See Create HTTP response headers for Engagement Messenger.
6. Configure the system properties to enable virtual agent chat, multi-provider SSO, and to set a user session time-out value. For more information, see Engagement Messenger properties.
7. Configure a custom URL to load Engagement Messenger on third-party websites. For more information, see Enable Engagement Messenger on a website when third-party application cookies are blocked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Configure the deep linking feature to launch a specified feature in Engagement Messenger. For more information, see Deep linking feature in Engagement Messenger.
9. Activate an Engagement Messenger module.
10. Embed Engagement Messenger in your web application.
11. Embed messenger in your native iOS mobile app using Now Mobile® SDK. For information, see the Embed Engagement Messenger in a native iOS app using Now Mobile SDK [KB1587276] article in the Now Support Knowledge Base.
12. Embed messenger in your native android mobile app using Now Mobile® SDK. For more information, see the Embed Engagement Messenger in a native android app using Now Mobile SDK [KB1587611] article in the Now Support Knowledge Base.

Engagement Messenger for Customer Service Management

By using the ServiceNow® Engagement Messenger application, your customers use self-service to find the information or service that they need from your third-party web applications that are outside of the ServiceNow environment.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Engagement Messenger benefits

With the Engagement Messenger application, you can manage how your customers use your web applications and services from one central location. You can also configure the behavior and styling of the messenger and deploy the configuration on the websites or mobile sites of your choice.

Engagement Messenger provides the following benefits:

- Let your customers access your services from within an integrated messenger in your third-party websites.
- Integrate customer support capabilities via a no or low-code configuration.
- Meet your customer needs faster with these pre-packaged features:
  - Case management including case types
  - Service catalog requests
  - Virtual and live agent chat
  - Field service management
  - Appointment booking for field service
  - Walk-up appointment booking
  - Knowledge article search that is powered by ServiceNow® AI Search

For more information about the Engagement Messenger application, see Features of Engagement Messenger.

To get started with the Engagement Messenger application, see Set up Engagement Messenger.

Features of Engagement Messenger

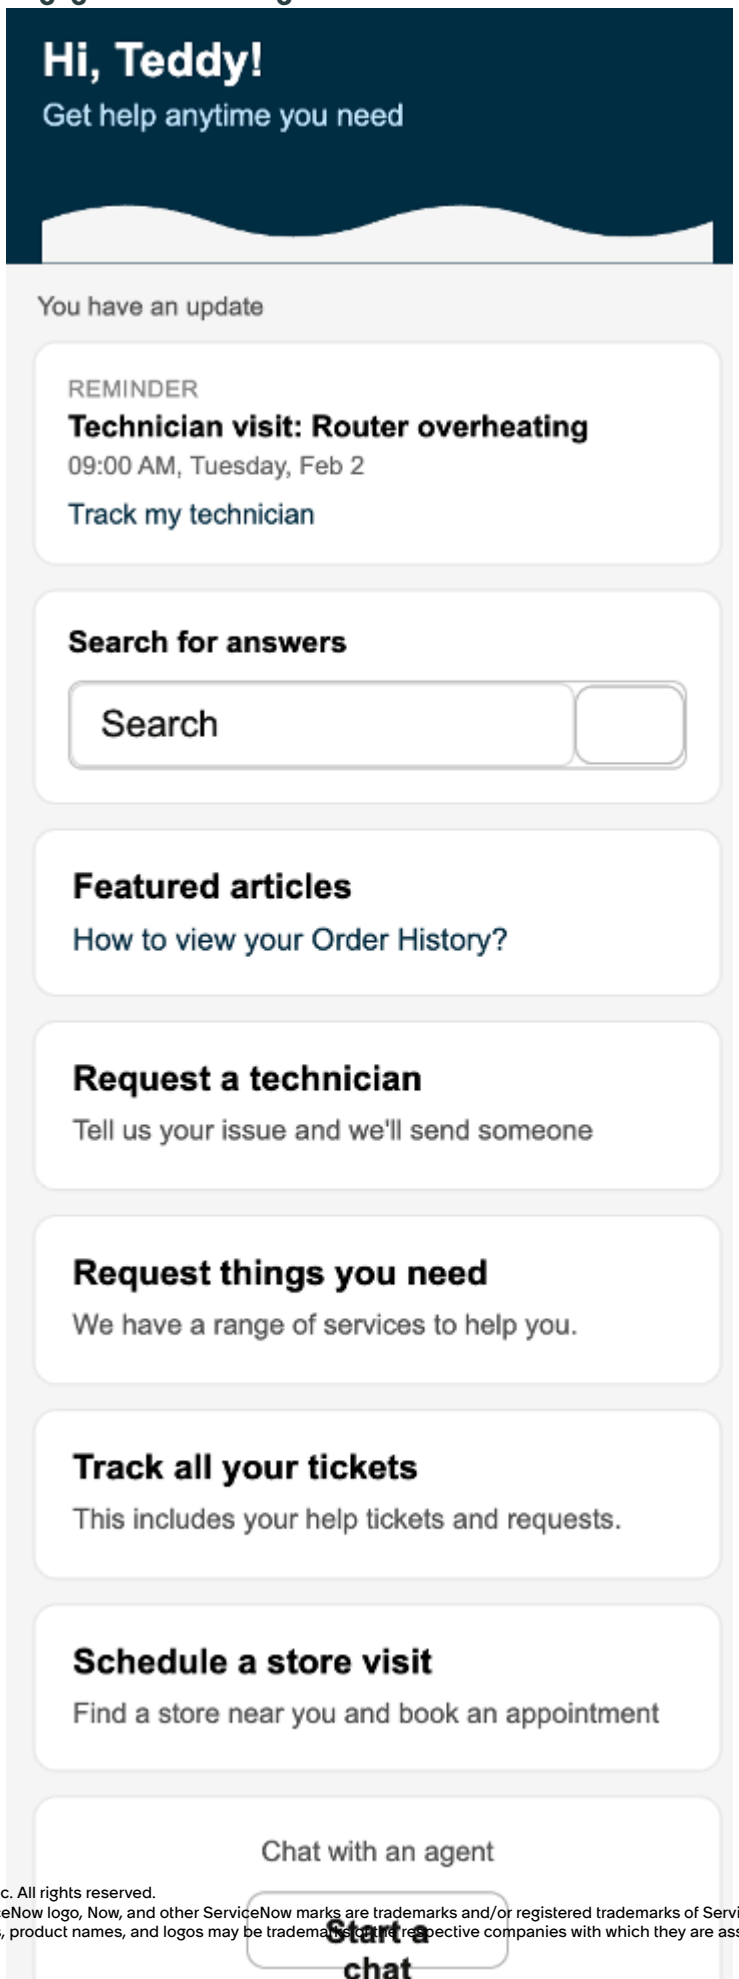
Understand what the Engagement Messenger application can provide to your customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you create and configure the Engagement Messenger module, you can customize it for your customers. For example, you can change the display order of any of these features on the home page of the messenger. Also, you can enable or disable any of these features to suit your customer's needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Engagement Messenger features



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of their respective companies with which they are associated.

Greeting

You can display the user greeting, which also includes a greeting message, on the header of the messenger. You can customize the way you want to greet your guest users and the users who sign in to your website.

Knowledge

You can select a knowledge base for your search results or choose to display featured articles on the home page of the messenger. You can also add multiple knowledge bases to suit your customer base.

Note:
To add knowledge bases to the Engagement Messenger module, you must manually assign the knowledge_admin role to the Engagement Messenger admin [sn_csm_ec.ec_admin] user.

Search

The ServiceNow® AI Search capability that is used in the Engagement Messenger application uses the knowledge bases that you selected for your messenger.

When a customer searches for information using the Search widget on the messenger, the displayed results are from the articles in the knowledge bases that are associated to your messenger module.

Customers can open the articles from the search results to get the information they need. They can also provide feedback to the article directly from the messenger to indicate whether the article was helpful or not. This feedback helps you to understand which articles are the most helpful so that you can improve those articles that weren't helpful.

Note:

- If the Service Portal - Restricted Pages plugin (com.glide.service-portal.pages.restricted) is activated in your ServiceNow instance, AI Search functionality will not work in Engagement Messenger for unauthenticated users.

  If this plugin is not activated, then the AI Search functionality works for both unauthenticated and authenticated users.

- You must configure AI Search in your ServiceNow instance and then enable Typeahead Search and AI Search Assist widgets so that the unauthenticated users can use the AI search feature from Engagement Messenger.

  For more information on enabling Typeahead Search and AI Search Assist widgets for Engagement Messenger, see Enabling AI search in the Customer and Consumer Service Portals for unauthenticated users.

  For more information of AI Search configuration, see Configuring AI Search.

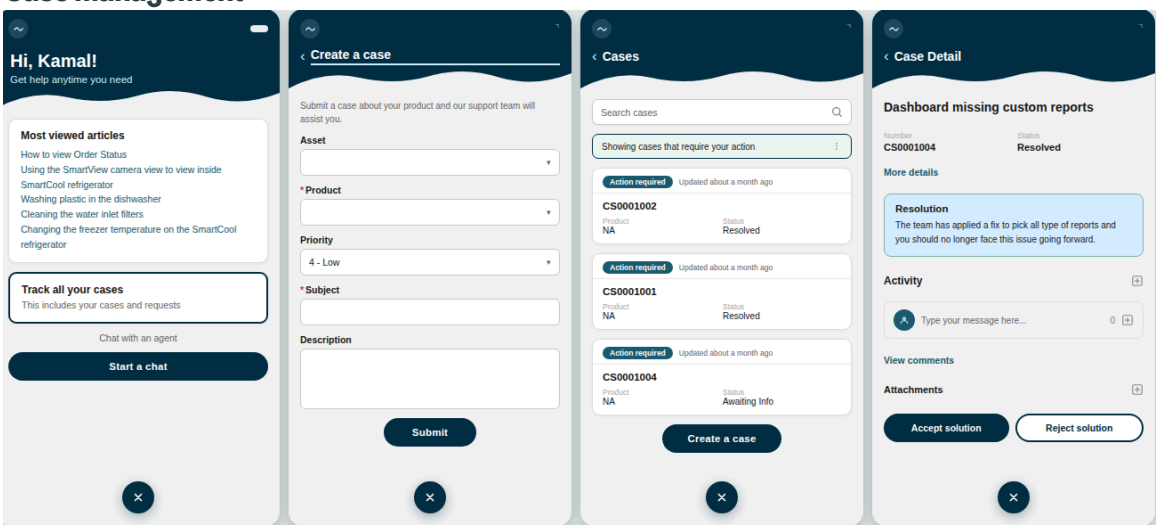
Case management

You can manage your customer cases on the messenger. This feature is available only for authenticated users of your website.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By using the Cases widget on the messenger, your customers can submit a case to request help with something or to report an issue. Submitted cases can be assigned to a customer service agent and tracked to a resolution.

Case management



Whenever your customers return to the customer portal and log in, they are notified of any updates to the cases that they created. They can also view the details of all the cases and requests that they have previously submitted and track their status.

Some cases would require action from the submitted user, asking them to provide more information about the help they need or to review a solution that the support team has provided. Customers can perform all these actions directly from within the messenger.

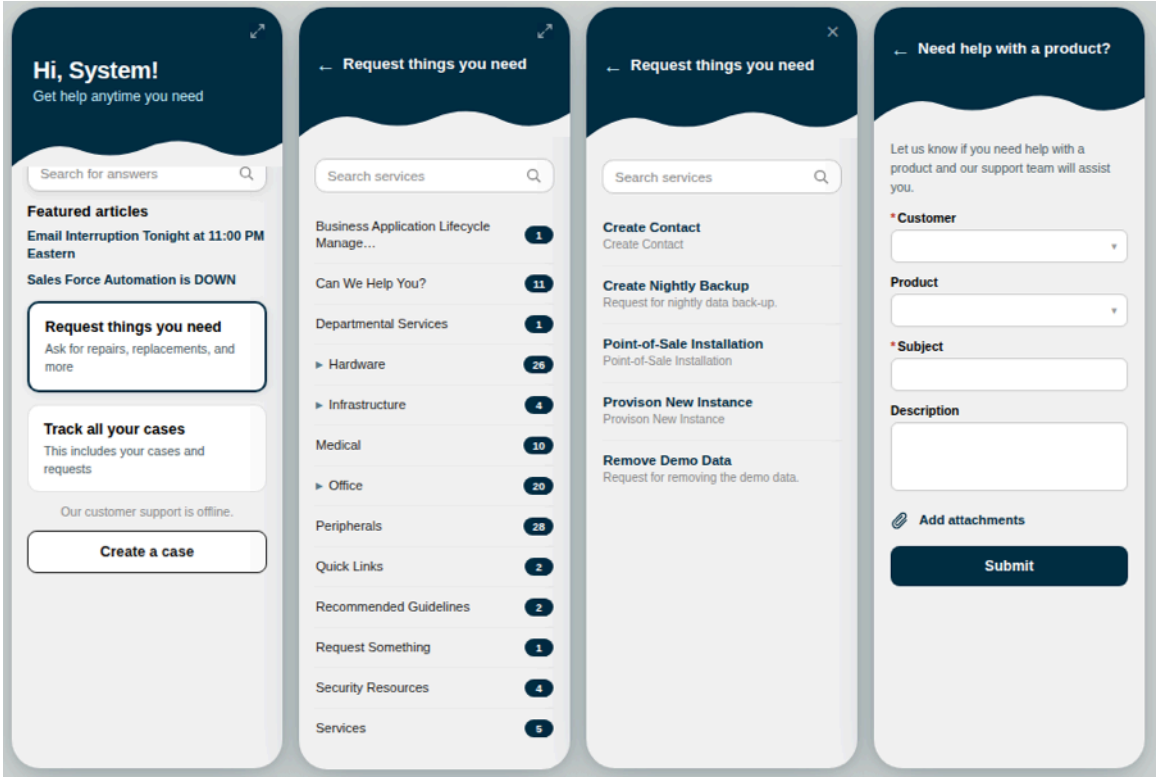
Catalogs

You can associate pre-defined catalogs with your Engagement Messenger. Customers can browse through the list of available catalog items. From this list of catalog items, they can choose to request a service or create a ticket. The requests that the customer makes can be tracked to a resolution using the case management feature.

Whenever your customers return to the customer portal and log in, they are notified of any updates to the requests that they have previously submitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog feature



Field service management

The field service feature enables your customer to request a technician visit to service their issue. By selecting a product or service that they need help with and their location, customers can submit a request for a technician visit. While submitting the request, customers can also add any supporting attachments that they think might help the support team understand the issue before a technician is allotted for the visit.

All technician requests are stored as work orders in your ServiceNow instance so that they can be tracked to completion.

The Work Order will have the location where the customer has raised a request. Geo-location services must be enabled for the technicians so that customers can track the live location and know the estimated time of arrival (ETA) of their technician. For more information, see Field service feature configuration.

Note:

- Verify that the Field Service Management - Customer Experience plugin (com.snc.fsm_customer_experience) is active in your ServiceNow instance.
- The field service feature is available only for users who log in to the Engagement Messenger and not for guest users.

Walk-up appointments

The walk-up feature enables your customers to book an appointment to visit one of your stores, service centers, and the like. Customers can view the support centers near them and select one to schedule an appointment to visit. Once an appointment is scheduled, customers receive a confirmation email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customers who log in into your website can view a list of scheduled appointments directly from this widget on the Engagement Messenger home page. They can modify or cancel existing appointments. They also receive notification emails on the following status of their walk-up appointment:

- They're ready to be assisted by an associate of the support center
- A walk-up interaction is assigned to an associate of the support center
- A walk-up interaction is closed

Customers who don’t log in can use the confirmation email to view and modify their appointments.

Note:
To enable a walk-up feature for your customers, verify that you activate the following plugins in your ServiceNow instance:

- Walk-up for CSM plugin (com.snc.walkup_for_csm) for authenticated users
- Guest Walk-up Experience for Customer Service plugin (sn_guest_walkup_cs) for unauthenticated users

Virtual and live agent chat

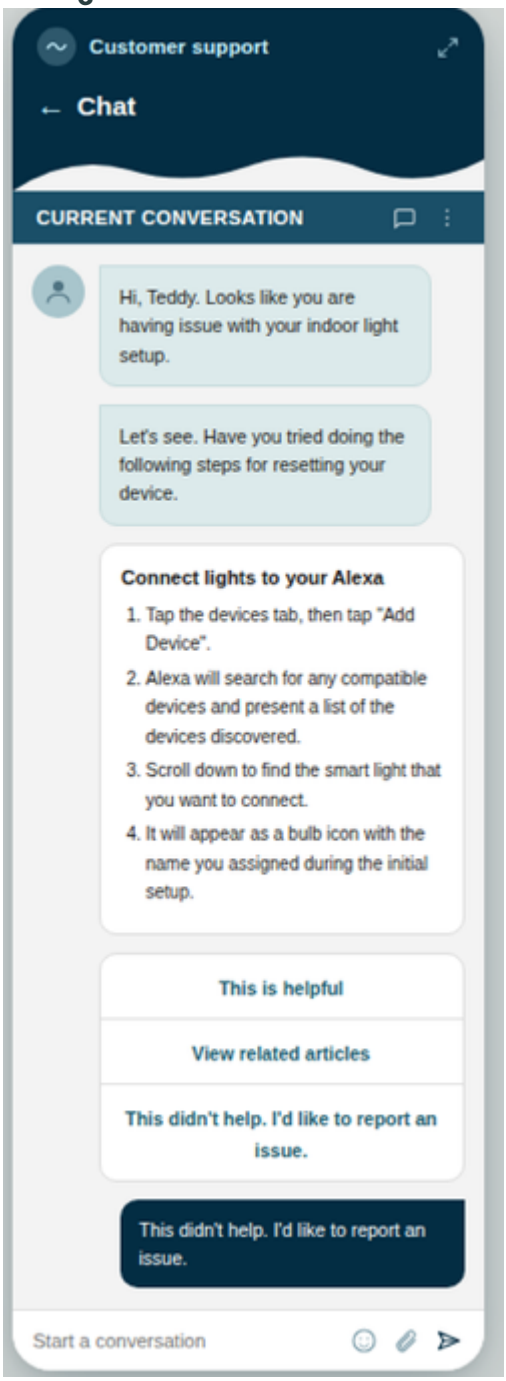
The chat feature enables support agents to interact with customers to resolve their issue by creating incident or case records or to transfer chats to another agent or queue if needed. Chat feature support is enabled for both authenticated and guest (unauthenticated) users.

Virtual and live agent chat

Customers can use the Chat widget on the messenger to interact with a virtual or live customer support agents in your organization. This way, your customers can get immediate responses to their queries or issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live agent chat



Engagement Messenger also provides contextual chat functionality. From any case details page, your customers can directly start a chat that opens with the context of that specific case.

Note:
Chat is available when you activate the Glide Virtual Agent plugin (com.glide.cs.chatbot) and set the *com.glide.cs.embed.csp_frame_ancestors* system property value to **'self' <your website URL>**.

Now Assist in Virtual Agent with Engagement Messenger

Now Assist in Virtual Agent offers a conversational support experience that improves the chat experience in Engagement Messenger

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

by delivering prompt answers to user questions. When enabled, Now Assist in Virtual Agent provides your users with an interactive generative AI experience. A friendly, natural language conversation that is easier to understand and helps users to be more comfortable with chatting to a bot.

By integrating generative AI chat capabilities, Now Assist in Virtual Agent enhances the user experience in Engagement Messenger. It improves asynchronous messaging, enabling users to resolve issues more quickly and efficiently. These capabilities help speed up issue resolution and increase efficiency by reducing the number of incoming queries that must be diverted to a live agent. To know more about Now Assist in Virtual Agent, see Exploring Now Assist in Virtual Agent.

Getting started with Now Assist in Virtual Agent in Engagement Messenger:

- To enable Now Assist in Virtual Agent chat support in Engagement Messenger, verify that the Now Assist in Virtual Agent experience is configured by virtual_agent_admin or admin. For more information, see Configuring assistants overview.
- You can create or use an existing assistant by navigating to **All** > **Conversational Interfaces** > **Assistants**. For more information, see Create a chat assistant.
- Once you select an assistant navigate to the **Display experience** tab to configure the Engagement Messenger module. In the **Portals** tab, select the Engagement Messenger module from the **Add portal** list and select the **Standard chat** as the experience. For more information, see Display your chat assistant on a portal, channel, or mobile app.

Note:
Each assistant comes with its own search configuration. For a smooth experience, if the assistant appears on a portal or mobile app that already has AI search configured, consider duplicating that setup to maintain consistency.

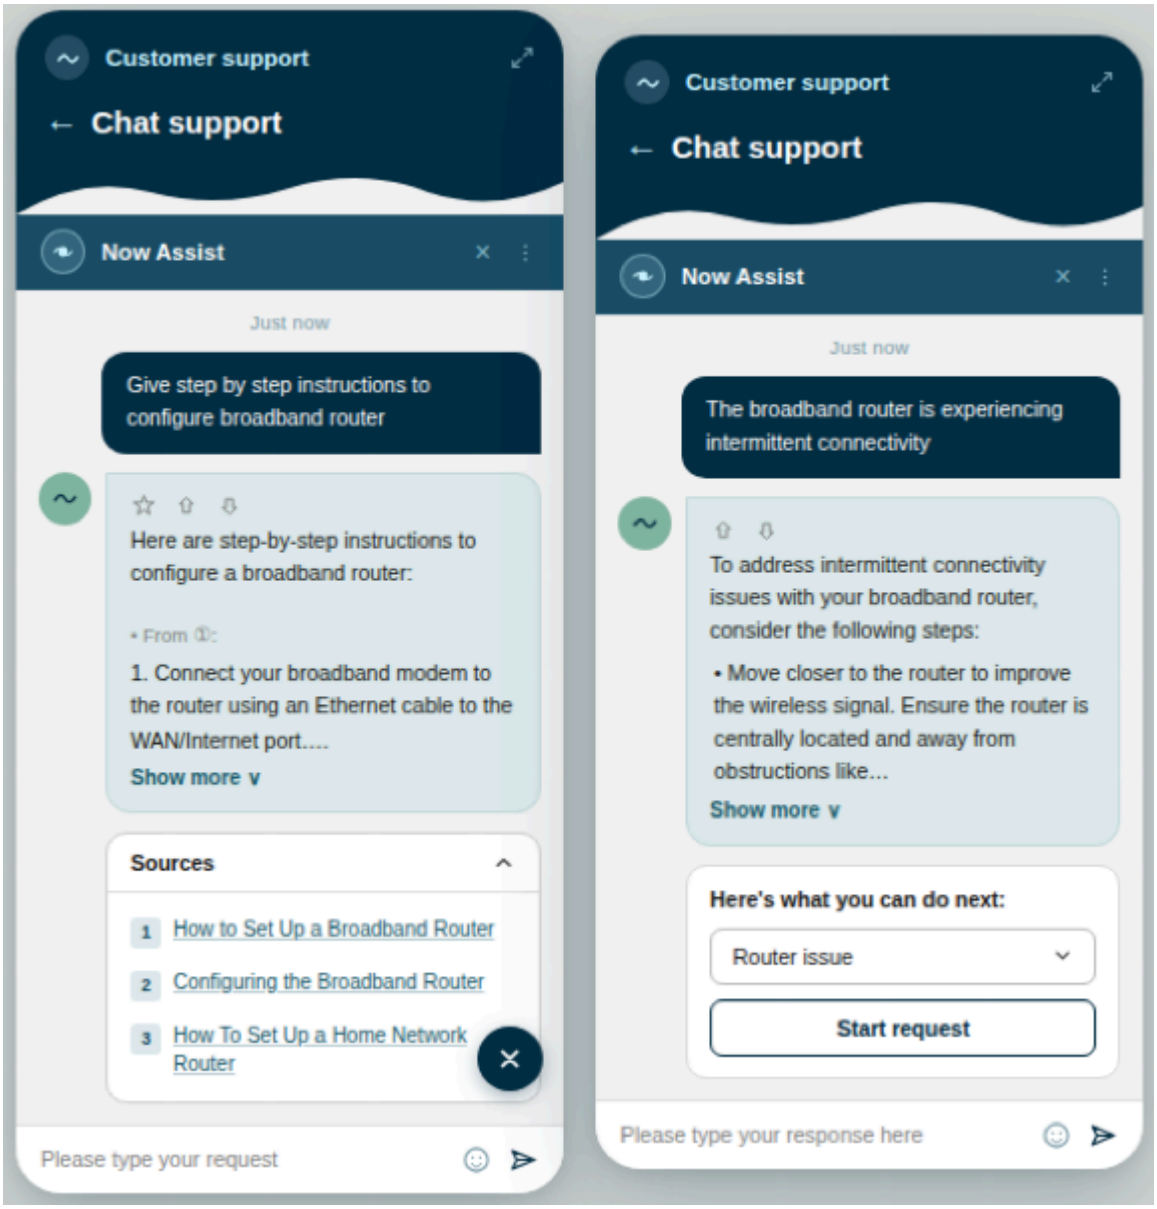
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Asynchronous chat

Engagement Messenger supports communication at different time intervals, enabling your support agents and end users to participate in long-running conversations without having to be online at the same time. For more information about asynchronous conversation, see Asynchronous Chat.

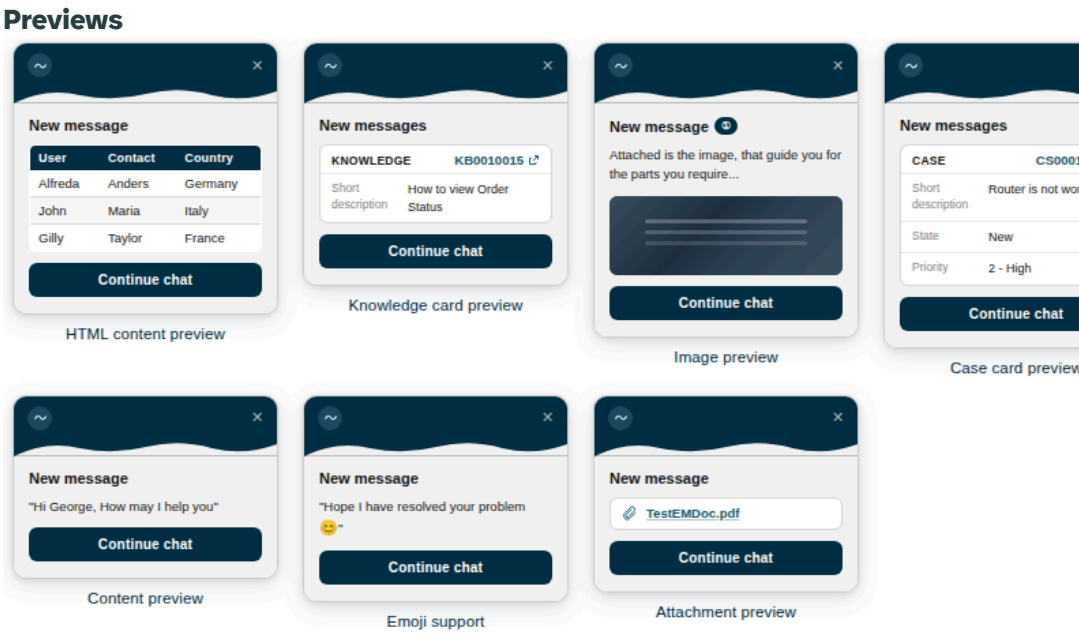
Configure asynchronous chat on Engagement Messenger by setting the web client as a messaging channel. For more information, see Configure asynchronous chat for the web channel.

Message preview

- Enable preview to see previews of unread chat message text, tables, links, HTML content, cases, knowledge cards, and images shared by the support agent without opening a message. The complete HTML content or video, and multiple unread messages, can be seen only when the user accesses the message.

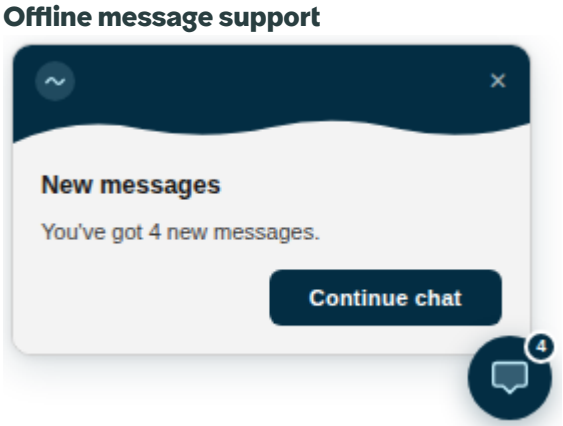
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Asynchronous chat supports emojis sent by an agent in the message preview for a more interactive conversation. For more information on how to use emojis in Agent chat, see Using emojis in Agent Chat.



Offline message support

Offline chat support enables users to view messages sent by the support agent while they were offline. The chat widget notification shows the total number of unread messages in real-time when the user revisits the website.



Chat messages history

Users can close and reopen the chat window as needed without losing context or progress so an accidental messenger closure doesn't reset the chat session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can set a specific timeout to manage the idle conversation. By default, if the requester doesn't respond to an agent message within two days, the conversation status changes to Closed Abandoned and the chat session is ended. As an admin, you can override the conversation idle timeout period for a web channel by setting the value in the Conversation Idle Timeout field in the Messaging Channels [sys_cs_channel] table. For details, see Closing Virtual Agent and Live Agent conversations.

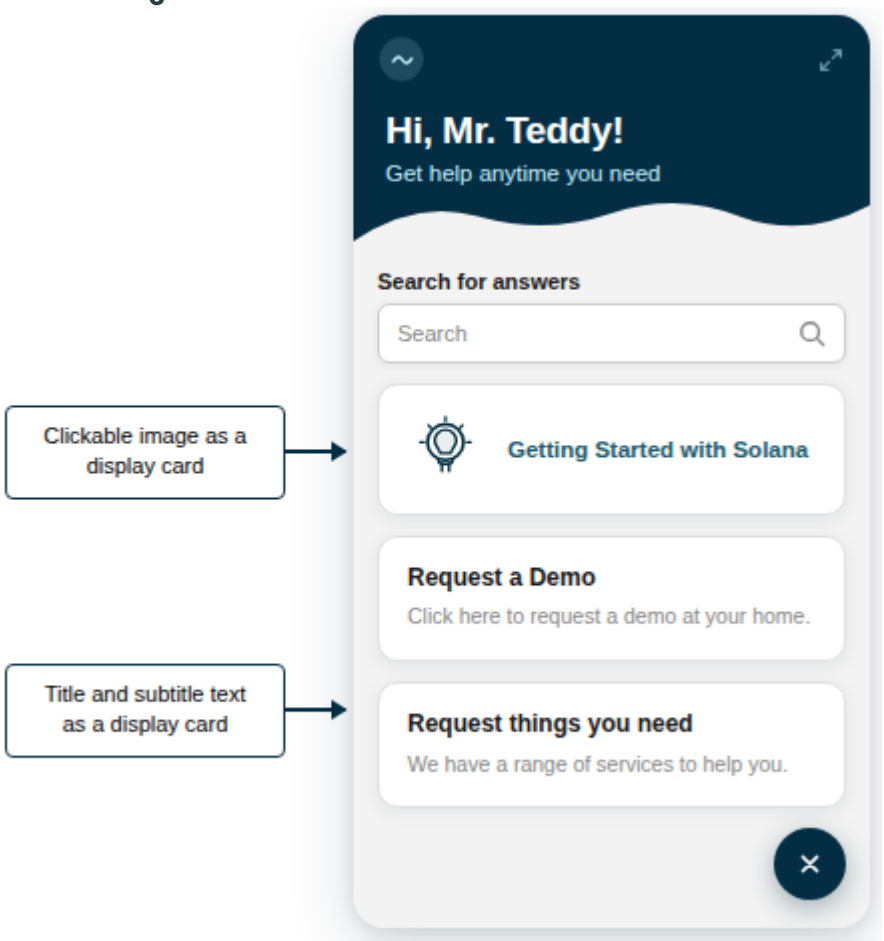
Configurable Cards

The Configurable Cards enables you to add custom features to Engagement Messenger. It enables Engagement Messenger to serve as a one-stop solution for accessing all the information. You can embed portal page, featured links, and data from any table on the messenger using the Configurable Cards.

Portal page feature card

Allows you to embed any portal page or catalog item on Engagement Messenger. The embedded page opens within the messenger when the user selects the feature card.

Portal configuration

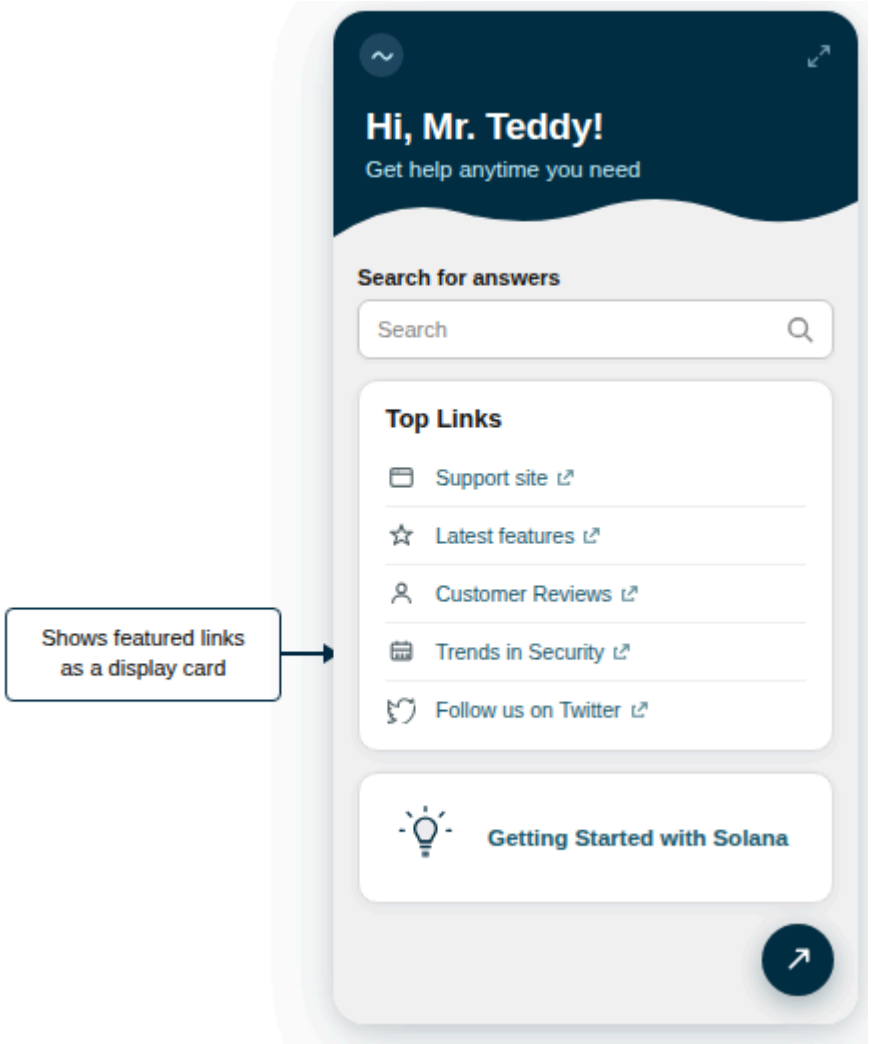


Featured links

Enables you to add a list of links to website on Engagement Messenger. The link opens in a new browser tab when accessed using the feature card on messenger's home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

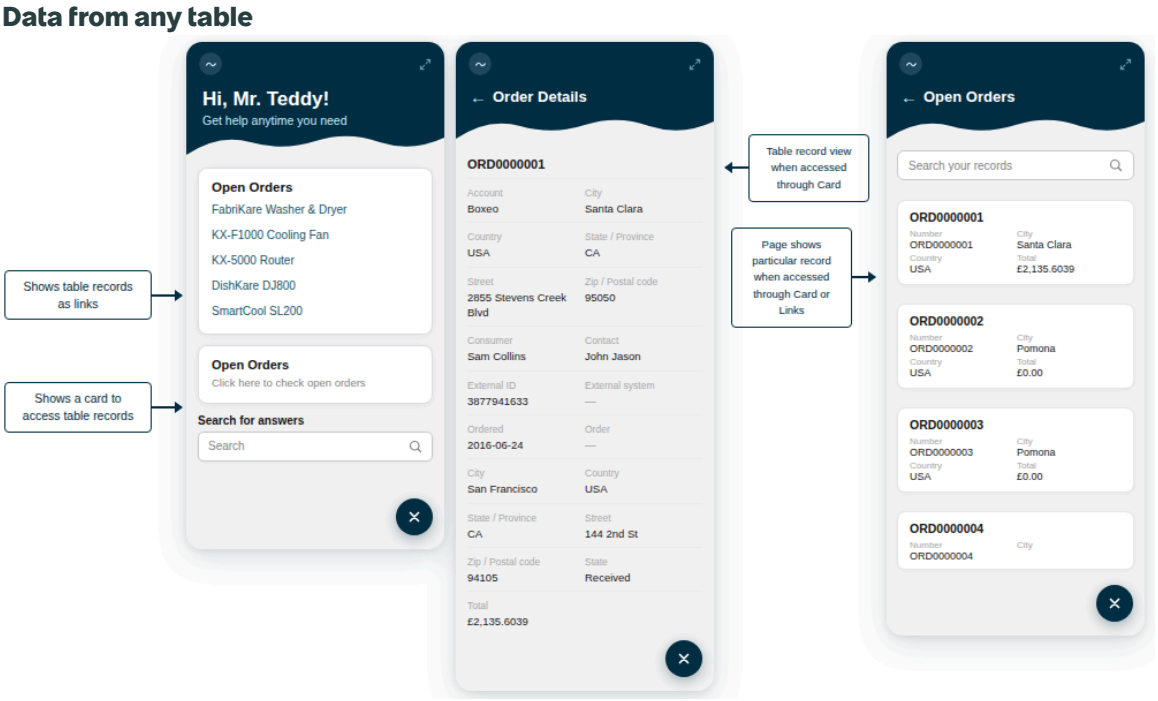
Featured links



Data from any table feature card

The feature card enables you to embed data from any table on Engagement Messenger. The added records appear as a card with a title or links on a messenger's home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Proactive updates and reminders

Engagement Messenger provides your customers updates and reminders in the following scenarios so that you can keep your customers updated even if they are not accessing the messenger directly.

- Reminder for an upcoming walk-up appointment, according to the walk-up feature configuration
- Reminder for an upcoming technician visit
- Updates on a case
- Update on a chat

According to the configuration of Engagement Messenger behavior, the count of the updates is displayed on the messenger widget on your customer support webpage. If the customer navigates away from your website, the count of updates is also displayed on the browser tab.

To learn how to start configuring Engagement Messenger for your third-party website, see Set up Engagement Messenger.

Install the Engagement Messenger application

Install the Engagement Messenger application from the ServiceNow Store if you have the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Engagement Messenger application (sn_csm_ec) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they'll be installed, are currently installed, or must be installed. If any plugins or applications must be installed, you must install them before you can install the Engagement Messenger application.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Result

The following items are installed with Engagement Messenger:

- Plugins
- Roles
- Tables

For more information, see Components installed with Engagement Messenger.

What to do next

- If you want to enable Virtual Agent chat support in the Engagement Messenger, activate the Glide Virtual Agent plugin (com.glide.cs.chatbot).

  For more information, see Activate Virtual Agent.
- Get started with Engagement Messenger. For more information on how to get started, see Set up Engagement Messenger.

Configure Engagement Messenger

Create a Engagement Messenger module and configure its behavior, appearance, and styling. By creating a messenger module, you can customize the appearance and behavior according to your organizational branding and to suit your customer needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install the Engagement Messenger application.
- Gather or prepare the following items:
  - Image files for your logo and messenger launcher icon. The images must be in .jpg, .png, .bmp, .gif, .jpeg, .ico, or .svg file format.
  - Color names and hex codes for branding to configure the styling of the messenger user interface.
- Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Choose to create an Engagement Messenger module or edit an existing module.
   - To create a module, select **New**.
   - To edit an existing module, select **Edit** in the Edit module column of your messenger module.

   The guided configuration view is displayed.
3. In the guided configuration view, navigate through Module, Appearance, Behavior, Features, and Implement.
4. On the form, fill in the fields.

Engagement Messenger module form

Field	Description
Module	
Module name	Unique name for your messenger module.
Short description	Brief description of the messenger module.
Appearance	
Logo	Logo that is displayed in the header of the messenger on your website. The recommended size and dimensions are: ○ Size (in bytes): approximately equal to 2 KB ○ Height (in pixels): 30–55 ○ Width (in pixels): 30–55 **Note:** If no logo is selected, the Home icon ( ) is displayed as a default logo in the header of the messenger.
Launcher icon	Icon that is displayed as the messenger option on your website. On your website, selecting this icon launches the messenger. The recommended size and dimensions are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Size (in bytes): approximately equal to 1 KB ○ Height (in pixels): 24–60 ○ Width (in pixels): 24–60 ○ Use a circular icon with a transparent background **Note:** The grid size range of a launcher icon is from 24X24 to 60X60. Any deviation from the defined range rescales automatically to fit the launcher icon size.
Launch icon position	Position of the messenger launch icon on your website.
Allow module to expand to full-height	Option for enabling the messenger module to expand to the full height of the browser tab.
Horizontal margin (in pixels)	Distance from the right or left of the browser tab for the placement of the messenger launcher icon. The distance is calculated from right or left based on your input for the field **Launch icon position**. For example, if you set the launch icon position as **Right** and the **Horizontal offset** as **50**, then the launch icon is placed at a distance of 50 px from the right of the browser tab. The maximum value for this field is 70 px.
Vertical margin (in pixels)	Distance from the bottom of the browser tab for the placement of the messenger launch icon. The maximum value for this field is 70 px.
Primary color	Primary color for styling the header or buttons in your messenger. For example, this color is used for user action buttons such as the **Submit**, **Yes**, or **OK**.
Primary font color	Text color that is used on UI elements that use the primary color.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secondary color	Secondary color for styling your messenger. For example, this color is used for user action buttons such as **Cancel** or **No**.
Secondary font color	Text color that is used on UI elements that use the secondary color.
Tertiary color	Tertiary color for styling your messenger. For example, this color is used to mark customer cases with tags such as **Action required**.
Tertiary font color	Text color that is used on UI elements that use the tertiary color.
Theme	Theme for other styling options of the messenger. This field is automatically set to **CWF Engagement Messenger Theme**. If you want to select a different theme, ensure that the theme that you select here must match certain criteria. For more information, see Engagement Messenger module theme requirements.
Note: If the value for the **Primary color**, **Secondary color**, or **Tertiary color** fields is set to color names, such as **Pink**, the Engagement Messenger UI doesn't display these colors correctly. As a workaround, you can enter the hexadecimal values of these colors. For example, use #FFC0CB for **Pink**.	
Behavior	
Notification	
Enable notifications on launcher icon	Option to enable in-app pop-up notification alert message when a new message is received.
Enable sounds	Option to get the notification alert sound.
Enable notifications in browser tab	Option to get the notification alert on the browser tab when the concerned web page isn't opened.
Enable user behavior tracking	Option for enabling the collection of user experience analytics from users of your Engagement Messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This option is available only if you activate the Service Portal Analytics plugin (com.glide.service-portal.analytics) in your ServiceNow instance. **Note:** If you update your Engagement Messenger module name after user behavior tracking is enabled, the User Experience Analytics dashboard would show the original module name, not the updated name.
As an administrator, you can configure the Proactive Recommendations feature for Engagement Messenger. For more information, see Proactive Recommendations configuration for Engagement Messenger.	
Features	
See Feature configuration for Engagement Messenger.	
Implement	
Website URLs	Comma-separated list of URLs of the websites where you want to deploy the messenger. For example, `https://www.example.com, https://www.yourwebsiteurl.com`
Authentication type	Authentication type for this embedded messenger. Select one of the following options: ○ None ○ Security assertion markup language (SAML)-based ○ Open ID connect (OIDC)-based If you want to enable only the guest user experience for the messenger in your website, set this field to **None**. Ensure that you create an identity provider (IdP) for the authentication type you select in this field. For more information, see Create an identity provider (IdP) for Engagement Messenger.
Advanced branding	
Hyperlink text color	Text color used for hyperlinks in messenger.
Navigate-back icon	The icon appears in the messenger header that enables the user to navigate to the previous page. The icon size is 24X24.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Close icon	This icon appears in the messenger header that enables the user to close messenger. The icon size is 16X16.
List search icon	The icon appears in the messenger header that enables searching through a list. The icon size is 16X16.
Expand icon	The icon appears in the header that enables the user to expand the messenger to access information. The icon size is 16X16.
Collapse icon	The icon appears in the messenger header that enables the user to collapse an expanded messenger. The icon size is 16X16.
Start-chat icon	The icon appears in the messenger header that enables the user to start a chat with an agent regarding their ticket or technician visit. The icon size is 16X16.
Filter menu icon	The icon appears at the top of the list page that enables the user to apply filters to get desired result. The icon size is 24X24.
Applied-filters icon	The icon appears at the top of the list page and shows applied filters icon in messenger. The icon size is 24X24.

Note:
The advanced branding configuration is only available in the form view.

5. Select **Save**.
6. Select **Email instructions** to notify your security administrator to complete the following tasks:
   a. Create an identity provider (IdP) for Engagement Messenger.
   b. Configure a CORS rule for Engagement Messenger.
   c. Create HTTP response headers for Engagement Messenger.

Note:
Engagement Messenger extends service portal capabilities that don't support domain separation. For more information, see Domain separation and Service Portal. However, other tables that are used in Engagement Messenger may support domain separation according to the configurations with which they're created.

Result
A new messenger configuration is created and listed in the Modules module of the Engagement Messenger application.

What to do next
1. Engagement Messenger properties.
2. configure the features of Engagement Messenger.

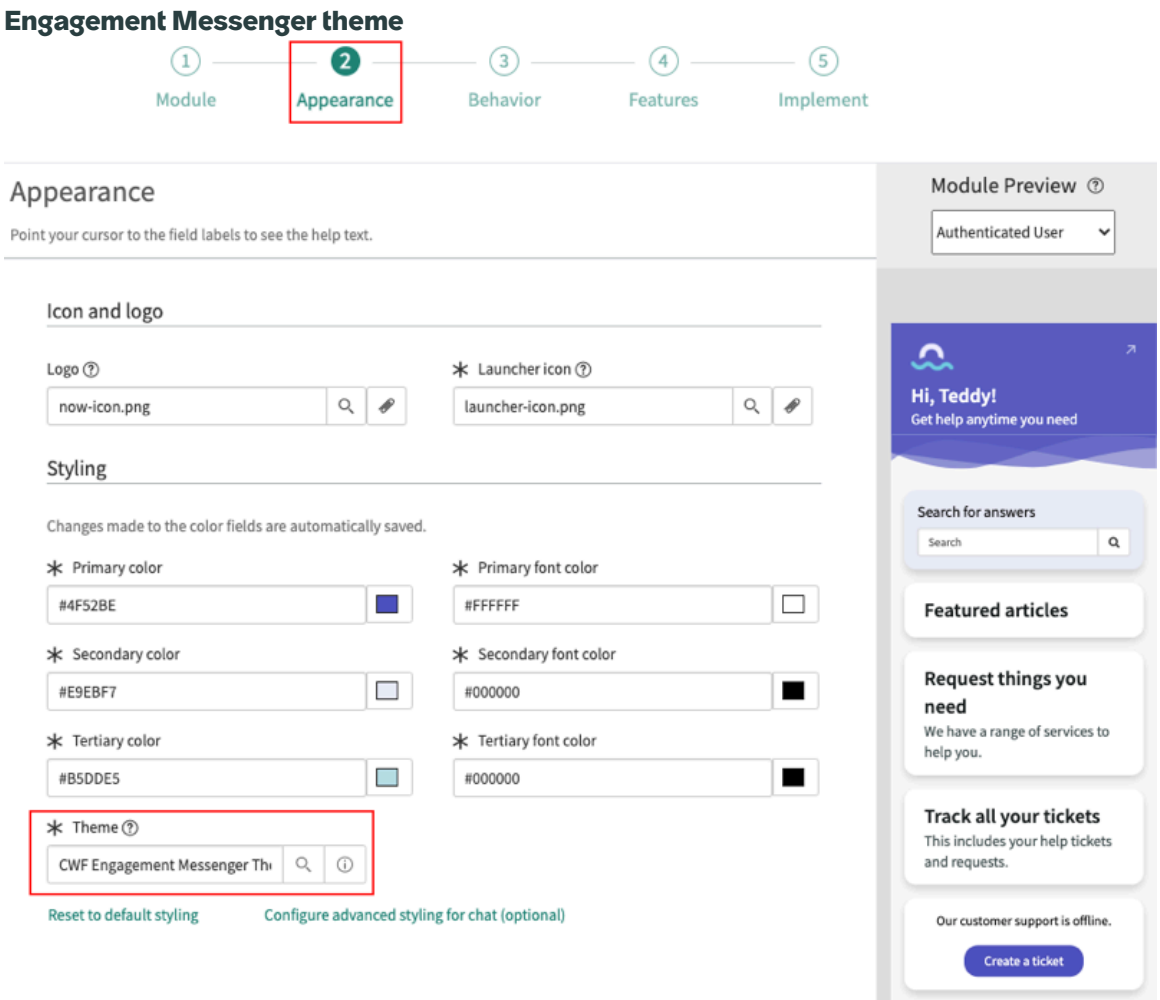
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Share the messenger module code with your developer using the **Email code** to embed Engagement Messenger in your website.
4. Following are the advanced formatting changes that are available as an optional configuration in Engagement Messenger:
   - Engagement Messenger module theme requirements to reuse Service Portal theme to customize the visual appearance in Engagement Messenger.
   - Default font sizes for search result text in Engagement Messenger.

Engagement Messenger module theme requirements

You can set a theme that you can apply to an Engagement Messenger module. A theme enables you to define additional styling of Engagement Messenger in your website.

You can select the theme for your Engagement Messenger in the Appearance section of the guided configuration.



A theme that you want to use for your messenger module must meet the following criteria:

- The header must be set as **CWF EC Header**
- It must contain the JS include `/scripts/sn_csm_ec.js`
- It must contain the CSS includes `cwf_ec_theme_inline_css` and `sp-theme-la-jolla.css`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default font sizes for search result text in Engagement Messenger

Define normal and genius search result font sizes to change text appearance in Engagement Messenger on different devices.

Note:
The ec_admin role is required to change the default configuration.

Search types and default configurations in Engagement Messenger

Search type	Default configuration
Normal search for Knowledge Base and Catalog	The default normal search result font size settings are: • Large for title • Medium for summary **Note:** • This setting for knowledge bases is found in the *em_kb_search_template* template script. • This setting for Catalog is found in the *em_catalog_search_template* template script. The default auto-spell correction text font size is medium. **Note:** The default configuration is set in the Faceted Search widget.
Genius search for Knowledge Base and Catalog	The default genius search result font size settings are: • Small for identifier • Large for heading • Medium for summary **Note:** • This setting for knowledge bases is found in the *em_qa_genius_results_template* template script. • This setting for Catalog is found in the *em_catalog_genius_results_template* template script.

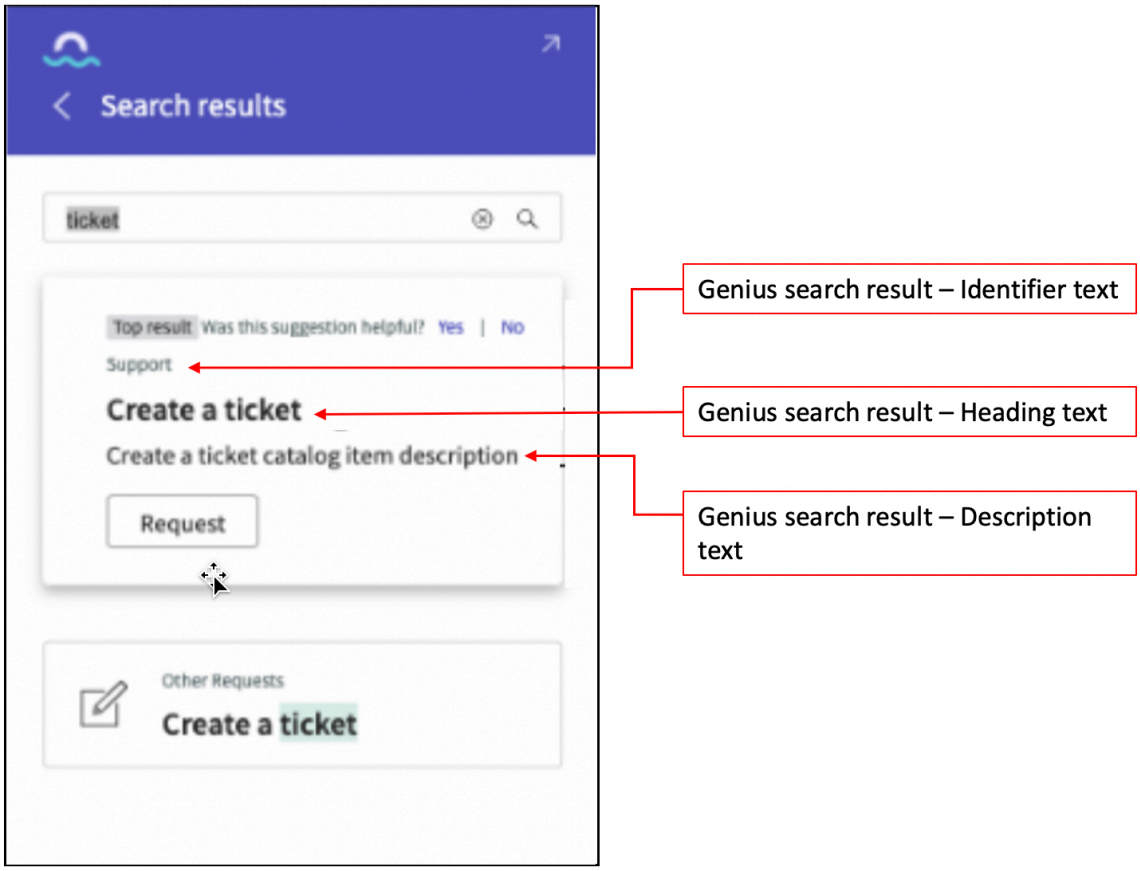
Genius search result text appearance in Engagement Messenger



Change the default chat mode for the Chat feature

Set either asynchronous chatting through a chat window or synchronous mode through messaging as the default chat mode of the Chat feature.

Before you begin

Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. On the Engagement Messenger Modules page, in the **Edit module** column, select **Edit**.
3. On the Configure Engagement Messenger Module page, select **Features**.
4. Enable the Chat feature by turning on **Chat** in the Feature settings pane.
5. On the Chat form, in the **Global chat settings** section, select **Change the default mode for chatting**.
   The Messaging Channel page opens in a new tab.
6. In the Type field, select the default chat mode.
   - To enable synchronous chat to engage in real-time conversation through a chat window, select **Chat**.
   - To enable asynchronous chat to engage in long-running conversations through messaging without being online concurrently, select **Messaging**.

     For more information, see Configure asynchronous chat for the web channel.
7. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure email notifications for unread chat messages

Send email summaries with all unread messages when the user isn't active during a chat conversation for a specified duration.

Before you begin
Role required: sn_csm_ec.ec_admin

About this task
You can send email summaries to an authenticated user or users who are verified by a live agent.

Procedure
1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. On the Engagement Messenger Modules page, in the **Edit module** column, select **Edit**.
3. On the Configure Engagement Messenger Module page, select **Features**.
4. Enable the Chat feature by turning on the **Chat** in the Feature settings pane.
5. On the Chat form, in the **Global chat settings**, select **Email notifications for unread messages**.
   The Missed activity emails page opens in a new tab.
6. Enable the sending of chat email notification by turning on the **Missed activity email** option.
7. In the Offline threshold drop-down list, set the time duration that the user is inactive before sending the email notification.
   - 15 minutes (default)
   - 2 hours
   - 8 hours
   - Custom
8. Select **Save**.

Result
Automatically sends email notifications of missed chat messages at the specified time interval.

Enable Engagement Messenger on a website when third-party application cookies are blocked

Configure a custom URL for the ServiceNow instance that helps prevent web browsers from blocking Engagement Messenger when cross-origin iframes and third-party cookies are blocked.

Before you begin
You must activate the Custom URL (com.snc.customurl) plugin. For more information, see Activate custom URLs.

Role required: admin

About this task
The latest versions of browsers including Safari and Chrome have enhanced browser security features. By default, the browser security features block third-party cookies that help prevent the loading of a third-party application on a website. If you don't use a custom URL, the browser treats the messenger as a third-party application when embedded inside a parent website. To prevent messenger from getting blocked by the browser, you need to set a custom URL for the ServiceNow instance to match the messenger domain with the website domain. Using custom URL, browser treats messenger as a first-party application rather than a third-party application. The web browser's security restrictions block messenger for the following reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Web browser blocks cross-origin iframes when the domain of the URL used in the iframe does not match the domain of the website itself.

  Note:
  Engagement Messenger uses an iframe to load messenger's#nterface on a third–party website.

- Web browser treats messenger's cookies as the third-party cookies and blocks them.

  Note:
  Engagement Messenger uses cookies to enable features like authentication, recommendations, proactive help and so on.

Note:
Custom URL is primarily configured to get a branded URL for the ServiceNow instance, Portals, and EM module that matches with your domain URL.

You must add a CNAME record to your website domain's DNS records where Engagement Messenger is embedded and set it as your ServiceNow instance URL. For example, in the name server for `acme.com`, create an entry

```
support.acme.com 300 IN CNAME acme.servicenow.com
```

where `acme.service-now.com` is the ServiceNow instance and `acme.com` is your website on which Engagement Messenger is integrated.

Procedure

1. Navigate to **All** > **Custom URL** > **Custom URLs**.
2. Select **New**.
3. On the Custom URL form, in the **Domain name** field, enter the CNAME record (your custom URL) that you have set as the ServiceNow instance URL.
4. Select **Create**.

   Note:
   The new custom URL takes approximately six hours for activation.

5. **Optional:** After the custom URL is active, on the Custom URL form, select the **Set instance URL** check box to enable the custom URL as an instance URL.
6. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
7. In the code, replace the existing website URL with a custom URL.
8. Save the file.

Result
Engagement Messenger loads on a third-party website.

Example:
The following code includes a sample URL that contains `support.acme.com` as a custom URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom URL in code

```
<script src='https://support.acme.com/scripts/sn_csm_ec.js?v=4.0.1'></script>
<script>
SN_CSM_EC.init({
    moduleID: 'https://support.acme.com'#<module_id>,
    loadFeature: chatFeatureContext()
});
</script>
```

Related topics

- Set a custom URL as the instance URL
- Custom URLs association to your instance

Update Engagement Messenger launch URLs to the latest version

Update the version of Engagement Messenger in the code used to embed Engagement Messenger in your website or to launch features automatically with Engagement Messenger.

Before you begin

Role required: Website administrator

Procedure

1. Open the HTML file of the web page on the website where you integrate Engagement Messenger.
2. Change the existing version number to `v=3.1`.
   For example:

```
<script src="https://example.service-now.com/scripts/sn_csm_ec.js?v=3.1"></script>
<script>
SN_CSM_EC.init({
       moduleID: "https://example.service-now.com/#aeff0547dd393010f87734cef087e2ba",
       loadFeature: SN_CSM_EC.loadEMFeature()
});
</script>
```

3. Save the file.

Engagement Messenger properties

You can configure the system properties for your Engagement Messenger module so that you can enable Virtual Agent chat, multi-provider SSO, and set a user session time-out value.

Properties installed with Engagement Messenger

After you configure an Engagement Messenger module, set the following system properties that are based on your configuration of the messenger module.

Tip:
In the navigation filter, enter `sys_properties.list` to view the list of all the system properties and search for the property that you want to update.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties and descriptions of the Engagement Messenger module (continued)

Property	Description
	These notification emails are sent in scenario submitting a case, requesting a service, reque field technician, or booking a walk-up appoint • Type: string • Value: None • Location: System Properties For example, if your customer support portal i `https://www.example.com/support` then set the property value to `https://` `www.example.com/support`.
sn_csm_ec.proactive_inactivity_time	Set the inactive period (in seconds) to trigger help in Engagement Messenger. • Type: integer • Value: 2 • Location: System Properties
glide.knowman.serviceportal.use_numbered_url	The property contains a comma-separated lis service portal record sys_ids. For any portal re specified in this property, the article link will b displayed with the sysparm_number URL para instead of sys_kb_id. • Type: string • Value: None • Location: System Properties

Feature configuration for Engagement Messenger

Configure the features of Engagement Messenger so that you can change the default settings to suit your customer needs.

Before you begin

Role required: sn_csm_ec.ec_admin

You must configure Engagement Messenger before configuring its features. For more information, see Configure Engagement Messenger.

About this task

Configure how the features of Engagement Messenger appear to your customers, their display arrangement, and their behavior.

Use the Features section of the guided configuration to customize the messenger configuration. View a live preview of how the Engagement Messenger would look like in your third-party website. You can also watch the academy video to understand the overall functionality of Engagement Messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

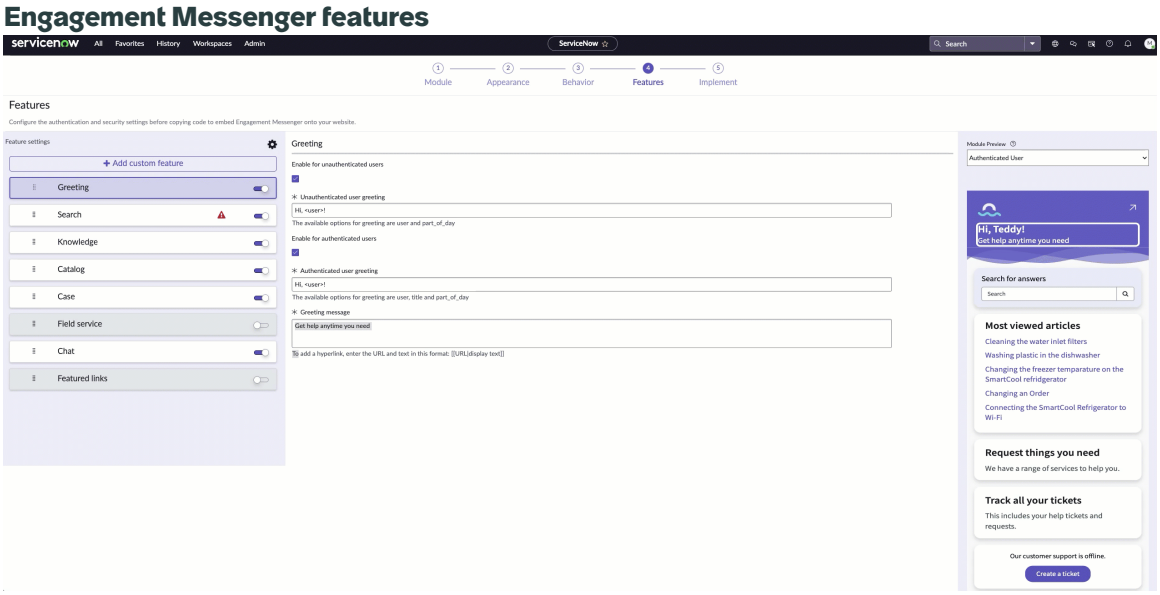
Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to configure, select **Edit**.
   The guided configuration view is displayed.
3. From the Features section of the guided configuration, enable or disable a feature by using the toggle ( ) on the feature card.
4. Open one of the following features and modify the values:
   - Greeting: See Greeting feature configuration.
   - Knowledge: See Knowledge feature configuration.
   - Search: See Search feature configuration.
   - Case: See Case management feature configuration.
   - Catalog: See Catalog feature configuration.
   - Field service: See Field service feature configuration.
   - Walk-up: See Walk-up feature configuration.
   - Chat with an agent: See Chat feature configuration form fields.

     Note:
     - The knowledge article, catalog item, and case links sent by an agent can be opened within Engagement Messenger. You can configure how links should be open in a messenger. For more information, see Create a smart link preference.
     - You can also enable the Now Assist in Virtual Agent in Engagement Messenger by Configuring assistants overview and then Display your assistant in Engagement Messenger.

   - Configurable Cards: See Configurable Cards feature configuration.
   - Callback: See Callback feature configuration form.
5. **Optional:** You can also add a feature in the **Features** section using Configurable Cards.
   a. Select **Add custom feature**.
   b. Enter the feature name and select the feature type.
   c. Select **Add**.
   For more information, see Configurable Cards feature configuration.
6. Select **Update**.
7. **Optional:** Change the display order of the features by reordering the feature cards.
   You can see the modified home page layout of your Engagement Messenger in the live preview of the module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
Engagement Messenger extends service portal capabilities that don't support domain separation. For more information, see (Domain separation and Service Portal). However, other tables that are used in Engagement Messenger may support domain separation according to the configurations with which they're created.

What to do next
Create an identity provider (IdP) for Engagement Messenger

Enable AI Search in Engagement Messenger for unauthenticated users

Enable the AI Search experience in Engagement Messenger so unauthenticated users can see the most relevant set of search results.

Before you begin
You must configure AI Search for the Engagement Messenger before enabling AI Search for an unauthenticated user. For more information, see Search feature configuration.

Role required: admin

About this task
As an admin, you must enable the EC AI Homepage Search, Typeahead Search, and AI Search Assist widgets in Engagement Messenger to enable the AI Search capability for unauthenticated users.

Procedure
1. Navigate to **Service Portal** > **Widgets**.
2. Search for and open the **EC AI Homepage Search** widget.
3. Select the **Public** check box.
4. Select **Update**.

What to do next
Enable the Typeahead Search and AI Search Assist widgets. For information, see Enable AI search in the Customer and Consumer Service Portals for unauthenticated users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the default behavior of Engagement Messenger

Configure the default behavior of Engagement Messenger to set the default settings for Notification, Recommendations, and Proactive.

Before you begin

Configure Engagement Messenger.

Use Engagement Messenger embed Code to integrate proactive recommendations on a web page.

Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Select the Engagement Messenger module you want to install on your website.
3. In the Edit module column, select **Edit**.
4. In the Configure Engagement Messenger module, select the **Behavior** tab.
5. In the **Behavior** tab, configure the **Recommendations** and **Proactive** settings to define the Engagement Messenger functions.
   For more information, see Proactive Recommendations configuration for Engagement Messenger.

   Note:
   For information about how to customize the Notification behavior, see Configure Engagement Messenger.

6. Select **Save**.

Proactive Recommendations configuration for Engagement Messenger

The Proactive Recommendations feature enables you to show context-based suggestions in real time and to configure the recommendations experience on Engagement Messenger.

Note:
To integrate Proactive Recommendations on a web page, you need to enable recommendations in the embed code of Engagement Messenger.

Recommendations setting configuration form

Field	Description
Enable recommendation	Option to show or hide the recommendations.
Title text	Title of the recommendation screen in the messenger.
Subtitle text	Helpful text about the recommendations that displays at the top of the recommendations screen.
Show the search bar	Option to display the search bar on the Recommendation page that enables you to search content in addition to the provided recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations setting configuration form (continued)

Field	Description
Maximum number of recommendations	The maximum number of recommendations to be shown on the recommendations screen.
Link text for additional recommendations	Text for the link that enables the user to view an additional recommendations.
Link text for Engagement Messenger	Text displayed in the footer of the messenger to enable navigation to the Engagement Messenger home page. Use the `[[display text]]` format to add a clickable link to messenger.
• If AI Search does not return any recommendations, then the Engagement Messenger home page is displayed. • You need to enable AI Search to make Recommendations available to users.	

Proactive setting configuration form

Field	Description
Type	Type of display to show the suggestions proactively on messenger after 30 seconds of inactivity. Select **None** to disable proactive behavior.
Choose an animation type	The type of animation for the launcher icon that activates when the user is inactive. • Ripple (like a wave) • Bounce
Show a tooltip above the icon	Option to show the tooltip message above the launcher icon.
Tooltip text	The message displayed on the tooltip.
Offer search	
Title text	Title of the widget that appears when **Offer search** is selected as the proactive help type.
Subtitle text	Description of the widget that appears on the widget body and appears below the title text.
Placeholder text	Placeholder text that appears in the search box.
Offer chat	
Title text	Title of the widget in the messenger.
Subtitle text	Description of the widget in the messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive setting configuration form (continued)

Field	Description
Chat button label	Label of the button that is displayed for the user to start the conversation.
Offer the recommendation you configured	
Select the **Offer the recommendation you configured** option to show the knowledge article and catalog items recommendations proactively as per the configuration in the Recommendations section.	
Note: AI Search needs to be enabled for Offer search and Offer the recommendation you configured options.	

Use Engagement Messenger embed Code to integrate proactive recommendations on a web page

Modify the embed code of Engagement Messenger to enable recommendations and pass the search query for recommendations based on AI Search.

Before you begin

- Embed Engagement Messenger in your web application.
- Activate an Engagement Messenger module.
- Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Select the Engagement Messenger module you want to install on your website.
3. In the Edit module column, click **Edit**.
4. In the Configure Engagement Messenger module, select the **Implement** tab.
5. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
6. In the **Implement** tab, copy the code from the Embed code section.
7. Paste the code you copied into the text file before the closing body tag.
8. Enable recommendations for a specific page in messenger by adding the parameter `enableRecommendations: true` in the embed code.

   In the website where you integrate Engagement Messenger, when the user enters a search term in messenger, by default the website URL slug (last part of the URL) will be considered the search query. The URL slug conditions for the search query entered in the messenger search bar are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a single forward slash is at the end of the URL, then no search term is picked. For example, `https://example.service-now.com/`.
- If a term is surrounded by forward slashes at the end of the URL, the enclosed text is considered to be a search term. For example, in the URL `https://example.service-now.com/product-xyz/`, product xyz is considered a search term.
- If a single forward slash is followed by text, that text is considered to be a search term. For example, in the URL `https://example.service-now.com/search_string` search string is considered as a search term.

The URL slug is used to deduce the search query as follows:

- All the special characters are replaced by a space. For example, in the URL `https://example.service-now.com/product-xyz`, the search term is "product xyz".
- Any file extension is ignored. For example, in the URL `https://example.service-now/product.html`, the search term is "product".

9. Enable recommendations at the module level.
   a. Navigate to **All** > **Engagement Messenger** > **Modules**.
   b. Select your Engagement Messenger module.
   c. Click **Edit**.
   d. In the Configure Engagement Messenger module, select the **Behavior** tab.
   e. Enable the **Enable recommendations** toggle switch.
10. **Optional:** Add custom logic for passing a search query parameter to the AI Search by passing a function callback as the value for a parameter `getAISRecommendationsContext`. The following example shows the modified code to generate proactive recommendations with the custom logic for passing a search context query.

```
‹script
 src="https://
example.service-now.com/scripts/sn_csm_ec.js"></script>
  ‹script>
  SN_CSM_EC.init({

 moduleID:"https://instancename.service-now.com/<sys_id>",
              loadFeature: SN CSM EC. loadEMFeature(),
              enableRecommendations: true,
              getAISRecommendationsContext: function
 getSearchQuery(){
              //Insert your code here to fetch the search
 query string return product xyz
}

  };
  </script>
```

11. Save and publish the HTML file.

Result
Engagement Messenger shows recommendations based on the context provided by the third-party website.

Example:
The following example shows the modified code to generate default proactive recommendations for the default context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
‹script
 src="https://
example.service-now.com/scripts/sn_csm_ec.js"></script>
  ‹script>
  SN_CSM_EC.init({

 moduleID:"https://instancename.service-now.com/<sys_id>",
              loadFeature: SN CSM EC. loadEMFeature(),
              enableRecommendations: true
             }

  };
  </script>
```

Create an identity provider (IdP) for Engagement Messenger

Create an IdP for your Engagement Messenger so that you can enable customer authentication. You can create an IdP for either the OpenID Connect (OIDC) or Security Assertion Markup Language (SAML) authentication type.

Before you begin

Role required: admin

About this task

If you previously configured an IdP, you can ignore this task and reuse the existing IdP.

Note:
If you have configured multiple IdPs on your instance and want to select a specific IdP for your Engagement Messenger module, do the following:

- Enable Engagement Messenger on a website when third-party application cookies are blocked
- Custom URL with Identity Provider
- If you have multiple IdPs on your instance:
  - In case of OIDC authentication type, the generated ID token should contain the client ID of a IdP record against which authentication is required.
  - In case of SAML authentication type, set the particular IDP record as Auto-redirect IdP.

Note:
For more information, see Setting up auto login and logout for Engagement Messenger.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Administration** > **Identity Providers**.
2. Select **New**.
3. Select either **OpenID Connect** or **SAML**.
   - If you select **OpenID Connect**, follow the procedure in Create an OpenID Connect (OIDC) configuration for Single Sign-On (SSO).
   - If you select **SAML**, follow the procedure from step 3 in Create and update identity providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- When customers sign in to your website where the Engagement Messenger module is deployed, they must also be authenticated within the messenger. User authentication is done by using the same IdP that authenticated the customer's login into your website.

  You must verify that the customers of your website are also added in your OIDC or SAML authentication provider for the ServiceNow instance.

- Enable cross-domain requests between Engagement Messenger and your website. For more information, see Configure a CORS rule for Engagement Messenger.

Related topics

How to set up OIDC provider on ServiceNow instance

Configure a CORS rule for Engagement Messenger

Configure a cross-origin resource sharing (CORS) rule to enable cross-domain requests between Engagement Messenger and your website where you want to deploy the messenger.

Before you begin

Role required: admin

You must complete the following tasks:

- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.

About this task

Use the Engagement Messenger API and your website URL to create a CORS rule.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Administration** > **CORS Rules**.
2. Click **New**.
3. On the form, fill in the fields.

CORS Rule form

Field	Description
Name	Unique name for the CORS rule.
Application	Application scope for this record.
REST API	Engagement Messenger REST API that this CORS rule applies to. Set this field to **Engagement Center API [sn_csm_ec/engagement_center_api]**.
Domain	Domain that sends the request to this REST API. Set this field value to the URL of the website where you want to deploy the messenger. For example, **https://www.example.com**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Max age	Number of seconds to cache the client session. After an initial CORS request, further requests from the same client within this time do not require a preflight message. If you do not specify a value, the default value of 0 indicates that all requests require a preflight message.
HTTP Methods	Allowed HTTP methods. Enable the GET and POST methods.
HTTP Headers	Comma-separated list of HTTP headers to send in the response. You can leave this field empty.

4. Select **Submit**.

What to do next
Create HTTP response headers for Engagement Messenger.

Create HTTP response headers for Engagement Messenger

Configure a name-value pair for HTTP response headers for the Engagement Messenger module. The ability to configure and pass response headers enables special handling of the page content by a client, which is most typically a browser.

Before you begin
- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.
- Configure a CORS rule for Engagement Messenger.
- Role required: admin

About this task
Use the Engagement Messenger API and your website URL to create a CORS rule.

Procedure
1. Navigate to **All** > **Engagement Messenger** > **Administration** > **HTTP Response Headers**.
2. Select **New**.
3. On the form, fill in the fields.

HTTP Response Header form

Field	Description
Active	Option for indicating that this HTTP response header configuration is active.
Application	Application scope for this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	Type of record that the HTTP response header configuration applies to. Select **Specific Type** to indicate that this HTTP response header configuration is for the specific type and record that you select in the **Type** and **Record** fields.
Type	Type of record that the HTTP response header configuration applies to. Select **Service Portal** to indicate that the records are related to the Service Portal.
Record	Engagement Messenger module record that the HTTP response header configuration applies to. Select a record: **a.** Select the Search ( ) icon to access the Select the document pop-up form. **b.** In the **Table name** field, ensure that the value is set to **Service Portal**. **c.** In the **Document** field, select the Search ( ) icon. **d.** From the list of Service Portal records, select the messenger module that you configured. **e.** Select **OK**.
Name	Name for the name-value pair for the HTTP response header. Set this field value to **Content-Security-Policy**.
Value	Value for the name-value pair for the HTTP response header. Set this field value to **frame-ancestors 'self' <enter your website URL>**. For example, **frame-ancestors 'self' https://www.example.com**.
Description	Detailed description for the HTTP response header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Activate an Engagement Messenger module.

Related topics

HTTP Response Headers

Activate an Engagement Messenger module

Activate the Engagement Messenger module that you configured so that you can embed it in your website.

Before you begin
Role required: sn_csm_ec.ec_admin

Perform the following tasks:

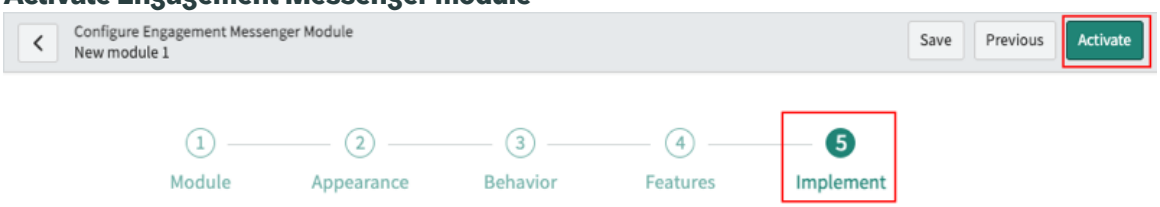
- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.
- Configure a CORS rule for Engagement Messenger.
- Create HTTP response headers for Engagement Messenger.

About this task
Unless you activate a messenger module, it would not be available for your customers to use from within your third-party website.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to activate, click **Edit**. The guided configuration view is displayed.
3. Select the **Implement** step.
4. Select **Activate**.

Activate Engagement Messenger module



What to do next
Embed Engagement Messenger in your web application.

Embed Engagement Messenger in your web application

Embed the source code of the messenger module that you configured in your website so that you can enable your customers to start using Engagement Messenger in your website.

Before you begin

- Activate an Engagement Messenger module.
- Role required: sn_csm_ec.ec_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Copy the source code of the messenger module that you activated and paste it in the HTML file of the website where you want to deploy the messenger.

Next, depending on the authentication type that you selected for your configured messenger module, you may have to write code for functions to get the ID token and to start and stop the session for a logged-in user in the messenger.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to install in your website, click **Edit**.
   The guided configuration view is displayed.
3. Click the **Implement** tab.
4. If you have done any changes to the Security settings section, click **Save**.
   The code of the Engagement Messenger module is updated.
5. Scroll down to the Embed code section and click **Copy code**.
6. Open the HTML file of your website and paste the copied code before the closing body tag.
7. For a messenger module with OIDC-based or SAMI-based authentication, complete the following configuration.

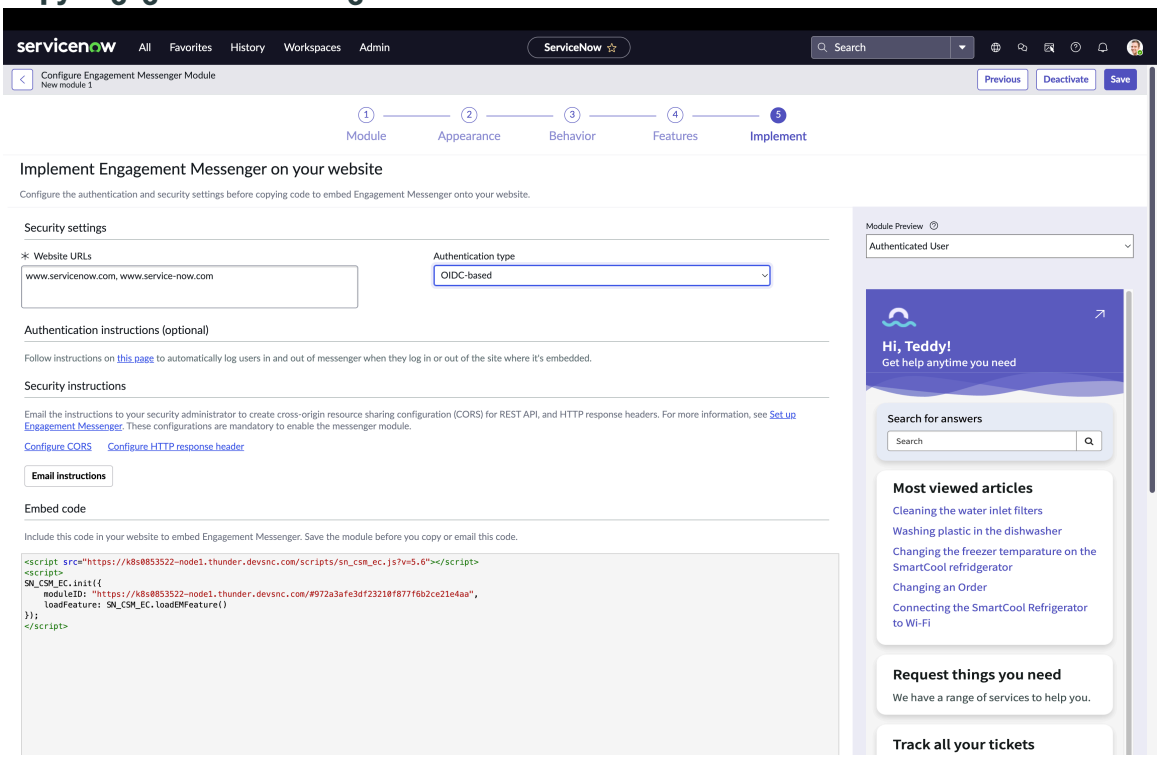
   Note:
   For more information about setup for OIDC and SAML-based authentication, see Setting up auto login and logout for Engagement Messenger [KB1560205] article in the Now Support Knowledge Base.

8. If you enabled the walk-up feature for unauthenticated users, uncomment the `//guestWalkupBaseUrl` code line and complete the configuration by entering the base URL of your customer support portal.

   For example, if your customer support portal is **https://www.example.com/support**, then update the code to **guestWalkupBaseUrl = https://www.example.com/support**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy Engagement Messenger code



9. **Optional:** To modify the embed code to set the preferred language in which Engagement Messenger is displayed, do one of the following.
   The `setLang : getEMLanguage` function takes preference when both parameters are available. However, if the user has set the preferred language in the [sys_user_preference] table, Engagement Messenger will be displayed in that language.

   Note:
   Beginning with the Zurich release, the upgraded customers can also modify the embed code to enable language switching.

10. **Optional:** Open the website to which you added the Engagement Messenger code to verify that the launcher icon is available and click the icon to verify that it launches Engagement Messenger.
11. **Optional:** Modify the embed code of Engagement Messenger to integrate Proactive Recommendations on a web page.
    For more information on using Engagement Messenger to integrate Proactive Recommendations on a web page, see Use Engagement Messenger embed Code to integrate proactive recommendations on a web page.

What to do next

Open the website that you added the Engagement Messenger code to and verify that the launcher icon of the messenger is available. Click the icon to launch the Engagement Messenger.

You can also embed Engagement Messenger in your native iOS and android applications using Now Mobile SDK:

- Embed Engagement Messenger in a native iOS app using Now Mobile SDK [KB1587276]
- Embed Engagement Messenger in a native android app using Now Mobile SDK [KB1587611]

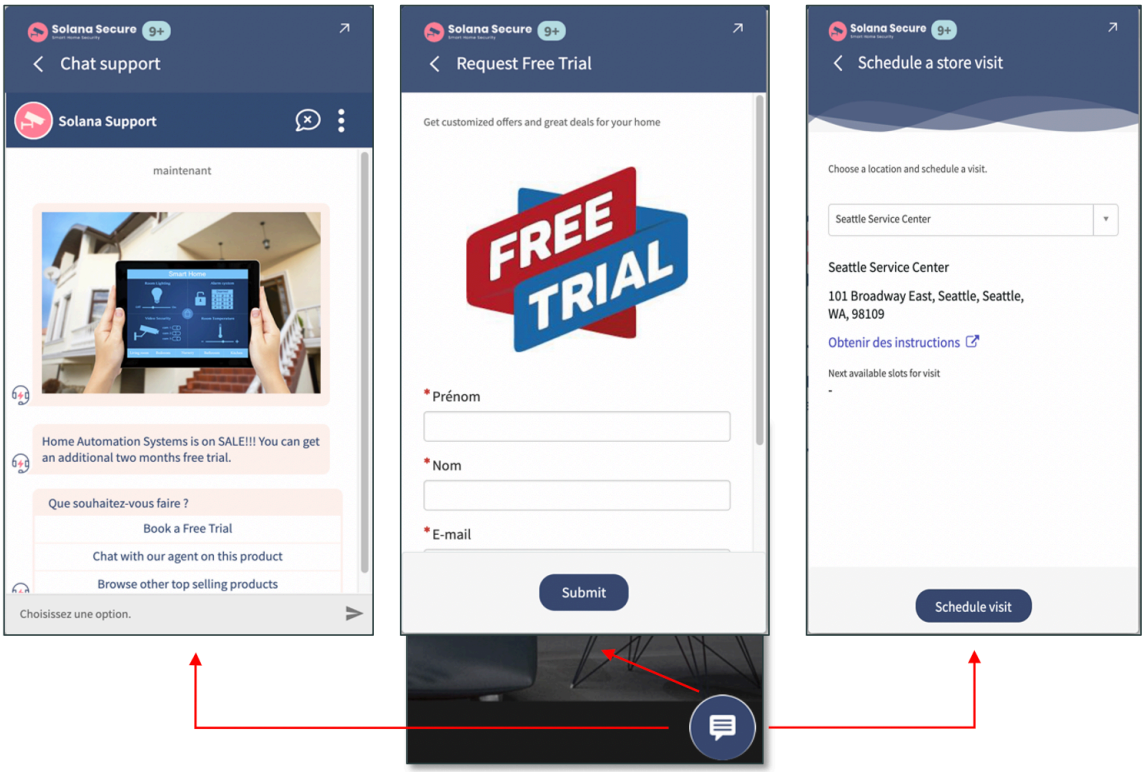
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deep linking feature in Engagement Messenger

Set a workflow as a default launch screen in Engagement Messenger either using custom code or a parameterized URL.

The deep linking capability enables you to customize the home page of Engagement Messenger so that you can launch a specified feature every time the messenger is accessed. The feature is launched through variables in a structured URL or in custom code through launch entries that contain substitution variables.

Deep linking launch screens



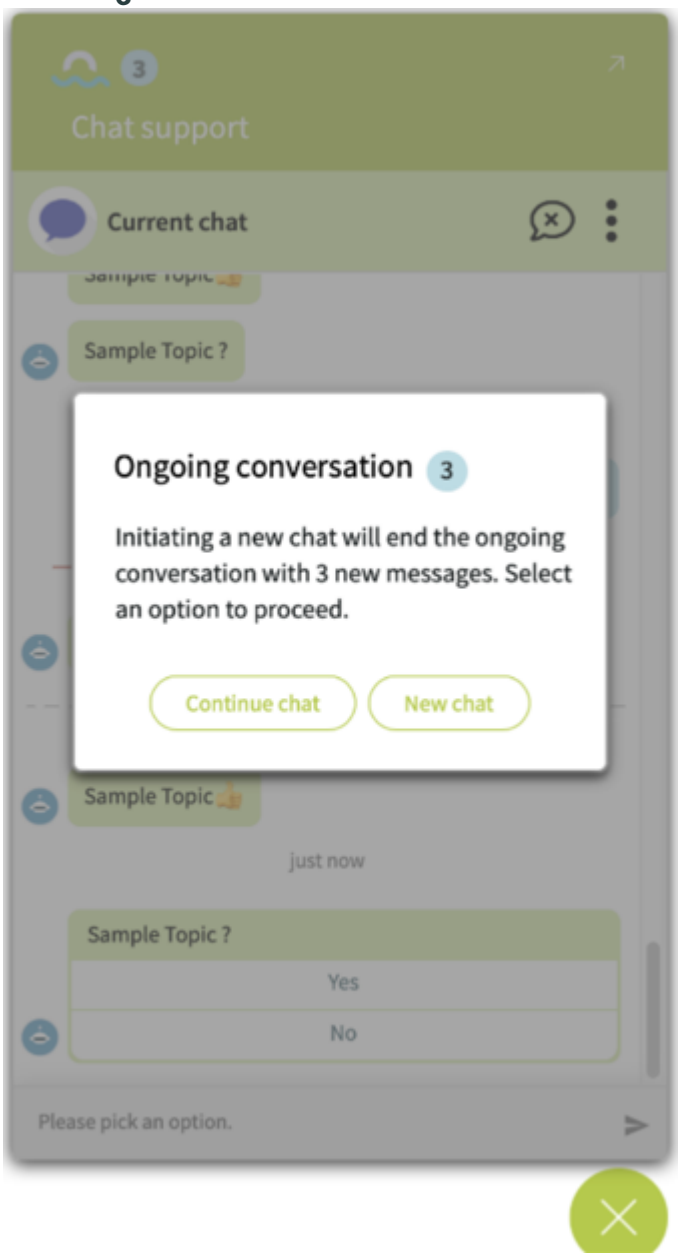
The deep linking capability supports the launch of View Article, New Case, Case List, Search, Case Search, Catalog Item, New Appointment, New Work Order, Default Home, Work Order, Virtual Agent and Live Agent chat features and display in Engagement Messenger.

Note:
Beginning with the Zurich release, in Virtual Agent and Live Agent chats, if a user is engaged in an ongoing conversation and tries to contextually open a topic then the following options are shown:

- Continue chat
- New Chat

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Switching chat



Launch a feature in Engagement Messenger using custom code

Use the custom code to enable the deep linking and launch a feature in Engagement Messenger integrated with your website.

Before you begin

Configure Engagement Messenger.

Embed Engagement Messenger in your web application.

Role required: ec_admin and website administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:

If you're using existing code, verify that you update the script to show `v=3.1`. For example:

```
<script
 src="https://
example.service-now.com/scripts/sn_csm_ec.js?v=3.1"></scri
pt>
<script>
SN_CSM_EC.init({
      moduleID:
 "https://example.service-now.com/#aeff0547dd393010f87734cef
087e2ba",
      loadFeature: SN_CSM_EC.loadEMFeature()
});
</script>
```

Procedure

1. Navigate to **Engagement Messenger** > **Modules**.
2. In the Configure Engagement Messenger Module, open the Implement tab.
3. Copy the code from the Embed code section.
4. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
5. Paste the code that you copied before the closing body tag.
6. Define the feature context and specify the variables for the feature.
   Use the following format to define a feature context:

```
{
 feature: "<feature_name>",
 openOnLoad: <true/false>,
 params: {
  "<param_name>": "<param_value>",
  "<param_name>": "<param_value>
 }
}
```

   In the format, specify the feature variables.

   feature

   The feature name. For more information, see Feature context parameters supported in Engagement Messenger .

   openOnLoad

   Include this option and set it to true only if you want Engagement Messenger to open automatically. The default setting for this option is for Engagement Messenger not to open automatically.

   <param_name>": "<param_value>

   Name and value of a parameter associated with the feature. For more information, see Feature context parameters supported in Engagement Messenger.

7. Create a custom wrapper function to pass the feature context to the `SN_CSM_EC.init` function of the embed code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, the following code uses the `chatFeatureContext()` custom wrapper function for the chat feature context.

```
function chatFeatureContext(){
 return {
   feature: "CHAT",
   openOnLoad: false,
   params: {
    "topic_id": "8708db281bd5b81080df6247b04bcb79",
    "language": "fr"
    }
    }
}
```

8. Replace the `SN_CSM_EC.loadEMFeature()` function with a custom wrapper function that you created in step 7.
   For example, in the following code, the `chatFeatureContext()` wrapper function is passed as the value of the `loadFeature` attribute.

```
SN_CSM_EC.init({
  moduleID: "https://example.service-now.com/#<module_id>",
  loadFeature: chatFeatureContext()
});
```

9. Save the file.
10. **Optional:** Verify that the designated feature launches.
    a. Open the website in which you embedded Engagement Messenger.
    b. Select the launcher icon.
    c. Verify that Engagement Messenger launches feature you configured in the embed code.

Result

The feature you specified in the embed code is launched by default when Engagement Messenger is opened in the website in which it's embedded.

Example:

The following code initiates the chat feature by default. It also shows how to trigger a Virtual Agent topic by default when chat is loaded by passing the system identifier (sys_id) of the topic. You can also specify a language to initiate chat in that language.

```
<script
 src="https://
example.servicenow.com/scripts/sn_csm_ec.js?v=3.1"></script>
<script>
function chatFeatureContext(){
 return {
   feature: "CHAT",
   openOnLoad: false,
   params: {
    "topic_id": "8708db281bd5b81080df6247b04bcb79",
    "language": "fr"
    }
    }
}

SN_CSM_EC.init({
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 moduleID:
 "https://example.service-now.com/#d27c94d6db403810a2a6a0ced39619da",
 loadFeature: chatFeatureContext()
});
</script>
```

function

chatFeatureContext(): The wrapper function for chat context.

feature

CHAT: The chat feature for initiating Virtual Agent or Live Agent chat.

openOnLoad

false: Disable the automatic launch of Engagement Messenger.

topic_id

8708db281bd5b81080df6247b04bcb79: The module system identifier (sys_id).

language

fr: Sets the default chat language to French.

Launch a feature in Engagement Messenger using URL parameters

Use URL parameters in your website's URL to enable the deep linking and launch a feature in Engagement Messenger integrated with your website.

Before you begin

Configure Engagement Messenger.

Embed Engagement Messenger in your web application.

Role required: ec_admin and website administrator

About this task

You can use URL parameters to display specific feature in Engagement Messenger. When the URL is accessed, it opens your website and automatically loads the specified feature in Engagement Messenger. For example, you can embed the URL in an email to share a knowledge article from Engagement Messenger.

Note:

If you are using existing Embed code, ensure that you update the script to include `v=3.1`. For example:

```
<script src="https://example.service-now.com/scripts/sn_csm_ec.js?v=3.1"></script>
<script>
SN_CSM_EC.init({
       moduleID: "https://example.service-now.com/#aeff0547dd393010f87734cef087e2ba",
       loadFeature: SN_CSM_EC.loadEMFeature()
});
</script>
```

Procedure

1. Navigate to **Engagement Messenger** > **Modules**.
2. In the Configure Engagement Messenger Module, open the Implement tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Copy the code from the Embed code section.
4. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
5. Paste the code you copied before the closing body tag.
6. Save the file.
7. Modify the website URL to include the feature.

```
https://website/page.html?feature=<FEATURE_NAME>&<PARAM_NAME1>=
<PARAM_VALUE1>&<PARAM_NAME2>=<PARAM_VALUE2>
```

<FEATURE_NAME>

The feature name. For information, see Feature context parameters supported in Engagement Messenger.

<param_name1>=<param_value1>

Name and value of a parameter associated with the feature. To define multiple parameters, use the same format. For more information, see Feature context parameters supported in Engagement Messenger.

8. **Optional:** Verify that the URL launches the designated feature automatically.

Result
The feature you included in the URL is set as the default launch screen in Engagement Messenger.

Example:
The following sample URL includes a system identifier (sys_id) for a knowledge article that will automatically display when the website is launched.

```
https://mywebsite/page.html?feature=VIEW_ARTICLE
 &sys_kb_id=ec7617461b01f01080df6247b04bcbaf
```

Configuring Omnichannel Callback for Customer Service Management

Configure various aspects of Omnichannel Callback for Customer Service Management to enable callback feature based on the specific requirements of your organization.

Installing and configuring Omnichannel Callback for Customer Service Management enables your customers to request a callback from various channels such a Virtual Agent, the Customer Service Portal, and Engagement Messenger.

The configuration process consists of the configuration tasks listed in the following table.

Configuration tasks

Task	Description
Install Omnichannel Callback for Customer Service Management	Install the Omnichannel Callback application (sn_callback).
Configure the callback behavior for Omnichannel Callback for Customer Service Management	Configure the various aspects of callback such as max retry attempts and expire time.
Publish the Virtual Agent topics for callback	Publish the callback virtual agent topics to display the callback option to customers on Virtual Agent clients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tasks (continued)

Task	Description
Callback feature configuration form	Configure the callback feature in Engagement Messenger.

Omnichannel Callback for Customer Service Management

Omnichannel Callback for Customer Service Management enables a callback option to be provided for customers when there is a long wait time for a live agent.

Omnichannel Callback for Customer Service Management offers an option for customer service agents to call customers back when the wait time for agents is long or agents are unavailable. For more information, see Omnichannel Callback.

Install Omnichannel Callback for Customer Service Management

You can install the Omnichannel Callback for Customer Service Management application (sn_callback) if you have the admin role.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Omnichannel Callback for Customer Service Management application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with the Omnichannel Callback for Customer Service Management application:

- Plugins
- Store applications
- Scheduled jobs - Send reminder for scheduled Callback tasks

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Omnichannel Callback for Customer Service Management application (sn_callback) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Related topics

Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration

Plugin requirements for voice and callback integrations with contact centers

Publish the Virtual Agent topics for callback

Publish the Virtual Agent topics for callback to help your customers request a callback from agents when there's a long wait time to reach a live agent or agents are unavailable.

Before you begin

Ensure that the Conversational appointment booking application is installed.

Role required: virtual_agent_admin or admin

About this task

Deploy the inactive topic to save it and make it available to users on Virtual Agent clients.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Virtual Agent** > **Designer**.
2. In the Topics page, publish the following topics.
   - Request a callback
   - Reschedule a callback
   - Cancel a callback
3. In the Header bar for the topic, select **Publish**.

   If you're using NLU discovery, the Choose what to publish dialog box appears. Select the available items to publish with the topic, such as the NLU model and language mappings, and then click **Publish**.

   Note:
   If the **Publish Model** option is unavailable, the model may need some work. For example, the model may not have enough intents or may need more utterances for some intents. Fix these issues before proceeding. Also, if a model language is unavailable, the language-specific model has never been published. Publish it from NLU Workbench. For more information, see Model management.

   For topics, the topic state is Active and the Published state changes to **just now**.
4. If you published a conversation topic, verify that your keywords or NLU utterances for the topic work as expected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Return to the Topics page, and then click **Test Active Topics**.

b. In the conversation window, enter keywords or NLU utterances that correspond to the topic intent to verify that the topic opens.
For the pre-built Virtual Agent topics, the bot returns a list of topics that match the entered keyword or utterance.

Result
The topics are published and are available for use in calling topics.

Configure the callback behavior for Omnichannel Callback for Customer Service Management

Configure the callback behavior of the callback, such as the maximum number of retry attempts or the expiration time, in Omnichannel Callback for Customer Service Management.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** search field, enter `sn_callback`.
3. Configure any of the properties listed in the following table.

Callback properties field description

Property	Default value	Description
sn_callback.callback_expire_time	60	Callback timeout in minutes after which the callback task is closed.
sn_callback.callback_max_retry_attempts	5	Maximum retry attempts after which the callback task is closed.
sn_callback.enable_scheduled_callback	true	Option to enable scheduled callbacks by enabling customers to select a time slot for callback.

Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration

Implement prebuilt, certified integrations with Contact Center as a Service (CCaaS) providers using the ServiceNow® voice reference architecture.

About this task
The Interaction Controls Component (ICC) feature enables CCaaS providers to display native voice and callback integrations so agents can manage customer calls directly from their configurable workspace.

For more information, see Interaction Controls Component (ICC) for voice calls and Integrating contact centers with Interaction Controls Component (ICC) for callbacks.

The voice controls and callback controls display under the following conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the interaction is a phone call, voice controls display. When the interaction is a phone call that is associated with a callback task, the callback controls display.
- The **Enable interaction controls** field is enabled on the OpenFrame Configuration record that allows the admin to configure the Agent Workspace to display voice interaction components.
- The agent is a member of the user group specified on the OpenFrame Configuration record. If no user group is specified, all agents can access the CSM voice interaction record page.
- Ensure the certified third-party App Store plugin is installed. For Example:
  - Unified Experience from Genesys
  - Unified Experience from Genesys - Core

Before you begin

Ensure the Interaction Controls Component (ICC) plugin (com.app_interaction_control) is installed to use the ICC voice features for CCaaS.

Role required: admin

Procedure

1. Navigate to **All** > **OpenFrame** > **Configurations**.
2. Create a new configuration record for the specific CCaaS provider.
   Some CCaaS providers can include OpenFrame configurations for their plugin.
3. Turn on the interaction controls for OpenFrame by selecting the **Enable interaction controls** check box.
4. From the **User Group** column, select a group and move it to the selected column.
   This is the group of users to whom the OpenFrame configuration applies.
5. Unlock the URL field.
6. In the URL field, enter a third-party URL.
   CaaS providers have specific configuration requirements for their plugins. Refer to the relevant contact center documentation for setup instructions.
7. Select **Update**.

What to do next

Refer to Plugin requirements for voice and callback integrations with contact centers for dependencies and address all prerequisite requirements to access the ICC features.

Plugin requirements for voice and callback integrations with contact centers

For the Interaction Controls Component (ICC) call features to work, you must have a combination of plugins that can be downloaded from the ServiceNow® Store and CCaaS providers.

The CCaaS providers must integrate with the ServiceNow platform. Additionally, they must submit their plugin for certification, to be made available for use from the ServiceNow® Store.

Note:
Verify plugin dependencies against the store listing to ensure you're using the latest compatible versions.

The following plugins are required to deploy the call control integration with the contact center platform:

- Interaction Controls Component (ICC) (sn_int_control)

  The following plugin and app dependencies are installed as part of the ICC plugin:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin dependency:

- Glide Conversation Server (com.glide.cs)
- Glide Conversation Server Custom Adapter (com.glide.cs.custom.adapter)
- Appointment Booking (com.snc.appointment_booking) is required for callback integrations.
- Openframe (com.sn_openframe)

App dependency:

- External Agent Management Util Pack (sn_external_agent)
- Contact Center Integration Core (sn_ct_ctr_it_core)
- Omnichannel Callback (sn_omni_callback)
- OpenFrame (sn_openframe)

- Advanced Work Assignment

  The External Routing Support plugin is required for callback integration with contact centers.

- Customer Service Management (CSM)
- Agent Workspace, as well as any workspace that works with Agent Chat, Email Interaction, or Messages.
- Products with Contact Center Integration Core Plugin
  - Application Spoke Selector
  - External Agent Management Util Pack

Note:
Address the Contact Center Integration Core plugin dependencies prior to downloading the plugin.

In addition to the preceding requirements, Install Omnichannel Callback for Customer Service Management for callback integration with contact centers.

Set default workspace for CCaaS

Configure and set a default workspace for contact center agents to let them navigate back to a workspace integrated with Interaction Controls Component (ICC), from any other unsupported workspace.

Before you begin

An interaction can be opened and details displayed in any workspace within the ServiceNow instance. However, if the workspace isn't integrated with ICC, then the global call controls supported by the ICC integration doesn't display in the workspace, rendering the workspace as unsupported.

Promote the Interaction Controls Component (ICC) plugin (com.app_interaction_control) is installed to use the ICC voice features for CCaaS.

Role required: **admin**

Configure the default workspace via OpenFrame within your ServiceNow instance as follows.

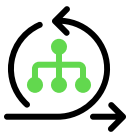
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **OpenFrame** > **Configurations**.
2. Create a configuration record for the specific CCaaS provider.
   Some CCaaS providers can include OpenFrame configurations for their plugin.
3. Turn on the interaction controls for OpenFrame by selecting the **Enable interaction controls** check box.
4. Checking the **Enable interaction controls** check box displays the **Default Experience** field.
5. Click the Search icon to search through the list of available supported workspaces and select the workspace you want to set as default.
6. From the **User Group** column, select a group and move it to the selected column.
   This user group refers to the group of users to whom the OpenFrame configuration applies.
7. Unlock the URL field.
8. In the URL field, enter a third-party URL.
   CaaS providers have specific configuration requirements for their plugins. Refer to the relevant contact center documentation for setup instructions.
9. Select **Update**.

Implement Intelligence

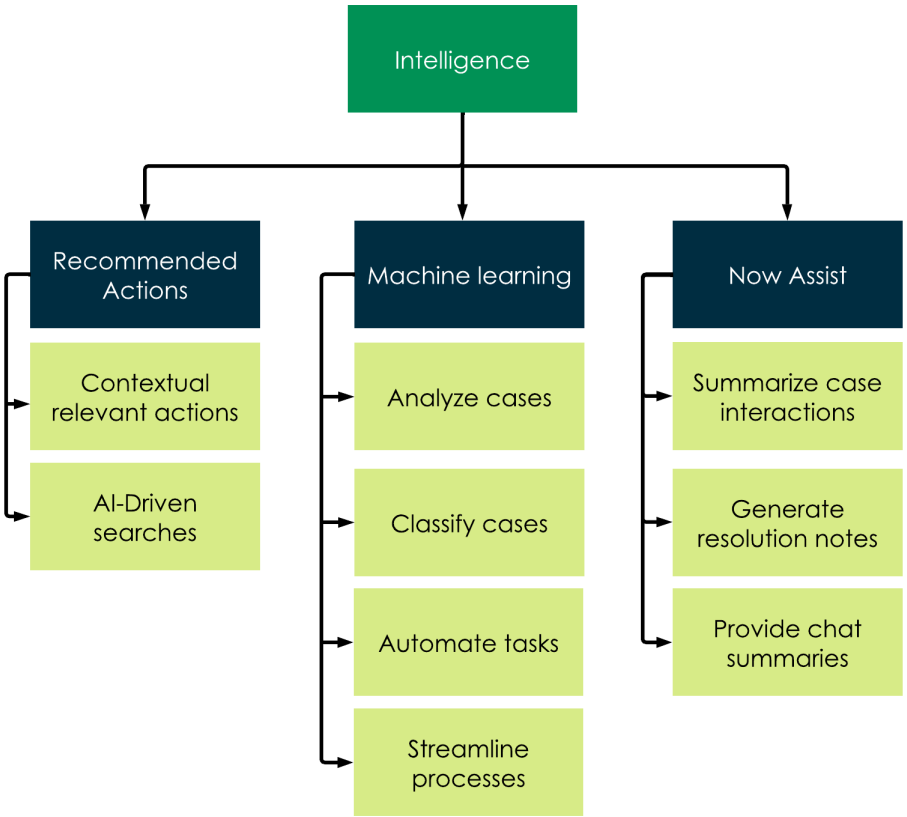
Integrate intelligence features to automate routine tasks and provide relevant content, enabling a quicker, more personalized customer experience.

Recommended Actions	Machine learning	Now Assist for Customer Service Management (CSM)
		


Set up recommended actions and field recommendations to help agents resolve cases effectively and efficiently.	Utilize machine learning solutions to analyze and classify cases and automate tasks.	Use Now Assist for CSM to enhance user productivity and efficiency through conversation and proactive experiences using generative AI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Implement intelligence overview



Recommended Actions

Set up recommended actions and field recommendations to resolve cases more effectively. The Recommended Actions application displays relevant actions based on the context of a record and enables you to perform AI-driven searches for pertinent resources. This functionality helps you quickly access and act on the most relevant information, enhancing your efficiency in addressing customer issues.

Machine learning

Use machine learning solutions in Customer Service Management to handle case creation, assignment, and resolution. Implement these solutions to analyze and classify cases, automate tasks, and streamline processes.

Now Assist for Customer Service Management

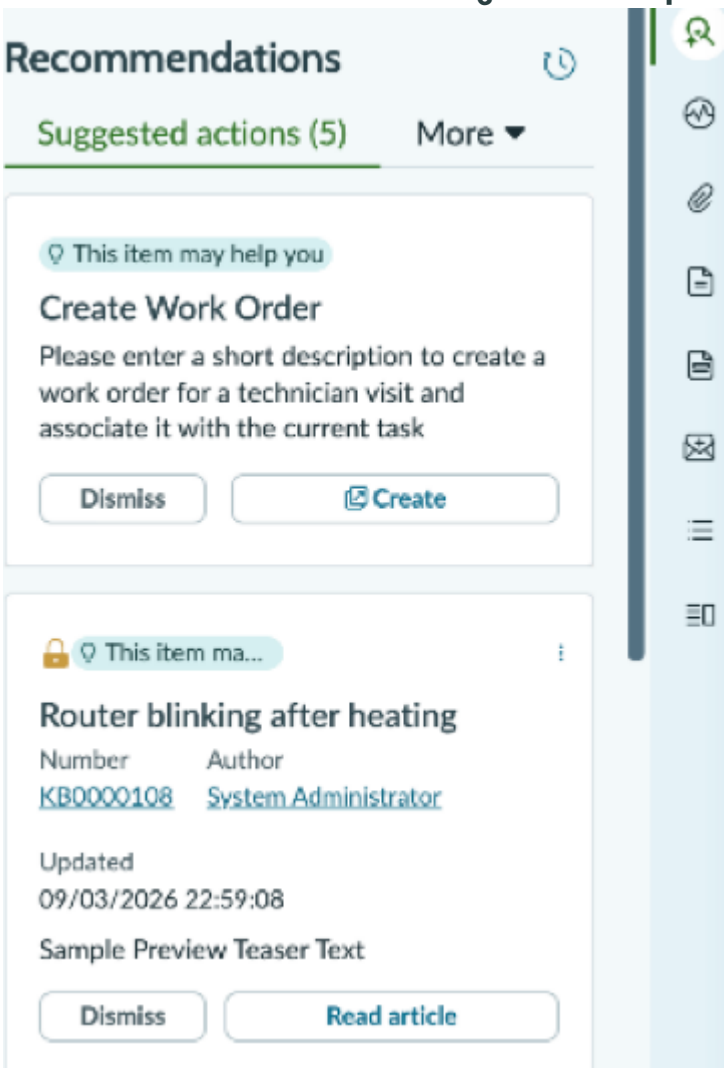
Use the Now Assist for Customer Service Management (CSM) to boost productivity and efficiency with generative AI. This tool enhances user interactions by summarizing case information, generating resolution notes, and providing chat summaries. It also helps you quickly understand chat and case context, enabling faster and more accurate customer resolutions.

Configuring Recommended Actions

Use the Recommended Actions application to display relevant actions to agents based on a context of a record or enable agents to perform an AI search to find relevant resources. Agents can quickly and easily take action to help customers and resolve their issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended Actions in CSM Configurable Workspace



With Recommended Actions:

- Provide agents with optimal action in a context of a record.
- Enable agents to focus their attention to the critical call-to-action.
- Allow agents to take an action in a contextual side panel or in a subtab.
- Enable agents to troubleshoot and provide a resolution to customers.
- Rank actions that agents can take based on a configurable logic.
- Recommend a value for a field on a form.
- Enable agents to use AI search to find the most relevant resources.

Example scenarios for implementing Recommended Actions

Use Recommended Actions to provide the following recommendations:

- Apply resolution from a solved case: Recommend agents to apply resolution from a similar solved case and then close the case.
- Reassign case: Recommend a field value for the Assignment group field so that the case is assigned to the relevant team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View and attach article: Recommend a Knowledge article relevant to the customer issue so that agents can view and attach the article to the current case.
- Review a refund request. Recommend a decision tree for agents to work through to determine if the customer is eligible for a refund.

For end-to-end configurations of recommended actions for specific scenarios, see Example configurations of recommended actions.

Action types for Recommended Actions

With the Recommended Actions application, you can create the following types of actions for agents to take. For more information, see Recommended Actions.

Action type	Description
Guidance	An action that an agent can take or information they can share. For example, guidance can recommend that an agent can attach a knowledge article in comment, work note, or mail of a case or create a work order.
Guided decision tree	A guided flow to follow. A decision tree is a multi-step process that includes a series of questions and answers and results in guidance.
Field recommendation	A recommended value to use for a field. For example, this type of action can recommend the assignment group based on the text in the case short description.

AI search

Agents can enter their queries in the search bar to access AI-powered search results. The most relevant answers for the search query appear as genius result cards. Agents can take the actions from the search cards directly to resolve an issue. For more information, see AI search in Recommended Actions.

Benefits of AI search integration with Recommended Actions

- Unified search and recommendations: This integration combines AI-driven search capabilities with proactive recommendations, providing a unified toolset for agents.
- Contextual intelligence: The system leverages contextual data to deliver highly relevant search results and recommendations tailored to each case.
- Proactive recommendations: Agents receive actionable suggestions to accelerate case resolution, based on real-time case context.
- Seamless workflow: The integration streamlines the user workflow by providing access to search and recommendations within a single interface.

Using recommended actions

Agents can access recommended actions in a workspace such as CSM Configurable Workspace by selecting the Recommended Actions icon ( ) in the contextual side panel. For more information, see Using the Recommended Actions application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up recommended actions

Set up the Recommended Actions application so that you can create actions of type guidance or field recommendation. An admin can complete the following setup tasks.

Steps to set up the Recommended Actions application

Setup task	Description
Install the Recommended Actions application	Download the Recommended Actions application from the ServiceNow® Store.
Assign roles to Recommended Actions users	Assign roles to your users to control access to Recommended Actions features and information.
Configuring the Recommended Actions application	Configure recommended actions to create a context, rule, and recommendations with action types such as guidance and field recommendation. **Note:** The Guided Decisions application (sn_gd_core) is required to create guided decision trees.

Note:
To ensure Recommended Actions loads automatically and performs optimally, enable the **Enable prefetch** check box and verify that the **Get recommendations** data broker exists under Data Resources. This enhancement applies only to the Front-line Case page and CSM default record page and requires Recommended Actions to be enabled on the page. If you have any custom variants created before this enhancement, you must manually enable these settings.

Note:
If Recommended Actions doesn't appear on a variant of a record page (such as the CSM default record page, CSM Interaction record page, or Front-line case page), ensure that the variant is marked active. For detailed steps, see Restore Recommended Actions on record page variants after upgrade.

Integrating decision trees in recommended actions

Optionally, set up the Guided Decisions Experience application so that you can create decision trees and then integrate them in recommended actions. Admins can complete the following setup tasks.

Steps to integrate decision trees in recommended actions

Setup task	Description
Install the Guided Decisions Experience application	Install the Guided Decisions Experience application from the ServiceNow® Store. This application enables you to configure decision trees that you can use as recommendations.
Configuring decision trees	Configure decision trees that agents can use to troubleshoot solutions for customer issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to integrate decision trees in recommended actions (continued)

Setup task	Description
Add Guided Decisions to Recommended Actions	Add decision trees to recommended actions, so that agents can take relevant action during troubleshooting based on a record context.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Recommended Actions

Use Recommended Actions to display relevant actions to agents based on a context of a record or recommend a value for a field.

Action types in Recommended Actions

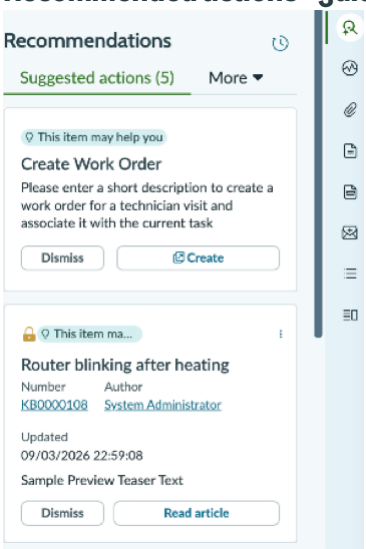
Action type	Description	Use cases
Guidance	A guidance is an action that an agent can take or information that an agent can share. • Guidances appear as cards in the contextual side panel in a workspace. • Agents can access these cards by selecting the Recommended Actions icon in the side panel. • Agents can perform the action by selecting the button on the card.	• Mary created a case to report an issue with a router. The agent assigned to this case is recommended to apply a resolution from a solved case to resolve the customer issue. The resolution notes and a resolution code from the solved case are copied into the Closure Information section of the current case. • Paul, who has an account with StellarVest bank created a case to report a loss of credit card. The agent assigned to this case is recommended to create a work order to dispatch a new credit card for Paul.
Field recommendation	A field recommendation is a value that is recommended for a field. Depending on the configuration, the recommended field values are auto-filled or shown as messages underneath the fields for the new records. The recommended field values are shown as messages only underneath the fields for the existing records.	• An agent wants to reassign the case to a different team who is better equipped to resolve a customer issue. A field recommendation can recommend the assignment group based on the text in the case short description. • While interacting with a customer, an agent creates a case on behalf of the customer. Based on the short description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action type	Description	Use cases
	• You can configure the fields with the text and values that appear in the messages. • You can also configure a confidence threshold to auto-fill a recommended value. • You can configure a preference to auto-fill a recommended value.	the agent enters in the case form, the values for the fields **Product**, **Assignment group**, and **Assigned to** are recommended to the agent.
Decision tree	A decision tree is a guided flow for agents to follow. A decision tree is a multi-step process that asks a series of questions. Based on the answers that an agent enters, a guidance is provided. **Note:** The Guided Decisions application (sn_gd_core) is required to create decision trees.	Rina created a case to report that their phone isn't charging. The agent assigned to the case is recommended to use a decision tree that asks a series of questions to troubleshoot the issue with the phone and provides a guidance in the end.

Actions of the type **Guidance** and **Guided Decision Tree** are displayed as cards within the contextual side panel.

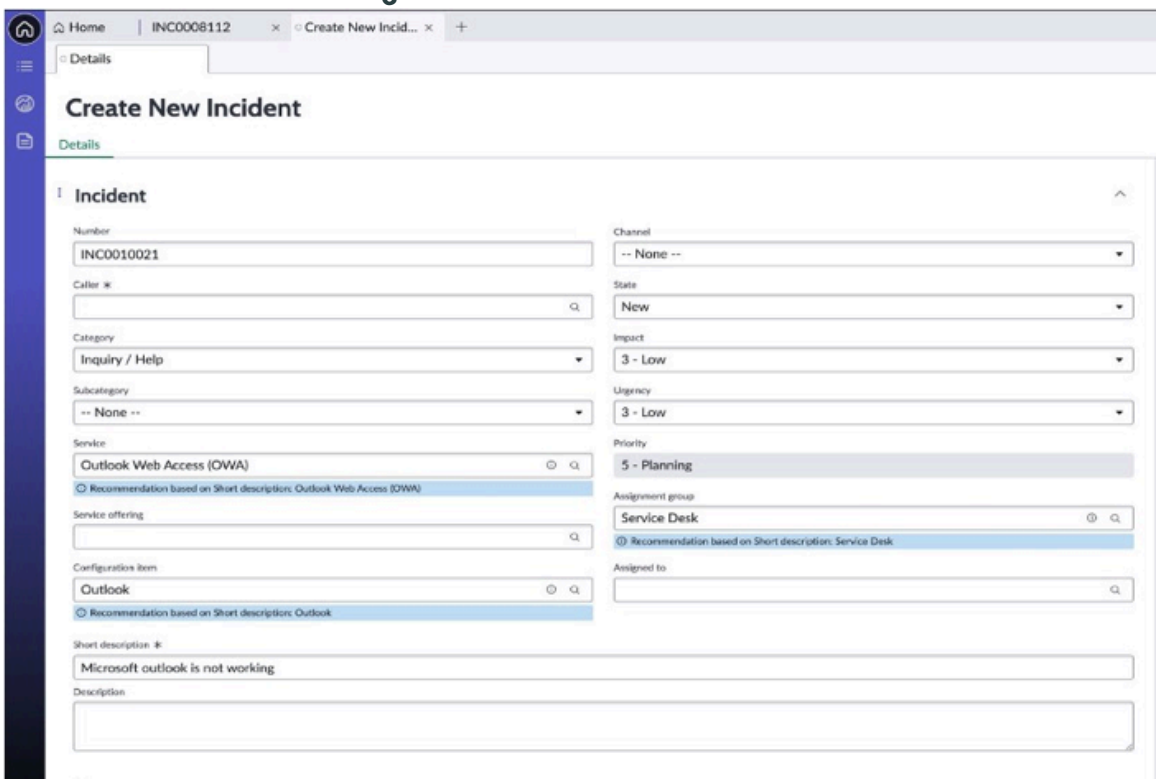
Recommended actions - guidance card



Actions of the type **Field Recommendation** are auto-filled in the fields or appear as messages under the fields on a record form. Agents can follow the recommendations and select these field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field recommendation messages in the Incident form



For more information, see Creating guidance and field recommendation in Recommended Actions.

Elements for configuring recommended actions

Configuring a recommended action is a multi-step process that involves:

Context

A context enables agents to see recommended actions for a record in that table when certain rules are met. For more information, see Contexts in Recommended Actions.

Context input

A context input enables you to utilize the entities other than the context table to define rules, recommendations, and resource generators so that recommendations are updated dynamically as the context changes. For more information, see Context inputs in Recommended Actions.

Rule

A rule is a set of conditions that applies to a context and determines when a recommended action appears for records in the context table. For more information, see Rules in Recommended Actions.

Recommendation

A recommendation is a way to suggest an action to an agent. You can create recommendations with action types of guidance and field recommendation. For more information, see Recommendations in Recommended Actions.

Resource generators

Resource generators provide helpful information for guidance and field recommendations. The resource generators use decision table, flow, scripts, Predictive Intelligence framework, or AI search capabilities to generate resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a resource generator can provide a knowledge article link that can then be used as a recommended action for a case. For more information, see Resource generators in Recommended Actions.

Arbitration parameters

Arbitration parameters determine the frequency of issues or the priority order of the recommended actions so that agents get the guidance that they must help resolve customer issues.

Contexts in Recommended Actions

A context enables agents to see recommendations for records from a table when certain rules are met. These recommendations can help agents by suggesting actions to take based on the record context.

Contexts are created for tables, such as the Case [sn_customerservice_case] table or the Incident [incident] table. Creating a context includes the following steps:

- Selecting a table.
- Creating Context inputs. A context input enables you to utilize the entities other than the context table to define rules, recommendations, and resource generators.

> **Note:**
> Creating context inputs is not mandatory.

- Creating rules for the context. A rule shows recommendations to agents with certain roles for records that meet certain conditions.
- Creating recommendations for the rules. A recommendation is a way to suggest a helpful action to an agent.

The Recommended Actions application includes a context record, Case Context, that you can use to create recommendations for cases.

The Recommended Actions application supports multiple context records per table, enabling users to create different experiences based on criteria such as user attributes or domains.

The Recommended Actions component can be configured in UI Builder to use the active context record. The recommendations and AI Search results adjust dynamically according to the configured active context.

Context form

You can access context records by navigating to **All** > **Recommended Actions** > **Contexts**. The Contexts list displays a brief description of each context and the table that the context applies to.

The Context form includes the name and description of the context, the selected table, parent context, and a search application configuration for AI search. When you create a context, provide this information and save the record. After saving, the Context form displays the following related lists.

- **Rules**: Displays the rules that have been created for the context, including the selected user roles. You can create a rule only from the Rules related list on the Context form. For more information on rules, see Rules in Recommended Actions.
- **Recommendations**: Displays the recommendations associated with the context rules, including the action type and action. You can create a recommendation only from the Recommendation related list on the Rule form. For more information on the recommendations, see Recommendations in Recommended Actions.

- **Search result mapping**: Displays mappings between AI search outputs and Recommended Actions inputs.
- **Inherited rules**: Displays the rules inherited from the parent context. The Inherited rules related list appears only for the contexts that have the parent context assigned. For more information on how the parent context rules are inherited by the child context, see Apply rules to tables extended from the context table.
- **Extended contexts**: Displays all the contexts which use the current context as a parent context. This related list appears only for the parent contexts.
- **Context Inputs**: Displays all the context inputs which can be used in defining rules, recommendations, and resource generators. This related list appears only when a parent context is not defined.

The Contexts list includes an Active column. You can use this column to view and set the Active value for a context record. The Context form includes an **Active** field that you can use to activate or deactivate a context record.

Refresh interval field

The **Refresh interval** field on the Context form determines how frequently recommendations are refreshed for the context. The default value for this field is 12 hours and the minimum value is 10 minutes.

Note:
You must configure the form view to display the **Refresh interval** field.

Synchronous and asynchronous modes of evaluation for Recommended Actions

As an admin, you can configure the loading behavior at the context level for Recommended Actions, by choosing between synchronous and asynchronous modes. In synchronous mode, recommendations are loaded before the page becomes interactive, ensuring a complete view is available before any action is taken. In asynchronous mode, recommendations load in the background without blocking the user interface, allowing agents to start interacting with the record immediately. Each mode is tailored to meet different performance and user experience requirements.

The **Asynchronous Evaluation** check box in the Context form, when selected enables the agents to make updates and perform actions on the case or incident record while the recommendations load on the contextual side panel. By selecting this field, an admin or RA author can enable asynchronous processing for recommended actions.

The *sn_nb_action.async_ra_timeout* system property specifies the timeout duration (in seconds) for an asynchronous process to generate the recommendations. This value serves as a guideline for managing execution time and preventing excessive delays. The default value is set to 30 seconds, and the maximum value can be 180 seconds. If the generation of recommended actions takes more than 30 seconds, the **Retry** button on the contextual side panel appears. The retry process starts in synchronous mode - it runs directly during user interaction instead of processing asynchronously.

Inheriting the rules and recommendations from hierarchical contexts

The Parent context field appears only when the table selected in the Table field has one or more parent tables for which context is defined. Using the Parent context field, you can import it's active rules and recommendations into the extended context. When you click the search icon in Parent context field, the list of contexts of parent tables is displayed. You can select any one parent context from the list. The rules that are inherited appear in the Inherited Rules related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on how to configure rules so that the recommendations are inherited by the extended context, see Apply rules to tables extended from the context table.

Note:

- If you configure context inputs for a context, you cannot add a parent context. To add a parent context, you must delete the already existing context inputs.
- When a parent context is defined, the Context inputs related list does not appear.

For more information on how context inputs limit the inheritance of the parent context's rules and recommendations, see Context Input configuration limitations.

Example: Inheriting the rules and recommendations from hierarchical contexts

Consider the following tables and their contexts, rules, and recommendations. Table 1 is the parent table for Table 2 and Table 3. Table 3 is the parent table for Table 4. Table 2 is the parent table for Table 5.

Tables and their contexts

Table	Context	Rule	Recommendation
Table 1	Context 1 (Active)	Rule 1 (Active)	Recommendation 1
Table 2	Context 2 (Inactive)	Rule 2 (Inactive)	Recommendation 2A and Recommendation 2B
Table 3	Context 3 (Active)	Rule 3 (Active)	Recommendation 3
Table 4	Context 4 (Active)	Rule 4 (Active)	Recommendation 4
Table 5	Context 5 (Active)	Rule 5 (Active)	Recommendation 5

In the Context form:

- Scenario 1: When you add Context 3 in the Parent context field of Context 4, the Rule 3 and Recommendation 3 are inherited by Context 4.
- Scenario 2: When you add Context 2 in the Parent context field of Context 5, the Rule 2 and its recommendation 2A and 2B aren't inherited by Context 5 as the Rule 2 is inactive.

Creating multiple context records for the same table

Starting with v14.0 of Recommended Actions, the *`Avoid duplicate active entry for context`* business rule allows the creation of more than one context per table. You can create more than one context for the same table. This enables you to configure precise recommendations for various types of records in the same table.

The following are use cases where you can create different contexts for the same table:

Use case 1: Different roles may interact with the same table but need tailored actions or views.

Consider the Interaction table. The same interaction data can be worked upon differently based on the user persona.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Context A: Show field recommendations for resolution, or related change tasks/ catalog items, or standard knowledge articles for the IT Support Agent on the Interaction record page.
- Context B: Surface similar resolved case or relevant knowledge article recommendations for the Customer Service Support Agent on the Interaction record page.

Use case 2: Each context may use a different Predictive Intelligence model or AI model variant for recommendations.

Enables testing and adoption of ML models in parallel without conflict.

- Context A: Use similarity model for Recommended Actions.
- Context B: Use classification model for categorization or assignment.

Use case 3: Users may access the same record through different channels—chat, email, voice, etc., requiring tailored recommendations.

Entry points provide different signals and user intent.

- Context A: When the case is created via Chat Agent, recommend and share the KB article in chat action.
- Context B: When the case is accessed via Phone Support, surface KB articles and enable sharing via SMS channel.

Configuring a context record for the Recommended Actions component

When configuring the Recommended Actions component in UI Builder, users with the Recommended Actions admin role (next_best_action_admin) can set a component input property to map the active context record to the component.

On the Config tab for the Recommended Actions component, enter the sys id of the active context record in the **Context Sys id** field. For more information about configuring UI Builder components, see Components documentation.

Note:
If the **Context Sys id** field is empty, the system uses the latest context record for that entity to map to the Recommended Actions component.

Case Context record

The Recommended Actions for Customer Service application adds the Case Context record for the Case table [sn_customerservice_case]. This record is active by default (Active=true). For more information on the Case Context record, see Contexts in Recommended Actions for Customer Service.

If an upgrade customer has one or more context records for the Case table available on their instance, the system runs a fix script that deactivates the out-of-box Case Context record (sets the **Active** field to false).

Note:
Ensure that the correct context record for the Case table is active.

Rules in Recommended Actions

A rule is a set of conditions that applies to a context. A rule shows recommendations to agents with certain roles for records that meet certain conditions.

Creating a rule includes the following steps:

- Selecting the user roles that can see the recommendations associated with the rule.
- Defining the conditions that apply to the context records and context inputs.
- Creating recommendations for the rule. A recommendation is a way to suggest a helpful action to an agent. A rule can have multiple recommendations.

The Recommended Actions application includes one context record, case context, that you can use to create recommendations for cases. For example, following are some guidance recommendations:

- Case field level recommendations: This rule includes one recommendation to predict a value for the **Assignment group** field on the Case form.
- Case side panel recommendations: This rule includes recommendations to view and attach a knowledge article to a case and to attach and add a link to a knowledge article in a comment, work note, or email.

Apply rules to tables extended from the context table

The rule created in the parent context are inherited by the extended context when you select the Apply to tables extended from the context table check box in a rule. The rules inherited from the parent context appear in the Inherited Rules related list of the extended context. Therefore, the recommendations of these rules are passed on to the extended context. Along with the recommendations of the context table, the recommendations of the active rules from the parent context are inherited by the extended context.

Rule form

The Rule form provides information about the rule, including a description, the selected user roles, and conditions that apply to the table in the associated context.

When you create a rule, provide this information and save the record. After saving, you can see the Recommendations related list.

You can access the rule records by navigating to **All** > **Recommended Actions** > **Rules**. New rules can only be created from within a context. For more information, see Create a rule.

Rule form fields

Field	Description
Name	The name of the rule.
Context	The context that this rule is associated with. This field is auto-populated from the Context form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rule form fields (continued)

Field	Description
Roles	The user roles that can see recommendations for this rule.
Description	A brief description of the rule.
Advanced Condition	The conditions that apply to the records from the context table. If a context input is available for the context, you can build conditions on it along with the context table.
Fields affecting this rule	Fields from the context table that need to be monitored. Changes to these fields generate recommended actions of the type field recommendation for unsaved records.
Active	When enabled, the rule is active.
Apply to tables extended from the context table	When enabled, the rule is applied to tables that are extended from the context table.
Order	Determines the order in which the rule is applied.

Create a rule in Recommended Actions

Recommendations in Recommended Actions

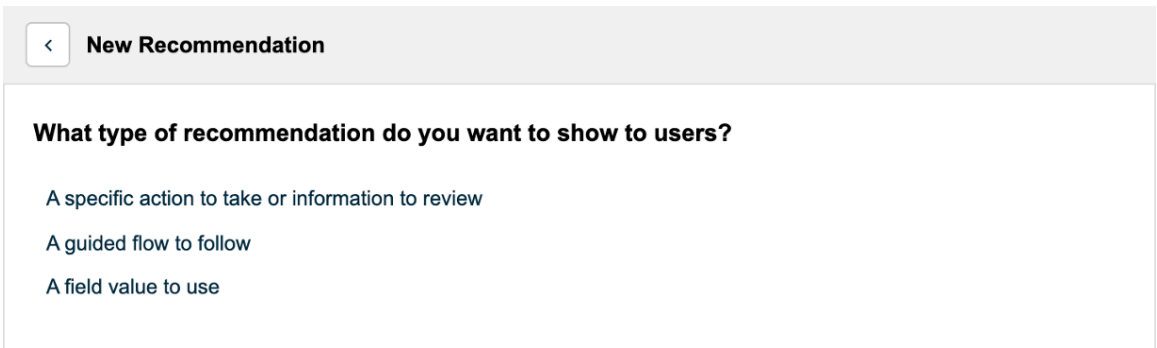
A recommendation is a way to suggest a helpful action to an agent. A recommendation includes the action and any relevant resources and inputs.

There are three types of recommendations that are provided to agents:

- **Guidance**: An action that an agent can take or information that they can share.
- **Decision tree**: A guided flow to troubleshoot an issue and provide a solution.
- **Field recommendation**: A recommended value to use for a field.

Creating a recommendation

When you create a recommendation, you can select the type from the New Recommendation screen. This screen lists the available types.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting a type on the New Recommendation screen takes you to the Recommendation form. The selected type is added to the **Action type** field on the Recommendation form.

Recommendation form

The Recommendation form provides information about a recommendation, including the selected action and any inputs and resource generators that the action requires.

When you create a recommendation, you select an action type and an action. The next steps depend on the action type that you select. For example, guidances and field recommendations require action inputs while decision trees don't.

When you create a recommendation, provide this information and save the record. After saving, you can see the Action inputs form section. Inputs are parameters that go into an action and enable agents to complete that action. You can select relevant inputs manually, from the context record, context inputs, or from the resource generator.

You can access the recommendation records by navigating to **All** > **Recommended Actions** > **Recommendations**. New recommendations can be created only inside the rules. For more information, see Create a recommendation.

Recommendation form fields

Field	Description
Rule	The name of the rule for the context. This field is read-only.
Context	The name of the context that the **Rule** belongs to. This field is read-only.
Name	The name of the recommendation.
Action type	The type of recommendation: • Guidance • Decision tree • Field recommendation This field is automatically filled with the selection from the New Recommendation screen.
Action	The action to select for the recommendation. The available actions are determined by the selection in the **Action type** field. You can also create an action for the selected action type of guidance, decision tree, or field recommendation.
Resource generator	The resource generator to select from the Resource generators list. You can also create a resource generator. Guidances and field recommendations can use resource generators to find relevant resources for the action inputs. If you change the value in the **Resource generator** field, you must save the recommendation to use the resource generator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendation form fields (continued)

Field	Description
Recommendation hint	Text that tells the agent why a recommendation is being suggested. Hints apply to action types of guidance and decision tree. The hint appears at the top of the action cards in the Recommended Actions side panel.
Order	The order of the recommendations inside the rule.
Active	When enabled, the recommendation is active.
Action inputs	Action types and actions require inputs. These inputs are the parameters that enable agents to complete an action. You can choose static values for action inputs, or you can use a resource generator to supply values. If a context input is available for the context, it appears in the pill picker of the fields in Action inputs section.
Group	Group created by a defined grouping strategy that displays relevant recommendations together. **Note:** You might need to configure the Recommendation form to display the **Group** field. This field is available by default for Workforce Optimization for ITSM users.

Note:
The **Action type**, **Action**, and **Recommendation hint** fields aren't shown for the AI search resource generator. You can configure the **Action type** and **Action** fields, and mapping between AI search outputs and guidance actions inputs in the Search result mapping related list.

Context inputs in Recommended Actions

A context input enables you to associate entities beyond just the context table with a context ensuring that recommendations are updated dynamically as the context evolves.

You can create a context input from the Context inputs related list in the Context form. These dynamic JSON-based context inputs enable you to include real-time updates such as user selections, additional table records, and so on, to refine recommendations and support multiple active contexts. This enhances recommendation relevance and operational efficiency. For example, you can create a context input for the Incident table and use in the Case context record.

Note:
You can create multiple active context inputs for a context.

The following data types are supported for a context input:

- String
- List
- Integer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Long
- Choice
- True- false
- Reference
- Reference dot walked
- Sys id

Configuring a context using a context input

Configuring a context using context inputs includes the following steps:

- Creating a context input. For more information on how to create a context input, see Create a context input in Recommended Actions.

  Note:
  - If a context has a parent context defined, you can't create context inputs for it.
  - You can have multiple active context inputs simultaneously.

- Mapping the context input to the following according to your requirement:
  - default search term by adding it in the Contextual AI Search Config section on Context form.
  - rules by using it in the condition builder on Rules form.
  - recommendations by adding it in fields of the Action inputs section on Recommendations form.
  - resource generators by adding it in the fields of Generator inputs section on Resource Generators form.
- Adding the JSON-format of the context inputs to the Recommended Actions component for the required record pages in the UI Builder. For more information, see Configuring Recommended Actions UIB component for context inputs.

The context inputs appear along with the context table in the appropriate fields of Rule, Recommendation and Resource generator forms so that you can include the data other than that of the context table to update the recommendations.

Configuring Recommended Actions UIB component for context inputs

As an RA author or admin, you must add the JSON-format of the context inputs in the **Context input** field of Recommended Actions UIB component of a record page to pass the values. You can get the JSON-format of the context input by selecting the **Copy input JSON** button on the Context input related list in the Context form. The JSON-format includes all the active context inputs. When a context input is deleted or deactivated after configuring the Recommended Actions UIB component, an empty value is passed for these context inputs in UIB from the upcoming iterations.

Note:
If you set a context input as mandatory in the Context input form and fail to set contextual inputs on Recommended Actions component in the UIB, the recommendations will not be generated.

Context Input configuration limitations

The limitations for context inputs configuration are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can either define a parent context or configure context inputs for a context.
- When context inputs are defined for a parent content, then it's rules and recommendations cannot be inherited by its child contexts. In other words, the parent context does not appear in the Parent context field of the Child context.
- To define context inputs for a context which has a parent context defined already, delete the parent context in the Parent context field so that the Context inputs related list appears. And in the Context inputs related list, select the New button to create context inputs.
- When a context input is defined for a parent context which has a child context associated, then the parent-child context link is broken. In the child context, the inherited rules and recommendations will be removed from the Inherited Rules and Recommendations related list respectively.

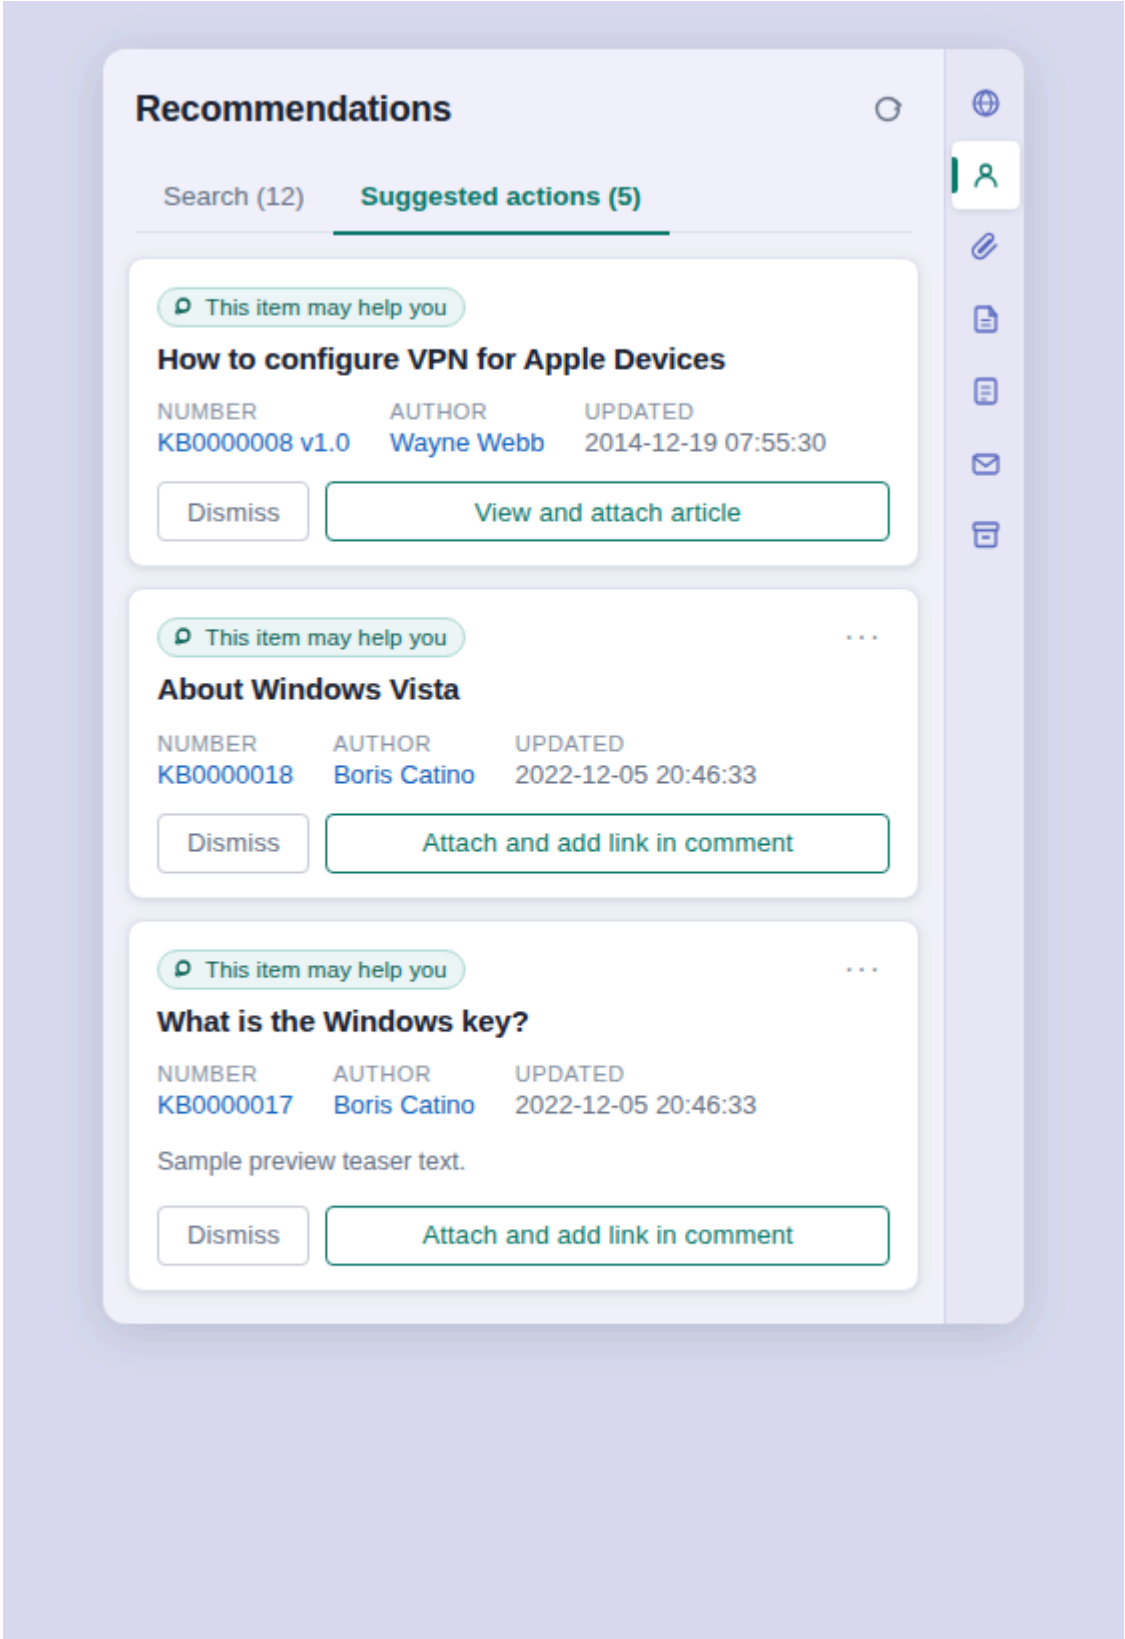
Guidances in Recommended Actions

A guidance is an action that an agent can take or information that an agent can share as they work to resolve tasks, such as customer service cases.

Guidances appear as cards in the contextual side panel in a workspace. Agents can access these guidance cards by selecting the Recommended Actions icon in the contextual side panel. Agents can then perform the actions by selecting a button on a card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended actions guidance cards



Guidances include actions such as sharing a knowledge article, creating a case task or a work order, or copying the resolution notes from a similar case. For a detailed list of guidances, see the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances in Recommended Actions

Guidance	Description
Apply resolution from a solved case	Applies the resolution from an existing solved case.
Attach and share article	Enables the agent to attach a knowledge article to a case and share the article with the customer.
Communicate workaround	Communicates a workaround to the customer.
Copy resolution notes	Copies the resolution notes from the recommended case to the current case.
Create work order	Creates a work order for a case.
Default guidance for search results	Default guidance that can be used for any search sources that don't have dedicated mapped guidances. For more information, see the following topics: • Automatically map AI search results with guidance inputs • Default guidance for search results .
Link case	Links the current case as a child of the recommended case.
Link case to existing defect	Links a case to an existing defect.
Open collab chat	Opens the collaboration chat modal.
Propose major issue	Proposes the current case as a major case.
Propose resolution	Proposes a resolution for a case.
Read message to customer	Directs the agent to read a message to the customer.
Reassign case	Reassigns the case to a different assignment group.
Review and attach article	Enables the agent to review and attach a knowledge article to a case.
Share KB in chat interactions	Shares a knowledge article in the chat window in an interaction record.
Similar major case	Displays similar major cases.

Attaching and sharing knowledge articles

Agents can use two different guidances to view and attach knowledge articles to task records and chat interaction records and share articles with customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances for attaching and sharing knowledge articles

Guidance	Description
Attach and share article	This guidance recommends knowledge articles to an agent who is working on a task, such as a case record. The guidance displays relevant articles and enables the agent to select an article and share it in a comment, a work note, or an email: • Attach and add link in comment • Add link in work note • Attach and add link in email
Share KB in chat interactions	This guidance recommends knowledge articles to an agent who is working on a chat interaction. The guidance displays relevant articles and enables the agent to select an article and share it in the chat conversation using Add link in message feature.

Configuring Recommended Actions guidances

Recommended Actions is a component that you can add to a record page in UI Builder. You can find information about configuring the Recommended Actions component, including the properties and events, in the Next Experience Components documentation.

The Recommended Actions component includes two views: a preview view (card view) and a detail view (full article view). How these views are displayed is determined by the Recommended Actions configuration. For more information, see the following topics:

- Create a guidance in Recommended Actions
- Configure a guidance preview experience
- Customize a guidance preview experience in UI Builder
- Customize a guidance detail view in U Builder

The Recommended Actions component includes **Recommended Action Specific Configuration** property. Users with the administrator role can use this property to configure the following settings:

- Select which type of experience to uptake on a record page: modal or modeless dialog.
- Select which of the guidance actions to show or hide.
- Order the guidance actions to determine the primary action (displayed as a button on the guidance card) and secondary actions (displayed on the overflow menu).

The **Recommended Action Specific Configuration** property is available in the Configure tab of the Recommended Actions component and includes expandable sections for each guidance.

Access to internal field values for predicted records

When accessing data for a predicted record within the Recommended Actions framework, the system provides the internal field values, in addition to display values, through standard guidance inputs. The system does so without requiring data brokers or custom scripts. By

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enabling direct access to internal values, the framework can support more complex logic, reduce performance bottlenecks, and verify consistent UI behavior across languages.

For catalog items:

- When the catalog item type field is used in a catalog item prediction, the system returns the internal value (for example, the catalog item or order guide) along with the sys_id.
- When the catalog item type field is accessed in a translated environment, the system relies on the internal field value instead of the display value to verify the language settings do not affect condition fulfillment.

For custom guidances based on the incident state:

- When custom guidance logic is applied to a predicted incident with a specified state, the system accesses the internal value of the incident's state field directly.
- When the state field is required for custom actions like linking an incident as a parent or copying resolution notes, the internal value should be accessible without causing UI performance issues or delays.

Attach and share article guidance

The Attach and share article guidance recommends relevant knowledge articles to customer service agents and enables them to share the selected articles in comments, work notes, or email.

The Attach and share article guidance recommends relevant knowledge articles based on the text in the case short description. Agents can view the recommended articles and share a selected article with the customer.

The agent can view the knowledge articles in a card format in the contextual side panel or expand a selected card to see an article in a detail view. The card view provides a condensed view of articles for quick scanning. The detail view provides the full content of the selected article for further reading.

Each card contains a primary action. The default primary action is Attach and add link in comment. Secondary actions are available in the More actions menu in the upper right corner of the card:

- Add link in work notes
- Attach and add link in email

The same primary and secondary actions are available in the expanded detail view. The system administrator can configure the primary and secondary actions in the **Recommended action specific configuration** property. For more information, see Configuring guidances in UI Builder.

The relevancy score displays on the Attach and share article guidance in the Search tab of the Recommended Actions contextual side panel. It indicates how well a search result matches the agent's query.

Modal and modeless dialog experiences

The agent can share the article in a comment, a work note, or an email using the primary and secondary actions. Two different experiences are available for this guidance depending on the record page you are using in the CSM Configurable Workspace:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Modeless dialogs**: This experience is available for record pages that support modeless dialogs (for example, the Front-line case page). Modeless dialogs are windows that overlay the main window content. Agents can move modeless dialogs around the window so they can interact with the window content and overlay content at the same time.
- **Modals**: This experience is available for record pages that support modals (for example, the CSM default record page). With modals, agents must complete the action within a modal before continuing to interact with the window content, which is the default experience.

The system administrator can configure the modal and modeless dialog experiences in the **Recommended Action Specific Configuration** property. For more information, see Configuring guidances in UI Builder.

If a record page supports the modeless dialog experience, selecting an action on a guidance card opens the corresponding modeless dialog. If a record page does not support the modeless dialog experience, the guidance uses the modal experience.

Note:
The result of guidance actions is the same in the modeless dialog and modal experiences, but when the actions are completed differs.

Public and private knowledge articles recommendations for case records

Some knowledge articles that appear in the search results display a lock icon in the upper left corner. The presence or absence of the lock icon determines the audience for the article and how an agent can share the article.

The *KnowledgeGuidanceUserResolver* extension point is shipped with the base system. This extension point allows business units (BUs) to return the requester and primary action based on their logic by creating the implementation in this extension point. You can create an implementation by selecting the **Create Implementation** link in the *KnowledgeGuidanceUserResolver* extension point. The `CSMKnowledgeGuidanceUserResolver` implementation for the Case table and its extended tables is shipped with the base system. This implementation identifies the primary requesters for a case record based on the Contact, Partner Contact, Consumer and Internal user fields in the Case table. The primary action is determined based on the channel type of the case record.

Note:
The Internal user field is checked only when the Service Organization (com.snc.service_organization) plugin is installed.

Lock icon

Agents can't share locked articles with customers as the customers do not have access to these locked article. The **Attach and add link in email** and **Attach and add link in comment** actions are not available when a lock icon is present on a guidance card. The following table shows the primary and secondary actions in preview and detail view on the guidance card:

Primary and secondary actions in preview and detail view on the guidance card

Action type	Description
Preview	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Primary and secondary actions in preview and detail view on the guidance card (continued)

Action type	Description
Primary actions	The default primary action is **Read article**.
Secondary actions	• Share in work notes • Copy Link
Detail view	
Primary actions	The default primary action on the guidance card is **Read article in full view**.
Secondary actions	• Share in work note • Copy Link • Flag article • Mark as helpful

No lock icon

Agents can share these articles with both customers and internal users. The following table shows the primary and secondary actions in preview and detail view on the guidance card:

Primary and secondary actions in preview and detail view on the guidance card

Action type	Description
Preview	
Primary action	The default primary action by channel: • Email channel: Attach and add link in email • Other channels: Attach and add link in comment
Secondary actions (available in the more options menu)	• Read article • Attach and share in work notes • Share in email • Flag article • Mark as helpful
Detail view	
Primary action	The default primary action:

© 2026 ServiceNow, Inc. All rights reserved.

Primary and secondary actions in preview and detail view on the guidance card (continued)

Action type	Description
	• Email channel: Attach and add link in email • Other channels: Attach and add link in comment
Secondary actions (available in the more options menu)	• Read article • Attach and share in work notes • Share in email • Flag article • Mark as helpful • Read article in full view

Attach and add links in comments

Use this action to attach a knowledge article to a case record and share the link in the activity stream. The behavior of the action depends on the modal or modeless dialog experience.

Experience	Description
Modal	This action does the following: • Opens the Compose a comment modal. • Inserts the article link in the **Comments** field. The agent can add information to the **Comments** field and select **Post Comments**. • The knowledge article is attached to the case record. • The activity stream is updated with the article attachment (as an internal post). • The comment and the link are posted to the activity stream (as an external post). • The guidance is marked as complete and moved to the Recommended Actions History tab. This action is available as the primary action on the knowledge article card. **Note:** This guidance is available by default.
Modeless dialog	This action does the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Experience	Description
	• Attaches the article to the case record. The article is available in the Attached Knowledge related list. • Updates the activity stream with the article attachment as an internal post. • Marks the guidance as complete and moves it to the History tab. • Opens the Compose a comment modeless dialog. • Inserts the article link in the **Comments** field. The agent can add information to the **Comments** field and select **Post Comments**. The comment is posted to the activity stream as an external post.

Add link in work note

Use this action to attach a knowledge article to a case record in the work notes. The behavior of the action depends on the modal or modeless dialog experience.

Experience	Description
Modal	This action does the following: • Opens the Compose a work note modal. • Inserts the article link in the **Work notes** field. The agent can add information to the **Work notes** field and select **Post work notes (private)** to post the work note and the link to the activity stream as an internal post. • The activity stream is updated with the article attachment as an internal post. • The guidance is marked as complete and moved to the Recommended Actions History tab. This action is available as a secondary action in the More actions menu. **Note:** This guidance is available by default.
Modeless dialog	This action does the following: • Opens the Compose a work note modeless dialog. • Inserts the article link in the **Work notes** field. The agent can add information to the **Work notes** field and select **Post work notes (private)** to post the work note and the link to the activity stream as an internal post. The guidance is marked as complete and moved to the History tab.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attach and add links in emails

Use this action to attach a knowledge article to a case record and share the link in an email. The behavior of the action depends on the modal or modeless dialog experience.

Experience	Description
Modal	This action does the following: • Opens the Email compose modal. • Inserts the article link in the body of the email. • If available, an email template auto-fills modal fields. The agent can add information to the email and select **Send email**. • The email is sent. • The knowledge article is attached to the case and is available in the Attached Knowledge related list. • The activity stream is updated with the article attachment (as an internal post). • The guidance is marked as complete and moved to the Recommended Actions History tab. This action is available as a secondary action in the More actions menu. **Note:** This guidance is available by default with the modeless dialog experience. For the modal experience, it must be configured by the system administrator.
Modeless dialog	This action does the following: • Attaches the article to the case record. The article is available in the Attached Knowledge related list. • Updates the activity stream with the article attachment as an internal post. • Marks the guidance as complete and moves it to the History tab. • Opens the Email compose modeless dialog. • Inserts the article link in the body of the email. • If available, an email template auto-fills email fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Experience	Description
	The agent can add information to the email and select **Send email**.

More actions menu

The More actions menu on a guidance card includes several actions in addition to **Add link in work notes** and **Attach and add link in email**.

In the card view, these actions include:

- Read article
- Copy link

In the detail view, these actions include:

- Read article in full view
- Copy link
- Mark article as helpful
- Flag article

Share KB in chat interactions guidance

The Share KB in chat interactions guidance recommends relevant knowledge articles to customer service agents and enables them to share the articles in chat conversations on chat interaction records.

The Share KB in chat interactions guidance recommends relevant knowledge articles to agents who are working on chat interactions. The guidance surfaces relevant knowledge articles based on the text in the interaction short description. Agents can view the recommended articles and share a selected article in the chat conversation.

The Share KB in chat interactions guidance enables automatic search results for knowledge articles by using the text in the interaction **Short description** field. The first article listed is the most relevant result. Agents can also manually search for articles.

Note:
If there's no text in the **Short description** field, no search results are displayed.

This guidance includes the following actions for sharing:

- **Send in chat**: Agents can share the article with customers.
- **Send in private chat**: Agents can only share the article with internal users such as other agents or managers. Customers can't access locked articles. Private chat messages use a yellow background.

The relevancy score displays on the Share KB in chat interactions guidance in the Search tab of the Recommended Actions contextual side panel. It indicates how well a search result matches the agent's query.

Public and private knowledge articles

Some knowledge articles that appear in the search results display a lock icon in the upper left corner. The presence or absence of the lock icon determines the audience for the article and how the agent can share the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Lock icon: The guidance card has a **Send in private chat** action. Agents can't share locked articles with customers.
- No lock icon: The guidance card has a **Send in chat** action. Agents can share these articles with both internal users and customers.

Send in chat

When an agent selects **Send in chat**:

- An information message is displayed.
- The number of the knowledge article is inserted in the chat.
- The knowledge article preview card is inserted in the chat. The card includes a link to the article and the article short description.

Send in a private chat

When an agent selects **Send in private chat**:

- The number of the knowledge article is inserted in the chat along with the lock icon.
- The knowledge article preview card is inserted in the chat along with the lock icon. The card includes a link to the article and the article short description.
- The entries use a yellow background indicate that it's a private chat.

Share knowledge articles in phone interactions

During a phone conversation, agents can send helpful knowledge base (KB) articles to customers through SMS using the **Add link in message** option.

Before you begin
Required plugins: To enable the **Add link in message** functionality, install the following plugins:

- Conversational SMS Service Channel (sn_awa_sms_int)
- Agent Messaging Component (sn_agent_messaging)
- Agent-Initiated Messaging Interface (sn_agent_initiated)
- SMS Adapter Plugin (for example, sn_sms_aws_adapter, or any other supported SMS adapter)

> **Note:**
> The system supports multiple SMS adapters. Verify that your selected adapter is compatible with the Conversational SMS framework.

If the required plugins are not installed, the **Add link in message** action is not available. Instead, the system displays other guidance actions such as:

- Copy link (default primary action)
- Read article in full view
- Mark article as helpful
- Flag article

Role required: none

Procedure

1. Select **Add link in message** in the interaction record.
   The Compose Message modal opens with a preview to the article and a pre-filled message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Customize the message as needed.
3. Review how the **To** field is populated.
   During phone interactions, the system auto-populates the To field using the following order:
   - If the **Contact** field is populated, the phone number from that contact is used.
   - If the **Contact** field is empty, the system uses the phone number from the Opened For field.
   - If both fields are empty, agents can manually enter a valid phone number.
4. **Optional:** If an agent manually changes the phone number in the To field:
   - The system treats it as a new interaction.
   - The previous message is logged as sent to the original number.
   - The new message is tracked separately to maintain clarity on what was shared and with whom.
5. Select **Send** to send the message to the customer.
6. After the message is sent:
   - A confirmation appears in the Notifications panel.
   - Select **View interaction** from the notification to open the related interaction record.
   - The message also appears in the Active SMS side panel.

Share knowledge articles in messaging-type interactions

Agents can share helpful knowledge base (KB) articles with customers during messaging-type interactions. Using the **Add link in message** option, agents can insert article links directly into the conversation to provide timely, contextual assistance.

Before you begin

Required plugins: To enable the **Add link in message** functionality, install the following plugins:

- Conversational SMS Service Channel (sn_awa_sms_int)
- Agent Messaging Component (sn_agent_messaging)
- Agent-Initiated Messaging Interface (sn_agent_initiated)
- SMS Adapter Plugin (for example, sn_sms_aws_adapter, or any other supported SMS adapter)

> **Note:**
> The system supports multiple SMS adapters. Verify that your selected adapter is compatible with the Conversational SMS framework.

If the required plugins aren't installed, the **Add link in message** action isn't available. Instead, the system displays other guidance actions such as:

- Copy link (default primary action)
- Read article in full view
- Mark article as helpful
- Flag article

Role required: none

Procedure

1. Select **Add link in message** in the interaction record.
   The Compose Message modal opens with a preview to the article and a pre-filled message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Customize the message as needed.
3. Review how the **To** field is populated.
   The system auto-populates the To field using the following order:
   - If the **Contact** field is populated, the phone number from that contact is used.
   - If the **Contact** field is empty, the system uses the phone number from the Opened For field.
   - If both fields are empty, agents can manually enter a valid phone number.

   Note:

   The To field is visible only in new interactions. In existing interactions, it's hidden, and the message box shows only the KB article link and the interaction details appear in the modal.

4. **Optional:** If an agent manually changes the phone number in the To field:
   - The system treats it as a new interaction.
   - The previous message is logged as sent to the original number.
   - The new message is tracked separately to maintain clarity on what was shared and with whom.
5. When the Add link in message action is used during a messaging-type interaction:
   - If an interaction is already in progress, the KB article link is added directly to the existing message.
   - If no interaction is active, the system creates a new interaction to deliver the KB article.
6. Select **Send** to send the message to the customer.
7. After the message is sent:
   - A confirmation appears in the Notifications panel.
   - Select **View interaction** from the notification to open the related interaction record.
   - The message also appears in the Active SMS side panel.

Default guidance for search results

The Default guidance for search results is a guidance that can be used for any search sources that don't have mapped guidances.

Using AI search results in Recommended Actions requires a search application configuration. For each search source in that configuration, the admin creates a mapping from the search result to an action.

Starting with the Yokohama release, the Recommended Actions application automatically creates the mapping between search results and actions.

When an admin creates or updates the search application configuration for a context record, the system automatically creates search result mapping records for each of the search sources in that configuration.

- If a search source does not have an existing mapping to an action, the system maps the search source to the default guidance.
- If a search source has an existing mapping to a specific action, the system keeps that mapping and does not overwrite it with the default guidance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

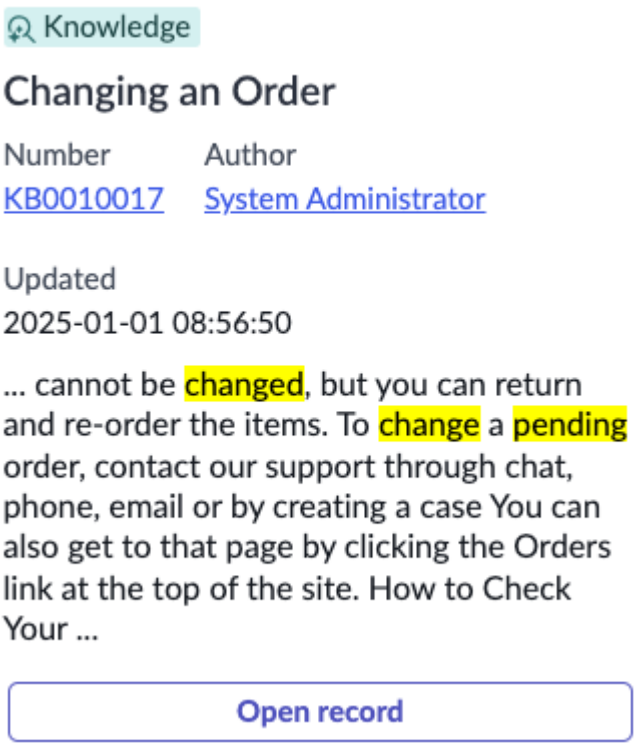
The default guidance enables agents to view search results for any type of record. The agent can view the search results in the Recommended Actions tab in the contextual side panel in CSM Configurable Workspace. Search results are displayed in a card format.

The default guidance is available on the following pages:

- CSM default record page
- Front-line case page
- CSM Interaction record page of type chat, video, email, and Walkup

Default guidance card

The preview card for the default guidance displays information about the search result.



The preview card for the default guidance includes the following elements.

Element	Description
Search icon	The search icon appears at the top of the card along with the hint text. The icon is made up of a magnifying glass with a sparkle. This icon makes it easy for customers to identify search results from suggested actions. Hint text	Text that provides context for the guidance. The icon and hint text appear together at the top of the card above the title.
Title	The title appears at the top of the card.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
Relevancy score	The relevancy score displays on the Share KB in chat interactions guidance in the Search tab of the Recommended Actions contextual side panel. It indicates how well a search result matches the agent's query.
Record fields	Relevant fields related to the guidance content are displayed on the card. These fields provide key information about the guidance content. For example, a preview card for a knowledge article includes fields for the article number and author while the preview card for a case includes fields for the case number, state, and priority.
Dismiss	Agents can use this action to move the guidance from the Suggested actions tab to the Actions history tab. After selecting **Dismiss**, the agent receives a notification that the guidance has been moved. To view the Actions history tab, click the clock icon in the upper right corner of the Recommendations panel.
Open record	Agents can use this action to open the associated record in a sub tab. Agents can view the record details in the sub tab without navigating away from the main window.

Resource generators in Recommended Actions

Resource generators in Recommended Actions provide resources that you can use as inputs to actions such as guidances and field recommendations.

Resource generators provide resources such as a knowledge article, a set of cases, or a field value that you can use in recommendations. Agents can use these recommendations in the Recommended Actions panel in a workspace such as CSM Configurable Workspace.

Another way to think of a resource generator is as a function with inputs and outputs. For example, you can create a resource generator that predicts a knowledge article and then use that knowledge article as a recommended action for a case.

You can select a resource generator from the list or create a resource generator. For a complete list of resource generators that are included with the Recommended Actions application, see Components installed with Recommended Actions.

Resource generator types

The Recommended Actions application provides the following resource generator types:

- Decision table
- Flow
- Scripting
- AI search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Recommended Actions - Advanced application provides the following additional resource generator types:

- Classification
- Similarity
- Similarity with Trend
- Task Intelligence Classification
- Task Intelligence Similarity
- Task Intelligence Similarity with Trend

These resource generator types are based on the Predictive Intelligence framework that you can use to create machine learning solutions.

Resource generator type	Definition
Decision table	Returns the results of the selected decision table. Use decision tables to help you resolve a complex decision that depends on multiple inputs and predetermined outputs. For example, a decision table might require inputs such as age, location, and health history to provide suggestions for different aspects of health insurance. You can use these suggestions, which are the outputs of the decision table, as action inputs for a recommendation. For more information, see Decision Tables.
Flow	Returns recommendations generated by executing the selected subflow. Use subflows to define logic and automate outputs for the resource generators. For example, you can find relevant KB articles using inputs such as product name, activation state, and publishing status. You can then propose to attach these KB articles as a recommended action. For more information, see Flow Designer.
Scripting	Returns recommendations generated by executing the selected script include. You must create an implementation of the ScriptingGeneratorFactory template to use a script include in the Scripting resource generator type. For more information, see Script includes.
AI search	Returns the AI search results and genius results based on real-time data and insights regardless of the search source. These results are relevant to the context of a record. This resource generator type requires the following inputs: • **Search field** - The field on which the AI search is performed. • **Top N results** - The number of records to return from the AI search. For example, you can configure AI search to recommend a KB article or similar case based on the relevancy and context of the short description. For more information, see AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource generator type	Definition
Classification	Uses machine learning algorithms to recommend field values during record creation. This resource generator type requires the following inputs: • **Classification definition** - The Predictive Intelligence classification model to return the predicted values or record references for a field on a table. • **Top N Results** - The number of values or records to return from the relevant records predicted by the classification definition. For example, you can configure the classification solution to recommend a value for the category or assignment group based on the short description. For more information, see Predictive Intelligence.
Similarity	Identifies existing records with similar values to a context record. You must create a word corpus that acts as a vocabulary for the machine learning system to compare trained records. This resource generator type requires the following inputs: • **Similarity definition** - The similarity solution definition to return records that are relevant to the context record. • **Top N Results** - The number of records to return from the relevant records predicted by the similarity definition. For example, you can find similar resolved cases to propose a resolution as a recommended action. For more information, see Predictive Intelligence.
Similarity with Trend	Uses a trend definition to find commonality in the records returned by the similarity solution. You can configure the trend definition using a common condition, common field, or common reference, and a threshold value for the minimum number of records that must follow a trend. This resource generator type requires the following inputs: • **Similarity definition** - The similarity solution definition to return records that are relevant to the context record. • **Trend definition** - The trend definition to filter the relevant records that follow a trend. For example, you can find similar major incidents with a trend. Then, you can propose to link the current context record to this major incident.
Task Intelligence Classification	Uses machine learning models created in Task Intelligence Admin Console to recommend field values. The models provide flexible options to either auto-fill values on the record form or to provide recommendations depending on the sensitivity of those fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource generator type	Definition
	Note: The field values are not recommended for fields when the TI model is in the background mode. This resource generator type requires the following inputs: • **Solution**: The solution contains configuration for recommended input fields and recommended output fields for prediction. The solution also contains preference whether the fields are auto-filled or a recommendation message is displayed. The Task Intelligence classification model predicts multiple values or record references for fields on a table. • **Top N Results** - The number of values or records to return from the relevant records predicted by the solution definition. For example, you can configure the Task Intelligence classification solution to recommend a value for the category or assignment group based on the short description. For more information, see Task Intelligence. **Note:** The Task Intelligence Admin Console (com.sn_ti_admin) plugin must be installed for selecting the Task Intelligence Classification resource generator type.
Task Intelligence Similarity	Identifies existing records with similar values to a context record. Uses machine learning models created in the Admin Console to recommend field values. This resource generator type evaluates the results of the Task Intelligence Admin Solution and returns the predicted values/ records for multiple fields. This resource generator type requires the following inputs: • **Model**: Reference to the Task Intelligence Admin Similarity model. • **Top N Results**: The number of values or records to return from the relevant records predicted by the solution definition. This resource generator type returns the following outputs: • **Predicted value**: For non-reference type fields, the Task Intelligence Admin Solution returns a predicted value. • **Predicted record**: For reference type fields, the Task Intelligence Admin Solution returns a predicted record. For more information, see Task Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource generator type	Definition
Task Intelligence Similarity with Trend	This resource generator evaluates the trend on the results of TI Similarity prediction. Using the solution (sn_ti_admin_solution) and trend (sn_nb_action_trend_definition) definitions, this resource generator type identifies records similar to the context record. Further, it analyzes these similar records to determine if they follow the specified trend. This resource generator type requires the following inputs: • **Solution**: Reference to the Task Intelligence Admin Similarity Model. • **Top N Results**: Specifies the number of predicted values/ records to be sent to the similarity prediction server. • **Trend definition**: Reference to the Trend Definition (sn_nb_action_trend_definition) table. This resource generator type returns the following outputs: • **Count**: Number of total records found in the trend. • **Oldest created record**: Oldest record in the trend. • **Highest confidence record**: Reference of the highest confidence ML result record. • **Qualified Records Sys IDs**: List of sys IDs of all qualified records. For more information, see Task Intelligence.

Timeout handling for resource generators

The Recommended Actions application uses a subflow API with a defined timeout when calling Machine Learning (ML) resource generators. This timeout ensures the RA generation engine prioritizes faster response times by terminating stalled ML prediction calls.

The subflow has a timeout setting of 1 second. If there is a delay and the predict call times out, the system generates a message.

The subflow applies to the following ML-based resource generators:

- Similarity
- Task Intelligence Similarity
- Similarity with Trend
- Task Intelligence Similarity with Trend

The *sn_nb_action_adv.similarity_prediction.timeout* system property controls the timeout value of the subflow. The default value is set to 1000ms.

Domain separation and Recommended Actions

Domain separation is supported for Recommended Actions. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

The tables and data in the application are domain separated. Recommendation authors can only see the context applicable to them based on the domain. In runtime, recommendations are evaluated in the user context and data is created in the corresponding domain applicable to the user.

How domain separation works in Recommended Actions

To use domain separation in the Recommended Actions application, you can create separate Context records for each domain. Context serves as a starting point in Recommended Actions. All other configurations such as Rule, Recommendation, and Resource Generator can then be associated with the domain of the corresponding context record.

Runtime evaluation and generation of recommendations are user-specific. The user's domain is selected and the corresponding Rules applicable to the user are evaluated to give final recommendations to the end user. Execution records created use the same domain of the context that are applicable for the given user.

Domain-separated tables

When you create related entities for a context, the domain for the related entities is set to the domain of the context. The following tables in the application are domain separated:

- Context
- Recommended Action Rule
- Recommendation
- Resource generator
- Recommendation group
- Search result recommended action mapping
- Recommended Action Context
- Recommended Action Execution

Domain separation for service providers

Queues for Recommendation Actions Application

Admins and Recommended Actions administrators can configure queues to manage the asynchronous evaluation of recommendations.

Access Path and Role Requirements

To view or manage the queue, navigate to the following location in the application:

Navigate to **All** > **System Policy** > **Queue Registry**

Required Roles: admin or sn_nb_action.next_best_action_admin.

Default Queue Configuration

The Recommended Actions application includes a preconfigured queue by default, for processing actions efficiently.

- Queue Name: sn_nb_action.ra_processor_queue_1
- Scale Factor: 2
- Polling Interval: 5 seconds

Optimizing Queue Configuration for Lower Latency

To enhance responsiveness and reduce latency in action processing, consider increasing the Scale Factor, such as from **2** to **3**

- Queue Name: sn_nb_action.ra_processor_queue_1.
- Updated Scale Factor: 3
- Polling Interval: 5 seconds

Considerations for Scaling

Increasing the Scale Factor enables the queue to process more items concurrently and reducing latency. However, it also increases demand on system resources such as CPU and memory.

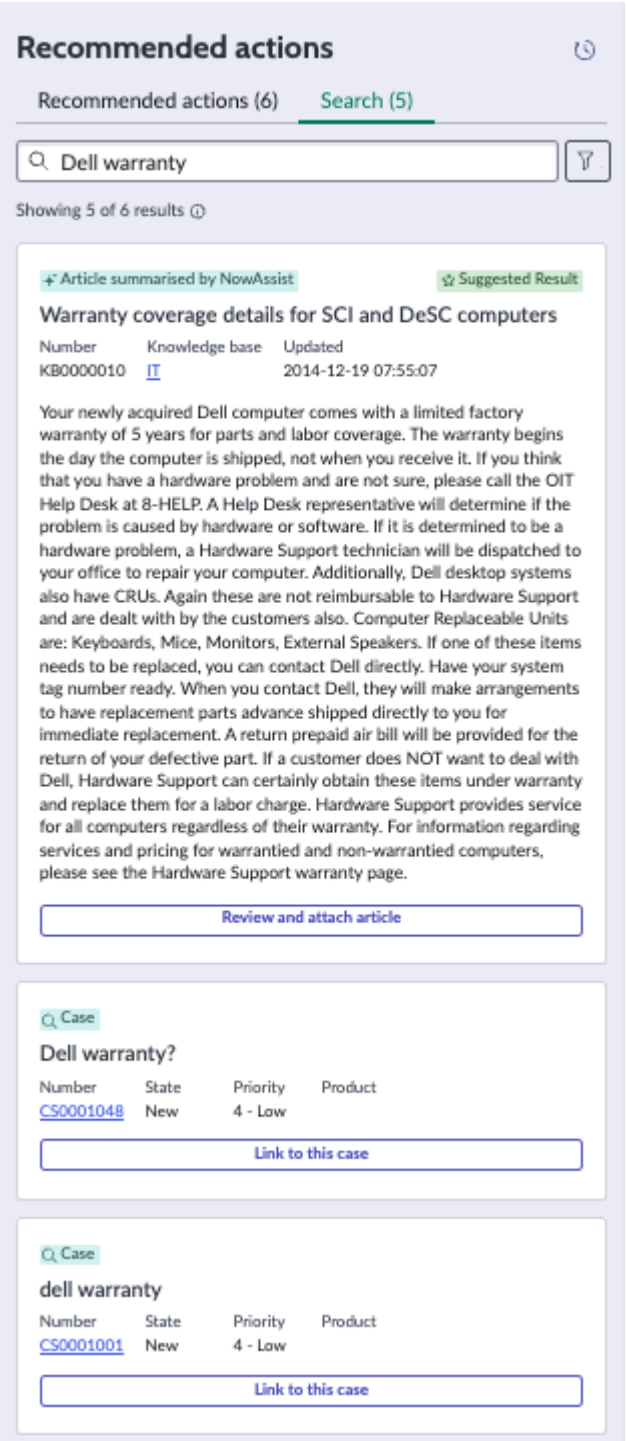
AI search in Recommended Actions

Enable agents to use AI search in Recommended Actions to find relevant resources or resolutions for customer issues.

AI search results and genius results are displayed in the Search tab of the Recommended Actions component in the contextual side panel. Agents can initiate actions from the search cards directly to resolve an issue.



The search results from the configured search sources are displayed in the form of cards. These cards are previews of search records. You can select the card to view the record details or directly take actions through the cards. The most relevant answers are displayed as top results in the form of genius result cards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI search harnesses advanced machine learning algorithms and natural language processing capabilities to comprehend user queries and provides the most relevant search results that can be employed to resolve issues effectively. For more information on:

- AI search and its features, see AI Search.
- enabling AI search for Next Experience, see Enable AI Search for Next Experience.

AI search features

- Highlights search query terms that appear in the search results.
- Displays the most relevant results first with machine learning relevancy. Machine learning automatically tunes and improves the search result relevancy score for each search profile based on the answers agents select.
- Displays the best answers as genius result cards.

AI search benefits

- Maximizes efficiency: Use AI search integration to reduce task resolution time and improve agent productivity.
- Leverages contextual intelligence: Make the most of context-aware searching to provide accurate and timely responses.
- Provides summarization: Configure genius results to get large language model-based knowledge summarization to align with your content and information needs.

Configuring AI search in Recommended Actions

Steps to configure AI search in Recommended Actions include enabling the AI search tab, mapping the AI search results with guidance inputs, and customizing the Recommended Actions component. Advanced customization options include adjusting the number of results to view on a page, identifying genius results to add to the search profile, and configuring search sources. For more information, see Configuring AI search in Recommended Actions.

Using AI search in Recommended Actions

Enable customer service agents to use AI search for faster access to relevant information and take appropriate actions to resolve customer issues. For more information, see Use AI search in Recommended Actions to resolve cases.

- Accessing AI search: Agents can access the AI search tab in the contextual side panel of the workspace.
- Finding context-aware results: Agents can enter their search queries in the search bar. AI search uses natural language processing to understand user queries and considers task context to produce relevant results.
- Showing AI search results: Review AI search results and take actions directly from the search cards.
- Showing genius results: Agents can view the most relevant results at the top based on criteria defined in the genius results configuration, drawing their attention to the most relevant information first.
- Narrowing search results: Agents can select a search source from the **Search filter** field to display results only from that search source and then return to viewing all matching records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Viewing results count: The search tab shows counts of the total number of matching search results. The search filters show the number of matching results for each search source.

> **Note:**
> Search results displayed and the total search count may vary due to security permissions or if the search result has already been executed. The executed guidances are added to the Activity stream and moved to the Actions history. Executed guidances will be included in the total search count but will not show up in the search results.

AI Search event and action logs for AI Search usage in Recommended Actions

AI search event and action logs capture user interactions and search activities, providing data for AI search analytics dashboards.

Search event and action logs

The logging of search-related events within a search system focuses on how search queries, results, and user interactions are recorded in various tables for analytics purposes.

- Search event logging: The search events logging, including search queries, results, and user actions, by queuing events and processing them into dedicated tables. The search events are queued in the Queued Signal Events table first and then when they're processed, they're moved into the search events table.
- Event logging triggers: The search events, search source events, and search signal events tables capture details like query changes, sources of results, and applied facet filters. The logging occurs not only when searches happen but also when filters, facets, or sorts are applied, ensuring comprehensive capture of user interactions with search features.

  Events are queued and then processed into the following tables:

  - Search Events table [sys_search_event]: Logs search queries, user info, and result status.
  - Search Source Events table [sys_search_source_event]: Captures the origin of the query (for example, catalog item).
  - Search Signal Events table [sys_search_signal_event]: Logs facet filters the facet filters applied on the results for a search query and source mappings.

  For more information on the preceding tables, see Search Suggestions tables.

- Search result action logging: Separate tables exist for logging clicks and actions on search results, including distinctions between normal and genius result actions, with multiple entries for multiple actions on a single source. When you interact with a search result, such as clicking on a link or performing an action, these actions are recorded. For the preview experience, actions like drill down are automatically logged to avoid duplication. This data is then used to populate analytics dashboards, either prebuilt or custom, enabling you to track and analyze the interactions with search results effectively.

  For custom guidances, you must emit the log search result event with the appropriate payload structure, which includes action-related data. Emitting action details in the payload is optional. Without it, events are still logged but lack specific action information, preventing duplication by using unique action IDs. Custom guidance actions require emitting events with a provided payload structure to log action details, while out-of-the-box guidances handle this automatically. For payload structure, see Custom action log payload structure.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Search Result Events table [sys_search_signal_result_event]: Stores signal data for search results that you select.
- Search Result Event Actions table [sys_search_signal_result_event_action]: Stores signal data for user interactions with search results.
- Genius Result Actions table [sys_search_genius_result_event_action]: Stores signal data for user interactions with Genius Result answer cards.

For more information on the preceding tables, see Search signal tables.

- AI search analytics: The logged data is then used to populate the AI search analytics dashboards, either prebuilt or custom, enabling you to track and analyze the interactions with search results effectively. For more information on the AI search analytics dashboard, see AI Search analytics dashboard. You can view the CSM workspace-related AI Search usage within Recommended Actions in the AI Search Analytics dashboard by selecting the **[CSM AIS] Configurable Workspace Search Config** option in the application drop-down on the top-right.

Custom action log payload structure

For custom action logging, that is, for the action you create on a guidance preview experience, you must emit an event with a payload structure that includes action-related data. Other common fields such as applied filters and views are handled by the system. If the payload is empty, the event will still be logged, but the action details won't be available. This structured payload is crucial for building detailed analytics dashboards, as it provides specific information about user interactions with custom actions.

```
api.emit(LOG_SEARCH_RESULT_EVENT, {actionData: {actionName:
 actionId}})
```

For more details on how to configure the payload for custom actions, see Customize a guidance preview experience in the UI Builder.

Example configurations of recommended actions

This example documentation demonstrates end-to-end configurations of recommendations with actions of type guidance, decision tree, or field recommendation to help you get started with Recommended Actions.

Recommended actions examples

Scenario	Description
Troubleshoot a failed credit card transaction	A decision tree that helps agents troubleshoot a failed credit card transaction. This decision tree asks a series of questions and based on the answers entered, provides a resolution, such as track the failed transaction, dispatch a new credit card, or provide further assistance.
Recommend an assignment group for a router issue	A field recommendation that recommends a value for the Assignment group field so that the agent can assign the case to the appropriate team to resolve the customer issue faster.
Link the current case to the similar major case	A guidance that recommends linking the current case to the recommended similar

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended actions examples (continued)

Scenario	Description
	major case so that the business owner can identify the trend and take corrective actions.

Example: Troubleshoot a failed credit card transaction

Learn how process analysts or business owners configure a recommended action that uses a decision tree to troubleshoot a failed credit card transaction.

Problem scenario

Paul was trying to purchase a smart watch using his StellarVest bank credit card. But the transaction failed at the time of payment. Paul created a case in the StellarVest bank customer support portal seeking assistance.

In this scenario, the agent assigned to the Paul's case is recommended to use a decision tree to troubleshoot the failed credit card transaction. The decision tree collects user, credit card, and transaction details. If money was debited, transaction tracking is initiated. However, if no money was debited, the agent provides a failure code, which determines what guidance is provided. Examples of potential guidances include: reassigning the case, creating a work order, or assigning the case to an IT technician.

Configuring a recommended action for troubleshooting a failed credit card transaction

Help process analysts configure a recommended action of type decision tree that enables agents to troubleshoot a failed credit card transaction reported by customers.

Task	Description
Creating a decision tree	Create a decision tree that enables agents to ask a series of questions to customers. Based on the answers provided, agents can troubleshoot and provide resolution to customer issues. For more information about how to configure a decision tree in Decision Tree Builder, see Troubleshoot a failed credit card transaction decision tree.
Create a rule from the Case context record	Create a rule to show recommendations for active cases that meet the condition specified in this rule.
Create a recommendation with the decision tree as an action type	Create a recommendation that uses decision tree to troubleshoot a failed credit card transaction.

Create a recommendation with the decision tree as an action type

Create a recommendation to select Troubleshoot credit card transaction failure decision tree as an action type.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

New recommendations can only be created inside the rules.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select the Case context.
3. Select Active rule from the Rules related list.
4. In the Recommendations related list, select **New**.
5. In the New Recommendation screen, select **A guided flow to follow** to create a recommendation of type decision tree.
   A new Recommendation form is displayed with the **Rule**, **Context**, and **Action type** fields auto populated.
6. In the **Name** field, enter `Troubleshoot credit card transaction failure`.
7. In the **Action** field, select the action.
   The available actions are determined by the selection in the **Action type** field.

   a. In the **Action** field, select the lookup icon.
      In the resulting pop-up window, the **Table name** field is auto populated with the table that stores the available actions for the selected action type.

   b. In the **Document** field, select the Troubleshoot credit card transaction failure decision tree by clicking the lookup icon.
      For more information about how to create this decision tree, see Create Troubleshoot credit card transaction failure decision tree.

   c. Select **OK**.

8. In the **Recommendation hint** field, enter `Troubleshoot credit card transaction failure`.
   The hint explains to agents why a recommendation is being suggested.
9. Select **Update**.

Example: Recommend an assignment group for a router issue

Learn how process analysts or business owners configure a recommended action of type field recommendation to recommend an assignment group for a router issue. This field recommendation uses a resource generator of type decision table that takes the router model and router issue as inputs and provides an assignment group as a result.

Problem scenario

QuantumLink Technologies, a newcomer to the networking equipment market, places a strong emphasis on customer satisfaction and resolving customer issues promptly. The business owners are committed to provide excellent customer service so that their business can thrive.

Alisha, one of the business owners at QuantumLink Technologies, sets up a recommended action that recommends a value for the Assignment group field based on the product model and problem specified by customers.

Rohit, a customer who recently purchased a QuantumLink router, is facing intermittent connectivity issues with his router. He creates a case on QuantumLink Technologies' customer

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

support portal. John is frustrated by the disruptions in his internet service and is seeking a swift resolution to confirm uninterrupted connectivity for his home and work needs.

John Jason, the agent assigned to this case is recommended a field value for an assignment group so that this case can be assigned to the appropriate team and the issue can be resolved quickly.

Configuring a recommended action for recommending an assignment group for a router issue

Help Alisha configure a recommended action of type field recommendation that recommends an assignment group for a router issue.

Task	Description
Creating a decision table for recommending assignment groups	Configure a decision table that takes product and problem as inputs to provide the assignment group as an output. You can use this decision table in a resource generator.
Configure a resource generator for providing assignment group as an outcome	Configure a resource generator that you can use while configuring a field recommendation to provide the appropriate assignment group for the router issue.
Create a field recommendation for recommending assignment group field value	Create an action of type field recommendation for recommending a field value for the assignment group.
Create a rule from the Case context record	Create a rule to show recommendations for active cases that meet the condition specified in this rule.
Create a recommendation with the field recommendation as an action type	Create a recommendation to surface the recommendation for the assignment group field value on a case record.

Creating a decision table for recommending assignment groups

Create a decision table with name **Assignment group for a router issue** that provides an assignment group as a result for a given product and problem combination.

This decision table requires two inputs:

Input	Type
Product	String
Problem	String

For the result, create the Assignment group column with Result type selected as Reference and Result table selected as Group [sys_user_group].

Configure the decision table conditions, results, and values as displayed in the following table. For more information, see Decision Tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample decision table: Assignment group for a router issue

Condition columns		Result column
Product	Problem	Assignment gro
Router M-series	Internet connectivity issue	Router-M-Tear
Router M-series	Router is heating up	Router-M-Tear
Router M-series	Network outage	Router-M-Tear
Router M-series	Security concerns	Router-M-Tear
Router N-series	Internet connectivity issue	Router-N-Tean
Router N-series	Router is heating up	Router-N-Tean
Router N-series	Network outage	Router-N-Tean
Router N-series	Security concerns	Router-N-Tean

Configure a resource generator for providing assignment group as an outcome

Configure a resource generator of type decision table that provides an assignment group for a given router model and associated issue.

Before you begin

Role required: sn_nb_action.next_best_action_author, sn_nb_action.resource_generator_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Resource Generators**.
2. Select **New** from the Resource Generators list.
3. In the **Name** field, enter `Assignment group for router issue RG`.
4. In the **Context** field, select Case context.
5. In the **Generator type** field, select Decision table.
6. In the **Generator** field, select the Assignment group for a router issue decision table.
7. Save the record to display the generator inputs.
8. On the Generator input form, fill in the fields.
   a. Select the pill picker next to the field.
   b. In the **Product** field, select **Context: Case** > **Product** > **Display name**.
   c. In the **Problem** field, select **Context: Case** > **Short description**.
9. Select **Update**.

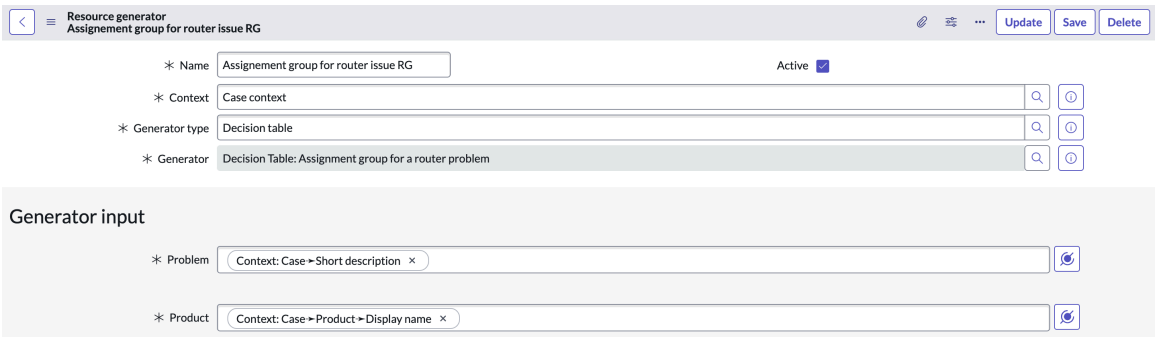
Result



What to do next

Create a field recommendation that you can use while creating recommended action for recommending assignment group field value.

Create a field recommendation for recommending assignment group field value

Create a field recommendation that you can select when configuring a recommended action. This field recommendation suggests an assignment group field value on a case record for a router issue.

Before you begin

Use the CSM default record page or the CSM Interaction record page to display field recommendations in CSM Configurable Workspace. For setting the CSM default record page or the CSM Interaction record page as the default page, see Set record page order.

Role required: sn_nb_action.next_best_action_author, or admin

About this task

Creating a field recommendation involves two main steps:

- Creating inputs for the field recommendation.
- Creating instructions about how to recommend values by configuring a definition for each field.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Field Recommendations**.
2. Select **New** on the Field Recommendations list.
3. In the **Name** field, enter `Field recommendation for assignment group`.
4. In the **Table** field, select `Case [sn_customerservice_case]` so that you can populate field recommendation for the **Assignment group** field on a case record.
5. Save the record to display the related lists.
6. In the Field Recommendation Inputs related list, select **New** to create an input.

   a. In the **Type** field, select Reference.

   b. In the **Label** field, enter `Assignment group`.
   The **Column name** field is auto-filled.

   c. In the Reference specification related list, configure the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
Reference	Select the `Group [sys_user_group] table.`
Reference qual condition	Select the `Active	is	true` condition.

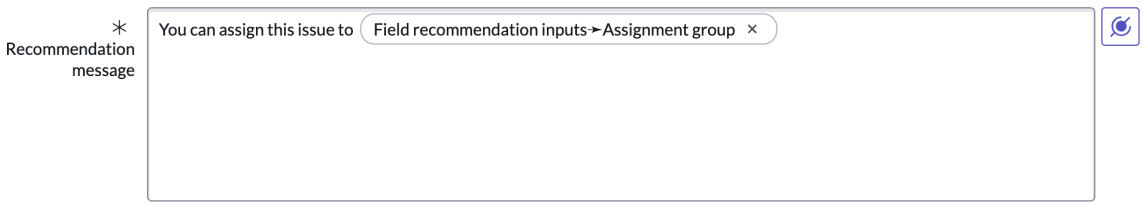
d. Select **Update**.

7. In the Field recommendation definitions related list, select **New** to create a definition.

a. In the **Name** field, enter `Assignment group for router issue definition`.

b. In **Field**, select the Assignment group field.

c. In the **Recommendation message** field, enter `You can assign this issue to` and use the pill-picker to add the recommended value **Field recommendation inputs** > **Assignment group** as part of the message.



> **Note:**
> If the resource generator returns an empty field value, the recommendation message isn't displayed.

d. In the **Recommendation Method** list, select Recommend only.

e. Select **Submit**.

Create a recommendation with the field recommendation as an action type

Create a recommendation to select the field recommendation as an action type for recommending a value for the Assignment group field on a case record.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select Case context.
3. In the Rules related list, select Active rule.
4. In the Recommendations related list, select **New**.
5. From the New Recommendation screen, select **A field value to use**.
   A new Recommendation form is displayed with the **Rule**, **Context**, and **Action type** fields auto populated.
6. In the **Name** field, enter `Recommend assignment group for router issue`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the **Action** field, select an action.

   a. In the **Action** field, select the lookup icon.
   In the resulting pop-up window, the **Table name** field is auto-populated with the table that stores the available actions for the selected action type.

   b. In the **Document** field, select the Field recommendation for assignment group field recommendation.

   c. Select **OK**.

8. In the **Resource generator** field, select the Assignment group for router issue RG resource generator.
9. Save the record to display the Action inputs form section.
10. Define the action inputs.
    a. Select the pill picker next to the field.
    b. In the **Assignment group** field, select **Resource generator** > **Assignment group: Group**.
11. Select **Update**.

Example: Link the similar major case to the current case

Learn how process analysts or business owners configure a recommended action of type guidance to propose a major case that can be linked to the current case. This guidance uses a resource generator of type similarity with trend to recommend the similar case that has a common trend.

Problem scenario

Isabella owns a thriving E-commerce business that specializes in selling handmade artisanal products. As the business grows, Isabella recognizes the increasing importance of providing exceptional customer service to maintain customer satisfaction and loyalty. Isabella understands that addressing customer issues effectively and promptly is crucial for the success of the business.

Daniel, a process analyst on the Isabella's team identifies the most common and critical issues that their customers report and create major cases for them. So that whenever a customer creates a case, it can be linked to the similar major case. This process helps them understand the pattern, identify the root cause, take corrective actions, and apply similar solutions.

Daniel identifies the following major issues:

- Missing items in the order
- Wrong items received
- Damaged or defective products
- Refund requests
- Billing discrepancies or errors
- Difficulty applying discount codes
- Difficulty reaching customer support

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now, Daniel configures a guidance that recommends a similar major case to the agent who is working on a new case created by a customer. The guidance provides an action to the agent to link the recommended major case to the current case.

Configuring a recommended action for linking the similar major case to the current case

Help Daniel configure a recommended action of type guidance that uses Similarity with Trend resource generator to link the major case to the current case.

Task	Description
Configuring a subflow for the guidance action automation	Configure a subflow that you can use in a guidance to link the proposed major case to the current case automatically on a click of an action button.
Configure a resource generator for providing a similar major case to the current case	Configure a resource generator of type similarity with trend that provides a similar major case to the current case.
Create a guidance for linking the similar major case to the current case	Create a guidance to link the similar major case to the current case by configuring guidance inputs, preview experience, and guidance action.
Create a rule from the Case context record	Create a rule to show recommendations for active cases that meet the condition specified in this rule.
Create a recommendation with guidance as an action type	Create a recommendation to select the Guidance as an action type for linking a major case to the current case record.

Configuring a subflow for the guidance action automation

Configure a subflow that you can use in a guidance to automatically link the proposed major case to the current case on a click of an action button.

Configure and publish a subflow with the following inputs and action. For more information, see Create a subflow in Workflow Studio.

Field	Value	Description
Name	Link major case	-
Subflow Inputs & Outputs > **Inputs**	• Current case • Major case	Input type: Re
Actions	Update Record	Update case r case as the pa

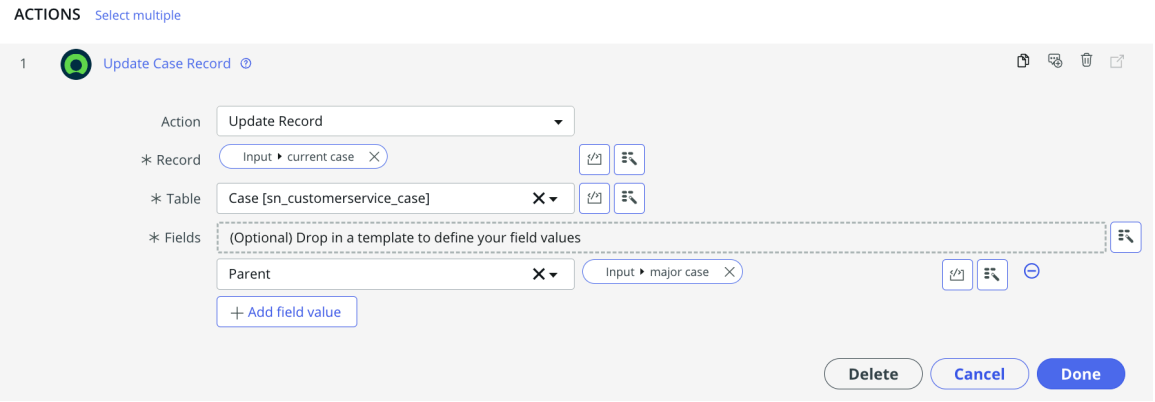
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Configure a resource generator for providing a similar major case to the current case

Configure a resource generator of type similarity with trend that provides a similar major case to the current case.

Before you begin

- Ensure Predictive Intelligence is active and set up on your instance. See Install Predictive Intelligence.
- Ensure you have a Predictive Intelligence subscription.
- Train the Major issue detector similarity solution with the existing customer cases. For more information, see Create and train a similarity solution.
- Create a trend definition with the name Major issue trends to define how many records that have something in common constitute a trend, for example, six or more records with common field values.

Role required: sn_nb_action.next_best_action_author, sn_nb_action.resource_generator_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Resource Generators**.
2. Select **New** from the Resource Generators list.
3. In the **Name** field, enter `Similar major case`.
4. In the **Context** field, select Case context.
5. In the **Generator type** field, select Similarity with Trend.
6. Save the record to display the generator inputs.
7. On the Generator input form, fill in the fields.
8. Select **Update**.

Create a guidance for linking the similar major case to the current case

Create a guidance for linking the similar major case to the current case by configuring guidance inputs, preview experience, and guidance action.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Select **New** in the Guidances list.
3. In the **Name** field, enter `Link similar major case`.
4. In the **Description** field, enter `This guidance recommends to link the identified similar major case to the current case.`.
5. Create the following inputs for the guidance.
   Inputs are the variables or information that the system needs to perform the guidance. You can use inputs in multiple places such as the guidance preview experience and the guidance actions.
   a. In the Guidance Input tab, select **New**.
   b. In the **Label** field, enter `Current case`.
   c. In the **Type** field, select Reference.
   d. In the Reference Specification related list, in the **Reference** field, select the Case table.
   e. Select **Submit**.
   f. In the Guidance Input tab, select **New** again.
   g. In the **Label** field, enter `Major case`.
   h. In the **Type** field, select Reference.
   i. In the Reference Specification related list, in the **Reference** field, select the Case table.
   j. Select **Submit**.
6. Configure the preview experience.
   a. In the **Preview Title** field, enter `Link to this major case`.
   b. In the **Fields to display**, select the parent case input.
   c. In the **Message** field, enter `This is the similar Major case predicted that you can link to the current case.`
7. Save the guidance record to display the Guidance Actions related list.
8. Configure a guidance action.
   a. In the Guidance Actions form section, select **New**.
   b. In the **Action Label** field, enter `Link major case`.
   c. In the **Call to Action Label** field, enter `Link major case`.
   d. In the **Action Behaviour** field, select Single-click.
   e. In the **Guidance Action Automation** field, select the Link major case subflow.
   f. In the **Completion Message** field, enter `The suggested major case is linked!`
   g. Save the record to display the flow inputs.
   h. In the **Automation Flow Inputs** related list, fill in the fields.

Input	Action
current case	i. Select the pill picker next to the field. ii. Select **Guidance inputs** > **Current case**.
major case	i. Select the pill picker next to the field. ii. Select **Guidance inputs** > **Major case**.

Create a rule from the Case context record

Create a rule to show recommendations for active cases that meet the condition specified in this rule.

Before you begin
Role required: sn_nb_action.next_best_action_author, admin

About this task
New rules can only be created from context records.

Procedure
1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select the Case context.
   The Case context is available by default.
3. In the Rules related list, select **New**.
4. In the **Name** field, enter `Active rule`.
5. In the **Roles** field, select the Edit User Roles icon and then select Customer service agent [sn_customerservice_agent] and Consumer service agent [sn_customerservice.consumer_agent].
   The selected user roles can see recommendations for this rule.
6. Select **Done** on the Roles pop-up window.
7. In the **Condition** field, use the condition builder to add the condition "Active | is | true".
   Agents can see recommendations for the records in the context table that meet this criteria.
8. **Optional:** Enable the **Apply to tables extended from the context table** check box, so that the rule and its recommendations are applied to tables that are extended from the context table.
   For more information, see Apply rules to tables extended from the context table.
9. In the **Field affecting this rule** field, select Short description from the slush bucket.
10. Select **Submit**.

Create a recommendation with guidance as an action type

Create a recommendation to select the Guidance as an action type for linking a major case to the current case record.

Before you begin
Role required: sn_nb_action.next_best_action_author, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select Case context.
3. In the Rules related list, select Active rule.
4. In the Recommendations related list, select **New**.
5. From the New Recommendation screen, select **A specific action to take or information to review**.
   A new Recommendation form is displayed with the **Rule**, **Context**, and **Action type** fields auto populated.
6. In the **Name** field, enter `Link major case to current case`.
7. In the **Action** field, select an action.

   a. In the **Action** field, select the lookup icon.
   In the resulting pop-up window, the **Table name** field is auto-populated with the table that stores the available actions for the selected action type.

   b. In the **Document** field, select the Link similar major case guidance.

   c. Select **OK**.

8. In the **Resource generator** field, select the Similar major case resource generator.
9. Save the record to display the Action inputs form section.
10. Define the action inputs.
    a. Select the pill picker next to the field.
    b. In the **Assignment group** field, select **Resource generator** > **Assignment group: Group**.
11. In the **Action Inputs** related list, fill in the fields.

Input	Action
Current case	**a.** Select the pill picker next to the field. **b.** Select **Context: case**.
Major case	**a.** Select the pill picker next to the field. **b.** Select **Resource generator** > **Highest confidence record: case**.

12. Select **Update**.

Install the Recommended Actions application

You can install the Recommended Actions application (sn_cs_nb_action) if you have the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Recommended Actions application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Recommended Actions:

- Store applications: Recommended Actions
- Roles
- Tables

For more information, see Components installed with Recommended Actions.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Recommended Actions application (sn_nb_action) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Components installed with Recommended Actions

Several types of components are installed with the Recommended Actions application, including tables, roles, guidances, resource generators, and scheduled jobs.

Tables

The Recommended Actions application adds the metadata tables described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Recommended Actions

Table	Description
Context [sn_nb_action_rule_context]	Stores contexts for tables such as case, incident, and problem for which recommendations are generated.
Recommendation [sn_nb_action_recommended_action]	Stores recommendations, which include action type, action, and resource generator information.
Action Type Definition [sn_nb_action_type_definition]	Stores action type definitions such as guidances, guided decision trees, and field recommendations.
Field Recommendation [sn_nb_action_field_recommendation]	Stores field recommendations.
Field Recommendation Definition [sn_nb_action_field_recommendation_definition]	Stores field recommendation definitions.
Field Recommendation Input [sn_nb_action_field_recommendation_input]	Stores inputs for field recommendations.
Resource Generator [sn_nb_action_resource_generator]	Stores resource generators.
Resource Generator Type [sn_nb_action_resource_generator_type]	Stores resource generator types such as flow, decision table, scripting, similarity, similarity with trend, and classification.
Resource Generator Type Input [sn_nb_action_generator_type_input]	Stores inputs for resource generators types.
Trend Definition [sn_nb_action_trend_definition]	Stores trend definitions.
Rule [sn_nb_action_condition_based_rule]	Stores rules, which include a condition and roles for the context.
Recommended Action Rule [sn_nb_action_rule_base]	Stores recommended action rules records.
Conditional Rule [sn_nb_action_conditional_rule]	Stores conditional rules. This table is no longer supported.
Decision Table Rule [sn_nb_action_decision_table_rule]	Stores decision table rules. This table is no longer supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Recommended Actions (continued)

Table	Description
Recommended Action Input Generator [sn_nb_action_input_generator]	Stores input generator records. This table is no longer supported.
Search result recommended action mapping [sn_nb_action_search_result_ra_mapping]	Stores mapping between search result outputs and action inputs.

Roles

The Recommended Actions application includes the roles described in the following table.

Roles installed with Recommended Actions

Role	Description	Contains roles
Recommended Actions admin [sn_nb_action.next_best_action_admin]	Grants administrator access to the Recommended Actions application.	sn_nb_action.next_best_action_author
Recommended Actions author [sn_nb_action.next_best_action_author]	Can create recommended actions.	• sn_nb_action.resource_generator_author • sn_gd_guidance.guidance_manager • sn_nb_action.next_best_action_user • sn_gd_core.decision_tree_author
Recommended Actions user [sn_nb_action.next_best_action_user]	Can use recommended actions.	sn_gd_core.decision_tree_author
Resource Generator author [sn_nb_action.resource_generator_author]	Grants access to configure resource generators.	• flow_operator • decision_table_reader • platform_ml_read • sn_nb_action.trend_definition_author • sn_ti_admin.tia_user
Trend Definition author [sn_nb_action.trend_definition_author]	Grants access to configure trend definitions.	None

Other than the roles in the preceding table, you can delegate deployment tasks to developers or non-admin users. For more information on the delegated development, see Delegated Development.

Guidances

The Recommended Actions application includes the guidances described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances installed with Recommended Actions

Guidance	Description
Apply resolution from a solved case	Enables agents to apply a resolution from a recommended solved case by clicking **Resolve case** button on a card, which copies the resolution notes and a resolution code from the solved case into the Closure Information section of the current case. The state of the current case changes to resolved.
Communicate Workaround	Enables agents to communicate a workaround from a recommended problem record by clicking a **Communicate workaround** button on a card, which opens the guidance in the side panel. The guidance shows the workaround from the problem record and provides a note field for the agent to add additional notes. The workaround and notes are added in the work notes and the problem record is linked to the current case.
Create case task	Enables agents to create a case task for the current case by clicking a **Create** button on a card, which opens the guidance in the side panel where the agent can enter a subject for a new case task and submit it.
Create Work Order	Enables agents to create a work order for a case by clicking a **Create** button on a card. Creates a work order task and opens the task in a subtab.
Link to existing defect	Enables agents to link an existing defect to the current case by clicking a **Link to defect** button on a card, which links the defect to the case and updates the work notes.
Link to existing open case	Enables agents to link the current case to an existing open case by clicking a **Link to this case** button on a card, which sets the open case as the parent of the current case.
Offer Recommendation	Enables agents to recommend upgrade of a product to provided product model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances installed with Recommended Actions (continued)

Guidance	Description
Propose Resolution	Enables agents to enter resolution notes and a resolution code for a case by clicking a **Propose Solution** button on a card.
Read message to customer	Enables an agent to indicate that a message was read to a customer during a call by clicking the **Mark as read** button on a card, and adding the message to the work notes.
Reassign case	Enables agents to reassign the current case to a recommended assignment group by clicking the **Reassign** button on a card, which opens the guidance in a side panel where the agent can enter notes. The current case is reassigned to a different assignment group and the work notes are updated.
Review and attach article	Enables agents to review a recommended knowledge article in the contextual side panel by clicking a **Review and attach article** button on a card, which opens the article in the side panel. In the side panel, agents can do the following: • Review the article. • Attach the article to the case. • Mark the article as helpful. • Open the article in a subtab.

Resource generators

The Recommended Actions application includes the resource generators described in the following table.

Resource generators installed with Recommended Actions

Resource generator	Description
Find most read KB Article for Product	Finds the most read KB article for the selected product. You can use this KB article to attach to a case as a recommended action.
Find Matching PRB with workaround	Finds a matching problem record that has a workaround. You can propose to share the workaround from this case as a recommended action.
Find Matching PRB without workaround	Finds a matching problem record without a workaround. You can propose to link to this problem record as a recommended action.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the Recommended Actions application

As an admin, configure the Recommended Actions application to display relevant actions to your agents based on a record context.

Recommended actions

You can configure recommended actions by following these steps.

Steps to configure Recommended actions

Step	Description
Create a context	A context enables agents to see recommendations for records from a specific table, such as the Case table.
Create a context input	A context input enables you to associate entities beyond just the context table with a context ensuring that recommendations are updated dynamically as the context evolves. **Note:** This step is not mandatory.
Create a rule for a context	A rule is a set of conditions that applies to a context and determines when a recommended action appears. When you create a rule: • Select conditions that apply to the context table. • Select the roles that have access to the recommended actions. **Note:** New rules can only be created from within a context.
Create a recommendation for a rule	A recommendation is a way to suggest an action to an agent. Create a recommendation by selecting one of the recommendation types available on the New Recommendation screen: • Guidance • Guided decision tree • Field recommendation **Note:** New recommendations can only be created from within a rule.

Action types

With the Recommended Actions application, you can create the following types of actions for agents to take.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action types in the Recommended actions application

Action type	Description
Guidance	An action that an agent can take or information that they can share. For example, a guidance can recommend that an agent can view and attach a knowledge article to a case or create a work order.
Guided decision tree	A guided flow to follow. A decision tree is a multi-step process that includes a series of questions and answers and results in guidance.
Field recommendation	A recommended value to use for a field. For example, this type of action can recommend the assignment group based on the text in the case short description.

For more information, see Creating guidance and field recommendation in Recommended Actions.

Resource generators

Configure resource generators to provide information that you can use as inputs to actions such as guidances and field recommendations. Configuration of decision trees don't require resource generators. For more information, see Create a resource generator in Recommended Actions.

Arbitration parameters

Configure arbitration parameters to determine the frequency of issues or the priority order of the recommended actions so that agents get the guidance that they must help resolve customer issues. For more information, see Configure the arbitration parameters in Recommended Actions.

Create a context in Recommended Actions

Create a context for an individual table, such as the Case table. Contexts store information including the recommended actions that agents can use and the rules that determine when those actions are available.

Before you begin

Role required: sn_nb_action.next_best_action_author, or admin

About this task

A context enables agents to see recommendations for a specific type of record when certain rules are met. These recommendations can help agents by suggesting actions to take based on the record context.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select **New** on the Contexts list.
3. Fill in the fields on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Context form

Field	Description
Name	Name for the context.
Table	Table for which the context applies to. If you select a table that already has a context, then a warning message is displayed.
Description	Brief description about the context.
Active (Optional)	Check box to make the context active.
Asynchronous Evaluation	When selected, enables asynchronous mode of evaluating recommendations on the contextual side panel in the CSM Workspace. That is, this mode enables agents to work on the case or incident record while the recommendations load on the contextual side panel. For more information, see Synchronous and asynchronous modes of evaluation for Recommended Actions.
Exclude fields	Fields of the context table that do not trigger the Recommendations refresh in the Configurable CSM Workspace, when these fields are updated. Add the context table fields that do not impact recommendations generation.
Parent Context Config	
Parent context	Enables you to choose which parent table's rules and recommendations must be applied to the context you are working with. **Note:** ○ This field appears when the selected table has a parent table with context defined. ○ This field does not show the parent context which have context inputs configured. ○ If parent context is set, the Context inputs related list does not appear.
Inherit exclusions from parent context	When selected, includes the exclusion fields of the parent context table to prevent the trigger of the Recommendations refresh in the CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field appears only when a context is added in the Parent context field.
Contextual AI Search Config	
Search Application Configuration (Optional)	Search application configuration that specifies AI Search as the search engine and the settings to use for the search. You can configure the search result display and refinement settings in the search application configuration. For more information, see Search application configurations. The **[CSM AIS] Configurable Workspace Search Config** search application configuration is provided with the CSM Configurable Workspace store application. To access this configuration, navigate to **AI Search** > **Search Experience** > **Search Applications**. For more information about AI search configurations, see Configuring AI Search in Recommended Actions.
Default search term	Search term that appears by default. You can map the context input from the pill picker.
Grouping strategy (Optional)	Strategy for grouping recommendations. For example, you can define a grouping strategy to group recommendations that have similar criteria. **Note:** You might need to configure the Context form to display the **Grouping strategy** field. This field is available by default for ITSM Workforce Optimization users.
Refresh interval (Optional)	This value determines how often recommendations are refreshed for the context. The default value for this field is 12 hours and the minimum value is 10 minutes. **Note:** You might need to configure the Context form to display the **Refresh interval** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show relevancy score for results	Displays the relevancy score on the search results and recommendations in the Recommended Actions contextual side panel.
Top N results	Limits the number of search results displayed in the AI search tab of Recommended Actions to the top N results for improved precision and easier management. The number of results that appear is determined by the **Search Results Limit** value which can be updated by opening the Search Application in the Search Application Configuration.

4. Select **Save**.
   After saving the context record, the system displays the Rules and Recommendations related lists.

What to do next

- Configure context inputs. For more information, see Create a context input in Recommended Actions.
- Use the Rules related list to view or create rules for this context. For more information on how to create a rule, Create a rule in Recommended Actions.
- Use the Recommendations related list to view the recommendations related to the context rules. You can only create a recommendation from within the rule. For more information on how to create a recommendation within a rule, see Create a recommendation in Recommended Actions.
- Use the Search result mapping related list to view or create mappings between AI search outputs and guidance inputs.

Related topics

Contexts in Recommended Actions

Create a context input in Recommended Actions

As an admin or RA author, create a context input for a context and use it in rule condition builder, resource generator input and recommendation-action mappings.

Before you begin

Role required: sn_nb_action.next_best_action_author, or admin

About this task

After creating context inputs, you must configure the RA UIB component to pass the context input values. For more information, see Configuring Recommended Actions UIB component for context inputs.

Note:

Creating context inputs is not mandatory. You can create context inputs for a context only when you want to include or map parameters other than the context table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Open a context that you want to edit.
3. On the Context inputs related list, select **New**.

> **Note:**
> The Context inputs related list appears only when a parent context is not mapped to the context. For more information on the context input configuration limitations, see Context Input configuration limitations.

4. In the form, fill in the fields.

Field	Description
Type	Field type of the input such as Choice, Reference, String, List, Integer, etc. Depending on the field type that you select, you might need to configure additional settings in the related tabs. For example, if you select Reference as the field type, you need to select a reference table.
Application	Scoped application name. The applicable name is populated by default.
Mandatory	When this check box is selected, you must set the values for these contextual inputs directly on Recommended Actions component on the record page in the UI Builder for the recommendations to be generated. **Note:** If you select this check box and fail to set contextual inputs on Recommended Actions component in the UIB, the recommendations will not be generated.
Label	Name of the context input. The **Column name** field is auto-filled.
Active	Enabling the **Active** check box makes the context input available for use in the context.

5. Provide the necessary details in the related tabs.
   The related tabs that display vary based on the field type selected in the **Type** field. For more information on the data types, see Field types reference.
6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The context input appears in the appropriate fields of rules, recommendations, and resource generators.

- **Default search term** pill picker in the Contextual AI Search Config section of Context form.
- **Advanced Condition** drop-down field of the Rule form.
- Pill pickers in the Action inputs section of the Recommendation form.
- **Default search term** pill picker in the Contextual AI search configuration section of the Context form.
- Pill pickers in the Generator inputs section of the Resource generator form.

What to do next
Use the context inputs for creating the conditions in rules, and action inputs in recommendations and generator inputs in resources generators.

Create a rule in Recommended Actions

Create a rule for a context that determines when recommended actions are made available to agents.

Before you begin
Role required: sn_nb_action.next_best_action_author, or admin

About this task
New rules can be created from the context records only.

Procedure
1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select a context.
3. In the Rules related list, click **New**.
4. Select the rule that you want to update.
5. Enter a name and a description for the rule.
6. In the **Roles** field, select the user roles that can see recommendations for this rule.
7. Click **Done** on the Roles pop-up window.
8. In the **Advanced Condition** field, use the condition builder to add one or more conditions that apply to the records for this context.
   Agents can see recommendations for the records in the context table that meet this criteria.

   If a context input is available for the context, you can build conditions on it along with the context table.
9. **Optional:** Enable the **Apply to tables extended from the context table** check box, so that the rule and its recommendations are applied to tables that are extended from the context table.
   For more information, see Apply rules to tables extended from the context table.
10. In the **Fields affecting this rule** field, add fields from the context table that must be monitored for changes.
    Changes to these fields generate recommended actions of the type field recommendation for unsaved records.
11. Fill in the remaining fields on the form, as needed.
    For more information about these fields, see Rule form.
12. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a recommendation in Recommended Actions

Create a recommendation with an action type of guidance, field recommendation, or guided decision tree to suggest helpful actions to agents.

Before you begin

Role required: sn_nb_action.next_best_action_author, or admin

About this task

You select an action type and action as part of creating a recommendation. The next steps depend on the action type that you select. For example, guidances and field recommendations need action inputs as a next step, while guided decision trees don't.

For the AI search resource generator, you can select guidances only as action types in the Search result mapping related list. You must map the fields from the search source table with guidance action inputs for AI search or fields from the genius result configuration with guidance action inputs for genius results.

Then you define the action inputs, which are the parameters that enable agents to complete an action. You can select static values for inputs or use a resource generator to supply values.

Note:
New recommendations can only be created inside the rules.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select a context.
3. Select a rule in the Rules related list.
4. In the Recommendations related list, select **New**.
5. Select the type of recommendation to create from the New Recommendation screen.
   - A specific action to take or information to review (guidance)
   - A guided flow to follow (guided decision tree)
   - A field value to use (field value recommendation)

   A new Recommendation form is displayed with the **Rule**, **Context**, and **Action type** fields auto populated.
6. In the **Name** field, enter a name for the recommendation.
7. In the **Action** field, select an action.
   The available actions are determined by the selection in the **Action type** field.

   a. In the **Action** field, select the lookup icon.
   In the resulting pop-up window, the **Table name** field is auto populated with the table that stores the available actions for the selected action type.

   b. In the **Document** field, select the desired action by clicking the lookup icon.
   You can also create an action of type guidance, field recommendation, or guided decision tree. For more information, see Creating guidance and field recommendation in Recommended Actions.

   c. Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Save the record to display the Action inputs form section.
After selecting the action type and action, saving the record displays the required action inputs.

8. **Optional:** In the **Resource generator** field, select or create a resource generator and then save the record.

   (Optional) For more information, see Create a resource generator in Recommended Actions. Guidances and field value recommendations can use resource generators to find relevant resources for the action inputs.

   The **Action type**, **Action**, and **Recommendation hint** fields are not available for AI search resource generator. You can select the action type as a guidance and an action when you configure the search result mapping for AI search. For more information, see Map AI search results with guidance inputs in Recommended Actions.

9. For guidances and guided decision trees: in the **Recommendation hint** field, enter a hint text. The hint explains to agents why a recommendation is being suggested.
10. **Optional:** Select a group in the **Group** field to show relevant recommendations together.

    Note:
    You might need to configure the Recommendation form to display the **Group** field. This field is available by default for ITSM Workforce Optimization users.

11. Define the action inputs.
    Action types and actions need inputs. These parameters enable agents to complete an action. You can choose static values for action inputs or you can use a resource generator to supply values.

Option	Description
Use a static value	Enter the value in the field in the input field or use the lookup icon to select a value from the list.
Use a pill picker	**a.** Select the pill picker next to the field. ▪ The context is available in the pill picker. ▪ If you selected a **Resource generator**, the outputs from the generator are available in the pill picker. ▪ If an active context input is available for a context, the context input appears in the pill picker. **b.** Select the outputs from the pill picker.

12. Select **Update**.

Creating guidance and field recommendation in Recommended Actions

Create guidances and field recommendations that you can use to configure recommended actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring guidances

When you create a guidance, you configure several different aspects of that guidance:

Guidance configuration steps

Feature	Description
Configure inputs and outputs for a guidance.	• Inputs: The variables or information that the system must perform the guidance. • Outputs: the result of the guidance.
Configure a preview experience for a guidance.	A preview on the card that is displayed to the agent can include: • A hint that briefly tells the agent what the guidance is about • A preview message that describes the guidance in more detail • The action that the agent can take
Configure a detail experience for a guidance.	A detailed message that is displayed for guidances that open in the contextual side panel or in a subtab.
Configure a primary call to action for a guidance.	A guidance can have multiple actions, with one identified as the primary action and optional secondary actions.
Configure the behavior of a guidance.	Determines how the system executes a primary action after the agent selects the action button on the card. • **Single click**: Initiates and completes the action and moves the card to the History tab in the Recommended Actions panel. This behavior is useful for simple actions such as escalating a case. • **Open in the contextual side panel**: Expands the action and displays information about that action in the Recommended Actions panel. This behavior is useful for actions such as reviewing the content in an article before attaching it to a case. • **Open in a sub tab**: Opens the action in a subtab under the case tab. This behavior is useful for guidances that require the agent to select and submit additional information, such as filling out the fields on a form.
Customize the preview experience and the detail experience of a guidance	Options to customize the following items in the UI Builder:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance configuration steps (continued)

Feature	Description
	• **Preview experience**: The preview of the recommendation card includes a hint, an icon, a message, and an action button. The preview of the card shows up in the contextual side panel. • **Detail experience**: The detail experience of the guidance includes the drill down actions. It opens in the contextual side panel or in a subtab.

Configuring field recommendations

Field recommendation suggests a value for a field in the record form. Creating a field recommendation involves two main steps:

- Selecting the inputs for the recommendation.
- Creating the instructions about how to use those inputs.

Create a field recommendation in Recommended Actions

Create a field recommendation that you can select when configuring a recommended action. Field recommendations auto-fill a value or suggest a value for a field. For example, this type of action can recommend the assignment group based on the text in the case short description.

Before you begin

Use the CSM default record page or the CSM Interaction record page to display field recommendations in CSM Configurable Workspace. For setting the CSM default record page or the CSM Interaction record page as default page, see Set record page order.

Role required: sn_nb_action.next_best_action_author, admin

About this task

Creating a field recommendation involves two main steps:

- Creating inputs for the field recommendation.
- Creating instructions about how to recommend values by configuring a definition for each field.

Depending on the configuration, the recommended field values are auto-filled or shown as messages underneath the fields for the new records. The recommended field values are shown as messages only underneath the fields for the existing records. For an example implementation of field recommendation setup, see Create a field recommendation for recommending assignment group field value.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Field Recommendations**.
2. Click **New** on the Field Recommendations list.
3. In the **Name** field, enter a name for the field recommendation.
4. In the **Table** field, select a table.
   This table includes the field for which you're configuring a recommended value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the record to display the related lists.
6. In the Field Recommendation Inputs related list, select **New** to create an input.
   a. In the **Type** field, select the field type for the input.
   b. In the **Label** field, enter a label for the input.
   c. In the **Column name** field, enter a column name.
   This name should use lower case letters and underscores. For example, `confidence_score`.
   d. Configure the settings for the input in the related lists.
   These settings and related lists are determined by the selection in the **Type** field. For example, if you select Reference as the input type, you must configure:
      - The table and any conditions for the reference field.
      - The type of list to use.
      - A default value.
   e. Click **Submit**.
7. In the Field recommendation definitions related list, select **New** to create a definition.
   a. In the **Name** field, enter a name for the definition.
   b. Select the **Field** to be recommended and save the record to see additional details.
   c. In the **Recommendation message** field, add the message that is recommended underneath the field on the form.
   You can include the recommended value as part of the message by using the pill-picker.

   Note:
   If the resource generator returns an empty field value, the recommendation message is not displayed.

   d. In the **Recommended value** field, use the pill-picker to select a value.
   e. In the **Recommendation Method** list, select one of the options that auto-fills the value or recommends the value as a message.

Recommendation Method list fields and descriptions

Field	Description
Recommend only	Displays a recommendation message for the field.
Autofill as per the confidence threshold	▪ **Confidence**: Field that provides the confidence score. Enter a static value or use the pill-picker to select an input that you configured in the Field recommendation inputs related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ **Confidence threshold for direct assignment**: Confidence threshold for the recommendation. If the confidence score is more than the threshold value, the recommended value is auto-filled. Otherwise, a message is displayed.
Autofill as per the resource generator preference	**Recommendation Preference**: Field that has "true" or "false" value for preference. If this value is true, the recommended value for the field is auto-filled. Otherwise, a message is displayed. Enter a static value or use the pill-picker to select an input that you configured in the Field recommendation inputs related list.

f. Click **Submit**.

Create a guidance in Recommended Actions

Create a guidance that you can select when creating a recommendation in Recommended Actions.

Before you begin

Role required: sn_nb_action.next_best_action_author, or admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Create a guidance.

   a. Select **New** in the Guidances list.

   b. In the **Name** field, enter a name for the guidance.

   c. In the **Description** field, enter a brief description of the guidance.

   d. **Optional:** Make the guidance available to multiple agents working on the case by selecting the **Action available to multiple users** check box.
   When this option isn't selected, only one agent can work on any guidance. When the first agent works on the guidance and the state is in-progress, completed, or error, the other agents can't see this guidance.

   e. **Optional:** Select **Allow users to re-run the guidance** to enable agents to go back to the previous node or edit the previous nodes in the runtime experience of a decision tree.
   This field is only displayed when the Guided Decisions Experience plugin (sn_ga_exp) is installed.

   f. **Optional:** Select **Hide completed guidance** to hide the guidance recommended for a case resolution.
   In other words, the completed guidance in the View my response section of a Decision Tree is not displayed for the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This field is visible only when the Guided Decision Experience plugin is installed. You may need to configure the form to add this field.

g. Select **Submit**.

3. Open the guidance that you want to update.
4. Create one or more inputs for the guidance.
   Inputs are the variables or information that the system needs to perform the guidance. You can use inputs in multiple places such as the guidance preview experience and the guidance actions.

   a. In the Guidance Input tab, select **New**.

   b. In the **Label** field, enter a name for the input.

   c. In the **Type** field, select the field type of the input.
   Depending on the field type that you select, you might need to configure additional settings. For example, if you select Reference as the field type, you need to select a reference table.

   d. If the guidance input requires an action by the agent, such as adding information to a field, select the **Is form field** check box.

   e. **Optional:** Enter a **Default value**.

   f. Select **Submit**.

5. **Optional:** Create one or more outputs for the guidance.
   Outputs are the desired result of the guidance action. For example, if a guidance action creates a case task, the output of that action can return a reference to the case task that was created.

   a. In the Guidance Output tab, select **New**.

   b. In the **Label** field, enter a name for the output.

   c. In the **Type** field, select the field type of the output.
   Depending on the field type that you select, you might need to configure additional settings. For example, if you select Reference as the field type, you need to select a reference table.

   d. **Optional:** Enter a **Default value**.

   e. Select **Submit**.

6. Configure the detail experience for the guidance in the Detail Experience tab.
   The detail experience is a message that is displayed for guidances that opens in the contextual side panel or in a subtab.
   a. In the **Title** field, add a title for the guidance in the detailed view.
   b. In the **Guidance Message** field, provide a message for the detail view.
7. Select **Submit**.

Configure guidance actions in Recommended Actions

Configure the actions that an agent can perform for a Recommended Actions guidance.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Select a guidance from the Guidances list.
3. In the Guidance Actions form section, click **New**.
4. On the Guidance Action form, fill in the fields.

Field names on the Guidance Action form

Field	Description
Guidance	The guidance that this action is associated with. This field is read only.
Action label	A name for this guidance action.
Call to Action Label	The label for the action button that appears on the recommendation card in the contextual side panel. For example, **Review and attach article** or **Propose Solution**.
Action Behavior	The selected behavior for the guidance action: ○ **Single click**: The action is initiated and completed with one click and the card moves to the **History** tab in the side panel. Useful for simple actions such as escalating a case. ○ **Open in Contextual Side Panel**: The action opens in a detailed view within the side panel. The agent can review the details in the side panel, such as reviewing the content of a knowledge base article. ○ **Open in Sub Tab**: The action opens in a separate tab. **Note:** Actions that open in the contextual side panel or in the subtab don't move to the in-progress state. The action moves to the in-progress or completed state only when the agent clicks the action button in the detail view.
Primary	Denotes the guidance action as a primary action. This field is enabled by default. A primary action highlights the action that the agent should take and makes that action available as a button on the recommendation card. **Note:** A guidance can have only one primary guidance action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If this field is not selected, the guidance action is a secondary action available through the more actions menu on the recommendation card.
Application	The application that this guidance action is associated with. This field is read only.
Guidance Action Automation	The flow associated with this guidance action.
Order	The order of the action.
Completion Message	The message that appears at the top of the recommendation card when the guidance action is complete. For example, **KB article was shared**.

5. Depending on the selected flow in the **Guidance Action Automation** field, you can configure flow inputs and guidance outputs.
   - Configure flow inputs in the **Automation Flow Inputs** tab.
   - Configure outputs in the **Guidance Outputs** tab.

     These fields can contain static text, dynamic content (field values from guidance inputs), or a combination of static text and dynamic content. To use dynamic content, select the pill picker icon next to the field and select a guidance input from the list.
6. Click **Submit**.

Configure a guidance preview experience

Configure a preview experience that conveys relevant information about the guidance action to the agent before a recommendation is triggered. This information appears on the Recommended Actions card in the contextual side panel.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

About this task

A guidance preview includes the following elements:

- A title
- Fields to display
- A message made up of text and HTML content, including images, videos, and links

You must configure at least one of these elements to save the guidance preview. This action prevents the guidance from appearing empty in the contextual side panel.

Procedure

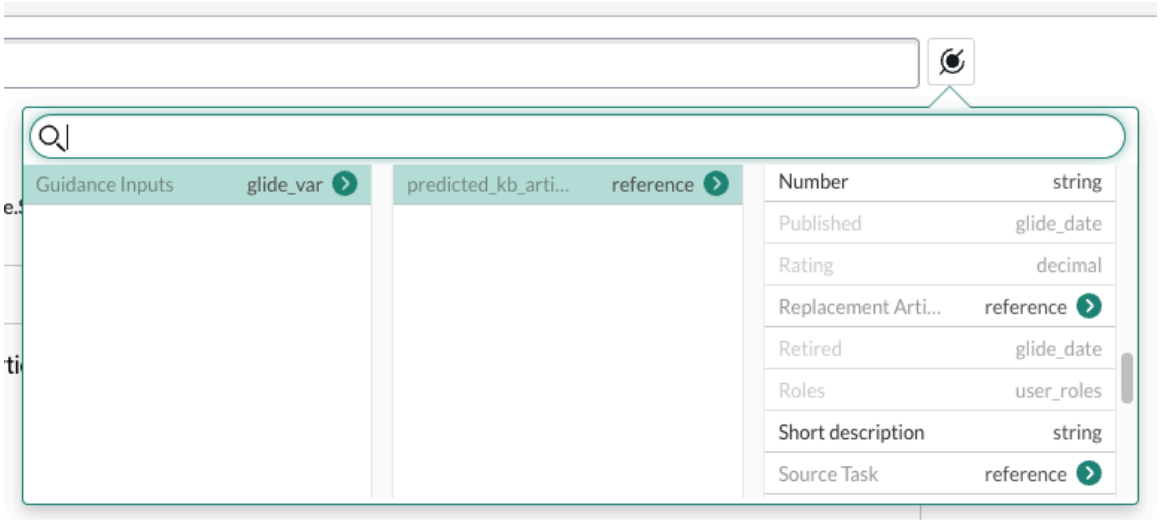
1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Select a guidance from the **Guidances** list.
3. Select the **Preview Experience** tab.
4. In the **Preview Title** field, add a title for the guidance preview.

   This field can contain static text, dynamic content (field values from guidance inputs), or a combination of static text and dynamic content. To select dynamic content as a field value:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the pill picker icon next to the **Preview Title** field.

b. Select a guidance input from the list. You can drill down to another level to find the input you want.



5. Select fields to display in the guidance preview.

   a. In the **Fields To Display** field, click the lock icon to unlock the field.

   b. Move the required fields from the **Available** column to the **Selected** column.
   You can select up to four fields.

   c. Use the up and down arrows to arrange the selected fields.

   d. Click the lock icon again to lock the field.

6. In the **Message** field, create a message for the guidance preview.
   You can use the tools available in the rich text editor to create and format the message. This field can include text and HTML content like images, videos, and links.

7. Click **Submit**.

Customize a guidance preview experience in the UI Builder

Customize a preview of a Recommended Actions card that displays in the contextual side panel using UI Builder. The preview experience includes a hint, an icon, a message, and an action button.

Before you begin

Role required: sn_nb_action.next_best_action_author and ui_builder_admin, admin

About this task

You begin by creating a UI page variant of a guidance preview experience. When you create a UI page variant from a page template, you start with a base structure that you can customize. By using the component properties, you can change how your recommendation card preview looks.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Select a guidance from the Guidances list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Create preview UI** to create a UI page variant of a guidance preview experience.

   This page includes an empty `customExpProps` container with the properties listed in the following table during run-time. The Recommended Actions framework passes the `customExpProps` object as a property to the custom experience.

Preview experience properties

Property	Description
sysId	ID of the recommendation.
name	Title of the preview experience.
description	Message for the preview experience.
recommendationHint	Text that tells the agent why a recommendation is being suggested.
callToActions	Settings for the guidance action.
actionTypeLabel	Label for the recommended action type.
icon	Icon for the recommendation card.
actionStateLabel	External name of the action state.
actionStateValue	Internal name of the action state.
previewFields	The fields to display in the guidance preview experience.
errorMessage	Error message to display when the recommendation fails to display.
ariaHidden	On the Recommended Actions grouped list, the sn-carousel component passes this property to each card to determine if the content is hidden within the carousel. If the card is hidden, you can use this value to set aria-hidden or disable any actionable component to true and avoid accessibility issues.
useCase	Search/RA tab where the guidance is getting rendered.
actionInputs	Guidance Inputs.
actionTypeSysId	Sys Id of the recommendation type.
actionId	Sys Id of the recommendation.
table	Recommended Actions Context table.
tableSysId	Recommended Actions Context table record sys_id.
renderer	Component responsible to render the detailed experience
secondaryCallToAction	Secondary actions to be shown on card.
isGenius	Is genius result card, used in Search tab genius result.
contextSysId	Recommended Actions context sysId.
actionConfigurations	Recommended Actions actionConfigurations property value. The Value field is empty by default.
isFullSearchView	If search displayed in full search view of side panel view, the value is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
contextInputs	Recommended Actions contextInput property value. To get the predefined syntax, navigate to **All >** > **Recommended Actions** > **Context** > **Context Inputs** and copy the JSON format of the context inputs.
Search relevancy score	Relevancy score of a search result which displays on the on the guidance card when the use case is `search` but not suggested actions. If the value is null or undefined, the relevancy score component is hidden on the guidance card.

The following example shows properties and sample values for the preview experience.

```
"customExpProps": {
        "sysId": "e8421a2a436f0210f81d92621ab8f2da",
        "name": "Attach and share article",
        "description": null,
        "recommendationHint": "Knowledge",
        "callToActions": [
            {
                "label": "",
                "name": "",
                "id": "1e8392aa436f0210f81d92621ab8f291",
                "actionBehavior": "contextual_side_panel",
                "primary": "true",
                "order": "100",
                "completionMessage": "Knowledge article
 successfully attached."
            }
        ],
        "recommendationAction": "",
        "actionTypeLabel": "Guidance",
        "icon": "magnifying-glass-sparkle-outline",
        "actionStateLabel": "New",
        "actionStateValue": "new",
        "previewFields": null,
        "attributes": "",
        "errorMessage": "",
        "ariaHidden": false,
        "useCase": "search",
        "actionInputs": {},
        "actionTypeSysId": "",
        "actionId": "",
        "table": "sn_customerservice_case",
        "tableSysId": "",
        "renderer": "sn-guidance-experience-connected",
        "secondaryCallToAction": {},
        "isGenius": false,
        "contextSysId": "",
        "actionConfigurations": {},
        "isFullSearchView": false
    }
```

4. Select **Edit preview in UI Builder**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The UI page variant opens in UI Builder, where you can add and configure components to customize the look and feel of the preview experience. For more information, see Working with components in the UI Builder.

5. Bind the preview experience properties to your preview UI.
   Data bindings are in the **Config** tab of the configuration panel in UI Builder. For more information, see Data resources in UI Builder.
6. Add and bind scripts to components in your preview UI to dispatch events by using an event handler to execute or skip a recommendation with a corresponding payload.

   The following table shows the list of events that are emitted with respect to the actions perform by an agent:

Preview experience events

Events handled	Description
ON_SINGLE_CLICK_ACTION_INITIATE	Initiates and completes the action when an agent selects the action button. This event passes the following parameters in the payload: `api.emit('ON_SINGLE_CLICK_ACTION_INITIATE', { sysId: api.context.props.customExpProps.sysId, name: api.context.props.customExpProps.name, actionStateValue: api.context.props.customExpProps.actionStateValue, actionMetadata: api.context.props.customExpProps.callToActions[0] , table: api.context.props.customExpProps.table, tableSysId: api.context.props.customExpProps.tableSysId, contextSysId: api.context.props.customExpProps.contextSysId, actionType: api.context.props.customExpProps.actionTypeSysId, actionInputs: api.context.props.customExpProps.actionInputs, formFieldInputs: { <actionInputs key>: <actionInputs value> },`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Events handled	Description

	<pre>actionId: api.context.props.customExpProps.actionId,
	name: api.context.props.customExpProps.name,
	actionMetadata: api.context.props.customExpProps.callToActions[0],
	actionStateValue: api.context.props.customExpProps.actionStateValue,
	}
	)</pre>
	The `formFieldInputs` contains the `actionInputs`, which must be updated when the event is emitted.

ON_DRILL_DOWN_ACTION_INITIATE	Expands the action and displays more actions or information after an agent selects the primary action button. This event passes the following parameters in the payload:
	<pre>api.emit(
	'ON_DRILL_DOWN_ACTION_INITIATE ', {
	table: api.context.props.customExpProps.table,
	tableSysId: api.context.props.customExpProps.tableSysId,
	actionType: <sys_id for "Guidance" action type/ e38f55b9b72120107d472397ee11a9be>,
	actionInputs: api.context.props.customExpProps.actionInputs,
	formFieldInputs: {"<actionInputs Key>":"<new value which needs to be set>"},
	actionId: api.context.props.customExpProps.actionId,
	sysId: api.context.props.customExpProps.sysId,
	name: api.context.props.customExpProps.name,</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Events handled	Description
	actionStateValue: api.context.props.customExpProps.actionStateValue, actionMetadata: api.context.props.customExpProps.callToActions[0], renderer: api.context.props.customExpProps.renderer, contextSysId: api.context.props.customExpProps.contextSysId, sysId: api.context.props.customExpProps.sysId, name: api.context.props.customExpProps.name })
DISMISS_ACTION_CLICK	Cancels the action. api.emit('DISMISS_ACTION_CLICK', { sysId: api.context.props.customExpProps.sysId })
ACTION_TRIGGERED_PROPAGATION	Enables user to add UI-specific behavior for guidance actions. This event propagates the payload details to the parent where this event can be handled. api.emit('SN_NEXT_BEST_ACTION_LIST_CONNECTED#ACTION_TRIGGERED_PROPAGATION' ', { "actionSysId": api.context.props.customExpProps.actionId "actionName": api.context.props.customExpProps.actionConfigurations[api.context.props.customExpProps.actionId][“actionName”] "actionType": "guidance", "eventName": "<eventName>", "payload": { } }

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Events handled	Description
LOG_SEARCH_RESULT_EVENT	Adds the search result logs to the Queued Signal Events [sys_signal_event_queue] table. `api.emit(LOG_SEARCH_RESULT_EVENT, {actionData: {actionName: actionId}})`

For more information, see Define and bind client scripts to components.

Customize a guidance detail experience in the UI Builder

Customize how your detail experience looks in the contextual side panel or in a subtab of the Recommended Actions card using UI Builder. The detail experience can include things such as user inputs and drill down actions.

Before you begin

Role required: sn_nb_action.next_best_action_author and ui_builder_admin, admin

About this task

You begin by creating a UI page variant of a guidance detail experience. When you create a UI page variant from a page template, you start with a base structure that you can customize. By configuring the components and using the component properties, you can change how your detail experience looks in the contextual side panel or in a subtab.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Action Types** > **Guidances**.
2. Select a guidance from the Guidances list.
3. Select **Create detail UI** to create a UI page variant of a guidance detail experience.
   This page includes an empty container with the properties listed in the following table.

Detail experience properties

Property	Description
guidanceInputs	The inputs required to perform the guidance.
guidanceOutputs	The outputs of the guidance.
status	The status of the guidance.
guidanceMessage	The message for the detail experience.
guidanceActions	The guidance actions in the detail view.
errorMessages	The error message to display when the recommendation fails to display.

The following example shows properties and their sample values for the detail experience.

```
{
    "guidanceInputs": {},
    "guidanceOutputs": {
        "meta": []
    },
    "status": "waiting",
    "guidanceMessage": "",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "guidanceActions": [
        {
            "label": "Attach",
            "action_sys_id":
 "1e8392aa436f0210f81d92621ab8f291",
            "variant": "primary",
            "isExecuted": false,
            "completionMessage": "Knowledge article
 successfully attached.",
            "action_behaviour": "contextual_side_panel",
            "primary": true
        }
    ],
    "errorMessage": "",
    "actionConfigurations": {},
    "guidanceId": "",
    "tableName": "sn_customerservice_case",
    "bare": true,
    "scrollable": "none"
}
```

4. Select **Edit detail in UI Builder**.
   The UI page variant opens in UI Builder, where you can add and configure components to customize the look and feel of the detail experience. For more information, see Working with components in the UI Builder.
5. Bind the preview experience properties to your custom detail UI.
   Data bindings are located in the **Config** tab of the configuration panel in UI Builder. For more information, see Data resources in UI Builder.
6. Add and bind scripts to components in your custom detail UI to dispatch events by using an event handler to execute, skip, or mark complete a recommendation with a corresponding payload.

Detail experience events

Events handled	Description
GUIDANCE_ACTION_CLICKED	The action that is selected. This event passes the action selected to the payload. `api.emit( 'GUIDANCE_ACTION_CLICKED',{ model: { fields: [{'name': 'input', 'value': '100'}] }, action: api.context.props.guidanceActions.find(action => action.label == "guidance action label"); } );`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Events handled	Description
	Note: In the `guidanceActions[n]` property in the response, provide the index number of the action that you want to apply.
SKIP_GUIDANCE	Skips the guidance. `api.emit( 'SKIP_GUIDANCE' );`
GUIDANCE_MESSAGE_PUBLISHED	Passes data to an upstream application. `api.emit( 'SN_GUIDANCE_EXPERIENCE_CONNECTED#GUIDANCE_MESSAGE_PUBLISHED', { name:'decision-tree-payload' jsonPayload: jsonObject } );`
GUIDANCE_MARK_COMPLETE	Marks a custom guidance as completed. `api.emit( 'GUIDANCE_MARK_COMPLETE' );`
GO_BACK_GUIDANCE	Goes back to the previous node in a decision tree. `api.emit( 'GO_BACK_GUIDANCE' );`
ACTION_TRIGGERED_PROPAGATION	Enables you to add UI specific behavior for guidance actions. This event propagates the payload details to the parent where this event can be handled. `api.emit( 'SN_NEXT_BEST_ACTION_LIST_CONNECTED #ACTION_TRIGGERED', { "actionSysId":api.context.props.guidanceId, "actionName": api.context.props.actionConfigurations[api.context.props.guidanceId]["actionName"] "actionType": "guidance", "eventName": "<eventName>", "payload": {}`

For more information, see Define and bind client scripts to components.

Create a resource generator in Recommended Actions

Create resource generators that you can use to provide resources for recommendations from Recommended Actions.

Before you begin

The Task Intelligence Admin Console (com.sn_ti_admin) plugin must be installed for selecting the Task Intelligence Classification resource generator type.

Role required: sn_nb_action.next_best_action_author, sn_nb_action.resource_generator_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Resource Generators**.
2. Select **New** from the Resource Generators list.
3. In the **Name** field, enter a name for the resource generator.
4. In the **Context** field, select a context.
5. In the **Generator type** field, select a generator type.
   Different types of generators are available that you can use. Some of the generator types require an additional selection in the **Generator** field.

   For example, if you choose flow as the generator type, you must also select the specific flow to use. Selecting the lookup icon opens a pop-up window that you can use to select the required flow.

   For more information, see Resource generator types.
6. If applicable, in the **Generator** field, select a generator.
7. Save the record.
8. On the Generator input form, fill in the fields.
   For a description of the field values, see Resource generator inputs form.

   The fields that appear in this form section are determined by the selections in the **Generator type** and **Generator** fields.
9. Select **Update**.

Resource generator inputs form

The form provides information about the generator type and generator inputs.

Resource Generators form fields

The Task Intelligence Admin Console (com.sn_ti_admin) plugin must be installed for selecting the Task Intelligence Classification resource generator type.

Note:

- You can enter static values for the generator input fields. If the **Generator type** is Flow or Decision table, you can use the pill picker to select dynamic values. The context record is available for selection in the pill picker.
- If the context inputs are defined for a context, they appear in the pill picker for selection. The context inputs are supported for Flow and Decision table generator types only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generator input form

Generator type	Generator inputs	Description
Flow	Generator	The subflow for the resource generator.
	Inputs for flow	Inputs for the selected subflow.
Decision table	Generator	The decision table for the resource generator.
	Inputs for decision table	Inputs for the selected decision table.
Similarity	Similarity definitions	The similarity solution definition to find records that are relevant to the context record.
	Top N Results	The number of records to return from the most relevant records found by the similarity solution definition.
Scripting	Script include	The script include record, which is an implementation of the ScriptingGeneratorFactory template.
AI search	Search field	The context field on which the AI search is performed.
	Top N results	The number of records to return from the AI search.
Similarity with Trend	Similarity definitions	The similarity solution definition to find records that are relevant to the context record.
	Trend definitions	The trend definition you want to associate with this solution definition.
Classification	Classification definition	The classification definition with a classification solution to return the predicted values or record references for a field on a table.
	Top N Results	The number of values or records to return from the values or records predicted by the classification definition.
Task Intelligence Classification	Solution	The solution record that contains configuration for recommended input fields and recommended output fields for prediction. The solution also contains preferences whether the fields are auto-filled or recommendation messages are displayed.
	Top N Results	The number of values or records to return from the relevant records predicted by the solution definition.

Configure the arbitration parameters in Recommended Actions

Configure the recommended actions by the frequency of issues or by the order of priority so that your agents get the guidance that they must help resolve customer issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_nb_action.next_best_action_author

About this task
A mathematical formula determines the priority of the recommended actions that are displayed to the agents. For most cases, you should use the default values to ensure that the relevant recommended actions are available for a given context. If you want to alter the frequencies, you can modify the values.

The recommended actions in the New state appear by ranking. For example, the score for these actions is calculated by the order of frequency and the priority order of the rule.

Procedure
1. Navigate to **All** > **Recommended Actions** > **Arbitration Configuration**.
2. On the Arbitration Configuration form, fill in the fields.

Arbitration Configuration form

Field	Description
Rule Order Weight (sn_nb_action.rule_order_weight)	Weight given to an action based on the priority of the rule that recommends it. The default value is 0.9.
Recommendation Order Weight (sn_nb_action.recommendation_order_weight)	Weight given to an action based on the priority of the rule that recommends it. The default value is 0.9.
Frequency Weight (sn_nb_action.frequency_weight)	Weight applied based on the number of times an action is recommended across rules. The default value is 1.5.

3. Select **Save**.

Configure force refresh for recommendations

Configure the *Trigger Recommendation Refresh* data broker to refresh and update the recommendations based on the results from UI events for precise recommendations. Similarly, use the `ForceRefreshRecommendations` method for configuring an explicit refresh mechanism.

Before you begin
Role required: sn_nb_action.next_best_action_author, or admin

About this task
Prior to the Zurich family release, the recommendations often remain outdated due to refresh triggers being tied only to updates on primary context records. Starting with the Zurich family release, you can configure explicit and event-driven refreshes for various context updates beyond just the primary context table to improve recommendations relevance.

- Explicit refresh mechanism: Enables you to trigger recommendation refreshes manually, independent of internal context changes, addressing scenarios where event-driven updates are insufficient.

  Call the `ForceRefreshRecommendations` method. The `ForceRefreshRecommendations` method is shipped with the base system as part of the *NextBestActionServiceImpl* script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`ForceRefreshRecommendations` method:

```
sn_nb_action.NextBestActionService().forceRefreshRecommendation
s(input.ruleContextSysIds, input.currentRecordSysId,
 input.refreshAllUsers);
```

- Event-driven refresh: Implements automatic recommendations updates triggered by predefined system events such as attribute changes on related tables or user interactions like button clicks or tab navigation.

  Configure the *`Trigger Recommendation Refresh`* data broker of a UI component in the UI builder. This data broker is shipped with the base system and is available for all the UI components of the record pages. Perform the following steps to configure this data broker.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI builder**.
2. In the UI builder, open the **Workspace** experience which you want update.
3. Open the record page containing the UI component for which you want to configure the data broker.
4. In the content tree, select a UI component.
   A panel opens on the right with Configure, Style and Events tabs.
5. In the Events tab, select **Execute Data Resource - Trigger Recommendation Refresh 1**.
6. On the Configure modal, set the following properties.

Configure modal

Property	Description
Rule Context SysIds	Sysid of the rule context records that must be applied to the UI component. The recommendations of these rules are reflected in the recommendations tab when the event is triggered. This property is of String array type.
Current Record SysId	Sysid of the record to which you want to associate the UI event. This property is of String type.
Refresh All Users	Refreshes recommendations for all the active agents, when set to true. By default, the value is set to false. This property is of Boolean type.

7. **Optional:** In the **When to trigger** drop-down, select one of the following.

8. Select **Apply** in the Configure modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
When the configured component is triggered, the recommendations are refreshed and updated accordingly in the CSM/FSM Configurable Workspace.

Configuring AI search in Recommended Actions

As an admin, configure AI search in Recommended Actions to enable agents to perform an AI search to find relevant resources.

You can configure AI search in Recommended Actions by performing these procedures.

Steps to configure AI search

Step	Action
Enable the AI search tab in UI builder	Deselect the **Hide Search** button in UI Builder to display the AI search tab in the contextual side panel of your workspace.
Create a context and select a search application configuration	• Create a context so that agents can see recommendations for records from a specific table, such as the Case table. • Select a search application configuration to specify AI search as the search engine. This configuration includes search sources and genius result configurations.
Map AI search results with guidance inputs in Recommended Actions	Map AI search results with guidance inputs to enable the AI search results to be displayed with appropriate actions.
Automatically map AI search results with guidance inputs	Automatically create AI search results for a search configuration application in Recommended Actions.

Configuring genius results

In the search profile of your selected search application configuration, link the following Genius Result configurations to display actionable top results. For more information, see Link a Genius Result configuration to a search profile.

Genius Result configuration	Description
Catalog item	Displays top search results from the Catalog Item [sc_cat_item] table. Each answer card shows a single CI record.
People	Displays top search results from the User [sys_user] table. Each answer card shows a single user record.
Q&A	Displays top search results extracted from HTML fields of records on the Knowledge [kb_knowledge] table and tables that extend it. Each answer card shows a topic snippet and an answer snippet extracted from a single knowledge article.
Now Assist Q&A	Displays the top search results extracted from the HTML fields of the records on the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Genius Result configuration	Description
	Knowledge [kb_knowledge] table and the tables that extend it. Each answer card shows an answer snippet extracted by Now LLM from a knowledge article. For reference, the answer card also includes a link the user can select to view the source knowledge article. **Note:** Now Assist in the AI Search application (com.ais_assist) is required to link the Now Assist Q&A Genius Result configuration to your search profile. For more information, see Now Assist in AI Search.

Customizing Recommended Actions UIB component for AI search

Customize the Recommended Actions UIB component to align with your organization's requirements:

- Modify titles for the main heading, Recommended Actions tab, and Search tab.
- Modify the order of the **Recommended Actions** and **Search** tabs.
- Hide or show Recommended Actions and Search tabs.

For more information, see Recommended Actions UIB setup.

Explore advanced customization options, such as adjusting the number of results to view on a page, identifying genius results to add to the search profile, and configuring search sources. For more information, see Configuring AI Search.

Map AI search results with guidance inputs in Recommended Actions

Create mappings between AI search results and guidance inputs to recommend relevant actions to agents using AI search or enable agents to use AI search to search for the relevant resources.

Before you begin

Role required: sn_nb_action.next_best_action_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select a context for the AI search.
   If a message appears about the application scope, select **here** to be able to edit the record.
3. In the **Search Application Configuration** field, select the Lookup using list icon and select either the base system CSM Configurable Workspace Search Config or a custom configuration that specifies AI search as the search engine and contains your desired search settings.
   You can configure the search result display and refinement settings in the search application configuration. For more information, see Search application configurations.

   The **[CSM AIS] Configurable Workspace Search Config** search application configuration is provided with the CSM Configurable Workspace store application. To access this configuration, navigate to **AI Search** > **Search Experience** > **Search Applications**.
4. In the Search result mapping related list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Action type** field, select Guidance as an action type.
6. In the **Action** field, select an action to associate with the guidance.
   The available actions are determined by the selection in the **Action type** field.

   a. In the **Action** field, select the Lookup using list icon ( ).
      In the resulting pop-up window, the **Table name** field is auto-populated with the table that stores the available actions for the selected action type.

   b. In the **Document** field, select the Lookup documents using list icon ( ) and then select the action.

   c. Select **OK**.

   d. Save the record.
      Saving the record displays the required action inputs.

7. Configure the AI search result type.

8. Save the record.
   The AI search parameters display in the pill picker.
9. Map the action inputs.
   Action types and actions need inputs. These parameters enable agents to complete an action. You can choose static values for action inputs or you can use the pill picker to supply dynamic values.

10. Select **Update**.

Automatically map AI search results with guidance inputs in Recommended Actions

Automatically create AI search results for a search configuration application in Recommended Actions.

Search application configuration records specify the search engine and settings to use for search in Recommended Actions. When you choose AI search as an application's search engine, you can configure the search results and map them to specific actions.

Starting with the Yokohama release, the Recommended Actions application automatically creates the mapping between search results and actions.

When an admin creates or updates the search application configuration for a context record, the system automatically creates search result mapping records for each of the search sources in that configuration.

- If a search source does not have an existing mapping to an action, the system maps the search source to the Default guidance for search results guidance.
- If a search source has an existing mapping to a specific action, the system keeps that mapping and does not overwrite it with the default guidance.

Mapping records are stored in the Search result recommended action mapping table (sn_nb_action_search_result_ra_mapping) and are displayed in the Search result mapping related list on the context record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a context record is saved or updated and search result mappings are created, the system displays a message: "Based on the selected Search Application Configuration the Search Result Mapping list has been updated. Please review!"

Adding new search sources

Admins can add search sources to the search profile of a search application configuration. If a new search source is added to the configuration selected for a context record, the system does the following:

- Creates a new record in the Search result to recommended action mapping table (sn_nb_action_search_result_ra_mapping) for the added search source.
- Maps the search source to the Default guidance for search results.

When a search source is deleted from the search profile, the system removes the corresponding record from the Search result to recommended action mapping table (sn_nb_action_search_result_ra_mapping).

Refreshing the Search result mapping related list

The system stores search result mapping records in the Search result to recommended action mapping table and displays them in the Search Result Mapping related list on the context record.

The Search Result Mapping related list includes a **Refresh** button that admins can use to create search result mapping records for the search sources within a selected search application configuration in a context record. Selecting **Refresh** generates mapping records for any missing search result mappings in the search application configuration and associates them with the Default guidance for search results guidance.

Note:
Refreshing the Search Result Mapping list does not override existing customer-defined mappings.

Newly created mapping records are active by default. Admins can control which search sources are displayed to agents by enabling or disabling the **Active** field on the mapping records.

Search result recommended action mapping table

The Search result recommended action mapping table (sn_nb_action_search_result_ra_mapping) stores the mapping between search sources and actions. Records in this table include an **Active** field which the admin can use to manage the activation state of search result mappings. When a new record is created in this table, the **Active** field is set to true by default.

When an agent performs a search in the Recommended Actions search component in CSM Configurable Workspace, the system displays the search sources that are marked as active in the search result mapping configuration. Inactive search sources are excluded from the search results.

Changes in the search result mapping, such as activating or deactivating a search source, are automatically reflected in the search results.

When the **Active** field is disabled for a search source, an admin can create a new mapping for that source. A search source can have multiple search result mapping records, but only one can be active at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditional UI display for search result mapping

The Recommended Actions context record includes the **Search application configuration** field. When an admin selects a configuration in this field, the search result mapping records for the configuration are displayed in the Search result mapping related list. If the **Search application configuration** field is empty, the Search result mapping related list does not appear on the context record.

Enable AI search in Recommended Actions

As an admin, you can enable the Recommended Actions - AI search on the Front-line case page, CSM default record page, and CSM Interaction page (for chat, video, walk-up, and email channels) by setting the **hideAgentAssistShowRA** UX page property to true.

Before you begin

Role required: admin

About this task

The Recommended Actions - AI search is available for the following pages:

- CSM default record page
- Front-line case page
- CSM Interaction record page for chat, video, email, and walk-up channels

The following table shows how you can avail Recommended Actions - AI search feature:

Recommended Actions AI search - version compatibility

Version	Feature availability
New customers starting with Yokohama release	Recommended Actions - AI Search is an integral part of the Contextual Side Panel by default. No additional manual configuration is required.
Customers who on-boarded before Yokohama release	Agent Assist is enabled by default with the option to manually migrate to Recommended Actions - AI search. To migrate from Agent Assist to Recommended Actions - AI Search create and set the *hideAgentAssistShowRA* UX page property to `True`. **Note:** If you already created this property for enabling Recommended Actions in the chat interaction record, you need not create it again.

Procedure

1. Navigate to **All**.
2. Search for `sys_ux_page_property.LIST` and press Enter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the *hideAgentAssistShowRA* UX page property already exists, you need not create it again.

3. Select **New**.
4. Fill in the fields on the form.

UX page property form

Field	Description
Page	Page for which the property is applicable. Select `CSM/FSM Configurable Workspace`.
Name	Name of the page property. Give the name as `hideAgentAssistShowRA`.
Type	True or False
Value	Enables or disables the property. Set the value to `true` to enable the property.
Application	Application scope in which the property is being created.
Description	Brief description of the UX page property that you are creating.

5. Select **Save**.

Enable full view search for Recommended Actions in a configurable workspace

The full view search feature displays the AI search results in a new subtab with an expanded view. Use the following information to enable this feature in any configurable workspace.

Before you begin
Role required: admin

About this task
AI search results appear in the Recommended Actions tab in the contextual side panel in the form of guidances that you can act on. Selecting the Full view search icon displays the AI search results in a new subtab with an expanded view.

When a user selects the Full view search icon, the Recommended Actions application dispatches an event called **RECOMMENDED_ACTIONS#ACTION_CLICKED** with a type of **raExpandedSearch**. This event needs to be handled in the corresponding team layer that wants to uptake the full view search page. The following code snippet provides an example about how to navigate to the page with the correct properties.

```
if (event.payload.actionProps.type == 'raExpandedSearch') {
          const { contextTable, contextId, contextSysId,
searchTerm,selectedFilterTab,selectedFacetOptions,
selectedSortOption,actionConfigurations } =
 event.payload.actionProps;
          helpers.navigate.to('ra-expanded-search',
 { 'contextTable':
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
contextTable, 'contextId': contextId }, {'contextSysId':
 contextSysId,
'searchTerm': searchTerm, 'selectedFilterTab':
 selectedFilterTab,
'selectedFacetOptions': selectedFacetOptions,
 'selectedSortOption':
selectedSortOption, 'actionConfigurations':
JSON.stringify(actionConfigurations)}, false, false, 'current');
      }
```

Use the following steps to define the full view search page in a configurable workspace.

Procedure

1. Navigate to UI Builder and select your workspace experience.
2. Create a new page with the following URL path: **ra-expanded-search**.
   This is the path that you will use in the above script to open the full view search page. For more information, see Create a blank page in the UI Builder documentation.
3. Select the following required parameters for the page.
   - contextTable
   - contextId
4. **Optional:** Select the following optional parameters for the page.
   - contextSysId
   - searchTerm
   - selectedFilterTab
   - selectedFacetOptions
   - selectedSortOptions
   - actionConfigurations
5. Open the page variant that you created in step 2 by navigating to the **sys_ux_screen.list** and selecting the page variant from the UX Screens list.
6. Use a copied version of the page definition created by RA for full view search.
   For example, **Recommended Actions Expanded Search Default (sysId - b646da9443a8c2108d82c8641ab8f2f3**.

   Note:
   It's not advised to use the mentioned page definition directly.

7. Create a viewport inside the page variant to load the guidance detailed experience to make it work in the full view search page.
   a. Create an app route record by navigating to **sys_ux_app_route.list** and selecting **New**.
   b. Fill in the fields based on how you have configured the full view search page.
   c. Select **Submit**.

   Note:
   Be sure to use a different route/parent macroponent composition element ID to avoid any conflicts with the CSM Recommended Actions Full View Search page.

Recommended Actions for Service

Use Recommended Actions for Customer Service to display relevant actions to agents based on the context of a record.

Important:
Starting with v31.0, the Recommended Actions for Customer Service plugin has been renamed to Recommended Actions for Service.

The Recommended Actions for Service application displays recommendations for case records in CSM Configurable Workspace. Agents can take the actions provided by the recommendations to help customers and resolve their issues. Agents can also use this application to perform an AI search to find relevant resources.

The Recommended Actions for Service application provides predefined guidances and recommendation context records tailored for Customer Service Management. It also provides workspace configurations that automatically display recommended actions and search results in the contextual side panel.

For more information about recommended actions and AI search results, see Recommended Actions.

Context records

The Recommended Actions for Service application provides context records for the Case and Interaction tables. A context enables agents to see recommendations for records from a specific table when certain rules are met.

- Case Context record
- Interaction Context record

Guidances

The Recommended Actions for Service application includes custom guidances for the following tables:

- Knowledge
- Case
- Incident
- Problem
- Change Request

These guidances enable search results from the corresponding search source tables for the Case Context record. Customer service agents can see these results in the Recommended Actions tab in the contextual side panel.

Plugin

The Recommended Actions for Service application (sn_cs_nb_action) is available from the ServiceNow Store.

This application has a dependency on the Recommended Actions application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Contexts in Recommended Actions for Customer Service

A context enables agents to see recommendations for records from a table when certain rules are met. These recommendations can help agents by suggesting actions to take based on the record context.

The Recommended Actions for Customer Service application provides context records for the Case and Interaction tables.

Case Context record

The Recommended Actions for Customer Service application provides the Case Context record for the Case table.

Context records include rules and recommendations. The Case Context record also includes search result mapping records for the search source tables. The following tables are mapped to specific guidance actions:

- Knowledge
- Case
- Incident
- Problem
- Change Request

The remaining tables are mapped to the Default guidance for search results guidance action.

Interaction Context record

The Recommended Actions for Customer Service application includes a context record and search mapping record that automatically displays search results from the Knowledge table for chat interaction records.

The Interaction Context record enables search based on the short description of the interaction record and displays relevant articles. The search mapping record maps knowledge results to the **Share KB in chat interactions** guidance. During chat interactions, the system accurately displays knowledge results in the Search tab in the contextual side panel.

The Recommended Actions for Customer Service application also includes a search mapping record that maps all search source tables, with the exception of the Knowledge table, to the Default guidance for search results guidance action. During chat interactions, the system accurately displays results for the search source tables in the Search tab.

Follow these steps to enable recommendations in the contextual side panel for chat interactions:

1. Navigate to **All** > **Recommended Actions** > **Contexts** > **CSM Interaction context**.
2. Enable the **Active** check box.
3. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fix script

The Recommended Actions for Customer Service application includes a fix script that checks for existing context records associated with the same table as the Interaction Context record.

- If one or more records for the same table are found, the Interaction Context record is deactivated.
- If no existing context records for the same table are found, the Interaction Context record remains active.

This avoids duplicate or conflicting context records.

Activating or deactivating context records

When activating or deactivating context records, the system displays alert messages so that contexts can be managed effectively without causing conflicts.

If multiple contexts are activated for the same table, the system alerts the admin to specify the correct **contextSysID** property in the Recommended Actions component on record pages for the referenced table.

If an admin activates multiple contexts for the same table, the system displays a message advising the admin to specify the correct **contextSysID** property on the Recommended Actions component for all record pages that reference this table.

The message includes information about how to configure the **contextSysID** property on the Recommended Actions component and what happens if the correct context is not specified.

The system logs all context activation and deactivation events along with the displayed alerts.

Guidances in Recommended Actions for Customer Service

A guidance is an action that an agent can take or information that an agent can share as they work to resolve tasks, such as customer service cases. Guidances appear as cards in the contextual side panel in a workspace.

The Recommended Actions for Customer Service application includes custom guidances for the following tables:

- Knowledge
- Case
- Incident
- Problem
- Change Request

These guidances enable search results from the corresponding search source tables for the Case Context record. Customer service agents can see these results in the Recommended Actions tab in the contextual side panel.

Knowledge guidance

The Case Context record includes a search result mapping record for the Knowledge table that maps search results to the Attach and share article guidance. When an agent is viewing a case record, preview cards for Knowledge search results in the Recommended Actions tab include the **Attach and share article** action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case guidance

The Case Context record includes a search result mapping record for the Case table. This record maps search results from the Case table to the **Case resolution guidance**.

The Case resolution guidance is configured with dynamic actions that are determined by the state of the case returned by the search. These actions include:

- **Link as parent case**: This action links the recommended case as a parent to the current case. (The current case is a non-major case and the recommended case is major/non-major).
- **Link as child case**: This action links the recommended case as a child to the current case. (The current case is a major case and the recommended case is a non-major case.)
- **Copy resolution**: This action copies the resolution code and resolution notes from the recommended case to the current case. This action is available when the recommended case is in the Closed or Resolved state.

Note:
If the current case and the recommended case are both major cases, no action is included on the preview card.

The preview card for the case resolution guidance includes the case title and number, the current state and priority, the case description, and the dynamic action.

Interaction guidance

The Case Context record includes a search result mapping record for the Incident table. This record maps search results from the Incident table to the **Link incident to current case** guidance.

Agents can link the recommended incident by selecting the **Link incident** action on the preview card in the Recommended Actions tab. This action does the following:

- Updates the **Incident** field on the case record with the incident number.
- Adds an entry to the work notes.
- Displays a message when the incident is successfully linked. A message is also displayed if the linking fails.

The preview card for the **Link incident to current case** guidance includes the incident title and number, the current state and priority, and a brief description of the incident.

Problem guidance

The Case Context record includes a search result mapping record for the Problem table. This record maps search results from the Problem table to the **Link problem to current case** guidance.

Agents can link the recommended problem by selecting the **Link problem** action on the preview card in the Recommended Actions tab. This action does the following:

- Updates the **Problem** field on the case record with the problem number.
- Adds an entry to the work notes.
- Displays a message when the problem is successfully linked. A message is also displayed if the linking fails.

The preview card for the **Link problem to current case** guidance includes the problem title and number, the current state, the number of related incidents, and a brief description of the problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change request guidance

The Case Context record includes a search result mapping record for the Change Request table. This record maps search results from the Change Request table to the **Link change request to current case** action.

Agents can link the recommended change request by selecting the **Link change request** action on the preview card in the Recommended Actions tab. This action does the following:

- Updates the **Change Request** field on the case record with the change request number.
- Adds an entry to the work notes.
- Displays a message when the change request is successfully linked. A message is also displayed if the linking fails.

The preview card for the **Link change request to current case** guidance includes the change request title and number, the current state, the risk level and type of change, and a brief description of the change request.

Recommended Actions in the chat interaction record

The Recommended Actions feature is available by default in the contextual side panel for chat interaction records.

This feature appears as the first tab in the contextual side panel and is available for interactions of type chat.

The Recommended Actions feature is enabled by default for new (zboot) customers. This feature replaces Agent Assist, which is disabled from the contextual side panel.

The Recommended Actions feature includes two tabs:

- Recommendations: displays relevant actions based on the context of the chat interaction record.
- Search: displays relevant search results based on the short description of the chat interaction record.

hideAgentAssistShowRA UX page property

Enabling Recommended Actions for chat interaction records is controlled by the **hideAgentAssistShowRA** UX page property, which is only available for new customers.

Existing customers that want to disable Agent Assist in the contextual side panel and enable Recommended Actions can create this UX page property.

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. Select CSM/FSM Configurable Workspace.
3. Select **New** in the UX Page Properties related list.
4. Create the property with the following values:
   a. Name: hideAgentAssistShowRA
   b. Type: true | false
5. Set the property to true.
6. Select **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended Actions component contextSysId property

The Recommended Actions (RA) component includes the contextSysId property, which determines the rules and data sources that are evaluated to provide recommendations and search results. This property is automatically set to the default context for case records and displays accurate recommendations and search results on the Front-line case page.

This change to the contextSysId property only applies to new customer instances where the Recommended Actions component is added to the Front-line case page. Existing customers are not impacted.

Machine learning solutions for Customer Service Management

Machine learning in Customer Service Management helps with case creation, assignment, and resolution.

Task Intelligence for Customer Service	Use the following AI capabilities to automate several routine tasks across the case life cycle and enable agents to focus on complex case resolution. • Record categorization • Sentiment analysis • Language detection • Document intelligence
Predictive Intelligence for CSM solution definitions	Use predictive intelligence solution definitions to assist agents with a variety of tasks. Solution definitions predict one or more output fields based on a configured input field.
Trending case topics	Identify clusters of cases with similar issues and pinpoint factors that drive up case volume. Each cluster of cases represents a trending case topic.
Similar case recommendations	Enable customer service agents to easily find similar cases that can provide helpful information about cases they are currently working on.
Estimated time to resolve a case	Predict the estimated time to resolve a case based on attributes such as the case short description, category, priority, and assignment group.
Predictive Intelligence for case management	Predict values for a case, such as the category, priority, and assignment group, based on information entered in the short description.
Auto-responder notifications	Use auto-responder notifications to share relevant content in email notifications that can help deflect cases.

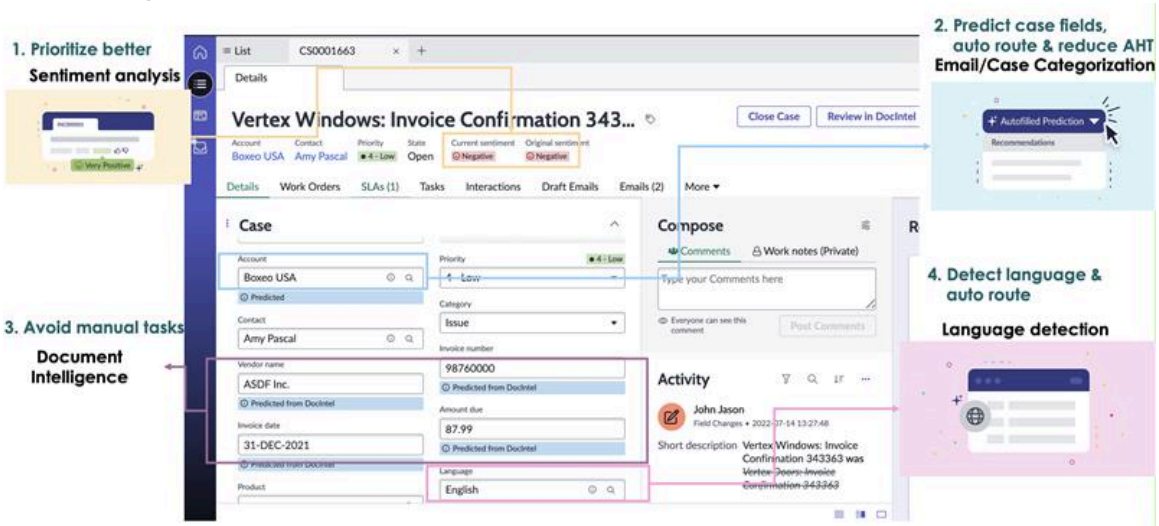
Task Intelligence for Customer Service

Task Intelligence for Customer Service offers several AI capabilities such as language detection, record categorization, Sentiment Analysis, and Document Intelligence. These capabilities automate several routine tasks across the case lifecycle and enable agents to focus on complex case resolution.

Task Intelligence features on the Case form



Task Intelligence for Customer Service features

Feature	Description
Record categorization	Task Intelligence for Customer Service provides the following types of categorization: • **Multi-lingual record categorization**: Use a machine learning model that understands English, French, German, and Spanish to evaluate text in emails and records created in different languages and to predict and automatically populate fields on records in the Case table, tables that extend the Case table, and the Interaction table. This feature uses one machine learning model to support multiple languages so you no longer need one model per language. The model can also support additional languages on demand. • **Attachment-based record categorization**: Use a machine learning model to parse email or record text and attachments and automatically populate fields on case and interaction records based on signals contained in the text. This feature evaluates text in the email subject and body, the record short description and description, and the attachments and uses all of this information to predict field values. As a result, you can integrate predictions with any routing engine and automatically route records to the appropriate service desk based on these values.

Task Intelligence for Customer Service features (continued)

Feature	Description
Sentiment Analysis	Detect and display the initial and ongoing sentiment of customer service cases by evaluating the following text: • Email subject and body • Case short description and description Help agents gauge customer emotions and better prioritize their work while enabling them to provide more empathetic and compassionate customer experiences. Sentiment Analysis is currently available in English.
Language detection	Identify the language used to create a customer service case and add the language to the **Language** field for the case record. This feature can identify up to 20 different languages. Add the identified language to the case as a skill, which is stored in the Task Skills table. This table can be configured as a related list on the Case form. Use the identified language to route cases to assignment groups and agents with the necessary language skills.
Document Intelligence	Document intelligence reduces the time needed to resolve the case by automating some of the routine case tasks, which enables agents to focus on more complex case resolution. Extract relevant information from PDF and image files, such as credit card numbers, vendor names, or customer addresses, and add that information to fields on the case.
Task Intelligence Admin Console	The Admin Console provides a business friendly interface that you can use to create, train, and deploy machine learning models to predict field values for records, extract sentiment, and detect language. The models provide flexible options to either auto-fill values on the records or to provide recommendations only, depending on the sensitivity of those fields. An option is also available to run the model in the background only for monitoring purposes.
DocIntel Admin experience	The Document Intelligence application includes the DocIntel Admin experience, which provides an easy-to-use interface that you can use to do the following: • Create and configure document processing use cases • Monitor the performance of Document Intelligence use cases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task Intelligence for Customer Service features (continued)

Feature	Description
	For more information, see Create a Document Intelligence use case.
Similar case recommendation	Use the Similar Case Recommendation feature to quickly locate similar cases that offer valuable insights into the current issue. Also, use this feature to suggest cases that might be related to major problems, helping you provide more informed and efficient support.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Task Intelligence for Customer Service application

The Task Intelligence for Customer Service application (com.snc.csm_ml_task) is available from the ServiceNow Store. This application has the following plugin dependencies:

- Predictive Intelligence for Customer Service Management (com.snc.csm_ml)
- Customer Service (com.sn_customerservice)
- Skills Management (com.snc.skills_management)
- Dynamic Translation (com.glide.dynamic_translation)
- ServiceNow Language Detection Service Spoke (com.glide.language_detection_spoke)
- Predictive Intelligence - Task Intelligence (com.glide.platform_ml_task)
- Admin Center for Task Intelligence (com.sn_ti_admin)

Configuring Task Intelligence for Customer Service

After installing the Task Intelligence for Customer Service application, you can configure the different features and use the Task Intelligence Admin Console to create models. For more information, see:

- Install and configure Task Intelligence features
- Set up and deploy Task Intelligence models

Using Task Intelligence for Customer Service

Use the Task Intelligence features to complete the following tasks:

- Create field prediction and sentiment models for case and interaction records
- Review and submit values extracted by Document Intelligence
- Review Task Intelligence analytics and prediction history

For more information about these tasks, see Use Task Intelligence for Customer Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

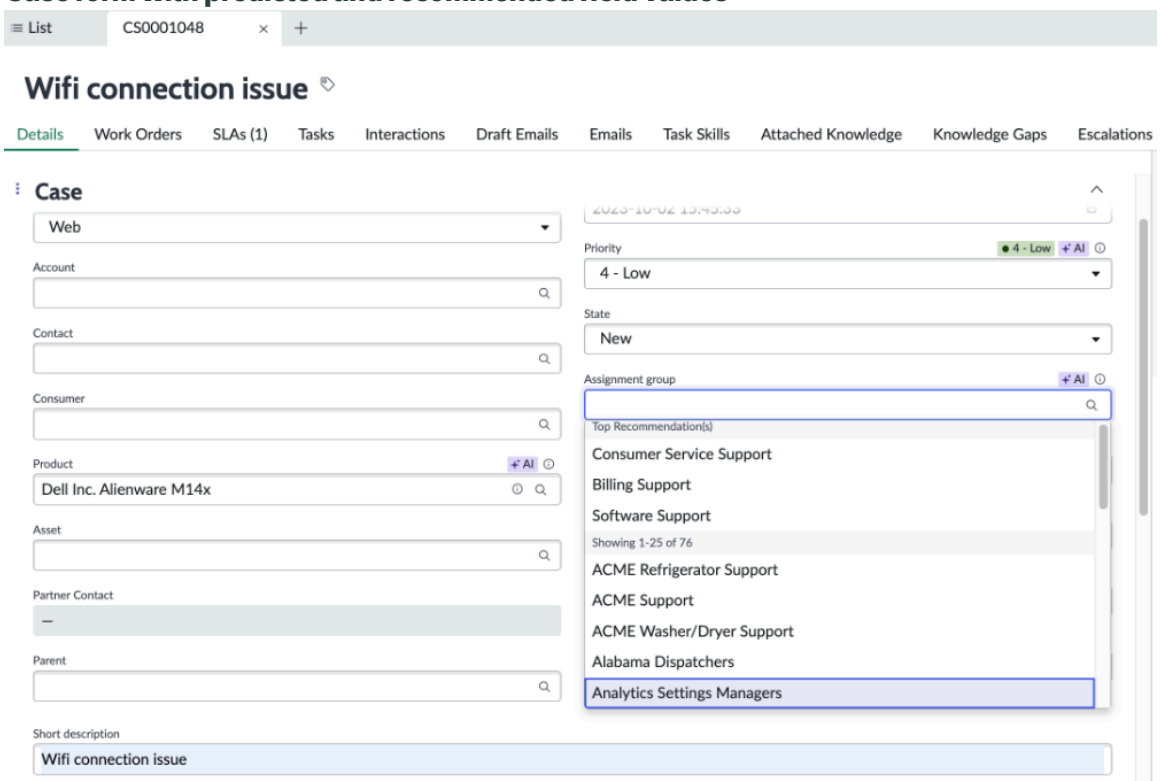
Record categorization

The record categorization feature included with Task Intelligence for Customer Service uses machine learning models to evaluate text, predict field values, and automatically populate fields on case and interaction records.

Record categorization supports multiple languages and can scan attachments in addition to evaluating text from emails and records. Use this feature to categorize cases, case types, and interactions from multiple channels including email, web, and chat.

You can use the results of the categorization to automatically route records to the right service desk, which avoid the need for multiple email inboxes and RPA bots. Auto- routing also frees up your employees to work on other tasks.

Case form with predicted and recommended field values



Predicted field values

On case and interaction records, the fields that contain predicted values are identified with an AI icon and label (AI). These fields also include an information icon that displays a message with additional context about the predicted values.

Note:
in CSM Configurable Workspace, the AI icon is persistent over the life-cycle of the record. In Core UI, the AI icon is removed when the agent changes the field value.

In CSM Configurable Workspace and Core UI, the fields on the record that contain predicted values are identified with the *Predicted* or **Recommended** messages.

Recommended field values

Fields that are predicted by AI include recommended values. When an agent selects a predicted field, the system displays a drop-down list that includes the top three recommendations at the top of the list followed by all other values. This feature is available for the following types of fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Choice lists
- Single lookup
- Multi lookup
- Single and multi text fields

If the top three recommendations aren't available, the system displays a message in the Top Recommendations section of the dropdown list that no predictions are available. The other values follow this message.

The agent can select any value from the dropdown list, either one of the top three recommended values or one of the other values. The agent can also type in the field and filter the results in the dropdown list, except the top three recommendations which are always displayed.

Note:
The top three recommendations remain in the dropdown list through the case life cycle regardless of the selected field value.

Filtering inactive field values from predictions

Enable the *sn_csm_ml_task.case.categorization.enable_inactive_filter* to remove inactive field values from predictions. The default setting for this property is false.

AI prediction banner

When a case record includes a categorization prediction, the system displays a banner at the top of the record. The banner is displayed when there is atleast one field with auto-fill predictions in categorization models. The banner is displayed for records in the Case table and extensions of the Case table.

Note:
The banner is displayed in CSM Configurable Workspace and in the Core UI.

The system displays the banner when there is at least one field with an auto-fill prediction in categorization models or when one of the extracted fields hasn't been reviewed by the agent. The banner is displayed for records in the Case table.

Note:
If the agent changes the predicted value, the banner is removed. If all predicted fields are recommended, the banner isn't displayed.

The banner can be enabled or disabled by the *sn_csm_ml_task.ui.banner.enabled* system property.

Prediction feedback

The system stores feedback on prediction results in the Predictor Result [ml_predictor_results] table. ml_admin role can access the table and view the results.

- Autofill: A value is considered to be predicted correctly (set to true) if the predicted value and the final value are the same.
- Recommendation: A value is considered to be predicted correctly if any one of the predicted values matches the final value.

The Predictor Result table also stores information about skipped and failed predictions. For more information about this table, see Components installed with Task Intelligence for Customer Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multi-lingual record categorization

Use a machine learning model that understands the following languages to evaluate text in emails and records created in different languages and to predict and automatically populate fields on cases, case types, and interactions.

- English
- French
- German
- Spanish

Multi-lingual record categorization uses one machine learning model that is trained to understand multiple languages. This model can:

- Understand the text in emails and records.
- Evaluate the text and predict field values.
- Add the predicted values to fields on cases, case types, and interactions.

Multi-lingual record categorization can support the following additional languages on demand:

- Arabic
- Chinese (PRC)
- Chinese (Taiwan)
- Dutch
- Italian
- Japanese
- Korean
- Polish
- Portuguese
- Russian
- Thai
- Turkish

Note:
If you must evaluate emails or cases in these additional languages, reach out to the product team for support.

Attachment-based record categorization

Attachments can include valuable signals that help support desks to categorize and route records automatically. To take advantage of attachment information, you can use a machine learning model to parse email and record text and attachments and automatically populate fields on cases, case types, and interactions based on signals contained in the text.

The model can predict information about a case based on:

- Text in the subject line and body of a customer email.
- Text in the short description and description of a case or interaction.
- Text in email and record attachments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The model can be configured to use different fields for prediction.

Attachment-based categorization uses all of this information to predict field values. As a result, you can automatically route records to the appropriate service desk based on these values.

Related topics

Configure record categorization

Task Intelligence Admin Console

Create a model to predict record fields

Sentiment Analysis

Sentiment Analysis can help you gauge customer emotions, enabling you to provide more empathetic and compassionate customer experiences.

Use the sentiment analysis feature included with Task Intelligence for Customer Service to:

- Evaluate email and case text.
- Identify the current sentiment of new cases.
- Identify the ongoing sentiment of updated cases.
- Display this information to agents and managers.

Agents can use current case sentiment to prioritize their work and ongoing sentiment as it trends over time to see if cases are moving in the right direction.

Managers can use sentiment to route cases to agents with the right empathy skills, monitor cases and reassign as needed, and avoid escalations. Manager can also identify coaching opportunities by looking at cases that ended on a negative sentiment.

Note:
In the Zurich release, the sentiment analysis feature can predict sentiment for cases created in English.

Sentiment analysis machine learning models

Sentiment analysis uses a pre-trained machine learning model to evaluate email and case text and predict sentiment. This analysis takes place when a case is created and when it is updated by the customer.

Sentiment analysis for cases

Cases scenario	Description
When a case is created	The sentiment analysis model evaluates the following text to make a prediction: • Text in the subject line and body of emails. • Text in the short description and description of cases. If the model can make a prediction, it returns the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sentiment analysis for cases (continued)

Cases scenario	Description

	• A sentiment label and corresponding sentiment level.
	  ○ Positive (1.0)
	  ○ Neutral (0.5)
	  ○ Negative (0.0)
	• A confidence level for the prediction.
	
	If the model can make a prediction, the sentiment is added to the **Original sentiment** field.
	
	If the model can't make a prediction, the **Original sentiment** is not set.
	
	This system stores the sentiment prediction information in the Predictor Results for Task table.

When a case is updated	The sentiment analysis model evaluates the following text to make a prediction:
	• The text from the body of a reply email.
	• Comments that a customer adds to the case.
	
	If the model can make a prediction, it returns the following information:
	• An updated sentiment label and corresponding sentiment level.
	• A confidence level for the prediction.
	
	The system:
	• Updates the **Current sentiment** field with the current sentiment.
	• Compares the updated current sentiment to the original current sentiment, calculates the change in sentiment, and updates the **Sentiment over time** field.
	  ○ If there is an increase in the score, the **Sentiment over time** field shows Improving.
	  ○ If there is a decrease in the score, the **Sentiment over time** field shows Declining.
	  ○ If there is no change in the score, the **Sentiment over time** field continues to display the previous value.
	
	Note:
	If the **Original sentiment** is Neutral and the **Current sentiment** is Neutral, then the **Sentiment over time** is Neutral.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sentiment analysis for cases (continued)

Cases scenario	Description
	If the model can't make a prediction, no information gets recorded and the value in the **Current sentiment** field remains the same.

For more information about the pre-trained machine learning model, see Create a model to predict case sentiment.

Prediction feedback

The system stores feedback on prediction results in the Predictor Result [ml_predictor_results] table. Users with the ml_admin role can access the table and view the results. For sentiment analysis:

- The default value in the **Predicted correctly** field for each sentiment prediction is set to true.
- The **Final input value** and **Final output value** fields remain empty because sentiment analysis predictions do not collect feedback from agents.

The Predictor Result table also stores information about skipped and failed predictions. For more information about this table, see Components installed with Task Intelligence for Customer Service.

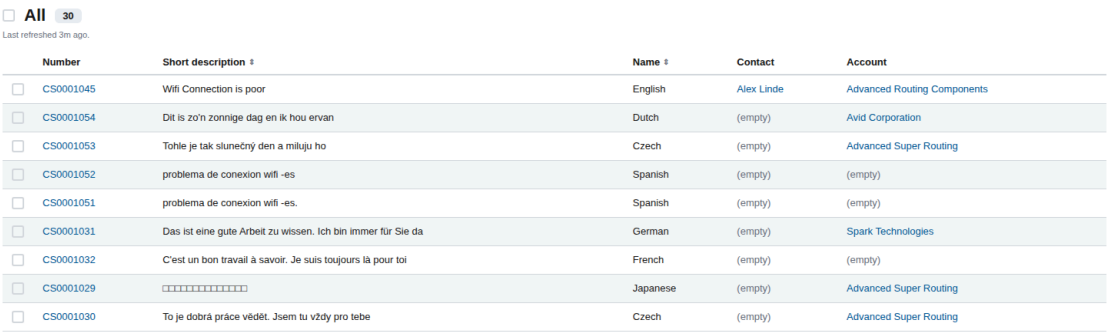
Create a model to predict case sentiment

Language detection

The language detection feature uses a pre-trained model to detect the language used to create customer service cases. You can configure the model to add the language to the **Language** field on the case record and/or add the language as a skill for the case.



All 30

Last refreshed 3m ago.

Number	Short description	Name	Contact	Account
CS0001045	Wifi Connection is poor	English	Alex Linde	Advanced Routing Components
CS0001054	Dit is zo'n zonnige dag en ik hou ervan	Dutch	(empty)	Avid Corporation
CS0001053	Tohle je tak slunečný den a miluju ho	Czech	(empty)	Advanced Super Routing
CS0001052	problema de conexion wifi -es	Spanish	(empty)	(empty)
CS0001051	problema de conexion wifi -es.	Spanish	(empty)	(empty)
CS0001031	Das ist eine gute Arbeit zu wissen. Ich bin immer für Sie da	German	(empty)	Spark Technologies
CS0001032	C'est un bon travail à savoir. Je suis toujours là pour toi	French	(empty)	(empty)
CS0001029	□□□□□□□□□□□□□□□	Japanese	(empty)	Advanced Super Routing
CS0001030	To je dobrá práce vědět. Jsem tu vždy pro tebe	Czech	(empty)	Advanced Super Routing

Agents can save time by not having to manually select the language for each case or rely on a manual process for case routing. You can use the language skill stored in the Task Skills table to route cases to the assignment groups and agents with the necessary language skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cases can be routed automatically with Advanced Work Assignment (AWA).
- Cases can be assigned to agents based on language skills using the assignment workbench.
- Cases can be assigned based on the value in the **Language** field.

Note:
Routing based on detected language must be configured separately.

The language detection feature supports 20 different languages. For details, see Languages supported by Task Intelligence.

Language detection flow

Detecting the language used to create a case is based on a flow, **Task Intelligence Case Language Detected**, which is available with the Task Intelligence for Customer Service application. This flow is triggered at case creation with the condition that at least one of these case fields is not empty:

- Short description
- Description

When a case is created, the system calls the Detect Language action in the Dynamic Translation spoke which evaluates the text and returns the detected language.

If the returned language confidence is above the defined confidence threshold, the system performs a check to see if the language exists in the Languages [sys_language] table. It performs this check by matching the language code to the value in the ID field.

If the language exists in the Languages table, the system does the following, depending on the language detection model configuration:

- Adds the language to the **Language** field in the Case table.
- Stores the prediction results in the Predictor Results for Task table [ml_predictor_results_task].
- Stores the language skill in the Task Skills table [task_m2m_skill].

For more information, see Create a model to detect case language.

Prediction results

The system stores feedback on prediction results in the Predictor Result [ml_predictor_results] table. Users with the ml_admin role can access the table and view the results.

For language detection, the Predictor Result table stores the prediction results from the Language Detection Service spoke. The **Detected Language** field stores the language returned by the Language Detection Services spoke.

The Predictor Result table also stores information about skipped and failed predictions. For more information about this table, see Components installed with Task Intelligence for Customer Service.

Related topics

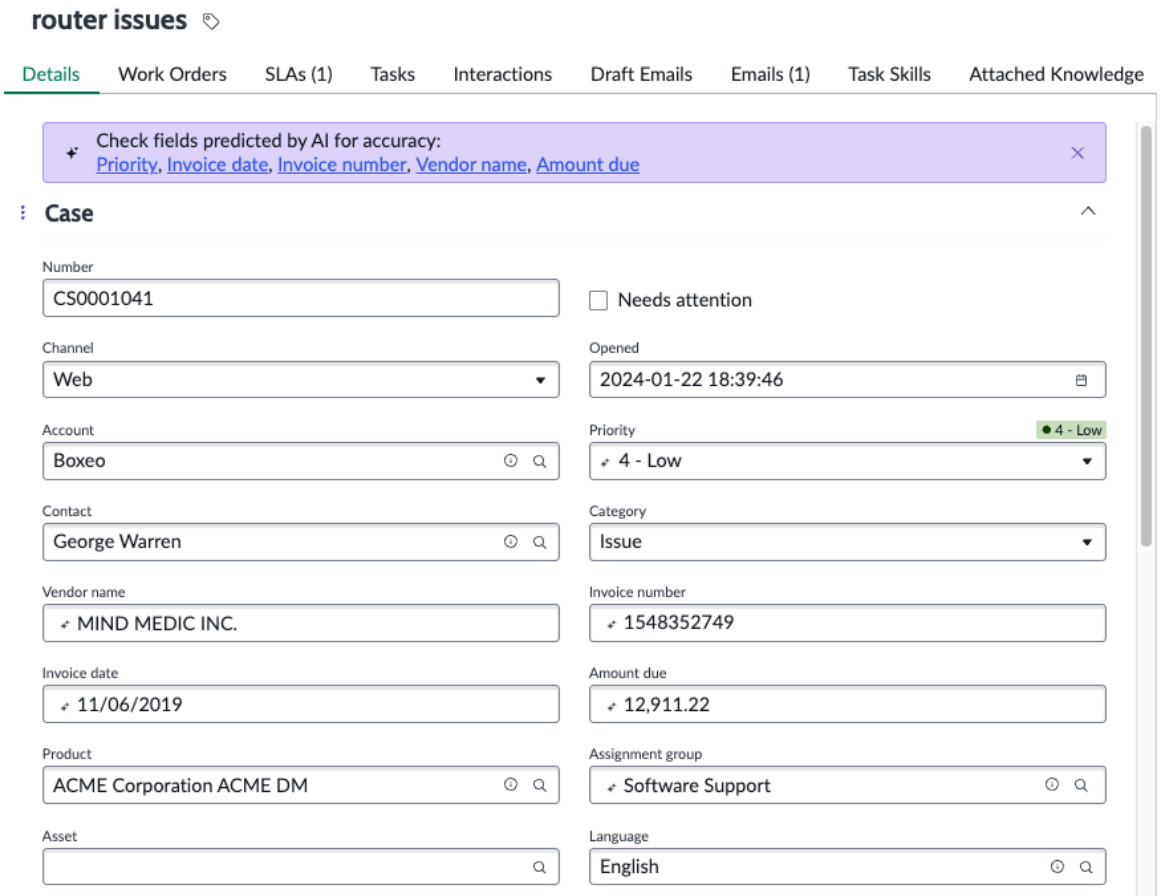
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Intelligence for Customer Service

Use the Document Intelligence for Customer Service feature to extract relevant information from email and case attachments, such as credit card numbers or customer addresses, and add that information to cases.

Document Intelligence for Customer Service extracted fields



Agents can review values for extracted fields and make corrections as needed by accessing the Document Intelligence interface directly from the case. From this interface, agents can confirm correct values, fix incorrect values, and continue to train the model. This HITL/Human In the Loop interaction of verifying the recommended values enables agents to refine the model and continually improve performance.

Predicted field values

In CSM Configurable Workspace and Core UI, the fields on the Case form that contain Document Intelligence predicted values are identified with an AI icon (✨) and label. These fields also include an information icon that displays a message with additional context about the predicted values.

Note:
The system displays the AI icon automatically. The agent doesn't need to refresh the record page.

In CSM Configurable Workspace and Core UI, the fields on the Case form that contain Document Intelligence predicted values are identified with the message `Predicted from DocIntel`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prediction banner

The system displays a banner at the top of a case record that contains one or more Document Intelligence field predictions. The banner is displayed:

- When there is at least one field with an auto-filled prediction from a categorization model.
- When one or more of the extracted fields haven't been reviewed by the agent.
- When the fields are being updated.
- When the fields can't be generated or predicted.

Once an agent reviews the field, the banner is removed.

The banner is displayed for records in the Case table, extensions of the Case table, and interaction records. The banner is displayed in the Core UI and CSM Configurable Workspace.

The banner can be enabled or disabled by the *sn_csm_ml_task.ui.banner.enabled* system property.

DocIntel Admin experience

The DocIntel Admin experience provides an easy-to-use interface that you can use to do the following:

- Create and configure document processing use cases
- Monitor the performance of Document Intelligence solutions

The DocIntel Admin experience is available with the Document Intelligence Admin (com.snc.docintel_admin) store app. This app automatically activates the flows and properties required by Document Intelligence for Customer Service.

Access the DocIntel Admin experience through the Task Intelligence Admin Console:

1. Navigate to **Task Intelligence for Customer Service** > **Setup**.
2. In the Explore related applications section of the console, select **Open DocIntel** in the Document Intelligence card.

> **Note:**
> If Document Intelligence Admin isn't installed, the home page displays a link that you can use to download and activate the application.

For more information, see the following topics:

- Create a Document Intelligence use case
- Monitor Document Intelligence performance

.

Use Cases list

From the DocIntel Admin experience, select **Use Cases** in the header to display a list of the use cases. The Use Cases list uses a default filter with an OR condition to show use cases for:

- Application = Task Intelligence for Customer service -or-
- MLUC ID = MLUC CSM-00003

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The user can't modify these filter conditions from the advanced view.

Each use case has an MLUC ID number that is automatically assigned when the use case is created. This ID number is used for machine learning usage tracking. The Task Intelligence for Customer Service application manages the MLUC ID for Document Intelligence for Customer Service use cases.

Document classification

With the system administrator role, you can create document classification use cases and define the classes or categories for the AI to detect and apply to documents. This process is useful in situations where there are multiple types of documents that must be evaluated.

Set up a document classification use case in the following steps.

1. Create a document classification use case.

   Define the name and properties for the use case.

2. Create a document class.

   Define the classes or categories that the AI learns to detect and apply to documents.

3. Create a document task for document classification and upload sample documents for each class.
4. Train a use case.

   Initiate a training job to provide user inputs from completed document tasks to the AI for continuous improvement.

Review and submit values predicted by Document Intelligence

How Document Intelligence for Customer Service works

Document Intelligence for Customer Service performs a series of steps to extract relevant information from email and case attachments and add that information to fields on the case record.

Use cases

A use case, previously known as a task definition, is a template that is used to define the structure of a type of document you want to process. A use case is made up of the use case record and its related fields, field groups, integrations, flows, and all the related machine learning (ML) models. For more information, see Set up document extraction use cases.

Document Intelligence use case components

Component	Description
Fields	Identifies a field that you want to extract a value for. A use case includes the list of fields to extract from case and email attachments and a mapping of the extracted values to fields in the Case table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Intelligence use case components (continued)

Component	Description
Field groups	Field groups help Document Intelligence extract data from documents with tables, check box lists, and other logical groupings of fields.
Document tasks	A document task includes one or more attached documents that are used to train the use case to identify and extract the correct information. Document tasks are stored in the Document Tasks related list on the Use Case form. The Document Intelligence feature creates these tasks for each case with valid attachments. Each task trains the model. In CSM Configurable Workspace, agents can view these tasks, confirm or correct extracted values, and continue to train the model.
Integrations	Select conditions that tell the Document Intelligence feature when to extract values. The system creates tasks for those cases that meet the specified conditions. For example, you can add a condition on the **Category** field where **[Category] [is] [Credit Card]**. At run time, the system evaluates the active use cases and identifies the use case to use for the case based on the integration. The first active use case that matches the integration for the case or case type is selected. If there are use cases for the case or case type but none that match the integrations, then no use case is selected. You can create one integration for a use case. If a use case has more than one integration, the system uses the latest one. **Note:** When creating an integration, make sure that the **Create Flow** check box remains unchecked.

Users with the ti_admin role or the ti_analyst role can create use cases for cases and for case types. At run time, the system identifies the correct use case based on the case or case type when a case is created and has a valid attachment. If there is no use case for a specific case type, the system goes up in the hierarchy chain until it finds a use case to use.

Use cases are stored in the Use Case (di_task_definition) table.

Extraction modes

A use case includes an extraction mode that determines how the data is extracted in the document task and how the task is processed. The mode changes the behavior of the fields in the Document Intelligence workspace.

DocIntel uses the following extraction modes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Intelligence use case extraction modes

Extraction mode	Definition
Recommendation	Provides recommendations for the extracted fields in the Document Intelligence workspace. Agents can choose the recommended value for a field or manually enter a value. All fields must be reviewed. Recommendations are ordered based on how confident the AI is in the prediction. As Document Intelligence continues processing your documents, recommendations can improve over time.
Auto-fill	Adds values for the extracted fields in the Document Intelligence workspace. All fields must be reviewed. Auto-fill works only if the AI has enough confidence to make the prediction. You can change the confidence threshold by updating the **Auto-fill threshold** field in the use case.
Fully automated (Straight through processing)	DocIntel extracts the data for all fields and processes the document task if the confidence scores for all required fields are above the defined confidence threshold. DocIntel becomes more confident over time, as it processes more and more documents. Choose Fully automated mode for frequently processed documents or if you're confident in the system.

Extraction labels

In CSM Configurable Workspace, the fields on the Case form that contain Document Intelligence predicted values are identified with an AI icon (✦) and label. These fields also include an information icon that displays a message with additional context about the predicted values.

In Core UI, the fields on the Case form that contain Document Intelligence predicted values are identified with the message `Predicted from DocIntel`.

- For Fully automated mode, the message appears below each extracted field returned by the task. The values and messages for each field are added to the case before the agent views the case record.
- For the other extraction modes, the message appears below the extracted fields after the agent reviews the extracted values in the Document Intelligence interface, confirms or corrects values, and submits those values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predicted field values

In CSM Configurable Workspace, the fields on the Case form that contain Document Intelligence predicted values are identified with an AI icon (✨) and label. These fields also include an information icon that displays a message with additional context about the predicted values.

In Core UI, the fields on the Case form that contain Document Intelligence predicted values are identified with the message `Predicted from DocIntel`.

Performance

The Document Intelligence for Customer Service feature needs time to identify cases with attachments, scan the attachments, and make recommendations for case fields. The response time also depends on factors such as case with attachment volume and data center location.

The system displays notifications to the user for the following scenarios:

- If the extraction fails.
- If the extraction is too slow.
- If there are no attachments.
- If there are unexpected attachments.

How it works

When a case is created, Document Intelligence for Customer Service checks to see:

- If the case has one or more attachments.
- If the attachment types are specified in the *sn_csm_ml_task.case.docintel.parsing_supported_types* system property.

If yes, the feature:

- Identifies the right use case to use based on the case or case type and the use case integrations.
- Creates a task using the use case, the sys_id of each attachment, and the case reference.
- Sends the task, attachment sys_ids, and case reference as inputs to the prediction model.
- Uses optical character recognition (OCR) solutions to extract data from the documents.
- Sets the status of the task to Done once the solution has completed.
- If the extraction mode in the use case is set to Fully automated, the extracted values are added to the case.
- If the extraction mode is set to Autofill or Recommendation, the agent can validate the extracted values in the Document Intelligence workspace.

The agent can open a case and review the predicted fields or review the prediction task by selecting **Review in DocIntel** and opening the Document Intelligence workspace interface in a separate tab. From this interface, agents can:

- Review each predicted field.
- Confirm correctly predicted values.
- Update incorrect or missing values.
- Submit the changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similar case recommendation

The Similar Case Recommendation feature enables customer service agents to quickly locate similar cases that offer valuable insights into the current issue.

This feature also suggests cases that might be related to major problems, helping agents provide more informed and efficient support.

With the Similar Case Recommendation feature, agents can:

- Identify similar cases.
- Copy resolution notes from resolved cases.
- Link the current case to a similar one.
- View and submit the current case as a major case candidate. The system displays three similar open and resolved cases.
- View similar major cases first and link the current case as a child to a major case.

When using similarity models in the workspace, the agent can:

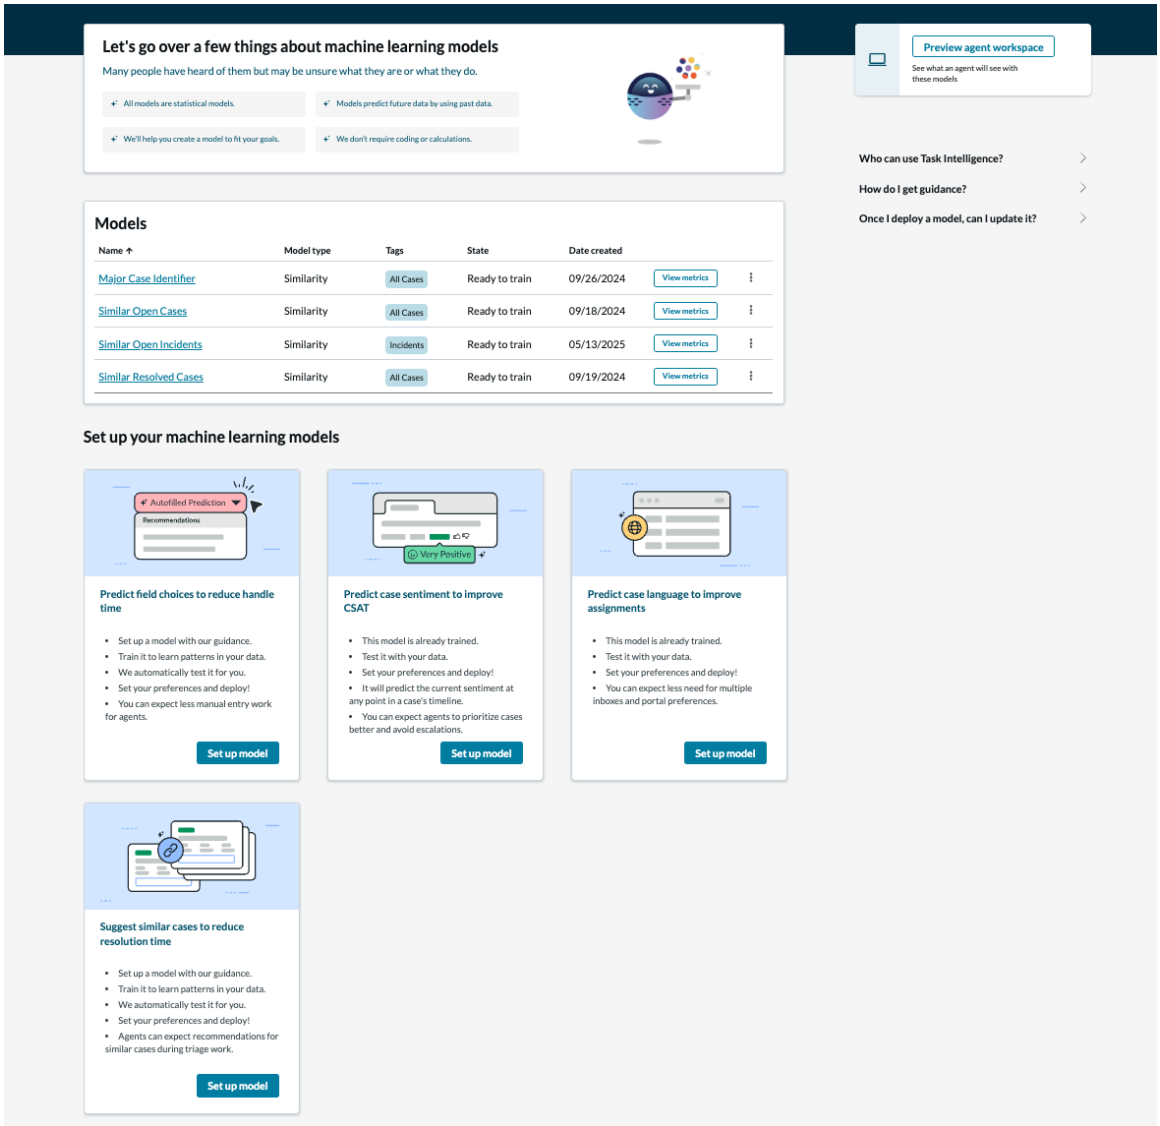
1. Open a case record.
2. Select the Recommendations tab in the contextual side panel.
3. Choose the Suggested Actions sub-tab to see:
   - A card to propose a major case and a card for similar major cases (if enabled).
   - Up to three similar open case cards (customer-configurable).
   - Up to three similar resolved case cards (customer-configurable).

For more info, see View similar case recommendations

Task Intelligence Admin Console

Use the Task Intelligence Admin Console to create, train, and deploy machine learning models that predict different types of information for case and interaction records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



From the Admin Console, you can set up predictive models, preview the agent's experience, view when the models are active, and track model performance.

The Admin Console provides tools that you can use to create and implement machine learning models in just a few steps. Each model follows a six-step process.

Steps to create and implement machine learning models

1. Select a model to use as a starting point.	Select the model based on what you want the model to do. For example: • Use the field prediction model to make field value predictions that you can use to categorize cases and interactions. • Use the case sentiment model to predict sentiment at any point from case creation to case resolution.
2. Define the purpose of the model.	Tell the model when you want it to make predictions and what you want it to predict.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to create and implement machine learning models (continued)

	For example, predict the category and priority when a new case is created.
3. Select the data used to train the model.	Train the model using selected data, such as the text in the case short description and description, so it can learn patterns in the data. Then test the model to see how well it works.
4. Assess the model's results.	View test results to see how your well the model performed. These results indicate how a model will perform after being deployed.
5. Select preferences for prediction results.	Add predictions directly to record fields, show predictions as recommendations, or monitor predictions in the background.
6. Deploy the model.	Review your selections and start using the model.

You can also use the Task Intelligence Admin Console to access related applications. For more information about using the console, see the following topics:

- Create a model to predict record fields
- Create a model to predict case sentiment
- Create a model to detect case language
- Create a Document Intelligence use case

Machine learning model setup and behavior

Set up models to predict field values and sentiment for customer service cases.

Training a model

Training a machine learning model is when the model learns patterns in past data to make predictions for new data. Models are trained using a lot of data so that they can learn patterns and the large data set makes the learned patterns statistically significant.

Setting up a field prediction model

Users with the ml_admin role can create and train a machine learning model to predict field values from the Task Intelligence Admin Console.

Using the field prediction model as a starting point, you can choose the training data set that the model learns from. The model can be trained using data from the following tables:

- Email [sys_email] table
- Case [sn_customerservice_case] table
- Tables that extend the Case table
- Interaction [interaction] table

Models can also be trained using data from email or case attachments.

You then direct the model to learn a pattern between two types of fields from that data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Output fields** are the fields that you want your model to predict. For example, the Category and Priority fields for cases.
- **Input fields** are the fields that the model uses as a basis for predictions. For example, text in the subject and body of an email.

You can use the recommended input fields or you can modify these fields and add your own preferences.

If the model is configured to use text from attachments, the system performs the following steps when a case or interaction is created:

- The system checks the record for attachments with supported content types and file extensions. It ignores the attachments that have unsupported file extensions.
- If the record has attachments in a supported format, the system parses the text and sends it as an input to the categorization model, along with text from the input fields.
- If the record does not have attachments, or no attachments in a supported format, the system sends text from the input fields to the categorization model.

Supported content types and file extensions are stored in the *sn_csm_ml_task.categorization.allowed_content_types* system property. For more information, see Components installed with Task Intelligence for Customer Service.

Supporting multiple languages

Categorization supports multiple languages including attachments, if the models are configured to include attachments. The categorization model returns the predicted language and stores it in the **Detected Language** field in the Predictor Result [ml_predictor_results] table.

Setting up a case sentiment model

The case sentiment model is pre-trained with a large data set to learn communication patterns. This data comes from customer emails and case descriptions and comments and reflects typical communication between agents and customers.

- **Email**: The model uses the text in the subject and body of the initial email to predict sentiment when the case is created. Text from the body of subsequent emails is used to update the prediction.
- **Cases**: The model uses the text in the case short description and description to predict sentiment when the case is created. Comments added to the case are used to update the prediction.

The case sentiment model supports case types. When setting up a sentiment model, you select the table on which to run sentiment analysis. You can select:

- The Case table
- Tables that extend the Case table

Note:
The sentiment analysis feature supports one level of custom extension from the Case table.

Install the Task Intelligence for Customer Service application

You can install the Task Intelligence for Customer Service application (com.snc.csm_ml_task) if you have the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Task Intelligence for Customer Service application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- The minimum version of the workspace required to support Task Intelligence for Customer Service application is CSM and FSM Configurable Workspace Foundation (sn_cwf_wrkspc): 24.2.1.
- To enhance ML functionality, we need to set up three Access Control Lists (ACLs) within the Customer Service application. These ACLs are essential for granting the platform_ml_read role the necessary read access to the sn_customerservice_case table and its associated fields. For more information, see KB1705485

Role required: ti_admin

About this task

The following items are installed with Task Intelligence for Customer Service:

- Store applications: Task Intelligence for Customer Service
- Roles
- Tables
- Properties
- Flows
- Scheduled jobs

For more information, see Components installed with Task Intelligence for Customer Service.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Task Intelligence for Customer Service application (com.snc.csm_ml_task) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components installed with Task Intelligence for Customer Service

Several types of components are installed with the Task Intelligence for Customer Service application, including tables, roles, properties, flows, and scheduled jobs.

Tables

The Task Intelligence for Customer Service application uses the following tables.

Tables installed with the Task Intelligence for Customer Service application

Table	Description
ML Solution [ml_solution]	The ML Solution table stores trained machine learning solutions. Activating the Task Intelligence for Customer Service application (com.snc.csm_ml_task) creates a record in this table for the pre-trained sentiment analysis machine learning solution: *ml_x_snc_global_global_sentiment*.
ML Sentiment [ml_sentiment]	This table stores machine learning sentiment information and includes the following fields: • **Original sentiment**: The sentiment that is predicted when the case is created. • **Current sentiment**: The sentiment that is predicted when the case is updated. • **Sentiment over time**: Displays the sentiment trend prediction as an agent works to resolve the case. To be able to calculate a value for this field, there needs to be a minimum of two sentiment predictions. The system uses the following formula used to determine the sentiment trend: `(currentSentiment - originalSentiment) > 0 ?'improving' :'declining';`
Predictor Result [ml_predictor_results]	This table stores prediction results and feedback for record categorization, sentiment analysis, and language detection. This includes skipped and failed predictions that result from prediction requests. For case categorization: • The **Default confidence** and **Predicted confidence** fields store confidence values returned by the categorization machine learning models. • For cases created from email, the **Source ID** field includes a reference to the sys_email record and the **Predicted Table** field includes a reference to the sys_email table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with the Task Intelligence for Customer Service application (continued)

Table	Description
	For sentiment analysis: • The default value in the **Predicted correctly** field for each sentiment prediction is set to true. • The **Final input value** and **Final output value** fields remain empty because sentiment analysis predictions do not collect feedback from agents. For language detection: • The Predictor Result table stores the prediction results from the Language Detection Service spoke. • The **Detected Language** field stores the language returned by the Language Detection Services spoke. The Predictor Result table includes the **Skipped** field, which is a true|false field. • **True**: The prediction was skipped. • **False**: The prediction was not skipped. For more details about skipped predictions, see Logic for Skipped field values below. **Note:** The Predictor Result list includes a filter on the **Capability** field, which displays results where the capability is Classification. Remove this filter to display all of the prediction results.
Case [sn_customerservice_case]	The Case table stores customer service case records. This table is the recipient for case categorization predictions. The **Language** field has been added to the Case table. This field is a reference to the Language [sys_language] table. This field is populated with the prediction made by the language detection spoke and stores the language that was used to create the email or case. The Case table is added with the Customer Service (com.sn_customerservice) plugin.
Task [task]	The Task table is one of the core tables provided with the ServiceNow base system. The sentiment analysis feature adds the **Sentiment** column to the Task table. This column is a reference to the Task ML Sentiment [task_ml_sentiment] table.
Task ML Sentiment [task_ml_sentiment]	This table stores sentiment predictions. The reference to the prediction record is stored in the **Sentiment** field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with the Task Intelligence for Customer Service application (continued)

Table	Description
	in the Task table. This table is an extension of the ML Sentiment [ml_sentiment] table. The **Task** column in the Task Sentiment table is a reference to the Task [task] table and is used for domain separation.
Task Skills [task_m2m_skill]	The Task Skills table stores skills for the Customer Service Management application. The language detection feature links language skills to new customer service cases by saving the detected language in the Task Skills table. The Task Skills table lists customer service cases and the language skill detected and assigned to each case.

Logic for Skipped field values

Prediction preference	Top 1 prediction	Top 3 (at least 1 prediction)	Skipped
Autofill	Yes	Yes	False
	Empty	Yes	True
Recommendations	Yes	Yes	False
	Empty	Yes	False
	Empty	Empty	True
Monitor only	Yes	Yes	False
	Empty	Yes	False
	Empty	Empty	True
Prediction unsuccessful	NA	NA	True
Prediction error	NA	NA	True

Tables installed with Document Intelligence for Customer Service

The Document Intelligence for Customer Service application uses the following tables

Tables installed with the Document Intelligence for Customer Service application

Table	Description
DocIntel Use Case [di_task_definition]	Stores Document Intelligence use cases for the Case table (sn_customerservice_case) or case type tables that extend the Case table.
DocIntel Task	Stores Document Intelligence tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with the Document Intelligence for Customer Service application (continued)

Table	Description
[di_task]	The **is_stp** field controls straight through processing. When this field is set to true, straight through processing is enabled for the task. The **agent_input** field is set to true if an agent makes changes to predicted values in the DocIntel tab. **Note:** You can track tasks from the ML Solusions table (ml_solution.list).
Integration Setup [di_integration_setup]	Stores use case filters that are applied to cases. The **Target Table** field stores the target for the predicted fields, either the Case table (sn_customerservice_case) or a case type table.
Field [di_key]	Stores the keys to be extracted by Document Intelligence.
Field Value [di_extracted_value]	Stores the extracted values for the keys in a use case task.

Roles

The Task Intelligence for Customer Service application includes the following roles.

Roles installed with Task Intelligence for Customer Service

Role	Description	Contains roles
Task Intelligence admin [sn_csm_ml_task.ti_admin]	Can create, train, and retrain machine learning models. This role can also deploy and delete models.	• sn_docintel.admin • sn_ti_admin.tia_admin • sn_customerservice.case_viewer
Task Intelligence analyst [sn_csm_ml_task.ti_analyst]	Can create, train, and retrain machine learning models.	• sn_customerservice.case_viewer • sn_ti_admin.tia_analyst • sn_docintel.manager
[sn_ti_admin.tia_admin]		• ml_admin • platform_ml_read
[sn_ti_admin.tia_analyst]		ml_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Task Intelligence for Customer Service (continued)

Role	Description	Contains roles
[sn_ti_admin.tia_user]		ml_report_user
Task sentiment viewer [task_ml_sentiment_viewer]	Provides read access to records in the Task Sentiment [task_ml_sentiment] table if the user has read access to the associated task records. This role is added to the following roles: • sn_customerservice_agent • sn_customerservice.consumer_agent	

Note:
The sn_docintel.extraction_agent role is added to the customer service agent role (sn_customerservice_agent) and the consumer service agent role (sn_customerservice_consumer_agent).

Properties

The Task Intelligence for Customer Service application includes the following properties.

Properties installed with Task Intelligence for Customer Service

Property	Description
sn_csm_ml_task.logging.verbosity	The log verbosity for the Task Intelligence for Customer Service application. This property has the following values: • **error**: Show only critical errors which may prevent the search from completing. • **warn**: Show warning which indicates possible unexpected changes in behavior while searching. Also shows errors. • **info**: Show progress messages as the Code Search application searches for results. Also shows errors and warnings. • **debug**: Show information that may be useful while debugging the application. Also shows errors, warnings, and info messages. • **off**: Do not generate logs. The default setting is info.
Categorization properties	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Task Intelligence for Customer Service (continued)

Property	Description
sn_csm_ml_case.case.categorization.enabled	Enables categorization predictions for customer service cases. The default setting is false.
sn_csm_ml_task.categorization.attachment.max_size	Determines the maximum size of an attachment that can be parsed by categorization machine learning models. The maximum supported size is 500kb. The default setting is 450kb.
sn_csm_ml_task.categorization.allowed_content_types	Controls the content types and file extensions that are supported by the ML predictor for categorization with attachment. By default, the following attachment types can be used with attachment-based case categorization predictions: pdf, xls, xlsx, docx, and csv. To configure content types: • Leave the property blank to allow all of the supported file extensions. This is the default setting. • Create a subset of the default values by entering a comma-separate list of content types and file extensions. For example, `application/pdf,text/csv`.
sn_csm_ml_task.categorization.flow_start_time.threshold	Sets the max waiting threshold for categorization predictions that include attachments. The default value is 10 minutes. If the call to the API does not return a prediction before the maximum waiting threshold is reached, predictions are made without the attachment text. These predictions are based on text from the subject and body of the email or the case short description and description.
sn_csm_ml_task.categorization.case.delay_before_fetch	Adds a delay before fetching valid attachments for Task Intelligence when cases are created from email.
sn_csm_ml_task.case.categorization.enable_property_removal	Enables property to remove inactive field choices from predictions. The default setting is false.
Sentiment analysis properties	
sn_csm_ml_task.case.sentiment.mlpredictor.enabled	Enables sentiment predictions for customer service cases. The default setting is false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Task Intelligence for Customer Service (continued)

Property	Description
	To enable sentiment predictions, set this property to true. **Note:** This property is automatically set to true when a sentiment model is trained and deployed from the Task Intelligence Admin Console.
Language detection properties	
sn_csm_ml_task.case.language.mlpredictor.enabled	Enables language detection for customer service cases. The default setting is false. To enable language detection, set this property to true. **Note:** This property is automatically set to true when a language detection module is tested and deployed from the Task Intelligence Admin Console.
sn_csm_customerservice.case.ml.language.detection.threshold	Controls the threshold for language prediction. The default value for this property is 0.70. Predictions with a confidence level greater than the threshold are saved in the Predictor Results (ml_predictor_results_task) table and the Task Skills (task_m2m_skill) table. Predictions with a confidence level less than the threshold are only saved in the Predictor Results (ml_predictor_results_task) table.
sn_csm_ml_task.case.languagedetection.threshold	Stores the confidence level threshold for the language detection feature. The default value is 0.7.
Document Intelligence properties	
sn_csm_ml_task.case.docintel.mlpredictor.enabled	Enables Document Intelligence for Customer Service Management. **Note:** This property is activated automatically when the user creates a use case.
sn_csm_ml_task.case.docintel.parsing_supported_types	Contains a list of the supported attachment types: *image/png,image/jpeg,application/pdf*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Task Intelligence for Customer Service (continued)

Property	Description
sn_csm_ml_task.straight_through_processing_max_waiting_threshold	Defines the maximum waiting time for a straight through processing task to finish. The default time is 5 minutes. If a use case is configured to use the straight through processing prediction mode, the agent can see the relevant fields on the Case form automatically populated within 5 minutes of case arrival. If this threshold is exceeded, the values are skipped. However, the agent can still view the task in the DocIntel tab and manually extract the values.
sn_csm_ml_task.case.delay_attachments_for_seve	Waits for several milliseconds before fetching valid attachments for Task Intelligence for Customer Service when a case is created from email. **Note:** This property is disabled by default. If you notice that attachments are being missed for cases created from email, enable this property.

Flows

The Task Intelligence for Customer Service application includes the following flows.

Flows installed with Task Intelligence for Customer Service

Flow	Description
Task Intelligence Sentiment [new_task_intelligence]	This flow is inactive out of box and is activated after setting up models on the Task Intelligence Admin Console.
Task Intelligence Sentiment Case Update [task_intelligence_case_update_flow]	This flow is inactive out of box and is activated after setting up models on the Task Intelligence Admin Console.
Task Intelligence Inbound Email Reply [task_intelligence_inbound_email_reply]	This flow is inactive out of box and is activated after setting up models on the Task Intelligence Admin Console.
Task Intelligence Case Language Detection [task_intelligence_case_language_detection]	Language detection determines the language used to create a case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flows installed with Task Intelligence for Customer Service (continued)

Flow	Description
	Depending on configuration, the system can add this value to the **Language** field on the Case form. This field is a reference to the Language [sys_language] table. It can also add the language as a skill to the Task Skills related list on the Case form. This flow is automatically activated when a language detection module is trained and deployed from the Task Intelligence Admin Console.
Task intelligence - DocIntel at case creation	This flow is inactive out of box.
Task Intelligence - DocIntel Process Extracted Values	This flow is inactive out of box.

Machine learning models

The sentiment analysis feature uses the *ml_x_snc_global_global_sentiment* machine learning model. This model is provided with the Task Intelligence for Customer Service application.

Scheduled job for categorization solution training

The system administrator can run the *Categorization solution training* scheduled job on demand.

Note:
It is recommended that you import a training data set to the Case table [sn_customerservice_case] to support the initial training of the Categorization machine learning model. The training data set should be tailored to the Case fields that you want to predict and include additional case records that have the correct labels (i.e., the expected field values) for the specific fields being predicted. By creating this data set, you leverage your own data to train the algorithm to predict on the fields you select.

The system administrator can set the following parameters before running the scheduled job.

Parameters for Scheduled jobs

Parameter	Description
trainNewSolution	Set to true to train a new solution. Set to false to retrain a solution and add the name of the solution in the *existingSolutionName* parameter.
inputFields	The fields that are used to train the model. For example: `["short_description","description"];`
outputFields	The fields to be predicted. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters for Scheduled jobs (continued)

Parameter	Description
	`["priority","category"];`
encodedQuery	The query that is applied to the data used for training.
existingSolutionName	The name of an existing solution. Add a name to this parameter if retraining a solution.

To determine when a solution is ready to be used for categorization predictions, the system administrator can check the status of the scheduled job. Once the state is Solution Complete, the solution can be used for predictions.

Scheduled job for publishing previously deployed models

The system administrator can run the *`Deploying Task Intelligence for Customer Service Management`* after upgrading the Task Intelligence for Customer service plugin.

This scheduled job verifies if there are previously deployed models for record categorization, sentiment analysis, language detection, and Document Intelligence and publishes these models.

Configure Task Intelligence for Customer Service

Install the Task Intelligence for Customer Service application and configure the different features: record categorization, language detection, Sentiment Analysis, and Document Intelligence for Customer Service.

Install and configure Task Intelligence features

Complete the following tasks to install Task Intelligence for Customer Service and configure the features.

Task Intelligence feature configuration

Task	Description
Install the Task Intelligence for Customer Service application	You can install the Task Intelligence for Customer Service application (com.snc.csm_ml_task) if you have the admin role.
Configure record categorization	Activate the required plugins and import training data. Then you can create and train a model to predict field values.
Configure Sentiment Analysis	Activate the required plugins, enable the sentiment analysis property, and assign roles. Then you can train a model to predict case sentiment.
Configure language detection	Activate the required plugins and the ServiceNow translator to use the language detection feature. Then you can set up a model to detect the case language.
Configure Document Intelligence for Customer Service	Enable Document Intelligence for Customer Service and create use cases to extract data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up and deploy Task Intelligence models

Once you have completed the configuration tasks, you can use the Task Intelligence Admin Console to set up and deploy models for record categorization, sentiment analysis, and language detection. You can also use the Task Intelligence Admin Console to access the Document Intelligence Admin interface, which you can use to create document processing use cases.

Model deployment in Task intelligence

Task	Description
Create a model to predict record fields	Create and train a model to predict fields for cases and interactions.
Create a model to predict case sentiment	Edit and test the pre-trained sentiment model to predict sentiment for customer service cases.
Create a model to detect case language	Edit and test the pre-trained model to detect the language used to create customer service cases.
Create a Document Intelligence use case	Create a use case to identify the information to extract from email and case attachments.
Create a model to predict similar cases	Test and edit the pre-trained similar cases model for predicting similarity in customer service cases and create a new model for custom cases.
Edit a model	Edit the case models that have already been trained and deployed. Change the model configurations, view the updated training results, and redeploy the model.
Export a model	Export a Task Intelligence model to another instance.
Create a custom similar case model	Set up a training model to help it recognize similarities between two types of tables by comparing their fields. The model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to configure record categorization (continued)

Step	Description
	framework for machine learning models. For more information, see Predictive Intelligence.
Activate the Task Intelligence for Customer Service application (com.snc.csm_ml_task).	The Task Intelligence for Customer Service application enables customers to create and train categorization machine learning models. This application automatically activates the following plugins: • Predictive Intelligence for Customer Service Management (com.snc.csm_ml) • Customer Service (com.sn_customerservice) • Skills Management (com.snc.skills_management) • Dynamic Translation (com.glide.dynamic_translation) • ServiceNow Language Detection Service Spoke (com.glide.language_detection_spoke) • Predictive Intelligence - Task Intelligence (com.glide.platform_ml_task) • Admin Center for Task Intelligence (com.sn_ti_admin)
Import a training data set.	You can use the record categorization feature with the Case table [sn_customerservice_case], tables that extend the Case table, and the Interaction table [interaction]. It is recommended that you import a training data set into the desired table to support the initial training of a categorization model. **Note:** This data should include case types if you have tables that extend the Case table. The training data set should be tailored to the fields that you want to predict. It should also include additional records that have the correct labels (for example, the expected field values) for the fields being predicted. Creating a training data set enables you to leverage your own data to train the algorithm to predict on the fields you select.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to configure record categorization (continued)

Step	Description
	1. Identify the table and the fields that you want your model to predict. 2. Select the table and records for training the model. 3. Identify the fields in the selected table as the input values to be used for training the model.
Set up and deploy at least one categorization model.	For details, see Create a model to predict record fields.

Related topics

Record categorization

Configure Sentiment Analysis

Activate the required plugin, enable the sentiment analysis property, and assign roles to use the sentiment analysis feature.

Follow the steps in the table below to configure the sentiment analysis property for cases.

Sentiment analysis configuration steps

Step	Description
Ensure that your instance is set up for Predictive Intelligence (PI).	Predictive Intelligence is a ServiceNow platform feature that provides a layer of artificial intelligence, which serves as a framework for machine learning models. For more information, see Predictive Intelligence.
Activate the Task Intelligence for Customer Service application (com.snc.csm_ml_task).	The Task Intelligence for Customer Service application enables customers to leverage machine learning algorithms in Customer Service Management. The sentiment analysis feature is included with this application. This application automatically activates the following plugins: • Predictive Intelligence for Customer Service Management (com.snc.csm_ml) • Customer Service (com.sn_customerservice) • Skills Management (com.snc.skills_management) • Dynamic Translation (com.glide.dynamic_translation)

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sentiment analysis configuration steps (continued)

Step	Description
	• ServiceNow Language Detection Service Spoke (com.glide.language_detection_spoke) • Predictive Intelligence - Task Intelligence (com.glide.platform_ml_task) • Admin Center for Task Intelligence (com.sn_ti_admin)
Configure the Case list and Case form to display the sentiment analysis fields.	The sentiment analysis feature adds the following fields: • **Original sentiment** • **Current sentiment** • **Sentiment over time** Configure these fields for each of the following interfaces as needed: • CSM Configurable Workspace • CSM Agent Workspace • Core UI Platform interface
Use the Task Intelligence Admin Console to create and deploy a sentiment model.	See Create a model to predict case sentiment.

Configure sentiment analysis fields

The sentiment analysis feature uses the following fields to display sentiment prediction information on Cases list and Case form:

- Original sentiment
- Current sentiment
- Sentiment over time

Add the sentiment fields to Case list views and to the Case form for CSM Configurable Workspace, CSM Agent Workspace, and Core UI.

- In CSM Configurable Workspace, these fields appear as secondary values in the configurable form header. You can configure secondary values to display either below the primary value at the top of the form or in the Record Information tab in the contextual side panel. (For more information, see Display the form ribbon and form header secondary values in the Contextual side panel.)
- In CSM Agent Workspace, these fields appear in the Case form header.
- In Core UI, these fields appear on the Case form.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sentiment analysis fields

Field	Description
Original sentiment	The sentiment that is predicted when a case is created. The values for this field include: • Positive • Neutral • Negative
Current sentiment	The most recent sentiment prediction for the case. This prediction is assessed when a case is created and updated. The values for this field include: • Positive • Neutral • Negative When a case is created, the **Original sentiment** and **Current sentiment** are assigned the same value. When a case is updated, the **Original sentiment** remains the same and the **Current sentiment** is updated with the most recent prediction.
Sentiment over time	A trend indicator that reflects the change in sentiment as a case is updated. The values for this field include: • Improving • Neutral • Declining This field requires a minimum of two sentiment predictions in order to calculate a value.

Configure sentiment fields for CSM Agent Workspace

To add the sentiment fields to the Case list:

1. Enter **sys_aw_list.list** in the application navigator and press **Enter**.
2. Click **All** from the Case [sn_customerservice_case] table.
3. Click the lock icon next to the **Columns** field.
4. Select and move the sentiment fields from the **Available** column to the **Selected** column.
5. Click the lock icon again.
6. Click **Update**.

To add the sentiment fields to the Case form header:

1. Select **CSM Workspace** as the application scope.
2. Navigate to **All** > **Now Experience Framework** > **Configuration Settings** > **UX Form Header**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Table column of the Form Headers list, select **sn_customerservice_case**.

   If adding sentiment fields for a case type, select the case type table that extends the Case table.

4. Click **New** in the Secondary Values related list.
5. Select the desired sentiment field in **Field** field and click **Submit**.
6. Repeat step 5 for the remaining sentiment fields.
7. Click **Update** on the Form Header form.

Configure sentiment fields for CSM Configurable Workspace

To add the sentiment fields to the Case list:

1. Enter **sys_ux_list.list** in the application navigator and press **Enter**.
2. Click **All** from the Case [sn_customerservice_case] table.
3. Click the lock icon next to the **Columns** field.

   If adding sentiment fields for a case type, select the case type table that extends the Case table.

4. Select and move the sentiment fields from the **Available** column to the **Selected** column.
5. Click the lock icon again.
6. Click **Update**.

To add the sentiment fields to the Case form header:

1. Select **CSM Workspace** as the application scope.
2. Navigate to **All** > **Now Experience Framework** > **Configuration Settings** > **UX Form Header**.
3. In the Table column of the Form Headers list, select **sn_customerservice_case**.
4. Click **New** in the Secondary Values related list.
5. Select the desired sentiment field in **Field** field and click **Submit**.
6. Repeat step 5 for the remaining sentiment fields.
7. In the UX header Configurations list, click **Edit**.
8. In the **Collection** field, add **CSM/FSM Configurable Workspace Header Config**.
9. Click **Update** on the Form Header form.

Configure sentiment fields for Core UI

To add the sentiment fields to the Case list:

1. Navigate to **Customer Service** > **Cases** > **All**.
2. Right-click the list header and select the desired list view.
3. Right-click any column heading and select **Configure** > **List Layout**.
4. Select and move the fields from the **Available** column to the **Selected** column.
5. Click **Save**.

To add the sentiment fields to the Case form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Customer Service** > **Cases** > **All**.
2. Open a case.
3. Right-click the form header and select **Configure** > **Form Layout**.
4. Select and move the fields from the **Available** column to the **Selected** column.
5. Click **Save**.

Review and submit values predicted by Document Intelligence

Document Intelligence

Create a model to predict record fields

Create and train a model to predict fields for case and interaction records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: ml_admin, ti_admin

About this task

The field prediction model is a guide that includes some recommended settings. You can use these settings, such as the recommended input fields, or add your own preferences.

You can create and train multiple field prediction models for cases, case types, and interactions.

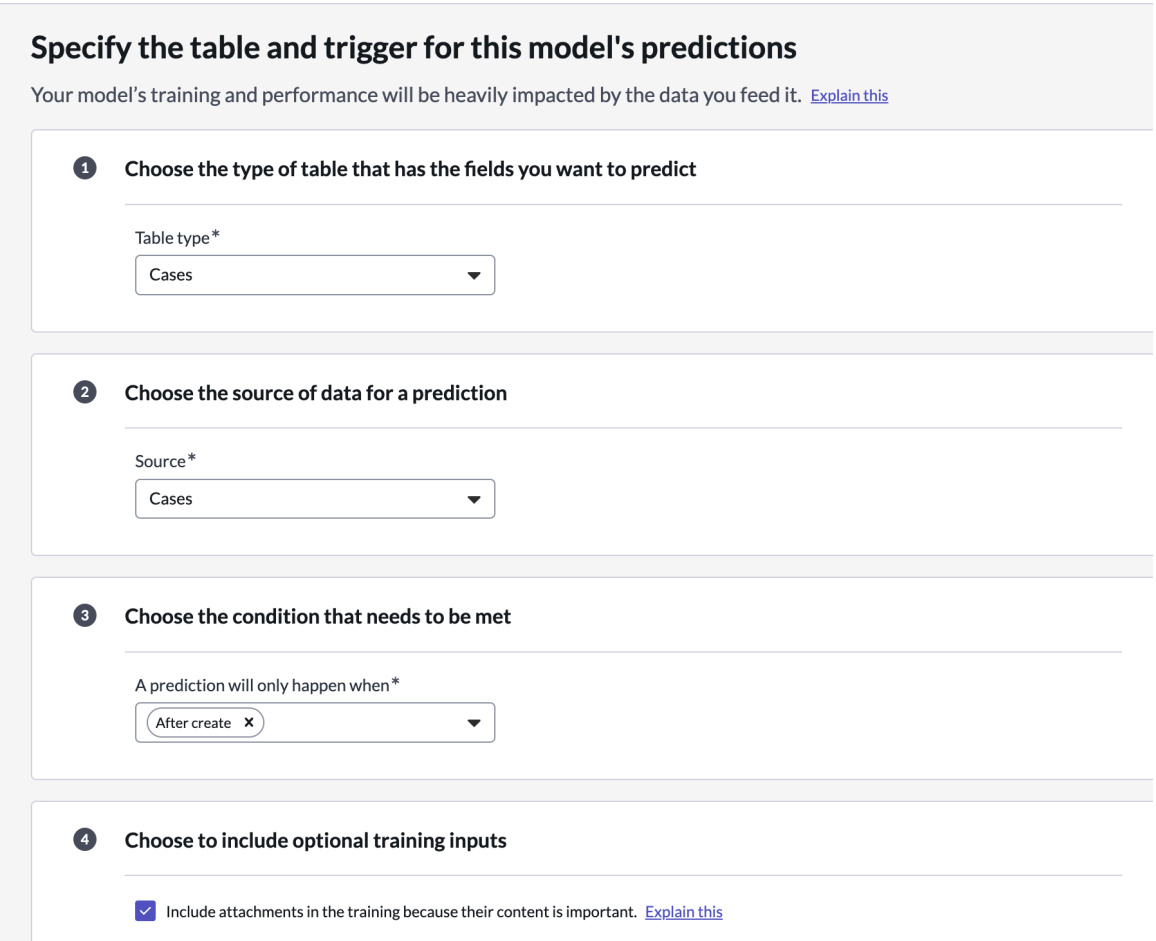
Set up your model

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup** to access the Task Intelligence Admin Console.
2. Select **Set up model** on this model: **Predict field choices to reduce handle time**.

This opens the model and displays the first of five pages. Each page in the model asks you questions and helps you select the information you need to build an effective model.

Define the purpose

Select the table and the trigger for the model's predictions.



You can have the model predict case or interaction fields when a new customer email arrives or when an interaction is created. Base your decision on the data that your model should use to make the predictions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the table and trigger	
Choose the type of table that has the fields you want to predict	Select the table type: • Cases • Interactions The model uses data from the selected table to make predictions.
Choose the moment or channel that should trigger a prediction	Select the trigger for the prediction: • Cases • Emails • Interactions
Choose to include optional training inputs	Enable the check box to include attachments when training the model. Email and record attachments can have information that is useful for routing records correctly.

1. Choose a table type for the model.
2. Choose the prediction trigger.
3. If desired, enable the check box to include attachment data.

   Include text from email or record attachments if this information is useful for making predictions. The model can evaluate attachment data, along with email or record text, to make predictions.
4. Select **Save & continue**.

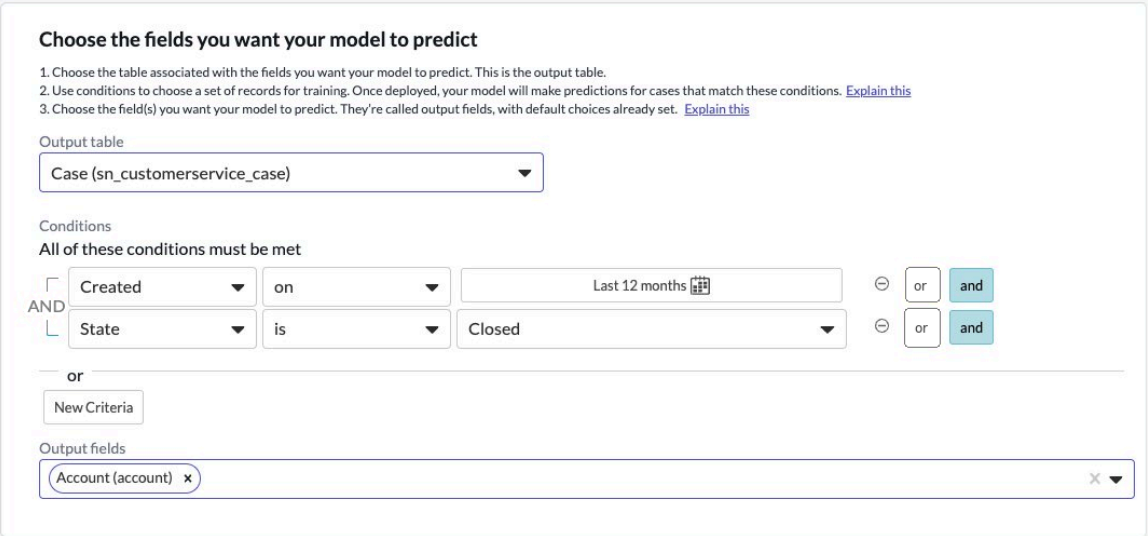
Train your model

Select the input fields and output fields so your model can learn patterns. Output fields are the fields that you want the model to predict. Input fields are the fields that the model uses to make predictions.

Selecting this information tells the model what to look for during training.

Note:
You can use the recommended settings or select different ones.

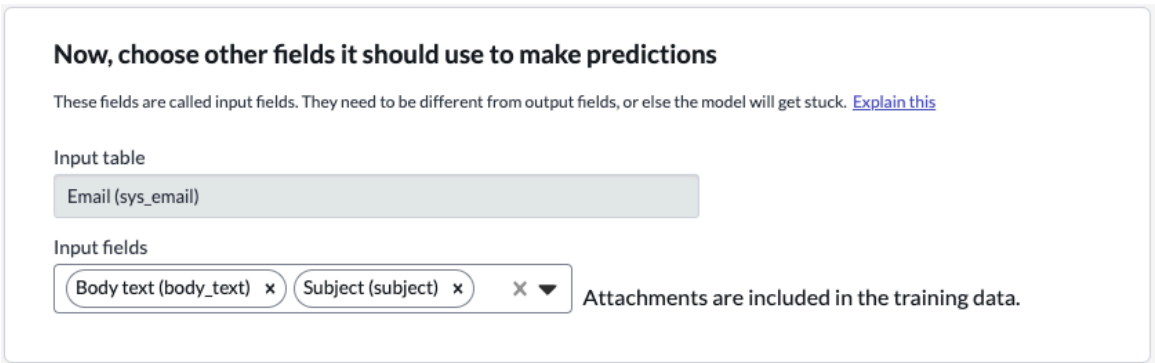
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Provide a name for the model.
2. Choose the output table and the output fields for the model to predict.
3. Select conditions to choose a set of records for training.

   The selected conditions determine both how the model is trained and act as a filter for the conditions that a record has to meet in order for predictions to be made.

4. Select the fields in the training data that the model should use to make the predictions (input fields).



5. Choose the input fields.
6. Review the resulting number of cases in the training data based on the selected conditions.

   The model needs a minimum of 500 records for effective training. If this minimum number isn't available, try selecting different conditions.

7. Select **Launch training**.

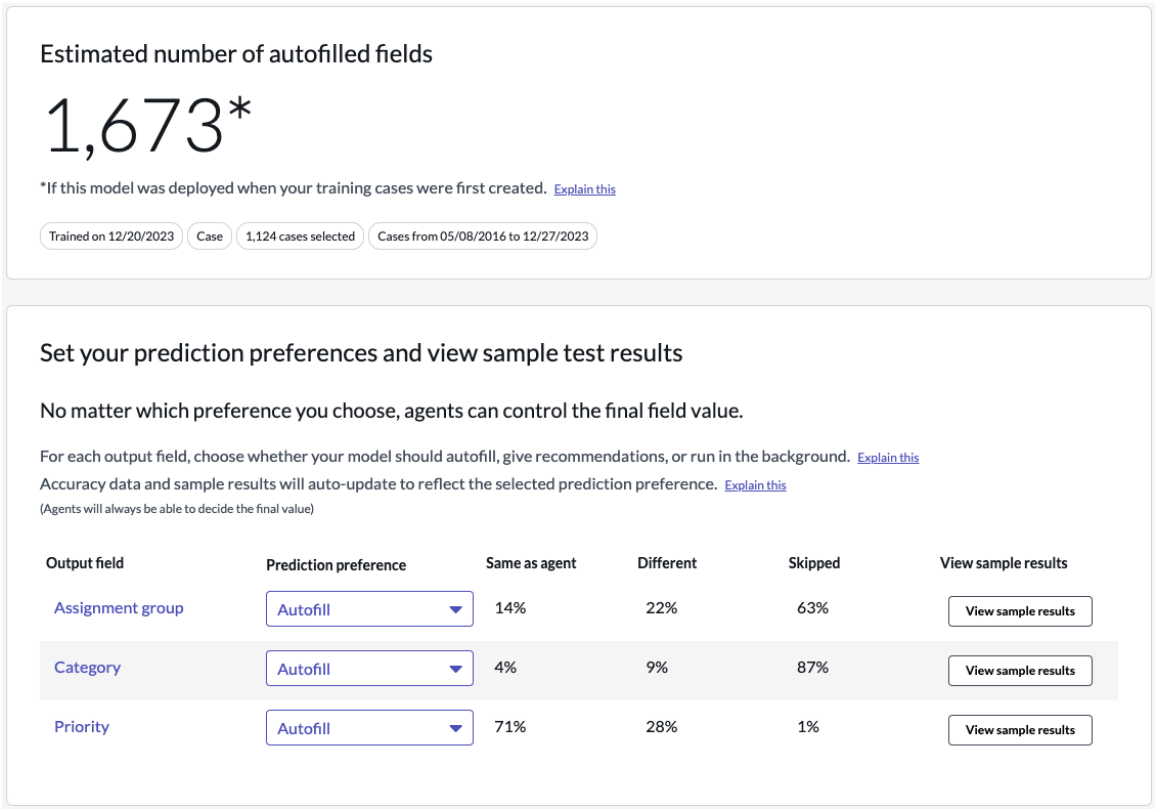
   Training can take some time, particularly if you are training the model on a large amount of data. You can request that the system send you an email when the training is done.

Assess your model

Assess the results from the training and view sample results for the predicted fields. Reviewing the results gives you a preview of how your model will perform after being deployed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the prediction preference for each field. The model provides flexible options to autofill field values, provide recommendations for field values, monitor only, or turn off predictions depending on the sensitivity of those fields.



1. Select a **Prediction preference** for each enabled field.

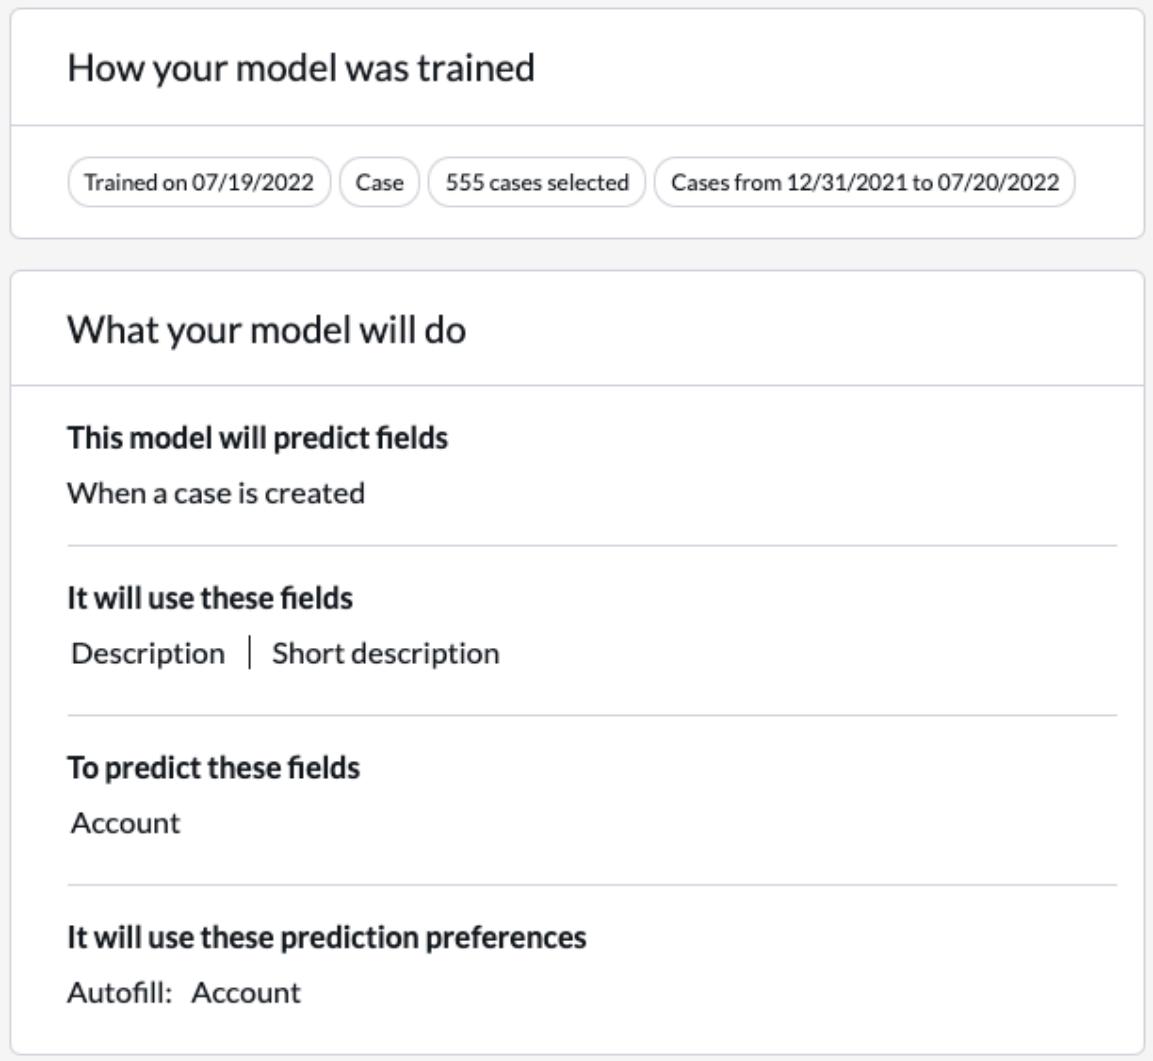
Autofill	Adds the best predicted value to the field on the record.
Recommendations	Shows the recommended value in a message below the field.
Monitor only	The system makes the field predictions and stores the information in the Predictions History but does not add any information to the case records.
Turn off predictions	Turns off predictions for the field.

2. Select **View sample results** to see sample results for each predicted field.
3. Select **Save & continue**.

Deploy your model

Review your choices from the previous pages and information about how the model was trained. Then you can select **Deploy** to deploy the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a model to predict case sentiment

Edit and test the pre-trained sentiment model to predict sentiment for customer service cases.

Before you begin

Role required: ml_admin, ti_admin

About this task

The case sentiment model is pre-trained with a large data set to learn communication patterns. You select a set of records to test the model and then view the results before deploying.

Set up your model

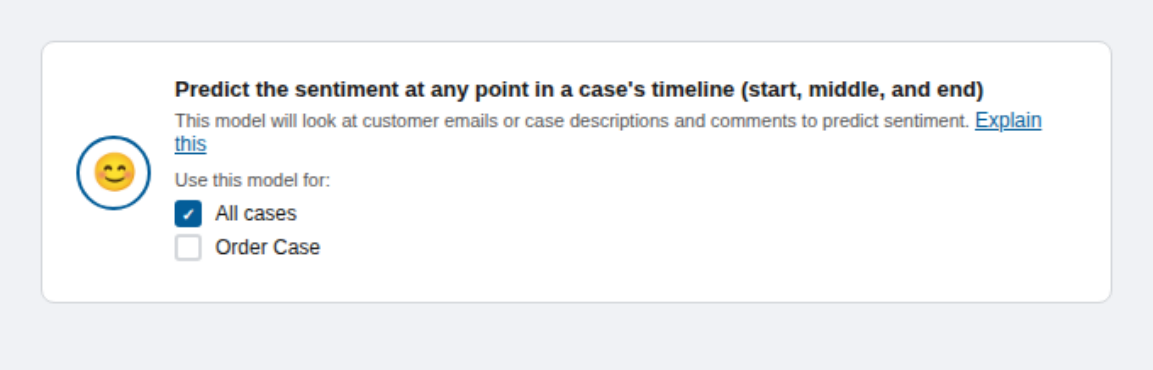
1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup** to access the Task Intelligence Admin Console.
2. Select **Edit model** on this model: **Predict case sentiment to improve CSAT**.

   This opens the model and displays the first of five pages. Each page in the model asks you questions and helps you select the information you need to build an effective model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define the purpose

Tell the model when you want it to make predictions.



The sentiment model is pre-trained with a large data set to understand communication patterns. This data comes from customer emails and from case descriptions and comments.

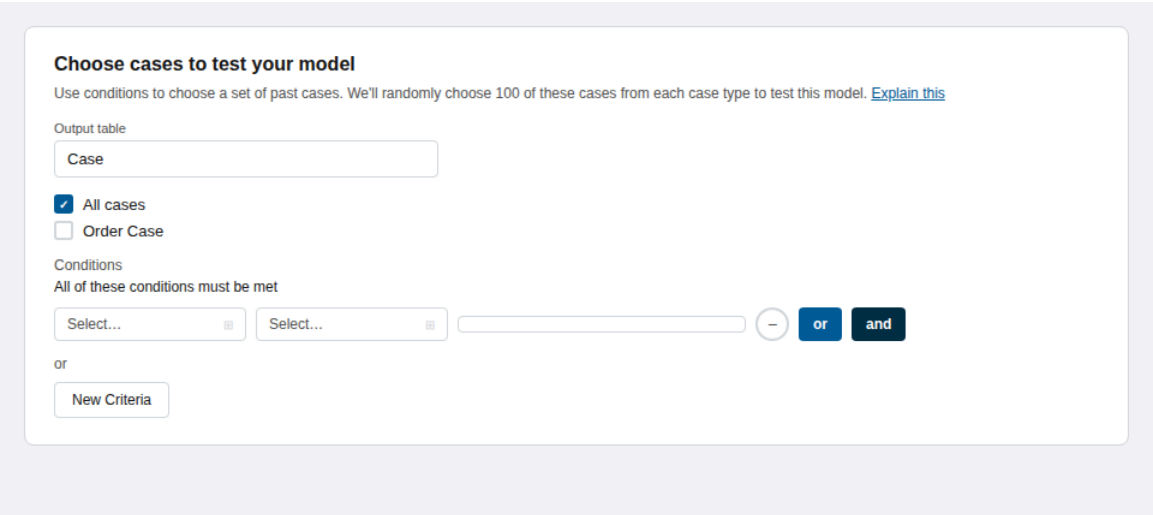
1. Select the table that contains the records to be tested.

   Select **All cases** to test records in the Case table or select a case type table.

2. Select **Save & continue**.

Test your model

Choose the cases to use to test the model.



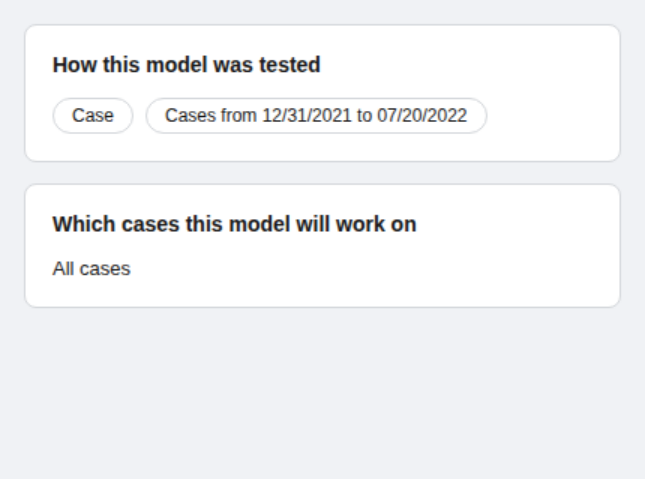
Selecting this information tells the model what type of records to use for testing. When the model is deployed, it predicts sentiment on all records in the table that match the selected conditions.

1. Use conditions to choose a set of records for testing.
2. Select **Launch testing**.

Assess your model

Assess the results from the testing and view sample results for past cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

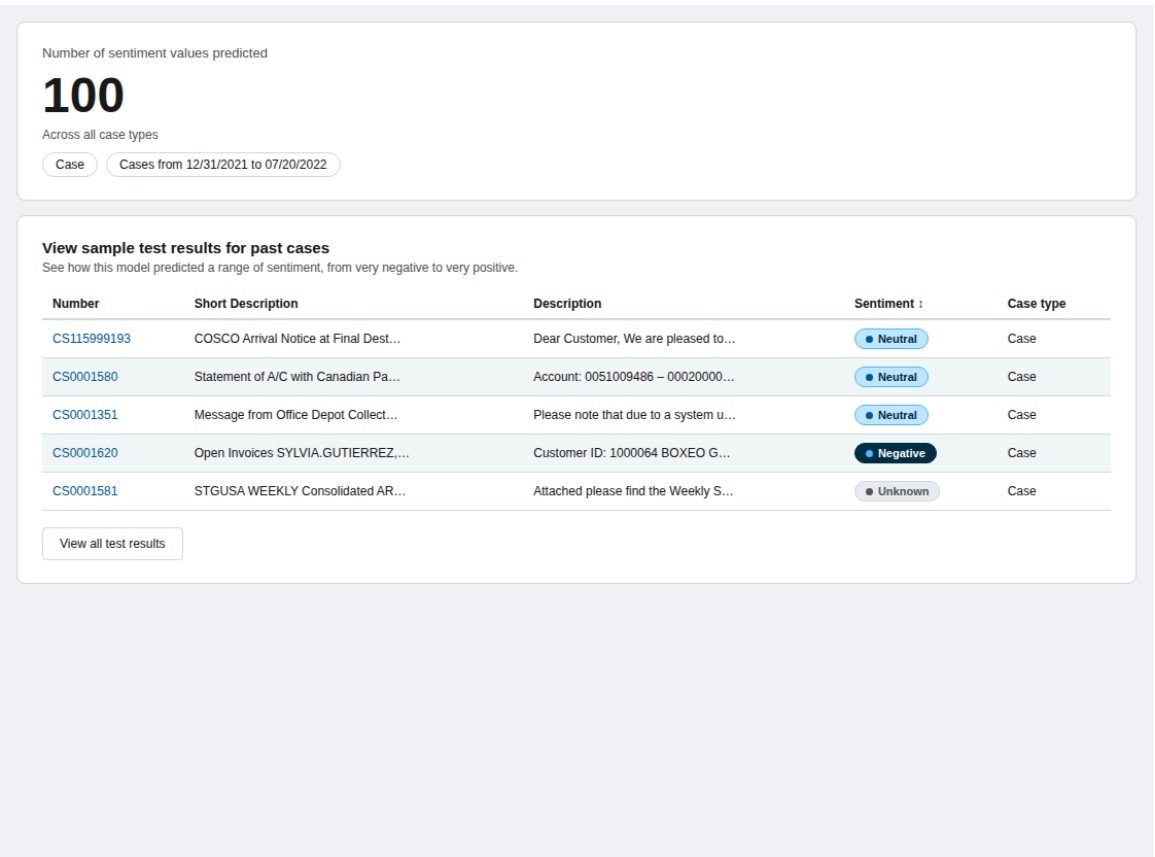


Reviewing the results gives you a preview of how your model will perform after being deployed.

1. Select **View all test results** to see a list of results.
2. Select **Save & continue**.

Set your preferences

Tell the model how you want to use the sentiment predictions.



1. Display predictions in the **Current sentiment** and **Sentiment over time** fields.
2. If desired, you can run the model in the background only.

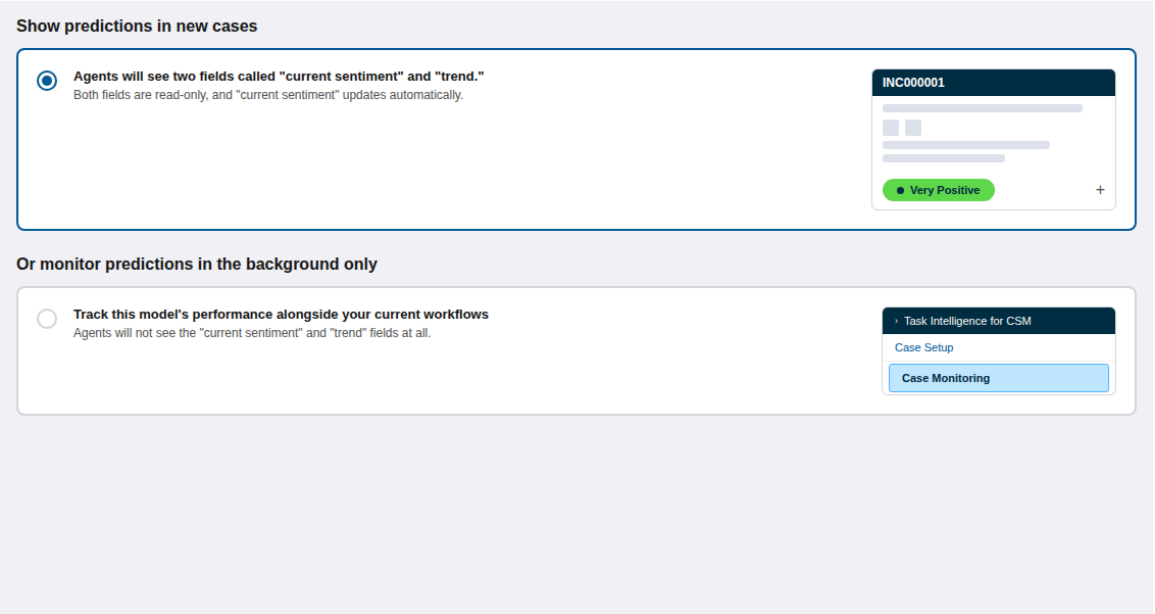
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With this option, the system makes the predictions and stores the information in the Predictions History but does not add any information to the case records.

3. Select **Save & continue**.

Deploy your model

Review your choices from the previous pages. Then you can select **Deploy** to deploy the model.



Create a model to detect case language

Edit and test the pre-trained model to detect the language used to create customer service cases.

Before you begin

Role required: ti_admin

About this task

The language detection model is a pre-trained model. You select a set of records to test the model and then view the results before deploying.

Using the language detection model automatically enables the Task Intelligence Case Language Detection flow and the *sn_csm_ml_task.case.language.mlpredictor.enabled* property.

Prerequisite

- Activate the I18N: Internationalization plugin
- Enable the ServiceNow translator.

For more information, see Configure language detection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

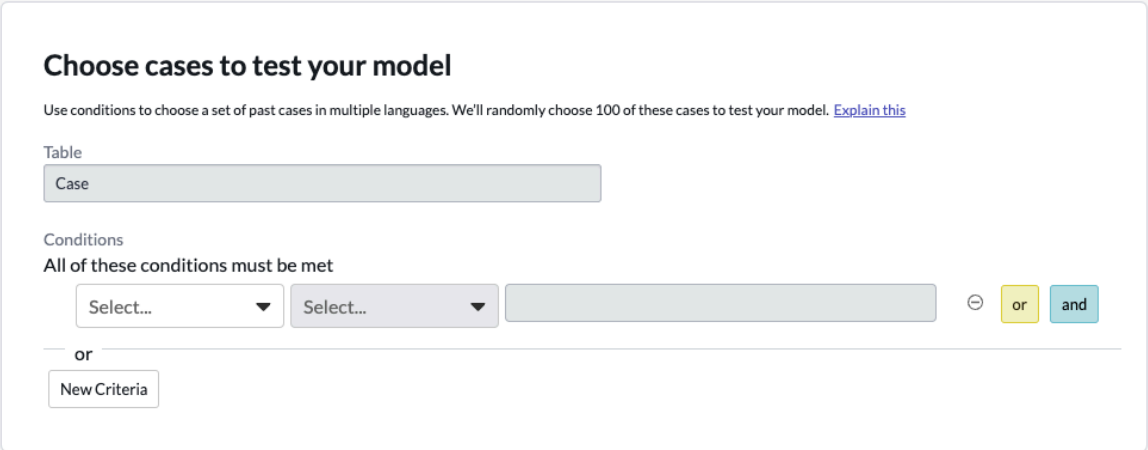
Set up your model

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup** to access the Task Intelligence Admin Console.
2. Select **Edit model** on this model: **Predict case language to improve assignments**.

   This opens the model and displays the first of four pages. Each page in the model asks you questions and helps you select the information you need to build an effective model.

Test your model

Choose the cases to use to test the model.



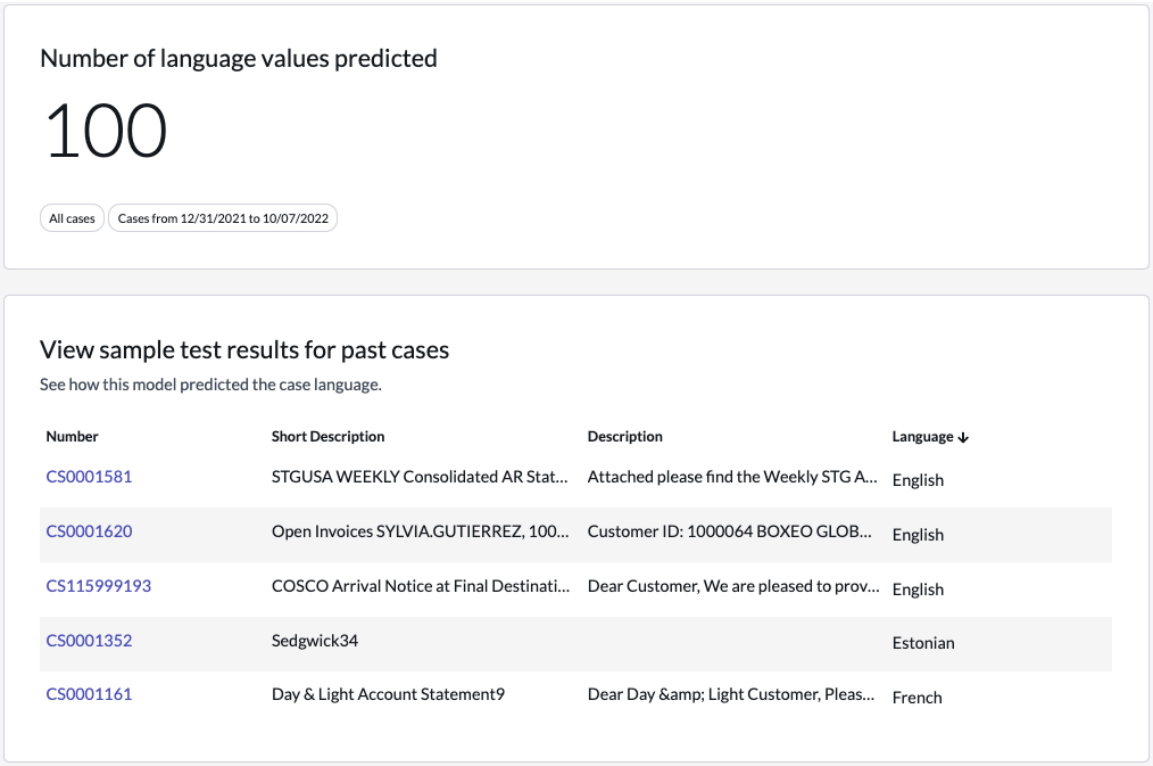
Selecting this information tells the model which records to use for testing. When the model is deployed, it predicts the language on all records in the table that match the selected conditions.

1. Use conditions to choose a set of records for testing.
2. Select **Launch testing**.

Assess your model

Assess the results from the testing and view sample results for past cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



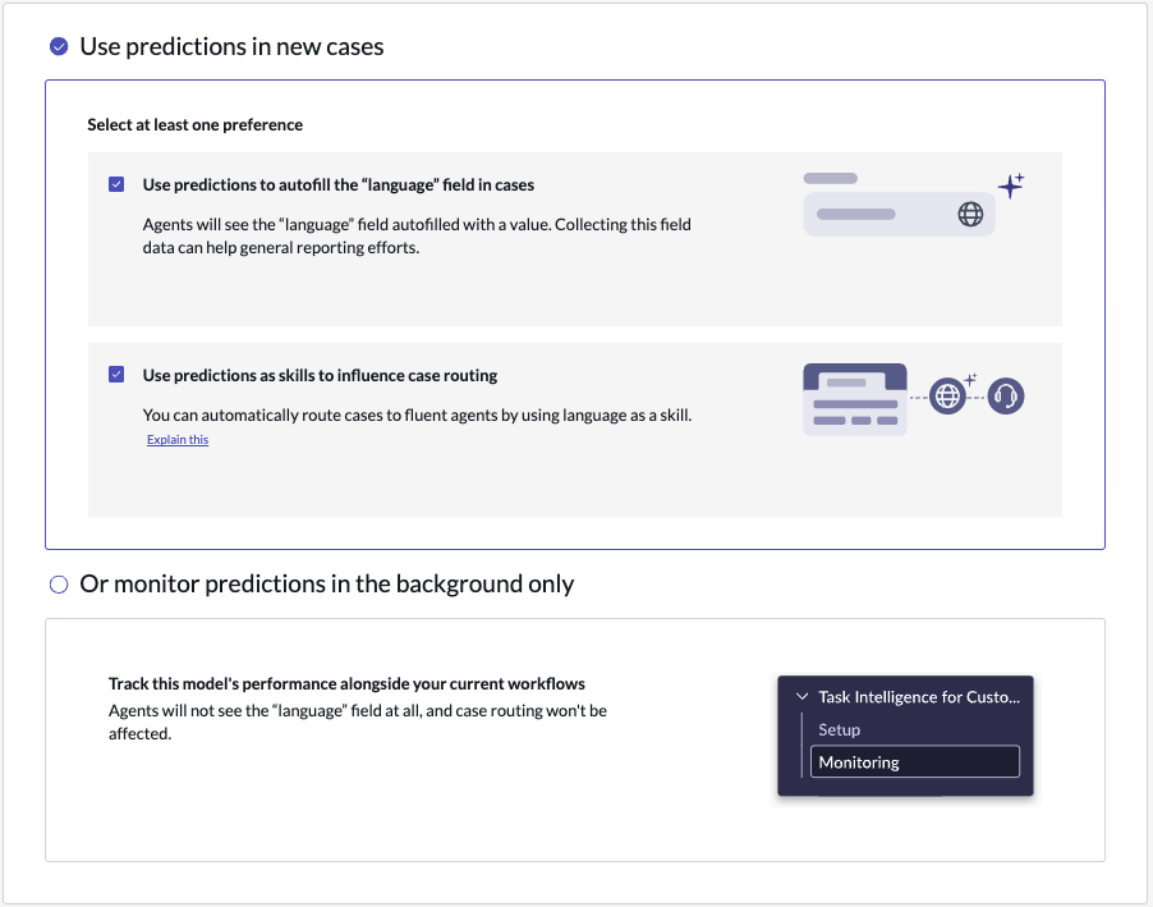
Reviewing the results gives you a preview of how your model will perform after being deployed.

1. Select **View all test results** to see a list of results.
2. Select **Save & continue**.

Set your preferences

Tell the model how you want to use the language predictions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



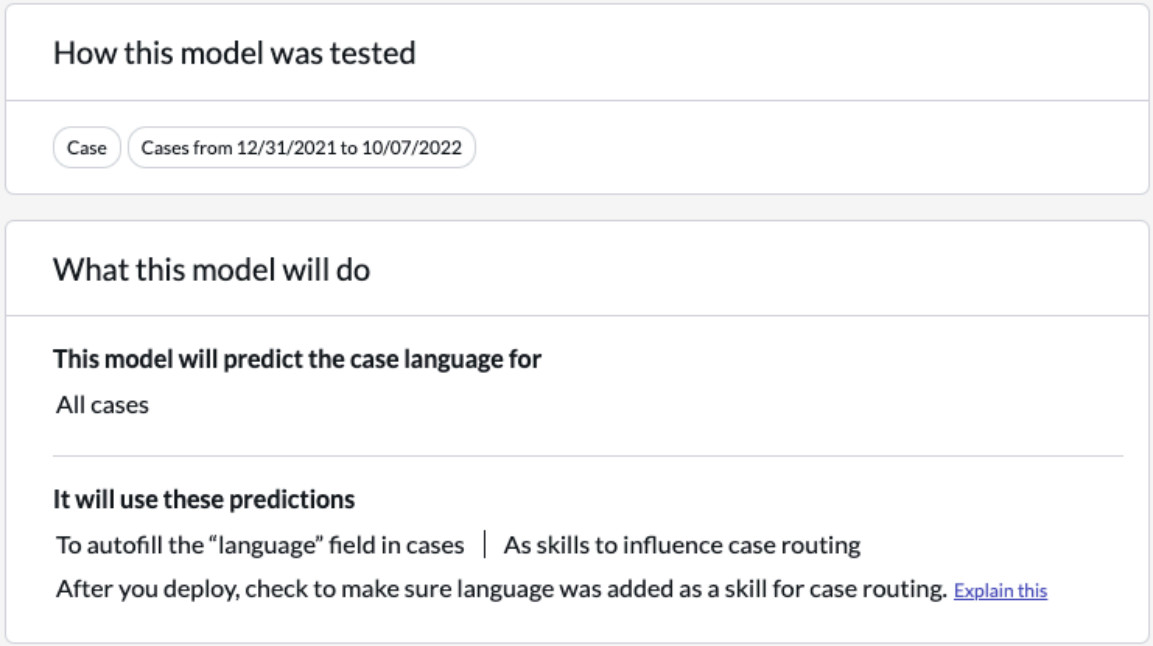
1. Use predictions in new cases.
   a. Add the predicted language in the **Language** field in cases.
   b. Use the language prediction as a skill to assist with case routing (add the language skill to the Task Skills table for the case record).
2. If desired, you can run the model in the background only.

   With this option, the system makes the language predictions and stores the information in the Predictions History but does not add any information to the case records.
3. Select **Save & continue**.

Deploy your model

Review your selections from the previous pages. Then you can select **Deploy** to deploy the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a Document Intelligence use case

Create a use case that identifies the information to extract from email and case attachments and determines how users with CSM agent roles interact with the extracted values in the Document Intelligence workspace.

Before you begin

Role required: sn_csm_ml_task.ti_analyst, sn_csm_ml_task.ti_admin

About this task

A use case contains the list of fields to extract from attachments and a mapping of those fields to fields in the Case table or a case type table. It also contains an extraction mode that controls how the values for the extracted fields are added to the case.

Use cases include the following information.

Use case form fields and descriptions

Use case information	Description
Fields	Configure the list of fields to predict for a use case. A field is a single piece of information to extract from a document. For example, the date on a document.
Document tasks	Create a document task and include attachments that are used to train the Document Intelligence model to identify the correct information.
Integrations	Select conditions for a use case that tell the Document Intelligence feature when to run.

Prerequisite

- Activate Task Intelligence for Customer Service (com.snc.csm_ml_task).
- Activate Document Intelligence Admin (com.snc.docintel_admin).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Configure Document Intelligence for Customer Service.

Access the DocIntel Admin experience

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup** to open the Task Intelligence Admin Console.
2. In the Explore related applications section of the console, select **Open DocIntel** in the Document Intelligence card to open the DocIntel Admin experience.

Create a use case

Create a use case to identify a document or set of documents to be processed together in Document Intelligence. With Document Intelligence for Customer Service, the Use Cases list in the DocIntel Admin experience uses a default filter with an OR condition to show use cases for:

- Application = Task Intelligence for Customer service -or-
- MLUC ID = MLUC CSM-00003

To create a use case:

1. Select **Use Cases** in the DocIntel Admin header.
2. Select **New use case** in the Use Cases list.
3. In the Define a new use case pop-up window, enter the following information.

Define a new use case pop-up window

Field	Definition
Name	The name of the use case.
Location for the extracted data	The table that contains the records to be automatically populated with data extracted from attachments. Set this field to the case or case type that is relevant to your use case.
Extraction mode set by default	The extraction mode determines how the results are displayed to agents in the Document Intelligence workspace. The DocIntel Admin starts by showing the results for each use case as recommendations.

4. Select **Save** to add the use case to the Use Cases list.

Define the fields to extract

After creating a use case, select the fields that you want to extract. You can select one or more fields for a use case. These fields can be of the text or Boolean type.

Note:
The fields to be extracted should already exist in the use case target table. If the fields do not exist in the target table, add them to the table and then complete this step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Select a use case in the Use Cases list.
2. Select the Fields tab.

   This tab lists the fields that have been selected for extraction for the use case.
3. Select **Define your fields**.

   If you have already defined one or more fields and you want to add another field, select **New field**.
4. Fill in the fields in the Define a new field pop-up window.

Define a new field pop-up window

Field	Definition
Use case	[Read only] The use case associated with this field record.
Field Name	The display name of the field to extract as it appears in the Document Intelligence workspace.
Field Type	The type of field (for example, a text field or a check box option). Field type is read-only if you add this field to a field group. The field type is whatever is designated for the group. Some field types convert the extracted value into a standard format. See Data normalization.
Is field required	[Text and number fields only] Required fields can't be left empty or unreviewed.
Add field	Select the field group that you want to add the field to.
Target Table	[Read only] The table that stores the document processing results for this use case.
Target Field	Field on the target table you want to align this field with. Used for interation. **Note:** You must select a use case with a target table.
Define multiple fields	If you're adding more than one field to the use case, enable this check box to keep the pop-up window displayed on the screen.

5. Select **Add field**.

   The system adds the field definition to the Fields list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a document task

Document tasks include attached documents that are used to train the model to identify and extract the correct information.

1. Select a use case in the Use Cases list.
2. Select the Document tasks tab.

   This tab lists the tasks that have been created for the use case.
3. Select **Create a document task**.

   If you have already created one or more tasks and you want to add another task, select **New document task**.
4. In the Create the document task pop-up window, enter a **Document task name**.
5. Select **+Add File** to add one or more attachments.
6. Select the file and then select **Open**.
7. In the Upload a file pop-up window, select **Upload**.
8. In the Create the document task pop-up window, select **Add Extraction**.

   The system adds the task to the Document Tasks list and Document Intelligence begins the data extraction process, which can take a short time to complete.
   - When the extraction process is complete, the **Is Processed** field is set to true.
   - When the values have been extracted from the document, the **Status** field is set to Done.
9. Open the task and select **Open in Document Intelligence** to view the task in the Document Intelligence Workspace.
10. Train the extracted fields to identify the correct values.
    a. If a field value is correct: put your cursor in the field and press Return to confirm the value.
    b. If a field value is missing: select the value from the list and press Return to confirm the value.
    c. If a field value is incorrect: delete the incorrect value and type the first few characters of the correct value. When the correct value appears in the list, select it and then press Return.
    d. If a field value is incorrect and the correct value does not appear on the image, select *Missing in the document* from the list.
    e. Select **Submit**.

Create an integration

Select conditions for a use case that tell the Document Intelligence feature when to run.

You can create one or more integrations for a use case. If a use case has more than one Integration, the system uses the latest one at run time.

> **Note:**
> When creating an integration, make sure that the **Create Flow** check box remains unchecked.

1. Select a use case in the Use Cases list.
2. Select the Integrations tab.

   This tab lists the integrations that have been created for the use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Set up your first integration**.

   If you have already created one or more integrations, select **Add integration**.

4. In the Create Integration pop-up window, enter a name for the integration.
5. Use the condition builder to select conditions that tell the Document Intelligence feature when to predict values.

   At run time, the system identifies the right task definition based on these filters. The first active task definition that matches the filters for the case or case type is selected.

6. Select **Save**.

Set general Document Intelligence features

General settings determine how the Document Intelligence feature displays information to agents. General settings apply to all use cases.

1. Select **Settings** in the DocIntel Admin header.
2. Enable or disable the **Exact match option**. When enabled, Document Intelligence displays only the candidate values that exactly match what the agent types.
3. Enable or disable the **Candidate score** to display confidence scores for each recommendation.
4. Select a layout for the **Side panels**.
5. Set the **Default width of the extraction panel**.
6. Set the **Default width of the thumbnail panel**.
7. Select the **Default document fit for the image panel**.

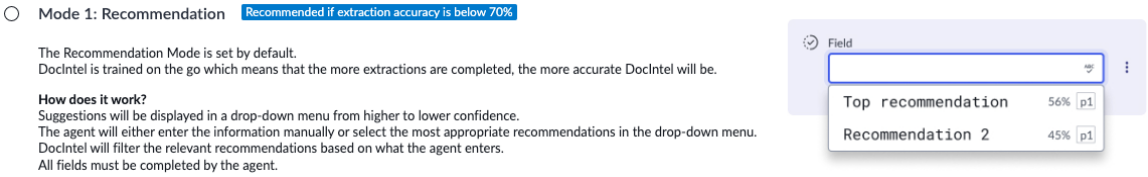
For more information about the general settings, see Configure Document Intelligence.

Configure the data extraction mode

The extraction mode determines how the Document Intelligence workspace handles the extracted values. Two extraction modes are available: Recommendation and Autofill.

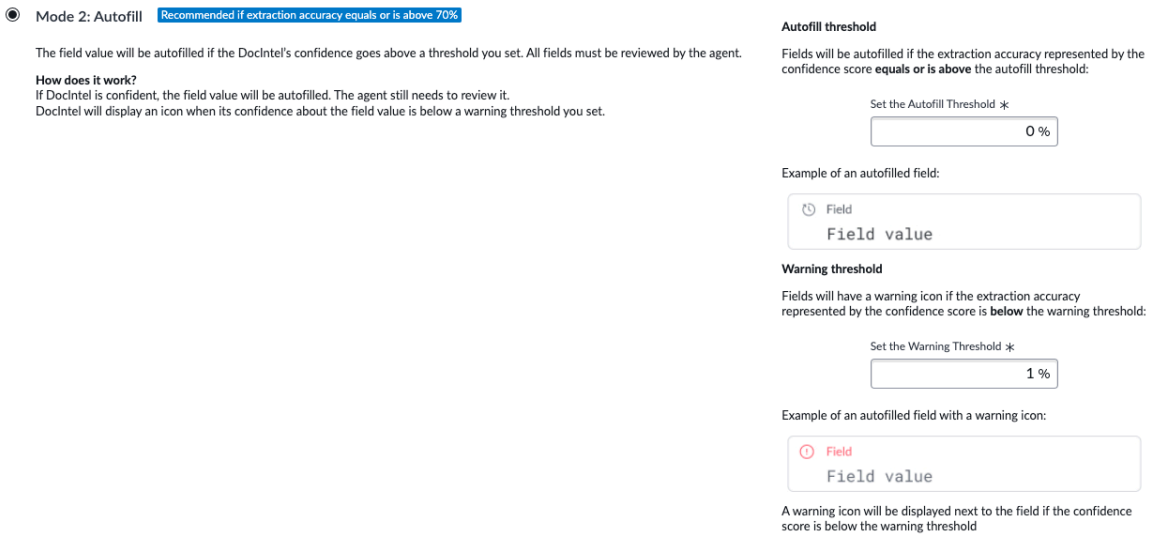
- Recommendation mode provides recommendations for the extracted fields in the Document Intelligence workspace. Agents can choose the recommended value for a field or manually enter a value.
- Autofill mode adds values to the fields in the Document Intelligence workspace if the extraction confidence is higher than the **Autofill Threshold** value.

1. Select **Settings** in the DocIntel Admin header.
2. In the left column of the Settings page, expand the Use Cases list and select a use case.
3. Select **Extraction Mode**.
4. To use the Recommendation mode, enable **Mode 1: Recommendation**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

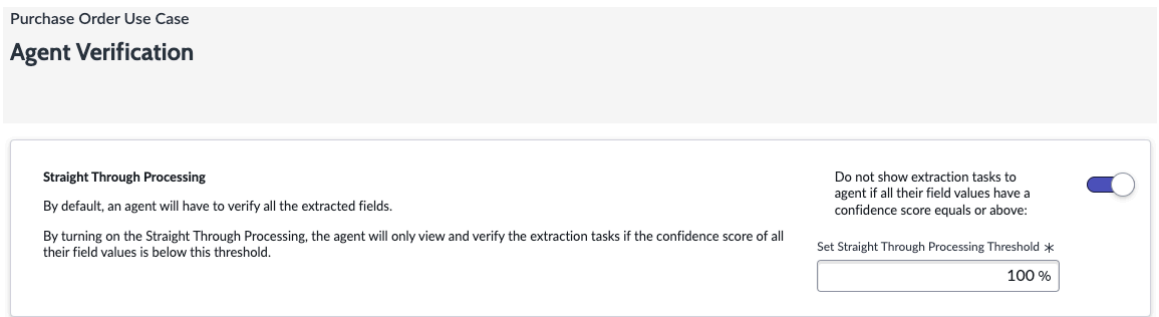
5. To use the Autofill mode, enable **Mode 2: Autofill**.
   a. Enter a percentage value in the **Set the Autofill Threshold** field.
   b. Enter a percentage value in the **Set the Warning Threshold** field.



Configure the agent verification setting

By default, agents review and verify the fields with values that are extracted from attached documents. You can enable Straight Through Processing to automatically populate these fields with extracted values. When enabled, agents only review and verify the extraction tasks if the confidence score of all field values is below the set threshold.

1. In the left column of the Settings page, expand the Use Cases list and select a use case.
2. Select **Agent Verification**.



3. If desired, enable **Straight Through Processing**.
4. Enter a percentage value in the **Set Straight Through Processing Threshold** field.

Create a model to predict similar open incidents

Use the Task Intelligence for CSM to create and train a machine learning model that identifies similar open incidents. The model analyzes similar open incidents data to suggest relevant incident records when working on a current open incident, helping agents resolve issues faster. The plugin includes a ready-to-train model for predicting similar cases and also lets you create custom models tailored to your specific use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Task Intelligence for Customer Service plugin is installed.
- Ensure that your instance contains sufficient open incident records (minimum 10,000 recommended) for meaningful training.
- Role required: ml_admin, ti_admin

Set up the prediction model

Procedure

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup**.
   The Task Intelligence Admin Console displays.
2. On the Similar Open Incidents card, select **Ready to train**.
   The model opens in a guided setup flow. The Define the purpose screen appears.
3. **Define the purpose:**

   a. Review the pre-filled Model name.

   b. The Prediction table and Training table are pre-selected as **Cases** and **Incidents**, respectively.
   These values are fixed and cannot be edited.

   c. Select **Save & Continue**.
   The Train your model screen appears.

4. **Train your model:**

   a. The **Model name** and **Prediction table** fields are pre-filled and cannot be edited.

   b. **Optional:** Apply **Conditions** to filter the training data.

   c. In the **Prediction table** field, select fields such as Description and Short description that the model should use to identify similarities.

   d. In the **Training table** section, select matching or relevant fields that help the model compare open incidents.

   e. Choose the **language** for training.

   f. Set the **Update frequency**.

   g. Review the **Number of records**.
   If needed, select the **Load records** icon to reload.

   h. **Optional:** Enable **Auto-retrain** to allow retraining the model on a set schedule.

   i. Select **Launch training**.

   j. Once training starts, select **View current results** to preview sample outputs.
   The Assess and define screen appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Assess and define**:

   a. Review the **Estimated number of records** used for training.

   b. In **Prediction preference**, select one of the following options:
      - Recommendations – Recommends similar open incidents (selected by default).
      - Monitor only – Runs the model in the background without displaying recommendations. You can analyze the logged data before enabling recommendations.
      - Turn off predictions – Disables all predictions for this model.

   c. Select **Save & Continue**.
   The Deploy your model screen appears.

6. **Deploy your model**:

   a. Review your setup and training summary and then select **Deploy** to activate the model.
   A confirmation message appears when deployment is complete.

   Result

   Once deployed, similar open incidents are displayed in the Recommended Actions section under the Suggested Actions tab when an agent opens a case that helps them resolve cases faster using related issues and prior solutions.

Create a model to predict similar knowledge articles

Use the Task Intelligence for CSM to create and train a machine learning model that recommends relevant knowledge articles based on the context of open incidents. The model analyzes existing data to display relevant articles when working on a current case, helping agents find useful information faster. The plugin includes a ready-to-train model for predicting similar articles and also enables you to create custom models tailored to your data.

Before you begin

- Ensure that the Task Intelligence for Customer Service plugin is installed.
- Ensure that your instance contains sufficient case and knowledge data (minimum 10,000 recommended) for meaningful training.
- Role required: ml_admin, ti_admin

Set up the prediction model

Procedure

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup**.
   The Task Intelligence Admin Console displays.
2. On the Similar Knowledge Articles card, select **Ready to train**.
   The model opens in a guided setup flow. The Define the purpose screen appears.
3. **Define the purpose:**

   a. The Prediction table and Training table are pre-selected as **Cases** and **Knowledge**, respectively.
   These values are fixed and can't be edited.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Save & Continue**.
The Train your model screen appears.

4. Train your model:

a. The **Model name** and **Prediction table** fields are pre-filled and can't be edited.

b. Optional: Apply **Conditions** to filter the training data.

c. In the **Prediction fields** field, select Short description that the model uses to identify similarities.

d. **Note:**
The options selected here are defaults. You can modify the options in the **Prediction fields** and **Training fields** based on your requirements.

In the **Training fields** field, select Article body and Short description of the Knowledge training table.

e. Choose the **language** for training.

f. Set the **Update frequency**.

g. Review the **Number of records**.
If needed, select the **Load records** icon to reload.

h. Optional: Enable **Auto-retrain** to enable retraining the model on a set schedule.

i. Select **Launch training**.

j. Once training starts, select **View current results** to preview sample outputs.
The Assess and define screen appears.

5. Assess and define:

a. Review the **Estimated number of records** used for training.

b. In **Similar Knowledge preference**, select one of the following options:

- Recommendations – Recommends similar records based on training and prediction fields (selected by default).
- Monitor only – Runs the model in the background without displaying recommendations. You can analyze the logged data before enabling recommendations.
- Turn off predictions – Disables all predictions for this model.

c. Select **Save & Continue**.
The Deploy your model screen appears.

6. Deploy your model:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Review your setup and training summary and then select **Deploy** to activate the model. A confirmation message appears when deployment is complete.

Result

Once deployed, similar knowledge articles appear in the Recommended Actions section under the Suggested Actions tab when an agent opens a case, helping them resolve cases faster.

Create a model to predict similar cases

Test and edit the pre-trained similar cases model for predicting similarity in customer service cases and create a model for custom cases.

Pre-requisites

Role required: ml_admin, ti_admin

About this task

Base system models: Task Intelligence for Customer Service includes three base system models for predicting similar records for cases:

- Major Case identifier
- Similar Open Cases
- Similar Resolved Cases

To get recommendations for a major case identifier that includes propose major cases and similar major cases, install the Major Issue Management plugin plugin and activate the feature as needed to get recommendations. When you install the Task Intelligence for CSM plugin in your production instance, the plugin automatically installs and trains the similar open cases, similar resolved cases, and major case identifier models using your data. These models are then auto-deployed. The similar open case and similar resolved case models show predictions on recommended actions on case form. However, recommendations aren't enabled for the major case identifier model in the base system.

Steps to activate Major Case identifier recommendation

1. Navigate to **All** > **Recommended Actions** > **Recommendations**.
2. Select **Propose major issue** under the Application scope **Task Intelligence for Customer Service**.
3. Check the **Active** check box.
4. Select **Update**.

Repeat the steps for **Similar major cases**.

Note:

Propose major issue and similar major cases are inactive in the base system.

Enable Suggested Actions on the front line case page record

Before you begin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: workspace_admin, ui_builder_admin, ti_admin, next_best_action_author

Recommended Actions component should be added to the specific record page. (Front line or CSM default record page)

About this task

To enable **Suggested Actions** tab, the admin should activate the **Recommended actions** feature on two specific pages: **Front line case page** and **CSM default record page**. Once activated, agents can view the recommendations on these pages.

Note:
For CSM default record page, first wire Recommended actions on this CSM default record page first, and then enable the **Suggested Actions** tab in UIB via the component property.

To enable **Suggested Actions** feature in the Recommended Actions component, follow the following steps:

1. Navigate to **All**> **Now Experience Framework** >**Experiences**.
2. Select the UX application **CSM/FSM Configurable Workspace**.
3. Select **Open in UI Builder**.
4. Navigate to **Record** under **Pages and variants**.
5. Select **Front-line Case page**.

Note:
Verify that you are in the accurate scope to be able to edit.

6. Select **Recommended Actions 1** under the Tabs.
7. In the Configure tab, turn off the toggle for **Hide recommended actions**.
8. Select **Save**.

By following these steps, you successfully activate the Recommended Actions feature, enabling agents to view suggestions under Recommendations in the CSM/FSM Configurable Workspace. When you open a case, you find the recommendations section with two tabs: **Search** and **Suggested Actions**. The recommendations are displayed under **Suggested Actions**.

Enable Recommended actions in the CSM default record page

1. Navigate to **All**.
2. In the search box, enter sys_ux_screen_condition.list and press enter.
3. Select the filter icon, enter **[Screen] [contains] [Recommeded Actions default]** and **[Application] [is] [Recommeded Actions]**, and select **Run**.
4. Select the **true** link under **Active**.
5. On the **UX Screen Condition** page in the Script, replace the return value with **true**.
6. Select **Update**.

Result: On opening a case, the recommendations section with two tabs: Search and Suggested Actions is displayed. The recommendations are displayed under Suggested Actions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Find out how to Create a custom similar case model, Edit a model, and Export a model

Edit a model

Edit the case models that have already been trained and deployed. Change the model configurations, view the updated training results, and redeploy the model.

Before you begin
Role required: ti_admin

A prediction model must already be created, trained, and deployed.

About this task
You have two options for editing your model: view the current training results or retrain the model. The first time you edit a model, a pop-up appears to ask you which option you would like to take. Resetting your prediction preferences enables you to change how visible the predictions are for agents. Retraining your model enables you to select new data for training, which changes the prediction capabilities of the model. While you can retest your prediction model, it doesn't change the prediction skills.

Procedure
1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup**.
2. From the **Models** list, select the menu icon of the model you want to edit, and then select **Edit Model**.
3. Modify the fields to get the required predictions.
4. Select **Launch training**.
   A warning message appears asking if you want to update and train the model.
5. Select **Retrain**.
   The new training results page loads.
6. Select the **Compare models results** button to show both the previous results and the new results.
7. Select **Save & continue**.
8. Set your preferences for displaying the predictions or running them in the background.
9. Select **Save & continue**.
   The **Deploy your model** screen loads and shows the changes that you made indicated in yellow. If you don't want to deploy the changes, select **Discard changes**.
10. Review the model and select **Redeploy**.
    Your updated model is deployed.

What to do next
See how to Export a model

Export a model

Export a Task Intelligence model to another instance.

Before you begin
Role required: ti_admin or tia_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup**, depending on which application and context you want to export for.
2. In the **Models** list, select the more options menu of the model you want to export.
3. Select **Export model**.
   A new tab opens with authentication steps.
4. Select **Allow**.
   Your browser screen goes blank. To check that the download was successful, look at the bottom left of your browser and also check your download location to see if you have the exported model on your computer. Repeat this process for any other Task Intelligence models that you want to move to the target instance.

Result

The browser downloads the XML file to your system.

What to do next

You can use the XML file to transfer the model to another instance using update sets. To learn more, see System update sets. Find out How to move your trained Task Intelligence Models to a different instance.

Create a custom similar case model

Set up a training model to help it recognize similarities between two types of tables by comparing their fields.

The model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records.

Before you begin

Role required: ml_admin, ti_admin

About this task

The case similarity model is pre-trained with a large data set to learn communication patterns. You select a set of records to test the model and then view the results before deploying.

Set up similar cases prediction model

Use Task Intelligence for CSM to set up similar case prediction model and train it with your data to make predictions. Access your model's performance results, set the prediction preferences and behavior, and deploy your model.

1. Navigate to **All** > **Task Intelligence for Customer Service** > **Setup** to access the Task Intelligence Admin Console.
2. On the **Suggest similar case to reduce resolution time** card, select **Set up model**.

This action opens the model and displays the introductory pages. Each page in the model asks you questions and helps you select the information needed to build an effective model.

Train the similarity model

Train your similar case model with training data to predict the similar records by recognizing similarities between fields of Case table and training tables. When you train a machine learning model, the model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select the table and fields that you want to predict, such as the Prediction table and Predictions fields. Also, you can select the tables and fields that you want the model to use to predict the similar records, such as the Training table and Training fields. Select this information to tell the model what to look for during training.

Note:
You can either use the recommended settings or customize the settings to fit your needs.

1. Enter a name for the model.
2. Select the **Prediction table** you want the model to predict.
3. Select **Conditions** to choose a set of records to use for training.

   Note:
   These conditions provide the requirements that a record must meet to make the predictions. However, this functionality is currently not supported.

4. Select the **Prediction fields** which will be used to predict similar records.
5. Select the **Training table** in the training data that you want the model to use to make predictions.
6. Select **Conditions** to choose a set of records to use for training.
7. Select the **Training fields** that you want the model to use to make predictions.
8. Select the **Language** in which training takes place.
9. Select the **Update Frequency** to decide how frequently the training should occur.
10. Review the resulting **Number of records** in the training data based on the selected conditions.

    The records that are counted include the number of fields, parameters, and data that the model uses to train. Based on the provided information and the set conditions, the number or records gets updated automatically. The model needs a minimum of 10,000 records for effective training. If this minimum number hasn't been reached, try selecting different conditions. You can also click the refresh icon to refresh the number.

11. Select to retain a model manually or set it to auto retrain.
12. Select **Launch training**.

Assess the similarity model

Assess the results from the model training and view sample results to see the similar records predicted for cases. Reviewing the results gives you a preview of how your model will perform after being deployed. Based on the sample results, select the prediction preference. The model has flexible options. Based on the sensitivity and requirements of each case record, you can do the following actions:

- Recommend similar records for the cases.
- Monitor and run the prediction model for the cases in the background only. Admin can track the predictions made by model by going to **All** > **Task Intelligence for Customer Service** > **History**.
- Turn off the predictions for the cases.

Steps in Assess the similarity model:

1. View the number value in the **Estimated number of records used for training** section.
2. Select **View sample results** to see the similar records predicted for each case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Choose one of the following options from the **Prediction preference** drop-down list for each field.

Options	Description
Recommendations	Shows the top recommendations based on the similarity patterns. Agents can choose to accept or reject the recommendation. You can configure the number of recommended values using Advanced Recommended actions for CSM. For more information, see Configuring the Recommended Actions application.
Turn off predictions	Stops the model from performing any predictions.
Monitor only	Monitors and runs the model in the background only without making any predictions on the case form.

4. Select **Save & continue**.

Deploy the similarity model

Deploy the Similar cases model to predict the similar records for the cases.

1. Review your choices from the previous pages and information about how the model was trained.
2. Select **Deploy** to deploy the model.

A pop-up appears confirming that your model was deployed.

Predictive Intelligence for CSM solution definitions

Use your instance records to build Customer Service Management specific solutions.

Solution definitions

These solution definitions are available as templates on instances where both Predictive Intelligence and Customer Service Management are active. Create your own solution definition records to customize the behavior.

Solution Definitions for Customer Service Management

Solution Definition	Solution Type	Description
CSM Case Assignment	Classification	Predicts the **Assignment group** field from the **Short description**.
CSM Case Categorization	Classification	Predicts the **Category** field from the **Short description**.
CSM Case Prioritization	Classification	Predicts the **Priority** field from the **Short description**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution Definitions for Customer Service Management (continued)

Solution Definition	Solution Type	Description
Grouping of Cases into Topics	Clustering	Clusters similar cases into topics based on the **Short description**.
All Similar Cases	Similarity	Recommends similar cases based on the **Short description** that can help customer service agents with case investigation and resolution processes.
Recommended Open Cases	Similarity	Recommends similar open cases based on the **Short description**.
Recommended Resolved Cases	Similarity	Recommends similar resolved cases based on the **Short description**.
Major Issue Detector	Similarity	Provides recommendations for major issues based on the **Short description**. • Recommends one or more major cases, if available. • Otherwise, recommends similar cases that are not linked as child cases to a major case.
Similar Knowledge Articles	Similarity	Recommends similar knowledge articles by comparing the **Text**, **Short description**, and **Description** fields of knowledge articles to the **Short description** of the customer service case.
Similar Knowledge Articles All	Similarity	Recommends similar knowledge articles by comparing fields in the Knowledge View database view [sn_customerservice_knowledge_view] with the **Short description** of the customer service case.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution Definitions for Customer Service Management (continued)

Solution Definition	Solution Type	Description
		Note: This solution definition is used in the Auto-Responder feature. For more information, see Train the similarity solution for finding Auto-Responder notification content.

Business rules for classification solutions

These business rules apply only to the CSM Case Assignment, CSM Case Categorization, and CSM Case Prioritization solution definitions. The rules are available only on instances where both Predictive Intelligence and Customer Service Management are active. Create your own business rules on the Case [sn_customerservice_case] table to customize prediction and reporting behaviors.

Business rules for Customer Service Management

Business rule	Table	Description
Default Case Based Prediction	Case [sn_customerservice_case]	Generates prediction results from the active Customer Service Management solutions. Runs when a case record is inserted.
Update Prediction Results	Case [sn_customerservice_case]	Updates the solution precision and coverage statistics. Runs when a case record is closed.

Upgrade Information

If your instance is running on the Kingston release and you are upgrading to the Zurich release:

- Use the Default Case Based Prediction business rule template to create a new business rule. This rule includes a Solution variable that gets all active solutions retrieved by the findActiveSolution(solutionName) method.
- In a global domain environment, use the solutionNames array variable which requires that you explicitly provide the solutions that are called by the business rule.
- In a domain-separated environment, such as an MSP environment, refer to the commented code in the business rule template for easy customization.
- The business rule template calls the applyPredictionForSolution() method to predict regardless of any changes to the default value.

Maintaining prediction accuracy

You can manage prediction drift by retraining, modifying, or creating solutions to reflect changes in your business conditions. Test and modify your business rule over time to verify it works as desired across multiple consumption points and user personas.

Related topics

Similar case/recommendation

Trending case topics

Resolve cases more efficiently and proactively using Predictive Intelligence to identify clusters of cases with similar issues and pinpoint factors that drive up case volume. Each cluster of cases represents a trending case topic.

Using trending case topics has the following benefits:

- Increase manager productivity: Quickly identify clusters of cases that point to similar underlying issues and act to resolve them.
- Improve customer experience: Proactively resolve issues by analyzing patterns in customer service data.
- Enhance operational excellence: Reduce the backlog of open cases by resolving similar cases at once.

System administrators train solution definitions to cluster similar cases and identify similar major cases for the clustering.

Major issue managers use trending case topic lists to analyze the backlog of cases. Using the lists, they can quickly identify any existing major cases that the backlog could be linked to or create a new major case.

Activation information

The trending case topics feature requires the Predictive Intelligence for CSM (com.snc.csm_ml) plugin and the Major Issue Management (com.sn_majorissue_mgt) plugin.

Related topics

Configure trending case topics

View trending case topics

Add trending case topics to existing major cases

Create major cases for trending case topics

Configure trending case topics

Train solution definitions to identify clusters of cases that point to similar underlying issues and find any related major cases for the clusters.

Before you begin

Role required: admin

About this task

Access the menus and use the modules to train the solution definitions to identify trending case topics. For more details, see Trending case topics.

Procedure

1. Navigate to **Predictive Intelligence** and then either **All** > **Similarity** > **Solution Definitions** or **Clustering** > **Solution Definitions**.
2. Complete the following tasks to train the solution definitions for trending case topics.

© 2026 ServiceNow, Inc. All rights reserved.

Solution definitions field description

Task	Description
Train the clustering solution definition to automatically group similar cases into topics	Configure a clustering solution definition to cluster similar cases into groups.
Train the similarity solution definition to find similar existing major cases	Configure a similarity solution definition to find similar major cases for the clusters.

Train the clustering solution definition to automatically group similar cases into topics

To enable clustering of similar cases into topics, you must first update and train the clustering solution definition.

Before you begin

Role required: admin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml).

About this task

By default, a clustering solution definition for clustering groups of cases into topics is already available. A clustering solution definition groups similar records into clusters so you can address them collectively or identify patterns.

You can modify the fields, filters, update frequency, and training frequency.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
2. In the Clustering Definitions list, search for and select the Grouping of Cases into Topics solution definition (ml_sn_sn_csm_ml_global_grouping_of_cases_into_topics).
3. On the Clustering Definition form, verify the default field values.
4. Change the fields and filters, as required.
5. To change the frequency with which the model for clustering solution definition must be rebuilt, edit the **Update Frequency** field.
6. To change the frequency with which to include new records in the model for the clustering solution definition, edit the **Training Frequency** field.
7. In the Training Request Schedule related list, view the schedule for training the Grouping of Cases into Topics solution definition.
8. Click **Update & Retrain**.
9. Open the Grouping of Cases into Topics solution definition.
10. In the ML Solutions related list, view the training solution progress in the **Progress** column.

> **Note:**
> Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

11. Click the **Cluster Visualization** tab.
    The clusters that were formed for the given solution are displayed in a tree map in descending order of size from top left to bottom right. Each node is colored from red to green depending on the cluster quality.

Train the similarity solution definition to find similar existing major cases

To enable finding related major cases in a cluster, you must first update and train the similarity solution definition.

Before you begin

Role required: admin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml).

About this task

By default, a similarity solution definition for finding similar existing major cases in a cluster is already available. A similarity solution definition collects and compares your existing records to new similar records.

You can modify the fields, filters, update frequency, and training frequency.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Major Issue Detector solution definition (ml_sn_global_major_issue_detector).
3. On the Similarity Definition form, verify the default field values.
   For more information about the Similarity Definition form fields, see Create and train a similarity solution.
4. Change the fields and filters, as required.
5. To change the frequency with which the model for similarity solution definition must be rebuilt, edit the **Update Frequency** field.
6. To change the frequency with which to include new records in the model for the similarity solution definition, edit the **Training Frequency** field.
7. In the Training Request Schedule related list, view the schedule for training the Major Issue Detector solution definition.
8. Click **Update & Retrain**.
9. Open the Major Issue Detector solution definition.
10. In the ML Solutions related list, view the training solution progress in the **Progress** column.

> **Note:**
> Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

Similar case recommendations

The similar case recommendation feature enables customer service agents to easily find similar cases that can provide helpful information about a current case. This feature can also provide recommendations about cases that may be related to major issues.

The similar case recommendation feature uses the following components:

Additional search resources for contextual search

Additional search resources are provided for contextual search. These additional resources enable customer service agents to search open or resolved cases for information related to the current case.

Predictive Intelligence similarity solution definitions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Several of the additional search resources have an associated Machine Learning (ML) similarity solution definition. These additional resources perform a contextual search based on the case short description and return a list of similar records.

Predictive Intelligence in Agent Workspace

Predictive Intelligence can provide agents with a list of cases that are similar to the current case. These similar cases may provide helpful details or resolution information for the current case. Predictive Intelligence can also provide recommendations about potential major issues and major cases.

With the similar case/recommendation feature, customer service agents can:

- Find cases that are similar to the current case.
- Copy resolution notes and codes from resolved cases to the current case.
- Link the current case to a similar case.
- View a list of open cases similar to the current case and submit the current case as a major case candidate.
- View one or more similar major cases and link the current case as a child to a major case.

Major issue managers can search for cases that are similar to a major case and add them as child cases.

Using the feature in Agent Workspace and in the platform interface

With Agent Workspace, agents can:

- Perform a search in Predictive Intelligence using the additional search resources.
- Create a link from the current case to a selected case in the search results.
- Copy resolution information from a selected case to the current case. This includes the resolution code and the resolution notes (the agent must then save the case).
- View a list of similar cases that do not include major cases. This is a way to see that the current case might be a major case candidate.
- View a list of similar cases that include one or more major cases. The major cases are displayed first in the list of results. Agents can use an available action to add the current case as a child of a major case.

With the platform interface, agents can:

- Perform a search in the Related Search Results section on the Case form using the additional search resources. Agents can select these additional resources from a list by the **Related Search** field.
- Create a link from the current case to a selected case in the search results.

Plugins

The configuration for the similar case/recommendation feature is included with the Customer Service plugin (com.sn_customerservice).

The similar case/recommendation feature has a dependency on the Contextual Search plugin (com.snc.contextual_search). Activate the Contextual Search plugin to use contextual search and the additional search resources.

To use similar case/recommendation with the following features, activate the associated plugins:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Major Issue Management – activate the Major Issue Management plugin (com.sn_majorissue_mgt)
- Predictive Intelligence – activate the Predictive Intelligence plugin (com.glide.platform_ml)
- Problem Management – activate the Problem Management Best Practice – Madrid – State Model (com.snc.best_practice.problem.madrid.state_model)

Related topics

Machine learning solutions for Customer Service Management

Additional search resources

The similar case recommendation feature uses additional search resources, which are configured using the Contextual Search application.

Navigate to **Contextual Search** > **Additional Resources** to view the Search Resources (Additional Resources view) list. Two types of additional search resources are available: Table and Predictive Intelligence Similarity.

Table resources

Additional search resources of the type **Table** are based on a selected table and have specific conditions that must be met for a record to be included in the search results.

The following **Table** additional search resources are included with the Customer Service plugin:

- Resolved Cases
- Open Major Issues

The following **Table** additional search resources are included with the Problem Management Best Practice - Madrid - State Model plugin:

- Open Problems
- Resolved Problems

Table type additional search resources

Additional Resource	Table	Description
Resolved Cases	Case	Returns a list of cases created in the last six months that have a state of resolved or closed and the resolution code is one of the following: • Solved - Fixed by support/Guidance provided • Fixed by closing related PRB • Workaround provided based on open PRB Actions available: • **Link to Case**: the current case becomes a child of the case selected from the search results. • **Copy Resolution Information**: copies the resolution notes and resolution code from the selected case to the current case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table type additional search resources (continued)

Additional Resource	Table	Description
Open Major Issues	Case	Returns a list of open major cases. Actions available: **Link to Case**: the current case becomes a child of the case selected from the search results.
Open Problems	Problem	Returns a list of open problems. Actions available: **Link to Case**: adds the selected record as the Problem reference on the current case.
Resolved Problems	Problem	Returns a list of problems that have a state of Resolved or Closed. Actions available: **Link to Case**: adds the selected record as the Problem reference on the current case.

Predictive Intelligence Similarity resources

Additional search resources of the type Predictive Intelligence Similarity are associated with a Machine Learning (ML) similarity solution definition. Search resources of this type require the Predictive Intelligence plugin (com.glide.platform_ml). The resources listed in the following table are included with the Predictive Intelligence plugin.

In addition to the associated similarity solution definition, Predictive Intelligence Similarity resources can have configured properties. These properties identify conditions that must be met for cases to be included in the search results.

Predictive Intelligence Similarity type additional search resources

Additional Resource	Table	Description
Recommended Resolved Cases	Case	Returns a list of resolved similar cases created in the last six months. Associated with the Recommended Resolved Cases similarity solution definition.
Recommended Open Cases	Case	Returns a list of open similar cases created in the last six months.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence Similarity type additional search resources (continued)

Additional Resource	Table	Description
		Associated with the Recommended Open Cases similarity solution definition.
All Similar Cases	Case	Returns a list of all similar cases created in the last six months. Associated with the All Similar Cases similarity solution definition.

Major case agent assist recommendations

The Major Case agent assist recommendations is used for recommending major cases.

The agent assist provides a recommendation for each of the two major case scenarios:

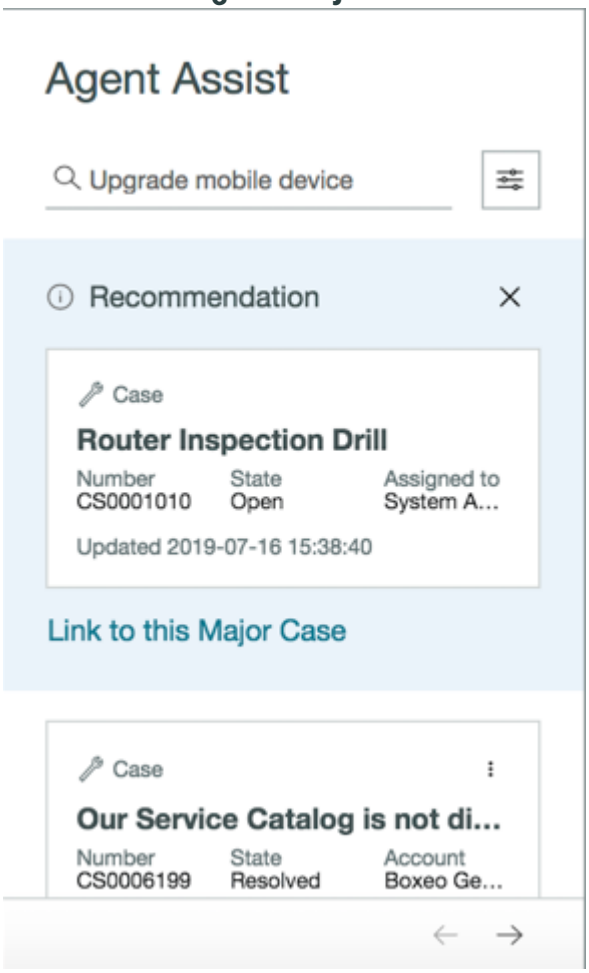
- Major case found: returns a list with one or more major cases created in the time-frame indicated in the solution definition that are similar to the current case. Cases are listed by similarity score. The default time-frame is set to the start of yesterday.
- No major case found: returns a recommendation based on the number of cases created in the time-frame indicated in the solution definition that is similar to the current case (does not include any major cases). The default time-frame is set to the start of yesterday.

To configure the time-frame for the solution definition threshold, see Update your similarity score threshold.

If the Major Case agent assist recommendations find one or more major cases similar to the current case, the Predictive Intelligence tab displays these cases ranked by similarity score. The case with the highest score is highlighted with a white box and the title **Major Case** and includes a user action to link the current case to the major case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

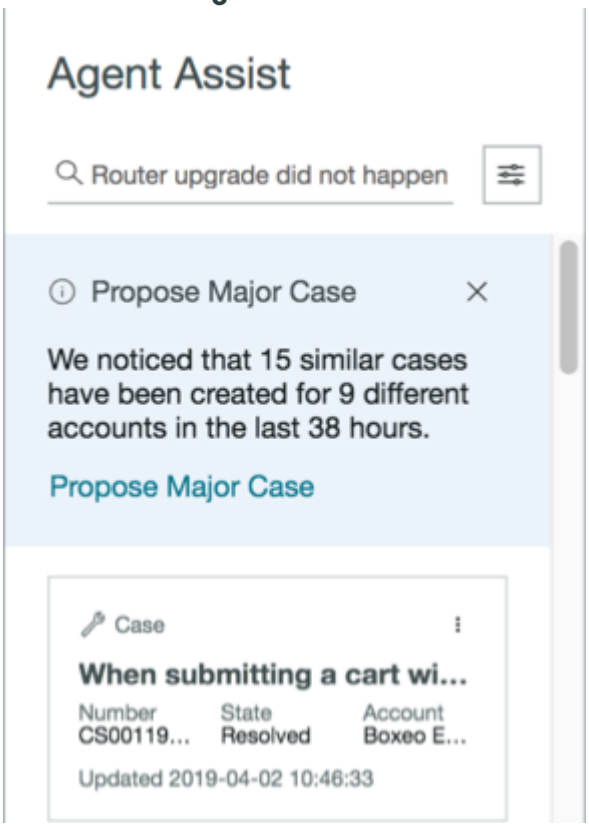
Predictive Intelligence major case recommendation



If the Major Case agent assist recommendations find cases similar to the current case, but no major cases, the Predictive Intelligence tab displays a recommendation highlighted with a blue box. It includes the option to propose the current case as a major case candidate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence tab similar case recommendation



The Major Case agent assist recommendations:

- Uses the Major Case agent assist recommendations ML solution definition.
- Includes some properties that provide customers with customization options, such as the recommendation title and message that appears in the Predictive Intelligence tab.
- Includes the **Potential Major Case** trend definition.

  This definition sets the threshold for:

  - Finding the number of distinct accounts that cases must belong to for a major issue recommendation. The default value is 3.
  - The number of similar cases that must be returned by the solution definition for a major issue recommendation using a script. The default value is 10.

Similarity solution definitions

The similar case recommendation feature uses several Predictive Intelligence solution definitions for similarity models.

Navigate to **Predictive Intelligence** > **Similarity** > **Solution Definitions**. The following solution definitions are provided with the similar case/recommendation feature.

- All Similar Cases (ml_sn_global_all_similar_cases)
- Recommended Resolved Cases (ml_sn_global_recommended_resolved_cases)
- Recommended Open Cases (ml_sn_global_recommended_open_cases)
- Major Issue Detector (ml_sn_global_major_issue_detector)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Several of the additional contextual search resources used by the similar case/recommendation feature are associated with these solution definitions. Agents can select these search resources and access the cases returned by these similarity solution definitions.

Estimated time to resolve a case

Machine learning in Customer Service Management helps with case resolution by predicting the estimated time to resolve a case.

Machine learning predicts the estimated time to resolve a case (ETTR) based on attributes of a case such as its short description, category, priority, and assignment group. For more information about configuring the machine learning regression definition for ETTR, see Configure the default estimated resolution time.

Activation

This feature is available with activation of the Predictive Intelligence for Customer Service Management plugin (com.sn_csm_ml). For more information, see Install Predictive Intelligence.

Agents must activate the **Time to resolve** ribbon component, which displays the ETTR, to view it in the CSM Agent Workspace or in the CSM Configurable Workspace. For more information, see Display the time to resolve ribbon component and Estimated time to resolve.

Configure settings for estimated time to resolve values

After upgrading, configure some settings to view the **Time to Resolve Numeric Value** column in the case report for older cases and determine the information that is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
You must have a trained default estimated time to resolve a case regression solution. For more information, see Configure the default estimated resolution time.

Role required: admin

Procedure
1. Navigate to **All** > **System Definition** > **Fix Script**.
2. Select the **Populate Numeric TTR values** fix script.
3. **Optional:** Modify the default parameter values.
   - *LookBackPeriodInMonths*: The number of past months of cases to examine. The default value is 15 months.
   - *report.setLimit*: The maximum number of records to examine. The default value is 150,000.
4. Click **Run Fix Script** to populate the estimated time values taken to resolve older cases.
5. Either run the script on screen or run it in the background.
   - To display the script running on the screen, click **Proceed**.
   - To run the script in the background, click **Proceed in Background**.

Configure the default estimated resolution time

The Estimated Time to Resolve a Case regression definition is available by default. You can modify the default values of case fields, the case timeline, and the training frequency.

Before you begin
Role required: admin, ml_admin

About this task
The Estimated Time to Resolve a Case definition is available by default. You can train this available definition to complete a solution and make predictions. You can change some of the default settings such as the fields, a filter, and the training frequency. For more information on creating and training a solution, see the following.

Create and train a regression solution.

Procedure
1. Navigate to **All** > **Predictive Intelligence** > **Regression** > **Solution Definitions**.
2. Click **Estimated Time to Resolve a Case**.
   In the Regression Definition screen, the **Table** field is autopopulated with the Case Report [sn_customerservice_case_report] table. The **Output Field** field is autopopulated with the time taken to resolve a case in seconds.

   Note:
   If you have upgraded, you have to run a fix script in order to show the **Time to Resolve Numeric Value** column to display values for older cases. For more information, see Configure settings for estimated time to resolve values.

3. To edit, add, or delete case attributes, modify the default values in the **Fields** field.
   The default case attributes are Short Description, Category, Assignment group, Assigned to, Priority, Product, Channel, Account, Service, Contact, Contract, and Description. These details are taken from the case record.
4. Edit the **Filter** field if you want to modify the number of past months of cases to examine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default value is 15 months.

5. Edit the **Training Frequency** field if you want to modify the frequency of training. The default value is every 30 days.
6. Either update the changes you made or update and retrain the solution.
   - To update the changes you made, click **Update**.
   - To update and retrain the solution, click **Update and Retrain**.

Display the time to resolve ribbon component

Activate the **ETTR Experience Card** so that you can display the time to resolve ribbon component in your CSM workspaces.

Before you begin

Role required: admin

About this task

The Time to resolve ribbon component is available by default and can be displayed in both CSM Agent Workspace and CSM Configurable Workspace. You must activate the component in CSM Agent Workspace before you activate it in CSM Configurable Workspace.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Forms** > **Workspace Ribbon Settings**.
2. Select any record that has the table value **Case [sn_customerservice_case]**.
3. Increase or decrease the values in the width column to make the total combined width of all the components to 12 or less.

   Note:
   If the total is already exceeding 12, decrease the values for the other components before modifying the value of **ETTR Experience Card**.

4. Select **ETTR Experience Card**.
5. Select **Active**.
6. In the **Ribbon Component Attributes** form section, modify components such as the **Card title** and **Info message** as required.

   Note:
   - You can see that the Solution name is pre-filled with the default name.
   - The same procedure applies to activate the **ETTR Experience Card** in the CSM Configurable Workspace. You must activate the **ETTR Experience Card** in the CSM Agent Workspace before activating it in the CSM Configurable Workspace. Navigate to **User Experience Framework** > **Ribbon Configuration Settings** and activate. The **Ribbon Component Attributes** section is not available for modifying.

Predictive Intelligence for case management

Assist agents with case creation by requiring a minimum of information, such as the short description, and predicting values for the category, priority, and assignment group.

From either Agent Workspace or the platform interface, agents can use this feature when creating cases by providing the short description. Based on the information entered in the **Short description** field, the Predictive Intelligence feature predicts the category, priority, and assignment group, and routes the case to the correct queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin

The Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml) provides Predictive Intelligence capabilities for Customer Service Management. This plugin enables customers to leverage machine learning algorithms for searching related cases in CSM. This plugin requires:

- Customer Service (com.sn_customerservice)
- Predictive Intelligence for Contextual Search (com.snc.contextual_search_ml)

The Predictive Intelligence for Customer Service Management plugin is activated automatically for new Orlando customers. Existing customers upgrading to the Orlando release must manually activate this plugin.

Solution definitions

Predictive Intelligence includes the following solution definitions for case management:

- CSM Case Categorization
- CSM Case Assignment
- CSM Case Prioritization

A solution definition predicts one or more output fields based on a configured input field. At least one solution definition must be active to use Predictive Intelligence with Customer Service Management.

For more information, see Predictive Intelligence for CSM solution definitions.

Business rules

Predictive Intelligence also includes business rules for Customer Service Management:

- Default Case Based Prediction
- Update Prediction Results

For more information, see Predictive Intelligence for CSM solution definitions.

Extension points

The Predictive Intelligence feature for Customer Service Management includes the **CSMPredictionService** extension point. This extension point contains a method that returns the following information:

- The list of solution definitions that are used to predict field values during case creation.
- The treatment of the predicted fields based on the values of the input fields.

The system administrator can use this extension point to customize the solution definitions.

Configure Predictive Intelligence for case management

Activate the Predictive Intelligence plugin and enable the related system property and client script to use Predictive Intelligence with Customer Service Management.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the Predictive Intelligence plugin (com.glide.platform_ml).
2. Enable the **Enable/Disable the prediction for case** property (*sn_customerservice.case.mlpredictor.enable*).
   a. Navigate to **Customer Service** > **Administration** > **Properties.**
   b. Enable the **Enable/Disable the prediction for case** check box.
   c. Click **Save**.
3. Enable the **Predict Case Values** client script.
   a. Navigate to **System Definition** > **Client Scripts**.
   b. Click **Predict Case Values** in the Client Scripts list.
   c. Enable the **Active** check box.
   d. Click **Update**.

Use Predictive Intelligence for case management

Agents can use Predictive Intelligence to predict values for configured fields when creating a customer service case.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task
When you create a case, the Predictive Intelligence feature predicts values for the configured fields based on the short description.

Note:
If you update the case, the values for these fields are not predicted again.

Procedure

1. Create a case.
2. Enter information in the **Short description** field and then tab to the next field.

   Based on this information, the system predicts the values for the **Priority**, **Assignment group**, and **Category** fields.

   Note:
   If the system can't predict values based on the short description, these fields remain empty.

3. **Optional:** Change the values in the predicted fields if needed or enter values for fields where Predictive Intelligence has skipped the prediction.
   The system doesn't overwrite user-entered values for the predicted fields.

Update cases with missing field predictions

View the list of open cases for which the prediction of category, priority, or assignment group was skipped by the Predictive Intelligence feature.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice_manager or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In the event that Predictive Intelligence cannot predict one or more case attributes for a case, customer service agents and administrators can update this information after a case is created. For example, the short description might not include enough detail to make a prediction.

Procedure

1. Navigate to **All** > **Customer Service** > **Cases** > **Cases Skipped by Predictive Intelligence**.
2. Select a case from the list.
3. Provide the missing information and click **Update**.

Configure Auto-Responder notifications

Configure the Auto-Responder feature for sharing relevant content in email notifications for deflecting cases.

Before you begin

Role required: admin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.

About this task

When you install and activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml), the following related plugins are also activated:

- Customer Service plugin (com.sn_customerservice)
- Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml)
- Email Notification Script for Contextual Search Results plugin (com.snc.adv_cxs_results_email_script)

You can also configure the Auto-Responder feature for tasks other than customer service cases. For more information, see Configure Auto-Responder for tasks other than cases.

Procedure

1. Follow the steps in this link: Enable Auto-Responder.
2. Follow the steps in this link: Train the similarity solution for finding Auto-Responder notification content.
3. **Optional:** Follow the steps in this link: Configure the search context for Auto-Responder.
4. **Optional:** Follow the steps in this link: Limit the number of articles in Auto-Responder notifications for cases.
5. **Optional:** Follow the steps in this link: Include advanced contextual search results in Auto-Responder notifications.

   Note:
   By default, any knowledge articles viewed in the last 30 days by the user are not included in the email notification. You can use the `getViewedContent` extension point to modify the filter out by the duration of the last viewed content.

6. **Optional:** Follow the steps in this link: Enable text search recommendations in Auto-Responder notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Follow the steps in this link: Include cases logged using specified communication channels in Auto-Responder notifications.
8. **Optional:** Follow the steps in this link: Include knowledge articles from custom portals in Auto-Responder notifications.

> **Note:**
> When you configure the Auto-Responder feature to use a custom portal, the default configuration for the customer service portal and consumer service portal are not used. Ensure that you use this configuration when you have your own custom portal and don't want to use the customer service portal or consumer service portal.

Related topics

Using Auto-Responder for case deflections

Enable Auto-Responder

Enable the Auto-Responder feature to include content suggested for deflecting cases in email notifications.

Before you begin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. In the Auto-Responder Recommendations section, select the check box for the **Enable auto-responder recommendations** property (*sn_customerservice.case.autoresponder.enable*).
3. Click **Save**.

Train the similarity solution for finding Auto-Responder notification content

Update and train a similarity solution definition to enable the Auto-Responder feature to suggest content by comparing the short description of a customer service case with those of existing knowledge articles.

Before you begin

Role required: admin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.

About this task

A similarity solution definition collects and compares your existing records to new similar records. The Similar Knowledge Articles All similarity solution selects knowledge articles for customer service cases from the predefined knowledge bases in the consumer service portal and customer service portal. To select knowledge articles from any custom knowledge base in a portal or from a knowledge base in any custom portal, you must modify this similarity solution.

For a similarity solution to work correctly, the Knowledge [kb_knowledge] table in the Knowledge View [sn_customerservice_knowledge_view] database view must have at least the required

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

number of records set in the configuration of your ServiceNow instance. The default minimum number required is 10,000.

If the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated, the tables for knowledge article templates (such as FAQ, How to, What Is, KCS Article) are also added to the Knowledge View [sn_customerservice_knowledge_view] database view. For a similarity solution to show results from each template type, each of the tables for the template type must have at least the required number of records. If a table doesn't have the required number of records, you might not see the results from that table. For more information, see Database View support for Predictive Intelligence.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Knowledge Articles All solution definition (ml_sn_sn_customerservice_global_similar_knowledge_view_articles).
3. On the Similarity Definition form, verify the default field values for knowledge articles.

Note:
If the application scope isn't set to Customer Service application, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

Similarity Definition form

Field	Description
Label	Unique name for your similarity solution.
Word Corpus	Defines which knowledge articles and cases are selected. By default, the **All Articles and Cases** word corpus is available to search for knowledge articles similar to a customer service case short description. **Note:** Modify the word corpus to use the knowledge base defined for your portal. If you have defined custom tables for knowledge articles and article templates, you must include their fields in the word corpus content. For more information about the word corpus and word corpus content, see Create a word corpus.
Table	Table or database view that contains the knowledge article records. Set the value to the Knowledge View [sn_customerservice_knowledge_view] database view unless you use a different table or database view for storing knowledge articles. This database view joins the Knowledge [kb_knowledge], What Is [kb_template_what_is], How To [kb_template_how_to], FAQ [kb_template_faq], and KCS Article [kb_template_kcs] tables for viewing all fields in a knowledge article. After you assign a table value, the number of records that match the filter conditions is displayed as a link. **Note:** The What Is [kb_template_what_is], How To [kb_template_how_to], FAQ [kb_template_faq], and KCS Article [kb_template_kcs] tables are available only if the Knowledge Management Advanced plugin is activated. For more information, see Activate the Knowledge Management Advanced plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Fields	Fields from the Knowledge View [sn_customerservice_knowledge_view] database view selected for similarity comparison with the case short description. The fields must be the same as the fields you define for the Word corpus content.
Filter	Filter conditions applied on the database view to filter knowledge article records for Auto-Responder recommendations. Click **Add Filter Condition** to apply conditions to the Field records you're using as a base to retrieve your similarity results. For example, for the customer service portal, you would set a **[Workflow] [is] [Published] AND [Knowledge base] is [Customer Service]** filter condition. For a custom portal, you select the knowledge base of the custom portal in the **[Knowledge base]** condition.
Test Table	Table that contains the case records that you want to compare with knowledge article records. Set the value to the Case [sn_customerservice_case] table unless you use a different table for storing case records.
Test Fields	Fields from the case selected for similarity matching with knowledge article fields. By default, the short description field of a customer service case is used for the similarity match with knowledge article fields.
Processing Language	Dominant language of the dataset you're training on the solution definition. By default, English processing is applied to all datasets. For example, if you select Italian, the system processes the data in both English and Italian. **Note:** The term "processing" indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming.
Stopwords	Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list appears by default.
Training Frequency	Frequency with which the model for the similarity solution definition must be retrained.
Update Frequency	Frequency with which to include new records in the model for the similarity solution definition.

For more information, see Create and train a similarity solution.

4. **Optional:** In the Training Request Schedule related list, update the schedule for training the Similar Knowledge Articles All solution definition.
   By default, the training request schedule is **Periodically** and runs after every 30 days.
5. Click **Update & Retrain**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Open the Similar Knowledge Articles All solution definition (ml_sn_sn_customerservice_global_similar_knowledge_view_articles) and in the ML Solutions related list, view the training solution progress in the **Progress** column.
   When **Progress** is 100%, in the ML Solutions related list, you can include more useful content in the Auto-Responder notification by reviewing the similarity examples based on the similarity score and updating the similarity score threshold value.
7. **Optional:** Update the similarity score threshold.

   a. In the **Active** column, click the link for the solution.

   b. Review the similarity examples by clicking the **Similarity Examples** related link on the ML Solution form.
   For more information, see Review solution similarity examples.

   c. In the Solution Statistics related list on the ML Solution form, enter the required value in the **Similarity Score Threshold** field, right-click the ML Solution form, and then click **Save**.
   For more information, see Update your similarity score threshold.

Result

When the solution is complete, the knowledge articles similar to the fields selected for a customer service case are sent as Auto-Responder recommendations.

Configuring the search context for Auto-Responder

You can configure the predefined search context for customer service cases to include relevant search resources in Auto-Responder email notifications.

The Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml) includes the predefined **Case Email Autoresponder KB search** search context for customer service cases configured for use in the Auto-Responder feature. This search context uses the predefined Search Knowledge Articles searcher that provides knowledge articles as search results.

By default, the **Case Email Autoresponder KB search** search context includes contextual search results based on Predictive Intelligence. You can edit this search context to include any additional resources. For more information, see Define a search context.

Note:
To provide other relevant recommendations to resolve a customer service case when Predictive Intelligence results are insufficient or unavailable, you can also enable the text search recommendations in the Auto-Responder email notification. For more information, see Enable text search recommendations in Auto-Responder notifications.

Limit the number of articles in Auto-Responder notifications for cases

Send the most relevant knowledge articles in Auto-Responder notifications for customer service cases by limiting the number of knowledge articles that are included.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.
- Set the application scope to Customer Service using the application picker. For more information, see Application picker.

Role required: admin

Procedure

1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Search for `Case [sn_customerservice_case]`.
3. Click the **Case [sn_customerservice_case]** link in the **Name** column corresponding to the row containing the **Case Email Autoresponder KB Search** search context.
4. In the Email Configurations related list, double-click the value in the Limit column for the **Case auto-responder recommendations** row.
5. Enter the maximum number of knowledge articles you want to include in the Auto-Responder email notifications for customer service cases and click the save icon ( ).
   The maximum allowed limit value is 20. If you enter a limit value of more than 20, the Auto-Responder email notification includes up to 20 articles only.
6. On the Table Configuration form, click **Update**.

Include advanced contextual search results in Auto-Responder notifications

Use scripted extension points to include the advanced contextual search results in email notifications for content suggested by the Auto-Responder feature.

Before you begin

Role required: admin

- Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.
- Set the application scope to Email Notification Script for Contextual Search Results. For more information, see Application picker.

About this task

The Email Notification Script for Contextual Search Results plugin (com.snc.adv_cxs_results_email_script) installs the *`csm_AdvancedEmailSearchResults`* script, *`CSMAdvancedEmailSearchResults`* script include and *`CSMAdvancedEmailSearchResultsExtensionPoint`* extension points.

The *`csm_AdvancedEmailSearchResults`* script is preconfigured for the customer service portal and consumer service portal.

Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

An implementation is available in the base system for scripted extension points. You can modify the data and add additional fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. In the **API Name** column, search for and click **sn_adv_emailscript.CSMAdvancedEmailSearchResultsExtensionPoint**.
3. On the Extension Point form, select a script include to use the `CSMAdvancedEmailSearchResultsExtensionPoint` extension points.
   - Modify the existing script by going to the Implementations related list and clicking **CaseAutoresponder**.
   - Create and register a custom script include.

     For more information, see Registering custom script includes against the scripted extension points.
4. Modify the script to use the extension points available through the `CSMAdvancedEmailSearchResults` script include.

   You can create multiple implementations for each extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.

   Configuration for different extension points implementation

Configuration	Implementation
Include a custom portal and search for knowledge articles from the knowledge base associated with the custom portal. **Note:** Applies only to tasks other than customer service cases.	Modify the `updateSearchRequestConfig` extension point to include the custom portal for your tasks other than customer service cases.
Filter out the content by the duration of the last viewed content.	Modify the `getViewedContent` extension point by entering the last viewed content duration in days. **Note:** By default, any knowledge articles viewed in the last 30 days by the user are not included in the email notification.
Define the layout of the email notifications.	Modify the `printSearchResults` extension point to specify a custom layout for the Auto-Responder email notifications.

5. On the Extension Point form, click **Update**.

Registering custom script includes against the scripted extension points

Register custom script includes against a selected scripted extension point in the application code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By registering the custom script, you create an extension instance record that links the scripted extension point definition to its implementation in the custom script include.

Enable text search recommendations in Auto-Responder notifications

Configure the Auto-Responder feature to send recommendations that match a text search of a case short description to resolve a customer service case when Predictive Intelligence results are insufficient or unavailable.

Before you begin

- Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.
- Set the application scope to Email Notification Script for Contextual Search Results using the application picker. For more information, see Application picker.

Role required: admin

About this task

By default, the Auto-Responder feature is configured to send contextual search results based on Predictive Intelligence. Knowledge articles that have significant text similarity with the short description of a case are sent as Auto-Responder recommendations.

You can configure the Auto-Responder feature to send knowledge article recommendations that match a text search of the case short description when the recommendations sent through the Predictive Intelligence feature aren't sufficient or the feature is disabled.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Search for the *`sn_adv_emailscript.textsearch.enable`* property.
3. In the **Value** field, enter `true`.
4. Click **Update**.

Include cases logged using specified communication channels in Auto-Responder notifications

Send Auto-Responder email notifications for customer service cases logged using a communication channel.

Before you begin

Role required: admin

Perform the following tasks.

- Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.
- Set the application scope to Customer Service using the application picker. For more information, see Application picker.
- Ensure that the required channel is already set up for use. For more information, see Configure communication channels.

About this task

By default, the Case auto-responder recommendations notification is configured to send Auto-Responder email notifications for customer service cases logged using emails. You can configure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

it to include other communication channels such as web, phone, chat, social, community, alert, and virtual agent.

Procedure

1. Navigate to **All** > **System Notification** > **Notifications**.
2. Search for `Case auto-responder recommendations`.
3. In the **Name** column, click the **Case auto-responder recommendations** link.
4. In the **Conditions** field, click **Add Filter Condition** or **Add "Or" Clause** to set the filter condition for a communication channel.

   Note:
   The default filter condition is **[Channel] [is] [Email] AND [Active] [is] [true]**.

   For example, to send Auto-Responder notifications for customer service cases logged using a mobile phone in addition to email, you would click **Add Filter Condition** and create the condition **[Channel] [is] [Phone] AND [Active] [is] [true]**.

Include knowledge articles from custom portals in Auto-Responder notifications

Configure the Auto-Responder feature to suggest knowledge articles from a custom portal.

Before you begin
Role required: admin

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Activate a plugin and Predictive Intelligence for CSM solution definitions.

About this task
By default, the Auto-Responder feature is configured to suggest knowledge articles from customer service portal and consumer service portal. Use this procedure only when you have your own custom portal and don't want to use the default customer service portal or consumer service portal.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. In the text box for the **Custom portal URL containing the knowledge article parameter** property (*sn_customerservice.case.autoresponder.customportal*), enter your custom portal URL containing a knowledge article parameter such as sys_kb_id or kb_number.
   Example format: `https://<instance-name>.service-now.com/csm?id=kb_article_view&sys_kb_id=<sys_kb_id>`
3. Click **Save**.

What to do next
After you configure the *sn_customerservice.case.autoresponder.customportal* property, you must configure the Similar Knowledge Articles All similarity solution definition to use the knowledge base of the custom portal. For more information, see Train the similarity solution for finding Auto-Responder notification content.

Configure Auto-Responder for tasks other than cases

Configure the Auto-Responder feature to send helpful resources for tasks other than customer service cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Perform the following tasks.

- Activate the Email Notification Script for Contextual Search Results plugin (com.snc.adv_cxs_results_email_script). For more information, see Activate a plugin.
- Set the application scope to the scope of your task table using the application picker. For more information, see Application picker.
- Verify that you have defined a search context for your task to include recommended resources in the Auto-Responder email notifications. For more information, see Define a search context.
- Verify that you have configured a table for the search context associated with your task. For more information, see Configure table for a contextual search.

Procedure

1. Configure the Notification [sysevent_email_action] table for your task to use the `csm_AdvancedEmailSearchResults` script.

   a. Navigate to **System Notification** > **Notifications**.

   b. Select the Notification [sysevent_email_action] table for your task.

   c. In the What will it contain related list, enter `${mail_script:csm_AdvancedEmailSearchResults}` in the **Message HTML** field.

   d. **Optional:** Verify that notifications aren't sent if there are no search results by entering the `hasResults()` function in the **Advanced condition** field of the When to send related list. The `hasResults()` function checks whether search results exist. You can use the return value of the function to avoid the system from sending an email notification if there are no search results. For more information, see Advanced conditions for email notifications.

   Tip:
   Refer to the Case auto-responder recommendations notification that uses the `hasResults()` function for returning the search results value. To view a notification, navigate to **System Notification** > **Notifications**.

   e. Select **Update**.

2. Map your task table configuration with the email notification for your task.

   a. Navigate to **Contextual Search** > **Table Configuration**.

   b. Select the task table configuration link in the **Name** column corresponding to the row containing the search context for your task.

   For the table that you're configuring, be sure to do the following:

   - Train the similarity solution for the table. For more information, see Train the similarity solution for finding Auto-Responder notification content.
   - Add the similarity solution in the Additional Resource Configurations tab on the Search Context form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Email Configurations related list, link your task table configuration with the Notification [sysevent_email_action] table.
   - To create another email configuration for a user field, select **New**.
   - To edit an existing email configuration, select the preview email configuration for email notification icon (ⓘ), and then in the Email Configuration window, select **Open Record**.

d. On the Email Configuration form, verify the default field values for your task, or fill in the values for a custom configuration.

Email Configuration form

Field	Description
Email notification	Select the email notification for your task.
User field	Reference field that helps narrow down the search results sent as recommended resources in Auto-Responder email notifications. For example, if you select **Caller** for the Incident [incident] table, the resources associated only with callers are added to the Auto-Responder email notifications. **Note:** This is a mandatory field for Auto-Responder. This field must be a reference field of the User table (sys_user) or tables that extend the User table.
Limit	Maximum number of resources you want to include in the Auto-Responder email notifications for your task. The maximum allowed limit value is 20. If you enter a value more than 20, the Auto-Responder email notification includes up to 20 resources only.

e. Update or submit the Email Configuration form.
   - For a new configuration, select **Submit**.
   - For an existing configuration, select **Update**.

3. **Optional:** Enable contextual search results based on text searches in addition to search results based on Predictive Intelligence to be included in Auto-Responder notifications.
   For more information, see Enable text search recommendations in Auto-Responder notifications.
4. **Optional:** Configure a custom portal and include advanced contextual search results in email notifications.
   For more information, see Include advanced contextual search results in Auto-Responder notifications.

Set up self-service

Creating a self-service portal helps customers resolve issues independently. You can integrate features like knowledge bases, chatbots, and appointment booking for easy access to information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer and Consumer Service Portals

Set up the Customer and Consumer Service Portals to provide information and support to your customers.

Walk-up Experience

Set up Walk-up Experience to configure a contact channel to support both online check-in and onsite check-in to a service center.

Conversational Appointment Booking

Set up Conversational Appointment Booking to enable customers to book, reschedule, and cancel appointments from Virtual Agent conversations.

Communities

Use Communities to interact, learn, share knowledge, troubleshoot issues, and stay informed about the latest developments and innovations within the Customer Service Management ecosystem.

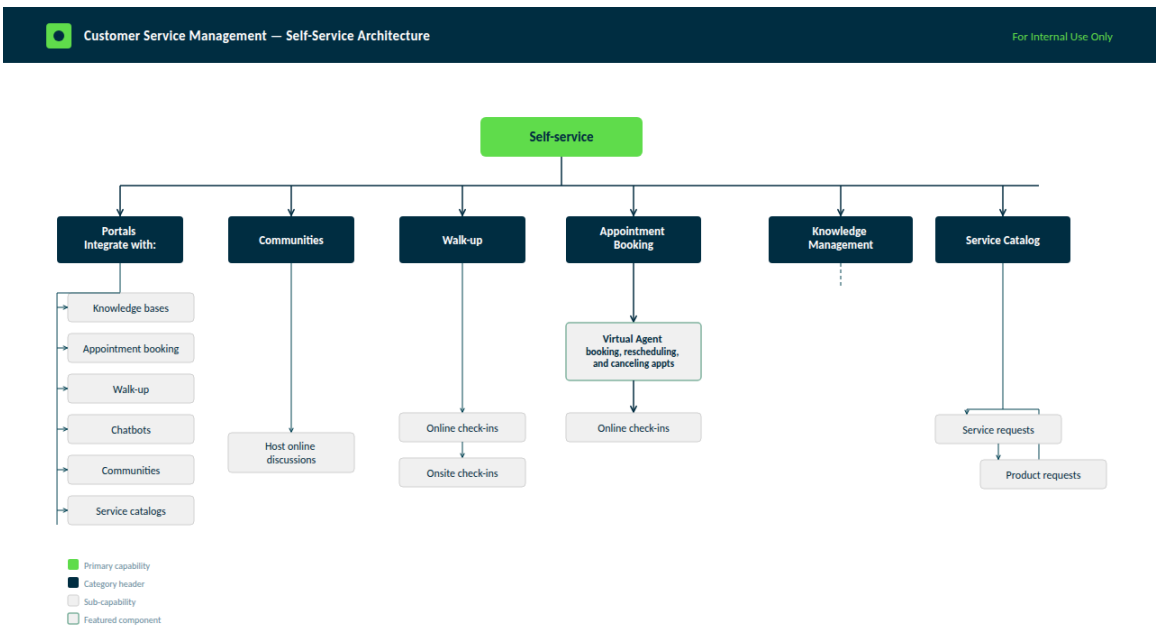
Knowledge Management

Create and share knowledge bases containing articles that provide users with information such as self-help, troubleshooting, and task resolution.

Service catalog

Create service catalogs to provide your customers with self-service opportunities to request items such as service and product offerings.

Self-service overview



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer and Consumer Service Portals

Create and enable self-service portals for your customers to support their needs efficiently. Integrate these portals with knowledge bases, communities, service catalogs, and chatbots. Additionally, provide features like walk-up experiences and appointment booking to enhance their self-service options.

Walk-up Experience

Set up Walk-up Experience to support both online and onsite check-ins at your service center. Configure the experience to fit the needs of your organization.

Conversational Appointment Booking

Install and set up the Conversational Appointment Booking application to enable customers to book, reschedule, or cancel appointments through Virtual Agent conversations.

Communities

With the Communities application, you can engage with your employees, customers, partners, and prospects. Share knowledge and troubleshoot issues, and stay informed about the latest developments in the Customer Service Management ecosystem. Get quick responses by posting questions, reviewing blogs or videos, and searching previous discussions.

Knowledge Management

Create and share knowledge bases using the Knowledge Management application. Use the knowledge base to share articles that provide your users with information such as self-help, problem-solving, and task resolution.

Service Catalog

Use the Service Catalog application to create and customize service catalogs so that your customers can request items such as services and product offerings. Additionally, you can standardize request fulfillment to maintain the accuracy and availability of the items in the catalogs.

Configure the Customer and Consumer Service Portals

Configure the Customer and Consumer Service Portals to provide information and support for your customers.

Before you begin

Role required: admin

About this task

The Customer and Consumer Service Portals are self-service web portals based on the ServiceNow Service Portal application.

The Customer Service Portal supports your business-to-business (B2B) customers and the Consumer Service Portal supports your business-to-consumer (B2C) customers.

Use the portals to provide information and support for your customers. The portals provide a basic format that customers can use to search for information or request assistance from a customer service agent. They include the following features:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A header with links for different customer activities.
- A search feature that customers can use to search for information from several repositories.
- Links to information sources such as the knowledge base, the user community, and customer support.

Note:
The Customer Service Portal is automatically installed when you activate the Customer Service plugin.

To activate the Consumer Service Portal, activate the Consumer Service plugin.

https://player.vimeo.com/video/1090650733?h=0d29c5ff48&badge=0&autopause=0&player_id=0&app_id=58479%22

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Customer Service Portal (B2B) or the Consumer Service Portal (B2C) category, view the list of tasks to configure the feature.

Customer and Consumer Service Portal configuration tasks

Task	Description
Customize the Customer Service Portal	Customize the Customer Service Portal to meet your needs.
Activate the Consumer Service Portal	Activate the Consumer Service Portal plugin.
Customize the Consumer Service Portal	Customize the Customer Service Portal to meet your needs.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Related topics

Service Portal

Activate the Consumer and Customer Service Portals

Activate the portal plugins to use the Consumer and Customer Service Portals.

Before you begin
Role required: admin

Procedure

1. Navigate to the ServiceNow store application or **All** > **System Definitions** > **Plugins** in the CSM application.
2. Install any one of the following plugins.

3. Select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup the Customer and Consumer Service Portals

Customize the Customer and Consumer Service Portals to meet your needs.

Before you begin
Role required: admin

Procedure

Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
Some of the components that you can customize include:

- Branding: Configure the portal branding to give your Customer Service Portal its own look and feel. The default theme for Customer and Consumer Service portals is the Coral theme.
- Menus: Configure the portal header menu to set up the main menu, one of the main navigation controls for your users.
- Homepage: Assign a homepage to the portal.
- Widgets: Use Service Portal widgets to define the content in your portal.
- Roles: Configure page security by role to either set up pages to be public (no login required) or to filter them by user role.

Configure AI Search for the Customer and Consumer Service Portals

You must configure the Customer and Consumer Service Portals to use AI Search.

Before you begin
You must install a CSM or CSP portal and AI Search integration for CSM and CSP Portals.

Role required: admin, sp_admin

About this task
AI Search is inactive by default and you must enable it by updating the portal record.

Procedure

1. Navigate to **All** > **Service Portal** > **Portals** and open a portal record.
2. Select **Customer Support** for csm portal or select **Customer Service** for CSP portal.
3. Select the **Enable AI Search** check box.
4. In the **Search Application** field, search and select either **CSM Portal Default Search Application** or **CSP Portal Default Search Application** for CSM and CSP portals respectively.
   A search application configuration defines search experience settings, such as the search engine, search results limit, and suggestions limit. A search application configuration is selected by default, but you can select a different configuration if needed.

   Note:
   You might have to configure the form layout to add **Search Application** field on the form. For more information about adding fields to a form, see Configuring the form layout.

5. In the **Search Results Configuration** field, search and select either **CSM Portal Search** or **CSP Portal Search**.
   A search result configuration defines how search results are displayed. A search result configuration is selected by default, but you can select a different configuration if needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You might have to configure the form layout to add **Search Results Configuration** field on the form. For more information about adding fields to a form, see Configuring the form layout.

6. Select **Update**.
7. Navigate to **Page Route Maps** and enable the **CSM AI Search Home Page** route map for CSM and **CSP AI Search Home Page** for CSP as they're inactive by default.

Enable AI search in the Customer and Consumer Service Portals for unauthenticated users

An administrator activates the AI search widgets so that guest users logging in to the Customer and Consumer Service Portals can use the AI search feature.

Before you begin

Role required: admin
You must configure AI Search for the Customer and Consumer Service Portals. For more information, see Enable and configure AI Search in Service Portal.

Procedure

1. Navigate to **All** > **Service Portal** > **Widgets**.
2. Search for **Typeahead Search**.
3. Click **Typeahead Search**.
4. Select the **Public** check box.
5. Click **Update**.
6. Repeat the steps for the **AI Search Assist** widget.

AI Search Assist for authenticated external users

Enable AI Search Assist in the Customer and Consumer Service Portals for authenticated external users with the snc_external role.

Configure AI Search Assist Actions for authenticated external users

Enable the AI Search Assist Actions to search knowledge articles in the Customer and Consumer Service Portals. It applies for authenticated external users with the snc_external role.

Before you begin

Activate Customer Service Management

You must configure AI Search for the Customer and Consumer Service Portals. For more information, see Enable and configure AI Search in Service Portal.

You must enable the Typeahead Search and AI Search Assist for the authenticated external users to use the AI search feature. For more information on the widgets, see Typeahead Search widget and AI Search Assist widget.

Role required: admin

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. On the Scripted REST APIs page, search and select **AI Search Assist Action (Internal API)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the AI Search Assist Actions (Internal API) page, in the Resources related list, select **Order [sc_cat_item]**.
4. On the Order [sc_cat_item] page, in the **Security** tab, do the following:
   a. Select the **Requires authentication** to turn on the authentication.
   b. Clear the **Requires SNC Internal** checkbox to turn off the feature.
   c. Select **Update**.
5. On the AI Search Assist Actions (Internal API) page, in the Resources related list, select **Resolves my issue**.
6. On the Resolves my issue page, do the following:
   a. Select the **Requires authentication** to turn on the authentication to access resource.
   b. Clear the **Requires SNC Internal** check box.
   c. Select **Update**.
7. Select **Update**.

Configure AI Search Assist in the Customer and Consumer Service Portals for authenticated external users

Enable the AI Search Assist to search knowledge articles in the Customer and Consumer Service Portals. It applies for authenticated external users with snc_external role.

Before you begin

Activate Customer Service Management

You must configure AI Search for the Customer and Consumer Service Portals. For more information, see Enable and configure AI Search in Service Portal.

You must enable the Typeahead Search and AI Search Assist for the authenticated external users to use the AI Search feature. For more information on the widgets, see Typeahead Search widget and AI Search Assist widget.

Role required: admin

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. On the Scripted REST APIs page, search and select **AI Search Assist (Internal API).**
3. On the AI Search Assist (Internal API) page, in the Resources related list, select **search**.
4. On the search page, in the **Security** tab, do the following:
   - Select the **Requires authentication** to turn on the authentication to access resource.
   - Clear the **Requires SNC Internal** check box.
   - Select **Update**.
5. Select **Update**.

Activate the standard ticket page for upgrade customers

If you have upgraded your instance, redirect the ticket page to the standard_ticket page in the Service Portal and view requests on the standard ticket page.

Before you begin

Role required: admin or sp_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For new customers, the standard ticket page is enabled by default. For upgrade customers, you must enable it.

Procedure

1. Navigate to **All** > **Service Portal** > **Page Route Maps**.
2. Search for Customer Service Management ticket route maps.
3. Set the value to **true** in the **Active** column.
4. Click the name of the page route map.
5. Click **here** to edit the record.
6. Select the **Active** check-box.
7. Click **Update**.

Related topics

Standard ticket page

Configure the standard ticket page for cases

You can configure the standard ticket page for customer service cases from where users can view the details of a case in the Service Portal.

Before you begin

Role required: admin

or sp_admin

Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration**.
2. Click sn_customerservice_case, csm_order case, sn_customerservice_task, or customer_project_task which is available by default.

   Note:
   You can add your own case types and add new configurations for the required tables. For more information, see Configure the standard ticket page.

3. Click **here** to edit the record.
4. Edit the fields on the Ticket Configuration form as required.
   For example, you can add tabs to the existing **Activity** and **Attachments** tabs in the **Info fields** field under the Info Region tab.
5. Click **Update**.

Activate the sitemap configuration and definition records for the Consumer Service Portal

Include knowledge articles and catalogs in your sitemap by activating the sitemap configuration and definition records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Activate Sitemap Generator
- Verify that an unauthenticated user can access the knowledge base article and catalogs by accessing it as a guest user.
- Verify that the Public option is selected on the Knowledge Article form or Service Catalog page form.

Role required: admin

About this task

Beginning with the Zurich release, the Sitemap Generator configuration is available with the base system and is inactive by default.

Procedure

1. Navigate to **All** > **Sitemap Generator** > **Sitemap Configuration**.
2. In the UX Sitemap Configurations [sys_ux_seo_sitemap_config] table, select the sitemap_config_CSP record.
3. Enable the generation of sitemaps.
   a. On the form, select the **Active** check box.
   b. In the Sitemap Config Definition related list, double-click the **Type** field and select the **true** option from the list.
   c. Select the Save icon ( ).
4. Select **Update**.

Result

All active sitemaps regenerate once in a day and include content from any of their active sitemap definitions.

Limit access to product model data on the Customer Service Portal

Use a system property to limit customer access to data in the Product Models table.

From the Customer Service Portal, product model data can be accessed by external users with the sn_esm_user role. System administrators can use the *csm_cmdb_model.customer_visible_flag* system property and the **Customer Visible** field on the Product Models table (cmdb_model) and child tables to limit this access.

The *csm_cmdb_model.customer_visible_flag* system property enables the **Customer Visible** field for the tables listed below. By default, this property is set to false. When set to true, the system uses the setting in the **Customer Visible** field to determine access to product model data on the Customer Service Portal.

- Product Models table (cmdb_model)
- Software Models table (cmdb_software_product_model)
- Application Models table (cmdb_application_product_model)
- Consumable Models table (cmdb_consumable_product_model)
- Facility Models table (cmdb_facility_product_model)
- Hardware Models table (cmdb_hardware_product_model)

The Model Categories table (cmdb_model_category) does not have a **Customer Visible** field. Access to model categories data is restricted by using the **Customer Visible** field on the Product

Model table. Only the categories for the products which are visible in the Product Model table will be visible in the Model Categories table.

For upgrades from Jakarta to madrid, the **Customer Visible** field is added to each record in the Product Models table and set to false.

To limit access:

1. Set the *csm_cmdb_model.customer_visible_flag* system property to true.
2. Customize the Product Models table (cmdb_model) and add the **Customer Visible** column.
3. Set the value of the **Customer Visible** field to true for the product models that should be visible to external customers.

External users can see these product using these product models if the products are linked to the customer account.

View the number of portal bot-based sessions

Ensure customers are not incorrectly billed by viewing the number of bot-based sessions. CSM portal usage sessions are billable to customers but sometimes customers are unnecessarily charged for sessions generated due to bots, crawlers, and DDOS attacks.

Before you begin
Role required: admin, usage_admin

About this task
For all new portals you create, bot sessions are captured in the Service Portal Bot Sessions [ua_sp_bot_session] table and all session types are captured in the Service Portal Usage [ua_sp_usage] table.

Procedure

1. Navigate to **All** > **Reports** > **View/Run**.
2. Enter `customer portal usage` in the **Search** field.
3. Select the **Customer Portal Usage** report from the drop-down list.
   The report shows the session count for all sessions and a separate count of sessions generated due to bots, crawlers, and DDoS attacks.

Approve a registration request with an invalid registration code

Approve a registration request from a user that was submitted from the Customer Service Portal with an invalid registration code.

Before you begin
Role required: sn_customerservice.customer_admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Pending Registration Requests**.
2. Select a registration request with a state of **Pending**.
3. Select an **Account** for the requester.
4. Click **Update**.
   The registration request is sent to the customer administrator of the assigned account.

Multi-factor authentication for Customer and Consumer Service Portals

Multi-factor authentication, also known as two-step verification, is a security requirement that asserts a user enter more than one set of credentials.

Enable multi-factor authentication for Customer and Consumer Service Portal users so that access to the self-service web portals is more secure from potential vulnerabilities. For more information, see Multifactor authentication (MFA).

Multi-factor authentication properties

Use properties to enable role-based multi-factor authentication criteria and configure the behavior.

Properties for multi-factor authentication

Property	Description
Enable Multi-factor authentication [glide.authenticate.multifactor]	Select this check box to enable users and administrators to use this feature. • Type: enabled | disabled • Default value: enabled • Location: **Multi-factor Authentication** > **Properties**
Number of times a user can bypass setting up multi-factor authentication [glide.authenticate.multifactor.setup.bypass.count]	Enter a number that represents how many times a user can skip the additional passcode requirement, allowing them to log in even without their mobile device. If you disable this feature and then re-enable it, the counter starts over again. • Type: string • Default value: 3 • Location: **Multi-factor Authentication** > **Properties**
The time in minutes, the one-time code sent to user's email address is valid for [glide.multifactor.onetime.code.validity]	Enter a number in minutes that specifies how long the reset code is valid. See Log on with multi-factor authentication. • Type: string • Default value: 10 • Location: **Multi-factor Authentication** > **Properties**
Additional time in seconds for which the code will be valid to accommodate for the clock skew. Max value is 60 seconds. [glide.authenticate.multifactor.clock_skew]	Enter a number in seconds with a maximum of 60. By default, the instance validates the code entered by you against the single app-generated code generated at whatever the `current time` is. You can skew the time window with this property and allow one or

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for multi-factor authentication (continued)

Property	Description
	more codes generated during a time window to be considered valid. The property's value is used in the following calculation: `current time - x/2` and `current time + x/2`, where 'x' is the value of this property. If you use the value of `10`, for example, the instance considers any codes generated by the app between the time range `[the current time - 5 seconds]` and `[current time + 5 seconds]` to be valid. Use this property to help prevent log in issues where you're unable to enter the correct code in the default time allotted.

Configure roles for multi-factor authentication

Add the following external roles to the multi-factor roles:

- sn_customerservice.customer
- sn_customerservice.consumer

Users with these roles are required to use multi-factor authentication. For more information, see Configure user-based multi-factor criteria.

Configure Business Portal

Configure the business portal to provide information and support for your customers.

Before you begin

Role required: admin

About this task

The Business Portal is a self-service web portals based on the Service Portal application.

The Business Portal supports your business-to-business (B2B) customers.

https://player.vimeo.com/video/1083575309?h=447472a1c0&badge=0&autopause=0&player_id=0&app_id=58479

Use the portals to provide information and support for your customers. The portals provides ready to use features that require minimal setup. These include:

- Header and footer with links for different customer activities.
- Home page provides a summary of essential items to the logged-in user.
- Hierarchical menu to systematically navigate to different portal pages.
- Unified browse experience for knowledge and catalog through taxonomy topics.
- List pages to browse, search, and filter through records of cases, products, orders, and others.
- Record view pages to view key information, related actions, related lists, and quick links of a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add additional self-service capabilities such as order management by installing the respective plugin.

Note:
The Business Portal Store app is automatically installed when you install the Customer Service Portal store app (from version 24.0.0 and above). For details, see Activate the Consumer and Customer Service Portals.

Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. On the Service Portals page, in the Title column, enter `*business portal`.
3. Select **Business Portal**.
   A page opens in your instance where you can configure the Business Portal.
4. Clear **Inactive** check box.

   Note:
   The business portal is inactive by default.

5. Select **Update**.
   You can access the business portal using the URL, <servicenow instance URL>/business_portal.

Service Portal

Setup the Business Portal

Customize the business portal to meet your needs.

Before you begin

Role required: admin

Procedure

Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
Some of the components that you can customize include:

- Branding: Configure the portal branding to give your business portal its own look and feel. The Coral Theme is available for the business portal.
- Menus: Update the base system menu or add a new one. For details, see Configure the portal header menu.
- Home page: Update the default home page by updating the widget configuration or assign a custom home page. For details, see Assign a homepage to the portal.
- Widgets: Use configurable portal widgets to define the content in your portal. For details, see Configurable Portal widget library.
- Header: Update the header configuration according to your need. For details, see Configure the Portal Polaris Header widget for your portal
- Footer: Customize information at the bottom of the page. For details, see Configure the Portal Polaris Footer widget.
- Taxonomy: Configure a taxonomy on Business Portal to define topics relevant to your users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- List pages: Browse, search & filter through records of cases, products, orders, and others. For details, see Add and configure the Portal Data List widget
- Roles: Configure page security by role to either set up pages to be public (no login required) or to filter them by user role.
- Search sources: Configure a search source for the portal to describe the behavior and source of searchable data. For details, see Define a search source.
- Knowledge base: Configure a knowledge base for the portal to view the associated knowledge articles. For details, see Configure knowledge bases for a portal.
- Catalog: Configure a catalog for business portal. For details, see Configure a catalog in Service Portal.

Setup the theme for Business Portal

Customize the theme of the business portal to add font and theme style sheets.

Before you begin

Role required: admin

About this task

The default theme for the business portal is the Coral Theme. You can use your own theme according to your branding.

You must customize your theme to add font or theme size-related style sheets.

Procedure

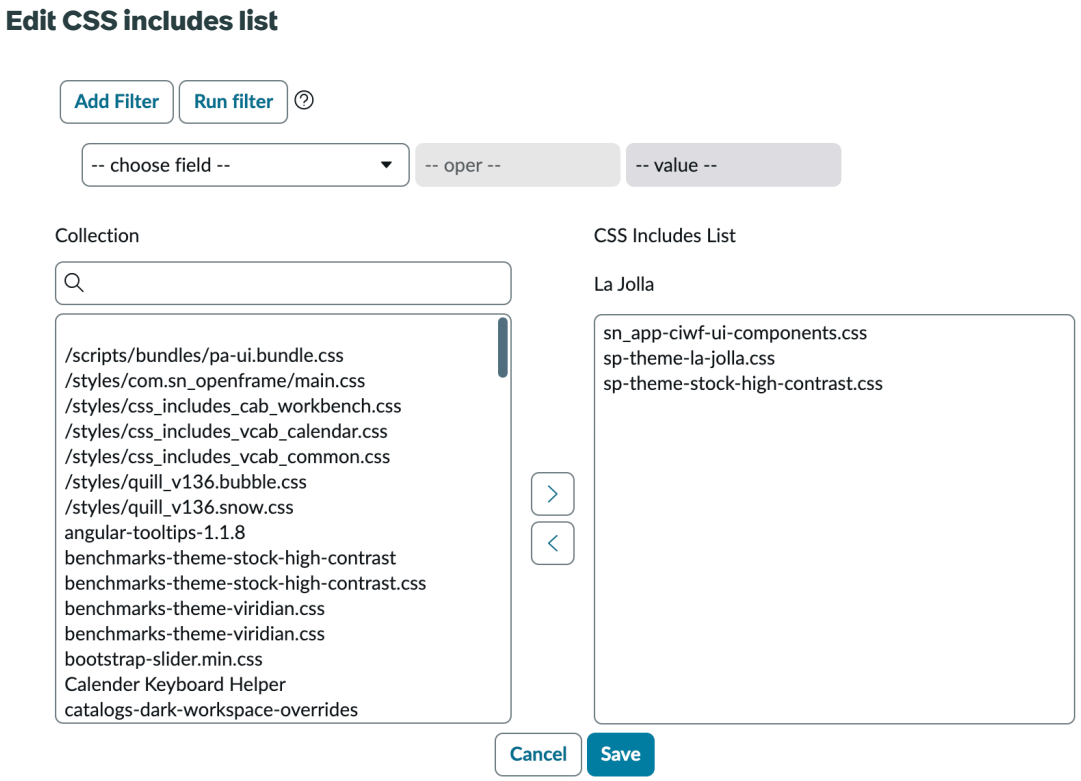
1. Navigate to **All** > **Service Portal** > **Themes**.
2. Search and select the required theme.
3. Add font and theme style sheets.

   a. On the theme record, select the **CSS Includes** in the related list.

   b. Select **Edit**.

   c. Add the following style sheets from the Collection list to the CSS Includes list:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- portal-polaris-set-base-font
- portal-polaris-rem-px-theme
- portal-polaris-kb-rem-px-theme

d. Select **Save**.

4. Hover over the style sheet and select the preview icon () then select **Open Record** to set the order of added style sheets.

a. Set the order of portal-polaris-set-base-font as the lowest.

b. Set the order of portal-polaris-rem-px-theme as second highest.

c. Set the order of portal-polaris-kb-rem-px-theme as the highest.

Note:
Convert any font or theme size from rems to pixel in the CSS with a conversion factor of 10. For example, 10 rems should be changed to 100 pixel.

5. Select **Update**.

Configure a taxonomy on Business Portal to define topics relevant to your users

Configure and manage the taxonomy on the Business portal to meet your needs.

Before you begin

Role required: admin or sp_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Add or edit taxonomy and child topics to the business portal. Taxonomy enables you to define topics which are relevant to your users.

For example, topics relevant to an e-commerce site can be orders, returns, payments, and others. Your users can find the relevant topic and then use available articles and catalog items of that topic.

Procedure
1. Navigate to **All** > **Service Portal** > **Portals**.
2. Search and select `*business portal` in the Title column on the Service Portals page.
3. Select **Business Portal**.
   If a message appears about the application scope, select **here** to be able to edit the record.
4. In Related Lists, select **Taxonomy**.
5. Select **Edit**.
6. On the Edit Members page, move the required taxonomy from **Collection** to the **Taxonomy List**.
   You can also create a taxonomy. For more information, see Create taxonomy.

   Note:
   Only one taxonomy can be associated with a portal.

7. Select **Save**.

What to do next
Create and associate topics to the new taxonomy and associate catalog items and knowledge articles to the topics created. For details, see Associate connected content to a topic.

Configure AI Search for Business Portal
Configure Business Portal to use AI Search.

Before you begin
Role required: admin, sp_admin

About this task
AI Search is disabled by default. You can enable it by updating the portal record.

Procedure
1. Navigate to **All** > **Service Portal** > **Portals** and open a portal record.
2. Select **Business Portal**.
3. Select the **Enable AI Search** check box.
4. In the **Search Application** field, search and select the required search application.
   A search application configuration defines search experience settings, such as the search engine, search results limit, and suggestions limit. A search application configuration is selected by default, but you can select a different configuration if needed.

   You can modify existing search application configurations such as CSM Portal Default Search Application, or create and configure your own search application configurations with AI Search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

specified as the search engine. For details, see Create a search application configuration for AI Search.

Note:
You may need to configure the form layout to add **Search Application** field on the form. For more information about adding fields to a form, see Configuring the form layout.

5. In the **Search Results Configuration** field, search and select the required search results configuration.
A search result configuration defines how search results are displayed. A search result configuration is selected by default, but you can select a different configuration if needed.

   You can modify existing search results configuration record such as CSM Search or create and configure your own search results configuration.

   Note:
   You may need to configure the form layout to add **Search Results Configuration** field on the form. For more information about adding fields to a form, see Configuring the form layout.

6. Select **Update**.

Configure the standard ticket page for cases

Configure the standard ticket page for cases from where users can view the details of a case in the Business portal.

Before you begin
Role required: admin or sp_admin

Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration**.
2. Select sn_customerservice_case, or sn_customerservice_task which is available by default.

   Note:
   You can add your own case types and add new configurations for the required tables. For more information, see Configure the standard ticket page.

3. Select **here** to edit the record.
4. Edit the fields on the Ticket Configuration form as required.
   For example, you can add tabs to the existing **Activity** and **Attachments** tabs in the **Info fields** field under the Info Region tab.
5. Select **Update**.

a. Select the **Requires authentication** to turn on the authentication to access resource.

b. Clear the **Requires SNC Internal** check box.

c. Select **Update**.

7. Select **Update**.

Configure AI Search Assist for authenticated external users in the Business Portal

Enable the AI Search Assist to search knowledge articles in the Business Portal.

Before you begin

Role required: Authenticated external users with snc_external role

Activate Customer Service Management

You must configure AI Search for the Business Portal. For more information, see Enable and configure AI Search in Service Portal.

You must enable the Typeahead Search and AI Search Assist for the authenticated external users to use the AI Search feature. For more information on the widgets, see Typeahead Search widget and AI Search Assist widget.

Role required: admin

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. On the Scripted REST APIs page, search and select **AI Search Assist (Internal API).**
3. On the AI Search Assist (Internal API) page, in the Resources related list, select **search**.
4. On the search page, in the **Security** tab, do the following:
   - Select the **Requires authentication** to turn on the authentication to access resource.
   - Clear the **Requires SNC Internal** check box.
   - Select **Update**.
5. Select **Update**.

Limit access to product model data on the Business Portal

Use a system property to limit customer access to data in the Product Models table.

External users can access the product model data from the Business Portal with the sn_esm_user role. System administrators can use the *csm_cmdb_model.customer_visible_flag* system property and the **Customer Visible** field on the Product Models table (cmdb_model) and child tables to limit this access.

The *csm_cmdb_model.customer_visible_flag* system property enables the **Customer Visible** field for the tables listed below. By default, this property is set to false. When set to true, the system uses the setting in the **Customer Visible** field to determine access to product model data on the Business Portal.

- Product Models table (cmdb_model)
- Software Models table (cmdb_software_product_model)
- Application Models table (cmdb_application_product_model)
- Consumable Models table (cmdb_consumable_product_model)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Facility Models table (cmdb_facility_product_model)
- Hardware Models table (cmdb_hardware_product_model)

The Model Categories table (cmdb_model_category) does not have a **Customer Visible** field. Access to model categories data is restricted by using the **Customer Visible** field on the Product Model table. Only the categories for the products which are visible in the Product Model table will be visible in the Model Categories table.

For upgrades from Jakarta to madrid, the **Customer Visible** field is added to each record in the Product Models table and set to false.

To limit access:

1. Set the *csm_cmdb_model.customer_visible_flag* system property to true.
2. Customize the Product Models table (cmdb_model) and add the **Customer Visible** column.
3. Set the value of the **Customer Visible** field to true for the product models that should be visible to external customers.

External users can see these product using these product models if the products are linked to the customer account.

Multi-factor authentication for Business Portal

Enable multi-factor authentication for business portal users so that access to the self-service web portals is more secure from potential vulnerabilities.

Multi-factor authentication, also known as two-step verification, is a security requirement that asserts a user enter more than one set of credentials. For more information, see Multi-factor authentication.

Multi-factor authentication properties

Use properties to enable role-based multi-factor authentication criteria and configure the behavior.

Properties for multi-factor authentication

Property	Description
Enable Multi-factor authentication [glide.authenticate.multifactor]	Select this check box to allow users and administrators to use this feature. • Type: enabled | disabled • Default value: enabled • Location: **Multi-factor Authentication** > **Properties**
Number of times a user can bypass setting up multi-factor authentication [glide.authenticate.multifactor.setup.bypass.count]	Enter a number that represents how many times a user can choose to skip the additional passcode requirement. This gives your users the ability to still log in the instance if they do not have their mobile device with them. If you disable this feature and then re-enable it, the counter starts over again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for multi-factor authentication (continued)

Property	Description
	• Type: string • Default value: 3 • Location: **Multi-factor Authentication** > **Properties**
The time in minutes, the one time code sent to user's email address is valid for [glide.multifactor.onetime.code.validity]	Enter a number in minutes that specifies how long the reset code is valid. See Log on with multi-factor authentication. • Type: string • Default value: 10 • Location: **Multi-factor Authentication** > **Properties**
Additional time in seconds for which the code will be valid to accommodate for the clock skew. Max value is 60 seconds. [glide.authenticate.multifactor.clock_skew]	Enter a number in seconds with a maximum of 60. By default, the instance validates the code entered by the user against the single app-generated code generated at whatever the `current time` is. You can skew the time window with this property and allow one or more codes generated during a time window to be considered valid. The property's value is used in the following calculation: `current time - x/2` and `current time + x/2`, where 'x' is the value of this property. If you use the value of `10`, for example, the instance considers any codes generated by the app between the time range `[the current time - 5 seconds]` and `[current time + 5 seconds]` to be valid. Use this property to prevent log in issues where the user is unable to enter the correct code in the default time allotted.

Configure roles for multi-factor authentication

Add the external role sn_customerservice.customer to the multi-factor roles.

Users with this role is required to use multi-factor authentication. For more information, see Configure user-based multi-factor criteria.

Configure Walk-up Experience for Customer Service Management

Configure various aspects of Walk-up Experience based on the specific requirements of your organization. Walk-up Experience users with the sn_csm_walkup.walkup_admin role and administrators can activate and configure the application to meet specific requirements.

Before you begin

Role required: admin

About this task

There is a sequence of tasks that enable you to configure CSM Walk-up Experience. Perform these tasks based on the plugin you activated.

You can configure appointments, decide when to send notifications to users, establish and configure physical queue locations and operating schedules, integrate with CSAT surveys, and associate stockrooms with queue locations. You can also customize your Walk-up Experience portal with a unique logo and branding.

To configure CSM Walk-up Experience, use the configuration tasks listed in the table below which takes you through the entire configuration process.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration**.
2. Complete the following tasks to configure the CSM Walk-up Experience feature.

CSM Walk-up Experience configuration tasks

Task	Description
Activate CSM Walk-up Experience.	Activate the Walk-up for CSM plugin (com.snc.walkup_for_csm). **Note:** This plugin includes demo data.
Click **Walk-up Locations** for configuring locations.	Create walk-up location queues with custom schedules, assignment groups, average wait time, and more. For more information about configuring locations, see Configure Walk-up Experience locations.
Click **Schedules**.	View, create, or modify walk-up venue schedules, such as 8-5 weekdays, and associate them to the walk-up location queues. For more information about configuring schedules, see Configure Walk-up Experience schedules.
Click **Appointment Configurations** for configuring appointments.	Create service configurations for individual walk-up queue locations. You can configure schedules, number of appointments allowed per day, how far in the future users can book appointments, and more. For more information about configuring appointments, see Configure appointment booking.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Click **Portal Configurations** for configuring a portal.	Create and modify custom Walk-up Experience online and on-site service portals. For more information about configuring the portal, see Configure the Walk-up Experience portal.
Click **Notifications** for configuring notifications.	Access and configure alerts that keep users and fulfillers informed of events that concern them. For more information about configuring notifications, see Configure Walk-up Experience notifications.
Surveys	Access customer satisfaction surveys and enable public access to the surveys, set survey trigger conditions, and view user responses. For more information about configuring schedules, see CSM Walk-up Experience customer satisfaction surveys.

Walk-up Experience for Customer Service Management

The ServiceNow® Walk-up Experience for Customer Service Management application enables you to set up a contact channel to support both online check-in and onsite check-in to a pre-established walk-up service center.

Walk-up Experience aims to support users and significantly improve their satisfaction through a fast in-person support. Employees and business guests can get real-time, in-person help with their issues.

User personas and roles are defined as follows:

Requesters

Users access the Walk-up Experience application in several ways.

- Online:
  - Quickly check in online to the nearest available walk-up venue using the **Walk-up Check In** option on the Service Portal using your computer.

    Note:
    Walk-up Experience application automatically routes you to the nearest walk-up queue using the IP address of your computer. You can change the location, if desired.

  - Join the queue and view your queue position.
  - Schedule appointments for support and receive appointment reminders, as well as cancel or reschedule appointments from links in the reminder or from the online check-in interface.
  - Schedule only one appointment per walk-up location queue at a time.

    Note:
    Even with a scheduled appointment, you can still check into a walk-up location queue online or in person onsite.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

    - Receive email notifications when your request is assigned to a technician when your position in the queue is close to being served and when your walk-up request has been closed or abandoned, should you decide not to attend the queue.
- Onsite at the Walk-up Experience location:
    - Check into a queue at the physical walk-up location by manually entering your name, email, and contact details.
    - Observe queue activities on a large monitor that displays both walk-in requesters and those with appointments.
    - View the monitor displaying how many people are currently in the queue, guest positions in the queue, who is being served, and estimated wait times.
    - Answer an available single-question survey which captures your user sentiment after a visit.

Technicians or Agents

Customer support uses Walk-up Experience application to meet the demand of urgent issues or requests from the requesters.

- Walk-up Experience technicians manage daily operations at the walk-up queue locations. They resolve customer service issues.
- Technicans can accept and close Walk-up Experience interactions through the Agent Workspace interface. Agent Workspace contains a personal inbox where walk-up interactions, if configured in Advanced Work Assignment, are automatically pushed for assignment.
- Agents can manage all aspects of Walk-up Experience fulfillment using Agent Workspace. Based on their capacity, and if records are on-hold, they can work on multiple transactions at the same time and promote interactions to cases.
- Technicians can view and accept scheduled appointments in their Agent Workspace personal inbox. Appointments are routed to the inbox according to agent availability. Alternatively, agents can pick and choose appointments manually.
- If necessary, technicians can work with anyone in the queue at any time. Technicians can manually assign themselves to a walk-up interaction, by accepting the interaction from a list of unassigned interactions in Agent Workspace.

Managers

Managers supervise the walk-up location technicians and oversee daily operations.

- Walk-up managers can observe and capture operational and performance data by monitoring the walk-up dashboard.
- Walk-up managers can use the application to increase customer satisfaction, provide customer service in a timely manner, and report performance data to upper management.

Administrators

Configure and maintain walk-up related systems, such as the walk-up location branding and text, queue locations and schedules, appointments, advanced work assignments, and notifications, and CSAT surveys.

Walk-up Experience User Roles

Role Name	Role	Description
sn_walkup.walkup_login	Store representative	A user with this role helps requesters check in at the walk-up location.
sn_csm_walkup.walkup_technician	CSM walk-up technician	A user with this role fulfills user demands at the CSM walk-up location.
sn_csm_walkup.walkup_manager	CSM walk-up manager	A user with this role manages the team at the walk-up location.
sn_csm_walkup.walkup_admin	CSM walk-up administrator	A user with this role administers walk-up interactions, location queues, and walk-up reasons.

Configuring Walk-up Experience for Customer Service Management

To get started with Walk-up Experience for Customer Service Management, see Configure Walk-up Experience for Customer Service Management.

Walk-up Experience for guest users

The Walk-up Experience application can enable guest users to manage walk-up appointments online from the Consumer Service Portal or Customer Service Portal home page.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Requirements to use Walk-up Experience for guest users

Note the following requirements for guest users to be able to use Walk-up Experience:

- The Guest Walk-up Experience for Customer Service store app must be installed. For more information on installing the store application, see Install a ServiceNow Store application.
- The com.snc.walkup_for_csm plugin must be activated. For more information on activating a plugin, see Activate a plugin.
- The Walk-up Check-in widget must be configured. For more information, see Add a Walk-up Experience online check-in link on the Service Portal home page.

Domain separation and the CSM Walk-up Experience application

This section is an overview of domain separation as it pertains to the CSM Walk-up Experience application and how it relates to Service Portal pages, interaction queues, and configurations. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation in the CSM Walk-up Experience application is supported at the **Basic** level. However, the application depends on the Service Portal, which is not supported for domain separation. Domain separation pertains to the CSM Walk-up Experience application in the following ways:

- Walk-up location queues support domain separation to define which end users can access each location queue.
- The Interaction table supports standard domain separation for data security. Interaction tickets are opened for a specific domain.
- Walk-up location queues and interactions support domain separation. Therefore, fulfillers also work within a domain-separated environment when addressing interaction tickets associated with a location queue.
- Management and administration configurations reside in the walk-up location queue records. Therefore, those configurations are available to the respective domain managers and admins.
- While the Service Portal pages are not domain separated, the CSM Walk-up Experience application's portal pages retrieve data within the user's specific domain. Therefore, those pages can be reused across different service portals designed and configured for separate domains. The admins must build each portal themselves.
- The **Domain** field is available on the wu_location_queue table. Setting domain here ensures users only see queues that are part of their domains during online check-in.
- For Advanced Work Assignment routing to operate, each wu_location_queue must include a work item routing condition. This condition explicitly adds a reference to the domain the queue is part of.

> **Note:**
> The appointment booking feature is not domain separated. Since Appointment [itil_appointment] table data is not domain separated, list views could reveal data across domains.

How domain separation works in the CSM Walk-up Experience application

For this application to be the most effective, walk-up administrators should configure walk-up locations accordingly. Configure the `wu_location_queue` record to meet a user need, which affects the requester experience. Each domain configured to the location queue record has its own set of rules. The same applies to other tables within the Walk-up application as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Elements of the Service Portal platform such as settings, portals, and widgets cannot be domain separated. However, the data within the widgets displays based on how the domain is configured. The recommended approach is to set up separate portals for each MSP customer.

Elements of the Service Portal that are used as part of the walk-up experience are as follows:

- Portal (Walk-up)
- Pages (`walkup_online_checkin, walkup_queue_on_site, walkup_home, walkup_survey, walkup_check_in`)
- Theme (Walk-up theme)
- Widgets (Online check-in experience, walk-up queue on site, walk-up check-in, walk-up exit survey, walk-up home, walk-up schedule)

To learn more, see Domain separation and Service Portal.

For data separation, the CSM Walk-up Experience application uses the walk-up user (Requester/ Walkup login user) domain to determine in which domain the requester data should be placed.

- Requesters can check in only in locations for which they have visibility.
- Requesters are able to select the Reasons that belong only to their own domain.
- Interaction records are created in the Requester's domain.

For the Fulfiller side, the application uses the domain of the walk-up user (walk-up technician/ manager/ admin) to determine which records are visible.

- By domain separation rules, Fulfillers can work only on interactions that are visible to them.
- Fulfillers are able to configure only walk-up location records that belong to their domain, are in the global domain, or have the parent-child hierarchy.
- The same visibility rules apply for the Many to Many `[wu_m2m_location_queue_reason]` tables that control the mapping between a location and reason.
- The walk-up context records also have domain separation support. This support ensures technicians to view detailed requester information only for the records that are visible by domain separation rules.

Domain-separated tables

As part of the CSM Walk-up Experience, records in the following tables can be domain separated.

- Walk-up location queues `[wu_location_queue]`
- Walk-up reasons for visit `[wu_reason]`
- Walk-up reasons `[wu_m2m_location_queue_reason]`
- Walk-up contexts `[wu_context]`
- Interactions `[interaction]`

CSM Walk-up Experience portal security and access

Security is built into the application to help prevent end-user facing devices at the Walk-up Experience onsite portal from offering elevated role privileges to users. The Walk-up Experience onsite portal is accessed by an account containing only the sn_walkup.walkup_login role. The sn_walkup.walkup_login role contains the snc_external role.

Understanding Walk-up Experience portal security

Accessing the onsite Walk-up Experience portal requires the singularly assigned sn_walkup.walkup_login role. The user record with this role cannot contain any other roles. Because most user records contain multiple roles, the sn_walkup.walkup_login role is assigned to a user record account, not a human user. The security feature helps prevent the onsite portal check-in device from permitting users who might try accessing the portal with an elevated privilege role.

The sn_walkup.walkup_login role is granted to a user record for an account used to log in to the check-in device. Typically, the device at the onsite Walk-up Experience portal is a tablet. It is not an actual human being with an assigned role, but an account with a role. For example, a technician opening the onsite Walk-up portal for business logs in to the check-in device using the user record that contains the sn_walkup.walkup_login role. Again, the portal can only be accessed by a user record that contains this role only. A user cannot access the portal with the admin role or if the user record contains roles other than the sn_walkup.walkup_login role.

Access to Walk-up Experience

Technicians opening up the onsite Walk-up location for business, or joining the support team during operation hours, access the user record account. Technicians with sn_walkup.walkup_login role can log in to the Walk-up Experience portal. Internal and external users can access the onsite Walk-up Experience portal via a check-in device, typically a tablet, to enter a queue. Internal, authenticated users can also access an online queue check-in via desktop.

Configure the Walk-up Experience portal

Create engaging walk-up center service portals featuring your logo, portal theme, desired catalog, links to a knowledge base and social community, and more.

Before you begin

Role required: admin or sn_walkup.walkup_admin

Walk-up Experience includes a complete base-system **Walk-up Portal** with theme. The **Walk-up Portal** pages are meant to be used as built. You can create custom portal pages to meet your needs by copying the portal pages and associated widgets and making changes to the copies. You can configure both an online check-in portal and a physical check-in portal for your walk-up locations.

There are several ways to configure the Walk-up service portal:

- **Service Portal** application: Modular user interface framework for quick and easy building and customization of application portals.
- Service Portal Walk-up form: Requires CSS and HTML experience.

Procedure

1. To configure the Walk-up service portal using the **Service Portal** application, navigate to **Service Portal** > **Service Portal Configuration**.
   The Service Portal configuration page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. To customize the base-system walk-up portal with your unique branding, title, logo, theme colors, layout, properties, widgets, and more, or to create a new walk-up portal, refer to Service Portal for detailed information.
3. Alternatively, to configure the Walk-up service portal using the Service Portal Walk-up form, navigate to **CSM Walk-up Experience** > **Administration** > **Portal Configurations**.
   The Service Portals list opens.
4. In the Service Portals list, click Walk-up or search for it in the list header search box.
5. Click the Form menu icon and select **Configure** > **Form Design**.
   The form designer opens.
6. In the form designer header drop-down list select or search for any of the configurable walk-up forms to customize your portal appearance.

Option	Description
Walk-up context [wu_context]	Configure an online check-in channel for users to join a walk-up queue before physical ly arriving at the walk-up location. Identifies a walk-up user and the description of the asso ciated interaction.
Walk-up Location Queue [wu_location_ queue]	Configure the physical walk-up location in teraction queue to manage and administer the service center. You can establish walk-up locations, set hours of operation, enable on line check-in, determine assignment groups, associate stockrooms, as well as design the queue time display and position notification system.
Walk-up Reason [wu_m2m_location_ queue_reason]	Define various common reasons why a user needs walk-up support.
Walk-up Reason for Visit [wu_reason]	Specify the order in which reasons for a visit should be prioritized at a walk-up location.

To modify form content to meet your portal requirements, refer to Form configuration for detailed information.

Configure Walk-up Experience service channel

Configure the Walk-up Experience service channel to meet the needs of your walk-up agents. You can configure the way the tasks are assigned and manage interactions in the Agent Workspace.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

The Walk-up Experience service channel is viewed and configured through Advanced Work Assignment. You can modify default values and conditions as required.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Service Channels**.
   The Service Channels list displays.
2. Select **Walk-up** to open the Walk-up Experience service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Refer to Create or configure a service channel for detailed information regarding the Service Channel Walk-up form values and conditions.
   For more information regarding Advanced Work Assignment service channels configuring capacity and utilization, inbox layout, and overriding agent capacity for selected agents, see Service channels.

Configure Walk-up Experience notifications

As an administrator, you can create and use notifications to notify requesters about events that impact them while they're getting their issue addressed through a walk-up experience. Requesters are notified of online appointments that they've taken or when their issue is assigned to a store representative by email.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

Walk-up Experience includes several base system notifications that you can use or customize to notify walk-up visitors about specific information and interactions.

Walk-up Experience notifications

Notification	Description
Walk-up Abandoned	Notifies when a walk-up interaction is closed.
Walk-up Threshold Notification	Notifies visitors when they're close to being next in line for support.
Walk-up Assigned	Notifies when an interaction is assigned to a technician.
Walk-up Closed	Notifies when an interaction is closed.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration** > **Notifications**.
2. Select an available walk-up notification to view basic properties, as well as information about when to send it, who receives it, and what the notification contains.
3. To modify a walk-up notification, edit any of the form fields.
4. To create a walk-up email or push notification, select **New**.
   For more information, refer to the following topics:
   - Create an email notification
   - Create a push message

   For complete information regarding using the System Notification application, refer to Notifications.

Configure Walk-up Experience schedules

Once you know the hours of operation for your Walk-up Experience location, you can either access the base system default schedules or create schedules to associate with your walk-up location.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration** > **Schedules**.
   The Schedules list opens. You can view all available base-system default schedules, such as **8-5 weekdays excluding holidays**.
2. To modify an existing base system schedule, select the schedule name, otherwise select New to create a schedule if none of the default schedules apply for your walk-up location.
3. Complete the Schedule New record form or modify fields on an existing form.

   To complete this process and for detailed information on creating, modifying, and using schedules in the system, including a definition of all form fields, refer to Schedules.

Walk-up Experience appointment booking

With the CSM Walk-up Experience appointment booking feature, walk-up users can view available appointment windows. The users can also select and book an appointment for a walk-up location using the online **Walk-up Check-in** feature.

Create time windows for walk-up queue locations enabling requesters to book service appointments.

The Appointment Booking plugin (com.snc.appointment_booking) must be activated to use the application. Appointment booking adds the Appointment Booking menu to the application navigator and the following modules:

- **Appointment Booking Configuration**: Use this module to create an appointment booking. Configure an application and then configure each service within that application.
- **Appointment Bookings**: Use this module to view a list of appointments that have been booked for services. This list includes the work orders associated with each appointment.

Appointment booking requires configuration at both the application level, in this case, Walk-up Experience, and at the walk-up queue service level, represented by the actual location of the walk-up queue.

The Walk-up Experience application configuration contains settings that apply to all the service locations within the application that support appointment booking.

A service configuration is required for each of the walk-up queue locations within the application that offer scheduled appointments. A service configuration includes settings that apply only to that specific walk-up queue service location.

Note:
Both the application configuration and the service configuration must be active to book appointments.

For detailed information about the **Appointment Booking** application, see Managing appointments.

Configure appointment booking

Create or modify appointment booking configurations for Walk-up Experience services. A service is defined as the actual physical location of a walk-up queue. The information stored in the Walk-up Experience application configuration applies to all services or queue locations within the application.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration** > **Appointment Configurations**.
2. Click **New** to create a new service configuration.
   Alternatively, you can click an existing service configuration to modify data.
3. In the Appointment Booking Service Configuration form, fill in the following fields as needed.

Appointment Booking Service Configuration form

Field	Description
Name	The name of the service configuration.
Active	Activates appointment booking for the service. **Note:** If deactivated, customers cannot schedule appointments for the service but can still create work orders.
General Information	
Configuration	The name of the appointment booking configuration to which this service belongs.
Availability table	The table calculates appointment availability. For Walk-up Experience, choose Walk-up Appointment [wu_appointment].
Enable advanced configurations	
Holiday Schedule	The holiday schedule to use when determining availability. Appointment booking evaluates the holiday schedule when determining the number of available appointments and excludes any day in the schedule that is set to **Exclude**. Click the lookup icon and select a schedule from the Schedules list. **Note:** Holiday schedules are useful when you set the assignment method for tasks to **manually**, which does not consider agent schedules.
Catalog Information	
Catalog item	The service in the service catalog for which you are creating this appointment booking configuration. Click the lookup icon and select the associated service from the Record Producers list. You must create a record producer for each walk-up service location. **Note:** The catalog item must exist in the service catalog. If you are using appointment booking with work orders, create a work order template before you configure appointment booking.
Location	The field on the record provider that determines the appointment location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Ensure the **Location** field on both this form and the Walk-up Location Queue (wu_location_queue) form are configured in alignment. Walk-up Experience contains the *location* reference variable, which is a Location (cmn_location) record. Selecting **Location** from the search list icon ensures you are aligning with the same time zone as the walk-up location you are configuring for. When you select **Location**, the online appointment scheduling calendar displays in the user time zone. If you leave this field empty or if you have not configured the user preference for the instance to have an associated time zone, the appointment scheduling calendar defaults to display in the user time zone. If a user in Europe has User preferences for **Time zone** configured for **Europe/Brussels** and the Appointment Booking Configuration for the **Location** field is set to a cmn_location with the time zone **US/Pacific**, then the appointment scheduling calendar displays in the US/Pacific time zone. When a user creates an appointment, the system defaults to use the schedule associated with the Walk-up Location Queue (wu_location_queue), regardless of the **Location** field value of this record producer.
Appointment is mandatory	Enable this check box if it is required for a customer to create an appointment when requesting this service. ○ If enabled, the **Appointment** field appears on the record producer and the user must select an available appointment before submitting the service request. ○ If disabled, the user can submit the service request without selecting an appointment.
User contact	The field on the record producer that determines for whom the appointment was created. Set this field to **Contact**. This is a reference field that looks for a sys_user variable on the record producer.
Booking	
Appointments per window	The number of available appointments for each configured appointment time slot. This number determines the number of available appointments displayed on the Select Appointment window. Enter a number in this field if the assignment method for tasks is set to **manually**. If set to either **using auto-assignment** or **using dynamic scheduling**, this setting does not apply, unless a location is not provided. Then the configuration defaults to the number of appointments per window.
Lead time	The number of hours or days from the current time after which you have booked an appointment for this service. Define the lead time in hours or days. The default is 4 hours.
Future bookable max days	The number of days after the current day for which an appointment can be booked for this service. The default is 14 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Reschedule/ Cancel by time	The number of hours or days prior to an appointment start time that are required for cancelling an appointment or rescheduled. If a user attempts to cancel or reschedule an appointment within this number of hours, the **Cancel** button is not available. Define the time in hours or days. The default is 4 hours.
Appointments	
Appointment window	The length or duration of the appointment window. **Note:** Allow enough time to start and complete the work within this window.
Work duration	The amount of time required to complete all tasks created by the record producer. You set the duration for a task when it is created which is used to determine availability. The default is 1 hour.
Travel duration (round trip)	An estimated value of the average travel time required (round trip) for the agent performing the task. Set the value to 0 since the work is performed onsite and travel time is not needed.
Daily Schedule	
Bookable days	The days of the week for which appointments can be booked. The default is Monday through Friday. Bookable days should reflect the appointment schedule. **Note:** Appointment schedules are separate from the walk-up queue location schedule but should be the same days and hours as the walk-up queue location schedule.
Daily start time	The start of the work day and the earliest start time for an appointment window. The default is 9:00.
Daily end time	The end of the work day and the latest end time for an appointment window. The default is 18:00 PM.
Include daily break	Enable this check box to schedule a break for each bookable day, then select the break start and end times. Can define one break which applies to all days.
Appointment booking preview	Provides a preview of the appointment windows and times based on the selected start and end times, break time, and appointment window.

4. Click **Submit**.

Walk-up Experience appointment booking administration

Create or modify and enable the CSM Walk-up Experience application configuration and the individual service location configurations for the **Appointment Booking** feature.

Administrators can create, modify, and enable the Walk-up Experience application configuration. Appointment booking administrators (appointment_booking_admin) can create, modify, and enable configurations for service locations within the Walk-up Experience application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Walk-up Experience is an application level configuration provided with the base system appointment booking feature. You can include as many service level configurations as needed. The service level configurations apply to the individual walk-up queue locations that exist. Administrators can modify these configurations as needed or use them as examples to create new configurations.

For detailed information on appointment booking administration, refer to Configure appointment booking.

Enable Walk-up Experience appointment-booking

Enable or disable the appointment booking feature for Walk-up Experience as well as for the individual walk-up service locations available to customers.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

The Appointment Booking plugin (com.snc.appointment_booking) must be activated to use the application.

When you enable appointment booking, the **Schedule an appointment** tab appears on the online check-in page. Users choose a reason for the appointment and select a date a time from the available appointments.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. Click **Walk-up Experience**.
   The **Walk-up Experience** configuration is provided with the base system **Appointment Booking** feature.
3. Click **Active** to enable appointment booking for the Walk-up Experience application.
   Alternatively, if the feature is active you can deactivate it by clicking **Active**.
4. In the Appointment Booking Service Configuration related list, click the name of a service.
   For Walk-up Experience, the physical location of a walk-up queue defines a service. Every walk-up queue associated with your application is a service that you must configure for appointment booking.
   The Appointment Booking Service Configuration form for the selected service opens.
5. Click **Active** to set the field to true.
6. Click **Update**.

Walk-up Experience appointment booking configuration

Create or modify appointment booking configurations for the Walk-up Experience. You can view or modify the Walk-up Experience application appointment booking configuration and create or modify related service appointment configurations.

The base system Walk-up Experience application includes a default appointment booking configuration that can be modified. By default, the information stored in the Walk-up Experience application appointment booking configuration applies to all services within that application. Services within the Walk-up Experience application are defined as the actual walk-up queue locations. You can create new appointment booking service configurations for the Walk-up Experience application or modify existing configurations.

For example, you may want to configure one walk-up queue to accept appointment booking every day from Monday to Friday, but for another queue, you only want appointment booking

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

available on Monday, Wednesday, and Friday. By configuring appointment booking at the service level, you can achieve this goal.

Specific Walk-up Experience set-up criteria for appointment booking include the following configurations:

- Define different appointment schedules and time windows per queue location.
- Define the time window in which you want to support appointments. For example, 15 minutes v. 30 minutes.
- Define the time window capacity. For example, the maximum number of appointments per time window.

View or modify a Walk-up Experience appointment booking configuration

View the base system default appointment booking configuration to determine if the criteria meets your walk-up appointment booking requirement. You can modify the configuration to manage appointment booking. The information stored in the Walk-up Experience appointment booking configuration applies to all the services within the application.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

The **Walk-up Experience** configuration is provided with the **Appointment Booking** feature.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Configurations**.
2. To view the **Walk-up Experience** configuration, click the configuration name.
3. In the Appointment Booking Configuration form, view or modify the following fields as needed.

Appointment booking application configuration fields

Field	Description
Name	The name of the application configuration.
Task Table	Appointments are created for the tasks in the selected table. The Walk-up Appointment [wu_appointment] table is the default table for the **Walk-up Experience** configuration.
Availability Method	Use one of two methods to determine appointment availability. ○ **Number of appointments per slot**: Define a specific number of appointments per time slot. Use this method if the task assignment is set to **manually** which is the default setting. ○ **Scripted**: Use this configuration setting to determine availability if the task assignment method is set to **using auto assignment** or **dynamic scheduling**.
Active	Activates the application configuration and enables appointment booking.
Auto acceptance	If the application configuration setting for **Process lifecycle** is set to **task-driven**, an agent must accept or reject an assigned task. Enable the **Auto acceptance** check box to override this configuration setting for appointment booking.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Portal View	Display available appointments for a single day or for a week on the online **Self Service Walk-up Check-in** portal or from the **Service Portal**.

4. Click **Submit**.

Create a Walk-up Experience appointment booking configuration for a service

Create or modify appointment booking configurations for Walk-up Experience services. A service is defined as the actual physical location of a walk-up queue. The information stored in the Walk-up Experience application configuration applies to all services,or queue locations, within the application.

Before you begin

Role required: admin or sn_apptmnt_booking.appointment_booking_admin

About this task

To use the appointment booking feature, administrators must create a configuration for each service, or queue location, that is available to walk-up customers. Service configurations are created within the **Walk-up Experience** application configuration, as part of the **Appointment Booking** application.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. Click **Walk-up Experience**.
3. In the Appointment Booking Service Configuration related list, click **New** to create a new service configuration.
   Alternatively, you can click an existing service configuration to modify data.
4. In the Appointment Booking Service Configuration form, fill in the following fields as needed.

Appointment booking service configuration fields

Field	Description
Active	Activates appointment booking for the service. **Note:** If deactivated, customers cannot schedule appointments for the service but can still create work orders.
General Information	
Name	The name of the service configuration.
Configuration	The name of the appointment booking configuration to which this service belongs.
Availability table	The table that is used to calculate appointment availability. For Walk-up Experience, choose Walk-up Appointment [wu_appointment].
Holiday Schedule	The holiday schedule to use when determining availability. Appointment booking evaluates the holiday schedule when determining the number of available appointments and excludes any day in the schedule that is set to **Exclude**. Click the lookup icon and select a schedule from the Schedules list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Holiday schedules are useful when the assignment method for tasks is set to **manually**, which does not consider agent schedules.
Catalog Information	
Catalog Item	The service in the service catalog for which this appointment booking configuration is being created. Click the lookup icon and select a service from the Record Producers list. **Note:** The catalog item must exist in the service catalog. If you are using appointment booking with work orders, create a work order template before you configure appointment booking.
Location	The field on the record provider that determines the appointment location.
Appointment is mandatory	Enable this check box if it is mandatory that a customer create an appointment when requesting this service. ○ If enabled, the **Appointment** field appears on the record producer and the user must select an available appointment on the Select Appointment window before submitting the service request. ○ If disabled, the user can submit the service request without selecting an appointment.
User contact	The field on the record provider that determines who the appointment is being created for. This is a reference field that looks for a sys_user variable on the record producer, for example, **Contact**.
Timezone	The appointment window based on the **Timezone** field specified in the user contact record or the location where the appointment for the task is scheduled.
Booking	
Appointments per window	The number of available appointments for each configured appointment time slot. This number determines the number of available appointments that are displayed on the Select Appointment window. Enter a number in this field if the assignment method for tasks is set to **manually**. If set to either **using auto-assignment** or **using dynamic scheduling**, this setting does not apply, unless a location is not provided. Then the configuration defaults to the number of appointments per window.
Lead time	The number of hours or days from the current time after which an appointment can be booked for this service. Define the lead time in hours or days. The default is 4 hours.
Future bookable max days	The number of days in advance of the current day for which an appointment can be booked for this service. The default is 14 days.
Reschedule / Cancel by time	The number of hours or days prior to an appointment start time that are required for an appointment to be canceled or rescheduled. If a user attempts to cancel or reschedule an appointment within this number of

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	hours, the **Cancel** button is not available. Define the time in hours or days. The default is 4 hours.
Appointments	
Appointment window	The length or duration of the appointment window. **Note:** Allow enough time for the work to be started and completed within this window.
Work duration	The amount of time required to complete all tasks created by the record producer. This duration is set for a task when it is created. Used to determine availability. The default is 1 hour.
Travel duration (round trip)	An estimated value of the average travel time required (round trip) for the agent performing the task. Set the value to 0 since the work is performed onsite and travel time is not needed.
Daily Schedule	
Bookable days	The days of the week for which appointments can be booked. The default is Monday through Friday. Bookable days should reflect the appointment schedule. **Note:** Appointment schedules are separate from the walk-up queue location schedule but should be the same days and hours as the walk-up queue location schedule.
Daily start time	The start of the work day and the earliest start time for an appointment window. The default is 9:00.
Daily end time	The end of the work day and the latest end time for an appointment window. The default is 18:00 PM.
Include daily break	Enable this check box to schedule a break for each bookable day, then select the break start and end times. Can define one break which applies to all days.
Appointment booking preview	Provides a preview of the appointment windows and times based on the selected start and end times, break time, and appointment window.

5. Click **Submit**.

Configure daily schedules for Walk-up Experience service appointment booking

Specify different daily hours of operation for your Walk-up Experience location appointment booking.

Before you begin

Role required: admin or sn_apptmnt_booking.appointment_booking_admin

About this task

Create a unique appointment booking schedule for each day of the week or for specific days of the week. For example, you can set the appointment booking availability schedule to run all day, from 9:00am to 5:00pm, Monday, Wednesday, and Friday. Tuesday and Thursday appointment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

availability schedule can run from 9:00am to 12:00pm. You can completely remove appointment booking for a specific day of the week, for example, Friday.

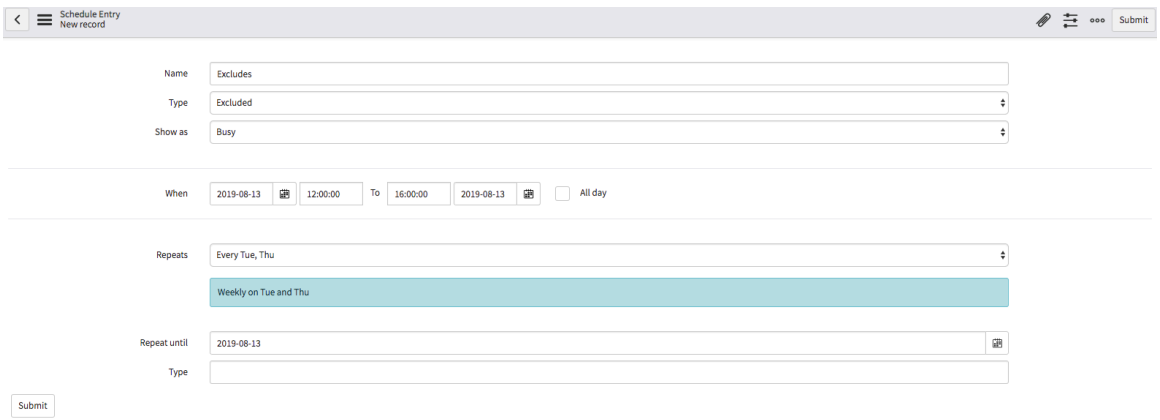
Note:
To specify unique daily booking schedules, while using your associated appointment booking configuration, create new Schedule Entries to exclude the hours appointment booking is not available.

Procedure

1. To configure, for example, Tuesday and Thursday appointment availability schedule from 9:00am to 12:00pm, navigate to **Walk-up Experience** > **Schedules**.
2. Select the schedule you use, for example, the **8-5 weekdays excluding holidays** schedule.
3. In the Schedule Entries related list, click **New** to display the Schedule Entry New record form.
4. Name the new record **Excludes** and fill in the form to create a unique daily booking schedule for Tuesday and Thursday appointments.

Schedule Entry Excludes configuration fields

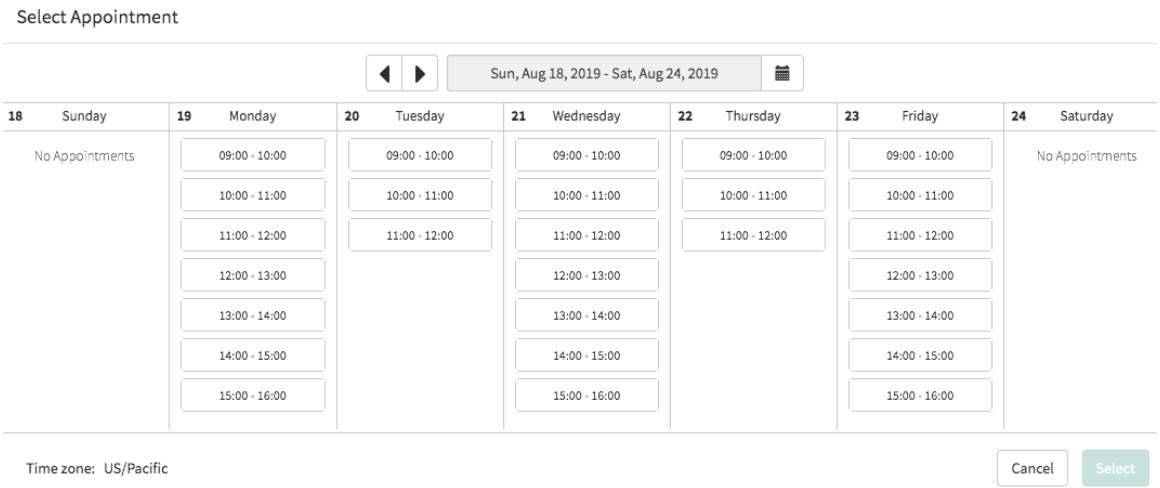
Field	Description
Name	Name the record. For example, name the record **Excludes** to indicate the hours excluded from appointment booking.
Type	Choose **Excluded** as the type.
Show as	Choose **Busy** as the reason for the exclusion.
When	Indicate the date to begin using this booking availability schedule. Also indicate the time to exclude booking availability for this date. For example, the hours of 12:00pm through 5:00pm.
Repeats	Indicate the recurrence for this availability schedule. For example, **Weekly on Tue and Thu**.
Repeat until	Specify how long you want this availability schedule to run by selecting an end date.



5. Click **Submit**.
6. To verify that Tuesday and Thursday appointment booking is only available from 9:00am to 12:00am, navigate to your online Walk-up Check-in application.
   If configured for view, You can access the online Walk-up Check-in application from the **Service Portal Home** page or under **Self-Service** in the left navigation bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the walk-up location for which you are verifying the schedule.
8. Click **Schedule an appointment** and select a reason for the visit.
9. Select a date for the appointment.
   The **Select Appointment** window displays the first available appointment, by week and day.
10. Determine that appointments are only available on Tuesdays and Thursdays from 9:00am to 12:00pm.



Activate and configure appointment booking reminders for Walk-up Experience

Configure scheduled appointment reminders for Walk-up Experience users. Reminders ensure that users attend appointments in a timely manner, and if they can't attend then reschedule or cancel an appointment.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

For using appointment booking reminders, you must activate the **Appointment Booking Reminders** Scheduled Job, which is not active by default. In addition, the **Appointment reminder** field doesn't appear on the **Appointment Booking Service Configuration** form by default. You must add it to the form and configure reminders. Reminders are inactive unless a configuration is set.

Procedure

1. To activate the **Appointment Booking Reminders** Scheduled Job, navigate to **System Definition** > **Scheduled Jobs**.
2. Search for **Appointment Booking Reminders** by name and click to open.
3. Click the **Active** field to activate the scheduled job.
4. Click **Update**.
5. To add the **Appointment reminder** field to the **Appointment Booking Service Configuration** form, navigate to **Walk-up Experience** > **Administration** > **Appointment Configurations**.
6. Select a Walk-up Experience service configuration from the list.
   The system opens an **Appointment Booking Service Configuration** form.
7. Click the menu button ( ) and scroll to **Configure** > **Form Layout**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Appointment reminder** from the **Available** list and move it to the **Selected** list using the add button.
9. Click **Save**.
   The **Appointment Booking Service Configuration** form displays with the **Appointment reminder** field.
10. To configure an appointment reminder, choose an amount of time, in hours, from the **Appointment reminder** field drop-down list.
    The hour/hours you choose represents the amount of time before a scheduled appointment that you want to send a reminder for. For example, two hours before a scheduled appointment.
11. Click **Update** to add the appointment reminder configuration.

Configure Walk-up Experience locations

Administrators define walk-up locations while setting up the walk-up experience for an organization. Requesters see this information when they schedule appointments or check in at a service location.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

Administrators can configure the following for locations:

- Create or modify walk-up location queues or mark locations as inactive.
- Allocate schedules for appointments, AWA conditions.
- Set conditions to automatically route work items.
- Location unavailable temporarily.
- Location address and picture.
- Specify reasons-for-visit options.
- Configure how interactions display for each walk-up location.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration** > **Walk-up Locations**.
2. Select **New**.
3. Complete the form.
4. Select the **Management** tab to complete the Management form section.
5. Select the **Administration** tab to complete the administration section of the form.
6. Right-click in the form header and select **Save**.
   Several tabs appear.
   - **Interactions**
   - **Walk-up Appointments**
   - **Reasons for Visit**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assignment Eligibility**
- **Work Item Sort Order**

7. Click the **Interactions** tab to view interactions or configure how the walk-up Interactions list should display.
8. Click the **Walk-up Appointments** tab to view appointments or configure how the Walk-up Appointments list should display.
9. Click the **Reasons for Visit** tab to view, modify, or create a reason for visit option.
   The base system includes three active reasons:
   - **I need something**
   - **Something is not working**
   - **Laptop refresh**
   - **Other**
10. Click the **Assignment Eligibility** tab to view, modify, or create an assignment rule for your walk-up queue locations.
    Assignment rules are configured in the Advanced Work Assignment product.
11. Click the **Work Item Sort Order** tab to view, modify, or create a Work Item Sort Orders for your walk-up queue locations.
12. Click **Update** to save the new or modified location queue.

Configure Walk-up Experience locations for guest users

Configure walk-up locations for guest-users so they can select a location while making appointments.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Administration** > **Appointment Configurations**.
2. Select a location that the guest user needs access to.
3. Click the Preview this record icon ( ) next to the **Catalog item** field.
4. In the Record Producer window, click **Open Record**.
5. Under Related Links, click the Available For tab.
6. Click **Edit**.
7. Move **Any Guest User** from the **Collection** list to the **Available For** list and click **Save**.
8. Under **Related Links**, click the Variable Sets tab.
9. Select *sn_appointment_variable_set* and set permissions for each of its variables.

   a. In the notice at the top of the form about the current application, click **here** to access the CSM Walkup Experience application record.

   b. Select the **sn_appointment** variable.

   c. Click the Permission tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. For the **Read roles** and **Write roles**, move the public, snc_internal, and snc_external roles from the **Available** list to the **Selected** list.

> **Note:**
> **Create roles** is also required for the correct auto-population of the information in the guest records.

e. Click **Done**.

f. Repeat these actions for the **sn_appointment_macro** variable.

10. Repeat step 9 to set permissions for the *sn_walkup_variable_set* variable set.

Result
The configured walk-up locations are now available for guest users.

Remove a Walk-up Experience location

If you permanently close down a physical Walk-up Experience location, you can also remove the location from the Walk-up Location Queues table.

Before you begin
Role required: admin or sn_csm_walkup.walkup_admin

Procedure
1. Navigate to **All** > **CSM Walk-up Experience** > > **Administration** > **Walk-up Locations**.
2. Click the name of the walk-up location you want to remove to open the location queue record.
3. Click **Delete** in the form header.
   A confirmation pop-up appears ensuring you want to delete the record.
4. Click **Delete**.
   The Walk-up Experience location queue is removed from the application.

CSM Walk-up Experience customer satisfaction surveys

With Walk-up Experience surveys, you can rate your satisfaction with walk-up location interactions, providing management with feedback to improve the walk-up experience.

The Walk-up Experience application includes two base-system predefined surveys.

Walk-up CSAT survey

This survey is an onsite, one-click sentiment analysis survey where you can quickly rate service based on a 1–3 scale, where 1 is a negative experience and 3 is a positive experience. The survey uses an image scale of three faces with different sentiments: sad, neutral, and smiling.

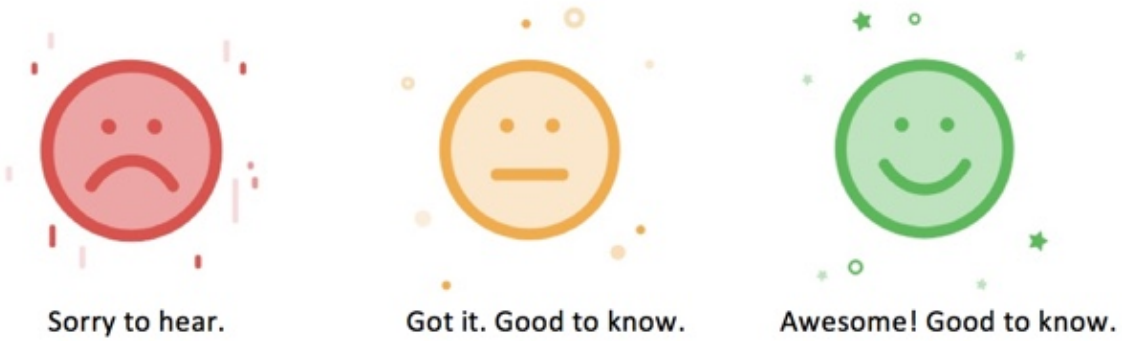
Walk-up sentiment analysis survey



Walk-up experience satisfaction survey

You can access this survey from a link enclosed in an email. The link is sent when walk-up interactions are closed. This survey uses sentiment analysis for the overall experience, wait-time experience, technician experience, technician professionalism, and additional comments. This survey is based on a 1–5 numeric rating scale, where 1 is very unsatisfied and 5 is very satisfied.

Walk-up administrators and managers can modify these surveys and the associated trigger conditions. Managers and administrators can review responses by question and see a scorecard for each survey on the **Walk-up Experience Dashboard** module. User comments provide feedback that is used to improve the performance of walk-up interactions.

For more detailed information about working with surveys, sentiment analysis, trigger conditions, and survey questions, see Assessments and Surveys.

Configure Walk-up Experience surveys

Define surveys so that requesters can provide feedback on their satisfaction with the service quality received at a location.

Before you begin

Role required: admin or sn_csm_walkup.walkup_admin

About this task

Creating a customer satisfaction survey requires that you first define a new survey and then use the Survey Designer to design, configure, and make it available to users.

Procedure

1. To view and use a base system predefined survey in the Walk-up Experience application, navigate to **CSM Walk-up Experience** > **Administration** > **Surveys**.
   The Assessment Metric Types list opens displaying the available walk-up surveys.
2. To modify an existing walk-up survey, select the survey name, otherwise navigate to **Survey** > **View Surveys** and select **New** to define a new survey if none of the base system surveys are optimal for your walk-up location.
3. To modify or complete the form, refer to modify a survey definition.

System properties for configuring Walk-up Experience for guest users

System properties enable you to configure the Walk-up Experience for guest users so they can access the Walk-up Check-in widget from the Service Portal Home Page and schedule appointments online.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties to configure Walk-up Experience application

As an admin, in your instance, enter `sys_properties.list` in the filter navigator and add the following properties. The default values are listed in the following table.

Walk-up Experience properties

Property	Default Value	Description
sn_guest_walkup_cs.guest_user.walkup_enabled (true/false)	true	Enables or disables Walk-up Experience for guest user.
sn_guest_walkup_cs.captcha.enabled (true/false)	true	Enables or disables the CAPTCHA validation from the welcome page.
sn_guest_walkup_cs.max_confirmations_validity_in_minutes (integer)	15	Time frame to confirm the appointment booking.
sn_guest_walkup_cs.max_otp_validity_in_minutes (integer)	5	The time that the one-time password the user receives to modify or cancel the appointment is valid.
sn_guest_walkup_cs.max_guest_appointments_per_location	0	The number of appointments the guest user can book per location.
sn_guest_walkup_cs.captcha.timeout	10 mins	The time after which the CAPTCHA vaidation on the welcome page times out.

Add a Walk-up Experience online check-in link on the Service Portal home page

Configure a Walk-up Experience link to enable guest users to check in online to a walk-up location via Service Portal.

Before you begin

Role required: admin and sp_admin

Service Portal for Enterprise Service Management (com.glide.service-portal.esm) and Walk-up for CSM (com.snc.walkup_for_csm) plugins must be activated.

Procedure

1. Navigate to **All** > **Service Portal** > **Pages**.
2. Select **ID** from the **Search** drop-down list and enter `csm_index` in the **Search** field.
3. Select **csm_index** to display the Customer Service Portal page.
4. Scroll down and select the **Open in Designer** related link.
5. Select the **Walk-up Check-In** widget from the **Widgets** list in the left pane and drag it to the desired location on the Customer Service Portal page where you want the link to appear.

Configure Conversational Appointment Booking

Install and set up the Conversational Appointment Booking application to enable customers to book, reschedule, or cancel an appointment with a Virtual Agent.

Before you begin

Role required: va_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This procedure provides general steps to set up the Conversational Appointment Booking application so that your customers can book appointments on your ServiceNow instance with a Virtual Agent.

Procedure

1. Install the Conversational Appointment Booking application.
   For more information, see Install Conversational Appointment Booking.
2. Navigate to **Virtual Agent** > **Designer**.
3. Publish the following topics:
   - Schedule a Walk-up Appointment
   - Reschedule a Walk-up Appointment
   - Cancel a Walk-up Appointment

   For more information, see Publish a Virtual Agent topic.

   These topics are read-only by default. To add custom controls.

   duplicate the topics.

   Note:
   Translation for custom controls is currently unavailable. You can manually add the translation in the ServiceNow® Walk-up Experience appointment booking application. See Walk-up Experience appointment booking configuration for more information.

4. Confirm that the **Appointment Booking** custom control is published.
5. Confirm that the **Book or Update Appointment** and **Get Walk-up Location** topic blocks are published.
6. Test the topics.
   See Test Virtual Agent topics for more information.

Conversational Appointment Booking

Book, reschedule, and cancel appointments from Virtual Agent conversations. The ServiceNow® Conversational Appointment Booking application uses Natural Language Understanding (NLU) to communicate with customers.

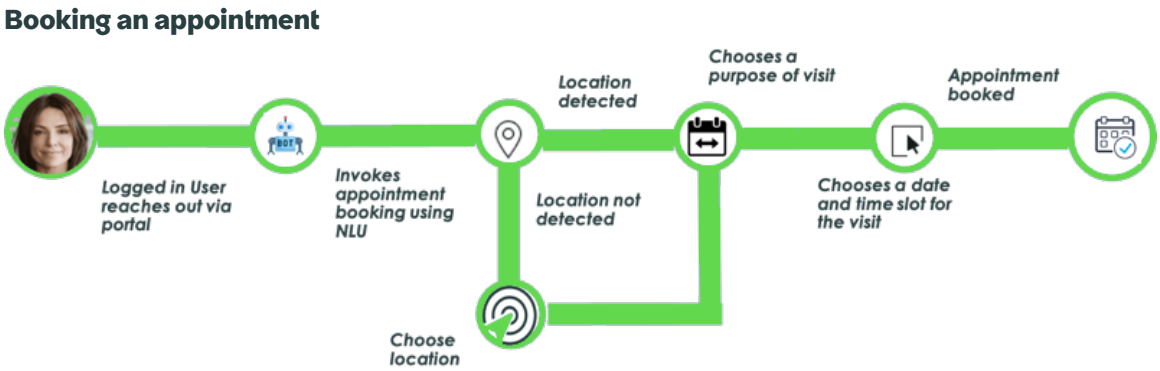
Booking an appointment

The appointment booking flow works as follows:

- The logged-in user contacts your business via your portal.
- The user enters the appointment booking request into the chat, and the Virtual Agent uses Natural Language Understanding (NLU) to understand the request.
- The Virtual Agent asks the user to share their location. If the user shares their location, the available appointment locations are displayed.
- The user chooses a location.
- The user chooses the purpose of the appointment.
- The user chooses a date and time slot for the appointment.
- The appointment booking is complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following image illustrates the appointment booking flow.

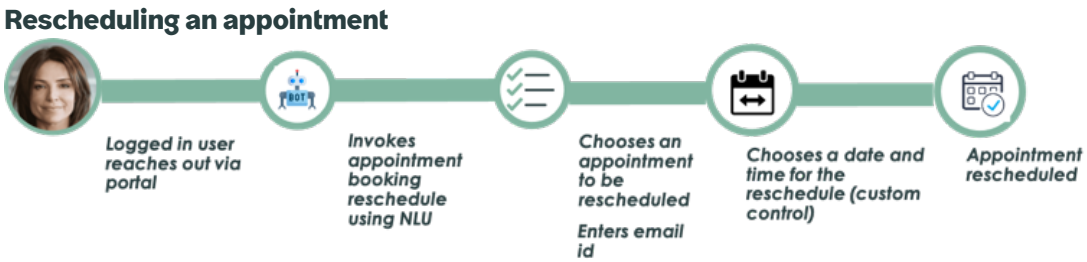


Rescheduling an appointment

The appointment rescheduling flow works as follows:

- The logged-in user contacts your business via your portal.
- The user enters the appointment booking request into the chat, and the Virtual Agent uses Natural Language Understanding (NLU) to understand the request.
- The user chooses an appointment to reschedule, and enters an email ID if needed.
- The user chooses the date and time for the rescheduled appointment.
- The appointment rescheduling is complete.

The following image illustrates the appointment rescheduling flow.



Cancelling an appointment

The appointment cancellation flow works as follows:

- The logged-in user contacts your business via your portal.
- The user enters the appointment booking request into the chat, and the Virtual Agent uses Natural Language Understanding (NLU) to understand the request.
- The user chooses an appointment to cancel.
- The appointment cancellation is complete.

The following image illustrates the appointment cancellation flow.

Configure Conversational Appointment Booking

Using Conversational Appointment Booking

Install Conversational Appointment Booking

Install the Conversational Appointment Booking application (sn_va_appt_schedul) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

About this task

Conversational Appointment Booking requires the following plugins. Ensure that these plugins are activated before you install Conversational Appointment Booking.

Required ServiceNow plugins

Walk-Up for CSM (com.snc.walkup_for_csm)

> **Note:**
> Conversational Appointment Booking can be used without the Walk-Up for CSM plugin. However, custom control and Virtual Agent topic blocks shown in Configure Conversational Appointment Booking cannot be used without this plugin.

The following items are installed with this plugin:

- NLU model for Conversational Appointment Booking.

  > **Note:**
  > In order to use the NLU model, you need to train and publish the model. See Natural Language Understanding for more information.

- Virtual Agent topics: Schedule a Walk-up appointment, Reschedule a Walk-up appointment, and Cancel a Walk-up appointment.
- Virtual Agent topic blocks: Get Walk-up location and Walk-up appointment scheduling.

Appointment Booking (com.snc.appointment_booking)

Enables the appointment booking feature for Walk-up Experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glide Virtual Agent (com.glide.cs.chatbot)

Activates the Virtual Agent platform. Virtual Agent requires additional licensing. See Virtual Agent for more information.

NLU Workbench (com.snc.nlu_studio)

Enables the creation of custom ServiceNow Natural Language Understanding models used by Virtual Agent.

Studio (com.glide.dev-studio)

Used for adding and updating application files.

For information about plugin activation, see Activate a plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Conversational Appointment Booking application (`sn_va_appt_schedul`) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Conversational Appointment Booking.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Set up Configurable Portal widgets

Configurable Portal widgets provide you with the ability to configure the behavior, content, and layout of a portal by configuring instance options.

By using configurable widgets, you can configure widget behavior, visual appearance, and content to update the information presented on the widgets. Configurable widgets also reduce the amount of work required to implement and maintain widgets for your users.

Configurable Portal widget benefits

Configurable Portal widgets offer the following benefits:

- Configurable behavior: Configure widget instance options to achieve behavioral variations tailored to your business environment.
- Reusability: The ability to update instance options enables you to reconfigure widgets having to create new widgets from scratch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Visual experience: Improve the usability and aesthetics of widgets and their conformance to your organization's look and feel by configuring visual aspects including colors, alignment, and styles.
- Content modification: Control the data sources or content that you want to display on the portal by mapping the widgets to data sets and configuring filters or parameters to control the information presented.
- No code or low code configuration: Update the data, behavior, and presentation of the widgets with minimal code or by updating the instance options.

For more information on using configurable widgets in your customer portals, see Using portal widgets.

Widget instances

You can use widget instances to configure the location, properties, and CSS specific to that instance. For more information, see Configure widget instances.

The following are Configurable Portal widgets that enable you to configure the portal homepage.

Widget	Description
Portal Polaris Header widget	Display access key features and pages from any place in portal. It shows logo, search, profile, and others on level 1 of the header, and menu items on level 2 of the header. The appearance of menu items in level 2 of the header is determined by the Portal Mega Menu widget selected.
Portal Mega Menu widget	The menu on the header of the portal home page to navigate to different pages. It displays topics in a menu format organized hierarchically.
Portal Browse Taxonomy widget	Display taxonomy topics along with the articles and catalog items related to them.
Portal Banner widget	Banner to display the announcements, new product or feature highlights, and important information on the top of the page.
Portal Banner Carousel widget	Displays multiple banners in a carousel to display information on multiple announcements, features, and products.
Portal Quick Links widget	Display different links for quick access including links to a knowledge article, a catalog item, a custom page, or an external URL. You can also select different layouts for quick links cards.
Portal Knowledge Quick Links widget	Display a list of articles for quick access. Articles can be selected based on featured articles, most viewed articles and more criteria or can be selected manually.
Portal Catalog Quick Links widget	Displays catalog items for important request items based on the criteria.
Portal Case Cards widget	Displays case records according to the filter criteria. You can display case details such as state, update, date, and more in a card format.
Portal Data List widget	Displays a list of cases, appointments, work orders, or other records from any ServiceNow table in list or card format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget	Description
Portal FAQ widget	Displays a list of frequently asked articles from a selected knowledge table that are categorized based on knowledge article category or related product.
Portal Polaris Footer widget	Display important information at the bottom of each page. The information includes company information and logo, site links, external links, and social media links.
Portal Object widget	Display key information of a record from the tables available on ServiceNow® table. Your users can also take related actions on the selected record.
Portal Taxonomy Topic widget	Displays topics as cards on your portal page enabling your users to access knowledge articles and catalog items related to a topic displayed on your portal in a Portal Browse Taxonomy widget.

Activate the UI Components for Customer Portals plugin

You can activate the UI Components for Customer Portals plugin (sn_ciwf_ui_cmpnt) to enable Configurable Portal widgets. The application installs related plugins if they aren't already installed.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a page for Configurable Portal widgets

Create a page into which you can add Configurable Portal widgets.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

Role required: ap_admin or admin

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Service Portal Designer page, select **Add a new Page**.
4. Enter the text for the page title.
5. Enter an ID for the page that does not include spaces or any special character except for an underscore.
6. Select **Submit**.

Result

The page is created in the Service Portal Designer.

Portal Polaris Header widget

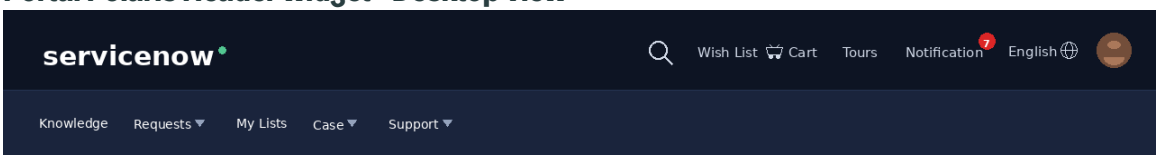
The Portal Polaris Header widget enables your users to quickly access key features, pages, and links from any place in the portal. You can select the Portal Polaris Header widget in the theme record, which is mapped to your portal.

You can display the logo, search, profile, and others on level 1 and menu items on level 2 of the header. The appearance of the menu items in level 2 of the header is determined by the widget selected in the menu record mapped to the portal. To enable a multi-level hierarchy for your menu items, you must select the Portal Mega Menu widget. For more information, Portal Mega Menu widget.

The following items that appear on level 1 and level 2 of the header menu and are configured on the portal record and menu record associated with the portal.

- Level 1 header consists of logo, search, language selector, profile, tours, notification approvals, surveys, wish list, and cart.
- Level 2 header consists of Main menu and sub menu items.

Portal Polaris Header widget - Desktop view



Additionally, in the mobile view, you can access all the menu items that are grouped by categories. Currently, the mobile view support isn't available for guided tours and language selector menu items.

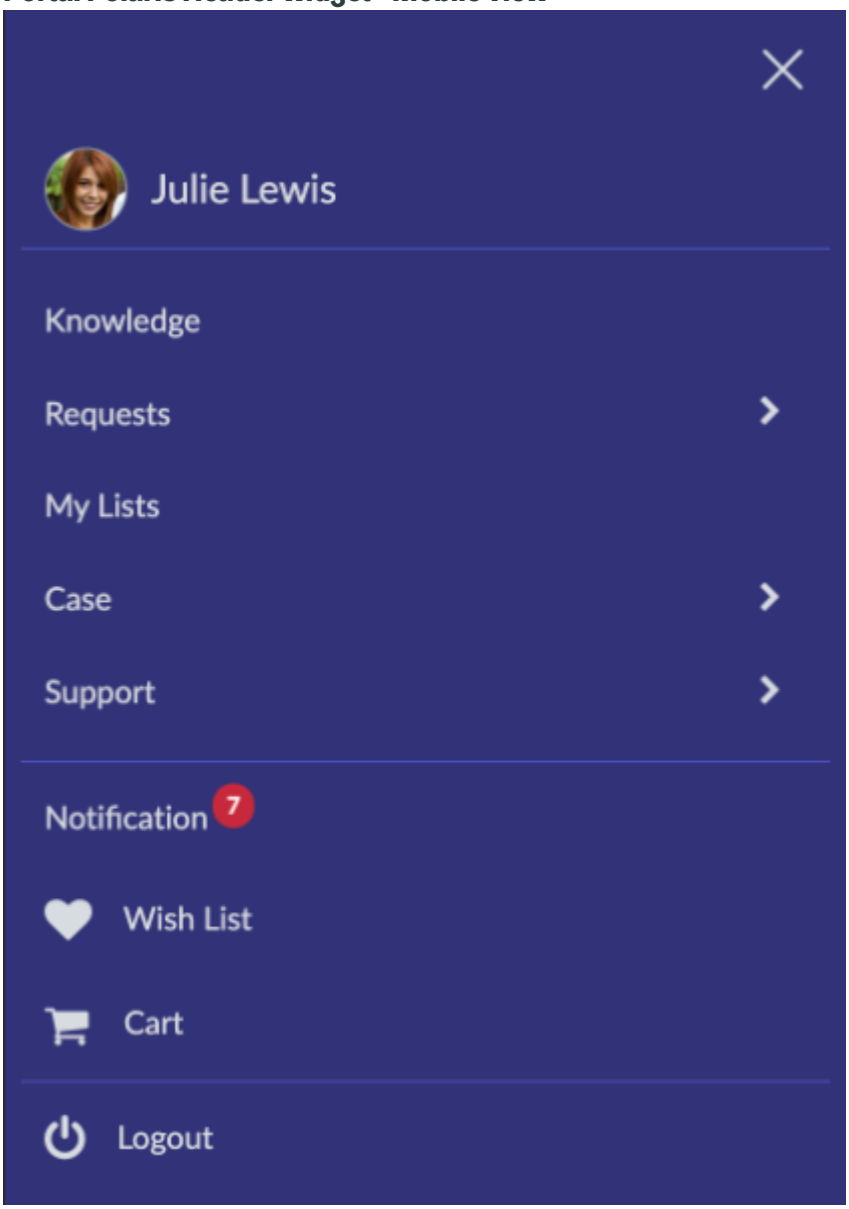
Portal Polaris Header widget - Mobile view



Configure the Portal Polaris Header widget for your portal

Associate the Portal Polaris Header widget as your header for the selected theme on your portal.

Before you begin

Role required: sp_admin or admin

About this task

Unlike other widgets in the Configurable Portal widgets, the Portal Polaris Header widget can't be dragged onto a page. Instead, you must configure it by associating the header menu with the selected theme for your portal.

Procedure

1. Navigate to **All** > **Service Portal** > **Portal**.
2. On the Service Portal page, search and select `Customer Support` in the Title column.
3. On the Customer Support page, in the **Theme** field, select the Preview this record icon ().
4. Select **Open Record** on the Theme pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Portal Next Experience Theme page, in the **Header** field, select the Lookup using list icon ( ).

Note:
If a message appears about the application scope, select **here** to be able to edit the record.

6. On the Header | Footers page, search and select **Portal Polaris Header**.
7. Select **Update**.

Result
The Portal Polaris Header is set as a header for the Portal Next Experience theme.

Configure company logo on your portal header

Display your company logo on the header of your portal.

Before you begin
Role required: sp_admin or admin

Procedure
1. Navigate to **All** > **Service Portal** > **Portal**.
2. On the Service Portal page, search and select `Customer Support` in the Title column.
3. On the Customer Support page, add an image in the **Logo** field.
4. Select **Update**.

Result
Your company logo appears on the left side of the header of your portal.

Configure the search option for your portal header

Configure search feature to display search option on you portal.

Before you begin
Role required: sp_admin or admin

Procedure
1. Navigate to **All** > **Service Portal** > **Portal**.
2. On the Service Portal page, search and select `Customer Support` in the Title column.
3. On the Customer Support page, in the **Quick start config** field, modify the JSON as shown.

```
"headerSearch": {
                "display_search": true,
"search_placeholder_text": "Search articles and request items",
"exclude_search_for_pages": "csm_home_new"
```

Note:
You can also modify the placeholder text. The default text is `Search articles and request items`.

4. Modify the placeholder text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default text is `Search articles and request items`.

5. Select **Update**.

Configure a wishlist and cart for your portal header

Display a wishlist and cart on your portal header.

Before you begin

Role required: sp_admin or admin

Procedure

1. Modify JSON.
   a. Navigate to **All** > **Service Portal** > **Portal**.
   b. On the Service Portal page, search and select `Customer Support` in the Title column.
   c. On the Customer Support page, in the **Main menu** field, select the Preview this record icon ().
   d. Select **Open Record** on the Instance with Menu pop-up window.
   e. On the Portal revamp demo menu page, in the **Additional options, JSON format** field, modify the JSON as shown.

```
{

  "enable_cart": {
    "displayValue" : "true",
    "value": false
  },
  "enable_wishlist": {
    "displayValue" : "true",
    "value": false
  }
}
```

   f. Select **Update**.

2. Enable wish list.
   a. Navigate to **Service Catalog** > **Maintain Catalogs**.
   b. Open **Customer Service** record.
   c. Select **Enable Wish List** check-box.
   d. Select **Update**.

Configure notification, approval, and survey for your portal header

Display menu items like notification, approval, and survey on your portal header.

Before you begin

Role required: sp_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portal** > **Portal**.
2. On the Service Portal page, search and select `Customer Support` in the Title column.
3. On the Customer Support page, in the **Main menu** field, select the Preview this record icon ().
4. Select **Open Record** on the Instance with Menu pop-up window.
5. On the Portal revamp demo menu page, select **New** in the related list and create notifications, approvals, and surveys.
6. Create a notification item on the header.

   a. On the form, fill in the fields.
   For a description of the field values, see Portal Header notification, approval, and survey form.

   b. Select **Submit**.

7. Create an approval item on the header.

   a. On the form, fill the fields.
   For a description of the field values, see Portal Header notification, approval, and survey form.

   b. Select **Submit**.

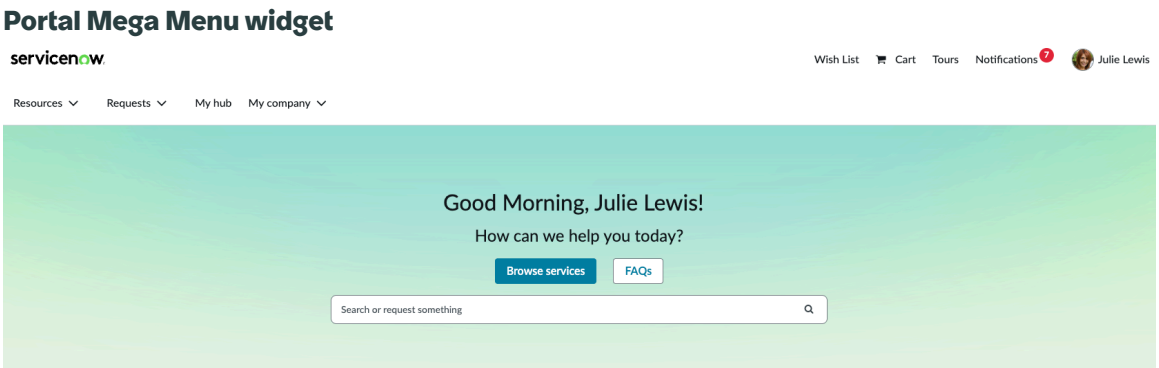
8. Create a survey item on the header.

   a. On the form, fill the fields.
   For a description of the field values, see Portal Header notification, approval, and survey form.

   b. Select **Submit**.

Portal Mega Menu widget

The Portal Mega Menu widget displays a hierarchical menu on the header of the portal home page to enable navigation to different pages. You can also display a cart, wish list, guided tour, and scripted list such as notification, approval, and survey on the header of your portal.



For more information about how to configure the Portal Mega Menu widget, see Configure the category of a Portal Mega Menu widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the category of a Portal Mega Menu widget

Configure a Portal Mega Menu widget to define a menu category and associate pages to it to be able to navigate easily to different pages from the portal page.

Before you begin

The UI Components for Customer Portals plugin must be installed. For more information, see Activate the UI Components for Customer Portals plugin.

Role required: sp_admin or admin

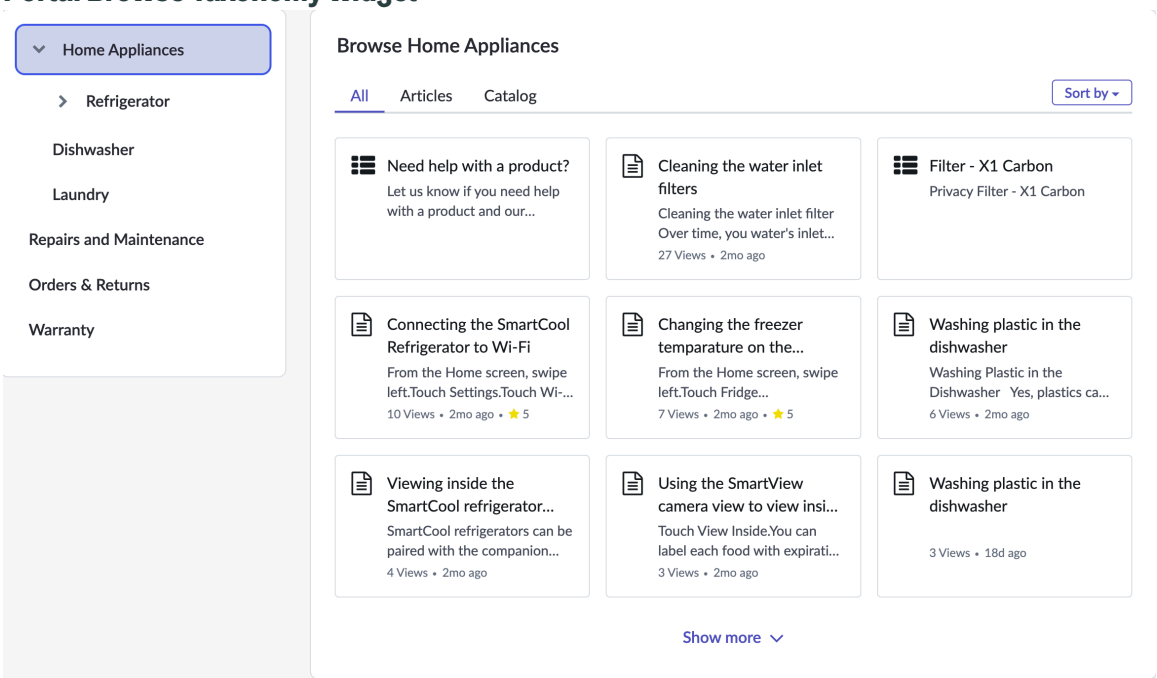
Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. On the Service Portals page, in the **Title** column, enter `Customer Service`.
3. Select **Customer Service**.
4. On the Customer Service form, in the **Main menu** field, select the Preview this record icon (). If a message appears about the application scope, select **here** to be able to edit the record.
5. On the Instance with Menu form, select **Open Record**.
6. On the CSP Header Menu form, if Portal Mega Menu doesn't appear in the **Widget** field, search for and select it.
7. Select **Update**.
8. On the CSP Header Menu page, in the Related Links section, select the category that you want to update.
9. On the Menu item form, fill in the fields.
   For a description of the field values, see Menu Item form .
10. Select **Update**.

Portal Browse Taxonomy widget

The Portal Browse Taxonomy widget displays hierarchical taxonomy topics that enable your users to navigate to knowledge articles and catalog items through the widget's navigation pane.

Portal Browse Taxonomy widget



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about how to configure the Portal Browse Taxonomy widget using the instance options, see Add and configure the Portal Browse Taxonomy widget.

Add and configure the Portal Browse Taxonomy widget

Add the Portal Browse Taxonomy widget to your portal and modify its behavior. The widget displays taxonomy topics along with the articles and catalog items related to them.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

You must have the following setup in order to add, update, and use this widget:

- The page to which you want to add the widget. For more information, see Create a page for Configurable Portal widgets
- A taxonomy to map your content. For more information, see Create taxonomy.
- At least one taxonomy associated with your portal. For more information, see Add a taxonomy to your portal.
- At least one topic associated with the taxonomy. For more information, see Create and associate topics.
- Topics associated with knowledge categories and catalog categories. For more information, see Associate content categories to topics and Associate content from catalog categories to a topic.

Role required: admin or sp_admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the Widgets pane, in the **Filter Widget** field, enter `Portal Browse Taxonomy`.
7. Drag the Portal Browse Taxonomy widget onto the container layout.
8. In the Edit page, select a Portal Browse Taxonomy widget.
9. Select the Pencil icon ( ).
10. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Browse Taxonomy widget instance options form.

Add a taxonomy to your portal

Create a taxonomy to organise knowledge articles and catalog items under topics which are relevant to your user. Associate a taxonomy to your portal to display the relevant topics on the widgets.

Before you begin

Role required: admin or sp_admin

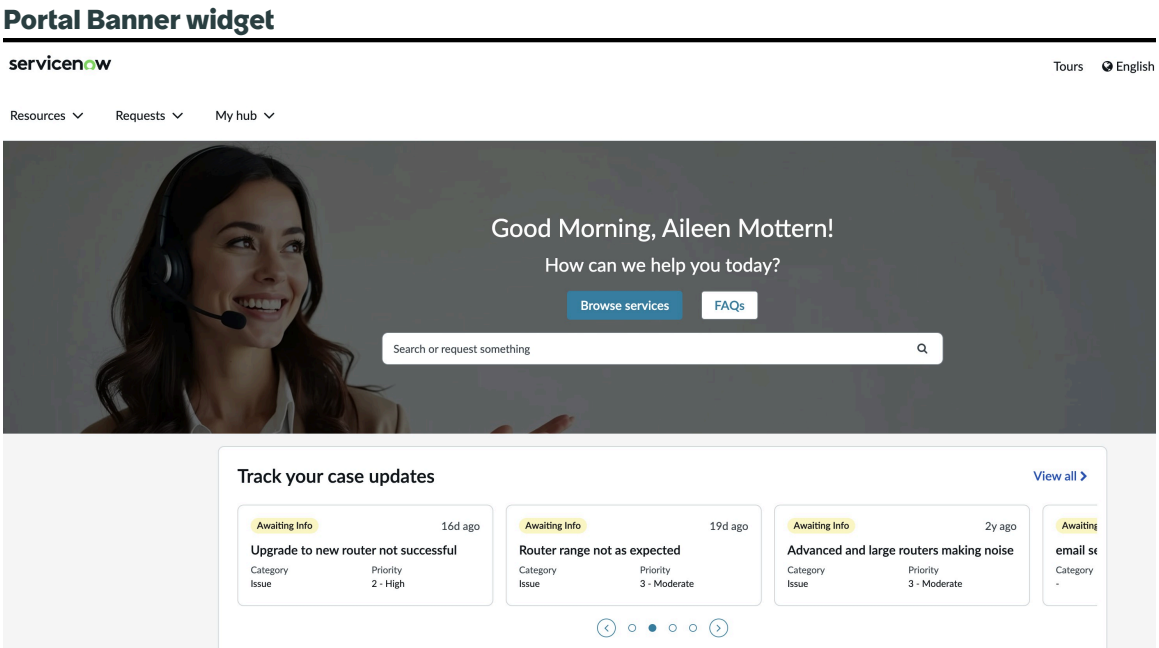
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. On the Service Portal page, search `Customer Support` in the **Title** column.
   You can select any portals and a taxonomy to it.
3. On the Customer Support page, in the related list, select the **Taxonomy** tab.
4. In the Taxonomy tab, move any taxonomy from the Collection to the Taxonomy list.

Portal Banner widget

You can use the Portal Banner widget to display announcements, new product or feature highlights, and important information on the portal page.



For information about how to configure instance options for the Portal Banner widget, see Add and configure the Portal Banner widget.

Add and configure the Portal Banner widget

Add a Portal Banner widget to your portal and modify its appearance and behavior. You can use the Portal Banner widget to display announcements, new product or feature highlights, and important information on the portal page.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

About this task

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Add container.
   a. Select the **Widgets** tab.
   b. In the Layouts section, drag the Container layout onto the portal edit page.
   c. On the container, select the Pencil icon ( ).
   d. In the **Width** field, select **Fluid**.
   e. Select **Save**.
5. Add columns to container.
   a. On the container, add a set of columns by selecting the plus button ( ).
   b. In the column, select the Edit page properties icon ( ).

      Note:
      Verify that **Column** is selected in the breadcrumbs navigation.

   c. Select the Edit page properties icon ( ) in the banner in Service Portal Designer.
   d. On the Page window, in the **Page Specific CSS** field, paste the following CSS code.

```
.col-md-12{
     padding-left: 0;
     padding-right: 0;
 }
.padding-top {
     padding-top: 0;
 }
```

      If a message appears about the application scope, select **here** to be able to edit the record.
   e. Select **Save**.
6. Add portal banner widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Widgets pane, in the **Filter Widget** field, enter `Portal Banner`.

b. Drag the widget onto the container.

c. In the Edit page, select the Portal Banner widget.

d. Select the Pencil icon ( ).

e. On the Instance form, in the **Presentation** field, paste the following JSON code into the **Search Placeholder Text** field.

```
{
    "title": "enter the title",
    "size": "enter the size of search bar",
    "color": "enter color"
}
```

For more information about each parameter, see Script parameters for the search option in the Portal Banner widget.

f. On the Instance form, fill in the fields.
For a description of the field values, see Portal Banner widget instance options form.

g. Select **Save**.

Provide web page link buttons to display on the Portal Banner widget

Provide a link to a web page that you want to display by defining primary or secondary buttons on the Portal Banner widget. The widget displays these buttons by default.

Before you begin

The UI Components for Customer Portals plugin must be installed. For more information, see Activate the UI Components for Customer Portals plugin.

Role required: sp_admin or admin

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. On the Extension Points page, in the API Name column, enter `*banner`.
3. Select **sn_ciwf_ui_cmpnt.BannerButtonsConditionScript** in the **API Name** column.
If a message appears about the application scope, select **here** to be able to edit the record.
4. On the BannerButtonsConditionScript page, in the Related links section, select **Create Implementation**.
If a message appears about the application scope, select **here** to be able to edit the record.
5. On the BannerButtonsConditionScript page, in the **Script** field, define the primary and secondary buttons by pasting the following CSS code and then customizing it.

```
var BannerButtonsConditionScript = Class.create();
BannerButtonsConditionScript.prototype = {
    initialize: function() {
    },

 showPrimaryButton: function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // add your condition here
  return true;
 },

 showSecondaryButton: function() {
  // add your condition here
  return true;
 },

    type: 'BannerButtonsConditionScript'
};
```

6. Copy the name of the condition script from the **Name** field.
7. Select **Update**.
8. Navigate to your portal home page.
9. On the Edit page, select the Portal Banner widget.
10. Press Control+right-click.
11. Select **Instance Options**.
12. In the **Behavior** section, paste the name that you copied into the **Button Condition Script** field.
13. Select the condition script from the list.
14. Select **Save**.

Add a widget in the Portal Banner widget

Add a widget for additional functionality to the Portal Banner widget and configure it. For example, you could add the Portal Quick Links widget to enable users to access knowledge articles, external URLs, catalog items, or custom pages from the Portal Banner widget.

Before you begin

The UI Components for Customer Portals plugin must be installed. For more information, see Activate the UI Components for Customer Portals plugin.

Role required: admin or sp_admin

Procedure

1. Navigate to your portal home page.
2. On the widget you want to add, press Control+right-click.
3. In the context menu, select **Instance in Page Editor**.
4. In the Edit section, select the Portal Quick Links widget from the flowchart.
   The Portal Quick Links widget has been considered as an example.
5. Select the **Instance 2**.
6. Copy the JSON code from the **Additional options, JSON format** field.
7. On your portal home page, press Control+right-click on the Portal Banner widget.
8. Select **Instance Options**.
9. In the **Behavior** section, paste the JSON code into the **Widget Option Schema** field.
10. In the **Widget Option Schema** field, modify the JSON code to update the configuration of the widget that you've added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on each JSON parameters of the Portal Quick Links widget, see Portal Banner widget JSON parameters.

11. Select **Save**.

Configure localization for Portal Banner heading

Configure the portal banner heading instance option to support localization and personalize the portal experience for different users.

Before you begin

Role required: admin

About this task

The portal banner widget enables you to customize the heading text displayed to users on the business portal. You can modify the heading text from the instance options and then create a translation record in the sys_ui_message table. This setup lets you personalize user experience across different regions and languages.

Procedure

1. Configure the instance option.

   a. Navigate to the page/portal where the widget is configured.

   b. Press Control+right-click on the Portal Banner widget and select **Instance Options**.

   c. In **Heading**, enter the desired text.
   For details on filling the Heading field, see Portal Banner widget instance options form.

2. Create a translation record (for localization).

   a. Navigate to **All** > **System Localization** > **Messages**.

   b. Select **New**.

   c. On the Message New Record form, fill in the fields.

Message New Record form

Field	Description
Key	Exact text as configured in the instance option. Pass the parameters, if you have used variables in the heading field: ▪ <user>: {firstName} {lastName} ▪ <title>: {title}
Language	Target language
Code	sn_ciwf_ui_cmpnt

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Message	Translation of text entered in the Key field.

d. Select **Submit**.

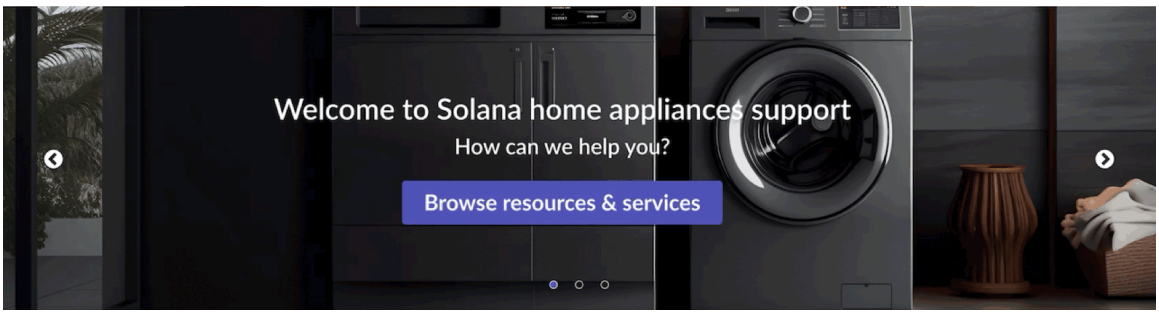
Result
A new translation record is created which supports localization.

Portal Banner Carousel widget

A carousel in your home page banner can display multiple announcements and highlight brief information on features and products.

Portal Banner Carousel widget

The following image shows a sample carousel widget on a portal home page.



For more information, see Add and configure the Portal Banner Carousel widget

Add and configure the Portal Banner Carousel widget

Add a Portal Banner Carousel widget to the portal and modify its presentation and behavior.

Before you begin
The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

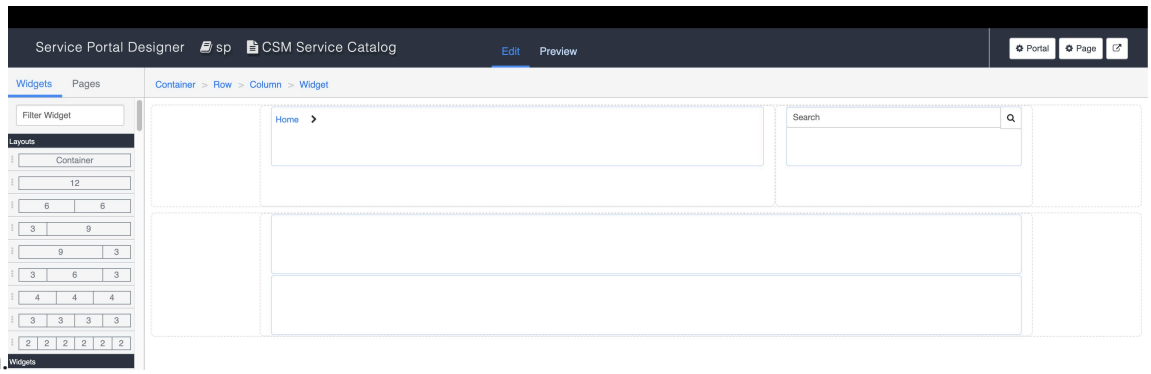
Role required: sp_admin or admin

Procedure
1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, select the Pencil icon ( ).
7. In the **Width** field, select **Fluid**.
8. Select **Save**.
9. On the container, add a set of columns by selecting the plus button ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. In the column, select the Edit page properties icon (Page) in the Service Portal Designer banner.

Note:
Verify that **Column** is selected in the breadcrumbs navigation.



11. On the Page window, in the **Page Specific CSS** field, paste the following CSS code:

```
.col-md-12{
     padding-left: 0;
     padding-right: 0;
 }
.padding-top {
     padding-top: 0;
 }
```

If a message appears about the application scope, select **here** to be able to edit the record.

12. Select **Save**.
13. On the Widgets pane, in the **Filter Widget** field, enter `Portal Banner Carousel`.
14. Drag the widget onto the container.
15. In the Edit page, select the Portal Banner Carousel widget.
16. Select the Pencil icon ( ).
17. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Banner Carousel widget instance options form.
18. Select **Save**.

Create a slide for the Portal Banner Carousel widget

Create a slide to include images in the Portal Banner Carousel widget that a user can scroll through.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

Role required: sp_admin or admin

Procedure

1. Select **All**.
2. In the filter navigator, enter `sp_carousel_slide.list`.
3. On the Carousel Slides page, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Carousel slides form, fill in the fields.

Carousel slides form

Field	Description
Name	Name of the carousel slide.
HREF/URL	The URL that opens an internal web page or a portal page in the same tab and an external page or a portal in a new tab. **Note:** For more information about linking to a page within a portal, see Page navigation in Service Portal by URL.
Application	The application that contains this configuration record. This field is automatically set to Global.
Background	Image to appear as the background of the slides in the carousel. The recommended dimension is 1022x300 pixels

5. Select **Submit**.

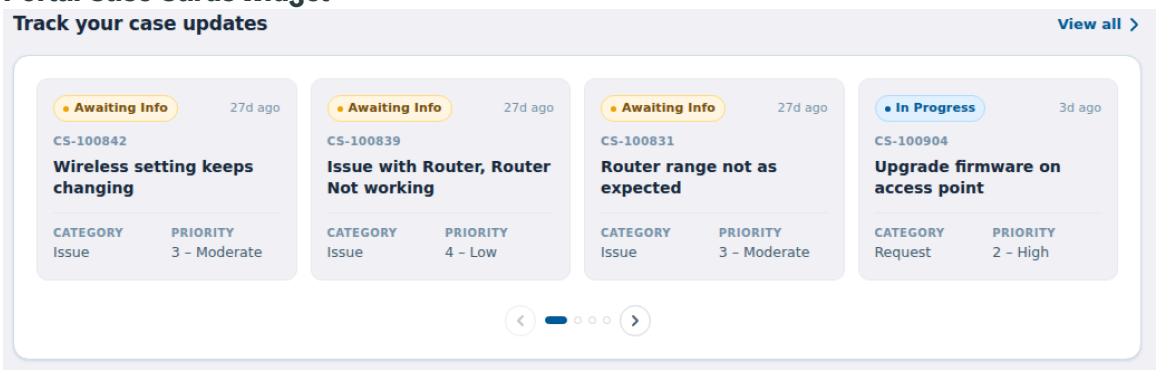
Result
The slide is created and appears on the Carousel Slides (sp_carousel_slide) page.

Portal Case Cards widget

The Portal Case Cards widget displays cards for cases that you define. By default, the displayed cases are those awaiting information or are resolved. You can choose to define different criteria.

The following illustration shows the default card view with cases that are currently in the awaiting info and resolved states.

Portal Case Cards widget



For more information about how to configure the instance options for the Portal Case Cards widget, see Add and configure the Portal Case Cards widget.

Add and configure the Portal Case Cards widget

Add a Portal Case Cards widget to your portal and modify its data, presentation, and behavior. You can use the Portal Case Cards widget to display status, priority, and other relevant details related to your cases.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( ).
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Case Cards`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Case Cards widget.
10. Select the Pencil icon ( ).
11. If you want to use configured background and text colors to indicate the state of the cases displayed in the widget, enter JSON code in the following format in the **State Highlight Color** field and modify it with your desired colors.

    The default text color for all case states is #181A1F (black). If you create a state, the default highlight color is #CBE9FC (light blue) and the text color is #181A1F (black). For more information about the default color values, see Default highlight color for different case states.

```
[
  {
    "value": "1",
    "background_colour": "#CBE9FC",
    "text_colour": "#181A1F"
  },
  {
    "value": "10",
    "background_colour": "#D1D2EE",
    "text_colour": "#181A1F"
  },
  {
    "value": "18",
    "background_colour": "#FBF7BF",
    "text_colour": "#181A1F"
  },
  {
    "value": "6",
    "background_colour": "#D2EABC",
    "text_colour": "#181A1F"
  },
  {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "value": "3",
    "background_colour": "#C2C4CA",
    "text_colour": "#181A1F"
  },
  {
    "value": "7",
    "background_colour": "#FFCCD2",
    "text_colour": "#181A1F"
  }
]
```

For <value>, enter an integer value of the case state for which you want to change the colors. For more information about finding this value, see Display the integer values of all case states.

12. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Case Cards widget instance options form.
13. Select **Save**.

Display the integer values of all case states

Display the integer values of all of the states associated with cases.

Before you begin

Role required: sp_admin or admin

Procedure

1. Navigate to **All** > **System Definitions** > **Choice Lists**.
2. On the Choices page, in the **Table** column, enter `*sn_customerservice_case`.
3. In the Element column, enter `state`.

Result

The Value column on the Choices page displays the integer values of all the states related to a case.

Portal Quick Links widget

The Portal Quick Links widget displays a variety of links to internal and external resources on the portal for quick access.

The quick links in the portal widget enable your users to quickly access content on the portal. These quick links can be related to different types of information: knowledge articles, external URLs, catalog items, or custom pages.

The following types of Portal Quick Links widgets display quick links related to a single type of information: knowledge articles or catalog items:

- Portal Knowledge Quick Links widget: Displays quick links in the widget associated with relevant knowledge articles. For more information, see Portal Knowledge Quick Links widget.
- Portal Catalog Quick Links widget: Displays quick links in the widget associated with relevant catalog items. For more information, see Portal Catalog Quick Links widget.

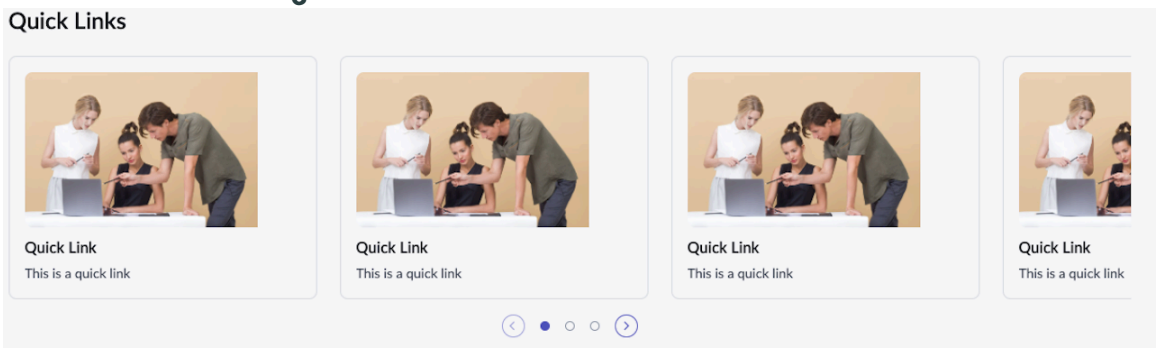
Portal Quick Links widget



For more information, see Add and configure the Portal Quick Links widget.

Add and configure the Portal Quick Links widget

Add a Portal Quick Links widget to the portal and modify its presentation and behavior. You can use the Portal Quick Links widget to display knowledge articles, external URLs, catalog items, or custom pages on your portal.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, seeActivate the UI Components for Customer Portals plugin.

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designers**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( )
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Quick Links`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Quick Links widget.
10. Select the Pencil icon ( ).
11. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Quick Links widget instance options form.
12. Select **Save**.

Portal Knowledge Quick Links widget

The Portal Knowledge Quick Links widget displays a list of relevant knowledge articles for quick access on the portal. The card displays article details such as the title, preview, author, view count, rating, and updated date in the widget.

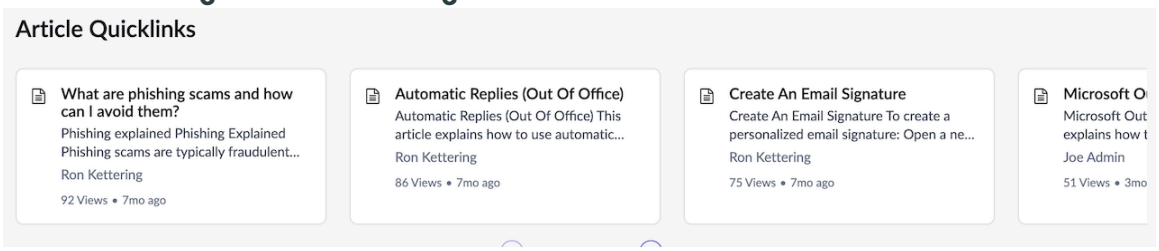
Portal Knowledge Quick Links widget



For more information, see Add and configure the Portal Knowledge Quick Links widget.

Add and configure the Portal Knowledge Quick Links widget

Add a Portal Knowledge Quick Links widget to the portal and modify its data, presentation, and behavior.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, seeActivate the UI Components for Customer Portals plugin

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( )
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Knowledge Quick Links` .
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Knowledge Quick Links widget.
10. Select the Pencil icon ( ).
11. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Knowledge Quick Links widget instance options form.
12. Select **Save**.

Result

The Portal Knowledge Quick Links widget appears in the widget according to the configured instance options.

Portal Catalog Quick Links widget

The Portal Catalog Quick Links widget displays catalog items according to filter criteria, enabling you to include an image, icon, name, and description on the card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

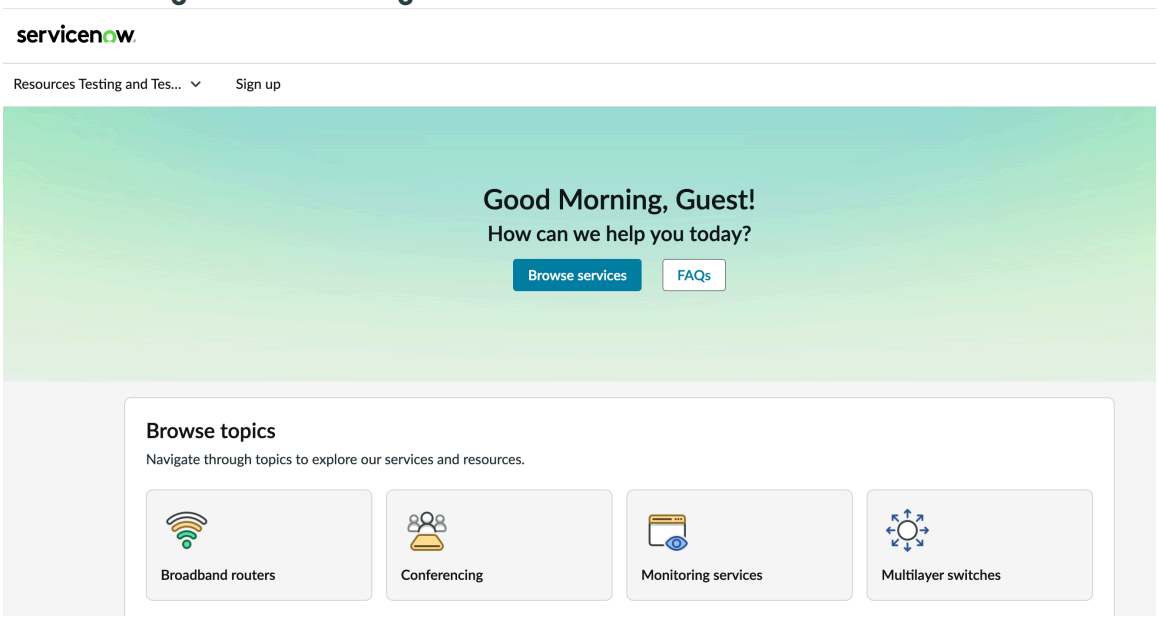
Portal Catalog Quick Links widget



For more information about how to configure the instance options for Portal Catalog Quick Links, see Add and configure the Portal Catalog Quick Links widget.

Add and configure the Portal Catalog Quick Links widget

Add a Portal Catalog Quick Links widget on your portal and modify its data, presentation, and behavior. You can use the Portal Catalog Quick Links widget to display frequently accessed catalog items on your portal.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( ).
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Catalog Quick Links`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Catalog Quick Links widget.
10. Select the Pencil icon ( ).
11. On the Instance form, fill in the fields.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Portal Catalog Quick Links widget instance options form.

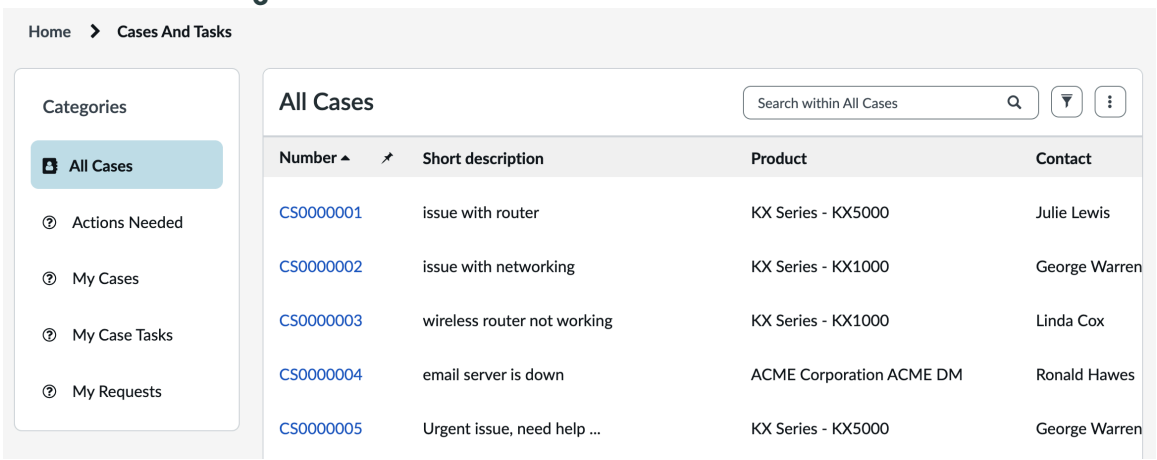
12. Select **Save**.

Portal Data List widget

The Portal Data List widget displays data related to cases from selected case tables in either a list or card format.

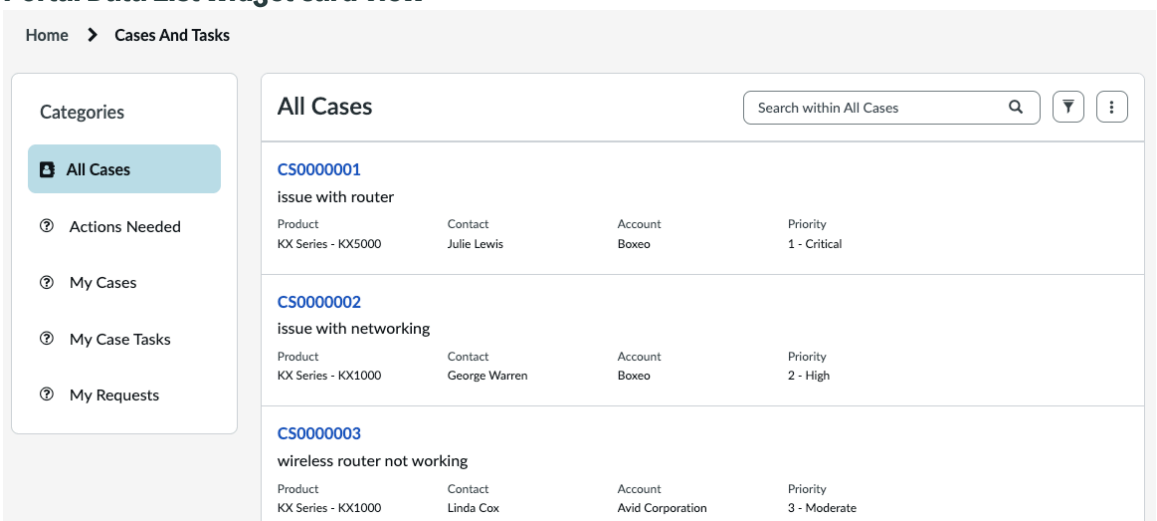
The list view displays a columnar list of cases and their information. You can also display the data list without the category on the left and pin the first column.

Portal Data List widget list view



The card view displays case information in stacked cards.

Portal Data List widget card view



© 2026 ServiceNow, Inc. All rights reserved.

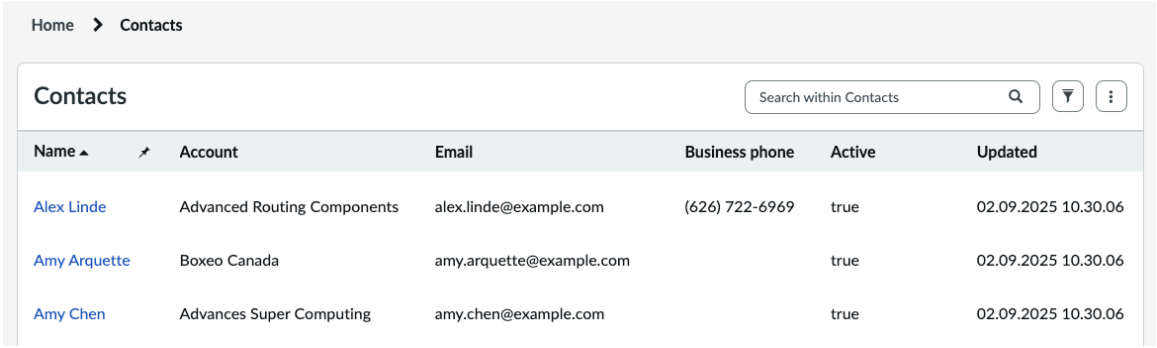
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portal Data List widget without categories



Each row in the widget represents a record. You can search, view, sort, and interact with the information presented.

For more information about how to configure the instance options for the Portal Data List widget, see Add and configure the Portal Data List widget.

The Data List portal widget can be used in the following scenarios:

- Dynamic data list: Enables you to display records dynamically based on the configuration provided in the URL parameters. It avoids the need to create duplicate list pages. You can use a common page to display records from any table by passing the following URL parameters: table, filter, sort order, view, and target view page.
- Static data list: Ability to display records from one or more tables specified in the widget instance options. It enables you to personalize the data list experience for a particular entity or table, such as cases, products, contacts, and so on.
- Related data list: Enables you to display records associated with an entity on the record view page. The data list is configured to identify the entity specified in the URL and filters the records accordingly.

Add and configure the Portal Data List widget

Add a Portal Data List widget to your portal and modify its data, appearance, and behavior. You can use the Portal Data List widget to display different case-related data in a card or list format on your portal.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Data List`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Data List widget.
10. Select the Pencil icon ( ).
11. On the instance options page, in the **Data** field, paste and update the following JSON code to configure the lists.

```
[

```

For more information, see Portal Data List widget JSON parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each category in the widget displays a list of filtered records from a selected table. The default table is the Case [sn_customerservice_case] table. In a category, you can further filter the records and display them in tabs using the *pre_defined_filters* parameter. You can also configure the filter options displayed in the filter icon using the *run_time_filters* parameter.

12. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Data List widget instance options form.
13. Select **Save**.

Configure public access on the Portal Data List widget

Configure the Portal Data List widget and page content for public access to enable guest users to view data without authentication.

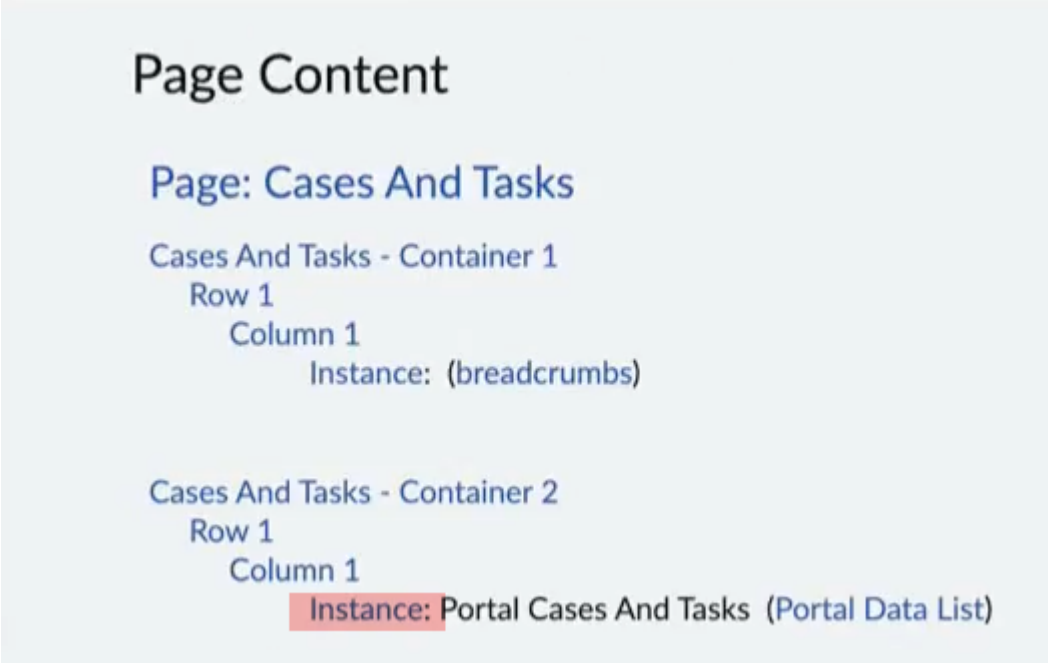
Before you begin

Role required: sp_admin

Procedure

1. Make Portal Data List Widget public
   a. Navigate to **All** > **Service Portal** > **Widgets**.
   b. Search and select `Portal data list` in the Name column.
   c. Select the **Public** check box.
   d. Select **Update**.
2. Make pages containing the Portal Data List widget public (For example, cases and tasks page).
   a. Navigate to **All** > **Service Portal** > **Pages**.
   b. Search and select the page containing the Portal Data List widget in the Title column (For example, cases and tasks page).
   c. Select the **Public** check box.
   d. Save the page.
   e. Select **Instance** for the Portal Data List widget from Page Content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The widget instance page opens.

f. Select **Roles**.

g. Search and move **public** from Available to Selected List.

h. Select **Done**.

i. Select **Update**.

3. Select **Update**.

Hide or show categories in the Data List widget

Create a condition script to hide or show a category in the Portal Data List widget.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

Role required: admin or sp_admin

Procedure

1. Navigate to **All** > **System Extensions Points** > **Scripted Extensions Points**.
2. On the Extension Points page, in the **API Name column** search field, enter `*datalist`.
3. Select the **sn_ciwf_ui_cmpnt.DatalistCategoryConditionScript** in the **API Name** column.
   If a message appears about the application scope, select **here** to be able to edit the record.
4. On the DatalistCategoryConditionScript page, in the Related links, select **Create implementation**.
5. In the **Script** field, paste the following CSS code:

```
showCategory: function(category_id, params) {

      /*
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    if(category_id=="cases_category"){
        return true;
    }
    */
    return true;
}
```

Function parameters

Parameters	Description
category_id	Portal Data List category id.
params	JSON containing url_params and related_table. For example, `{ "url_params": { "table": "customer_contact", "sys_id": "60beb5e7d7600200e5982cf65e6103ad", "view": "sp" }, "related_table": "sn_customerservice_case" }`

6. Copy the name of a condition script from the **Name** field.
7. Select **Update**.
8. Navigate to your portal home page.
9. On the Data List widget, press Control+right-click.
10. Select **Instance Options**.
11. In the Behavior section, paste the name that you copied into the **Data List condition script** field.
12. Select the condition script from the list.
13. Select **Save**.

Modify view in the Data List widget

Create a condition script to modify views in the Portal Data List widget.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

Role required: sp_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Priority order for how the Data List widget determines the view

Priority	Source	Description
1 (Highest)	Script	If a Views Condition Script is configured and returns a view name, that view is used. Scripts have the most flexibility since they can apply custom logic using the parameters - `categoryId`, `params`.
2	role_based_views / guest_view	If no script is configured or the script doesn't return a view, the system checks the JSON instance options. • For logged-in users, it checks `role_based_views` to find a view matching the user's roles. • For non-logged-in users, it uses `guest_view` .
3	view	The widget uses the view JSON instance option if the script or role based view/guest view mappings doesn't apply.
4 (Lowest)	Default View on Platform	If no other configuration applies, the widget uses the platform's default view for the table.

Procedure

1. Navigate to **All** > **System Extensions Points** > **Scripted Extensions Points**.
2. On the Extension Points page, in the **API Name column** search field, enter `*datalist`.
3. Select the **sn_ciwf_ui_cmpnt.DatalistCategoryConditionScript** in the **API Name** column.
   If a message appears about the application scope, select **here** to be able to edit the record.
4. On the DatalistCategoryConditionScript page, in the Related links, select **Create implementation**.
5. In the **Script** field, paste the following CSS code:

```
getView: function(category_id, params) {
    return "case"; // view
}
```

Function parameters

Parameters	Description
category_id	Portal Data list category id.
params	JSON containing url_params and related_table. For example, `{`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters	Description

	<pre>{
	  "url_params": {
	  "table":
	  "customer_contact",
	  "sys_id":
	  "60beb5e7d7600200e5982cf65e6
	103ad",
	  "view": "sp"
	  },
	  "related_table":
	  "sn_customerservice_case"
	}</pre>

6. Copy the name of a condition script from the **Name** field.
7. Select **Update**.
8. Navigate to your portal home page.
9. On the Data List widget, press Control+right-click.
10. Select **Instance Options**.
11. In the Behavior section, paste the name that you copied into the **Data List condition script** field.
12. Select the condition script from the list.
13. Select **Save**.

Filter records in the Data List widget

Create a condition script to filter records in the Portal Data List widget.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

Role required: sp_admin

Procedure

1. Navigate to **All** > **System Extensions Points** > **Scripted Extensions Points**.
2. On the Extension Points page, in the **API Name column** search field, enter `*datalist`.
3. Select the **sn_ciwf_ui_cmpnt.DatalistCategoryConditionScript** in the **API Name** column.
   If a message appears about the application scope, select **here** to be able to edit the record.
4. On the DatalistCategoryConditionScript page, in the Related links, select **Create implementation**.
5. In the **Script** field, paste the following CSS code:

```
getQuery: function(category_id, params) {
    return “query”; // filter query
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function parameters

Parameters	Description
category_id	Portal Data List category id.
params	JSON containing url_params and related_table. For example, `{ "url_params": { "table": "customer_contact", "sys_id": "60beb5e7d7600200e5982cf65e6103ad", "view": "sp" }, "related_table": "sn_customerservice_case" }`

6. Copy the name of a condition script from the **Name** field.
7. Select **Update**.
8. Navigate to your portal home page.
9. On the Data List widget, press Control+right-click.
10. Select **Instance Options**.
11. In the Behavior section, paste the name that you copied into the **Data List condition script** field.
12. Select the condition script from the list.
13. Select **Save**.

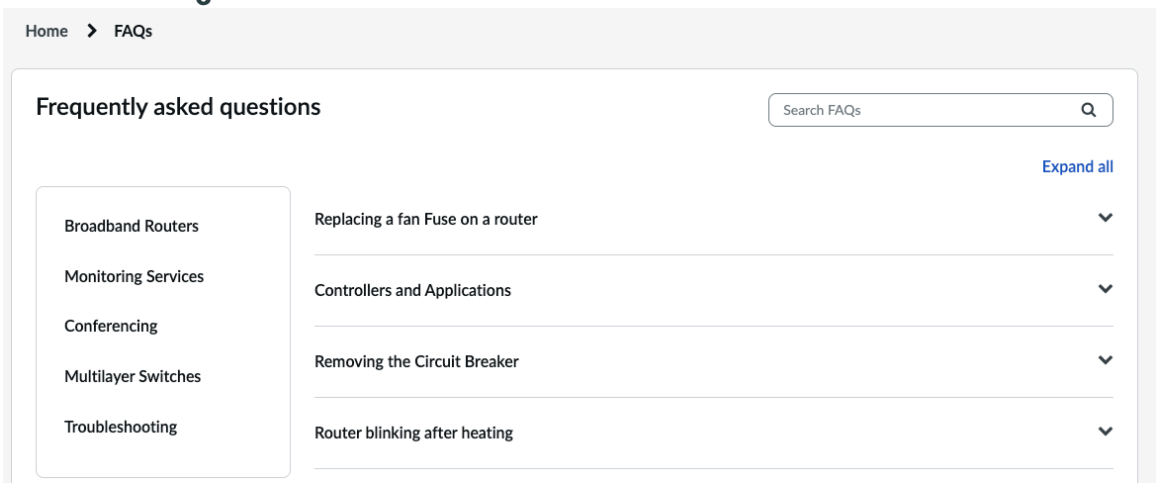
Portal FAQ widget

The Portal FAQ widget displays a frequently asked questions list (FAQ) from the selected knowledge table in the widget on the portal. It enables your users to find answers to their queries without the need to contact customer support or navigate through multiple knowledge article pages. You can filter the FAQs using options in the main navigation.

The following illustration shows five FAQs as the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portal FAQ widget



For more information, see Add and configure the Portal FAQ widget.

Add and configure the Portal FAQ widget

Add the Portal FAQ widget to your portal and modify its data, presentation, and behavior. You can use the Portal FAQ widget to display a frequently asked questions list (FAQ) from a knowledge table on the portal.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin.

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: sp_admin or admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( )
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal FAQ`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal FAQ widget.
10. Select the Pencil icon ( ).
11. On the Instance form, fill in the fields.
    For a description of the fields values, see Portal FAQ widget instance options form
12. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portal Polaris Footer widget

The Portal Polaris Footer widget displays contact information, social media links, and other common links at the bottom of the portal page.

Include the Portal Footer widget on your portal page to display information about your company. The items you can display are:

- Organization logo on top-left corner of footer
- Organization address under the logo
- Sitemap links under different categories at the center of the footer
- Footer links at the bottom right of the footer
- Social media at the bottom right of the footer
- Copyright text on the bottom-right corner of the footer

For more information, see Configure the Portal Polaris Footer widget.

Configure the Portal Polaris Footer widget

Configure the Portal Polaris Footer widget to display your company's corporate office address, email address, and more on the portal page.

Before you begin

The Portal Next Experience theme application should have been activated.

Role required: sp_admin

About this task

Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. On the Service Portal page, in the **Title** column, enter `*customer support`.
3. Select **Customer Support**.
4. On the Customer Support form, in the **Quick start config** field, paste the following JSON code and update it.

```
 [{

"footer": {
      "org_info": [
         "<line #1>",
         "<line #2>",
         "<line #3>"
      ],
      "copyright": "<copyright text>",
      "logo_img_name": "<image name from db_image table>",
      "sitemap_links_menu_sys_id": "<enter the sys_id>",
      "footer_links_menu_sys_id": "<enter the sys_id>",
      "social_links_menu_sys_id": "<enter the sys_id>"
    }
}]
```

   For more information about the parameters, see Portal Footer widget JSON parameters.

5. Select a theme for your portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note that the predefined La Jolla theme, used as an example, is active by default.

a. In the Theme field, select the Lookup using list icon ( )

b. On the Themes page, in the **Name** column, search for and select the `La Jolla` theme. The La Jolla theme is set as your portal theme.

6. Select the Portal Footer as the footer for your portal theme.

a. In the **Theme** field, select the Preview this record icon ( ).

b. On the Theme form, select **Open Record**.

c. On the La Jolla form, in the **Footer** field, select the Lookup using list icon ( ).

d. On the Header | Footers window, in the **Name** column, search for and select `Portal Footer`.

e. Select **Update**.

What to do next

Configure links to appear in the Portal Footer widget:

- To add pages or sections of your website in a sitemap, see Configure sitemap links for the Portal Polaris Footer widget
- To add the social media accounts of your organization, see Configure social media links in the Portal Polaris Footer widget
- To include a link to a site on a portal page, see Add related links in the Portal Polaris Footer widget.

Configure sitemap links for the Portal Polaris Footer widget

Display links to various important pages or sections of your website in a sitemap. Sitemaps help users explore the site's content.

Before you begin

The Portal Next Experience theme should have been activated.

The Portal Polaris Footer widget must have been configured. For more information, see Configure the Portal Polaris Footer widget

Role required: admin or sp_admin

Procedure

1. Navigate to **All** > **Service Portal** > **Menus**.
2. On the Instances with Menu page, in the **Title** column, enter `Portal Footer Sitemap Links`.

> **Note:**
> You can create a new menu record by selecting **New**. After the record is created, update the Quick start config field with the new record's sys_id.

3. Select the entry in the **Updated** column.
4. On the Portal Footer Sitemap Links page, in the Related Links, select the category that you want to configure.
5. On the Category page, in the Related links, select a sitemap link from the **Label** column.
6. On the Menu item form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Menu Item form.

If a message appears about the application scope, select **here** to be able to edit the record.

7. Select **Update**.

Result
The sitemap links are configured and enabled.

Configure social media links in the Portal Polaris Footer widget

Configure links to your organization's social media accounts in the footer of the portal page.

Before you begin
The Portal Next Experience theme should have been activated.

The Portal Poalris Footer widget must have been configured. For more information, see Configure the Portal Polaris Footer widget.

Role required: admin or sp_admin

Procedure
1. Navigate to **All** > **Service Portal** > **Menus**.
2. On the Instances with Menu page, in the **Title** column, enter `Portal Footer Social Links`.

   Note:
   You can create a new menu record by selecting **New**. After the record is created, update the **Quick start config** field with the new record's sys_id.

3. Select the entry in the **Updated** column.
4. On the Portal Footer Social Links page, in the Related Links, select any social link from the **Label** column.
5. On the Menu item form, fill in the fields.
   For a description of the field values, see Menu Item form.

   If a message appears about the application scope, select **here** to be able to edit the record.

6. Repeat these steps for any social media account for which you want a link in the portal footer.
7. Select **Update**.

Add related links in the Portal Polaris Footer widget

Configure the footer link to include a link to a site you want your users to be able to access from your portal page.

Before you begin
The Portal Next Experience theme should have been activated.

The Portal Polaris Footer widget must have been configured. For more information, see Configure the Portal Polaris Footer widget

Role required: admin or sp_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portal** > **Menus**.
2. On the Instances with Menu page, in the **Title** column, enter `Portal Footer Links`.
3. Select the entry shown in the **Updated** column.
4. On the Portal Footer Links page, in the Related Links, select any category from the **Label** column.
5. On the Menu item form, fill in the fields.
   For a description of the field values, see Menu Item form.

   Note:
   If a message appears about the application scope, select **here** to be able to edit the record.

6. Select **Update**.

Result

The link is included in the portal footer and opens a web page when accessed.

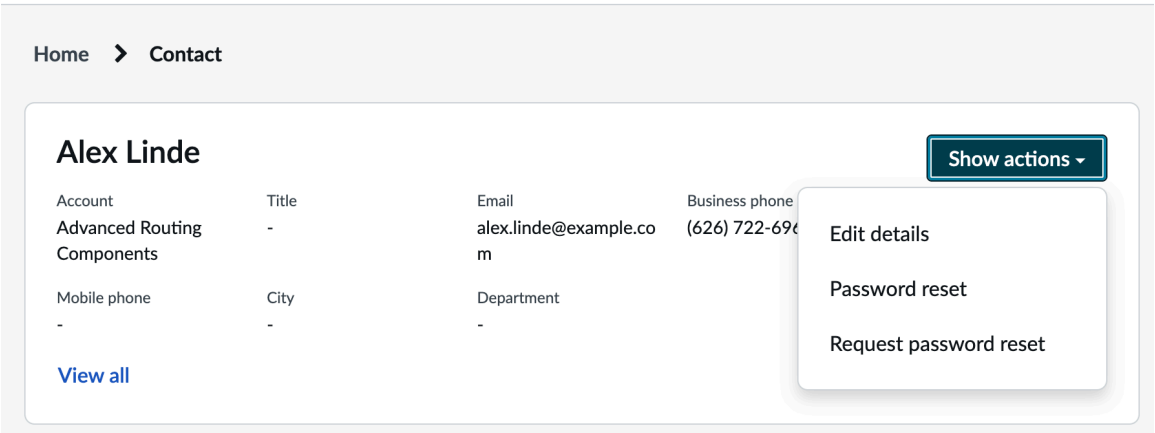
Portal Object widget

The Portal Object widget displays key information of a record from the tables available on your ServiceNow® instance. Additionally, your users can take related actions on the selected record.

The Portal Object widget enables you to display information from a specified table as cards on your portal. You can select any table from the ServiceNow® instance. The widget displays information based on the sys_id of the record. It also displays a list of actions your user can take on the selected record.

The Portal Object widget currently supports both desktop and mobile versions.

Portal Object widget



For more information about how to configure the Portal Object widget, see Add and configure the Portal Object widget.

Add and configure the Portal Object widget

Add a Portal Object widget to your portal and modify its data and behavior. You can use the Portal Object widget to display important information and actions related to records from a defined table on your portal homepage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

If you haven't already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: admin or sp_admin

About this task

The Portal Object widget displays the information based on the sy_id entered in the widget instance options. If no sys_id is provided in the instance options, the widget uses the sys_id parameter provided in the URL.

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( ).
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Object`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Object widget.
10. Enable editing of the widget by selecting the Pencil icon ( ).
11. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Object widget instance options form.
12. Select **Save**.

Portal Taxonomy Topic widget

The Portal Taxonomy Topic widget displays topics as cards on your portal page. It enables your users to access knowledge articles and catalog items related to a topic displayed on your portal in a Portal Browse Taxonomy widget.

Display topic-related information to your users through cards displayed on your portal page that are defined through the Portal Browse Taxonomy widget. When a topic is selected on a card, your user is automatically redirected to a portal page that is defined when you configure a Portal Browse Taxonomy widget. This widget displays knowledge articles and catalog items related to the selected topic. You can display up to eight topics as cards.

Portal Taxonomy Topic widget

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Add and configure the Portal Taxonomy Topic widget.

Add and configure the Portal Taxonomy Topic widget

Add a Portal Taxonomy Topic widget to your portal to display topics that your users can get more information about and modify its presentation and behavior. Once a topic card is selected, users are redirected to relevant knowledge articles and catalog items configured through the Portal Browse Taxonomy widget.

Before you begin

The UI Components for Customer Portals plugin must have been activated. For more information, see Activate the UI Components for Customer Portals plugin

If you have not already created the page to which you want to add the widget, see Create a page for Configurable Portal widgets.

Role required: admin or sp_admin

Procedure

1. Navigate to the **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. On the Service Portal Designer page, search for and select the page to which you want to add the widget.
4. Select the **Widgets** tab.
5. In the Layouts section, drag the Container layout onto the portal edit page.
6. On the container, add a set of columns by selecting the plus button ( ).
7. On the Widgets pane, in the **Filter Widget** field, enter `Portal Taxonomy Topic`.
8. Drag the widget onto the container.
9. In the Edit page, select the Portal Taxonomy Topic widget.
10. Enable editing the widget by selecting the Pencil icon ( ).
11. On the Instance form, fill in the fields.
    For a description of the field values, see Portal Taxonomy Topic widget instance options form.
12. Select **Save**.

What to do next

Configure a Portal Browse Taxonomy widget to work with the Portal Taxonomy Topic widget

Configure a Portal Browse Taxonomy widget to work with the Portal Taxonomy Topic widget

Enable users to access knowledge articles and catalog items in the Portal Taxonomy widget by selecting a topic on the card in the Portal Taxonomy Topic widget.

Before you begin

You must add and configure the Portal Browse Taxonomy widget before accessing taxonomic topic on the Portal Taxonomy Topic widget. Otherwise, a blank page displays on the Portal Taxonomy Topic widget. For more information, see Add and configure the Portal Browse Taxonomy widget.

You must add and configure the Portal Taxonomy Topic widget in your portal. For more information, see Add and configure the Portal Taxonomy Topic widget.

Role required: admin or sp_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your portal home page, in the website URL, copy the page ID.

```
https://<instance-url>/<portal-id>?id=<page-id>&sys_id=<record-id>
```

2. On you portal home page, press Control+right-click on the Portal Taxonomy Topic widget.
3. Select **Instance Options**.
4. On the Instance options window, in the Behavior section, paste the page ID into the **Browse taxonomy page** field.
5. Select **Save**.

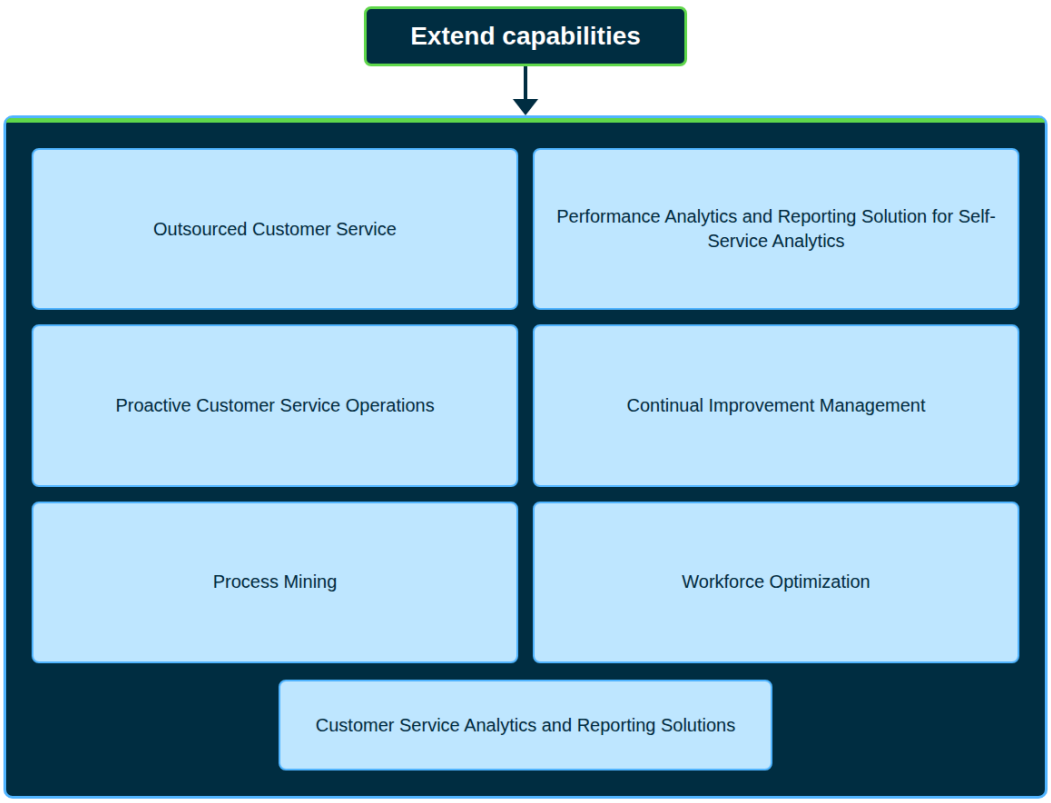
Result

Selecting topics redirects the user to a Portal Browse Taxonomy widget that displays related knowledge articles and catalog items.

Extend capabilities

To extend your Customer Service Management environment, integrate additional applications and features. This enhances functionalities and improves support for more efficient interactions.

Extend capabilities overview



Setting up advanced features

Application or feature	Description
Outsourced Customer Service	Configure Outsourced Customer Service to enable the outsourced company or individuals

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up advanced features (continued)

Application or feature	Description
	to perform tasks, handle operations, or provide services.
Proactive Customer Service Operations	Configure Proactive Customer Service Operations to trigger case workflows and notify customers of any issues to resolve issues faster and lower inbound call volume.
Configure Customer Service Platform Analytics Solutions	Configure Customer Service Platform Analytics Solutions to view preconfigured dashboards with actionable data visualizations to improve your business processes.
Configure the Platform Analytics Solution for Self-Service Analytics for Customer Service	Configure Platform Analytics Solution for Self-Service Analytics to run diagnostics, review and customize components, and start collecting data.
Continual Improvement Management	Request improvement opportunities, and implement phases and tasks to meet performance goals, track progress, and measure success.
Process Mining	Create automated business process flows from your data to help analysts and process owners to analyze and optimize their business processes.
Workforce Optimization for Customer Service	Manage and maintain the productivity of your workforce and efficiently route work to your team, manage your team's skills and schedules, and monitor their performance.

Outsourced Customer Service

Outsourcing is a business practice where an enterprise hires another company or individuals to perform tasks, manage operations, or provide services. These functions were previously handled by the enterprise's own employees.

Outsourced Service Providers (OSPs) are organizations engaged by enterprises to deliver customer service to external customers. These services can address various needs, including regional support, multilingual capabilities, and seasonal demand. Benefits of outsourcing services are as follows:

- Cost savings
- Increase support coverage
- Access to skilled expertise

Plugin

If you have the administrator role, you can activate the Outsourced Customer Service plugin (com.snc.outsourced_service_provider).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Outsourced Customer Service plugin (com.snc.outsourced_service_provider) requires the Customer Service (com.sn_customerservice) plugin to get activated.

The Outsourced Customer Service plugin adds the **Customer Service** > **Outsourced Customer Service** module to the application navigator. If you have the administrator role, you can access this module. The administrator can assign the following roles to users:

- sn_csm_ocs.ext_manager (external OSP manager)
- sn_csm_ocs.ext_agent (external OSP agent)
- sn_csm_ocs.manager (internal OSP manager

Outsourced Customer Service Guided Setup

Activating the Outsourced Service Provider plugin adds the Outsourced Customer Service Guided Setup section. Navigate to **Outsourced Customer Service** > **Guided Setup** and use the tasks in this section to configure Outsourced Service Providers.

Configure various components of Outsourced Customer Service based on the specific requirements of your organization.

Set up Outsourced Customer Service

Configure various aspects of Outsourced Customer Service based on the specific requirements of your organization.

Before you begin
Role required: admin

About this task
There's a sequence of tasks that enable you to configure Outsourced Customer Service. You can perform these tasks based on the plugin you activated. Certain setup tasks apply only if you activated the Outsourced Customer Service plugin and this point is noted at the top of each task. To configure Outsourced Customer Service, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Outsourced Customer Service** > **Guided Setup**.
   The Outsourced Customer Service Guided Setup page is displayed.
2. On the Onboarding Outsourced Service Provider (OSP) window, select **Get Started**.
3. View the list of tasks to configure the feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboarding Outsourced Service Provider configuration tasks

Task	Description
Setup Outsourced Service Provider	Creates an OSP by specifying the internal manager and setting up transfer group. **Note:** Whenever an OSP is set up and mapped, it automatically creates a company record.
Setup Outsourcing Criteria	Defines outsourcing criteria based on account, consumer, asset, and sold product. OSP agents can view all the cases matching the outsourcing criteria. For example, consumer-based criteria can be defined for all Spanish speaking consumers and all consumers based out of Australia.
Onboard Manager	Onboard OSP manager for managing cases and agents. Once onboarding is complete, a password reset email is sent to the manager's email id.
Setup Assignment Groups	Creates a group and associates it to an OSP manager. OSP manager assigns cases to the agents assigned to the group.
Onboard Agent	Onboard agents for an OSP for fulfilling cases. Once onboarding is complete, a password reset email is sent to the agents email id.

4. Go back to the Outsourced Customer Service Guided Setup page.
5. On the Case Routing and Assignment window, click **Get Started**.
6. View the list of tasks to configure the feature.

Case Routing and Assignment configuration tasks

Task	Description
Create Matching Rules	Rules to identify customer service cases that meet certain conditions.
Create Assignment Rules	Cases that meet certain conditions based on the rules created are routed to customer service agents.

7. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Define outsourcing criteria

OSP managers and agents view cases based on the defined outsourced criteria. Defining outsourcing criteria can be based on account, asset, consumer, or sold product. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

consumer-based criteria could be defined for all Spanish speaking consumers and all consumers based out of Australia.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Outsourced Service Providers**.
2. Select the OSP name.
3. Select **Outsourcing Criteria** related list.
4. Select **New**.
5. Fill in the fields on the new record form, as appropriate.
6. Select **Submit**.
   OSP managers and agents can now view assigned cases which meet the condition under **All Cases**, **Unassigned Cases**, **My Cases**, and **Open Cases**. For example, if an OSP organization has been created with outsourcing criteria with the consumer table selected, an agent belonging to this OSP can view cases created by a consumer.

What to do next
Create groups and set assignment rules for the OSPs.

Create groups and assignment rules

An administrator creates groups and associates it to an OSP. This group is the default group to which the case is assigned to when an OSP agent transfers the unresolved case back to an enterprise.

Before you begin
Role required: admin

Procedure

1. Select an OSP you have created.
2. Go to **Groups** related list.
3. Click **New**.
4. Fill in the fields on the Outsourced Service Provider form, as appropriate.
5. Click **Submit**.
6. Click **Group Staff** related list to view the list of members for the selected group.
7. Click **Assignment Rules** related list to define assignment rules.
8. Click **Submit**.

Onboard Outsourced Service Provider staff

An administrator creates Outsourced Service Providers (OSPs) after which OSP managers and agents must be onboarded to manage and fulfill cases. As an administrator you can onboard both the OSP managers and agents.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Outsourced Service Providers**.
2. Select an existing OSP.
3. Select the **Onboard Staff** related link.
4. Fill in the fields on the Outsourced Service Provider form, as appropriate.

   Note:
   A new OSP staff member record is created and the OSP is created in the **Service Organization** field of the service organization external staff [sn_csm_service_organization_external_staff] table. Additionally, the same change applies to other related lists, including Onboard Agent, Onboard Manager, Create Group, Transfer Case, Register Staff, and Register Member.

5. Select **Submit**.
   The onboarded staff records are visible under the **Service Organization Staff** related list.

   Note:
   Once onboarding is complete, a password reset email is sent to the manager's or agent's email address.

Create an Outsourced Service Provider

An enterprise creates Outsourced Service Providers (OSPs) to provide customer service to external customers.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Outsourced Service Providers**.
2. Select **New**.
3. Fill in the fields on the Outsourced Service Provider form, as appropriate.
   The following fields on the company record are automatically updated whenever you update them on the OSP record:
   - **Name**
   - **Street**
   - **City**
   - **State**
   - **Zip/Postal Code**
   - **Country**
   - **Latitude**
   - **Longitude**
   - **Fax phone**
   - **Phone**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Website**
- **Active**

4. Select **Submit**.

What to do next

Define outsourcing criteria so that cases matching the criteria are visible to the OSP managers and agents.

Outsourced Service Provider manager tasks

Configure the Performance Analytics for the Outsourced Customer Service

Run diagnostics, review and customize components, and start collecting data.

Before you begin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

Role required: pa_admin

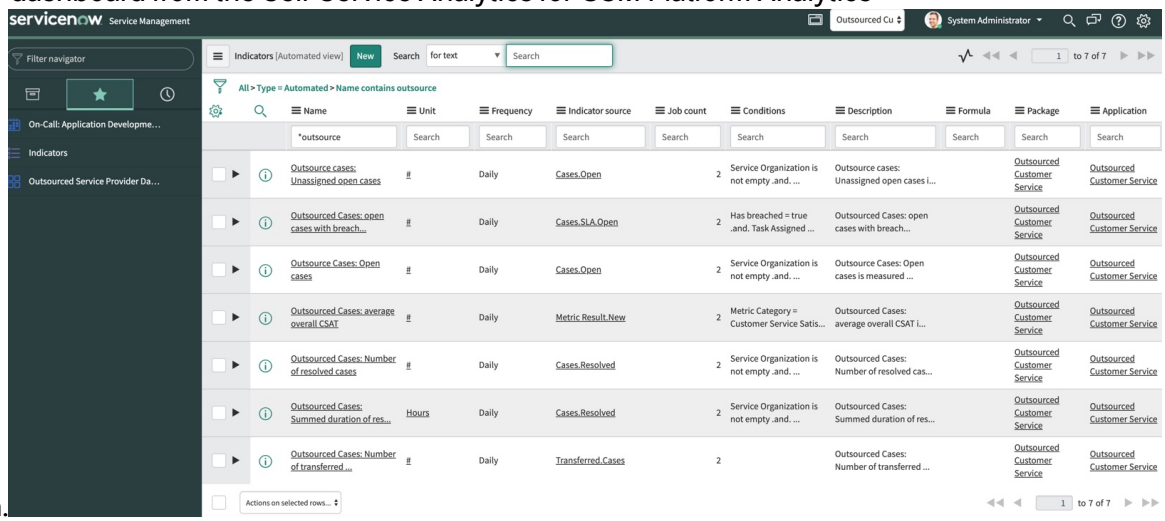
Procedure

1. Run all diagnostics on all records, as described in Performance Analytics diagnostics. These diagnostics can catch many mismatches between the configuration of your Platform Analytics Solutions and your tables.
2. Navigate to **Performance Analytics** > **Administration Console**.
3. Click the **Dashboards** link in the **Explore and Manage** tile.
4. Verify the names of the dashboards that have been installed with this Platform Analytics Solution
5. Open the **Indicator Sources** tab.
6. For each dashboard included in this Platform Analytics Solution:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Filter the indicator sources on the dashboard name.

Example
This screenshot shows the indicator sources filtered on the Outsourced Service Provider dashboard from the Self-Service Analytics for CSM Platform Analytics Solution.



b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

c. If necessary, open an indicator source and make corrections.

d. If you are editing an indicator source record, go to the Indicators related list and review the **Conditions** field for each indicator.
Changing the indicator source can also affect the additional conditions on the individual indicators.

7. If you changed the time field stamps in any indicator sources, also change any related Performance Analytics scripts.
8. Open the Breakdown Sources tab.
9. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
10. Navigate to **Performance Analytics** > **Jobs**.
11. Set up and run the historical job for this Platform Analytics Solution, <name of historical job>.
12. Edit and activate the scheduled data collection job for this Platform Analytics Solution, <name of scheduled job>

Outsourced Service Provider dashboard

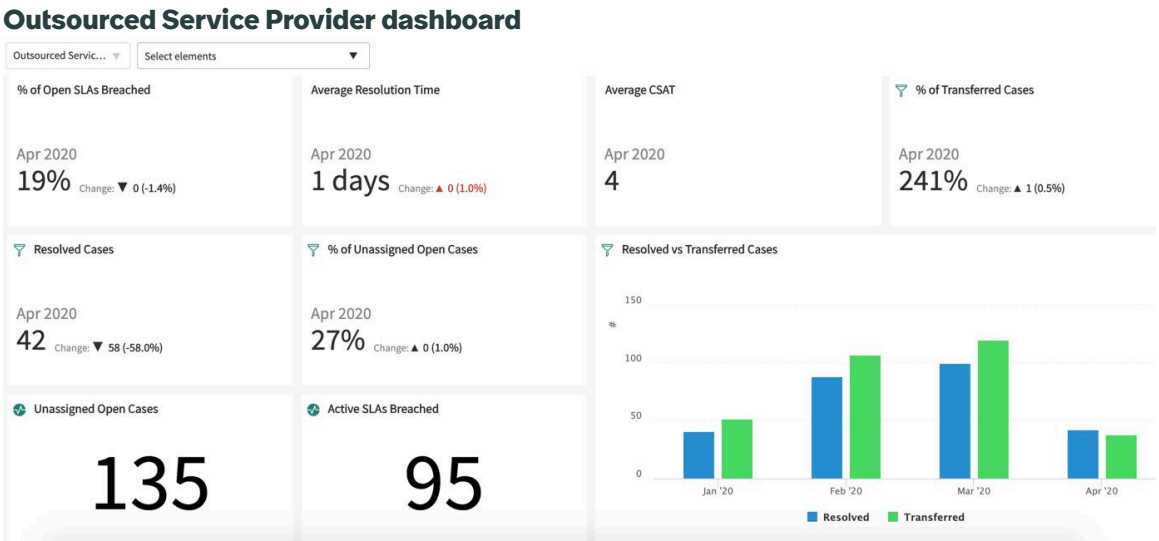
The Outsourced Service Provider dashboard enables monitoring of breached service-level agreements (SLAs), average resolution time, and case transfer percentages, among other metrics. You can utilize the insights to identify the areas of concern and to plan your case management strategy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Starting with the Xanadu release, the Outsourced Service Provider dashboard has a new, modernized look and feel.

To access the new Outsourced Service Provider dashboard, navigate to **All** > **Outsourced Customer Service** > **Analytics**, and select the outsourced service provider (OSP) name. Existing customers upgrading from earlier releases to the Xanadu release can also access the new Outsourced Service Provider dashboard.

However, existing customers on release versions prior to the Xanadu release can still view the old Outsourced Service Provider dashboard by navigating to **All** > **Outsourced Customer Service** > **Overview**.



End user and roles

End user and goal	Required role
Internal OSP Manager	sn_csm_ocs.manager

Indicators

Outsource cases: Unassigned open cases

The number of open cases that are unassigned to the OSP agents.

Outsourced cases: open cases with breached SLAs

The number of cases that have remained open past the time required by the Service Level Agreement (SLA).

Outsource cases: open cases

The number of cases that are in the open state.

Outsourced cases: Average overall CSAT

Average customer satisfaction (CSAT) based on survey results. For more information about CSAT, see Customer service satisfaction surveys.

Outsourced cases: Number of resolved cases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The number of cases that the OSP agent has worked on and moved to resolved state.

Outsourced cases: Summed duration of resolved cases

The total time taken by the OSP agents to resolve the cases.

Outsourced cases: Number of transferred cases

Number of cases that are transferred to an internal ServiceNow agent when an OSP agent couldn't resolve the case.

Global filter

The Outsourced Service Provider dashboard utilizes the outsourced service providers as global filters. You can select one or more outsourced service providers to view different metrics and reports. By default, the dashboard displays data from all outsourced service providers.

Reports

Title	Type	Description
Unassigned Open Cases	42	The number of cases that are in the open state and isn't yet assigned to an OSP agent. In this report, for example, there are 42 cases that are yet to be assigned. The OSP manager views the number of such cases at a glance and assigns them.
Active SLAs Breached	42	This report shows all breached SLAs that are still active In this report, for example, there are 42 such active SLAs. The OSP manager views the number of breached SLAs at a glance, which helps in taking immediate action.

Configure Proactive Customer Service Operations

Configure various aspects of Proactive Customer Service Operations based on the specific requirements of your organization.

Before you begin

Role required: admin

About this task

There are a sequence of tasks that enable you to configure Proactive Customer Service Operations. You can perform these tasks based on which plugin or application you have installed. This is noted at the top of each task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To use integration with Event Management, install the Proactive Customer Service Operations with Event Management plugin and the Event Management application from the ServiceNow store.

Event Management integration is only available if you are using the CSM Agent Workspace or the ServiceNow AI Platform interface.

To configure Proactive Customer Service Operations, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**
3. In the Proactive Customer Service Operations category, view the list of tasks to configure the feature.

Proactive Customer Service Operations configuration tasks

Task	Description
Activate Proactive Customer Service Operations plugin (com.snc.proactive_cs_ops). **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activate the Proactive Customer Service plugin to use Proactive Customer Service Operations.
Activate Proactive Customer Service Operations with Event Management plugin (com.snc.proactive_cs_itom). **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activate the Proactive Customer Service Operations with Event Management plugin to enable integration with Event Management. This plugin automatically installs the Proactive Customer Service Operations plugin.
Install the Event Management application.	Install the Event Management application from the ServiceNow store.
Configure form views	Configure the form layout and related lists for the different views of the Case, Install Base Item, and Account forms to display the fields you require.
Activate an alert rule to automatically create a proactive case from an alert	Configure an alert rule to automatically create a proactive case when an incident is created from an alert that has one or more affected install base items. **Note:** This task is only applicable if you are using the integration with Event Management.

Proactive Customer Service Operations

Proactively trigger case workflows and notify customers of any issues to resolve issues faster and lower inbound call volume.

Proactive Customer Service Operations enables you to track the digital services sold to and in use by your customers. This is referred to as install base.

If you identify any service disruptions to a customer's install base, you can proactively create a case to notify them.

These cases are resolved and closed in the same way as customer-reported cases. When multiple customers are affected, you can use the major issue management process.

You can also associate outage information to a case to keep your customers informed about the impact of the outage and the status of the resolution. It also gives customers visibility into planned service disruptions, enhancing transparency and reducing the number of customer-reported cases.

Your customers can use the Customer Service Portal to view proactive cases that you opened on their behalf, any outages associated with their install base, and interact with you using the proactive case.

The Proactive Customer Service Operations plugin (com.snc.proactive_cs_itom) provides an integration between Customer Service Management and the Event Management console in IT Operations Management. For more information, see Integration with Event Management.

Before you begin

Meet with your stakeholders to define your requirements. Depending on your requirements, you can activate either the Proactive Customer Service Operations plugin or the Proactive Customer Services with Event Management plugin.

© 2026 ServiceNow, Inc. All rights reserved.

Configure Install base

Outage tracking for install base

Provide visibility into any current or upcoming outages affecting a customer's install base, enhancing transparency and reducing the number of customer-reported cases.

Outage definition

An outage refers to a time period that a service delivering value to a customer is unavailable or experiencing performance issues.

A customer can experience the following types of outages:

- Unplanned outage: Outages such as those caused by hardware or network issues.
- Planned outage: Outages caused by planned maintenance or upgrades.
- Degradation: Problems affecting a service that does not result in a disruption of that service.

Outage tracking overview

Proactively inform customers about planned or unplanned service disruptions by associating outages with a case. In doing so, your customers are aware of the impact of the outage and have visibility into the resolution status. They can then use this information to assess the business impact of different outage types over a period and calculate any charge backs, if necessary.

Outages are typically created automatically when an alert is created for a service or by service fulfillers when working on an incident.

An outage specifies the outage type, impacted service as well as the begin and end time. Multiple services used by a customer can be associated with an outage.

Roles

As a major issue manager or customer service manager, you can create, associate, and track all outages related to a case. Customer service managers can also view reports of business impact by outage type.

As a customer service agent, you can view any outages associated with the case.

Your customers can view outage information on the Customer Service Portal.

Integration with Event Management

Create cases proactively from alerts either manually or through automation. Track the accounts and health status of the corresponding install base items affected by the alert to better correlate customer issues and provide faster responses.

Customer Service Management provides an integration with the Event Management console in IT Operations Management, which enables you to improve the customer experience by breaking down the silos that exist between the processes and systems used by front line customer service and back-office operations teams. By monitoring issues and creating cases proactively, you can be one step ahead of your customers and solve issues faster.

Network Operations Center (NOC) operators monitor alerts from the Service Operations Workspace. For more information, see Monitor service health.

When alerted to a service disruption, they can identify the accounts and corresponding install base items affected and create a case for customer service to review. Customer service can view the customers affected and notify#hem.

Customer service agents and managers can also track the service health status of install base items for an account to provide faster and more accurate support to customers.

Activation information

To enable Proactive Customer Service Operations with Event Management, activate the Proactive Customer Service with Event Management plugin (com.snc.proactive_cs_itom).

Service health status for install base

View the real-time health status of a customer's install base. Correlate customer issues with the operational health of their install base to provide more informed responses to your customers.

Service health tracking overview

The integration between Customer Service Management and the Event Management console in IT Operations Management enables you to track the service health status of a customer's install base.

When an issue affects one or more install base items and an alert is created, the severity of the alert is calculated in Event Management. It is calculated according to alert impact calculation rules. Based on the severity of the alert, the service health status of each install base item is calculated. Customer service agents can view the service health status of install base items in an account or a case in Customer Service Management.

For more information about how the severity of an alert is calculated, see Alert impact calculation.

To provide the service health status for an install base item in Customer Service Management, the following fields are mapped.

Event management fields for calculating alerts

Event Management (em_impact_status table)	Customer Service Management (sn_install_base_item table)
Business Service	Service Context
Element Identifier	Configuration Item
Severity	Health Status

Note:
The service health status is displayed only if the install base item has both a Configuration Item (CI) and a service context associated with it. Service context is the application service associated with the underlying CI for impact calculation in Event Management. For more information about application services, see Lesson 2 of the Event Management operator guide.

The service health status is displayed in Customer Service Management as follows.

Health status alerts

Severity of alert (Event Management)	Service health status on Account and Case forms (Customer Service Management)
Critical	Critical: Resource is either not functional or critical problems are imminent.
Major	Major: Major functionality is severely impaired or performance has degraded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health status alerts (continued)

Severity of alert (Event Management)	Service health status on Account and Case forms (Customer Service Management)
Minor	Minor: Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Warning: Attention is required, even though the resource is still functional.
Info	Normal: No severity. An alert is created. The resource is still functional.
Clear	Normal
Empty/Null	Not Available

For more information about alert severity, see Lesson 1 of the Event Management operator guide.

Roles

As a system administrator, configure form views to add the **Service Context**, **Health Status**, and **Health Status Last Updated** fields to the relevant forms.

As a customer service agent, view the service health status of install base items on the Account or Case form.

Activation information

This feature requires the Proactive Customer Service Operations with Event Management plugin (com.snc.proactive_cs_itom).

Activate Proactive Customer Service Operations

Activate the Proactive Customer Service plugin to use Proactive Customer Service Operations.

Before you begin

Role required: admin

About this task

Proactive Customer Service Operations is only available for customers who are licensed for the Customer Service Management application.

To activate Proactive Customer Service Operations, activate the Proactive Customer Service Operations Management plugin (com.snc.proactive_cs_ops). This plugin is not active by default.

Note:
This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activating this plugin also installs the Major Issue Management, Customer Service Install Base Management, Customer Service with Service Management, Customer Service Case Action Status, and Task-Outage Relationship plugins.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the plugin com.snc.proactive_cs_ops.
3. Click **Activate**.

Activate Proactive Customer Service Operations with Event Management

Activate the Proactive Customer Service Operations with Event Management plugin to use Proactive Customer Service Operations with Event Management.

Before you begin
Role required: admin

About this task
Proactive Customer Service Operations with Event Management is only available for customers who are licensed for the Customer Service Management application.

To activate Proactive Customer Service Operations with Event Management, activate the Proactive Customer Service with Event Management plugin (com.snc.proactive_cs_itom). This plugin is not active by default.

> **Note:**
> This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.

Activating this plugin also activates the Proactive Customer Service Operations (com.snc.proactive_cs_ops) and Event Management (com.glideapp.itom.snac) plugins.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the plugin com.snc.proactive_cs_itom.
3. Click **Activate**.

Configure form views for Proactive Customer Service Operations

Configure the form layout and related lists for the different views of the Case, Install Base Item, and Account forms to display the fields you require.

Before you begin
Role required: admin

Certain fields on the forms can only be added if you have activated the Proactive Customer Service Operations with Event Management plugin. This is noted in the following table.

Procedure

1. Navigate to **Customer Service**.
2. Add the following fields to forms and related lists, as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure form views

Form	Procedure
Case	**a.** Click **Cases** > **Proactive**. **b.** Add the **Proactive** field to the **Proactive Case** and **Workspace** view, and other views as required: ▪ **Proactive** ▪ **Alert** **Note:** The **Alert** field is only available if you have activated the Proactive Customer Service Operations with Event Management plugin. **c.** **Note:** This only applies if you have activated the Proactive Customer Service Operations with Event Management plugin. Add the following fields to the **Affected Install Base Items** related list, **Proactive Case** and **Workspace** view, and other views as required. ▪ **Health Status** ▪ **Health Status Last Updated**
Account	**Note:** This only applies if you have activated the Proactive Customer Service Operations with Event Management plugin. **a.** Click **Customer** > **Accounts**. **b.** Add the following fields to the **Install Base Items**related list for the **Case** and **Workspace** views, and other views as required. ○ **Health Status** ○ **Health Last Updated**
Install Base Item	**Note:** This only applies if you have activated the Proactive Customer Service Operations with Event Management plugin. **a.** Click **Products** > **Install Base Items**. **b.** Add the **Service Context** field to the **Default** and **Workspace** views.

Activate an alert rule to automatically create a proactive case from an alert

Configure an alert rule to automatically create a proactive case when an incident is created from an alert that has one or more affected install base items.

Before you begin
Role required: evt_mgmt_admin

About this task

Note:
This task is only applicable if you are using the integration with Event Management.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management**.
2. Click **Create Proactive Case**.
3. Select the **Active** check box.
4. Click **Update**.
   When an incident is created from an alert that contains affected install base items, a case is automatically created. The case number is added to the **Case** field on the Alert form.

Configure proactive case flows

Automate workflows for proactive case creation to improve your operational efficiency and respond to customer issues faster.

Before you begin
Role required: admin

About this task

Note:
This task is only applicable if you are using the integration with Event Management.

Configure the flow designer to automate the next steps in processing a proactive case. You can automate that a proactive case is proposed to a major case or is directly promoted to a major case. If promoted directly to a major case, child cases are automatically created when multiple customers are impacted.

If a single account is affected, you can also automate that an account and primary contact are associated to a case.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Proactive Case Flows**.
2. Click the **Process Proactive Cases Created from Alerts** flow.
3. Click the **Process Proactive Cases for Single and Multiple Accounts** subflow.
4. In the **Major Case Status** field, set the initial status of the major case for multiple accounts. By default, this field is set to **None**. Based on your selection, the proactive case is either **Proposed**, **Accepted**, or **None**. If you set the status to **Accepted**, child cases are created automatically.
5. In the **Affected Account Threshold** field, enter the number of affected accounts required for a proactive case to be eligible for major case processing.
   The default is two.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the **Process Case for Single Account** check box to associate an account and primary contact to the case if a single account is affected.
   This also applies if multiple install base items from the same account are affected.
7. Click **Done**.

Configure Customer Service Platform Analytics Solutions

Enable Customer Service Platform Analytics Solutions to view preconfigured dashboards with actionable data visualizations to improve your business processes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Performance Analytics** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Customer Service category, view the list of tasks to configure the feature.

Performance Analytics for configuration tasks

Task	Description
Activate Performance Analytics for Customer Service Management	Activate the Performance Analytics - Content Pack - Customer Service (com.snc.pa.customer_service) plugin to add Performance Analytics configuration records to your instance.
Review Indicator Sources	Review the provided indicator sources to ensure they match your Customer Service application table structure.
Review Indicators	Review the provided indicators to ensure that the metrics you want to measure are tracked.
Review Breakdown Sources	Review the provided breakdown sources to ensure they match your table structure and include the elements you want.
Review Breakdowns	Review breakdowns to ensure that you can filter scores by the appropriate elements.
Collect Data	Run historical data collection once to collect scores on existing data, and enable scheduled data collection to begin collecting scores on new data automatically.
View Analytics Hub	View the Analytics Hub for indicators that you collected data for to begin exploring your scores.
View Dashboards	View the provided dashboards to get an overview of your scores and view multiple metrics in a single location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Configure the Platform Analytics Solution for Self-Service Analytics for Customer Service

Run diagnostics, review and customize components, and start collecting data.

Before you begin

Role required: pa_admin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

Procedure

1. Run all diagnostics on all records, as described in Performance Analytics diagnostics. These diagnostics can catch mismatches between the configuration of your Platform Analytics Solutions and your tables.
2. Navigate to **Performance Analytics** > **Admin Console**.
3. Click the **Dashboards** link in the **Explore and Manage** tile.
4. Verify the names of the dashboards that have been installed with the Self-Service Analytics Platform Analytics Solution.
5. Open the **Indicator Sources** tab.
6. For each dashboard included in this Platform Analytics Solution:

   a. Filter the indicator sources on the dashboard name.

   Example

   This screenshot shows the indicator sources filtered on the Self-Service Analytics dashboard from the Self Service Analytics for Customer Service Platform Analytics Solution.

   b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Important:**
> Pay particular attention to time stamp fields such as Resolved or Created that are referenced in the **Conditions** field. You may need to use different time stamp fields.

c. If necessary, open an indicator source and make corrections.

d. If you are editing an indicator source record, go to the Indicators related list and review the **Conditions** field for each indicator.
Changing the indicator source can also affect the additional conditions on the individual indicators.

7. If you changed the time field stamps in any indicator sources, also change any related Performance Analytics scripts.
8. Open the Breakdown Sources tab.
9. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
   b. Review the conditions on the breakdown source.
10. Navigate to **Performance Analytics** > **Jobs**.
11. Set up and run the historical job for this Platform Analytics Solution, [SSA] Self-Service Analytics Data Collection.
12. Edit and activate the scheduled data collection job for this Platform Analytics Solution, [SSA] Self-Service Analytics Data Collection.

Platform Analytics Solutions for Self-Service Analytics for Customer Service

Self-Service Analytics

Activate the Self-Service Platform Analytics Solution

Activate the content pack plugins or ServiceNow Store application for the Platform Analytics Solution.

Before you begin

Activate the full, subscription version of Performance Analytics on the instance where you are activating this Platform Analytics Solution. You can activate Performance Analytics on a sub-production instance without purchasing a subscription. For more information, see Activate your Performance Analytics subscription.

> **Note:**
> The data for the Communities and Virtual Agent tabs on the Self-Service Analytics dashboard are generated when the Communities plugin (com.sn_communities) and Glide Virtual Agent plugin (com.glide.cs.chatbot) are activated respectively.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for Self-Service Analytics for Customer Service plugin (com.snc.pa.self_service_analytics_csm).
3. Install the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you install this application, you also activate the following plugins:

- Customer Service (com.sn_customerservice)
- Self-Service Analytics PA (com.snc.pa.self_service_analytics)
- Self-Service Analytics Core (com.snc.self-service_analytics_core)

Features and applications for administering Customer Service Management (continued)

Feature or application	Description
	agents,evaluate skills and availability, and assign tasks efficiently and intelligently.
Special handling notes	Use the Special Handling Notes application to create notes that bring important information about individual records to the user's attention.
Case and account escalation	Use the escalation feature to highlight specific cases or accounts and raise awareness of important customer issues.
Administering case action status	Use the case action status feature to indicate the status of cases in the Case list. Agents can easily identify cases that need attention and quickly prioritize their work.
Major issue management overview	Major issue management enables customer communication for issues that impact a wider audience. Use this feature to proactively identify impacted customers, provide information to these customers, and manage the resolution process.
Automatically close customer service cases	Automatically close cases in the Resolved state if customers do not take any action.
Administer Customer Contracts and Entitlements	Customer service managers can perform tasks to maintain service contracts, contract lines, and entitlements.

Anonymous chat

Consumers can chat with a consumer service agent without logging in to the Consumer Service Portal.

From the Consumer Service Portal, guest users can click the **Chat** link in the portal header to initiate a chat session with a consumer service agent. Clicking this link opens a form that requests some basic information, including the user's name, email address, and type of issue. Completing and submitting the form creates a chat request that is routed to the appropriate agent queue based on the selected issue type. Once the assigned agent accepts the request, a chat session is established. If necessary, the agent can create a consumer record or a case for the guest user, or transfer the chat to another agent.

Setting up anonymous chat

Setting up the anonymous chat feature involves the following steps.

1. Activate the Consumer Service Portal plugin (com.glide.service-portal.consumer-portal).
2. Modify the default anonymous chat record producer or create a new record producer.
3. Create one matching rule for each agent queue.
4. Configure anonymous chat properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. If necessary, modify the Connect actions to provide the desired functionality for consumer service agents in chat conversations. The anonymous chat feature includes these actions: **Create Case for Guest** and **Create Consumer and Case for Guest**. For more information, see Administer Connect actions.

Anonymous chat plugins

The anonymous chat feature requires two plugins which are activated as part of the Consumer Service Portal plugin:

- Anonymous Connect Support (com.glide.connect.anonymous_support): enables the anonymous chat feature for Connect.
- Connect Support Routing (com.glide.connect.support.routing): routes Connect Support requests to the appropriate chat queue.

Anonymous chat record producer

The form used to request information from a guest user is a configurable record producer based on the Consumer Interaction table (sn_customerservice_customer_interaction), which is a new table in the Istanbul release. When a guest user submits the form, the information provided is stored as a record in the Customer Interaction table. This record is used for routing the chat request.

The default anonymous chat record producer, **What can we help you with?**, is located at **Service Catalog** > **Catalog Definition** > **Record Producers**. This is a public record producer. You can modify this record producer or create your own. If you choose to create your own, see Section 3 in the Making a record producer and catalog item public on a CMS page [KB0551300] article. You must also set the *glide.sc.use_user_criteria* property to **false**.

For more information, see Record Producer.

Anonymous chat routing

Information provided by the guest user assists with routing and also provides the context of the request to the consumer service agent. The chat request is routed to the appropriate agent queue based on the type of issue selected. The routing for anonymous chat requests uses matching rules. Create one matching rule for each queue and tie a chat request to a chat queue based on the selected issue type. Matching rules for anonymous chat are based on the Customer Interaction table.

The following matching rules are provided:

- Anonymous Connect - Billing Support
- Anonymous Connect - Order Support
- Anonymous Connect - Product Support

These rules are based on the selections in the **Issue Type** field on the default anonymous chat record producer.

Anonymous chat properties

There are two properties related to the anonymous chat feature. Set these properties to limit the number of chat requests created by guest users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of Anonymous chat

Property	Description
connect.support.max_guest_sessions_per_hour	Limit maximum number of guest conversations created in the last hour. • Type: integer • Default value: 200 • Location: **Collaborate** > **Connect Support** > **Support Administration** > **Properties**
connect.support.guest_sessions_rate_limit_reached_message	Message shown to user when rate limit for guest conversations is breached. • Type: string • Default value: Guest Chat is currently not available, please retry later. • Location: **Collaborate** > **Connect Support** > **Support Administration** > **Properties**

Record Producer

Connect Support

Routing and assigning customer service cases

Modify the anonymous chat record producer

Modify the default anonymous chat record producer to gather the desired information from guest users.

Before you begin

Role required: admin

About this task

This record producer requests information from a guest user on the Consumer Service Portal and stores the information as a record in the Consumer Interaction table (sn_customerservice_customer_interaction). The record is then used for routing the chat request.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Record Producers**.
2. Click **What can we help you with?**.
3. Modify the record producer as necessary, including the variables in the **Variables** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Create a record producer to log incidents.

4. Click **Update**.

Create a matching rule for anonymous chat

Create one matching rule for each agent queue.

Before you begin
Role required: admin

About this task
A chat request is tied to a chat queue based on the selected issue type.

Procedure

1. Navigate to **All** > **Routing and Assignment** > **Matching Rules**.
2. Click **New**.
3. Enter a **Name** for the matching rule.
4. In the **Table** field, select **Customer Interaction**.
5. In the **Conditions** field, use the condition builder to create the following conditions.

Create conditions with condition builder

Field	Operator	Value
Channel	is	Chat
Category	is	Select one of the categories created for anonymous users to define an issue on the record producer: ○ Product Issue ○ Billing Issue ○ Order Issue

6. Click **Submit**.

Configure anonymous chat properties

Users with the system administrator role can set properties to limit the number of chat requests created by guest users.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Collaborate** > **Connect Support** > **Support Administration** > **Properties**.
2. Set the following properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Limit maximum number of guest conversations created in the last hour. (*connect.support.max_guest_sessions_per_hour*)	Limits the number of guest chat requests that can be created in a one-hour time frame. The default value is 200.
Message shown to user when rate limit for guest conversations is breached. (*connect.support.guest_sessions_rate_limit_reached_message*)	The message that is displayed on the Consumer Service Portal when the limit on the number of guest chat requests has been reached.

3. Click **Save**.

Respond to an anonymous chat request

Select a chat request from the chat queue and respond to a guest user's question or comment.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

Procedure

1. Navigate to **All** > **Collaborate** > **Connect Chat**.
   The Connect workspace opens in a new tab.
2. Click the support tab of the Connect sidebar, indicated by a headset icon.
   The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a consumer starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue has the option to accept the conversation. An agent can also request to transfer a conversation directly to you.
3. Accept a conversation in one of the following ways.
   - Accept a conversation from a queue
   - Accept a transfer request
4. Respond to the guest user and help resolve the issue.
   By default, your messages are added to the conversation record as comments and are visible to the user.

What to do next

If necessary, you can create a consumer record for a guest user and create a consumer service case from the conversation to track the issue. You can also transfer the conversation to a different agent or queue, or escalate the conversation to a higher priority queue. For more information, see Connect Support.

Customer Service Management Workflow Studio actions

Use Workflow Studio actions as building blocks to create Customer Service Management business processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Workflow Studio actions

Action	Description
Get Case	Retrieve a case record using the case number. If multiple records are found, only the first record is returned.
Create Case	Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes all of the fields present on the Case table.
Create Quick Case	Create a case using the customer, description, channel, priority, and category attributes.
Create Task on Case	Create a case task and optionally associate it with a case.
Update Case	Update a case by providing the case reference and the fields that you want to update.
Assign Case	Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).
Escalate Case	Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.
Escalate Account	Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.
Add Work Note to Task	Add a work note to a task or to task extended objects (for example, a case or case task).
Add Comment to Task	Add a comment to a task or to task extended objects (for example, a case or case task).

Domain separation and Customer Service Management

Domain separation is supported in Customer Service Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation for Customer Service Management is designed for:

- **Customers using the application in a domain-separated environment or in a hybrid environment**. With domain separation, a customer can grant access to end users (contacts or consumers) to other entities in addition to customer service cases. For example, contacts or consumers can access problems, changes, or projects. Administrators can synchronize the CSM account model with the domain structure and maintain data separation for entities that don't have account-based data separation enabled.
- **Managed service providers (MSPs) using the application to provide customer support**. In this scenario, an MSP can provide support to multiple customers, where domains are necessary to contain all relevant customer data and processes. For example, an MSP providing support to customers related to billing questions, contract renewals, or other non-service operations.
- **Managed service providers offering the application as a service that customers can provide to their customers**. In this scenario, an MSP can offer Customer Service Management as a service to customers who, in turn, use the application to support their end customers. This scenario requires additional configuration due to domain support for some of the core entities in the platform such as Product Model.

How domain separation works in Customer Service Management

Domain separation for Customer Service Management aligns each customer account to one domain. To use domain separation with the application, all customer accounts must be assigned to a domain.

The customer account is the main entity within Customer Service Management. All entities related to the account, such as contacts and cases, are created in the same domain as the account. This rule also applies for all entities on customer service cases, including addresses, assets, and contacts.

When a new account is created, a domain of the same name is also created and assigned to the account. All related entities for an account, such as contacts and cases, must reside in the same domain. When a related entity for a domain-separated account is created, the entity is assigned to the account domain.

Setting up domain separation for Customer Service Management

Domain separation for Customer Service Management requires the domain separation plugin. Contact ServiceNow to activate domain separation.

Domain separation for Customer Service Management also requires enabling the **csm_auto_account_domain_generation** property. This property is installed with Customer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Management and is available only after the domain separation plugin is active. Contact ServiceNow to enable this property.

When the **csm_auto_account_domain_generation** property is enabled, the Customer Service Management application automatically creates a domain of the same name when a new account is created.

Note:
Enabling the **csm_auto_account_domain_generation** property doesn't add domains for existing accounts. It only creates domains for newly created accounts. Adding domains for existing accounts requires a migration script. You can request for the migration script from the ServiceNow Professional Services team.

Changes to Customer Service Management tables

Domain separation for Customer Service Management adds the **Domain** and **Domain Path** fields to the Account [customer_account] table. These fields aren't exposed by default. Customers can customize lists and forms to view these fields.

Account domains and related entities

When creating related entities for an account, the domain for the related entities is set to the account domain. Related entities include:

- Contacts
- Cases
- Assets
- Contracts
- Entitlements
- Addresses
- Social profiles
- Escalations
- Sold Products
- Installed Products
- Install Base Items
- Affected Install Base Items
- Sold Product Covered

Changing the domain for an account also changes the domain for all the account's related entities.

Domain visibility for customer service agents and managers

Users with the customer service agent (sn_customerservice_agent) and customer service manager (sn_customerservice_manager) roles must be manually assigned to the **TOP/MSP/Default** domain. Agents and managers can't see case or account details until they're assigned to the **TOP** domain.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation for case and account escalation

Escalation template records and escalation severity records are domain separated. By default, these records reside in the global domain. Users can configure the Escalation Template and Escalation Severity forms to display the **Domain** field and set the domain as needed.

When an escalation record is created from a case or account, it's created in the account domain.

Domain separation for ribbon configuration, Lookup and Verify configuration, and Special Handling Notes

Ribbon and Lookup Verify configurations and Special Handling Notes support domain separation as process-separated tables.

When inserting or updating a record for process-separated tables, the picker domain scope takes precedence by design with the Overrides [sys_override] field on process-separated tables. For more information, see Process administration.

Domain separation for service providers

Domain separation and entity relationships

With domain separation in Customer Service Management, you can further control visibility and access to data by using contact, partner, and parent-child relationships.

Partner-customer account relationships

In partner-customer account relationships, the partner account can see data in the customer account's domain. When setting up an account relationship, the domain visibility direction is **From > To**. The account in the **From** field contains the domain of the account in the **To** field.

When a partner admin creates a case for a customer account, the case is created in the customer account's domain so that all relevant parties can access the case.

In partner-customer account relationships where the customer account has child relationships, the partner admin can create a case for the customer account but not for the child accounts. The partner admin can only create cases for the account with which the relationship has been established.

Contact relationships

In contact relationships, the contact included in the relationship can see data for the specified account domain.

Parent-child relationships

The account hierarchy feature creates a parent-child relationship between accounts. This relationship is defined by selecting the parent in the **Parent Account** field on the Account form for the child account. Domain hierarchy is also achieved using the **Parent Account** field. In parent-child account relationships, parent domains can see data in child domains.

To provide access from the child account to the parent account, you need to set domain visibility. Navigate to the child account and set visibility in the Visibility Domains related list (sys_user_visibility) by connecting the user to the domain.

Extension points in Customer Service Management

Use extension points to call custom scripts in the Customer Service Management application.

To access the available extension points, type **sys_extension_point.list** in the application navigator and press **Enter**. Click the desired extension point to view the record details.

You can create multiple implementations for each extension point and provide an order number for each implementation. The implementation that has the lowest order number is the implementation that is executed.

Customer Service Management extension points

Extension point	Description
sn_customerservice.CSMService	Defines the default value logic for case objects. Available with the Customer Service (com.sn_customerservice) plugin.
sn_customerservice.CSMCaseSync	Use this extension point to customize the logic for parent-child case synchronization. This extension point can be used in one of two ways: • Define the conditions for parent case records that can be considered for synchronization to child cases. The default functionality is based on the **sn_customerservice.parent_child_case_sync** system property. Customers can add additional conditions using this extension point. • Customize the logic for parent-child case synchronization based on the state of the child case. By default, if the child case is in the **Resolved**, **Closed**, or **Cancelled** state, there is no sync from the parent case. This extension point is used by the *CSCaseSyncHelper* script include and is available with the Customer Service (com.sn_customerservice) plugin. **Note:** In the base system, parent-child case synchronization is available only for the Case table (sn_customerservice_case). This feature must be configured for tables that extend the Case table.
sn_majorissue_mgt.MajorCase	Available with the Major Issue Management (com.sn_majorissue_mgt) plugin.

© 2026 ServiceNow, Inc. All rights reserved.

Customer Service Management extension points (continued)

Extension point	Description
sn_action_status.NeedsAttentionActionStatus	Create a switch application to choose the user roles that can enable and disable the **Needs Attention** field on a case form. Available with the Customer Service Case Action Status plugin (com.snc.csm_action_status).
sn_cs_sm.CSMChangeIntegrations	Creates the logic for mapping the **Change Request** field on the case record. Available with the Customer Service with Service Management (com.sn_cs_sm) plugin.
sn_cs_sm.CSMIncidentIntegrations	Creates the logic for mapping the **Incident** field on the case record. Available with the Customer Service with Service Management (com.sn_cs_sm) plugin.
sn_cs_sm.CSMProblemIntegrations	Creates the logic for mapping the **Problem** field on the case record. Available with the Customer Service with Service Management (com.sn_cs_sm) plugin.
sn_cs_sm_request.CSMRequestIntegrations	Creates the logic for mapping the **Request** field on the case record. Available with the Customer Service with Request Management (com.sn_cs_sm_request) plugin.
global.CSMRelationshipServiceEP	Create CSM relationships with responsibilities. Available with the Customer Service (com.sn_customerservice) plugin.
global.CSMContentAccessEP	Creates the logic to implement ACLs for create, read, update, and delete (CRUD) operations. Available with the Customer Service (com.sn_customerservice) plugin.
AddressMgmtExtensionPoint	Enables users to customize the reference qualifiers of the location field in the Account Address table. Allows users to create an implementation of this extension point and override the “getAccountLocationsRefQual” function.

Knowledge product entitlements

The Knowledge Product Entitlements application enables administrators to designate the knowledge bases and knowledge articles that customers can view from the Customer Service Portal.

Limit access on the Customer Service Portal to the following:

- The knowledge bases and articles for the products that a customer's company has purchased.
- The knowledge bases and articles for which a customer's company has entitlements.

The Knowledge Product Entitlements plugin (com.snc.kb_product_entitlements) must be activated to use this application. Installing this plugin adds the **Related Products** field to the Knowledge Base form and to the Knowledge form. The knowledge information available on the customer portal is limited to the products selected in this field.

Additional controls are available by enabling properties that allow you to:

- Limit access to knowledge bases based on product entitlements.
- Enable access if no products are specified in the **Related Products** fields.

Add a related product to a knowledge base or knowledge article

Add a product to a knowledge base or knowledge article using the **Related Products** field on the corresponding form.

Before you begin

Role required: admin

About this task

To access knowledge bases and articles associated with a product, a user must have read or contribute access and have the product included in the user's account as an asset. For more information about assets, see Configure assets.

Procedure

1. To add a related product to a knowledge base:
   a. Navigate to **Knowledge** > **Administration** > **Knowledge Bases**.
   b. Select the desired knowledge base.
   c. Add one or more products in the **Related Products** field.
   d. Select **Update**.
2. To add a related product to a knowledge article:
   a. Navigate to **Knowledge** > **Articles** > **All**.
   b. Select the desired knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add one or more products in the **Affected Products** related list.

d. Select **Update**.

Set knowledge product entitlement properties

Set various properties to allow customers to access knowledge bases and knowledge articles on the Customer Service Portal.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Knowledge Product Entitlements** > **Properties**.
2. Set the following properties, as needed.

Option	Description
Enable access control of Knowledge Bases based on product entitlements	If enabled, customers can access all of the knowledge bases related to the products for which they have entitlements.
Allow access to Knowledge Bases with empty related_products	If enabled, customers can access all knowledge bases even if no products have been specified in the **Related Products** field on the Knowledge Base form.
Enable access control of Knowledge Articles based on product entitlements	If enabled, customers can access all of the knowledge articles related to the products for which they have entitlements.
Allow access to Knowledge Articles with empty related_products	If enabled, customers can access all knowledge articles even if no products have been specified in the **Related Products** field on the Knowledge form.

3. Click **Save**.

Limit knowledge base access to internal users

Limit access to the information in a knowledge base to internal users.

Before you begin
Role required: admin

About this task
The articles in a knowledge base are available to both internal users, such as customer service agents, and to external users (customers and partners). If the articles in a knowledge base are intended for internal users only, the system administrator can restrict access by customizing the knowledge base form.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Click the desired knowledge base.
3. Right-click the form header and select **Configure** > **Related Lists**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Cannot Contribute** from the Available column and move it to the Selected column.
5. Click **Save**.
6. On the selected knowledge base form, click the **Cannot Contribute** related list.
7. Click **Edit**.
8. Click **All Customer Contacts** in the left column and move it to the right column.
9. Click **Save**.

Quick start tests for Customer Service Management

Quick start tests are part of the Automated Test Framework (ATF). Use these tests to validate that the Customer Service Management application still works after you make any configuration change, such as applying an upgrade or developing an application.

A quick start test is a test or test suite installed with the demo data of an application. You can use quick start tests as templates to build your own tests and test suites that ensure successful execution with your instance-specific data.

For more information about using quick start tests, see the following topics:

- Test your apps with the ATF
- Quick start tests
- Getting started with quick start tests

CSM test suites and tests

The CSM test suites and tests are listed in the tables below.

- CSM: Case management test suite
- CSM Configurable Workspace test suite
- CSM: Case Types - Complaint
- CSM: Case Types - Onboarding
- CSM: Operations Dashboard test suite
- CSM Portal test suite
- Guided Decision - Next Best Action ATF test suite
- TC: Targeted Communications test suite
- CSM Walkup Experience tests

Plugins

All Customer Service Management quick start tests require activating the Customer Service Management Demo Data plugin (com.snc.customerservice.demo). Some quick start tests also require activating the following plugins:

- Business Location (com.snc.business_location)
- Case Playbook for Complaints (sn_complaint)
- Case Playbook for Onboarding (sn_onboarding)
- Consumer Service Portal (com.glide.service-portal.consumer-portal)
- CSM Contributor User (com.snc_csm_contributor_user)
- CSM Extension for Proxy Contacts (com.snc.csm_proxy_contacts)

Routing and assigning customer service cases

The case routing feature uses matching rules and assignment rules to identify customer service cases that meet certain conditions and then route those cases to customer service agents.

This video covers various aspects of configuration for routing and assignment including creating assignment rules, the assignment workbench and advanced work assignment.

Overview

Create one or more matching rules that establish specific conditions that a case must meet before it can be routed to an agent. Then use an assignment rule to route those cases to agents based on product knowledge and availability. You can also invoke the MatchingRuleProcessor API to execute the matching rules and return a list of users (sys_ids).

Matching Rules

Matching rules are based on two defined sets of conditions, one that identifies specific case attributes and another that identifies the agent resources best suited to handle cases with these attributes. Matching rules are created using the Matching Rule form.

To identify case attributes, select a table that stores the task type (for example, the Case table) and then use a condition builder to create one or more conditions that a case must meet before being routed. For example, you can build conditions for a specific account and product or for a specific product and priority level.

To identify an agent resource, use one of the following resource matching methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Simple**: Select the resource name from a list of users.
- **Advanced**: Build conditions that filter the available agent resources. These conditions can be based on user role, agent group, specific skills, work load, or agent availability.
- **Scripted**: Create a customized script to identify agent resources.

Another resource matching method, Selection Criteria, can be used to create a matching rule with selected matching criteria for use with the assignment workbench.

Assignment Rules

Use assignment rules to automatically assign task to users and groups. Create an assignment rule for a matching rule by selecting the **Create assignment rule** related link on the Matching Rule form. When the matching rule conditions are met, a case can be routed to a user or a group using the assignment rule. The assignment rule is applied only if the task isn't already assigned to another user or group.

Note:
Matching rules and assignment rules are independent records with no synchronization. If you change the **Applies to** component of the matching rule, it isn't reflected in the assignment rule.

When you create an assignment rule, you select the following:

- The table for the task type and the conditions that must be met before the task is assigned.
- The user or the group to which the task is assigned.

Alternately, you can create a script to further customize the assignment rule.

Related topics

Assignment rules module

Invoke the MatchingRuleProcessor API

After you create one or more matching rules, you can invoke the MatchingRuleProcessor API and run the rules.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, admin

Procedure

- You can invoke the matching engine using the `processAndGetCandidates` method of the `matchingRuleProcessor` class.
  Pass in the task record and the number of resources. The result is an array of resource sys_ids.
- The system processes the matching rules based on the number stored in the **Execution Order** field for each rule.
  The result is a list of users (sys_ids), which you can use for case routing and assignment.

Reverse matching

Reverse matching uses the same matching rules to match tasks to a resource rather than resources to a task.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, and admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The resource matching engine can match resources and tasks in two ways:

- Forward: matches resources for a task
- Reverse: matches tasks for a resource

The same matching rule can be used for both forward and reverse matching.

Procedure

- In the Customer Service Management application, you can use reverse matching to determine which call the next available agent should take.
- Reverse matching returns a list of case sys_ids instead of user sys_ids.
  When using reverse matching, you can also limit the cases returned to a specific set. The following example shows how to use reverse matching.

```
MatchingRuleProcessor.processAndGetCandidates(resource,
 taskLimit, "sn_customerservice_case", "reverse", false,
 [<array of cases to consider>])
```

Limit the number of task sys_ids returned for reverse matching rules

Reverse matching rules return a list of case sys_ids. Limit the number of cases returned by configuring the number in the reverse.matchingrule.entity.limit system property.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, type `sys_properties.list`.
2. Search for the reverse.matchingrule.entity.limit system property.
3. In the number field, change the number of cases returned.
   The default number is 30.

Result

If the number of cases returned is more than the value listed in the system property, the reverse matching rule doesn't run for Scripted and Selection Criteria matching rules.

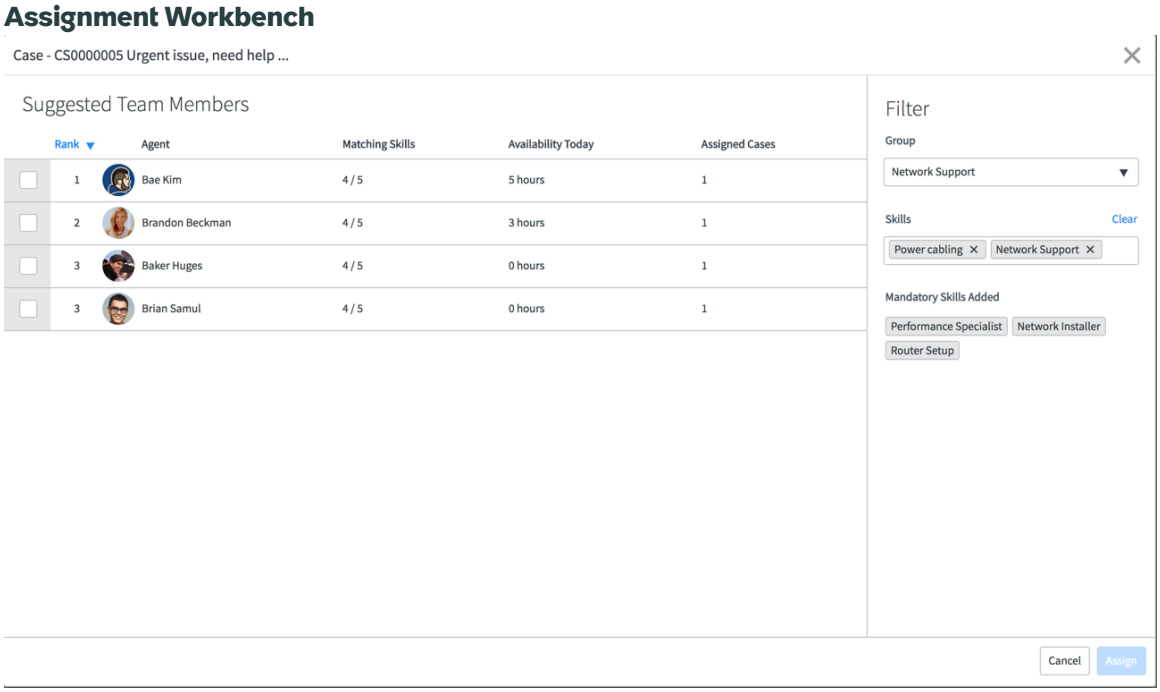
Assignment workbench overview

The assignment workbench enables customer service managers to assign tasks to agents efficiently and intelligently. The workbench uses configurable criteria, such as skills and availability, to evaluate the agents in a selected group and provide an overall ranking. Managers can view these results and click one button to assign a task.

The assignment workbench displays all the relevant information for task assignment, including:

- A list of the agents in the task assignment group.
- The matching criteria used to evaluate the agents.
- An overall ranking for each agent in the assignment group.
- A filter with the current assignment group and the skills identified for the task, including any mandatory skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Agents are ranked from 1 to any number based on the criteria configured for the workbench. The more criteria that matches, the higher an agent's rank. When the criteria for two agents is the same, the agents have the same rank. Point to an agent's rank to display the details.

Use the filter to change the assignment group and to add or remove skills. Changes to the assignment group or to the skills lists are reflected immediately in the workbench:

- Changing the assignment group displays a different list of agents.
- Adding or removing skills can change the agent ranking.

If you are using the mandatory skills feature, the agents displayed in the assignment workbench are filtered by the skills in the **Mandatory Skills Added** list and then ranked by the other matching criteria.

Note:
Agents cannot add or remove mandatory skills or make a skill not mandatory.

Configuring the assignment workbench

The assignment workbench configuration is stored in a matching rule that is based on the **Selection criteria** matching type. The default configuration uses the **Recommendation for Case Assignment** matching rule, which includes three of the four default matching criteria:

- Availability Today
- Matching Skills
- Assigned Cases

Based on these matching criteria, the workbench calculates and displays an overall rank for each agent in the group. You can modify or create matching criteria and the **Recommendation for Case Assignment** matching rule as needed or you can create your own configuration following these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create one or more matching criteria.
2. Create a matching rule with the **Selection criteria** matching type.
3. Open the matching rule and add the desired matching criteria.

If you are using mandatory skills, you must replace the **Matching Skills** criterion in this matching rule with the **Matching Skills - Mandatory Skills Support** criterion to match agents with mandatory skills required for a case.

Using the assignment workbench

Access the assignment workbench by clicking the Find Agents icon ( ) next to the **Assigned to** field on the task form.

Note:
The state of the current record determines the availability of the Find Agents icon. The icon is available for records in the **Open**, **Awaiting**, and **Cancelled** states, and if the user has write access for the **Assigned to** field. The icon is not available for records in the **New** or **Closed** states or when the **Assigned to** field is read-only for the current user.

Sort the list of agents by any of the matching criteria by clicking the desired column header, which reorders the suggested agents based on the selected criteria.

Select a different assignment group from the **Group** list in the filter. The list of agents is updated based on the selection. If the selected group does not contain any agents, a message is displayed to select another group.

Add or remove skills from the **Skills** list in the filter. These selections are reflected in the **Matching Skills** column.

Skills that have been identified as mandatory for a task are displayed in the **Mandatory Skills Added** list. These selections are also reflected in the **Matching Skills** column. You cannot add or remove skills from this list.

Select an agent and click **Assign** to assign the task. The workbench closes and returns to the Case form. The **Assigned to** field is updated with the selected agent. Click **Save** on Case form to save this assignment.

Plugins

The Assignment Workbench plugin (com.snc.assignment_workbench) is activated as part of Customer Service Management.

The Case Assignment Workbench Demo plugin (com.snc.case_assignment_workbench_demo) provides demo data for the workbench.

Tables

Assignment Workbench adds the following tables.

Assignment Workbench tables

Table	Description
Matching Criteria [matching_dimension]	Stores the matching criteria that can be used to create a configuration for the assignment workbench.

Configure assignment workbench

Matching criteria for case assignment

The assignment workbench uses configurable matching criteria, such as skills and availability, to evaluate the agents in a selected group and provide an overall ranking.

There are three types of matching criteria:

- **Simple Match**: Creates one-to-one matching, such as matching the time zone of an agent with the time zone of a task location.
- **Aggregate**: Uses a simple query and returns an aggregate result. For an aggregate type, select a table and create a filter, and then select an aggregate field such as the **Assigned to** field. This type of query returns a set of users.
- **Scripted**: Uses a scripted query which returns a list of users.

Several matching criteria are provided with the assignment workbench:

- **Availability Today**: Availability is calculated based on the agent's work schedule, assigned work, and personal time off. The more availability an agent has, the higher the contribution to the agent's overall rank.
- **Matching Skills**: The number of agent skills that match the skills required for the case. The more skills that match, the higher the contribution to the agent's overall rank.
- **Matching Skills - Mandatory Skills Support**: Calculates the number of agent skills that match the mandatory skills. The calculation is done by filtering out all agents who don't have the mandatory skills and ranks the remaining agents. The more skills that match, the higher the contribution to the agent's overall rank.

  Note:
  If using the mandatory skills feature, use the **Matching Skills - Mandatory Skills Support** criterion to match agents with the mandatory skills identified for a case.

- **Assigned Cases**: The number of cases already assigned to this agent. The more cases assigned, the lower the contribution to the agent's overall rank.
- **Last Assigned**: To balance assigned work, prioritize the agent based on their last assigned work.

To create matching criteria, select the type and use the fields related to that type to build the query. After creating matching criteria, you can create a configuration for the assignment workbench by creating a matching rule of the type **Selection criteria** and selecting the desired matching criteria.

As part of selecting the matching criteria for the workbench configuration, you can specify the following settings for each individual criterion:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ranking and display usage
- ranking method
- ranking weight
- threshold
- active/inactive

Ranking and display usage

In the **Use for** field, specify how you want that matching criterion to be used:

- Ranking and display: Uses the criterion to determine agent ranking and displays it in a column on the workbench.
- Display only: Displays the criterion in a column on the workbench but doesn't use it to determine agent ranking.
- Ranking only: Uses the criterion to determine agent ranking but doesn't display it on the workbench.

Ranking method

There are two ranking methods:

- More is better: For example, more availability is better when determining the agent ranking.
- Less is better: For example, fewer assigned cases are better when determining agent ranking.

Weight

Each matching criterion has an assigned weight. By default, the matching criteria in the **Recommendation for Case Assignment** matching rule have an assigned weight of 10. You can assign a higher weight to the criteria that are more important.

Threshold

A threshold sets a minimum requirement for a criterion. For example, set the threshold of the Matching Skills criterion to 3 if you want to see only those agents who have at least three of the required skills for a task. For availability, set the threshold to the desired number of hours to display only those agents who have that minimum number of work hours available. You can set the threshold in the **Select Criteria** related list on the Matching Rule form. If necessary, personalize the list and add the **Threshold** column.

Active/Inactive

There can be several matching criteria associated with the matching rule that determines the assignment workbench configuration. Each individual criterion can be set to active or inactive. Changing this setting has an immediate impact on the agent ranking. You can change the **Select Criteria** related list on the Matching Rule form. If necessary, personalize the list and add the **Active** column.

Calculating the agent ranking

The assignment workbench adds the values of the matching criteria and their respective weights and uses these values to determine the overall agent ranking.

1. Calculate a number for each criterion.
2. Multiply that number by the criterion weight.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Divide the result by the total of all criterion weights.
4. Repeat for each criterion and add the results.

The following example shows how the ranking is determined for an agent with these matching criteria values:

- Matching Skills with Mandatory Skills Support: 5/6
- Availability Today: 7 hours
- Assigned Cases: 2

Calculations:

- **Matching Skills**: `2 / 3 = 0.666` (with 3 being the maximum number of skills)
- **Availability Today**: `7 / 8 = 0.875` (with 8 being the maximum number of hours)
- **Assigned Cases**: `2 / 26 = 0.0769` (with 26 being the total number of tasks in the table)
- **Weight**: Each matching criterion has an equal weight of 10

```
((0.666 x 10) / Total of criterion weight (10+10+10)) + ((0.875
 x 10) / Total of criterion weight (10+10+10)) + ((0.0769 x
 10) / Total of criterion weight (10+10+10))
```

```
(6.66 / 30) + (8.75 / 30) + (0.769 / 30)
```

```
0.222 + 0.291 + 0.0256 = 0.53
```

This calculation is performed for each agent in the assignment group. Agents are ranked based on the value of this calculation, with the highest number earning the highest ranking.

Matching rules for case assignment

Use a matching rule to create a configuration for the assignment workbench.

The assignment workbench configuration is stored in a matching rule that is based on the **Selection criteria** matching type.

The default configuration uses the **Recommendation for Case Assignment** matching rule, which uses three of the four default matching criteria:

- Availability Today
- Matching Skills
- Assigned Cases

> **Note:**
> If using the mandatory skills feature, use the **Matching Skills - Mandatory Skills Support** criterion to match agents with the mandatory skills identified for a case.

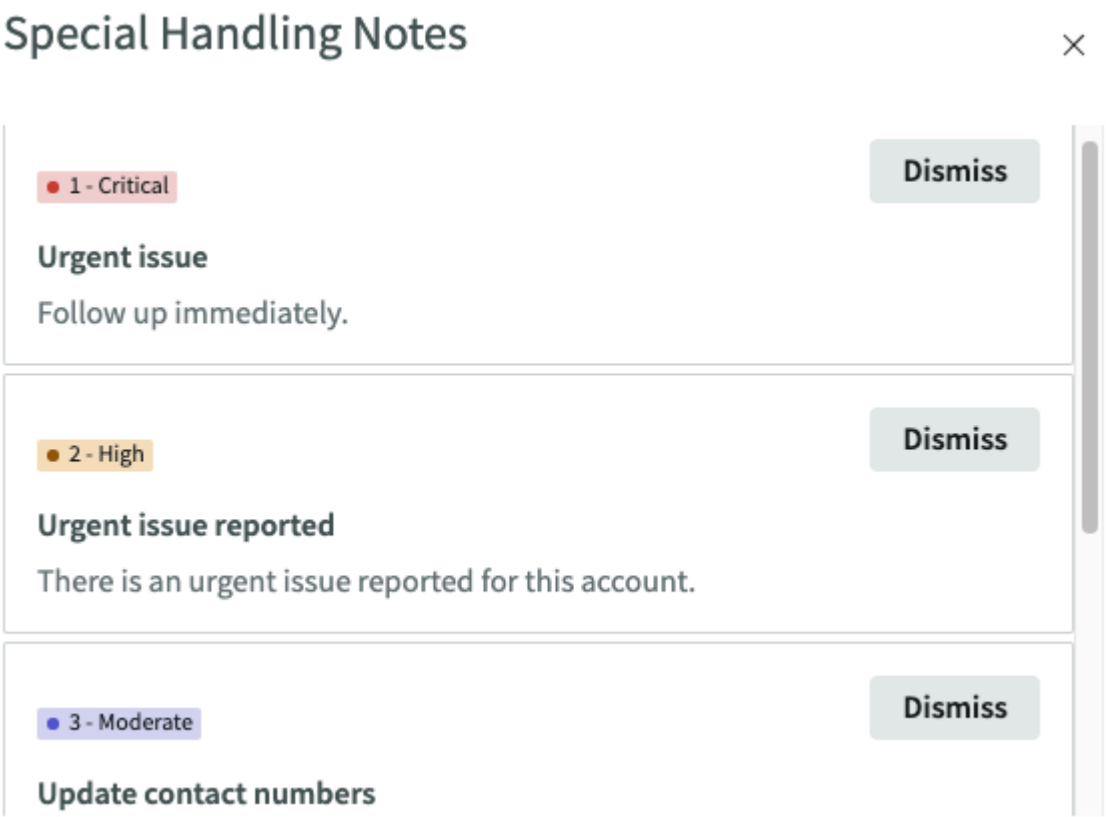
You can customize this matching rule to meet your specific need for calculating agent recommendations. This matching rule can also be used for auto assignment if you create an assignment rule.

Special handling notes

The Special Handling Notes application enables you to create notes that bring important information about individual records, such as a case or account record, to the user's attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Special handling notes in CSM Configurable Workspace



You can create special handling notes for specific records or for a set of records that meet one or more conditions. You can also configure this application to display any special handling notes from related records, such as the account or the product associated with a customer service case.

Important:
Use special handling notes for special circumstances and not for the general case processing workflow. It is not recommended to have more than 10k special handling notes on an instance. In addition, avoid complex conditions and use dot walking sparingly when creating special handling notes. Having a large number of notes with complex conditions can affect the load time.

Configuring special handling notes

Users with the sn_shn.admin role can configure the desired entity tables, such as the Case table, to use special handling notes. Special handling notes can be configured to display in the following ways:

- In a pop-up window that appears when a user accesses a form.
- In an embedded list or a related list on a record form.

For more information, see the following configuration topics:

- Configure special handling notes
- Configure an entity table to use special handling notes
- Configure a form to show special handling notes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating, updating, and deleting special handling notes

Users with the sn_shn.admin role can create, update, and delete special handling notes. Users with the sn_shn.editor role can view and update notes and users with the sn_shn.user role can view notes. For more information about creating special handling notes, see the following topics:

- Create a special handling note
- Components installed with Special Handling Notes

Special handling notes display important information to the user. In addition to a message, a special handling note also has a status, an assigned priority, and an expiration date.

The status of a note can be one of the following:

Special handling note states

Status	Definition
Active	The note is active. Active notes appear on the Special Handling Notes list or pop-up window. Active notes remain on the list until they are set to **Inactive** or **Expired**. Active notes remain on the pop-up window until dismissed or until they are set to **Inactive** or **Expired**.
Inactive	The note is no longer active. Users with the sn_shn.admin or sn_shn.editor role can set a note to **Inactive** if the information in the note is no longer useful. When a note is set to **Inactive**, it is removed from the Special Handling Notes list or pop-up window. Inactive notes can be viewed by navigating to **Special Handling Notes** > **Special Handling Notes**.
Expired	The note has reached it's expiration date or it has been expired manually. If a note is expired, the form becomes read-only for all user roles other than the system administrator. A note is expired automatically by a scheduled job when it reaches it's expiration date. The scheduled job also sets any inactive notes to expired if the inactive notes have reached their expiration date.

A note can be assigned one of the following priorities. Each priority has an associated color, which is displayed as a colored bar in the pop-up window and as a colored circle in the **Priority**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

field in a list. The Core UI and the CSM Configurable Workspace interface use different colors to represent priority.

Special handling note priorities

Priority	Core UI	CSM Configurable Workspace
1 - Critical	Red	Red
2 - High	Orange	Orange
3 - Moderate	Green	Purple
4 - Low	Blue	Gray

When creating a special handling note, you can make it effective right away or you can select a date when it becomes effective. You can also select an expiration date.

Special handling notes pop-up window

Special handling notes can be displayed on a form in a pop-up window. Users with the sn_shn.admin role can configure a form to display the Special Handling Notes pop-up window. This window appears when you access a record that has one or more active notes. The pop-up window displays the following information for each note:

- Message
- Priority

To dismiss a note, click **Dismiss**. Once you dismiss a note, it no longer appears in the pop-up window. To close the Special Handling Notes pop-up window, click **X**.

Special handling notes list

Special handling notes can be displayed on a form in an embedded or related list. Users with the sn_shn.admin role can configure a form to display the Special Handling Notes list. This list appears on a form when there are one or more active notes for a record. The Special Handling Notes list displays the following information for a note:

- Message
- Expiration date
- Priority
- Table

Resurfacing special handling notes

Special handling notes are typically displayed in a pop-up window when a record is opened. Agents can view the special handling notes, dismiss individual notes, and close the window. If an agent closes the window, they can open it again and display the special handling notes without closing and reopening the record tab in CSM Configurable Workspace.

To open the special handling notes pop-up window after it has been closed, select **Special handling notes** from the More actions menu (···) on the action bar. If no special handling notes are available, the system displays an informational message: “No special handling notes are available.”

The **Special handling notes** action that agents can use to reopen the special handling notes window is currently available on the following record pages in CSM Configurable Workspace:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Front-line case page
- CSM default record page

In addition to these pages, the action is also available on records from the following tables:

- Account
- Asset
- Contact
- Incident
- Product model
- Work order task

Expiring special handling notes

The **Deactivate Special Handling Notes** scheduled job, which runs daily at midnight, checks the dates in the **Effective on** and **Expires on** fields for each note.

- If a special handling note has reached its **Effective on** date, the scheduled job sets the status of the note to **Active**.
- If a special handling note has reached its **Expires on** date, the scheduled job sets the status of the note to **Expired**.

Domain separation for Special Handling Notes

The Special Handling Notes application supports domain separation as a process-separated table.

When inserting or updating a special handling note, the picker domain scope takes precedence by design with the Overrides [sys_overrides] field on process-separated tables. For more information, see Process administration.

Case and account escalation

Use the escalation feature to highlight specific cases or accounts and raise awareness of important customer issues.

Escalating a case or an account provides the following benefits:

- Increases attention about a customer issue.
- Facilitates communication about that issue.
- Provides a way to track progress toward a resolution.

Users with the escalation requester role can escalate a case or an account by selecting the **Escalate Case** related link on the case or account form.

Case and account escalation differences

While the escalation process is similar for cases and accounts, there are some important differences to note.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Case escalations: A customer service agent typically manages a case escalation and works directly with the escalated case to resolve the issue.
- Account escalations: An escalation manager typically manages an account escalation, which can include multiple associated cases, and records details in the escalation record.

For more information, see Case and account escalation differences.

Configuring case and account escalation

The following table includes an overview of case and account escalation configuration tasks. Users with the system administrator role can perform these tasks.

Case and account escalation configuration tasks

Task	Description
Configure escalation management	Configure case and account escalation using Customer Service Management guided setup.
Create a case or account escalation template	Escalation templates determine how an escalation request is processed, including the type of escalation and an optional approval process.
Create a case or account escalation severity	Create definitions for different levels of escalation severity and select color indicators to highlight escalated cases and accounts in the user interface.

Using case and account escalation

The following table includes an overview of case and account escalation user tasks.

Case and account escalation user tasks

Task	Description
Escalate a case or an account	Escalate cases or accounts, either on behalf of customers or for internal purposes. Escalating a case or account creates an associated escalation record. Role required: escalation requester
Manage an escalated case or account	Manage a case or account through the escalation process using the escalation record. The system identifies cases and accounts on lists and forms with color indicators that correspond to the escalation severity: red (high) or orange (medium). Role required: • Customer service agent • Escalation manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case and account escalation user tasks (continued)

Task	Description
De-escalate a case or an account	De-escalate cases or accounts when the cause of the escalation is resolved. Role required: de-escalation requester
Use an optional escalation approval process	Include an optional approval step for approvers to review a request and either approve or reject an escalation. When using the optional approval step, the system creates the escalation record upon approval and associates it with the case or account.

Case and account escalation differences

An overview of the differences between case escalations and account escalations.

- **Case escalations**: A customer service agent typically manages a case escalation and performs most of the problem resolution work, which is recorded in the case record. For case escalations, the escalation record is used primarily for status reporting purposes. The escalation SLA is also associated with the case record rather than the escalation record because that is where the agent provides regular updates.
- **Account escalations**: An account escalation manager typically manages an account escalation because it is associated with multiple underlying cases. An account manager works with multiple case owners to resolve the customer escalation and uses the escalation record to consolidate the status of the associated cases and provide regular updates. Therefore, the SLA is associated with the escalation record.

Case and account escalation differences

Feature	Case Escalation	Account Escalation
Relationships	Corresponds one-to-one to a case.	Corresponds one-to-one to an account. Users can link specific cases to the escalation record to indicate which cases are causing the escalation.
Templates	Uses case escalation templates. **Note:** When you select Case Escalation in the **Type** field, an additional checkbox field appears for **Add Case Assignment Group Manager to Approvers**.	Uses account escalation templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case and account escalation differences (continued)

Feature	Case Escalation	Account Escalation
Approval workflow	Includes an option to automatically add the manager of the case assignment group to the approver list when using the default approval workflow.	Does not include an option to automatically add the manager of the case assignment group to the approver list because an account escalation can be associated with multiple cases.
Escalation assignment	Does not include a separate assignment. A case escalation corresponds to an individual case and the customer service agent manages the escalation.	Includes a separate assignment. An account escalation can have multiple associated cases that are assigned to different agents so the escalation record includes an **Assigned to** field. An account escalation is typically assigned to an escalation manager because account escalations are typically more serious than case escalations.
Watch list	Does not include an option to automatically add an account team to the escalation watch list.	Includes an option to automatically add an account team to the escalation watch list.
Escalation updates added to case	Updates to the escalation record are also added to the **Work notes** field on the corresponding case record.	Updates to the escalation record are not added to the account record.
SLAs	The case escalation SLAs provided with the escalation feature are attached to the case.	The account escalation SLAs provided with the escalation feature are attached to the account.

Case and account escalation process

The case and account escalation process follows several steps from request to completion.

1. Your users with the escalation requester role request an escalation for a case or account. As part of the request, you can provide the following information:
   - The reason for the request
   - Justification for the escalation
   - The escalation severity
   - The escalation template
   - The watch list for the escalation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. If approval is required for an escalation request, approvers from the selected approval group review and approve or reject the escalation request. The chosen approval subflow then updates the approval status accordingly.
3. Following approval, the agent manages the escalation as it progresses using the escalation form. For example, the agent can add users to the watch list and update the escalation trend.

   Note:
   Updates to the escalation form send email notifications to the current user and to users on the watch list.

4. When the issue has been resolved, your users with the de-escalation requester role can de-escalate a case or an account.

Case and account escalation components

The roles, modules, and tables installed with the case and account escalation feature.

Roles

Roles included with the case and account escalation feature.

Different roles with the case and account escalation feature

Role	Description
Escalation requester (sn_customerservice.escalation_requester)	Can request an escalation for a case or account.
De-escalation requester (sn_customerservice.deescalation_requester)	Can de-escalate a case or account. This role contains the sn_customerservice.escalation_requester role.

Escalation modules

The case and account escalation feature adds the Escalations module to the Customer Service menu:

- **All**: lists all escalation records for cases and accounts.
- **Escalation Templates**: lists the case and account escalation templates.
- **Escalation Severity**: lists the types of escalation severity.

This feature also adds a list of escalated cases to the Customer Service menu: **Customer Service** > **Cases** > **Escalated**

Tables

Tables included with the case and account escalation feature:

Different tables with the case and account escalation feature

Table	Description
Escalation Templates	Stores escalation template records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Different tables with the case and account escalation feature (continued)

Table	Description
[sn_customerservice_escalation_template]	
Escalations [sn_customerservice_escalation]	Stores records created for escalated cases and accounts.
Escalation Severities [sn_customerservice_escalation_severity]	Stores escalation severity definition records.

Case and account escalation form

Customer service agents use the Escalation form to manage escalations for cases and accounts.

The Escalation form includes information about the escalation, such as the associated case or account, and the reason and justification for the escalation. It also includes information about the escalation as it progresses, including the trend and notes about the work being done to resolve the issue.

An escalation record can contain one or more associated cases. When updating escalation records, customer service agents can enter comments or work notes. For case escalations, updates are replicated to the case activity history as work notes so they aren't visible to the customer.

The Escalation form has a **Related Cases** related list that includes the related cases for account escalations. The user can associate specific cases using this related list to indicate which cases are causing the escalation. The Escalation form also includes **Task SLAs** and **Approvers** related lists.

Escalation form fields

Field	Description
Number	The number automatically assigned to the escalation request.
Source Record	The case or account for which escalation is requested. **Note:** The case or account form for the source record includes an **Escalations** related list.
State	The current state of the escalation: • **Requested**: An agent with the escalation requester role has requested an escalation for the case or account. • **Escalated**: The escalation request has been approved. • **Declined**: The escalation request hasn't been approved. • **Closed**: The reason for the escalation has been resolved and the escalation has been closed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Escalation form fields (continued)

Field	Description
Request Source	The source of the case escalation request: • Customer requested • Internally requested
Reason	The reason for requesting the case escalation: • Inactivity • Lack of Progress • Customer Imposed Deadline
Watch List	The watch list for this particular escalation record. For account escalations, you can **Add account team members to watch list**. Users added to the watch list for a case, account, or escalation record receive email notification when the case or account has been escalated and when updates are made to the escalation record.
Assignment group	For account escalations, the assignment group for this account.
Assigned to	For account escalations, the customer service agent assigned to this account.
Request By	The user who requested the escalation.
Approved By	If approved, the user who approved the escalation request.
Declined By	If declined, the user who declined the escalation request.
De-escalated By	The user who de-escalated the case or account escalation.
Escalation Type	The escalation type selected by the user who requested the escalation.
Escalation Severity	The escalation severity associated with this escalation, which defines the severity level for the escalation and the color used to highlight the escalated record in the user interface. • **High Severity**: Escalated records are highlighted in red. • **Medium Severity**: Escalated records are highlighted in orange.
Escalation Trend	The current state of the escalation: • **Improving** • **Same** • **Declining**
Escalation Justification	Additional information that explains why this escalation is needed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administering case and account escalation

Create escalation templates and escalation severity definitions to control the escalation process for cases and accounts.

Escalation templates

An escalation template determines how an escalation request is processed by defining the following information:

- The type of escalation (case or account)
- If approval is required:
  - If no, the escalation request is automatically approved.
  - If yes, provide the approver list required by the default approval subflow or provide a different approval subflow.
- The escalation watch list. Users added to the watch list receive email notifications when an escalation record is updated.

The escalation feature provides two standard escalation templates, one for case escalation and one for account escalation. If needed, users with the system administrator role can modify these templates or create templates.

Escalation severity

An escalation severity record defines the severity level for the escalation and the color that is used to highlight the escalated case or account record in the user interface. This assigned severity enables agents to easily identify escalated cases and accounts on lists and forms. The escalation feature provides two escalation severity definitions:

- **High Severity**: Escalated records are highlighted in red.
- **Medium Severity**: Escalated records are highlighted in orange.

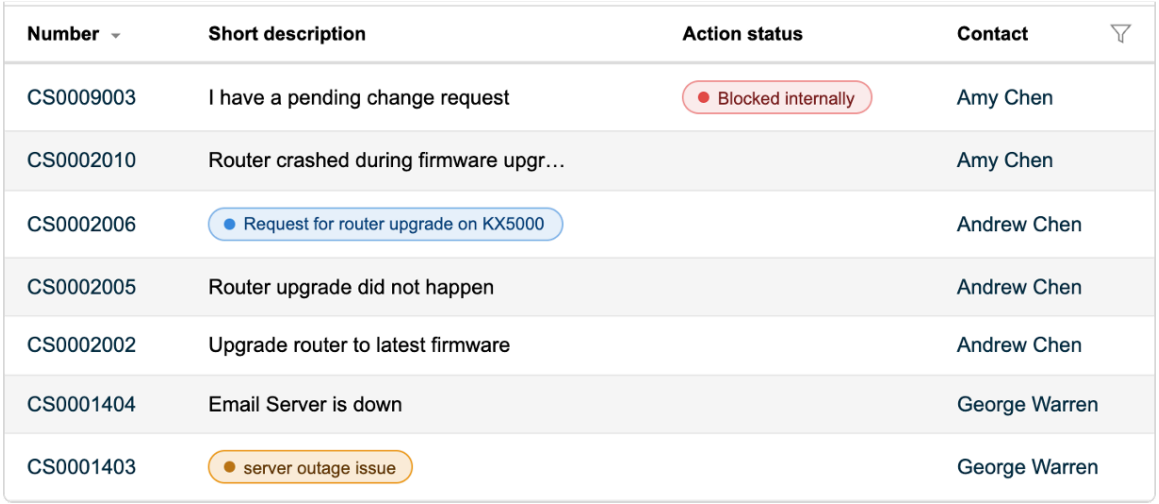
The user interface determines which fields are highlighted for escalated cases and accounts.

User interface indicators to identify escalated cases and accounts

User interface	Description
CSM Agent Workspace	Field indicators and field highlights appear on the **Short description** field for escalated cases and on the **Name** field for escalated accounts. **Note:** You can move indicators and highlights to any field that is not a hyperlinked field.
Platform interface	Escalated case and account numbers are indicated with a colored dot on a list and a colored background on a form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Agent Workspace case list with escalated cases



Number	Short description	Action status	Contact
CS0009003	I have a pending change request	Blocked internally	Amy Chen
CS0002010	Router crashed during firmware upgr…		Amy Chen
CS0002006	Request for router upgrade on KX5000		Andrew Chen
CS0002005	Router upgrade did not happen		Andrew Chen
CS0002002	Upgrade router to latest firmware		Andrew Chen
CS0001404	Email Server is down		George Warren
CS0001403	server outage issue		George Warren

The CSM Agent Workspace case list shows these escalation details:

- Number: Automatically generated case number.
- Short description: Describes the case.
- Action status: Indicates the status of the case.
- Contact: Shows the contact person for the case.

In addition to defining the field indicator and field highlight of an escalated case or account, the severity can be used when configuring SLAs. To configure additional escalation severity definitions, the system administrator must configure a new style with the desired color. For more information, see Highlight list fields.

Escalation SLAs

Escalation SLAs are typically used to govern the frequency of updates required for different types and severities of escalations. An escalation SLA is associated with an escalation severity in the SLA definition. When a user creates an escalation request, the selection in the **Escalation Severity** field determines the SLA for the escalation record. The escalation feature provides the following case and account escalation SLAs. The following table provides information about the escalation SLAs and their descriptions.

Case and Account Escalation SLAs

Escalation SLAs	Description
Case escalation SLAs	On case escalations, because the escalation corresponds one-to-one with a case, the default SLAs are associated with the case: • **Escalated case response - 4 hours**: De-escalate the case within four hours. • **Escalated case response - 8 hours**: De-escalate the case within eight hours. For case escalation, update the SLA reset condition to `complete the old SLA and start a new one when the case has new comments`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case and Account Escalation SLAs (continued)

Escalation SLAs	Description
Account escalation SLAs	On account escalations, because the escalation corresponds to an account which typically doesn't support SLAs, the SLAs are associated with the escalation. • **Escalated account response - 4 hours**: De-escalate the account within four hours. • **Escalated account response - 8 hours**: De-escalate the account within eight hours.

Users with the system administrator role can configure case and account escalation SLAs that are based on escalation attributes such as the escalation type, severity, and trend. Escalation SLAs are stored in the following locations:

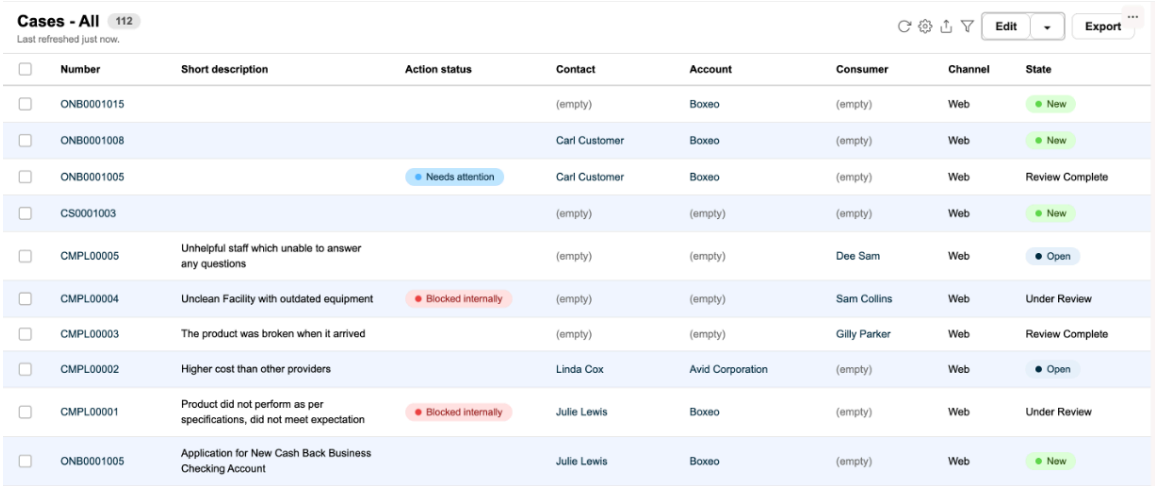
- For account records, on the Escalation form in the **Task SLAs** related list.
- For case records, on the Case form in the **Task SLAs** related list.

Administering case action status

The case action status feature displays the status of cases in the Case list. With this feature, customer service agents can easily identify cases that need attention.

The case action status feature provides visual indicators in the **Action status** column on the My Cases and My Open lists to highlight case status. In addition to the colored indicators, the **Action status** column also displays a brief status message.

Action status column on the Case list



Actionable case flows

The case action status feature uses actionable case flows to automatically determine the action status for customer service cases. These flows create and resolve blocking tasks for different case-related actions and automatically update the action status indicators. Certain agent actions trigger these case flows, which in turn create and resolve the blocking tasks.

Customer service agents and managers can also manually set the action status for cases by enabling the **Needs Attention** field on the Case form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Blocking tasks

A blocking task is something that prevents an agent from making progress toward case resolution. For example, a case might have one or more open related case task records or be waiting for customer feedback.

Certain agent actions trigger case flows that create and resolve blocking tasks for customer service cases. These tasks determine the case action status. Additionally, there are actions that resolve these blocking tasks, such as the customer responding to an agent's question or an internal user resolving a problem task. For more information, see .

Related topics

- Case action status
- Configure case action status
- Activate Case Action Status

Actionable case flows

Actionable case flows contain predefined user actions that automatically create and resolve blocking tasks for customer service cases.

The Case Action Status plugin provides several actionable case flows that create and resolve blocking tasks for different case-related actions. These flows are enabled by default. If you don't want to create blocking tasks for a specific action, disable the associated flow.

To view these flows, navigate to **Customer Service** > **Administration** > **Actionable Case Flows**.

Flow Designer actions

Case flows use the following predefined Flow Designer actions:

- Add Blocking Task
- Inactivate Blocking Task
- Set Needs Attention Flag

Flows for customer service cases

The case action status feature provides the following flows for customer service cases.

- Create blocked by record if case needs customer information
- Create blocked by record if Case Task is associated with case
- Create blocked by record if Change Request is associated with case
- Create blocked by record if SC Request is associated with case
- Create blocked by record if Work Order is associated with case
- Create blocked by record if Incident is associated with case
- Create blocked by record if Problem is associated with case
- Resolve blocked by record if Case Task is closed
- Resolve blocked by record if Change Request is closed
- Resolve blocked by record if Incident is closed
- Resolve blocked by record if Problem is closed or Fix is communicated
- Resolve blocked by record if Problem is closed or Fix/Workaround is communicated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resolve blocked by record if SC Request is closed
- Resolve blocked by record if user information is provided for case
- Resolve blocked by record if Work Order is closed or cancelled
- Set Needs Attention if additional comments are added by others
- Update case when blocked by record is created
- Update case when Needs attention field is toggled

Flows for customer service orders

The case action status feature provides the following flows for customer service orders.

- Create blocked by record if order case needs customer information
- Resolve blocked by record if user information is provided for order case
- Set Needs Attention if additional comments are added by others on order case
- Update order case when Needs attention field is toggled

Flows for problem records associated with a case

If a problem is associated with a case with the **Need task resolution** blocking reason, a case flow is provided to resolve the blocking task when a fix is communicated or the problem record is closed or cancelled.

If a problem is associated with a case with the **Need PRB workaround** blocking reason, a case flow is provided to resolve the blocking task when a workaround is provided or the problem record is closed or cancelled.

Blocking tasks

Certain agent actions trigger case flows which create and resolve the blocking tasks for customer service cases. These tasks determine the case action status.

When an agent performs certain actions, such as asking a customer for more information or associating a problem with a case, the system:

- Adds a blocking task to the case. This task appears on the Case form in the **Blocked by** form section.
- Updates the **Action Status** field on the Case form and Case list.

Note:
A blocking task is something that prevents an agent from making progress toward case resolution. For example, a case might have one or more open related task records or be waiting for customer feedback.

Additionally, there are actions that resolve these blocking tasks, such as the customer responding to an agent's question or an internal user resolving a problem task. When one of these actions occur, the system:

- Updates the status of the blocking task on the Case form.
- Updates the **Action Status** field on the Case form and Case list.
- Enables the **Needs Attention** field on the Case form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that create blocking tasks

The following actions create blocking task for customer service cases:

- The agent sets the state of the case to **Needs More Information**.
- The agent associates one of the following to the case:
  - Problem
  - Request
  - Change
  - Incident
  - Case task
  - Work order

Actions that resolve blocking tasks

The following actions resolve the blocking tasks for customer service cases:

- A customer provides the requested information.
- A fix or a workaround is associated with a related problem record.
- A related problem, request, change, or incident record is resolved.
- A related case task or work order is closed or cancelled.

Needs attention field

When the **Needs attention** field on the Case form is enabled, the **Action Status** column on the Case list displays a blue indicator.

The **Needs attention** field is enabled automatically when:

- A blocking task for a case is resolved.
- A customer or someone other than the case owner comments on a case.
- A work note is added to a case that is a child of a major case.

Customer service agents and managers can manually enable the **Needs attention** field if information is required from customers or internal users. This field can be disabled only by the agent assigned to the case or by the customer service manager or admin.

Requesting additional information from a customer

When an agent requests additional information from a customer, the system enables the **Needs attention** field and sets the **Action status** field to Needs attention.

If an agent needs to request additional information from a customer for a second time on the same case, be sure to clear the **Needs attention** field on the Case form before requesting the information. This ensures that the status updates correctly.

Case action status and major issue management

When using the case action status feature with major issue management, the following actions enable the **Needs attention** field for a major case:

- A customer provides comments for a case that is a child of a major case.
- An agent adds a work note to a case that is a child of a major case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Blocked by related list

Blocking tasks that are created for a case are added to the **Blocked by** related list. Each blocking task is assigned one of the following blocking reasons:

- Need information from the customer
- Need task resolution
- Need PRB workaround
- Other

Note:
When a problem is associated with a case and a blocking task is created, the blocking reason is set to **Need task resolution**. If necessary, the agent can change this reason to **Need PRB workaround**.

When a blocking task is resolved:

- The **Unblocked By** field displays the user who performed the unblocking action.
- The **Unblocked On** field displays the date that the blocking task was resolved.

Blocking Tasks table

Records that have the blocking tasks are stored in the Blocked By table [sn_action_status_blocked_by]. Records are periodically removed from this table. Six months after a blocked record is closed, the entries in the Blocked By table related to the blocked record are removed.

Case action status analytics

The Customer Service Manager dashboard displays the percentage of the case backlog that is waiting for an agent response, customer input, or a response for other users.

The dashboard includes the **Open Backlog - Blocked** widget which breaks down the remaining work to show cases that are with the following users:

- Agent
- Customer
- Other Internal Stakeholder

As blocking tasks for a case get created and resolved, this dashboard widget tracks the case time spent with each of these users. The breakdown is set for:

- Blocked internally
- Blocked by customer
- Blocked internally and by customer

Case action status logging

Logging for the case action status feature uses a metric definition to view information about blocking tasks associated with customer service cases.

Defined metrics can track how long a specific field holds a certain value. The **Case Actor Duration** metric definition logs the events related to case blocking tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a case blocking task is created or resolved, the system logs the information. This information can be used to report on the duration of the case with the customer, the agent, or other internal stakeholders.

As a case gets blocked and unblocked by a customer or an internal user, the metric definition tracks the duration of the case with each of these actors.

The metrics include:

- Case number
- Metric definition
- Value
  - Needs attention
  - Blocked by customer
  - Blocked internally and by customer
- Start and end times
- Duration

To access the **Case Actor Duration** metric definition, navigate to **All** > **Metrics** > **Definitions** and select the definition from the list. For more information about metric definitions, see the following topics:

- Metrics
- Define a metric

Major issue management overview

Major issue management enables customer communication for issues that impact a wider audience. Use this feature to proactively identify impacted customers, provide information to these customers, and manage the resolution process.

This feature enables you to efficiently manage the communication and resolution process for issues that impact multiple customers. With major issue management, you can identify impacted customers who have not yet reported an issue and proactively create cases for these customers.

Major issue management introduces the concept of a major case which contains the details about a particular issue. Child cases can easily be created for a major case, with one child case created for each customer affected by the issue. These child cases contain the customer-specific information.

Identify affected customers by creating a recipients list of accounts or consumers and attaching it to the major case. Create this list using the Targeted Communications application. Build a recipients list by identifying dynamic conditions, running a script, or importing customer information into a template. Once attached to a major case, use the recipients list to create a child case for each customer included in the list.

A major case is created in one of two ways:

- A customer service manager can create a major case.
- A customer service manager or major issue manager can promote a major case candidate.

Major case candidates are created either by promoting an existing customer service case (for customer reported issues) or by creating a candidate case directly (for non-customer reported issues). Candidate cases require approval before being promoted to major cases.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Major issue management also provides properties that enable automatic synchronization from a major case to the associated child cases. Use these properties to enable synchronization and to identify the synchronized fields.

Major Issue Management menu can be used in the ServiceNow AI Platform interface and in the Agent Workspace interface.

Identifying issues and creating major cases

Customer service agents, managers, and major issue managers can use the following process to identify potential issues, create major cases, and identify impacted customers.

1. Create a major case candidate or flag an existing customer service case as a major case candidate.
2. Review the major case candidate and either approve it as a major case or reject it.
   - If approved, the candidate case becomes a child case of the major case.
   - If rejected, the candidate case returns to a normal case.
3. Associate other cases reported for the same issue as child cases of the major case.
4. Identify other customers impacted by the issue by creating a recipients list and attaching it to the major case.
5. Create child cases for the customers included in the recipients list.
6. Manage the issue to resolution using the major case.
   - Update the major case as needed, which automatically updates the child cases.
   - Close the major case when the issue is resolved. Closing the major case automatically closes all the child cases.

Major, candidate, and child cases

Major issue management uses major case candidates to identify potential issues that impact multiple customers. With approval, candidate cases are promoted to major cases, which you can use to manage issues to resolution. Child cases are created for customers impacted by an issue and are associated with the corresponding major case.

Major cases

A major case contains information about a specific issue that impacts multiple customers. It is not associated with any accounts, contacts, or consumers. This customer-specific information resides in the child cases associated with the major case.

The recipients list associated with the major case identifies customers impacted by the issue. Select a list in the **Affected Customers** field in the Major Case Information form section of the Major Case form. After adding the list, you can automatically create child cases for all customers on the list. These cases are added to the **Child Cases** related list on the Major Case form.

With synchronization enabled, updates to the parent major case are automatically synchronized to the associated child cases. When the major case is closed, the associated child cases in the following states are also closed: New, Open, Awaiting Customer Info.

To identify major cases in the list view, check the value in the **Major case state** field.

- Major cases have a state of Accepted.
- Major case candidates have a state of either Proposed or Rejected.
- Regular cases have a blank value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the form view, major cases and major case candidates display the Major Case Information form section.

Note:
Related links on a major case form do not synchronize to associated child cases.

Major case candidates

A customer service agent uses a major case candidate, or candidate case, to flag an issue that could be a wider issue impacting multiple customers. An agent can create a major case candidate in the following ways:

- By promoting an existing customer service case with a reported issue to a major case candidate.
- By creating a new major case candidate.

A major case candidate requires the approval of the customer service manager or major case manager before being promoted to a major case.

- If a major case candidate was promoted from an existing case, a new major case is created and the candidate case becomes a child case of that major case.
- If a new major case candidate was created directly, that same case becomes the major case.

If a major case candidate is rejected, it reverts to a regular case.

Child cases

Child cases are associated with a major case. One child case is created for each account (B2B) or consumer (B2C) impacted by the major case issue. Child cases are created from the recipients list on the major case and can also be added manually by the major issue manager.

When child cases are created, the short description from the major case is copied to each of the child cases. Duplicate child cases are not created. If a child case already exists for an account or consumer, it is not created again.

As child cases are created, you can enter text in a pop-up window that is added to the **Additional comments** field on the child case form. These comments are added only to the newly created child cases. The major case and any existing associated child cases are not updated.

The primary contact for an account is the contact on the child case and is automatically added to the child case watchlist.

Synchronization between major cases and associated child cases

The system administrator can set system properties that enable or disable the synchronization between the major case and associated child cases and also define the fields to synchronize. Synchronization occurs from the major case to the child cases. If the state of a child case is Resolved, Closed, or Canceled, the synchronization does not take place.

A major case and the associated child cases maintain synchronization on the fields identified by the **sn_customerservice.case_fields_to_sync** property. This property specifies the list of fields to synchronize from the major case to the associated child cases. By default, these fields include:

- Priority
- State

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Comments
- Work notes
- Close notes
- Resolution code

If the **State** field is synchronized from the major case to the child cases, the **Close notes** and **Resolution code** fields must also be synchronized.

Note:
Child cases can be manually added to a major case at any time. There is no retroactive synchronization for newly added child cases.

When synchronization is enabled, saving changes to a major case results in a pop-up window. Verify the update by clicking **OK**.

Note:
In the base system, parent-child case synchronization is available only for the Case table (sn_customerservice_case). This feature must be configured for tables that extend the Case table.

Recipients lists

Use recipients lists that contain account or consumer information to create the child cases for a major case.

Major issue managers and customer service managers can select the desired list in the **Affected Customers** field on the Major Case form. Selecting **Create Child Cases** then creates a child case for each account or consumer in the recipients list.

Managers can change the recipients list before child cases are created. After child cases are created, the **Affected Customers** field becomes read only.

Creating recipients lists

Recipients lists are created using the Targeted Communications application. With this application, managers can select the type of list to create and the method used to create the list: by uploading files, selecting dynamic conditions, or using scripts.

The Targeted Communications application creates several types of recipients lists, including accounts, contacts, consumers, and internal users. The recipients list for a major case must be of type accounts or consumers. Recipients lists are limited to one specific type and can’t contain mixed types, for example accounts and consumers.

Note:
The Major Issue Management plugin is dependent on the Targeted Communications plugin. If Targeted Communications is active, recipients lists can be created for internal users. If Targeted Communications and Customer Service Management are both active, recipients lists can also be created for accounts, contacts, and consumers.

Manually editing a recipients list

Major issue managers and customer service managers can manually add or remove accounts or consumers from a recipients list by navigating to the Recipients List form, selecting **Edit** in the **Recipients** related list, and then using the arrows to add or remove records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Recipients** related list includes the **Dynamically Added** column which displays either True or False, depending on how a record was added:

- True for records that are dynamically generated, either by using the condition builder or by running a script.
- False for records that are added manually, either by using the **Edit** button on the **Recipients** related list or by file upload.

The **Active Communication** column is set to True by default for both dynamically and manually added records. This field indicates whether the recipient requires active communication.

Refreshing a recipients list

Refresh a recipients list by selecting **Refresh Recipient List** on the Recipients List form. For major issue management, the following guidelines apply to refreshing a recipients list:

- Refreshing a recipients list doesn't impact manually created records.
- If you remove a manually created record from a recipients list, it doesn't reappear when the list is refreshed unless it meets the dynamic conditions used to filter the list.
- If you remove a dynamically generated record from a recipients list, it may reappear when the list is refreshed if it meets the dynamic conditions used to filter the list.
- If the **Active Communication** field is set to false for a record, this setting doesn't change when a recipients list is refreshed.
- If created using the Upload File method, you don't need to refresh the recipients list.

Related topics

Create a recipients list

Major Case form view

Major issue management provides the Major Case form view, which includes the Major Case Information form section and the Child Cases related list.

The Major Case form view does not display account-related information because a major case is not linked to a specific account, contact, or consumer. This information is stored in the child cases associated with a major case.

Major Case Information form section

Major cases and major case candidates include the Major Case Information form section which includes the following fields.

Major Case Information form

Field	Description
Major case state	A major case can be in one of these states: • **Proposed**: the initial state when a candidate case is created or proposed by an agent or manager. • **Accepted**: the Initial state when a major case is created by a manager or when a candidate case is promoted by a manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Major Case Information form (continued)

Field	Description
	• **Rejected**: the candidate case is rejected by a manager. • **Cancelled**: the case is cancelled.
Business impact	The business impact of the issue identified in the major case.
Probable cause	The probable cause of the issue identified in the major case.
Affected Customers	The recipients list selected for the major case. Child cases are created for the accounts or consumers included in the recipients list. This field is only visible when the major case state is Accepted.

Customer service agents can update the **Business impact** and **Probable cause** fields as well as add **work notes**. Major issue managers can update the **Business Impact** and **Probable Cause** fields and attach a recipients list. The **Affected Customers** field is only visible when the major case state is Accepted.

The **Work notes** field on the major case form is updated when a major case is proposed or a candidate case is created manually. The **Work notes** field on associated child cases is updated when a major case is accepted.

When a major issue manager rejects a candidate case, the **Major Case State** field is set to Rejected and the **Work notes** field is updated with the case state. The candidate case reverts to a regular case.

Child Cases related list

Major issue management adds the **Child Cases** related list to the Customer Service Case form. All child cases associated with a major case are added to this list. Child cases are created automatically from the recipients list and can also be added or removed manually.

Propose a case as a major case candidate

A customer service agent role can propose an existing customer service case as a major case candidate.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task

Cases in these states can be proposed as a major case candidate:

- New
- Open
- Awaiting Info

Cases that are Resolved, Closed, or Canceled can't be proposed as a major case candidate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When proposing a case as a major case candidate, agents can specify the reason or justification for the case in the Propose Major Case pop-up window. Information provided in the **Work notes** and **Business Impact** fields are added to the Case form.

The major issue manager role receives a notification email when a case is proposed as a major case candidate. These users can select the link in the notification email to open the major case candidate in the platform interface.

Note:
You can also propose a case as a major case on Agent Workspace.

Procedure

1. Navigate to the desired customer service case.
2. Select **Propose Major Case** in the Additional Actions menu on the Case form.
3. In the Propose Major Case pop-up window, enter a reason for the proposal in the **Work notes** field.
   If desired, enter the business impact of the selected case in the **Business Impact** field.
   This information is added in the Case form in the **Work notes** field and the **Business Impact** field in the Major Case Information section.
4. Select **Propose**.
   An entry is added to the **Work notes** on the Case form that the case was proposed as a major case candidate. The information entered in the Propose Major Case pop-up window is also added to the Case form.

Create a major case candidate

Users with the customer service agent role can create a major case candidate.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task
Users with the major issue manager role receive a notification email when a major case candidate is created. These users can click the link in the notification email to open the major case candidate in the platform interface.

Note:
All major case candidates are automatically created as proactive cases as they are created internally and on behalf of the customer. To leverage the full capabilities of Proactive Customer Service Operations, install the Proactive Operations Management (com.snc.proactive_cs_ops) plugin.

You can also create a major case candidate from Agent Workspace.

Procedure

1. Navigate to **All** > **Major Issue Management** > **Create Major Case Candidate**.
2. Enter a description in the **Short description** field.
3. In the Major Case Information form section, enter the relevant information in the **Business impact** and **Probable cause** fields.
4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approve or reject a major case candidate

Users with the major issue manager role can approve or reject a major case candidate.

Before you begin
Role required: sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task
You can also approve or reject a major case candidate from Agent Workspace.

Procedure
1. Navigate to **All** > **Major Issue Management** > **Candidates**.
2. Select the desired candidate case.
3. Select one of the following from the Case form context menu.
4. Click **Update**.

Create a major case

Users with the customer service manager role can create a major case.

Before you begin
Role required: sn_customerservice_manager

Procedure
1. Navigate to **All** > **Major Issue Management** > **Create Major Case**.
2. Fill in the fields on the Case form.
3. In the Major Case Information form section, fill in the **Business impact** and **Probable case** fields.
4. Click **Submit**.

What to do next
You can view all cases by navigating to **Customer Service** > **Cases** > **Proactive**.

Create child cases for a major case

Users with the customer service manager role can create a child case for each of the customers included in the major case recipients list.

Before you begin
Role required: sn_majorissue_mgt.major_issue_manager, sn_customerservice_manager

About this task
The **Create Child Cases** button on the Major Case form creates a child case for each account or consumer in the recipients list selected in the **Affected Customers** field. If a child case for an account or consumer exists, the system doesn't create a duplicate child case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use caution when selecting the recipients list for a major case. Selecting the wrong recipients list can have a serious impact by creating a large number of cases for incorrect accounts or consumers. Verify that you have selected the correct recipients list before selecting **Create Child Cases**.

You can also create child cases for a major case from Agent Workspace.

Once child cases have been created, you can't change the recipients list. Any additional recipients must be added manually. After manually adding recipients to the list, select **Create Child Cases** again to create child cases for these new recipients.

Creating child cases copies information from the major case to each of the child cases. The field values that are copied to the child cases are identified by the **sn_customerservice.case_fields_to_sync system** property.

Procedure

1. Open the desired major case.
2. In the Major Issue Management form section, select a recipients list in the **Affected Customers** field.
3. Select **Update**.
4. Select **Create Child Cases**.
5. In the Create Child Cases pop-up window, enter information about the major case. This information is added as additional comments to each of the newly created child cases. If child cases for this major case exist, these child cases aren't updated.
6. Select **Continue**.
   The child cases are created and added to the **Child Cases** related list.

Recipients lists

Add an existing case as a child to a major case

A customer service manager can add an existing customer service case as a child to a major case.

Before you begin

Role required: sn_majorissue_mgt.major_issue_manager, sn_customerservice_manager

About this task

Identify and narrow a list of cases, then select the desired case or cases to add to the major case.

- Filter and narrow down the child case list.
- Select one or more cases and add as child to the major case.
- Add work notes/activity log when a parent is added or removed

Messages on the pop-up window:

You can also create child cases for a major case from Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the desired major case.
2. In the **Child Cases** related list, select **Add** to display the Added Child Cases pop-up window. The Add Child Cases pop-up window displays a list of customer service cases that aren't major cases.
3. **Optional:** Use the filters to narrow the list of cases displayed in the window.
4. Select the cases to add to the major case by enabling the check box for each case.
5. Select **Submit**.
   The system evaluates the selected cases and adds none, some, or all cases to the **Child Cases** related list. A message on the major case form informs you of the results by displaying one of the following:
   - No selected cases were added as child cases.
   - (x) of (y) selected cases were added as child cases.
   - All (y) selected cases were added as child cases.

   A work note is added to the **Activities** field for each child case added to the major case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Major issue management properties

Property	Description
Synchronize fields from parent to child case sn_customerservice.parent_child_case_sync	Enable this property to synchronize fields from a major, or pa associated child cases. • Type: true|false • Default value: false • Location: **Customer Service** > **Administration** > **Propertie**
Comma-separated list of fields that synchronize from parent case to child cases sn_customerservice.case_fields_to_sync	Specifies the list of fields to synchronize from the major, or p associated child cases. • Type: string • Default value: priority,state,comments,work_notes,assigned_to,close_no • Location: **Customer Service** > **Administration** > **Propertie**
Processes SLA asynchronously during parent to child case creation and synchronization sn_customerservice.parent_child_case_sla_async	Enables major issue management to process the SLA asynch child case creation and parent-to-child case synchronizatio • Type: true|false • Default value: true • Location: **Customer Service** > **Administration** > **Propertie**

Automatically close customer service cases

Customer service cases in the **Resolved** state can be closed automatically if customers don't act.

This feature uses the **Auto Close Resolved Cases** Flow Designer flow.

Note:
This flow isn't active by default.

The **Auto Close Resolved Cases** Flow Designer Flow identifies cases in the **Resolved** state that are waiting for a customer response and takes the following actions:

- Sends a reminder notification to the customer after five days with no response that the case is pending solution acceptance.
- Closes the case and sends a reminder notification to the customer after 10 days that the case has been auto-closed.

The notifications are added to the **Additional comments** field on the Case form.

The administrator can enable the **Auto Close Resolved Cases** flow and configure the timing of the reminder notifications. The default settings include two notifications that are sent at 5

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

days and 10 days after a case has been resolved. The administrator can also create additional notifications to the flow.

The administrator can also create a configuration that enables both the system and agents to exclude cases from auto-closure.

Using the Auto Close field on the Case form

Customer service agents can use the **Auto Close** field on the Case form to exclude cases from auto-closure. This field is hidden by default. To use this field, configure the Case form to display the **Auto Close** field.

Configuring business rules for auto closure

The administrator can configure business rules to enable or disable the **Auto Close** field on the Case form.

Rules for Auto Close on the Case form

Business rule	Description
Mark for Auto Close	Use this business rule to configure when the system sets the **Auto Close** field to true. The default configuration is as follows: • The case status is Resolved. • The **Needs attention** field on the Case form is false. • The case isn't escalated. • The account isn't escalated.
Clear Auto Close	Use this business rule to configure when the system automatically sets the **Auto Close** field to false. By default, the case status returns to **Open** if the solution is rejected.

Workflow Studio

Notifications for resolved cases

Customers receive notifications about resolved cases that are automatically closed if no action is taken.

When an agent proposes a solution for a customer service case, the customer has a time window in which to accept or reject the solution. If the customer doesn't take action within this window, the case is automatically closed.

The system administrator can configure the settings for the notifications that are sent to the customer. The default settings include two notifications that are sent at 5 days and 10 days after a case has been resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- After 5 days, the customer receives a reminder message about the resolved case on the Customer Service Portal: **This case is pending solution acceptance. It will be auto closed if you do not take action.**
- If the customer doesn't take any action after 10 days, the system automatically closes the case and adds the following message to the case: **This case was auto closed.**

This feature uses the **Auto Close Resolved Cases** Flow Designer flow. For more information, see Automatically close customer service cases.

Note:
The **Auto Close Resolved Cases** flow isn't active by default.

Administer Customer Contracts and Entitlements

Set up the Customer Contracts and Entitlements application to enable maintaining service contracts, contract lines, and entitlements.

Administration tasks for Customer Contracts and Entitlements

Task	Description
Add related lists to sold products and install base items	Add related lists to the Sold Product and Install Base Item forms to see the associated contracts, contract line items, and entitlements.
Add a service contract related list	Add related lists to the Account, Consumer, and Household forms to see the associated contracts.

Add related lists to sold products and install base items

Add Customer Contracts and Entitlements entities' related lists on the sold products and install base Items pages.

Before you begin
Role required: admin

About this task
To see the contracts, contract line items, and entitlements associated with a sold product, or an Install base Item on the same page, you must add the respective related lists manually on the form.

Note:
You can only add the related lists on the platform interface. The same settings are implemented on the CSM Configurable Workspace.

Procedure

1. Add related lists to sold products and install base items.
2. From the Additional actions menu, select **Configure** > **Related Lists**.
3. Select the following related lists from the Available menu and move them to the **Selected** menu using the **Add** option (forward arrow):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service Contracts
- Service Contract Lines
- Service Entitlements

4. Select **Save**.
   The related lists are added on the Sold Product or Install Base Item form.

Add a service contract related list

Add a service contract related list to the Accounts, Consumers, and Households pages.

Before you begin
Role required: manager

About this task
To see the contracts associated with Accounts, Consumers, and Households, respectively, on the same page, you must add the related list manually on the form.

Note:
You can only add the related list on the platform interface in the Workspace view. The same setting is implemented on the CSM Configurable Workspace.

Procedure

1. Add related lists to sold products and install base items.
2. From the Additional actions menu, select **Configure** > **Related Lists**.
3. Select **Workspace** in the **View name** field.
4. Select the **Service Contracts** from the **Available** menu and move to the **Selected** menu using the **Add** option (forward arrow):
5. Select **Save**.
   The related lists are added on the Sold Product or Install Base Item form.

Integrating Customer Service Management with other applications

Extend the capabilities of Customer Service Management and connect with other departments to assist with case resolution by integrating with other applications.

Customer Service Management provides integrations with the applications listed in the following table:

Customer Service Management Application Integrations

Step	Description
Integrating withIT Service Management	Integrate with Incident, Problem, Change, and Request Management applications.
Integrating with Service Portfolio Management	Get visibility into sold products and their associated service offerings with this integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management Application Integrations (continued)

Step	Description
Integrating with Continual Improvement Management	Get help with setting goals, organizing effort, and completing tasks.
	Create and view all FSM work orders and appointments as a Customer Service Management user.
Integrating with IT Operations Management	Create cases proactively from alerts and track the corresponding install base items affected by the alert.
Integrating with Customer Project Management	Use this integration to create projects and project tasks for your customer accounts.
Integrating with Financial Management	Allocate, track, and get report on expenses in your organization using this integration.
Integrating with Adobe Experience Manager	Deliver a pre-integrated web experience built on AEM by embedding Customer Service Management and Knowledge Management capabilities.
Integrating with Computer Telephony Integration (CTI)	Enable the Customer Service application to support inbound and outbound telephone calls with this integration.
Integrating with Microsoft Outlook	Manage contacts and cases from within Microsoft Outlook using this integration.
Integrating with Safe Workplace applications	Enable contacts or consumers to safely enter locations and comply with health and safety policies after emergencies and pandemics
Integrating with consumer messaging apps	Let customers use their choice of messaging apps to message anytime to your company's account.
Integrating with Process Mining	Analyze processes relevant to your KPIs, and identify bottlenecks associated with customer service cases.
Integrating with contact centers	Integrate with your contact center as a service (CCaaS) provider.

Integrating withIT Service Management

Integrate Customer Service Management with IT Service Management that includes the Incident, Problem, Change, and Request Management applications. With this integration, users can create request, incident, problem, and change records from customer service cases and external users can view these records from the Customer and Consumer Service Portals.

Integration with the Service Management applications provides the following functionality for internal and external users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles and tasks

User	Tasks
Agents	• Create incident, problem, change, and request records from open cases. • Associate existing incident, problem, change, and request records with cases • Remove associated records from cases.
Agents and managers	• View cases with Service Management -related indicators on the Customer Service dashboards. • View updates to records associated with a case. These updates automatically update the case work notes. • Use the updates to records associated with a case to communicate with customers.
External users	• View problem, change, and request records associated with cases from the Customer and Consumer Service Portals. • Create requests from the Customer and Consumer Service Portals. • Approve changes and requests from the Customer Service Portal. • View Known Error articles for a problem related to a case.

Integration with Incident Management

Integration with the Incident Management application enables customer service agents to create incident records from cases or associate existing incident records to cases. For more information, see CSM integration with Incident Management.

Integration with Problem Management

Integration with the Problem Management application enables customer service agents to create problem records from cases or associate existing problem records to cases. For more information, see CSM integration with Problem Management.

Integration with Change Management

Integration with the Change Management application enables customer service agents to create change records from cases or associate existing change records to cases. For more information, see CSM integration with Change Management.

Integration with Request Management

Integration with the Request Management application enables customer service agents to create request records from cases or associate existing request records to cases. It also enables customers to create requests from the Customer and Consumer Service Portals. For more information, see CSM integration with Request Management.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM integration with IT Service Management overview

Customer Service Management provides an integration with the Incident, Problem, Change, and Request Management applications.

Plugins

Customer Service Management integration with Service Management requires the following plugins:

- Customer Service with Service Management plugin (com.sn_cs_sm)
- Customer Service with Request Management plugin (com.sn_cs_sm_request)

For additional information, see Integrate with Service Management.

Roles

The Service Management integration plugins do not add any roles to the customer service agent (sn_customerservice_agent) role. To enable the Service Management integration features, you must assign the CSM/ITSM integration roles included with the Incident Management application to the agents who need this capability. For more information, see Assign CSM/ITSM integration roles.

Creating records for a case

The Service Management integration plugins add the following menu items to the Additional Actions menu on the Case form. Agents can use these menu items to create records for a case.

- Create Incident
- Create Problem
- Create Request
- Create Normal Change
- Create Standard Change

Note:
Agents can create or associate one incident, problem, or change record with a case. After a record is created or associated with a case, the corresponding menu items are no longer available on the Additional Actions menu.

For more information, see Create incident, problem, change, and request records from cases.

Viewing incident, problem, and change records related to a case

The Service Management integration plugins add the Related Records form section to the Case form. This section includes the following fields:

- Incident
- Problem
- Change Request
- Caused by Change

When an incident, problem, or change record is created from a case, or an existing record is associated with a case, the record number is added to the corresponding field in the Related Records form section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing requests related to a case

When a request is created from a case, or an existing request is associated with a case, the request record number is added to the **Requests** related list on the Case form.

Note:
Agents can create multiple requests for a case.

Related records list widget for external customers

When viewing a case on the Customer or Consumer Service Portal, external users can see other records that are associated with the case in the Related Records list widget. These records can include problems, changes, and requests. Users can click a record in the Related Records widget to view additional details in a pop-up window.

Note:
If a case does not have any related records, the Related Records widget does not appear on the case view page.

From the Customer and Consumer Service Portals, users can view lists of cases and requests by doing one of the following:

- Clicking **My Lists** in the portal menu header.
- Clicking **Requests** > **All Requests** in the portal menu header.

For more information, see View case records from the Customer and Consumer Service Portals.

Using case resolution codes

The Service Management integration plugins provide the following case resolution codes.

Agents can select these codes from the **Resolution code** field in the **Resolution Information** section on the Case form.

- Solved – Fixed by closing related PRB
- Solved – Workaround provided based on open PRB
- Solved – Fixed by closing related Change Request
- Solved – Fixed by closing related Incident
- Solved – Related Request is Closed Complete

IT Service Management integration and Major Issue Management

The major issue management feature works with the CSM integration with IT Service Management as follows:

- A major issue manager with the itil role can create incident, problem, change, and request records from a major case.
- When a major case candidate with an associated record is accepted as a major case:
  - A new major case is created and the candidate becomes a child of the major case.
  - The related record information is copied from the child case to the major case.
  - For the child case, the options to create related records are removed from the Additional Actions menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - For the child case, the fields in the Related Records form section are read-only.
  - Updates to the related records appear in the work notes of the major case. These updates are added to the child case when fields are synchronized from the major case to the child case.
- A major case and child cases can have different types of related records. This can happen when an existing case with a related incident, problem, change, or request record is added as a child of a major case. When updates are made to the record related to the child case, information about the update is added to the child case work notes.
- If a major case and child cases have the same related record, updates to that record are added to the major case work notes. These notes are copied from the major case to the child cases if:
  - The **sn_customerservice.case_fields_to_sync** property is enabled.
  - The field in the in the Related Records form section is added to the **sn_customerservice.case_fields_to_sync** property.
- If a major case and child cases have different related records of the same type, updates to the records are copied only to the respective cases.

CSM integration with Incident Management

Integration with the Incident Management application enables customer service agents to create incident records from cases or associate existing incident records to cases.

With this integration, customer service agents can:

- Create an incident from a case.
- Associate an existing open incident to a case.
- Remove an associated incident from a case.
- View the following in the case work notes:
  - Incident state changes.
  - Additional comments added to the incident record.

Note:
A case can be associated with one incident. If a case is already associated with an incident, the **Create Incident** item does not appear on the Additional Actions menu.

Plugins

Integration with Incident Management requires the Customer Service with Service Management plugin (com.sn_cs_sm).

Roles

The following roles enable customer service agents to view and create incidents for customer service cases.

- sn_incident_read
- sn_incident_write

For more information, see Assign CSM/ITSM integration roles.

Determining the incident priority, impact, and urgency

When creating an incident from a case:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the incident data lookup is active, the system copies the case priority to the incident priority and calculates the incident impact and urgency based on the Priority Data Lookup [dl_u_priority] table.
- If the Incident data lookup is inactive, the system uses these default settings for the incident fields:
  - Priority: 5 - Planning
  - Impact: 3 - Low
  - Urgency: 3 - Low

Synchronizing data between the incident and the case

Work notes are synchronized from the incident to the case when:

- The incident state changes. If the incident state changes to On Hold, the hold reason is copied to the case work notes.
- The incident is resolved or closed. The incident resolution notes and resolution code are copied to the case work notes.
- Additional comments are added to the incident.

Note:
When an incident is created or an existing incident is associated with a case, notification from the incident is suppressed if the caller is an external user (contact or consumer).

CSM integration with Problem Management

Integration with the Problem Management application enables customer service agents to create problem records from cases or associate existing problem records to cases.

With this integration, customer service agents can:

- Create a problem from a case.
- Associate an existing open problem to a case.
- Remove an associated problem from a case.
- View problem state changes in the case work notes.

Note:
A case can be associated with one problem. If a case is already associated with a problem, the **Create Problem** item doesn't appear on the Additional Actions menu.

Plugins

Integration with Problem Management requires the Customer Service with Service Management plugin (com.sn_cs_sm).

Roles

The following roles enable customer service agents to view and create problems for customer service cases.

- sn_problem_read
- sn_problem_write

For more information, see Assign CSM/ITSM integration roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synchronizing data between the problem and the case

With the Problem Management Best Practice – Madrid plugin activated, customer service agents can view the following information in the case work notes:

- When the state of a related problem is updated, the text of the work note includes a link to the problem.
- When **Communicate Workaround** is selected from the related problem, the workaround text is copied to the case work notes.
- When **Communicate Fix** is selected from the related problem, the fix text is copied to the case work notes.
- When the problem is resolved or closed with a specific resolution code:
  - State is Closed and Resolution Code is Cancelled. The Cancelled Reason text is copied to the case work notes.
  - State is Closed and Resolution Code is Risk Accepted, the Cause notes, Risk accepted reason, and Fix notes are copied to the case work notes.
  - State is Resolved and Resolution Code is Fix Applied, the Cause notes, and Fix notes are copied to the case work notes.
  - State is Closed and the Resolution Code is Fix Applied, the Cause notes, and Fix notes are copied to the case work notes.

With the Problem Management Best Practice - Madrid - Knowledge Integration plugin activated, the customer service agent can view information in the case work notes when a Known Error Article is created for or associated with a related problem. The work note includes a link to the article.

CSM integration with Change Management

Integration with the Change Management application enables customer service agents to create change records from cases or associate existing change records to cases.

With this integration, customer service agents can perform the following tasks:

- Create a change from a case.
- Associate an existing open change to a case.
- Remove an associated change from a case.
- View the following information in the case work notes:
  - State changes for the change record.
  - Additional comments added to the change record.

Note:
A case can be associated with one change. If a case is already associated with a change, the **Create Normal Change** and **Create Standard Change** options do not appear on the Additional Actions menu.

Plugins

Integration with Change Management requires the Customer Service with Service Management plugin (com.sn_cs_sm).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles

The following roles enable customer service agents to view and create changes for customer service cases.

- sn_change_read
- sn_change_write

For more information, see Assign CSM/ITSM integration roles.

Synchronizing data between the change and the case

Work notes are synchronized from the change to the case when:

- The change state or change type is updated.
- Additional comments are added to the change record.
- When the change associated with a case is put on hold, the work notes are updated with the hold reason.
- When a hold on the change associated with a case is removed, the work notes on the case are updated.
- When the change is resolved or closed.

Change form related lists

Integration with the Change Management application adds the following related lists to the Change form:

- Cases Fixed by Change
- Cases Caused by Change

Standard change record producer behavior

When a record producer for a standard change or normal change is created and exposed to customer service agents from the Customer or Consumer Service Portals:

- The record producer only appears in the portal after clicking the **Create Request** UI action.
- The record producer does not appear as part of Standard Change catalog items.
- If the agent chooses to create a Standard Change from the normal record producer, the Standard Change is created but the change record is not linked with the case.

CSM integration with Request Management

Integration with the Request ManagementCSM application enables customer service agents to create request records from cases or associate existing request records to cases. It also enables customers to create requests from the Customer and Consumer Service Portals.

With this integration, customer service agents can:

- Create one or more requests on behalf of a customer from an existing customer service case.
- Associate an existing request to a case.
- Remove an associated request from a case.
- View a list of requests associated with a case in the **Requests** related list.
- View the following in the case work notes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Request state changes.
- Additional comments added to the request item record.

Note:
When creating a request from a case, if the agent chooses a catalog item that is using cart v1 (the use_sc_layout field is not checked), the case is not set as the parent of the request.

Plugins

Integration with Request Management requires the Customer Service with Request Management plugin (com.sn_cs_sm_request).

Roles

The following roles enable customer service agents to view and create requests for customer service cases.

- sn_request_read
- sn_request_write

For more information, see Assign CSM/ITSM integration roles.

Enabling the Create Request UI action for case types

To enable the **Create Request** UI action for a case type table that extends the Case [sn_customerservice_case] table, add an entry for the case type to the Request Parent Mapping [request_parent_mapping] table. For more information, see Enable the Create Request UI action for case types.

Synchronizing data between the request and the case

Work notes are synchronized from the request to the case when:

- The request state changes.
- The request is closed.
- Additional comments are added to the request.

Note:
When a request is closed, the case does not automatically move to solution proposed.

Communicating with the requester

The task fulfiller can communicate with the requester if additional information is needed. Use the **Additional comments** field on the request to communicate with the requester through the case. Information added to the **Additional comments** field on the request is synchronized to the case work notes.

If the case is the parent of the request, notifications to the requester are suppressed when additional comments are added to the request by the fulfiller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

- Create a request on behalf of a customer or consumer
- Create a request record from a case
- Create a request from the Customer and Consumer Service Portals

Service catalog integration with the Customer and Consumer Service Portals

Users with the customer administrator role (sn_customerservice.customer_admin) can associate a portal with a service catalog.

The following catalog pages and widgets are provided as part of the Customer Service with Request Management integration.

For more information, see Associate a portal with a catalog.

CSM Catalog page

The CSM Catalog page is the display page for catalog items on the Customer and Consumer Service Portals. This page serves as the landing page for any service catalog item exposed on a CSM portal. All request items exposed on the CSM portals are either service catalog items or service catalog record producers. Navigate to **Service Portal** > **Pages** to view this page.

- Page ID: csm_sc_cat_item
- Update name: sp_page_7ea80b123bb31300bfe04d72f3efc4b7
- Available to roles: snc_internal, snc_external

CSM Catalog Item widget

This widget handles the redirection logic on submission of the catalog item and embeds the default catalog item widget. This widget listens to event **$sp.sc_cat_item.submitted**. On submission of a catalog item, it handles the portal redirection logic based on the page_id and the catalog portal URL. When there's no parent set in the Requests (sc_request) table, the URL is redirected to the default service portal ticket page. If a record producer has a redirect URL, this widget uses the redirect URL from the record producer instead of redirecting to the ticket page.

- Widget ID: csm-sc-cat-item
- Update name: sp_widget_ec837c713bbb1300bfe04d72f3efc4d1
- Available to roles: snc_internal, snc_external

Page route map

It's important to set up a page route map for any new Service Portals to handle the redirection to the Case ticket page. The redirection is based on the logic described in the CSM Catalog Item widget.

- CSM Catalog item page route map: For the Customer Service Portal, this page route map routes the URL redirect from the sc_cat_item page to the csm_sc_cat_item page.
- CSP Catalog item page route map: For the Consumer Service Portal, this page route map routes the URL redirect from the sc_cat_item page to the csm_sc_cat_item page.

Portal settings for catalog items

Once the catalog items are defined, visibility of the **Submit**/**Add to Cart** button can be controlled by navigating to **Service Catalog** > **Catalog Definitions** > **Maintain Items**, selecting the desired item, and enabling or disabling the fields in the Portal Settings form section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maintain Items Portal settings fields

Field	Description
Request method	Select Order, Request, or Submit as the type of catalog item.
Hide 'Add to Cart'	Enable if the **Add to Cart** button should be disabled for the catalog item. **Note:** The **Add to Cart** button isn't currently supported on the Customer Service Portal or the Consumer Service Portal.
Hide Quantity	Enable if the **Quantity** of the catalog item should be hidden.
Hide Delivery Time	Enable if the **Delivery Time** of the catalog item should be hidden.
Hide 'Add to Wish List'	Enable if the **Add to Wish List** button for the catalog item should be hidden.
Hide Attachment	Enable if the attachment of the catalog item should be hidden.

Extension points for CSM integration with IT Service Management

Use the extension points available with CSM integration with IT Service Management to extend the functionality of your application.

Extension points enable you to extend the functionality of an application and integrate customizations without altering the application code. Extension points are stored in the Extension Point [sys_extension_point] table.

Using an extension point to map the Incident field

Customers can create the logic for mapping the **Incident** field by using the *sn_cs_sm.CSMIncidentIntegrations* extension point.

For more information about mapping fields, see the How to map or copy field values from Case to Incident when using CSM Integration with Incident Management [KB0817494] article in the HI Knowledge Base.

Using an extension point to map the Problem field

Customers can create the logic for mapping the **Problem** field by using the *sn_cs_sm.CSMProblemIntegrations* extension point.

Using an extension point to map the Change Request field

The Customer Service with Service Management plugin (com.sn_cs_sm) adds the *CSMChangeIntegrations* extension point, which exposes generic APIs that are used for Case to Change integration.

Note:
The *CSMChangeIntegrations* extension point is read only. To modify this extension point, contact ServiceNow Customer Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Customer Service with Service Management plugin also adds an implementation of the *CSMChangeIntegrations* extension point. This implementation can be modified and deactivated. However, this isn't recommended.

If it's necessary to modify the APIs within the *CSMChangeIntegrations* extension point, the system administrator can:

- Create an implementation of an extension point.
- Make the necessary changes in the implementation.
- Update the order of the implementation to a lower number. The system executes the implementation with the lowest order number.

Note:
API names used in the implementation must remain the same, otherwise the extension point won't be able to identify the implementation, causing an error.

For example, the *CSMChangeIntegrations* extension point includes the following *copyFieldsFromCaseToChange* API for creating a change from a case record.

```
copyFieldsFromCaseToChange: function(changeGr, caseGr) {
  changeGr.short_description = caseGr.short_description;
  changeGr.cmdb_ci = caseGr.cmdb_ci;
  changeGr.impact = caseGr.impact;
  changeGr.urgency = caseGr.urgency;
  changeGr.priority = caseGr.priority;
  changeGr.company = caseGr.account;
  changeGr.sys_domain = caseGr.sys_domain;
},
```

To modify this API, create an implementation of the extension point and make the desired changes without changing the API name.

```
copyFieldsFromCaseToChange: function(changeGr, caseGr) {
  changeGr.abcd = caseGr.abcd;
},
```

Using an extension point to map the Request field

Customers can create the logic for mapping the **Request** field by using the *sn_cs_sm_request.CSMRequestIntegrations* extension point.

Using an extension point to approve changes and requests from the Customer Service Portal

This feature includes an extension point that can be used to configure approval entities: **global.CSMApprovalsManagement**. Use this extension point to extend the approval functionality to any other entity, such as a problem.

Related topics

Using extension points to extend application functionality

Setting up CSM integration with IT Service Management

Integrate Customer Service Management with IT Service Management that includes the Request, Incident, Problem, and Change Management applications. With this integration, users can create request, incident, problem, and change records from customer service cases. External users can view these records from the Customer and Consumer Service Portals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IT Service Management configuration tasks

Task	Description
Integrate with IT Service Management using Guided Setup	Use the Guided Setup to integrate CSM with IT Service Management.
Activate Customer Service Management with Service Management	Activate the CSM with Service Management plugin (com.sn_cs_sm) to enable the integration the following applications: • Incident Management • Problem Management • Change Management
Activate Customer Service Management with Request Management	Activate the CSM with Request Management plugin (com.sn_cs_sm_request) to use the integration with the Request Management application.
Assigning CSM/ITSM integration roles	Assign the required roles to the customer service agents and managers who will be creating the request, incident, problem, and change records from customer service cases.
Enable external customers to access problem, change, and request records	Assign access controls (ACLs) to the external user roles to provide visibility to case-related request, problem, and change records from the Customer and Consumer Service Portals.
Enable external customers to create requests	Assign roles to external customers which enable them to create requests.

Enable external customers to approve requests and changes	Enable external customers to approve changes and requests:
	• Add external users to approval groups or assign roles for approval users.
	• Add the necessary ACLs to the snc_external role for the following table:
	  ○ Change Request (change_request)
	  ○ Request (sc_request)
	  ○ Request Item (sc_req_item)

Enable the Create Request UI action for case types	Enable the **Create Request** UI action for case type tables that extend the Case [sn_customerservice_case] table.

Integrate with IT Service Management using Guided Setup

Use the Guided Setup to integrate Customer Service Management with the Request, Incident, Problem, and Change Management applications.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To configure the integration with the Request, Incident, Problem, and Change Management applications, use the Customer Service guided setup. The guided setup takes you through the setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Integration with Service Management category, click **Get Started**.
   The Integration with Service Management page opens with a list of tasks to activate plugins and assign roles.
4. To perform a task, click **Configure**.
   This button opens the page in your instance where the configuration is completed.

Activate Customer Service Management with Service Management

Activate the CSM with Service Management plugin to use the integration with Service Management.

Before you begin

Instead of doing the configuration through this procedure, consider using guided setup. For more information, see Integrate with IT Service Management using Guided Setup.

Role required: admin

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Search for the Customer Service with Service Management plugin (com.sn_cs_sm).
3. Click **Activate**.

Activate Customer Service Management with Request Management

Activate the CSM with Request Management plugin to use the integration with Request Management.

Before you begin

Instead of doing the configuration through this procedure, consider using guided setup. For more information, see Integrate with IT Service Management using Guided Setup.

Role required: admin

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Search for the Customer Service with Request Management plugin (com.sn_cs_sm_request).
3. Click **Activate**.

Assigning CSM/ITSM integration roles

To enable the Service Management integration features, assign the CSM/ITSM integration roles that are included with the Incident Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Service Management integration plugins do not add any roles to the customer service agent role (sn_customerservice_agent). To enable the Service Management integration features, you must assign the CSM/ITSM integration roles included with the Incident Management application.

- Assign roles to agents using guided setup. For more information, see Integrate with IT Service Management using Guided Setup.
- Assign roles to agents using the *ServiceNow AI Platform* user administration feature. For more information, see Assign a role to a user.

CSM/ITSM integration roles

Several types of roles are available with CSM integration with ITSM.

CSM/ITSM integration roles for agents

These roles enable customer service agents to view and create incident, problem, change, and request records for customer service cases.

CSM/ITSM integration roles for agents

Role title [name]	Description	Contains roles
sn_incident_read	Customer service agents with this role can: • View information about an incident record associated with a customer service case. • Associate an existing incident record with a customer service case. • Remove an incident record associated with a customer service case.	• dependency_views • workspace_agent • view_changer • sn_comm_management.comm_plan_viewer • cmdb_read • cmdb_query_builder_read
sn_incident_write	Customer service agents with this role can: • Create an incident record for a customer services case. • Associate an existing incident record with a customer service case. • Remove an incident record associated with a customer service case.	sn_incident_read
sn_problem_read	Customer service agents with this role can:	• dependency_views • workspace_agent • view_changer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM/ITSM integration roles for agents (continued)

Role title [name]	Description	Contains roles
	• View information about a problem record associated with a customer service case. • Associate an existing problem record with a customer service case. • Remove a problem record associated with a customer service case.	• cmdb_read • cmdb_query_builder_read
sn_problem_write	Customer service agents with this role can: • Create a problem record for a customer services case. • Associate an existing problem record with a customer service case. • Remove a problem record associated with a customer service case.	sn_problem_read
sn_change_read	Customer service agents with this role can: • View information about a change record associated with a customer service case. • Associate an existing change record with a customer service case. • Remove a change record associated with a customer service case.	• dependency_views • workspace_agent • view_changer • cmdb_read • app_service_user • cmdb_query_builder_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM/ITSM integration roles for agents (continued)

Role title [name]	Description	Contains roles
sn_change_write	Customer service agents with this role can: • Create a change record for a customer services case. • Associate an existing change record with a customer service case. • Remove a change record associated with a customer service case.	• sn_change_read • template_editor • cmdb_query_builder
sn_request_read	Customer service agents with this role can view information about request records associated with a customer service case in the **Requests** related list.	None
sn_request_write	Customer service agents with this role can create request records for customer service cases.	• sn_request_read • task_editor • dependency_views • workspace_agent • view_changer • cmdb_read • cmdb_query_builder_read

CSM/ITSM integration roles for external customers

These roles enable external customers to take the following actions:

- View and create request records from the Customer and Consumer Service Portals.
- Approve changes and requests from the Customer Service Portal.

CSM/ITSM integration roles for external customers

Role	Actions
Customer administrator [sn_customerservice.customer_admin]	Users with this role can: • Browse the service catalog and catalog items and make a selection. • Create requests for themselves, for other contacts from the same account, or for child accounts. • View the request details.

CSM/ITSM integration roles for external customers (continued)

Role	Actions
Partner [sn_customerservice.partner]	Users with this role can: • Browse the service catalog and catalog items and make a selection. • Create requests for themselves (if they also have the customer role). • Create requests on behalf of the accounts with which they have established relationships. • View cases and requests.
Customer case manager [sn_customerservice.customer_case_manager]	Users with this role can: • Browse the service catalog and catalog items and make a selection. • Create requests for themselves or for other contacts from the same account. • View the request details.
Customer [sn_customerservice.customer]	Users with this role can: • Create a request. • View the request details.
Proxy contact [sn_customerservice.proxy_contact]	Users with this role can: • Browse the service catalog and catalog items and make a selection. • Create requests on behalf of customers. • Add the account and contact information of the customers. • View the details of the case and the related request.

Enable external customers to access problem, change, and request records

With access to problem, change, and request records, external customers can view these records associated with their customer service cases from the Customer and Consumer Service Portals.

Before you begin

Role required: admin

About this task

The snc_internal or snc_external role and with read access to the related problem, change, and request records can view these records from the Customer and Consumer Service Portals. After logging in, users can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select a case and view the records related to that case in the Case Related Records widget.
- Select a record in the Case Related Records widget to open the record details in the Ticket Fields widget.

Note:
The Related Records list shows data only if the logged-in user has access to view the related records.

Customers, customer partners, and internal users with the proxy contact role (sn_customerservice.proxy_contact) can also create requests from the Customer and Consumer Service Portals. For more information about this feature, see Create cases as a proxy contact.

Customers can also view Known Error articles for a problem related to a case. These articles are displayed:

- If there's a KE article present for the problem record. If there are multiple articles associated with the problem, the customer has access to the primary article. If there are no articles, the customer doesn't see the link.
- If the customer has access to the KE article.

Procedure

1. Provide access to problem, change, and request records by configuring ACLs for the snc_external role.
   This access isn't provided out of box. You must add these ACLs to the snc_external user role based on case access. For more information, see Access control list rules.

   Note:
   Existing ACLs on the problem, change, and request records might impact the visibility for external users.

2. Configure the Case Related Records widget.
   By default, this widget is displayed for users with the snc_internal and snc_external roles. For more information, see Service Portal widgets.
3. Define the views for the problem, change, and request records and select the fields that are visible to external customers.
   For more information, see Create and delete views.

   Note:
   For the Consumer Service Portal, you can define views and select fields for problem and change records. Request records display a default set of fields in the Ticket Fields widget.

Related records list widget

When viewing a case on the Customer or Consumer Service Portal, external users can see other records associated with the case in the Related Records list widget.

These records can include problems, changes, and requests. Users can select a record in the Related Records widget to view additional details in a pop-up window.

Request records

For request records, users can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Expand or collapse a request and view a list of the items associated with the request.
- Select an item in this list to see additional information, including the state of the requested item.

Note:
If a case does not have any related records, the Related Records widget does not appear on the case view page.

From the Customer and Consumer Service Portals, users can view lists of cases and requests by doing one of the following:

- Selecting **My Lists** in the portal menu header.
- Selecting **Requests** > **All Requests** in the portal menu header.

The list view page includes a **My Lists** filter with the following options:

- **All**: Displays all case and request records.
- **Action Needed**: Displays cases in the **Resolved** state that are waiting for a customer response.
- **My Issues**: Displays the cases that were not initiated as a request.
- **My Requests**: Displays the cases that were created as a request.

Enable external customers to create requests

Enable your external customers to create and track requests from the Customer and Consumer Service Portals.

Before you begin
Role required: admin

About this task
Each submitted request generates a case, with the request record associated to that case. Customer service agents can also create requests on behalf of contacts and consumers.

Note:
This feature requires activation of the Customer Service with Request Management plugin (com.sn_cs_sm_request).

Procedure

Configure the Case form to display the **Initiated as request** field.
When a request is created from the portal, the system creates a case for the request and sets this field to true.

Note:
The **Initiated as request** field is read-only for all users.

Related topics

Create a request on behalf of a customer or consumer

Request an item or service from the Customer Service Portal

Enable external customers to approve requests and changes

Enable your external customers to approve change and request records related to customer service cases from the Customer Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Changes and requests related to a case typically require end user approval before the tasks can be completed. The tasks can be initiated by customers and by external users. For example:

- A customer creates a change in order to apply a patch. This change requires approval from the contact before the patch can be applied.
- A contact requests a catalog item from the Customer Service Portal. This request requires approval by another employee within the contact's organization before the request can be fulfilled.

Use this feature to send approval requests and enable external customers with the snc_external role to approve those requests as part of the task approval workflow. From the Customer Service Portal, external customers can:

- View and approve requests and change requests.
- View the details of the requested items in a request record.
- View the status of a request or change request in the Related Records widget.

Important:
Approving requests and changes requires the approver_user role, which is a licensed role. For more information, see KB0716592.

Procedure

1. Add external users to approval groups or assign roles for approval users in order to see approval records on the Customer Service Portal.
2. Add the necessary ACLs to the snc_external role for the following tables.
   - Change Request (change_request)
   - Request (sc_request)
   - Request Item (sc_req_item)

   Note:
   The sn_esm_user role provides access to the approval records where the logged-in user is the approver and enables the logged-in user to either approve or reject the approval request. Customer Service Management requester roles (including the customer contact, partner contact, customer admin, and partner admin roles) contain the sn_esm_user role, which enables these roles to perform the approve and actions.

   For more information, see Table ACL rules and Field ACL rules.

Enable the Create Request UI action for case types

Enable the **Create Request** UI action for case type tables that extend the Case [sn_customerservice_case] table.

Before you begin
Role required: admin

About this task
To enable the **Create Request** UI action for a case type table that extends the Case table, add an entry for the case type to the Request Parent Mapping [request_parent_mapping] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an agent creates a request for a case in the case type table, the system adds the request to the Requests tab on the case record.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the Request Parent Mapping [request_parent_mapping] table.
3. Select the Show List related link to open the list view for the table.
4. Select **New** to create an entry for the case type table.
5. Fill in the following fields in the Request Parent Mapping record.
   a. Enter a name for the entry in the **Name** field.
   b. Select the case type table in the **Parent table** field.
   c. In the **Request parent** field, select Parent.
   d. In the **Parent requestor** field, select Contact.
6. Select **Submit**.

Create incident, problem, change, and request records from cases

As customer service agents, create incident, problem, change, and request records from open cases in workspaces.

Create an incident record from a case

As a customer service agent, create an incident record from a case or associate an existing incident with a case in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

Procedure

1. Open a customer service case.
2. Select the More UI Actions icon (...) and select **Create Incident**.
   The following information is copied from the case to the incident record:

Case to incident field mapping

Case fields	Incident fields
Short description	Short description
Default impact	Impact
Urgency	Urgency
Contact	Caller
Configuration item (if available)	Configuration item

Note:
You can manually change the incident impact and urgency to different values on the incident record as needed.

Result

Information about the incident is added as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An update with the incident number is added to the case work notes.
- The incident is added to the **Incident** field in the **Related Records** form section on the case form.
- The case number is added to the Customer Cases related list on the Incident record.
- If the case has an associated Problem, Change Request, or Caused by Change record, this information is also copied to the incident record.
- The domain of the incident is mapped to the domain of the case.

Create a problem record from a case

As a customer service agent, create a problem record from a case or associate an existing problem with a case in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

Procedure

1. Open a customer service case.
2. Select the More Actions icon (···) and select **Create Problem**.
   The following information is copied from the case to the Problem record:

Case to problem field mapping

Case fields	Problem fields
Short description	Problem statement
Impact	Impact
Urgency	Urgency
Priority	Priority
Company	Company
Configuration item (if available)	Configuration item (if blank on case, agent can manually update on problem record)
Case sys_id	First reported by

Note:
You can manually change the problem impact and urgency to different values on the Problem record as needed.

Result

Information about the problem is added as follows:

- An update with the problem number is added to the case work notes.
- The problem is added to the **Problem** field in the **Related Records** form section on the case form.
- The case number is added to the Customer Cases related list on the Problem record.
- The domain of the problem is mapped to the domain of the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a normal change record from a case

As a customer service agent, create a normal change record from a case or associate an existing normal change record with a case in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

Procedure

1. Open a customer service case.
2. Select the More Actions icon (⋯) and select **Create Normal Change**.
   The following information is copied from the case to the change record:

Normal Change record fields

Case fields	Change fields
Short description	Short description
Description	Description
Impact	Impact
Urgency	Urgency
Priority	Priority
Company	Company
Contact	Caller
Configuration item (if available)	Configuration item **Note:** The change manager can update the configuration item on the change record. If the configuration item is not available, the agent can also manually update this information.

Note: You can manually change the change impact and urgency to different values on the change record as needed.

Default values are added to the following fields on the change record:

- **Type**: Normal
- **State**: New
- **Category**: Other
- **Risk**: Moderate

Result

Information about the change is added as follows:

- An update with the change number is added to the case work notes.
- The change is added to the **Change Request** field in the **Related Records** form section on the case form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The case number is added to the Customer Cases related list on the Chnage record.
- The **Requested by** field on the change record is updated with the case agent.
- The domain of the change is mapped to the domain of the case.

Create a standard change record from a case

As a customer service agent, create a standard change record from a case or associate an existing standard change record with a case in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

Procedure

1. Open a customer service case.
2. Select the More Actions icon (···) and select **Create Standard Change**.
   The standard change record is created using the Standard Change template, which is defined in the Standard Change catalog. The data mapping is created from the template; no data is copied from the case to the change record.

Create a request record from a case

As a customer service agent, create a request record from a case or associate an existing request with a case in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

Procedure

1. Open a customer service case.
2. Select the More Actions icon (···) and select **Create Request**.
   The following information is copied from the case to the request record:

Case to request field mapping

Case fields	Request fields
Short description	Short description
Contact	Contact

Note:
You can manually change the request impact and urgency to different values on the request record as needed.

Result

Information about the incident is added as follows:

- An update with the request number is added to the case work notes.
- The request is associated with the case and is added to the **Requests** related list on the Case form.
- The case number is added to the Customer Cases related list on the request record.
- The domain of the request is mapped to the domain of the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a request from the Customer and Consumer Service Portals

As customers, you can create and submit requests from the Customer and Consumer Service Portals. The request process is integrated with Service Catalog.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.customer_case_manager, sn_customerservice.customer, sn_customerservice.consumer, sn_customerservice.proxy_contact

About this task

Note:
Creating a request from the Customer and Consumer Service Portals requires activation of the Customer Service with Request Management plugin (com.sn_cs_sm_request). It also requires that the system administrator provide external customers with access to request records.

Partners, partner administrators, and proxy contacts can submit requests on behalf of other accounts or contacts with the addition of the following variable set to the desired catalog items: **csm_request_variable_set**. This variable set adds the **Account** and **Contact** fields. For more information, see Service catalog variable sets.

Procedure

1. Do one of the following to create a request:
   - Click the **Request Something** link on the portal landing page.
   - Click **Requests** > **Request Something** in the portal menu header.
2. Browse the service catalog and select the desired item or service.
   You can also use the Category filters to filter the available items.
3. Fill in any necessary information related to the request.
4. Click **Submit**.
   The following information is copied from the request to the case:

Request to case field mapping

Request fields	Case fields
Short description	Short description
Requested for	Contact
Account	Account

Result

- A new case is created, which becomes the parent of the request. One request is associated with a case and a request contains one item.
- The case is used as the reference for the customer, who can see the request status and updates from the case on the Customer Service Portal.
- All cases associated with a request appear on the request record in the **Cases** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrating with Service Portfolio Management

Integrate Customer Service Management with the Service Portfolio Management (SPM) application. This integration gives customer service managers, customer service agents, and service owners visibility into sold products and their associated service offerings.

Using the integration between Customer Service Management and Service Portfolio Management has the following benefits:

- Increase customer service agent productivity: Empower customer service agents to quickly view the service offerings and associated definitions for sold products.
- Increase service owner productivity: Empower service owners to quickly identify customers subscribed to services.

The Customer Service Management integration with Service Portfolio Management can be used in the following ways.

1. Customer service managers can associate service offerings to product models. For more details, see Associate services with product models
2. Customer service managers can associate service offerings to sold products. For more details, see Associate service offerings with sold products
3. Service owners can view service offerings and which customers have subscribed to them.
4. Customer service agents can view which service offerings are associated to the sold products affected by an issue. They can also see the service commitments and availability. For more details, see View sold product information in CSM Configurable Workspace

Activation information

Activate the following plugin.

Name	Description
CSM with Service Portfolio Management (SPM) [sn_csm_spm]	Enables integration with the Service Portfolio Management (SPM) application. This integration gives customer service managers, customer service agents, and service owners visibility into sold products and their service offerings.

Roles

Ensure that users can perform all the necessary actions by assigning roles.

Roles required for Service Portfolio Management (SPM) application integration

Role	Description
service_editor	Assign this role to customer service managers if they need to update any service offerings they own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required for Service Portfolio Management (SPM) application integration (continued)

Role	Description
portfolio_admin	Assign this role to customer service managers if they need to associate service offerings to a product model.

Integrate with Service Portfolio Management using Guided Setup

Use the Guided Setup to integrate Customer Service Management with the Service Portfolio Management (SPM) application.

Before you begin

Role required: admin

About this task

To configure the integration with Service Portfolio Management, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**
3. In the Integration with Service Portfolio Management (SPM) category, view the list of tasks to configure the feature.

Service Portfolio Management configuration tasks

Task	Description
Activate Customer Service Management with Service Portfolio Management	Activate the CSM with Service Portfolio Management (SPM) plugin to use the integration with Service Portfolio Management.
Configure form views	Configure the form layout and related lists for the Sold Product, Case, Account, and Service Offering forms. Configuration provides users with information regarding which service offerings are associated with each sold product.
Assign roles	Assign the required roles to customer service managers based on your organization's existing roles and responsibilities.

4. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Related topics

Service Portfolio Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Customer Service Management with Service Portfolio Management

Activate the CSM with Service Portfolio Management (SPM) plugin to use the integration with Service Portfolio Management.

Before you begin

Consider using guided setup to complete the Service Portfolio Management configuration. For more information, see Integrate with Service Portfolio Management using Guided Setup.

Note:
Check your entitlements to determine whether you have access to the integration with Service Portfolio Management and the CSM with Service Portfolio Management (SPM) plugin (sn_csm_spm).

Role required: admin

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Search for the sn_csm_spm plugin.
3. Select **Activate**.

Configure form views for Service Portfolio Management integration

Configure the form layout and related lists for the Sold Product, Case, Account, and Service Offering forms to provide users with the correct visibility into which service offerings are associated with which sold products.

Before you begin

Role required: admin

Instead of doing the configuration through this procedure, consider using guided setup. For more information, see Integrate with Service Portfolio Management using Guided Setup.

Procedure

1. Navigate to **Customer Service**.
2. Add the following fields to forms and related lists, as required.

Configure form views

Form	Procedure
Service Offering	Add the **Add the Sold Products** related list to provide service owners visibility into which customers have subscribed to which service offerings.
Product Model forms	Add the **Offerings** (**Offering** > **Model ID**) related list on the Product Model/Service Model forms to enable customer service managers to associate service offerings to product models. To enable the **Edit** button on the Offerings related list: **a.** Configure the list control and deselect the **Omit Edit** check box. **b.** Add the sn_customerservice_manager role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Form	Procedure
	If you do not see the **Edit** button enabled, see Assign roles for Service Portfolio Management integration for more details. **Note:** To configure catalog items for product models, add the Catalog Items related list. For more information, see Configure product model and catalog item relationships.
Sold Products on the Account form	Add the **Service Offering** column to the Sold Products related list to enable customer service agents or managers to view service offerings associated with the sold product for an account or consumer.
Case	Add the **Service Offering** field for the Sold Product to the Case form. This enables customer service agents dealing with customer issues to see the service offering associated with sold product for a case.
Sold Product	Add the **Service Offering** field to the Sold Product form to enable customer service managers to associate a service offering to a sold product for an account or consumer.

Assign roles for Service Portfolio Management integration

Assign the required roles to customer service managers based on the roles and responsibilities in your organization.

Before you begin

Role required: admin

Instead of doing the configuration through this procedure, consider using guided setup. For more information, see Integrate with Service Portfolio Management using Guided Setup.

Procedure

1. Assign the service_editor role to customer service managers if they need to update any service offerings they own.
2. Assign the portfolio_admin role to customer service managers if they need to associate service offerings to a product model.

Integrating with Continual Improvement Management

Integrate Customer Service Management (CSM) with the Continual Improvement Management (CIM) application to request improvement opportunities and to implement phases and tasks to meet performance goals, track progress, and measure success.

You can use CIM for improvements to Performance Analytics (PA) indicators and to service operations. For example, create a new improvement initiative to:

- Reduce the open case backlog.
- Improve the average case response time.

See Continual Improvement Management for more information about how CIM can help you with setting goals, organizing effort, and completing tasks.

- Managing improvements

Integrate with Continual Improvement Management

Customer Service Management provides an integration with the Continual Improvement Management application. This integration enables you to request improvement opportunities and to implement phases and tasks to meet performance goals, track progress, and measure success.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the Continual Improvement Management (com.sn_cim) plugin.
3. Click **Activate**.

Integrating with IT Operations Management

The Proactive Customer Service Operations plugin (com.snc.proactive_cs_itom) provides an integration between Customer Service Management and the Event Management console in IT Operations Management.

This integration enables you to create cases proactively from alerts either manually or through automation and track the accounts and the corresponding install base items affected by the alert. It also enables you to view the service health status of their install base items.

For more information, see Integration with Event Management.

Integrate with ITOM Event Management

Customer Service Management provides an integration with the ITOM Event Management application. This integration enables you to create cases proactively from alerts either manually or through automation and track the accounts and the corresponding install base items affected by the alert.

Before you begin
Role required: admin

About this task
For more information about this integration, see Integration with Event Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the Proactive Customer Service with Event Management plugin (com.snc.proactive_cs_itom).
3. Select **Activate**.

Integrating with Customer Project Management

Integrate Customer Service Management with the Project Portfolio Management application. This integration enables customers to manage complex projects with multiple tasks and provide end users with visibility into these projects.

Customer Service Management provides an integration with the ServiceNow® PPM Standard application, earlier known as Project Portfolio Suite with Financials.

Customers can use this integration to create projects and project tasks for their customer accounts. Customers can also provide end users with visibility into their projects and tasks from the Customer Service Portal and enable them to request additional actions.

Product use rights included with this application

When subscribed to the Strategic Portfolio Management (SPM) Subscription Product, Customer Service Management users can create and edit projects. External CSM users can view projects#and#edit project tasks of their own or related#accounts.

Plugin

Users with the system administrator role can activate the Customer Project Management plugin (com.snc.csm_ppm).

Note:
This plugin requires the Customer Service plugin (com.sn_customerservice) and the PPM Standard plugin (com.snc.financial_planning_pmo).

The Customer Project Management plugin adds the **Customer Service** > **Projects** module to the application navigator. Users with the customer project manager role can access this module.

Customer Project Management Guided Setup

Activating the Customer Project Management plugin adds the Customer Project Management section to the Customer Service Management Guided Setup. For more information, see Integrate with Customer Project Management using Guided Setup.

Integrate with Customer Project Management using Guided Setup

Use the Customer Service Management Guided Setup to configure Customer Project Management.

Before you begin
Role required: admin

About this task
You can configure a number of different processes and components for the Customer Project Management feature using Guided Setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Customer Service** > **Administration** > **Guided Setup**.
2. Select **Get Started** on the Customer Service Management home page.
3. Scroll through the list of categories, locate Customer Project Management, and select **Get Started**.

   The following table provides a description of the configuration steps included in this guided setup section.

Customer Project Management configuration tasks

Task	Description
Activate PPM Standard.	Activate the PPM Standard plugin (com.snc.financial_planning_pmo).
Activate Customer Project Management.	Activate the Customer Project Management plugin (com.snc.csm_ppm).
Configure form views.	Configure the Case form and add the following fields to the Case view, Workspace view, and Customer Self-Service view: ○ Project ○ Project Task ○ Issue ○ Project Change Request
Configure related lists.	Configure the Account form and add the **Projects** related list to the Case view and Workspace view. Configure the Contact form and add the **Projects** related list to the Case view and Workspace view. Configure the Customer Project Task form and add the following related lists to the **Default** view: **Work Order** > **Initiated From**. This step can only be completed if the following plugins are active: ○ Customer Service with Field Service Management (com.snc.csm_fsm_integration) ○ Field Service with Project Management (com.snc.wm_ppm)
Configure notifications.	Configure the **Send Email to Contact when Customer Project Task is assigned** Flow Designer flow to send an email to the assigned contact when a customer project task is assigned. Configure the **Send Email to SO member when SO Customer Project Task is assigned** flow to send an email to assignees when assigned is changed on a customer project task that is customer visible.

Task	Description
	On selecting **Configure**, the following details of the selected flow are displayed and can be configured as required: ○ Project number and name ○ Task number and short description ○ Task planned start and end dates and duration
Configure Flow Designer flows.	Use Flow Designer flows provided with Customer Project Management to: ○ Configure the fields that are copied over, when you create a project issue or project change request from a case. ○ Update the work notes for a case record when the state of an associated project issue or project change request is updated. ○ Close a case record when an associated project issue or project change request is closed. **Create Project Issue from Case**: When a project issue is created from a case, this flow copies the **Priority** and **Short description** fields from the case to the project issue record. This flow is active by default. **Create Project Change Request from Case**: When a project change request is created from a case, this flow copies the **Priority** and **Short description** fields from the case to the project change request record. This flow is active by default. **Update and Close Case Record on Issue Closure**: This flow enables you to automatically: ○ Update the case work notes when the state of an associated issue is updated. ○ Close a case if the state of the associated issue is set to Closed. Activate this flow as needed. **Update and Close Case Record on Project Change Closure**: This flow enables you to automatically: ○ Update the case work notes when the state of an associated project change request is updated. ○ Close a case if the state of the associated project change request is set to Closed. Activate this flow as needed.
Assign Access Controls (ACLs)	Assign ACLs to the Customer Service Management user roles to provide access to the Project Portfolio Management tables, including the Project Change Request, Status Report, and Issues tables.

Customer Project Management personas, roles, and tables

An overview of the tasks that can be performed by the different Customer Project Management roles.

Personas and roles

The following table lists the personas, their description, and the roles included with them.

Customer Service Management personas and roles

Persona	Description	Required roles
Customer project manager	A user who creates and manages projects for customer accounts. • Creates projects. • Set up project tasks and resource plans. • Identifies customer contacts who have access to projects and project tasks. • Assigns and manages tasks and dependencies.	• it_project_manager • sn_customerservice.projectmanager
Location Project Member [sn_bus_loc.location_project_stakeholder]	Views project details and project tasks of their respective business location. Marks project task as complete.	None
Location Project Manager Contributor [sn_bus_loc.location_manager_project_stakeholder]	Views project details and project tasks of their respective business location and child business locations. Marks project task as complete.	None
Service Organization Project Manager [sn_service_org.project_manager]	This role can perform the following actions: • Project initiation: Creates and launches projects **Note:** Service Organization project manager and customer project manager can access all project modules. • Project planning: Develops project plans, such as, task assignments and resource allocation.	• sn_bus_loc.ibl_viewer • sn_bus_loc.ebl_viewer

Tables

Tables are added with activation of the Customer Project Management plugin.

Customer Project Management tables

Table	Description
Customer Project [customer_project]	Stores customer projects.
Customer Project Task [customer_project_task]	Stores customer project tasks
Project Contact [project_contact]	Stores project contacts.

The following columns are added to the Case table:

- Customer Project
- Customer Project Task
- Issue
- Project Change Request

Customer Project Management domain separation

With Customer Project Management, you can create customer projects for customer accounts. Domain separation for customer projects is based on the account domain. New projects are created in the same domain as the associated customer account.

Customer project child entities use the domain of the parent project. Child entities include:

- Project tasks
- Requirements
- Project budget
- Status reports
- Risks
- Issues
- Decisions
- Actions
- Project change requests
- Stakeholders
- Project contacts
- Expense lines
- Time cards

The project manager can add sub projects to a customer project if the sub projects belong to the following accounts:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Accounts in the same hierarchy as the main project account.
- Accounts that have a relationship to the main project account.

Customer project manager tasks

A customer project manager can perform specific tasks to manage projects for customer accounts.

A customer project manager requires the following roles to perform the tasks described in the following table:

- it_project_manager
- sn_customerservice.projectmanager

Customer project manager tasks

Task	Details
Create a project for a customer account	1. Navigate to **Customer Service** > **Projects** > **Create New**. 2. Enter a name for the project in the **Project Name** field. 3. Select an account in the **Account** field. 4. Fill in additional project information. 5. Click **Save**.
Create a project for a customer account from a project template	1. Navigate to **Customer Service** > **Projects** > **Create New**. 2. Click a template at the bottom of the form to apply the template to the project. If the templates do not appear at the bottom of the form, click the More options icon at the top of the form and select **Toggle Template Bar**. 3. Enter a name for the project in the **Project Name** field. 4. Select an account in the **Account** field. 5. Fill in additional project information. 6. Click **Save**.
Create a project task for a customer project	1. Navigate to **Customer Service** > **Projects** > **All**. 2. Select a project. 3. In the **Project Tasks** related list, click **New**. 4. Add a short description for the task.

© 2026 ServiceNow, Inc. All rights reserved.

Customer project manager tasks (continued)

Task	Details
	5. Fill in additional project task information. 6. Click **Save**.
Identify the project tasks on a project template that are visible to external customers	1. Navigate to **Customer Service** > **Projects** > **Templates**. 2. Select a template. 3. In the **Project Template Tasks** related list, select a task. 4. In the Data section of the Project Template Task form, add the **Visible to customer** field and set it to **true**. 5. Click **Update**. 6. Repeat for other project tasks as needed.
Identify project tasks that are visible to external users	1. Navigate to **Customer Service** > **Projects** > **All**. 2. Select a project. 3. In the **Project Tasks** related list, select a task. 4. Enable the **Visible to customers** field. 5. Click **Save**.
Identify the account contacts who have access to a project	To give customers visibility into projects from the Customer Service Portal, you must add one or more contacts to the project. • Contacts must belong to the account linked with the project. • Partner contacts must have access to the account linked with the project. • Contacts who have a relationship with the account can also be added to the project. 1. Navigate to **Customer Service** > **Projects** > **All**. 2. Select a project. 3. In the **Project Contacts** related list, click **New**. 4. Select a contact in the **Contact** field and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer project manager tasks (continued)

Task	Details
Assign project tasks to internal users, customer contacts, or customer partner contacts	See Assign a project task .
See the cases that have been created for a project or project task	View cases in the **Cases** related list on the Customer Project form and Customer Project Task form. Click a case to view the case details. **Note:** The customer project manager has read-only access to the Case form.
Add a comment or an attachment to a case that has been created for a project or project task	1. Navigate to **Customer Service** > **Projects** > **All**. 2. Select a project. 3. In the **Cases** related list, select a case. 4. Add a comment in **Additional comments** field. 5. Click the attachment icon, select a file, and attach it to the case. 6. Click **Update**.
Create project change requests and project issues for cases that have been created for a project or project task	See the following tasks: • Create a project issue for a case • Create a project change request for a case
Save a customer project as a template	1. Navigate to **Customer Service** > **Projects** > **All**. 2. Select a project. 3. Click the **Save as New Template** related link. 4. In the Create Template popup window, enter a template name and description. 5. Click **OK**. 6. Update the template as needed and click **Update**.

Assign a project task

The customer project manager can assign a customer project task to an internal user, a customer or partner contact, or a contact that has a relationships to the account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

About this task
Assigning a task to an external user enables the **Visible to customer** field on the Project Task form. Customers can view assigned tasks in the Project Tasks list on the Customer Service Portal. The system sends an email notification to the customer when a customer project task is assigned.

Procedure
1. Navigate to **Customer Service** > **Projects** > **All**.
2. Click a project in the Customer Projects list.
3. Click the **Project Tasks** related list on the Customer Project form.
4. Click a task to open the Customer Project Task form.
5. Select a contact or partner contact in the **Assigned to** field.
   Users are stored in the User [sys_user] table.
6. Click **Update**.
   The system sends an email notification to the assigned user.

Create a project issue for a case

The customer project manager can create project issues for cases that have been created for customer projects and project tasks.

Before you begin
Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

About this task
The project manager can create one issue for a case.

Procedure
1. Navigate to **Customer Service** > **Projects** > **All**.
2. Click a project in the Customer Projects list.
3. In the **Cases** related list, click a case.
4. Click **Create Issue** on the Case form.
   The system creates a new issue for the project and copies the **Short description** and **Priority** from the case.
5. Fill in the details for the issue and click **Save**.
   The system does the following after you save the issue:
   - Adds the case number to the activity stream on the Issue form.
   - Adds the issue number to the activity stream on the Case form.
   - Adds the issue to the **Issues** related list on the Customer Project form.
   - Adds the issue to the **Issue** field in the Related Records section of the Case form.

Create a project change request for a case

The customer project manager can create project change requests for cases that have been created for customer projects and project tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

About this task
The project manager can create one project change request for a case.

Procedure
1. Navigate to **Customer Service** > **Projects** > **All**.
2. Click a project in the Customer Projects list.
3. In the **Cases** related list, click a case.
4. Click **Create Project Change Request** on the Case form.
   The system creates a new change request for the project, copies the case short description to the **Title** field, and the case priority to the **Priority** field.
5. Fill in the details for the change request and click **Save**.
   The system does the following after you save the change request:
   - Adds the case number to the activity stream on the Project Change Request form.
   - Adds the project change request number to the activity stream on the Case form.
   - Adds the project change request to the **Project Change Requests** related list on the Customer Project form.
   - Adds the project change request to the **Project Change Request** field in the Related Records section of the Case form.

Create a customer project from an idea

Create a customer project from an idea on the Idea Portal.

Before you begin
Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

About this task
The Idea Portal provides a central location to collect, curate, and promote ideas into demand, project, epic, or story. With the Customer Service Management integration with Project Portfolio Management, you can also create a customer project from an idea. For more information, see Idea Portal.

Procedure
1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Click the title of an idea that you want to create a task for.
3. Open the idea in form view by clicking the More Options icon and selecting **Open in platform**.
4. In the Idea pop-up window, click **Create Task**.
5. In the Convert Idea to Task pop-up window, select Customer Project in the **Select task type** field and click **OK**.
   The system creates the project and displays the project number in an information message at the top of the Idea pop-up window. On the Customer Project form, the idea record is added to the Ideas related list.

Create a customer project from a demand

Create a customer project from a demand record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

Procedure

1. Create a demand record by navigating to **Demand** > **Demands** > **Create New**.
2. Fill in the fields on the Demand form and click **Save**.
   For more information about the fields on this form, see Create a demand.
3. Open the demand record and click the **Create Project** related link.
4. In the Create Project pop-up window, select Customer Project in the **Project class** field.
5. Click **OK**.
   The system creates the project and displays the project number in an information message at the top of the Demand form. On the Customer Project form, the demand record is added to the Demands related list.

Customer service agent tasks

A customer service agent can view customer projects and create cases for customer projects and tasks.

An agent must have the following roles to perform the tasks described in the following table:

- sn_customerservice_agent
- sn_customerservice.projectstakeholder

Customer service agent tasks

Task	Details
View customer projects	Customer service agents can view a list of customer projects by navigating to **Customer Service** > **Projects** > **All**. Click a project in this list to view project details on the Customer Project form, including project tasks, project contacts, and sub projects. **Note:** Agents have read-only access to project details.
View the projects and project tasks created for an account	Customer service agents can see projects that are linked to customer accounts. From a customer account record, agents can see the projects for that account in the **Projects** related list. Click a project in this list to view project details on the Customer Project form, including project tasks, project contacts, and sub projects.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer service agent tasks (continued)

Task	Details
	Note: Agents have read-only access to project details.
See the projects and project tasks associated with a contact	Customer service agents can see the projects and project tasks that are associated with a contact. Navigate to **Customer Service** > **Customer** > **Contacts** and select a contact. • Click the **Projects** related list to see projects. • Click the **Project Tasks** related list to see tasks. **Note:** If necessary, configure the Contact form to add these related lists.
Create a case for a project	Customer service agents and agent managers can create cases for customer projects. When creating a case, the agent selects a project in the **Project** field on the Case form. • If an account has been selected in the **Account** field, the agent can select from the projects that are associated with that account. • If the **Account** field is empty, the agent can select from all projects that have been created for an account. Upon selection, the **Account** field is populated with the associated account. When created from a project, these fields are automatically set on the Case form. Cases created for a project appear in the **Cases** related list on the Customer Project form.
Create a case for a project task	Customer service agents and agent managers can create cases for customer project tasks. When creating a case, the agent selects a task in the **Project Task** field on the Case form. • If a project has been selected in the **Project** field, the agent can select from the project tasks that have been created for that project.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer service agent tasks (continued)

Task	Details
	• If the **Project** field is empty, the agent can select from the project tasks for all projects that have been created for an account. Upon selection, the **Project** and **Account** fields are populated with the associated project and account. When created from a project task, these fields are automatically set on the Case form. Cases created for a project task appear in the **Cases** related list on the Customer Project form and the Customer Project Task form.

Customer tasks

From the Customer Service Portal, external users can view projects, complete assigned tasks, and create cases for project issues.

A user must have one of the following CSM external roles to perform the tasks described in the following table:

- sn_customerservice.customer
- sn_customerservice.customer_admin
- sn_customerservice.partner
- sn_customerservice.partner_admin

Various customer tasks

Task	Details
View projects and project details	Customers can view the projects created for their accounts if they've been associated with the project as a project contact. Customers have read-only access to project details on the Customer Project form. Customers can also view records in the following related lists if the system administrator has configured the corresponding ACLs for each of the tables. • Customer Project Tasks • Project Change Requests • Status Reports • Sub Projects • Work Orders • Project Contacts

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various customer tasks (continued)

Task	Details
	Note: The Work Orders related list is displayed if the following plugins are active: Field Service with Project Management (com.snc.wm_ppm) and Customer Service with Field Service Management (com.snc.csm_fsm_integration). To view projects: 1. Click **Support** in the Customer Service Portal header. 2. Click **Projects** and select a project from the Customer Projects list. 3. View the details in the Customer Project form.
View and update project tasks	Customers can view project tasks for the projects that have been created for their accounts if: • They have been associated with the project as a project contact. • The project tasks have been marked as **Visible to customer**. Customers can view and update project tasks that have been assigned to them by the customer project manager. To view and update project tasks: 1. Click **My Lists** in the Customer Service Portal header. 2. Click **My Project Tasks** and select a task from the Customer Project Tasks list. 3. View the details in the Customer Project Task form. 4. Update the **Actual start date** and **Actual end date** fields as needed and click **Save**. 5. Add a comment in the **Activity** field and click **Post**. **Note:** Customers can also view tasks directly from **Support** > **Projects** > **Project Tasks**.
Complete project tasks	When a customer completes the work for a project task, they can mark the task as complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various customer tasks (continued)

Task	Details
	1. Click **My Lists** in the Customer Service Portal header. 2. Click **My Project Tasks** and select a task from the Customer Project Tasks list. 3. Click **Mark Complete** in the Actions widget.
Create cases for projects and project tasks	Customers can create cases for projects and project tasks if they have been associated with a project as a project contact. Customers can create cases in two ways: • From a project or, project task form. • From the Case menu in the Customer Service Portal header. To create a case from a project or project task: 1. Navigate to a Customer Project form or a Customer Project Task form. 2. Click **Create Case** in the Actions widget. 3. Fill in the fields on the Create Project Case record producer. The **Project** and **Project Task** fields are auto populated. 4. Click **Submit**. To create a case from the Case menu. 1. Click **Case** in the Customer Service Portal header and select **Create Project Case**. 2. Fill in the fields on the Create Project Case record producer. 3. Click **Submit**. The Create Project Case record producer includes **Project** and **Project Task** fields. These fields are displayed if a customer has access to any of the project tasks. Project and project task selection is limited to the projects for the customer's account.
View a list of cases created for the projects and project tasks for an account	Customer administrators, partner administrators, and customer case managers can see all cases that have been created for the projects and project tasks for an account. 1. Click **My Lists** in the Customer Service Portal header. 2. Click **All Cases** in the My Lists widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various customer tasks (continued)

Task	Details
View the project change request and project issue records created for a case	Customer contacts can view the project change request and project issue records that have been created for a case if: • They have been added to a project as a project contact. • The system administrator has configured the corresponding ACLs for each of the tables. 1. Click **My Lists** in the Customer Service Portal header. 2. Click **All Cases** in the My Lists widget. 3. Select a case from the Cases list. 4. View the records in the Related Records widget.

Customer Service Investment Portal

The Customer Service Management integration with Project Portfolio Management provides access to a CSM-specific view of the Investment Portal, which displays customer projects.

Use the CSM Investment Portal to do the following:

- Add CSM-specific columns to investment boards
- Add filters to CSM-specific columns on investment boards

You can view both customer projects and IT projects in the IT Investment Portal. For more information, see Investment Portal in the Project Management documentation.

Create an investment board on the CSM Investment Portal

Create an investment board on the CSM Investment Portal and add the desired customer service project-specific information.

Before you begin

Role required: customer project manager (it_project_manager + sn_customerservice.projectmanager)

Procedure

1. Navigate to **All** > **Customer Service** > **Projects** > **Investment Portal**.
2. Click **New**.
3. Fill in the fields on the Create New pop-up window.
   For more information about these fields, see Create an investment board.
4. Click **Create**.
   Once the investment board is created, it opens up in the CSM Investment Portal page.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrating with Financial Management

Customer Service Management and Field Service Management provide an integration with the ServiceNow® Financial Management application as well as dashboards and reports.

The Financial Management application enables you to allocate, track, and report on expenses in your organization. When the Financial Management application allocates an expense, it breaks down the expense into detailed amounts of money called allocations. These allocations can be associated with specific segments and accounts for a specific cost model. The integration with Financial Management provides cost allocations for Customer Service Management and Field Service Management.

Use these cost allocations on the Financial Management workbench, which provides financial administrators with a graphical interface to allocate expenses. Access the workbench through the **Cost Transparency** > **Workbench** module.

Plugins

Two different plugins, one for Customer Service Management and one for Field Service Management, enable the integration with Financial Management. These plugins also add dashboards based on cost allocations.

- Performance Analytics - Content Pack - Financial Management for Customer Service plugin (com.snc.pa.fm.csm).
- Performance Analytics - Content Pack - Financial Management for Field Service Management plugin (com.snc.pa.fm.fsm)

The Performance Analytics - Content Pack - Financial Management for Customer Service plugin includes demo data for FY16: Q1 through FY17: Q2. The demo data includes records with the CSFM prefix, which indicates that the records are for the Customer Service Management integration with Financial Management. Activating the plugin adds these records to the Case (sn_customerservice_case) table.

Note:
The Performance Analytics - Content Pack - Financial Management for Field Service Management plugin doesn't include demo data.

Cost models

A cost model is a set of rules, methods, and metrics that determines the allocation of expenses. Select cost models on the Data Definitions tab of the Financial Management workbench.

For Customer Service Management, the integration with Financial Management provides these cost models:

- **CSM Allocation Model for Cost Account**: Allocates expenses for individual B2B customer accounts.
- **CSM Allocation Model for Channels**: Allocates expenses for communication channels.

For Field Service Management, the integration with Financial Management provides this cost model:

FSM Allocation Model for Company: Allocates expenses for companies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Segment hierarchy

All accounts in the chart of accounts belong to segments which are structured in a hierarchy. This hierarchy enables the roll-up of expenses from lower-level accounts and segments to higher-level accounts and segments.

- **CSM Allocation Model for Cust Account** uses this segment hierarchy: Assignment Group > Product > Customer Account.
- **CSM Allocation Model for Channels** uses this segment hierarchy: Assignment Group > Product > Channels.
- **FSM Allocation Model for Company** uses this segment hierarchy: Assignment Group > Product > Company.

Account buckets

Use account buckets to categorize cleansed expenses before assigning them to accounts and segments. Account buckets can be organized in parent-child relationships so that several child buckets can refer to a single parent bucket.

The Customer Support and Field Service Support account buckets include:

- Facilities
- IT Chargeback
- Payroll and Labor Expenses
- Professional Fees & Services
- Supplies
- Training
- Other expenses

Allocation metrics

Allocation metrics are rules that you can create and use to split an allocation based on dimensions such as:

- Number of Customer Service cases: Allocate expenses to a product based on the number of cases closed in a fiscal period.
- Total Customer Service case resolution time: Allocate expenses to a product based on the total hours worked on cases closed in a fiscal period.
- Number of Field Service work order tasks: Allocates expenses to a product based on the number of work order tasks completed in a fiscal period.
- Total work order completion time: Allocates expenses to a product based on the total hours worked on tasks completed in a fiscal period.

For Customer Service Management, the integration with Financial Management provides these allocation metrics:

- CSM Allocate to Assignment Groups by Headcount
- CSM Allocate to Product by # Cases
- CSM Allocate to Product by Case Time Worked Duration
- CSM Rollup from AssgGrp to Product by # Cases
- CSM Rollup from AssgGrp to Product by Case Time Worked Duration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CSM Rollup from Product to Account by # Cases
- CSM Rollup from Product to Account by Case Time Worked Duration

For Field Service Management, the integration with Financial Management provides these allocation metrics:

- FSM Allocate to Assignment Groups by Headcount
- FSM Allocate to Product by # Work Orders
- FSM Rollup from Product to Company by # Work Orders

User roles

These roles can access the Financial Management workbench (**Cost Transparency** > **Workbench**):

- cost_transparency_analyst
- cost_transparency_admin
- financial_mgmt_user
- financial_mgmt_admin

Dashboards and reports

The Performance Analytics - Content Pack - Financial Management for Customer Service and Performance Analytics - Content Pack - Financial Management for Field Service Management plugins provide the following dashboards:

- CSM Financials Dashboard
- FSM Financials Dashboard

Navigate to **Performance Analytics** > **Dashboards** and select the desired dashboard from the Dashboard menu.

Integrate with Financial Management

Customer Service Management provides an integration with the ServiceNow® Financial Management application as well as dashboards and reports.

Before you begin

Role required: admin

About this task

Note:
The Financial Management For CSM plugin (com.snc.financial_management_for_csm) is no longer available for direct activation by the system administrator. You can request this plugin through the HI Customer Service system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the Performance Analytics - Content Pack - Financial Management for Customer Service plugin (com.snc.pa.fm.csm).
3. Click **Activate**.

Integrating with Adobe Experience Manager

Extend Customer Service Management and Knowledge Management capabilities through ServiceNow components in Adobe Experience Manager (AEM) to deliver a pre-integrated web experience for external customers.

When working with a website built on AEM, you can embed Customer Service Management and Knowledge Management capabilities related to customer service cases and knowledge articles respectively within the website. The integration with AEM provides the following advantages:

- Use ServiceNow knowledge and case components on your branded websites built on AEM.
- Ensure a unified and consistent experience for end users to access information when and where they need it.

Supported AEM versions

Beginning with AEM 6.5, you can add knowledge and case components to pages of your websites built on AEM and use pages available within the ServiceNow site in AEM as a reference to design your website content. For more information, see ServiceNow pages in Adobe Experience Manager, Display ServiceNow knowledge articles on an Adobe Experience Manager page, and Display ServiceNow cases on an Adobe Experience Manager page.

ServiceNow Components for AEM package

Install the **ServiceNow Components for AEM** package on your AEM instance. You can download the package by using the direct download URL or accessing the package at https://experience.adobe.com/downloads. For more information, see Experience Cloud Software Distribution in the Adobe Help Center.

After you install the package, configure authentication and integration settings for ServiceNow services and components in AEM. For more information, see Configuring authentication settings for ServiceNow services and components in AEM and Configuring integration settings for ServiceNow services and components in AEM.

Integrate Customer Service Management with Adobe Experience Manager

Deliver a pre-integrated web experience for external customers by using ServiceNow components in Adobe Experience Manager (AEM).

Before you begin

Role required: admin

About this task

This task provides the general steps to integrate Customer Service Management and Knowledge Management capabilities with AEM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Install the **ServiceNow Components for AEM** package on your AEM instance.
   You can download the package by using the direct download URL or accessing the package at https://experience.adobe.com/downloads. For more information, see Experience Cloud Software Distribution in the Adobe Help Center.
2. Configuring authentication settings for ServiceNow services and components in AEM.
3. Configuring integration settings for ServiceNow services and components in AEM.

Configuring authentication settings for ServiceNow services and components in AEM

Enable logging in to both the Adobe Experience Manager (AEM) instance of your website and the ServiceNow instance using a third-party OpenID Connect (OIDC) provider that supports both OIDC and single sign-on (SSO) protocols.

You can select Okta or Microsoft Azure as the third-party OIDC provider that supports both OIDC and single sign-on (SSO) protocols.

Note:
Your AEM instance must use the selected third-party OIDC provider as the SSO provider.

Register ServiceNow with a third-party OIDC provider

Register ServiceNow as a web application with a third-party OIDC provider to validate the identity of a user using a JSON Web Token (JWT).

Before you begin

ServiceNow identifies an end user by sending the JWT token containing the end user information to the OIDC provider. The process to register ServiceNow with the OIDC provider varies depending on the provider.

Note:

This topic uses Okta as an example, but you can substitute the details of your own OIDC provider.

Role required: Okta account (Third-party OIDC provider account)

Procedure

1. Log in to your Okta account.
2. Select the Applications menu.
3. On the Applications page, click **Add Application**.
4. On the Create New Application page, select **Web**.
5. Fill in the fields.

OIDC settings

Field	Value
Application label	Unique application name for your ServiceNow instance.
Authorization Code	Selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Refresh Token	Selected
Login redirect URIs	Callback URL of your AEM instance. The URL structure is: `https://<AEM-instance>:<AEM_port>/bin/now/auth/callback`
Login initiated	App Only

6. Click **Done**.

What to do next
In the Client Credentials section, record the Client ID and Client secret values for when you set up Okta as an OAuth provider in your ServiceNow and AEM instances.

Add an OIDC provider to the ServiceNow instance

Add a third-party OIDC provider service to your ServiceNow instance to verify the identity of end users.

Before you begin
You must have configured the third-party OIDC provider service as an OAuth provider and recorded your **Client ID** and **Client secret** values. For more information, see Register ServiceNow with a third-party OIDC provider.

Role required: oauth_admin

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Set up OAuth for your ServiceNow instance.
   - Click **New**, select **Configure an OIDC provider to verify ID tokens**, and then fill in the Application Registries form.
   - Select an existing template for your OIDC provider (Okta or Microsoft Azure), and then either accept the default values in the Application Registries form or modify them.

Note:
OIDC provider templates are available after loading demo data with the OAuth 2.0 plugin. For more information, see Configure an OAuth OIDC provider.

Application Registries form

Field	Description
Name	Unique name for the OAuth provider.
Client ID	Client ID you recorded earlier for your ServiceNow instance registered in the third-party OIDC server. The ServiceNow instance uses the client ID when requesting an access token.
Client Secret	Client secret you recorded earlier for your ServiceNow instance registered in the third-party OIDC server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth OIDC Provider Configuration	OIDC provider with which you registered your ServiceNow instance. **Note:** Select the record of your OIDC provider configuration or create another configuration, if not available, to ensure that the **OIDC Metadata URL** field value is correct and the **User Claim** and **User Field** fields are mapped correctly.

3. Save your changes.
   - For an existing template, click **Update**.
   - For a new template, click **Submit**.

Configure OIDC provider details in Adobe Experience Manager

Configure the third-party OIDC provider details in your Adobe Experience Manager (AEM) instance to access the ServiceNow components as an authenticated user.

Before you begin

You must have configured the third-party OIDC provider service as an OAuth provider and recorded your **Client ID** and **Client secret** values (see Register ServiceNow with a third-party OIDC provider).

Role required: AEM administrator

About this task

Configure the OIDC provider details in AEM to enable the AEM users to access the ServiceNow instance as authenticated users. If you don't configure the OIDC provider details in AEM, an AEM user is considered as a public user when accessing the ServiceNow instance.

Procedure

1. Access the web console in AEM with a URL in the following format: `https://<AEM_hostname>:<AEM_port>/system/console/configMgr`.
2. Search for `ServiceNow OAuth Configuration`.
3. In the **Name** column, click the **ServiceNow OAuth Configuration** link.
4. Provide values for the configuration settings.

ServiceNow OAuth Configuration settings

Field	Description
ServiceNow Client ID	Client ID you recorded when setting up the OAuth for your ServiceNow instance.
ServiceNow Client Secret	Client secret you recorded when setting up the OAuth for your ServiceNow portal.
OAuth Provider Auth URL	Authorization server end point used for obtaining the authorization code. In the following URL structure, substitute the domain name of the authorization server of your third-party OIDC provider. Example: `https://<auth_server_domain>/oauth2/authorize`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Provider Access Token URL	Authentication server endpoint used for exchanging the authorization code for an access token. In the following URL structure, substitute the domain name of the authorization server of your third-party OIDC provider. Example: `https://<auth_server_domain>/oauth2/token`
Authorization request scope	List of scopes for limiting the authorization access. **Note:** The default value `openid email profile offline_access` works for most OIDC providers (for example, Okta).
User property to store refresh token	Name of the user property to store the authentication refresh token. **Note:** Once filled, this token is used to obtain access tokens for that user in all future requests.

5. Click **Save**.

Configuring integration settings for ServiceNow services and components in AEM

You have to set up your ServiceNow services and components to integrate with your Adobe Experience Manager (AEM) instance.

Settings to enable use of ServiceNow services in AEM

You can define the following types of configuration settings for ServiceNow services in AEM:

- Authentication settings with a third-party OIDC provider (see Configure OIDC provider details in Adobe Experience Manager).
- Specific settings for ServiceNow services (see Define OSGi configuration settings for ServiceNow services).
- Log file settings for ServiceNow services (see Configure log file settings for ServiceNow services in Adobe Experience Manager).

Settings for using ServiceNow components in AEM

To use the Knowledge API endpoint on your AEM instance, you have to define the cross-origin resource sharing (CORS) rule on your ServiceNow instance. For more information, see Define a cross-origin resource sharing rule (CORS) to access ServiceNow API endpoints from AEM.

Define OSGi configuration settings for ServiceNow services

Define OSGi configuration settings for ServiceNow services used by ServiceNow components in Adobe Experience Manager (AEM).

Before you begin
Role required: AEM administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the web console in AEM using a URL in the following format: `https://<AEM_hostname>:<AEM_port>/system/console/configMgr`.
2. Search for `ServiceNow Configuration`.
3. In the **Name** column, click the **ServiceNow Configuration** link.
4. Provide values for the configuration settings.

ServiceNow Configuration settings

Field	Description
Base Instance URL	Complete URL of your ServiceNow instance.
Knowledge Bases	System identifier (sys_id) of a knowledge base that contains associated knowledge articles. For multiple entries, separate the knowledge bases with commas. **Note:** A blank value indicates articles from all knowledge bases in your ServiceNow instance are accessible to a user with appropriate permissions.
Show Articles in All Languages	Option to show knowledge articles in all languages for ServiceNow components.

5. Click **Save**.

Configure log file settings for ServiceNow services in Adobe Experience Manager

Configure log file settings for ServiceNow services in Adobe Experience Manager (AEM) to generate debug logs to help identify issues in the authentication process.

Before you begin

Role required: AEM administrator

Procedure

1. Access the web console in AEM using a URL in the following format: `https://<AEM_hostname>:<AEM_port>/system/console/configMgr`.
2. Navigate to **OSGi** > **Configuration**.
3. Search for and select **logs/project-servicenow-components.log: info**.
4. Verify the default field values, or fill in your own values for a custom configuration.

Logger configuration settings

Field	Value
Log Level	Debug
Log File	Path of the ServiceNow log file.
Message Pattern	Message-format pattern for formatting log messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Logger	Logger name for ServiceNow login services.
Additivity	Option to disable sending logs to an appender attached higher in the hierarchy.

5. Click **Save**.

Define a cross-origin resource sharing rule (CORS) to access ServiceNow API endpoints from AEM

Define a cross-origin resource sharing (CORS) rule on your ServiceNow instance to access endpoints of the Knowledge Management REST API, Case API, or CSM Attachment API from your Adobe Experience Manager (AEM) instance.

Before you begin

Ensure that you have configured the API for which you are defining the CORS rule.

- Activate the Knowledge API plugin (sn_km_api) to use the Knowledge Management REST API endpoints for knowledge articles. For more information, see Knowledge Management REST API.
- Activate the Customer Service plugin (com.sn_customerservice) to use the Case API endpoints for customer service cases. For more information, see Case API.
- Configure the *glide.rest.attachment_csm_api.allowed_tables* system property and include the Case [sn_customerservice_case] table to use the CSM Attachment API end points for case attachments. For more information, see CSM Attachment API.

Role required: web_service_admin

About this task

Procedure

1. Navigate to **All** > **System Web Services** > **CORS Rules**.
2. Click **New**.
3. On the CORS Rule form, fill in the fields.

CORS Rule form

Field	Description
Name	Name for identifying your CORS rule.
REST API	REST API this CORS rule applies to. ○ For knowledge articles, select **Knowledge Management REST API [sn_km_api/knowledge]**. ○ For customer service cases, select **Case [sn_customerservice/case]**. ○ For case attachments, select **CSM Attachment API [now/attachment_csm]**
Domain	AEM instance that this CORS rule applies to.
Max age	Number of seconds to cache the client session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the HTTP Methods related list, select HTTP methods to send a request to a web service provider.
   - For knowledge articles, select **GET**.
   - For customer service cases, select **GET**, **PUT**, **POST**.
   - For case attachments, select **GET**, **POST**, **DELETE**.
5. For Case API, in the **Exposed headers** field of the HTTP Headers related list, enter `X-Total-Count`.
6. Click **Submit**.

Customizing the colors of ServiceNow components in AEM

You can define the look and feel of the ServiceNow components in Adobe Experience Manager (AEM) by specifying colors for them.

As an AEM administrator, you can either modify the color variables preconfigured for all components or use the *`initializeCSS`* function for customizing the colors of a particular component using a custom CSS class. You specify the custom CSS class for a component in the **Custom CSS Class** property. For more information, see Display ServiceNow knowledge articles on an Adobe Experience Manager page and Display ServiceNow cases on an Adobe Experience Manager page.

Note:
By default, the ServiceNow components are configured using the Bootstrap v4.4.1 CSS styles. If your AEM page uses a different Bootstrap version, the ServiceNow components style is overridden by the page style.

Modify the color theme for all ServiceNow components in AEM

Set the color theme for the ServiceNow components in Adobe Experience Manager (AEM) all at once by configuring the color variables.

Before you begin
Role required: AEM administrator

About this task
Note:
By default, the ServiceNow components are configured using the Bootstrap v4.4.1 CSS styles. If your AEM page uses a different Bootstrap version, the ServiceNow components style is overridden by the page style.

Procedure
1. Open CRXDE Lite in your browser.
   For example, in your browser, enter the URL in the format `http://<AEM_hostname>:<AEM_port>/crx/de`. The default URL for CRXDE Lite is `http://localhost:4502/crx/de`.
2. Navigate to **apps** > **servicenow-components** > **clientlibs** > **clientlib-common**.
3. Open the `variables.less` file.
4. Configure the color variables available for the HTML elements in the ServiceNow components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Color variable settings

Color setting	Variable
Text content	@text-color
Hyperlinks	@link-color
Badges	@badge-text-color
Badges background	@badge-background-color
Primary color for visual emphasis	@primary-color
Color complementary to the primary color, for visual emphasis	@secondary-color
Component titles	@title-color
Primary button text	@primary-btn-text-color
Primary button background	@primary-btn-bkg-color
Secondary button text	@secondary-btn-text-color
Secondary button background	@secondary-btn-bkg-color

Note:
You specify a color for a variable in one of the following ways:

- Color name

  For example, `red`

- HEX value

  For example, `#FF0000`

- RGB value

  For example, `rgb(255,0,0)`

- *`var`* function

  Use the var function to specify a custom property for a color. For example, `var(--gray-dark)`.

5. From the CRXDE Lite menu, click **Save All** to save the changes on the AEM server.

Modify the color theme for a ServiceNow component in AEM

Override the color theme for a ServiceNow component in Adobe Experience Manager (AEM) by using the *`initialize`* function.

Before you begin
Role required: AEM administrator

About this task
The color variables you specify in the `variables.less` file are applied to all ServiceNow components in AEM. You can override the default colors for a particular component by setting the color variables for the component in the *`initializeCSS`* function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
By default, the ServiceNow components are configured using the Bootstrap v4.4.1 CSS styles. If your AEM page uses a different Bootstrap version, the ServiceNow components style is overridden by the page style.

Procedure

1. Open CRXDE Lite in your browser.
   For example, in your browser, enter the URL in the format `http://<AEM_hostname>:<AEM_port>/crx/de`. The default URL for CRXDE Lite is `http://localhost:4502/crx/de`.
2. Navigate to **apps** > **servicenow-components** > **clientlibs** > **clientlib-common**.
3. Open the `variables.less` file.
4. Specify the *`initializeCSS`* function for a component in the format `<component_type>;<class_name>;<color_variable_1>;<color_variable_2>;<color_`
   - component_type: The type of the component on which you want to apply the custom color theme, for example, articlelist, articleview, casecards, and so on.
   - class_name: The Custom CSS class you enter in the **Custom CSS class** property of your component.
   - color_variable_1, color_variable_2, color_variable_n: The color variables you specify for the HTML elements in a component. For more information, see the Color variable settings table.

   Use the following sample code as a reference for color styling at the component level.

```
.initialize(@componentType:articlelist;@className:now-article-l
ist;@text-color:red;
 @link-color:orange;@badge-text-color:blue;@badge-background-co
lor:yellow;@title-color:magenta;@secondary-color:indigo;);
.initialize(@componentType:articleview;
 @className:now-article-view;@text-color:red;
 @link-color:orange;@badge-text-color:blue;@badge-background-co
lor:yellow;@secondary-color:indigo;);
.initialize(@componentType:casecards;
 @className:now-case-cards;
 @text-color:red;@link-color:orange;@badge-text-color:blue;@bad
ge-background-color:yellow;@title-color:magenta;@secondary-colo
r:indigo;);
.initialize(@componentType:caselist;
 @className:now-case-list; @text-color:red;
 @link-color:orange;@title-color:magenta;@primary-color:green;@
secondary-btn-text-color:white;@secondary-btn-bkg-color:black
;);
.initialize(@componentType:searchbox;
 @className:now-search-box; @text-color:red;
 @link-color:orange;@title-color:magenta;@primary-color:green;@
secondary-btn-text-color:white;@secondary-btn-bkg-color:black
;);
.initialize(@componentType:searchresults;@className:now-search-
results;@text-color:gray;
 @link-color:orange;@badge-text-color:blue;@badge-background-co
lor:yellow;@title-color:magenta;@secondary-color:indigo;);
.initialize(@componentType:caseview;@className:now-case-view;@t
ext-color:red;@link-color:orange;@primary-color:green;@secondar
y-color:indigo;@primary-btn-text-color:blue;@primary-btn-bkg-co
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
lor:white;@secondary-btn-text-color:white;@secondary-btn-bkg-co
lor:blue;);
.initialize(@componentType:createcase;@className:now-create-cas
e;@text-color:red;@link-color:orange;@primary-color:green;@seco
ndary-color:indigo;@primary-btn-text-color:blue;@primary-btn-bk
g-color:white;@secondary-btn-text-color:white;@secondary-btn-bk
g-color:blue;)
```

5. From the CRXDE Lite menu, click **Save All** to save the changes on the AEM server.

ServiceNow pages in Adobe Experience Manager

Use pages provided on the ServiceNow site in the Adobe Experience Manager (AEM) as a reference to organize your AEM-based websites and provide a consistent user experience.

An AEM page houses containers, which in turn contain components. By manipulating the layout of the page and the components within it, you can construct a consistent user experience.

By default, ServiceNow sites and pages aren't accessible to public users, which are anonymous AEM users who are not logged in. For information about how to publish them and make them available to anonymous AEM users, see the Adobe documentation topic Publishing pages.

ServiceNow page in AEM for knowledge articles

The following table shows default pages available in the ServiceNow site in AEM and the knowledge components available on these pages.

ServiceNow pages in AEM for knowledge articles

Page	Description	Knowledge components on the page
ServiceNow Article Search	Reference page to view knowledge article search results.	• Search Box • Search Results
ServiceNow Article View	Reference page to view a knowledge article.	Article View
ServiceNow Article List	Reference page to browse and search for knowledge articles.	• Search Box • Article List (one each for featured articles and the most viewed articles lists)

ServiceNow page in AEM for customer service cases

The following table shows default pages available in the ServiceNow site in AEM and the case components available on these pages.

ServiceNow pages in AEM for customer service cases

Page	Description	Case components on the page
ServiceNow Create Case	Reference page to create a customer service case.	New Case

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow pages in AEM for customer service cases (continued)

Page	Description	Case components on the page
ServiceNow Case View	Reference page to view a customer service case.	Case View
ServiceNow Case List	Reference page to browse and search for customer service cases.	Case List

ServiceNow home page in AEM

The following table shows default home page available in the ServiceNow site in AEM and the knowledge and case components available on this page.

ServiceNow home page in AEM

Page	Description	ServiceNow components on the page
ServiceNow Home	Reference page to browse and search for knowledge articles and create a case.	• Article List • Search Box • Case Cards

Display ServiceNow knowledge articles on an Adobe Experience Manager page

Use knowledge components available within Adobe Experience Manager (AEM) to access knowledge bases from the ServiceNow instance and display associated knowledge articles on an AEM-based website.

Before you begin

- Activate the Knowledge API plugin (sn_km_api) to use the Knowledge Management REST API endpoints for knowledge articles. For more information, see Knowledge Management REST API.
- Define the cross-origin resource sharing (CORS) rule to access the Knowledge API from your AEM instance. For more information, see Define a cross-origin resource sharing rule (CORS) to access ServiceNow API endpoints from AEM.

Role required: AEM author

Procedure

1. Log in to your AEM instance.
2. Open your AEM page in Edit mode.
3. Open the components browser.
4. From the **All** list, select **ServiceNow**.
5. Drag a component to the required position on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If components are not available, update your template configuration to include the knowledge components. In addition, you must modify the properties of the site template and add each knowledge article component to the list of allowed components.

6. Open the component dialog for editing.

Note:
By default, the knowledge components in the Edit mode of a page in AEM aren't accessible by public users, which are anonymous AEM users who are not logged in. To change the default behavior, you must enable the **Public** property for each knowledge component.

7. Set the Search Results component properties to display knowledge search results that include a list of knowledge articles from the knowledge bases in the ServiceNow instance.

Search Results component properties

Property	Description
Public	Option to make the content of the component visible to public users. When selected, the knowledge articles available to unauthenticated users included in the component are available to all users, including public users.
Knowledge Bases	System identifier (sys_id) of a knowledge base that contains associated knowledge articles. Click **Add field** and enter the sys_id of a knowledge base. You can add multiple entries. **Note:** If you don't add a value, knowledge bases from the OSGi configuration settings are used for ServiceNow components.
Language	Enables the display of knowledge article search results in different languages. Select one of the following options: ○ **Select from ServiceNow OSGi Configuration**: Knowledge articles are displayed in the language configured in the OSGi configuration for ServiceNow components. This value is selected by default. ○ **Restrict to portal language**: Knowledge articles are displayed in the language configured in the AEM site. ○ **All languages**: Knowledge articles are displayed in all languages.
Search parameter	Parameter key for the search query. Example: `kb_query`
Secondary fields	Metadata of a knowledge article that appear with the article. Metadata include information such as the author, the date the article was last updated, and the date the article was last viewed. For multiple entries, separate the fields by commas. Example: `author,sys_view_count,sys_updated_on,rating`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Search results count	Maximum number of articles included in the search results list. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Article page URL	Relative URL of the article page to redirect to. Example: `/content/NOWApp/now_article_view.html`
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

8. Set the Search Box component properties to display a search box for users to enter search text and find knowledge articles in the ServiceNow instance matching the search text.

Note:
Triggering a search from the Search Box component leads to the Search Results component.

Search Box component properties

Property	Description
Public	Option to make the content of the component visible to public users. When selected, the knowledge articles available to unauthenticated users included in the component are available to all users, including public users.
Placeholder	Hint text displayed in the search box to provide information about what users can search for or conditions for the search text. Example: `Search (minimum three characters)`
Knowledge Bases	System identifier (sys_id) of a knowledge base that contains associated knowledge articles. Click **Add field** and enter the sys_id of a knowledge base. You can add multiple entries. **Note:** If you don't add a value, knowledge bases from the OSGi configuration settings are used for ServiceNow components.
Language	Enables the display of knowledge articles in different languages in the search box. Select one of the following options: ○ **Select from ServiceNow OSGi Configuration**: Knowledge articles are displayed in the language configured in the OSGi configuration for ServiceNow components. This value is selected by default. ○ **Restrict to portal language**: Knowledge articles are displayed in the language configured in the AEM site. ○ **All languages**: Knowledge articles are displayed in all languages.
Search page URL	Relative URL of the search page to redirect to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Example: `/content/NOWApp/now_article_search.html`
Search parameter	Parameter key for the search query. Example: `kb_query`
Typeahead	Option to enable typeahead search.
Typeahead search results count	Maximum number of articles to include in the typeahead search results list. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Article page URL	Relative URL of the article page to redirect to. Example: `/content/NOWApp/now_article_view.html`
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

9. Set the Article View component properties to display knowledge articles and their attachments, if available, from a ServiceNow instance.

Article View component properties

Property	Description
Public	Option to make the content of the component visible to public users. When selected, the knowledge articles available to unauthenticated users included in the component are available to all users, including public users.
Article parameter	Name of the URL query parameter for the article number. Example: `kb_article`
Secondary fields	Metadata of a knowledge article that appear with the article. Metadata include information such as the author, the date the article was last updated, and the date the article was last viewed. For multiple entries, separate the fields by commas. Example: `author,sys_view_count,sys_updated_on,rating`
Language parameter	Name of the URL query parameter containing the requested language for a knowledge article. Example: `kb_lang`
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

10. Set the Article List component properties to display a list of knowledge articles depending on the list criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Article List component properties

Property	Description
Public	Option to make the content of the component visible to public users. When selected, the knowledge articles available to unauthenticated users included in the component are available to all users, including public users.
Title	Title corresponding to the articles list that appears as the component header. Example: `Most viewed articles`
Knowledge Bases	System identifier (sys_id) of a knowledge base that contains associated knowledge articles. Click **Add field** and enter the sys_id of a knowledge base. You can add multiple entries. **Note:** If you don't add a value, knowledge bases from the OSGi configuration settings are used for ServiceNow components.
Language	Enables the display of a knowledge article in different languages when viewing the article. Select one of the following options: ○ **Select from ServiceNow OSGi Configuration**: Knowledge articles are displayed in the language configured in the OSGi configuration for ServiceNow components. This value is selected by default. ○ **Restrict to portal language**: Knowledge articles are displayed in the language configured in the AEM site. ○ **All languages**: Knowledge articles are displayed in all languages.
Secondary fields	Metadata of a knowledge article that appear with the article. Metadata include information such as the author, the date the article was last updated, and the date the article was last viewed. For multiple entries, separate the fields by commas. Example: `author,sys_view_count,sys_updated_on,rating`
Criteria	List of criteria for the knowledge articles list. Select one of the following options: ○ **Featured**: List of featured knowledge articles based on the keywords configured in the *`glide.knowman.default_keyword`* property. For information about featured articles, see Add a knowledge article to featured content and Knowledge properties. ○ **Most Viewed**: List of knowledge articles with the most views.
Article count	Maximum number of articles to include in the articles list. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Article page URL	Relative URL of the article page to redirect to. Example: `/content/NOWApp/now_article_view.html`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Hide component when empty	Option to hide the component when there are no knowledge articles to display.
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

Display ServiceNow cases on an Adobe Experience Manager page

Use case components available within Adobe Experience Manager (AEM) to access customer service cases from the ServiceNow instance and display them on an AEM-based website.

Before you begin

Define the cross-origin resource sharing (CORS) rule to access the Case API and CSM Attachment API from your AEM instance. For more information, see Define a cross-origin resource sharing rule (CORS) to access ServiceNow API endpoints from AEM.

Role required: AEM author

About this task

The Case REST API enables you to create, retrieve, and update customer service case records. For more information, see Case API.

The CSM Attachment API enables you to upload, download, and remove attachments associated with customer service cases and to retrieve attachment metadata. For more information, see CSM Attachment API.

Procedure

1. Log in to your AEM instance.
2. Open your AEM page in Edit mode.
3. Open the components browser.
4. From the **All** list, select **ServiceNow**.
5. Drag a component to the required position on the page.

   Note:
   If components are not available, update your template configuration to include the case components. In addition, you must modify the properties of the site template and add each case component to the list of allowed components.

6. Open the component dialog for editing.

   Note:
   The case components in the Edit mode of a page in AEM are accessible to all users, including public users. Public users are anonymous AEM users who are not logged in.

7. Set the Case Cards component properties to display all open customer service cases from your ServiceNow instance as column cards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Cards component properties

Property	Description
Title	Title of this component that appears on the AEM page.
Label parameters	Comma-separated label parameters for Case [sn_customerservice_case] table columns. Each parameter is specified in the format *label*:*column* . Where *label* is displayed on the component and *column* is the name of a column from the Case [sn_customerservice_case] table. Example: `Number:number,Priority:priority,Product:product`
Case list page URL	Relative URL of the case list page to redirect to. Example: `/content/servicenow/en/now_case_list.html`
Case view page URL	Relative URL of the case view page to redirect to. Example: `/content/servicenow/en/now_case_view.html`
Hide component for no cases	Option to hide the component when there are no cases to display.
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

8. Set the New Case component properties for users to create a customer service case in your ServiceNow instance from your AEM page.

New Case component properties

Property	Description
Title	Title of this component that appears on the AEM page.
Short description label	Label for the field to enter a brief description of the case.
Description label	Label for the field to enter a description of the case.
Product label	Semicolon-separated parameters to define the label and the placeholder text for the product list.
Asset label	Semicolon-separated parameters to define the label and the placeholder text for the asset list
Number of list items	Maximum number of items to include in the product and asset lists. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Show assets	Option to display the asset list on the component.
Case list page URL	Relative URL of the case list page to redirect to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Example: `/content/servicenow/en/now_case_list.html`
Case view page URL	Relative URL of the case view page to redirect to. Example: `/content/servicenow/en/now_case_view.html` **Note:** You need to enter a value for this property to navigate to the case view page from the Case created window.
Attachment file size limit in MB	Maximum size limit for an attachment file that can be added to a case.
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

9. Set the Case View component properties to display customer service cases and any comments and attachments, if available, from a ServiceNow instance.

Case View component properties

Property	Description
Case parameter	Name of the URL query parameter for the case number. Example: `case_no`
Label parameters	Comma-separated label parameters for Case [sn_customerservice_case] table columns. Each parameter is specified in the format *`label`*`:`*`column`* . Where *`label`* is displayed on the component and *`column`* is the name of a column from the Case [sn_customerservice_case] table. Example: `Number:number,Priority:priority,Product:product`
Activities count	Maximum number of activities such as comments and attachments to be displayed on the Activity tab. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Attachment file size limit in MB	Maximum size limit for an attachment file that can be added to a case. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`.
Article page URL	Relative URL of the article page to redirect to. Example: `/content/servicenow/en/now_article_view.html` **Note:** If an article link is included in a case, you need to enter a value for this property to navigate to the knowledge article view page from the case.
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Set the Case List component properties to display a list of customer service cases.

Case List component properties

Property	Description
Title	Title of this component that appears on the AEM page.
Label parameters	Comma-separated label parameters for Case [sn_customerservice_case] table columns. Each parameter is specified in the format *label*:*column*. Where *label* is displayed on the component and *column* is the name of a column from the Case [sn_customerservice_case] table. Example: `Number:number,Priority:priority,Product:product`
Case count	Maximum number of cases to display on the component. Use the increment or decrement icons to increase or decrease the values. You can also manually enter a value. The value must be greater than `1`. The maximum value you can enter for this field is 50.
Show create case	Option to display the button to create a case on the component.
Create case button label	Label for the button to create a case.
Case create page URL	Relative URL of the case create page to redirect to. Example: `/content/servicenow/en/now_case_create.html`
Case view page URL	Relative URL of the case view page to redirect to. Example: `/content/servicenow/en/now_case_view.html`
Custom CSS class	Custom CSS class for applying custom styles to this component. For more information, see Customizing the colors of ServiceNow components in AEM.

Integrating with Computer Telephony Integration (CTI)

Integrate Customer Service Management with Computer Telephony Integration (CTI). This integration enables the Customer Service application to support inbound and outbound telephone calls.

Customer service agents can do the following with CTI:

- Make an outgoing call to a phone number.
- Receive an incoming call from a phone number or from another user within the system.
- Transfer a call to another user within the system.
- Place a call on mute.
- Set their availability status.

CTI does not require any specific user role except the OpenFrame user (sn_openframe_user) role. Roles are based on the application using CTI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see the following topics:

- Computer Telephony Integration
- Computer Telephony Integration workflows
- Callback interaction features

OpenFrame overview

OpenFrame provides a communication frame that customer service agents use to place and receive customer calls.

OpenFrame user roles

The OpenFrame window is available to agents who belong to one of the user groups specified in the OpenFrame configuration, and with any of the following roles:

- sn_openframe_user
- sn_customerservice_agent
- sn_customerservice.consumer_agent
- admin

About OpenFrame

Use OpenFrame to integrate telephony systems into the ServiceNow AI Platform®. Use the OpenFrame API to communicate between the ServiceNow AI Platform and the domain opened in the OpenFrame window.

OpenFrame includes these components:

- TopFrame, a ServiceNow application.
- OpenFrame API, which gets sourced from the partner application. This API communicates with TopFrame and controls the OpenFrame visual features.

  The location of the API is `https://[servicenow instance]/scripts/openframe/1.0.5/openFrameAPI.min.js`. This minified version includes other needed libraries and should be used for integration.

  For API reference, you can use the unminified version: `https://[servicenow instance]/scripts/openframe/1.0.5/openFrameAPI.js`. This version can't be used directly for integration purposes.

Note:

- To stay current with reference to the OpenFrame library, use the following resource URI: `https://[servicenow instance]/scripts/openframe/latest/openFrameAPI.min.js`.
- To integrate softphone into the ServiceNow AI Platform using OpenFrame, add the third-party URLs of telephony services in the following property: *`glide.ui.concourse.onmessage_enforce_same_origin_whitelist`*. For more information see, Available system properties, and Enable URL allow list for cross-origin iframe communication in Instance Security Hardening Settings.

Using the OpenFrame window

OpenFrame provides support for embedded and contextual phone conversations, including:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Context identification: Incoming calls maximize the OpenFrame window and display details about the caller, including the account, contact or consumer name, and phone number.
- Links to forms: Use the openFrameAPI (openServiceNowForm) to create links to forms. When an incoming call is received, an agent can select the account, contact, consumer, or case number in the OpenFrame window to open the corresponding record.
  - In Agent Workspace, records open in either a primary tab or a subtab depending on the tab configuration.
  - In the platform interface, records open in TopFrame (that is, the current page).
- Select-to-call capability: Click phone number fields to make a call.
  - In Agent Workspace, agents can select phone number fields on forms and in the Customer 360 ribbon component to make a call.
  - In the platform interface, agents can select the phone icon next to the **Contact** or **Consumer** fields.
    - If a contact or consumer has one phone number, the call is placed to that number.
    - If a contact or consumer has more than one phone number, a dialog box displays the available numbers. Select a number to place the call.
- OpenFrame window actions:

OpenFrame window actions

User action	Description
Open the window	In Agent Workspace, select the phone icon: ○ In the navigation bar. ○ Next to the **Contact** or **Consumer** fields on the Case form. In the platform interface, select the phone icon: ○ In the banner frame. ○ Next to the **Contact** or **Consumer** fields on the Case form. With the admin role, you can configure the phone icon. For more information, see CTI integration with the Case form.
Hide the window	Select the **X** in the OpenFrame window header. **Note:** The OpenFrame window remains on top of other forms or pages until hidden.
Expand or collapse the window	Select the **+ / –** buttons in the OpenFrame window header (if **Enable collapsed view** is set to **True** in the OpenFrame configuration).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User action	Description
	Note: When collapsed, agents can still access call control actions.
Move the window	Select and drag the OpenFrame window header.

Using OpenFrame in CSM Configurable Workspace

In the CSM Configurable Workspace, you can:

- Integrate OpenFrame with the Interaction Management System (IMS) and interaction records. This enables agents to manage the phone interaction life cycle.
- Use the native voice control capability from the Interaction Controls Component (ICC) plugin to integrate to the contact center voice channel. You would need to be enable this in the CSM Configurable Workspace to manage the voice channel. For more information, see Interaction Controls Component and Interaction Controls Component (ICC) call features.

Creating an OpenFrame configuration

With the admin role, you can create or modify an OpenFrame configuration. This configuration stores information about the OpenFrame window settings, including:

- The window height and width.
- The icon, title, and subtitle displayed in the window header.
- Users and groups that have access to the window.

Related topics

openFrameAPI - Client

Interaction Controls Component

Interaction Controls Component (ICC) is a component that allows for a native call controls interface embedded in Agent Workspace.

- Create state context in OpenFrame to read the state of idle and active call state
- Create the state context in OpenFrame to read the state of transfer
- Provide iframe sandbox parameters to allow iframe access to security features and to enable additional iframe restrictions
- Create an extension point implementation to hide the conversation panel when real-time transcription is turned on/off
- Create an extension point implementation to create and get phone log segments
- Implement Click to Dial on CSM Workspace with ICC enabled
- Seismic event emitted to the Polaris shell via Active call component when any action clicked related to the transfer component
- Screen pop for Interaction should be available on Dialpad and Click-to-call outbound call
- sn_openframe.create_interaction will be ignored when using ICC. All inbound and outbound calls will have interactions created.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Interaction Controls Component (ICC) and OpenFrame to integrate with the voice channel for contact centers. For more information, see Interaction Controls Component (ICC) for voice calls.

Computer Telephony Integration Workflows

Computer Telephony Integration (CTI) enables customer service agents to place and receive phone calls in ServiceNow applications.

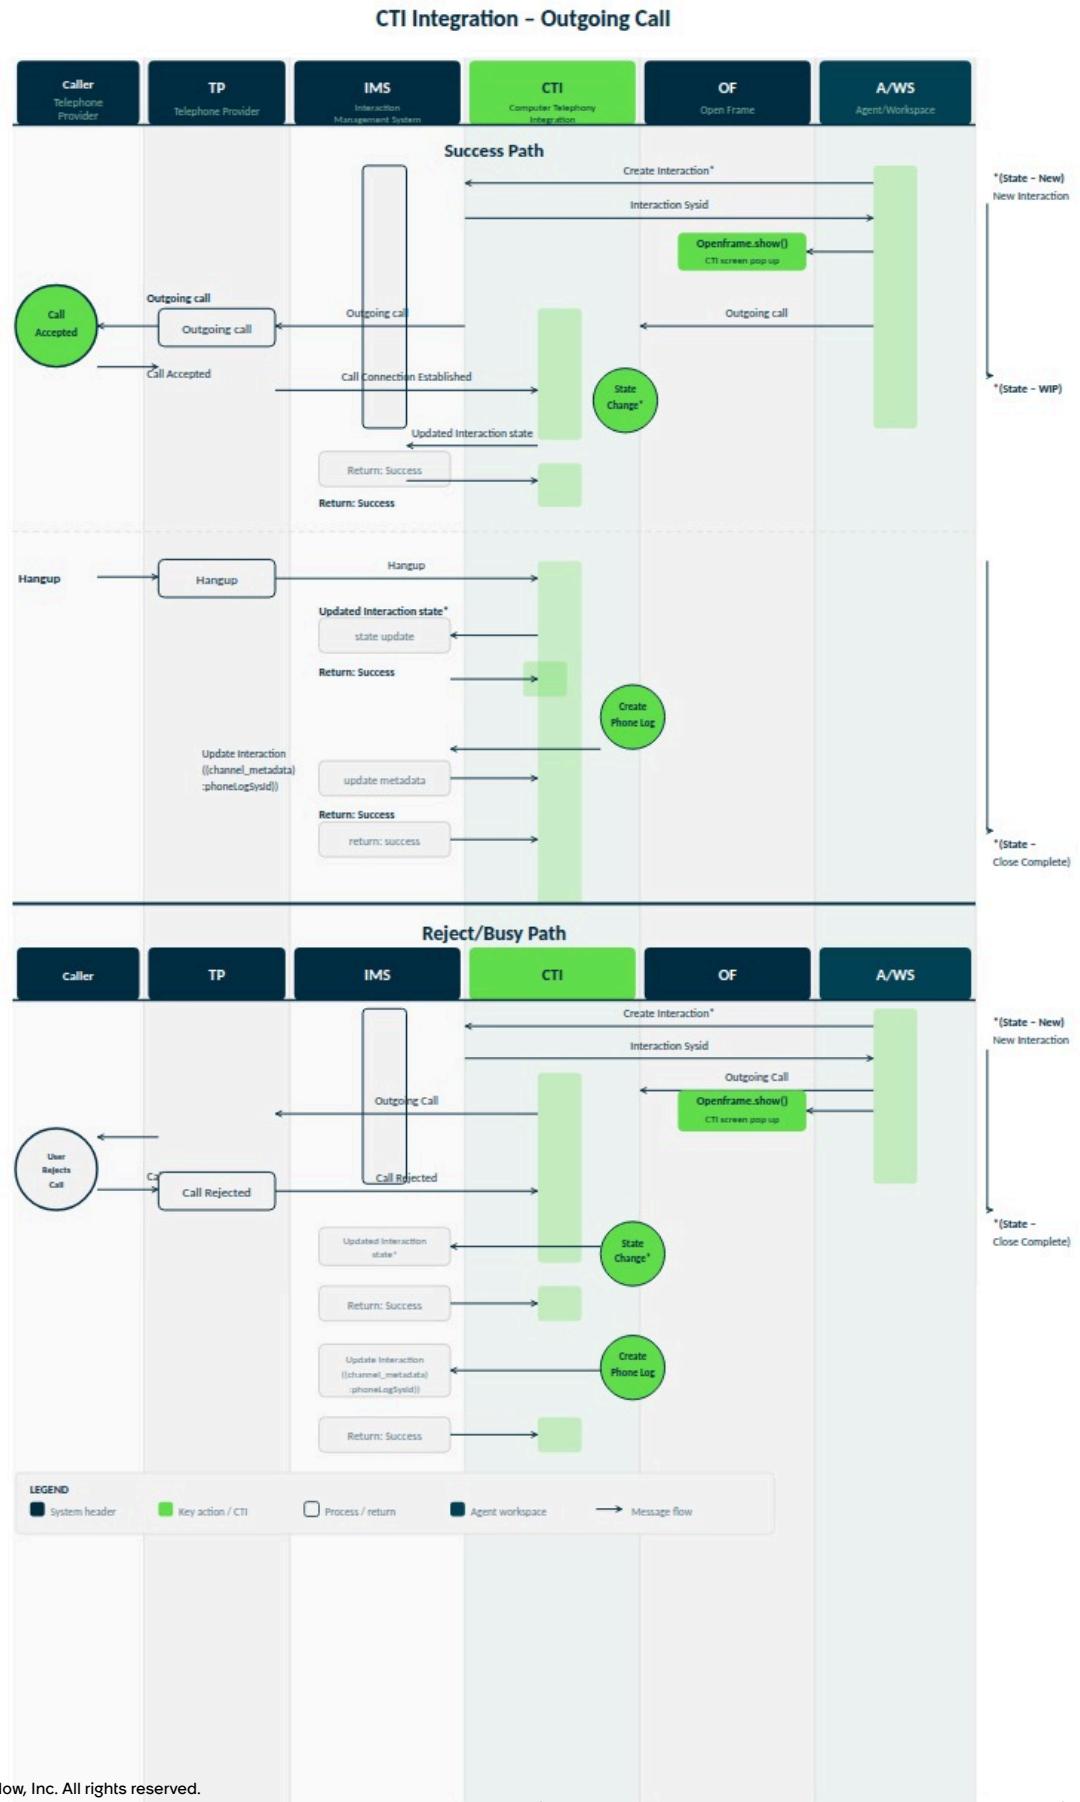
The following sample workflows show how CTI can be integrated with Interaction Management System (IMS) and OpenFrame (OF) to support outgoing and incoming telephone calls.

CTI integration for outgoing call

The following workflow describes the logical sequence of actions when an outgoing call is triggered using the OpenFrame window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CTI Integration — Outgoing Call: Success Path & Reject/Busy Path

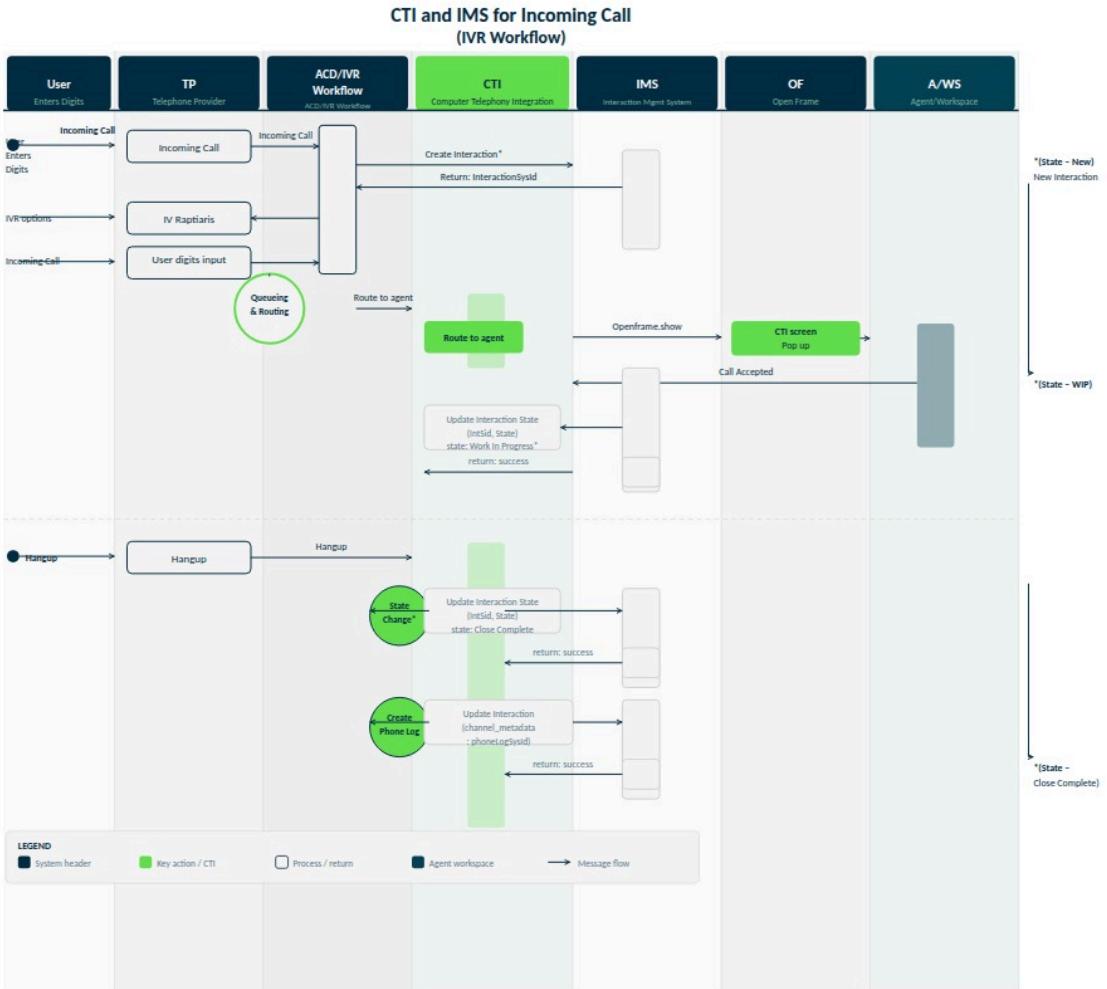


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CTI integration for incoming call

The following workflow describes the logical sequence of actions when an incoming call is received using the OpenFrame window.

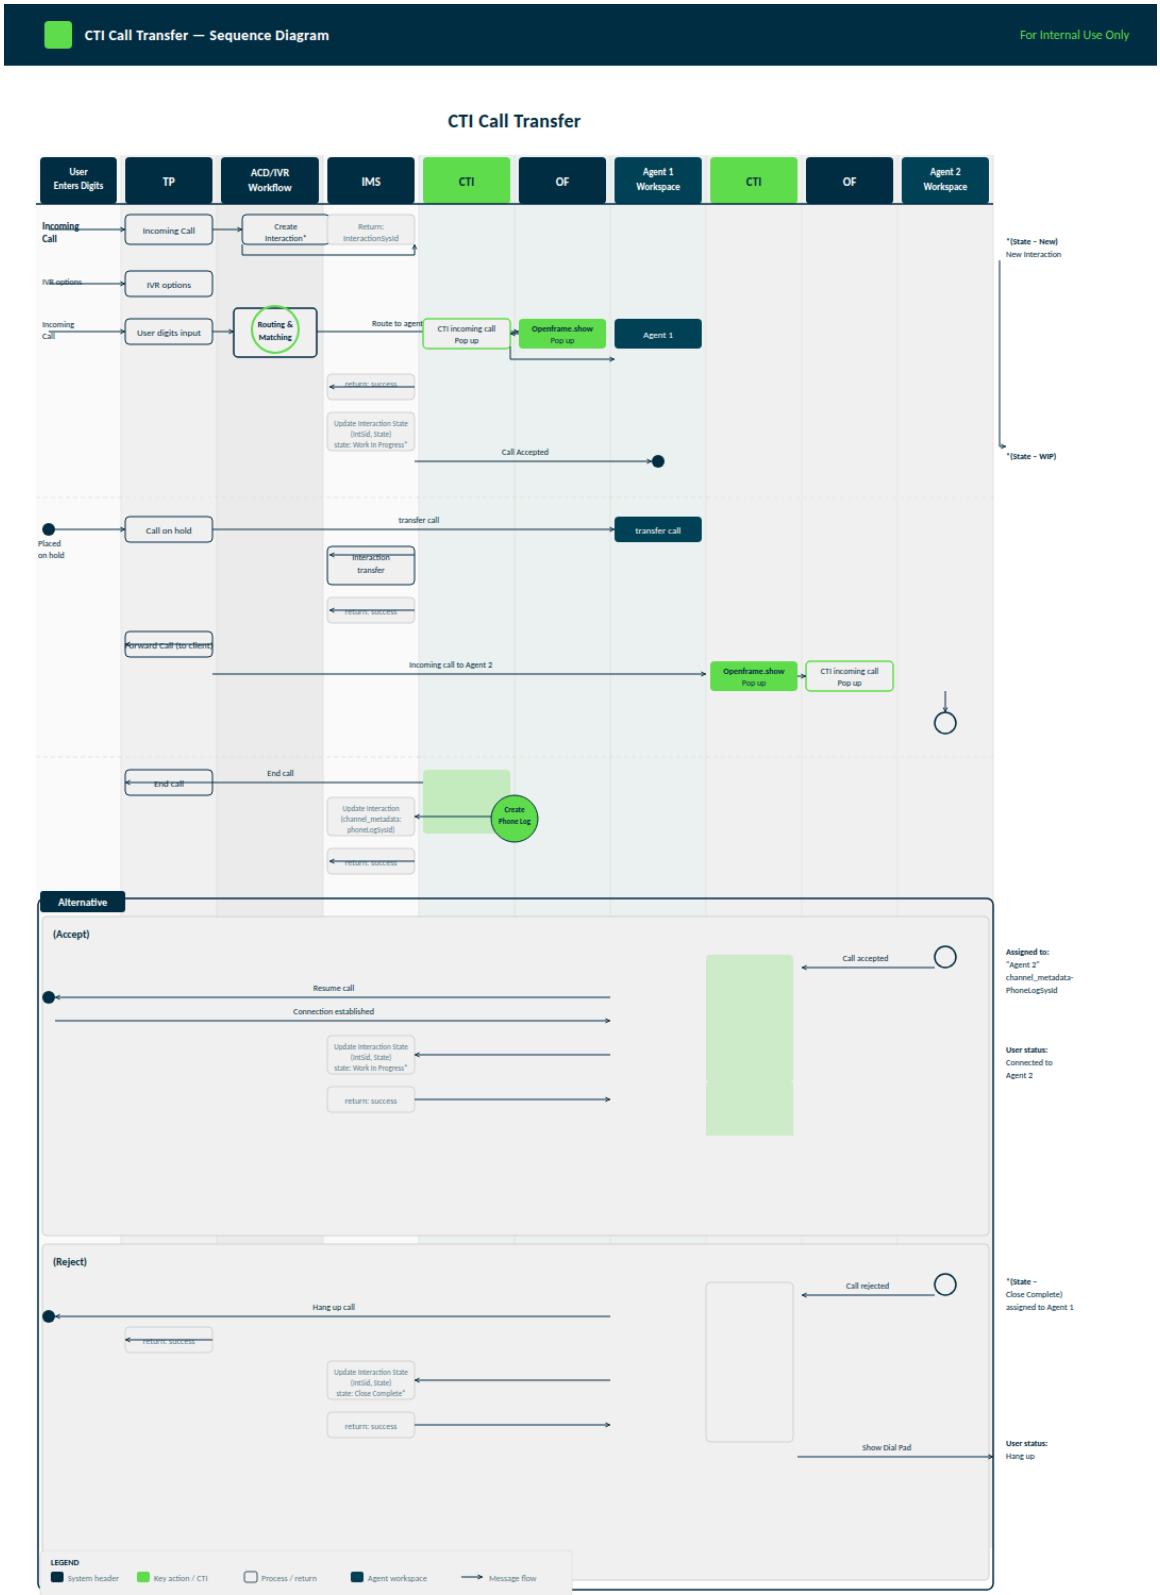
CTI and IMS for Incoming Call — IVR Workflow



CTI integration for transferring call

The following workflow describes the logical sequence of actions when an incoming call is transferred to an agent.

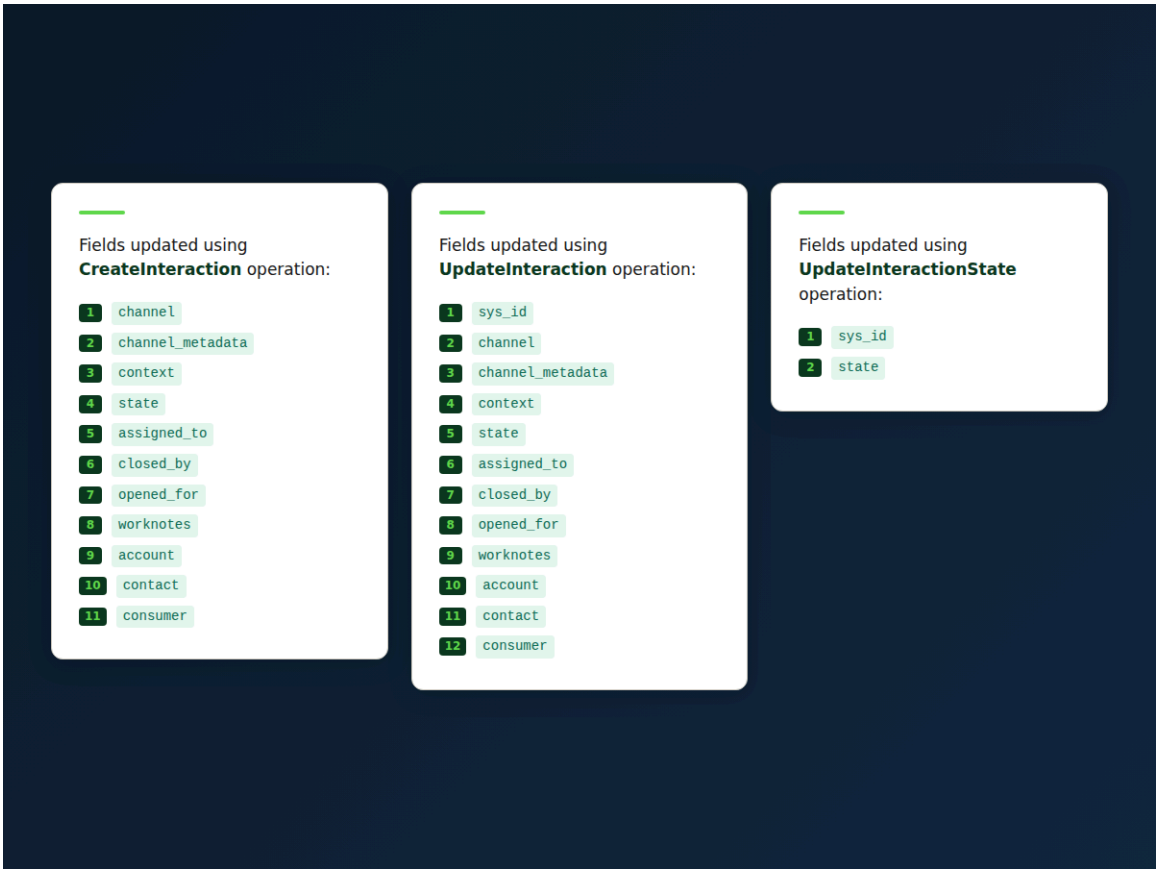
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



CTI call interactions operations

CTI integration with IMS and OF uses the `OpenframeInteractionUtility` script. You can use the`createOrUpdateInteractionForOpenframe` method from the utility script to create an interaction. For more information about creating interaction using APIs, see Understanding the Interaction Management API see the Understanding the Interaction Management API [KB1941272] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



CTI demo implementation

Use the CTI demo implementation to test the phone communication channel between customer service agents and external customers in a non-production instance.

Starting with the Zurich release, the Computer Telephony Integration (CTI) plugin is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The CTI Softphone plugin enables softphone functions and call center capabilities. This plugin provides integration between the ServiceNow platform and the Twilio Voice service using the Notify application. This plugin can be activated any time after activating Notify.

The CTI Softphone plugin includes one OpenFrame configuration, called CTI. This configuration specifies the necessary OpenFrame window settings as well as the URL to be launched within OpenFrame.

Note:
The included CTI configuration does not have the **Default** field enabled. You must enable this field to use the CTI configuration as the default.

Configure the CTI demo

Before the phone communication channel between customer service agents and external customers can be used, the Notify, CTI Softphone, Customer Service Management, and Openframe plugins must be activated and configured, and a Twilio Voice account must be set up.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate Notify (com.snc.notify).
2. Set up a Twilio Voice account.
   You can create an account at `https://www.twilio.com`.
3. Configure Notify with Twilio.
4. Activate the CTI Softphone plugin (com.snc.cti).
   If you want to load the demo data for CTI Softphone, you must also activate the Customer Service CTI Demo Data plugin (com.snc.customerservice_cti_demo). This demo data includes sample workflows.
5. Activate the Customer Service plugin (com.sn_customerservice).
6. Activate the Openframe plugin (com.sn_openframe).
   Activating the Customer Service Management plugin automatically activates the Openframe plugin.
7. Create an OpenFrame configuration or use the default CTI configuration by enabling the **Default** field.

Working with the CTI using the OpenFrame window

Use the OpenFrame window to make a call, answer a call, transfer a call, or set status.

Answer an incoming call

Use the OpenFrame window to answer an incoming call.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_open_frame, or admin

About this task

The OpenFrame window displays the incoming call, including the phone number and the customer contact or consumer information.

Procedure

1. Click **Accept**.
2. When the call is finished, click **End**.

Make an outgoing call

Use the OpenFrame window to make an outgoing call.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_open_frame, or admin

Procedure

1. Select one of the following options.

Option	Description
Click the phone icon in the banner frame.	Enter the phone number in the **Number** field and click **Call**.
Click the phone icon next to the Contact or Consumer fields on the Case form.	Customer contacts and consumers can have multiple phone numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ If only one phone field is populated, a call is placed to that number. ○ If more than one phone field is populated, a dialog box displays the available numbers. Click the desired number to place the call and close the dialog box.

2. When finished with the call, click **End**.

Transfer a call

After accepting an incoming call, a customer service agent can transfer a call to another agent.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_open_frame, or admin

Procedure

1. Answer an incoming call.
2. Click **Transfer**.
3. Select an agent from the drop-down list.
4. Click **Call**.

Set agent call status

Customer service agents can set their current call status.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_open_frame, or admin

Procedure

1. Click the phone icon in the banner frame.
2. Select your availability.

Option	Description
Available	The agent is available to take a call.
Not Available	The agent is not available to take a call.
Busy	The agent is currently on a call with a cus tomer.
Wrap Up	The agent is updating case information after completing a call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	After completing a call and the subsequent wrap up, an agent must manually change the status from **Wrap Up** to **Available**.

The **Presence** field in the **OpenFrame** > **OpenFrame Agent Presence** record is updated with the availability status set for the agent.

Computer Telephony demo integration with the Case form

Activating the CTI Softphone plugin enables call-related features on the Case form.

The customer service or consumer service agent can use the phone icon next to the **Contact** and **Consumer** fields on the Case form to make a phone call. The phone icon appears next to these fields if the entity record has at least one phone field (ph_number) and at least one of those phone fields contains a phone number.

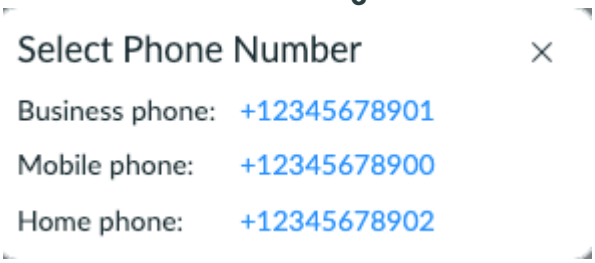
The phone icon is a reference contribution that can be added to any reference field by modifying the dictionary and adding the following attribute: *ref_contributions=show_phone_customer_service*.

Note:
If you're using a third-party provided CTI application, then you can integrate with the show_phone UI macro to make calls. For more information on UI macros, refer to UI macros installed with OpenFrame

Select the phone icon to call a consumer or contact.

- If only one phone field is populated, a call is placed to that number.
- If more than one phone field is populated, a dialog box displays the available numbers. Select the desired number to call and close the dialog box.

Select Phone Number dialog box



Incoming and outgoing calls are logged in the Phone Log [sn_openframe_phone_log] table. Call details are recorded in the **Activity** field on the Case form and in the **Phone** related list.

CTI demo integration with case routing

An incoming call from a customer contact or a consumer can be routed to an available customer service agent.

Similar to the other communication channels, incoming calls from customer contacts and consumers can be routed to a specific agent by using matching rules. If an agent is not available, the call can be placed in a queue. After the agent is free, the matching call in the queue with the longest wait time is rerouted to the agent.

Case routing is enabled as an activity in a workflow. In the Call Center demo workflow (available with the Customer Service CTI Demo Data plugin), a call is forwarded to an agent after the caller either creates a new case or enters a valid number for an existing case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If no agents are available, the call goes into a queue and remains there until an agent becomes available. If a call is in the queue for longer than 10 minutes, it is forwarded to voice mail and the caller is asked to leave a message.

Related topics

Routing and assigning customer service cases

Computer Telephone demo integration with tasks

The CTI Softphone component can be integrated with other task entities on the ServiceNow AI Platform.

A workflow can be implemented to operate on the Incident table.

Note:
The Call Center for Incident Management workflow, a demo workflow, is available with the Customer Service CTI Demo Data plugin.

Incoming or outgoing calls are logged in the Phone Log [sn_openframe_phone_log] table. The call logs also appear in the activity history of the task.

Associate a phone number with a workflow

You can associate a Notify phone number with a workflow.

Before you begin

You must create a Twilio Voice account and configure Notify with Twilio Voice before you can associate a phone number with a number group and workflow.
A number group allows you to group Notify phone numbers and then share workflows across grouped numbers. For each number group, you can specify a workflow for incoming and outgoing calls.

The CTI Softphone demo data includes these sample workflows:

- Call Center, for use with the Customer Service Management application
- Call Center for Incident Management

The Call Center workflow uses several Notify workflow activities that determine workflow functionality. Each activity performs a different task, such as playing a message greeting or creating a list of user input options. Activities can succeed or fail, which can result in actions performed by other activities.

You can use the default Call Center workflow or modify this work flow as needed.

Role required: admin

Procedure

1. Navigate to **All** > **Notify** > **Numbers**.
2. From the Notify Phone Numbers list, click the phone number that you want to edit.
3. Select a **Notify Group** that uses the incoming call workflow that you want to handle this phone number.
   The CTIDemo group uses the Call Center workflow for incoming calls.
4. Click **Update**.

Integrating with Microsoft Outlook

Integrate Customer Service Management with Microsoft Outlook to perform tasks such as managing contacts and cases from within Microsoft Outlook.

The following plugins are required to enable you to interact with the ServiceNow platform and customers from within Microsoft Outlook:

- ServiceNow Add-In for Microsoft Outlook (com.sn_outlook_addin)
- CSM Extension for Proxy Contacts (com.snc.csm_proxy_contacts)

Integrate Customer Service Management with Microsoft Outlook

Customer Service Management provides an integration with Microsoft Outlook. This integration enables you to manage workflows such as creating and updating contacts and cases from within Microsoft Outlook.

Before you begin

Role required: admin

About this task

Note:
You must be an Office 365 administrator to deploy the ServiceNow Add-in for Microsoft Outlook. This add-in is supported only for use with Microsoft Outlook 2016+ for MacOS and for Windows.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the ServiceNow Add-In for Microsoft Outlook plugin (com.sn_outlook_addin).
3. Click **Activate**.
4. Search for the CSM Extension for Proxy Contacts plugin (com.snc.csm_proxy_contacts).
5. Click **Activate**.

Related topics

- Using Microsoft Outlook with CSM

Configure the ServiceNow Add-in for Microsoft Outlook

Configure user roles and download the office add-in manifest file in order to use the ServiceNow Add-in for Microsoft Outlook.

Before you begin

Role required: admin or both sn_customerservice.proxy_contact and sn_customerservice.contact_manager roles.

Procedure

1. Go to your ServiceNow instance.
2. Navigate to **ServiceNow Add-Ins for Office** > **Office Add-In-Manifests**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **ServiceNow for CSM**.
4. Click **Download Manifest** to download the Microsoft Office add-in manifest file.
5. Provide the downloaded `manifest.xml` file to the account manager to enable the installation of the add-in.

Related topics

Install the ServiceNow Add-in for Microsoft Outlook

Include a combined CSM and ITSM add-in icon in Microsoft Outlook

Enable users to access both CSM and ITSM through one combined add-in icon.

Before you begin

Role required: sn_customerservice.contact_manager and sn_customerservice.proxy_contact

Procedure

1. Go to your ServiceNow instance.
2. Navigate to **ServiceNow Add-Ins for Office** > **Office Add-in Manifests**.
3. Download the manifest files for CSM and ITSM.
4. Click **Download Manifest**.
5. Install the ServiceNow Add-in for Microsoft Outlook add-in.
   Follow the procedure in Install the ServiceNow Add-in for Microsoft Outlook.
   The ServiceNow for CSM/ITSM icon appears in the header and users can view both the CSM and ITSM tasks through it.

Install the ServiceNow Add-in for Microsoft Outlook

Installing the ServiceNow Add-in for Microsoft Outlook enables you to interact with the ServiceNow platform from within Microsoft Outlook.

Before you begin

Role required: sn_customerservice.contact_manager

Procedure

1. Navigate to **All** > **Microsoft Outlook** > **Get Add-ins**.
2. Select **My add-ins**.
3. Go to the Custom add-ins tile and select **Add from file** from the Add a custom add-in drop-down list.
4. Select the `manifest.xml` file that your admin provided.
5. Click **Install**.
6. Click **View in ServiceNow** in Microsoft Outlook and log in with the credentials your admin provided.
7. Click **Allow**.

Result

You can now connect to your account on your ServiceNow instance and interact with its records from within Microsoft Outlook.

Integrating with Safe Workplace applications

Integrate Customer Service Management with ServiceNow® Safe Workplace applications. This integration helps you safely reopen locations and support the health and safety of contacts and consumers after emergencies and pandemics.

Overview

Integrate with Safe Workplace applications, specifically with the Employee Health Screening application, to enable contacts or consumers to safely enter locations and comply with health and safety policies.

As a consumer or contact, verify that you understand and comply with requirements and policies by filling out the Health Verification form on the Consumer or Customer Service Portal.

As a customer or consumer service agent, screen contacts or consumers entering a location to ensure compliance with entry requirements such as a temperature check and Personal Protection Equipment (PPE).

For more information on the Employee Health Screening application, see Employee Health Screening.

Key features

- Access for consumers and contacts to the Health Verification form on the Consumer or Customer Service Portals.
- Ability for customer or consumer service agents to screen consumers and contacts on visiting a location.

Set up Customer Service Management integration with Safe Workplace applications

Enable the integration with Safe Workplace applications to help contacts or consumers safely enter locations and comply with health and safety policies.

Before you begin

Ensure that the Customer Service plugin (com.sn_customerservice) is installed.

If you are supporting business-to-consumer (B2C) customers, ensure that the Consumer Service Portal plugin (com.glide.service-portal.consumer-portal) is installed.

Role required: admin

Procedure

1. Install Employee Health Screening.
2. Give external users access to the Health Verification form.
   For more information, see the Allow external users access to "Health Verification" catalog item [KB0856301] article in the HI Knowledge Base.
3. Assign the sn_imt_monitoring.monitoring_user role to a customer or consumer service agent.
4. **Optional:** Configure the health screening form.
5. **Optional:** Create relationships to show health screening information on Agent Workspace.
6. **Optional:** Customize the Consumer or Customer Service Portal to display a link to the Health Verification form in the portal header menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the health screening form

Provide additional information on contacts or consumers to health screeners by adding fields to the health screening form.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Record Producers**.
   a. In the Record Producers list, search for `Screen a person` in the **Name** column.
   b. In the Variables related list, click **New**.
   c. Create a variable.
   For more information about the different types of variables and how to configure them, see Creating variables.
   d. Click **Submit**.
   e. In the Catalog Client Scripts related list, open **Show additional CSM fields**.
   f. Add the variable to the client script as a consumer or contact field.
   For more information on client scripts, see Client scripts.
2. Navigate to **Activity Subscriptions** > **Script Includes**.
   a. Add the variables to the **HealthScreeningUtil** script include.
   For more information on script includes, see Script includes.

Using Customer Service Management with Safe Workplace applications

Screen consumers and contacts for compliance with health and safety policies to determine whether they are permitted to enter a location.

To ensure that consumers and contacts can enter a location safely after emergencies and pandemics, consumers or contacts fill out a Health Verification form and health screeners or customer or consumer service agents perform a health screening.

Note:
Typically, you receive an email or a mobile notification with a link to the health verification form. Alternatively, you can search for the health verification form on the Consumer or Customer Service Portal.

Roles required

Users with the roles listed in the following table can use Customer Service Management with Safe Workplace applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles Required for Safe Workplace applications

Role	Task
sn_customerservice.consumer or sn_customerservice_customer	Access and complete the Health Verification form on the Consumer or Customer Service Portals. **Note:** For more information on filling out the form, see Verify your health status and compliance.
sn_imt_monitoring.monitoring _user	Screen external users entering a location to ensure compliance with entry requirements. **Note:** Health screeners cannot view additional Customer Service Management information on the screening form. For more information on screening, see Conduct a health screen for entry.
sn_customerserviceagent with the sn_imt_monitoring.monitoring_user role	Screen contacts entering a location to ensure compliance with entry requirements. The **Accounts** field for contacts is displayed by default on the screening form. Other fields that have been configured for contacts are also visible.
sn_customerservice.consumer_agent with the sn_imt_monitoring.monitoring_user role	Screen consumers entering a location to ensure compliance with entry requirements. The **Suffix** field for consumers is displayed by default on the screening form. Other fields that have been configured for consumers are also visible.

Integrating with consumer messaging apps

Integrate Customer Service Management with each consumer messaging app to deliver a conversational mobile messaging experience for consumers and customer contacts.

Engage customers wherever they are with useful conversations by enabling them to message anytime to your company's account using their choice of messaging apps. Consumers and customer contacts can start conversations with a virtual agent by sending messages to your company's designated mobile number. They can also select to chat with a live agent from the same messaging app.

The following consumer messaging apps can be integrated with Customer Service Management:

- WhatsApp
- LINE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Facebook Messenger
- Apple Messages for Business

Integrating WhatsApp with Customer Service Management through Twilio

Deliver a pre-integrated chat conversation experience with the WhatsApp messaging app for consumers and customer contacts. Integrate WhatsApp by using the ServiceNow® Conversational Integration with WhatsApp (powered by Twilio) application.

As an administrator, if you have configured the Conversational Integration with WhatsApp (powered by Twilio) application, then your customer contacts and consumers can initiate a WhatsApp chat conversation with a virtual agent or live agent. An agent can initiate a conversation or accept a conversation initiated from a WhatsApp chat conversation. For more information, see Configure Conversational Integration with WhatsApp (powered by Twilio).

Note:
As an administrator, you can also use any predefined Customer Service Virtual Agent conversations to capture information from customer contacts or consumers. For more information, see Customer Service Virtual Agent conversations.

Key features of the integration include the following:

- Initiate WhatsApp chat conversations with a virtual agent, live agent, or customer.
- Use the chat to search for articles in community posts and knowledge articles, access service catalogs, or create a customer service case.
- View the WhatsApp chat conversation details from which a work item was initiated in Agent Workspace.
- Indicate your presence in the Agent Workspace Inbox with the WhatsApp service channel.
- Make outbound chat conversations to connect with a customer's WhatsApp chat conversation, and automatically capture interaction details to simplify data entry.

Example workflows

The following example workflow shows the use of the Conversational Integration with WhatsApp (powered by Twilio) application in resolving a consumer issue:

1. A customer has an issue with a product and initiates a WhatsApp chat conversation using the Virtual Agent bot.
2. The Customer Service Management application identifies the customer and starts an interaction of type **Messaging**.
3. The customer selects the product and views the knowledge articles associated with the product.
4. The customer then selects to chat with a live agent.
5. A live agent accepts the customer request. The Customer Service Management application starts another interaction of type **Messaging**.
6. The live agent creates a case on the product, and then closes the conversation.

The following example workflow shows the use of the Conversational Integration with WhatsApp (powered by Twilio) application in addressing customer feedback:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. A customer purchases a new product and opts in to receive notifications from your business on the WhatsApp app.
2. The customer receives a welcome message from customer support.
3. After two months, the customer receives another message asking for feedback on the product.
4. The customer shares negative feedback.
5. An agent reviews the feedback and starts a conversation with the customer to offer help and find out more about the customer's experience with the product.

End users and roles

The users with the roles listed in the following table can use the Conversational Integration with WhatsApp (powered by Twilio) application.

Roles required for Conversational Integration with WhatsApp (powered by Twilio)

Roles	Tasks
agent_workspace_user	Accept an ongoing WhatsApp chat conversation with a customer through the WhatsApp service channel in Advanced Work Assignment.
sn_customerservice_manager	View details of a WhatsApp chat conversation by using interaction records of type **Messaging** and subtype **WhatsApp**.
sn_customerservice.consumer, sn_customerservice.customer	Initiate WhatsApp chat conversations with a virtual agent or live agent so that you can search for articles in Communities and Knowledge Management, access service catalogs, and create a customer service case.

Integrating WhatsApp with Customer Service Management using the WhatsApp Cloud API

Use WhatsApp messaging with Customer Service Management to enable direct communication with customers through WhatsApp using the WhatsApp Cloud API.

This WhatsApp direct integration connects to Meta's WhatsApp business platform and enables agents to provide real-time customer support with rich media, interactive controls, and full CSM workflow integration.

The WhatsApp channel supports both automated conversations through Virtual Agent and live agent interactions through Agent Workspace, providing a complete customer service experience.

WhatsApp messaging capabilities

WhatsApp messaging capabilities in Customer Service Management enable rich, interactive customer conversations beyond basic text messaging. Agents can exchange media files, send structured interactive controls, request customer inputs, and deliver formatted messages that improve clarity and reduce friction.

Rich and interactive messaging features

WhatsApp supports the following messaging features and rich interactive controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Text messaging
- Rich media (images, videos, audio files, documents)
- Typing indicators
- Location sharing
- List pickers
- Opt-in and consent

WhatsApp rich controls

Rich controls	Description
Typing indicators	Real-time visual feedback shows when agents or customers are composing messages, keeping both parties informed about conversation activity. Agent-side capabilities: • Automatically displayed to customer when agent types in Agent Workspace • Appears as "typing..." status in customer's WhatsApp • Provides immediate feedback that agent is responding
Message status indicators	WhatsApp automatically handles message delivery and read status indicators according to WhatsApp's standard behavior. The application displays these statuses in the interaction timeline. Status indicators (for users): • Sent: Single gray checkmark (message sent to WhatsApp server) • Delivered: Double gray checkmarks (message delivered to agent’s device) • Read: Double blue checkmarks (agent viewed message) Status indicator (for agent): Sent: Single gray checkmark (message sent to user’s device)
Link previews	URLs in messages automatically generate rich previews with images, titles, and descriptions.
Customer-initiated conversations	These conversations begin when the customer sends the first message to your business. WhatsApp applies specific rules for messages sent within this interaction window. Messaging window:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WhatsApp rich controls (continued)

Rich controls	Description
	• Opens when customer sends first message • Remains open for 24 hours from last customer message • Resets to 24 hours with each new customer message • Agent can send any messages within this window Characteristics: • No restrictions on message content • Supports all message types and interactive features • Most common conversation type for customer serviceOpens when customer sends first message
Agent-initiated conversations	These conversations begin when agent proactively messages the customer. WhatsApp enables outbound initiation only under certain conditions. Requirements: • Customer must have active channel user profile in the application • Customer must have opted in to receive messages • Customer's phone number must be valid and registered on WhatsApp • Must be within 24 hours of customer's last message
System-initiated conversations	These conversations begin when an automated workflow sends a WhatsApp message to the customer. Requirements: • Customer must have opted in • Must be within 24 hours of customer's last message
Opt-in and consent	The integration captures and records customer opt-in and opt-out messages to track communication consent.

End users and roles

The users with the roles listed in the following table can use the Conversational Integration with WhatsApp (WhatsApp Cloud API) application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required for Conversational Integration with WhatsApp (WhatsApp Cloud API)

Role	Tasks
admin	Configure and manage the WhatsApp Cloud API integration, including connection settings, routing rules, system properties, and security configurations.
agent_workspace_user	Accept an ongoing WhatsApp chat conversation with a customer through the WhatsApp service channel in Advanced Work Assignment.
sn_customerservice_manager	View details of a WhatsApp chat conversation by using interaction records of type Messaging and subtype WhatsApp.
sn_customerservice.consumer, sn_customerservice.customer	Initiate WhatsApp chat conversations with a Virtual Agent or live agent so that you can search for articles in Communities and Knowledge Management, access service catalogs, and create a customer service case.

- Using Conversational Integration with WhatsApp (WhatsApp Cloud API)

System properties for configuring WhatsApp (WhatsApp Cloud API)

You can configure the system properties for your Conversational Integration with WhatsApp (WhatsApp Cloud API) application so that you can enable secure and authenticated communication.

Navigate to#**All> System Properties> All Properties**.

Alternatively, in your instance, enter `sys_properties.list` in the filter navigator and customize the WhatsApp (WhatsApp Cloud API) system properties.

System properties for WhatsApp (WhatsApp Cloud API)

Property	Description
sn_va_whatsapp.webhook_verify_token	Stores the verification token used to authenticate the incoming messages from WhatsApp. • Type: password2 • Default value: None (must be configured during the initial setup) • Location: **All> System Properties> All Properties**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrating LINE with Customer Service Management

Deliver a pre-integrated chat conversation experience with the LINE messaging app for consumers and customer contacts. Integrate LINE with the ServiceNow® Conversational Integration with LINE application.

As an administrator, if you have configured the Conversational Integration with LINE application, your customer contacts and consumers can initiate a LINE chat conversation with a virtual agent or live agent. An agent can initiate a conversation or accept a conversation initiated from a LINE chat conversation. You can configure system-initiated messages to be sent to the customer. For more information, see Configure Conversational Integration with LINE.

Note:
As an administrator, you can also use any predefined Customer Service Virtual Agent conversations to capture information from customer contacts or consumers. For more information, see Customer Service Virtual Agent conversations.

Key features of the integration include the following:

- Initiate LINE chat conversations with a virtual agent, live agent, or customer.
- Use the chat to search for articles in community posts and knowledge articles, access service catalogs, or create a customer service case.
- View the LINE chat conversation details from which a work item was initiated in Agent Workspace.
- Indicate your presence in the Agent Workspace Inbox with the Line service channel.
- Make outbound chat conversations to connect with a LINE chat conversation from a customer contact or consumer, and automatically capture interaction details to simplify data entry.

Example workflows

The following example workflow shows the use of the Conversational Integration with LINE application in helping a customer to resolve an issue with the recently purchased router:

1. The customer initiates a LINE chat conversation using the Virtual Agent bot.
2. The Customer Service Management application identifies the customer and starts an interaction of type **Messaging**.
3. The customer selects the router as a product and finds knowledge articles associated with it.
4. The customer ends the conversation because the issue was resolved with the help of a knowledge article.

The following example workflow shows the use of the Conversational Integration with LINE application in addressing customer feedback:

1. A customer purchases a new product and opts in to receive notifications from your business on the LINE app.
2. The customer receives a welcome message from customer support.
3. After two months, the customer receives another message asking for feedback on the product.
4. The customer shares negative feedback.
5. An agent reviews the feedback and starts a conversation with the customer to offer help and find out more about the customer's experience with the product.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End users and roles

Users with the roles listed in the following table can use the Conversational Integration with LINE application.

Roles required for Conversational Integration with LINE

Roles	Tasks
agent_workspace_user	Accept an ongoing LINE chat conversation with a customer through the LINE service channel in Advanced Work Assignment.
sn_customerservice_manager	View details of a LINE chat conversation by using interaction records of type **Messaging** and subtype **Line**.
sn_customerservice.consumer, sn_customerservice.customer	Initiate LINE chat conversations with a virtual agent or live agent so that you can search for articles in Communities and Knowledge Management, access service catalogs, and create a customer service case.

Integrating Facebook Messenger with Customer Service Management

Integrate Facebook Messenger chat conversations with your ServiceNow® instance so that consumers and customer contacts can communicate with your business using the Conversational Integration with Facebook Messenger application.

As an administrator, if you have configured the Conversational Integration with Facebook Messenger application, your customer contacts and consumers can initiate a Facebook Messenger chat conversation with a virtual agent or live agent. An agent can accept a conversation initiated from a Facebook Messenger chat conversation. For more information, see Configure Conversational Integration with Facebook Messenger.

Note:
As an administrator, you can also use any predefined Customer Service Virtual Agent conversations to capture information from customer contacts or consumers. For more information, see Customer Service Virtual Agent conversations.

Key features

Customer experience

Initiate Facebook Messenger chat conversations with a virtual agent or live agent to search for articles in community posts and knowledge articles, access service catalogs, or create a customer service case.

Agent experience

- View the Facebook Messenger chat conversation details from which the work item was initiated in Agent Workspace after accepting a work item associated with the Facebook Messenger service channel.
- Indicate your presence in the Agent Workspace Inbox with the Facebook Messenger service channel.
- Make outbound chat conversations to connect with a Facebook Messenger chat conversation from a customer contact or consumer and automatically capture interaction details to simplify data entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End users and roles

Users with the roles listed in the following table can use the Conversational Integration with Facebook Messenger application.

Roles required for Conversational Integration with Facebook Messenger

Roles	Tasks
agent_workspace_user	Accept an ongoing Facebook Messenger chat conversation with a customer through the Facebook Messenger service channel in Advanced Work Assignment.
sn_customerservice_manager	View details of a Facebook Messenger chat conversation using the interaction record of the type as **Messaging** and subtype as **Facebook Messenger**.
sn_customerservice.consumer, sn_customerservice.customer	Initiate Facebook Messenger chat conversations with a virtual agent or live agent to search for articles in Communities and Knowledge Management, access service catalogs, and create a customer service case.

Example workflow

The following example workflow shows the use of the Conversational Integration with Facebook Messenger application in helping a customer to resolve an issue with the recently purchased router:

1. The customer initiates a Facebook Messenger chat conversation using the Virtual Agent bot.
2. The Customer Service Management application identifies the customer and starts an interaction of type **Messaging**.
3. The customer selects the router as a product and finds knowledge articles associated with it.
4. The customer ends the conversation because the issue was resolved with the help of a knowledge article.

Integrating Apple Messages for Business with Customer Service Management

Deliver a pre-integrated chat conversation experience with the Conversational Integration with Apple Messages for Business app for consumers and customer contacts. Integrate Apple Messages for Business by using the ServiceNow® Conversational Integration with Apple Messages for Business application.

As an administrator, if you have configured the Conversational Integration with Apple Messages for Business application, then your customer contacts and consumers can initiate a Apple Messages for Business chat conversation with a virtual agent or live agent. An agent can accept a conversation initiated from a Apple Messages for Business chat conversation. For more information, see Conversational Integration with Apple Messages for Business. Refer to the Apple documentation for more details about Apple Messages for Business.

Note:
As an administrator, you can also use any predefined Customer Service Virtual Agent conversations to capture information from customer contacts or consumers. For more information, see Customer Service Virtual Agent conversations.

Key features of the integration include the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Customers can initiate Apple Messages for Business chat conversations with a virtual agent or live agent.
- Use the chat to search for articles in community posts and knowledge articles, access service catalogs, or create a customer service case.
- View the Apple Messages for Business chat conversation details from which a work item was initiated in Agent Workspace.
- Indicate your presence in the Agent Workspace Inbox with the Apple Messages for Business service channel.

Example workflow

In this example workflow, the Conversational Integration with Apple Messages for Business application is used to resolve a consumer issue:

1. A customer wants to get a replacement credit card, and initiates a Apple Messages for Business chat conversation on iMessage using the Virtual Agent bot.
2. The Customer Service Management application identifies the customer and starts an interaction of type **Messaging**.
3. The customer is presented with a list of credit card options that they own and picks that card that they want to replace.
4. A form opens and asks about the reason for replacement, date lost, address, and phone number. The customer submits the form.
5. The customer selects the iMessage app to schedule the delivery.
6. The replacement card is scheduled to arrive in 3-5 business days.
7. The customer additionally wants to know about home refinance options, and is shown links on refinancing.
8. The customer then selects to chat with a live agent.
9. A live agent schedules a call back with a mortgage specialist. The Customer Service Management application starts another interaction of type **Messaging**.
10. The customer sends feedback on the interaction using the quick reply action.

End users and roles

Users with the roles listed in the following table can use the Conversational Integration with Apple Messages for Business application.

Roles required for Conversational Integration with Apple Messages for Business

Roles	Tasks
agent_workspace_user	Accept an ongoing Apple Messages for Business chat conversation with a customer through the Apple Messages for Business service channel in Advanced Work Assignment.
sn_customerservice_manager	View details of a Apple Messages for Business chat conversation by using interaction records of type **Messaging** and subtype Apple.
sn_customerservice.consumer, sn_customerservice.customer	Initiate Apple Messages for Business chat conversations with a virtual agent or live agent so that you can search for articles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required for Conversational Integration with Apple Messages for Business (continued)

Roles	Tasks
	in Communities and Knowledge Management, access service catalogs, and create a customer service case.

Integrating with Process Mining

Integrate Customer Service Management with the Process Mining application to analyze processes relevant to your KPIs, and identify bottlenecks associated with customer service cases.

For more information about enabling the Process Mining Content Pack for CSM, see Activate Process Mining content packs.

End user and roles

If you have the required roles, you can use Analyst Workbench to access the visualized process workflow data, and tools for analyzing data related to customer service cases. For more information, see Overview of the Analyst Workbench.

The following combinations of roles are required for using the Process Mining application with Customer Service Management.

Combinations of roles

Process Mining role	Customer Service Management role
sn_process_optimization_admin	sn_customerservice_manager
sn_process_optimization_power_user	sn_customerservice_manager
sn_process_optimization_analyst	sn_customer_service_agent

Projects included with Process Mining Content Pack for CSM

Several projects are included with the Process Mining Content Pack for CSM (sn_csm_po) that customers can use to get started:

- Case evaluation project: Use this project to evaluate Process Mining and become familiar with the Process Mining capabilities.
- **Long resolution time analysis project**: Use this project to identify bottlenecks to minimize delays in the case flow.
- SLA Breach Analysis project: Use this project to identify and analyze customer service cases where service level agreements (SLAs) have been violated.

Optimization project for customer service cases

The Process Mining Content Pack for CSM (com.snc.csm_process_optimization) adds a prebuilt project that includes a predefined **Customer Service Cases** process model definition for customer service cases. By default, the **Customer Service Cases** project filters customer service cases for the last two quarters. You can also configure a new process project based on the prebuilt project. For more information, see Create a project using ServiceNow platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Customer Service Cases** process model definition includes default activity definitions and breakdown definitions for customer service cases. Use the definitions as they're or modify them for a custom configuration.

- Use activity definitions to understand state transitions and analyze the linked processes such as Problem (PRB) records. Transitions can include, for example, going from the work in progress state to the solution proposed state.
- Use breakdown definitions to filter records and analyze a process map by categories. For example, you can filter the customer service case data by different channels, products, assignment groups, and locations.

Continual Improvement Management initiative for customer service cases

If the Continual Improvement Management (CIM) application is enabled, the CIM project from the Analyst Workbench can be used to track customer service case improvement initiative progress. The improvement initiative and the process mining model are automatically linked. For more information, see Integration with Continual Improvement Management.

Performance Analytics for customer service cases

If the Performance Analytics application is enabled, the available template configurations can also open the Process Mining application from a Performance Analytics (PA) indicator based on the customer service case data. For more information, see Integration with Performance Analytics (PA).

Process configuration for customer service cases

Select the Process Mining Content Pack for CSM (com.snc.csm_process_optimization) templates to set up projects with preconfigured default settings. Process configurations specify preferences that activate key functionalities within the Process Mining workspace and streamline project setup for cases. Well Configured processes enable you to build projects autonomously and derive insights efficiently, supporting enterprise-wide scalability of process mining. For more information, see Creating process configurations using content pack templates.

Process Optimization for CSM

Integrating with contact centers

Integrate your contact center platform with the ServiceNow Customer Service Management (CSM) application to unify customer service teams through a single user interface. This integration centralizes routing across departments and channels, and optimizes workforce engagement for more personalized customer experiences and simplified employee experiences.

Contact Center integration overview

Prerequisite: Ensure that agents are set up via configuration through their contact center integration to access the ServiceNow Workspace. The agent profiles are synced automatically when the agent logs in through the contact center connector in OpenFrame. For example, agent John Jason in the ServiceNow workspace must be able to log in to the contact center.

See Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration to enable ICC for CCaaS calls.

Additionally, the agent presence state must match between the ServiceNow workspace and the contact center. In some cases, the state "available" might have a different name in the contact center environment, "on queue" for example.

© 2026 ServiceNow, Inc. All rights reserved.

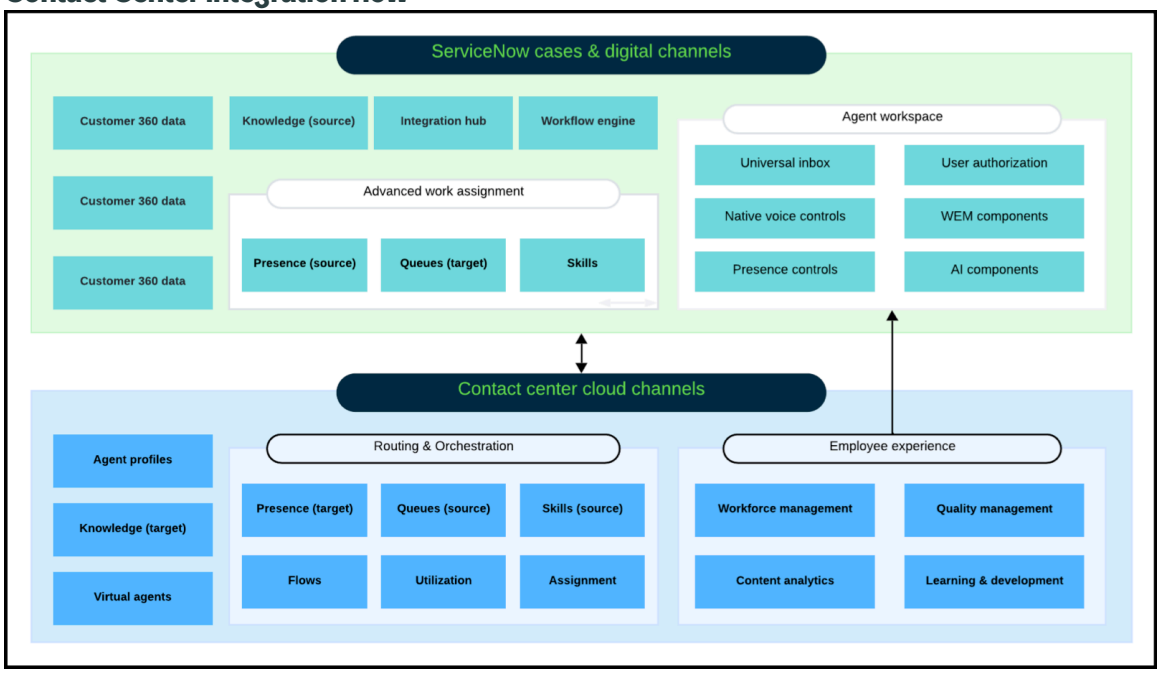
Review the following architecture diagram for more insight on the contact center integration flow with ServiceNow.

Contact Center integration flow



External routing with Contact Centers

Contact center spokes allow communication between ServiceNow and contact centers via the contact center API. Using a spoke requires the use of Integration Hub, and each contact center provider creates a spoke with actions to initiate the routing instructions. In general, the actions should correspond to these external routing events:

- New interaction
- End interaction
- Transfer to agent
- Transfer to queue

The spoke should also be able to retrieve data, such as skills, queues, and wrap-up codes. To learn more about creating a spoke, refer to Building spokes using Spoke Generator.

The contact center provider uses the AWA Work Offer API to provide the agent target for the work items. This allows the contact center provider to provide parameters to accept conversations, reject conversations, set timeout duration, and set the ServiceNow agent ID. See AWA Offer Work API.

In the ServiceNow platform, you can import contact center platform skills, queues, and wrap-up codes between the ServiceNow instance and the contact center provider.

Contact center integration gives you the ability to route ServiceNow chats, emails, or cases via an external routing platform.

Implementing the integration includes the following high-level steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Set up the ServiceNow environment, including credentials, the AWA queue, and the OpenFrame configuration.
2. Set up the integration on the contact center side, matching the ServiceNow setup.
3. Create test users and test the integration.

For specific instructions for integrating with Genesys Cloud, refer to the Genesys Cloud documentation.

For agents

As an agent, you can manage the chat with the customer using the inbox card alert by accepting or rejecting the chat. After accepting a chat, you can continue chatting with the customer through the workspace chat panel.

Agents using the integration can do the following:

- Accept work items.

  Note:
  If the agent doesn't accept the chat within the configured timeout period, the work items may time out and return to the queue.

- Reject work items
- Transfer to another agent
- Transfer to a queue
- Cancel a transfer to another agent

CCaaS Admin Console

The Admin Console is a tool that administrators use to automate the import of data from CCaaS (Contact Center as a Service) providers into ServiceNow. This integration enhances Customer Service Management by enabling Unified Desktop and External Routing, which improves agent efficiency and customer experience.

Admin Console overview

The Admin Console streamlines the integration of CCaaS providers with the ServiceNow platform, providing a seamless and unified experience for both customers and partners using ServiceNow.

CCaaS providers can use the following features by integrating with the capabilities through their custom plugins. Review prerequisites and plugin requirements to enable the CCaaS Admin Console. See Plugin requirements for voice and callback integrations with contact centers.

Accessing Admin Console

Access the CCaaS Admin Console in your ServiceNow instance by navigating to **All** > **Contact Center Integration Center** > **CCaaS Admin Console**.

In the Admin Console, admins must enter the provider ID and label for their contact center to establish a connection with their database. This integration allows the contact center to fetch data and import queues, skills, and wrap-up codes into ServiceNow. The process is streamlined using an extension point, enabling CCaaS providers to consistently return provider IDs and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

labels. This simplifies the integration, reduces manual configuration, and facilitates easy connections to multiple contact centers.

Data Import

The key capability of the Admin Console is importing skills, queues, and wrap-up codes from the CCaaS provider platform into ServiceNow. This ensures data synchronization between both platforms for seamless and efficient interaction routing. Queues and skills routing helps direct incoming interactions to the right queue based on agent skills and interaction metadata, ensuring efficient handling of customer queries.

Data import helps customers set up and execute External Routing and Unified Desktop by ensuring data is synchronized across platforms. The Unified Desktop experience allows agents to handle both digital and voice interactions from a single ServiceNow Workspace, eliminating the need to switch between different interfaces and improving efficiency. Customers can choose between different routing engines to manage incoming calls and messages. The routing engine intelligently matches interactions with agents based on skills and experience, ensuring a better customer experience.

For more information, see: Importing skills, queues, and wrap-up codes.

Importing skills, queues, and wrap-up codes

Import the skills, queues, and wrap-up codes that you have configured in your contact center provider to your ServiceNow® instance.

Routing

Skills and queues are a way that admins can route incoming work items to the agent best suited to handle customer inquiries.

Skills

In a contact center, skills are the specific areas of knowledge or expertise that agents have, enabling them to handle certain types of calls or tasks. They can be associated with specific agents or groups of agents. These skills help direct customer inquiries to the agent who can best meet their needs. Common skills include the following:

- Language proficiency
- Technical support
- Product knowledge
- Customer service abilities

By setting up and importing these skills, contact centers can route customer queries to the agents most capable of solving them.

To import skills from your contact center to your ServiceNow® instance, refer to Import skills.

Queues

Queues are systems used to manage and organize incoming customer inquiries. They help calls, emails, or messages get routed to the appropriate agents based on the defined skills and availability. Queues help in distributing the workload evenly among agents and minimize wait times for customers. They can be set up to handle various service channels, such as phone, email, chat, and social media, so that customer interactions are managed efficiently.

To import queues from your contact center to your ServiceNow® instance, refer to Import queues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Wrap-up codes

Wrap-up codes are labels or categories that agents use to classify the outcome of a customer interaction after it has concluded. These codes help in tracking the nature of interactions and identifying trends or common issues. Wrap-up codes provide insights into the types of customer inquiries received, the efficiency of issue resolutions, and areas that need improvement. This information provides insights that help with reporting and analytics.

For example, wrap-up codes can indicate whether a call was for technical support, billing inquiries, or a product return. Accurately assigning wrap-up codes helps data get correctly captured for future reference and analysis.

To import wrap-up codes from your contact center to your ServiceNow® instance, refer to Import wrap-up codes.

Import queues

Import queues from your contact center provider to ensure that customer interactions are routed to the appropriate agents based on their skills and availability.

Role required: admin (sn_ct_ctr_it_core)

Follow these steps in the workflow to import queues from your selected contact center:

Step 1: Select queues

Identify the queues that you want to import from your selected contact center provider.

Step 2: Assign channels

Select queues, assign service channels to them, and import them into ServiceNow.

Step 3: View summary

Review the newly imported queues and the ones that existed before in your ServiceNow instance.

Note:
The **Start Over** button resets your current changes and takes you back to the **Select queues** step.

Select queues

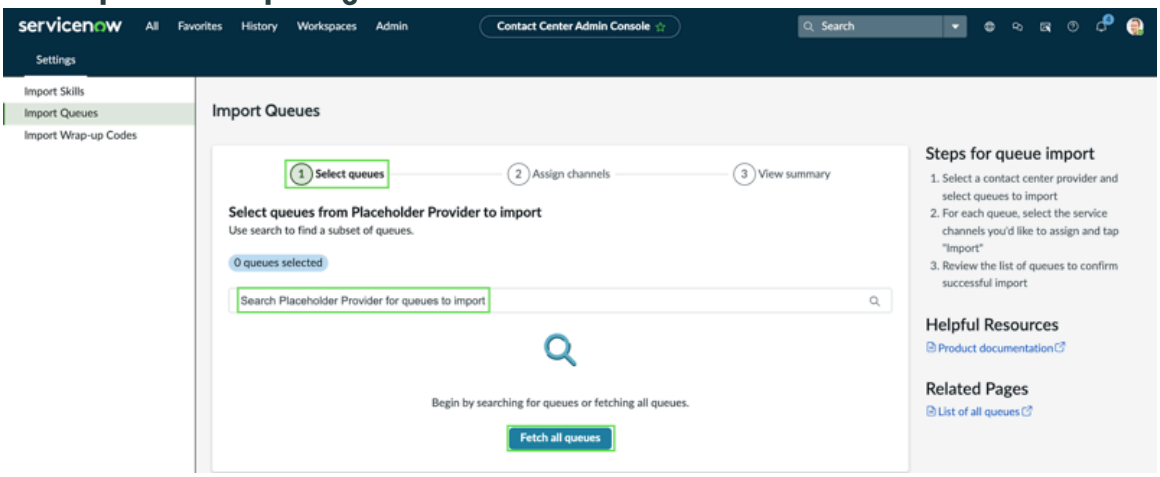
1. Navigate to **All** > **Contact Center Integration Center** > **Contact Center Admin Console**.
2. Select a contact center provider to import queues from the dropdown menu for the **Select a provider** field.

   Note:
   The contact center dropdown menu appears only when multiple providers are configured. If you have just one provider, it's automatically selected and can't be changed.

3. Select the **Import Queues** tab from the navigation pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select queues for importing



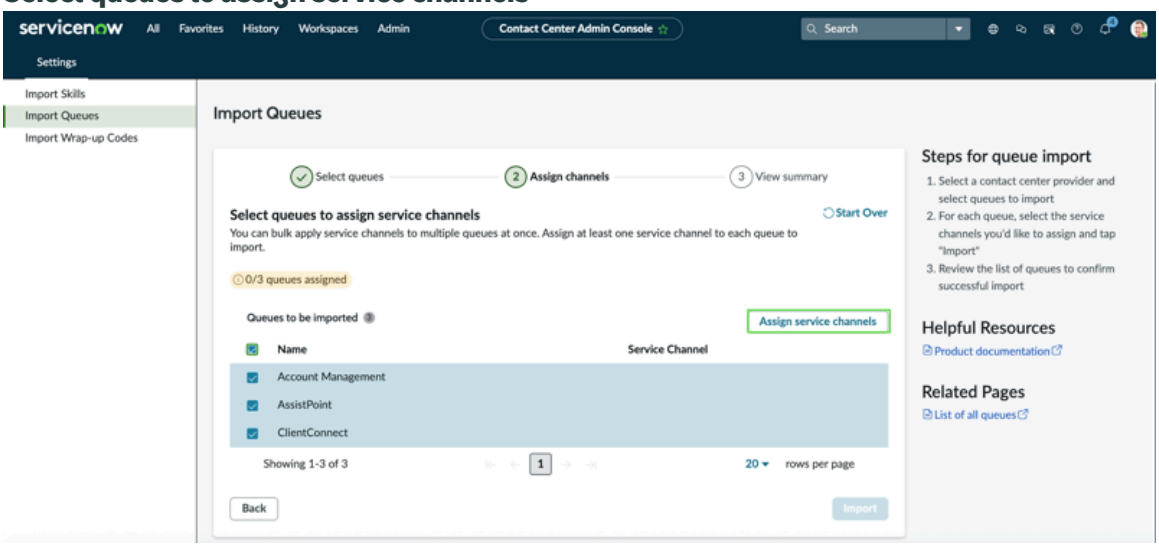
4. Search for specific queues by using the search bar or select **Fetch all queues** to fetch the entire list of available queues.
5. Once you've fetched a set of queues, select the queues you plan to import by selecting the check box next to each queue.

> **Note:**
> You can also select all queues by selecting the check box at the top of the list.

6. Select each queue that you want to import and click **Continue**.
7. Proceed to the next step of assigning service channels for your selected queues.

Assign channels

Select queues to assign service channels



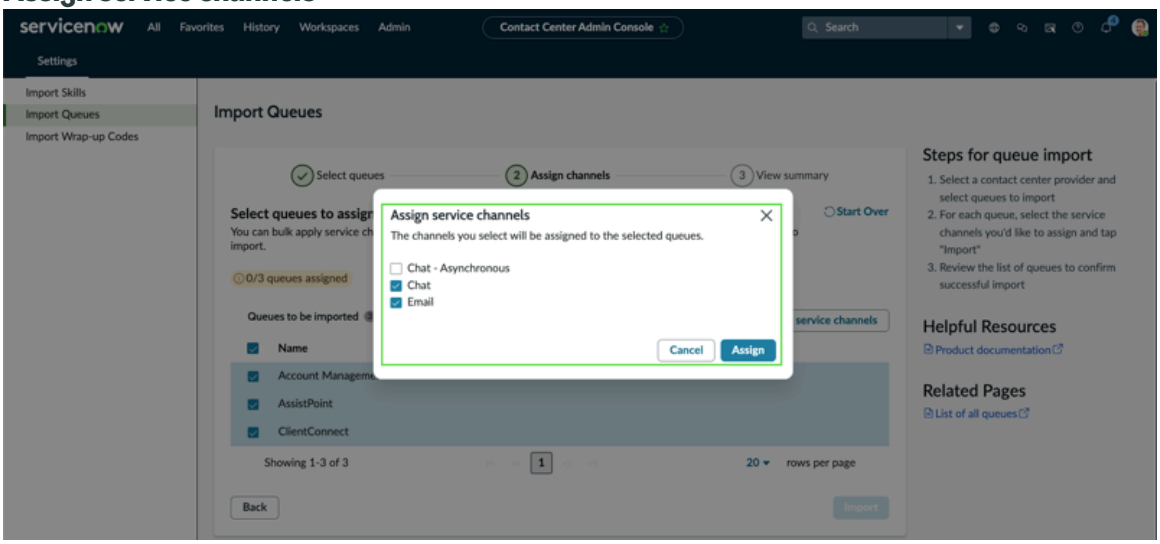
1. Select one or more queues from the displayed queues list by selecting the check box next to them.

> **Note:**
> You can select all queues by selecting the check box at the top of the queues-list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Assign service channels** to display the service channel modal.

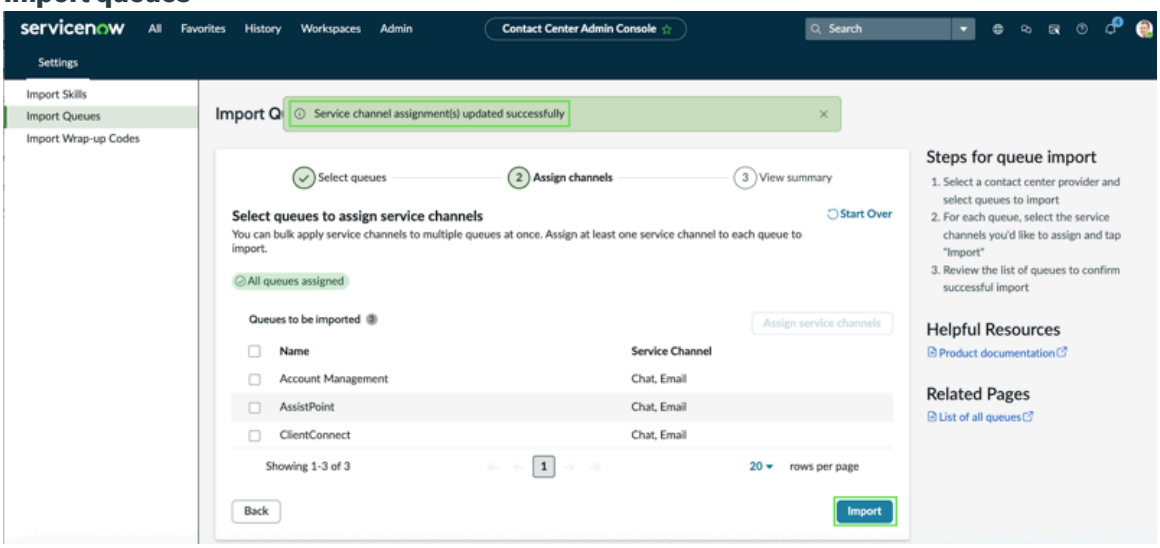
Assign service channels



3. Select one or multiple service channels and assign them to the selected queues.
4. Repeat steps (1) through (3) and confirm that all queues have at least one service channel assigned to them.
5. Select **Import** to begin the import process.

Note:
Each pairing of a new queue and service channel creates a unique queue record in ServiceNow.

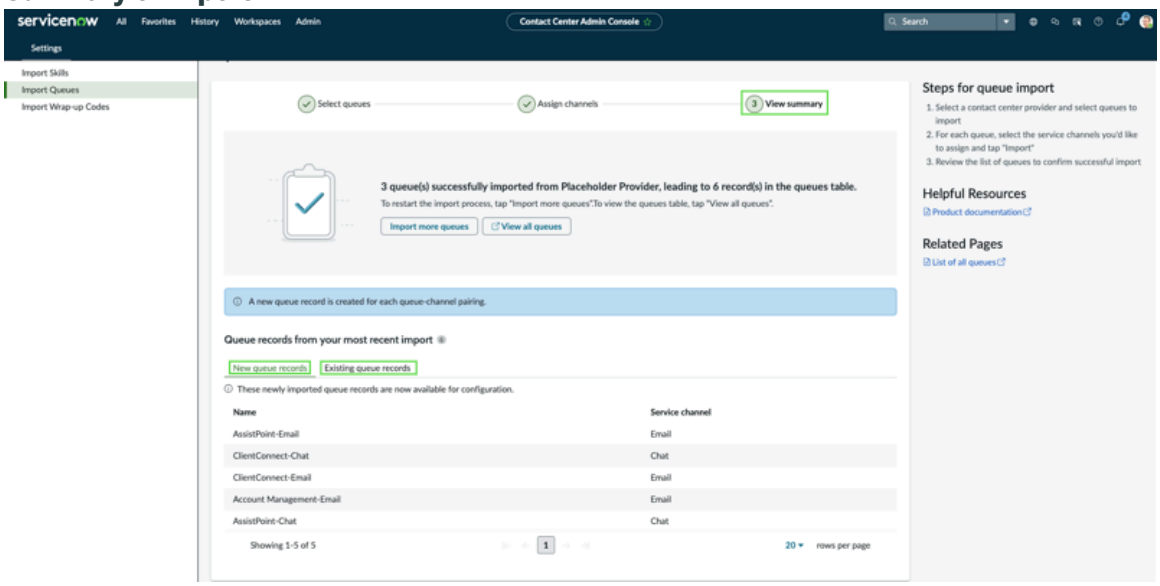
Import queues



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View summary

Summary of import



1. In the **View summary** step, review a summary of your recent actions.
2. Additionally, you can also choose to import more queues or view all queues in the table.
3. Review the list of queues to confirm their successful import.
4. The new imported queues and queues that previously existed are displayed in two separate lists in the confirmation page.

Example: Fetch all queues, assign a service channel, and import all queues

The following example demonstrates how to fetch all available queues, assign the Chat service channel, and import them into ServiceNow.

1. Select **Fetch All** to retrieve all queues from the CCaaS provider.
2. Select all queues using the **Name** field or **Select all item(s)** link.
3. Select **Import** to proceed to the channel assignment step.
4. Repeat step (2).
5. Select **Assign service channels**, then select Chat, and select **Assign**.
6. The refreshed screen shows all queues with the Chat service channel assigned.
7. A banner confirms the successful assignment.
8. Select **Import** to start the import process.
9. Review a summary of your import in the **View summary** step.

Import wrap-up codes

Import wrap-up codes from your contact center provider to ensure that each customer interaction is classified appropriately. For example, you can specify whether a call was for technical support, billing, or a product return.

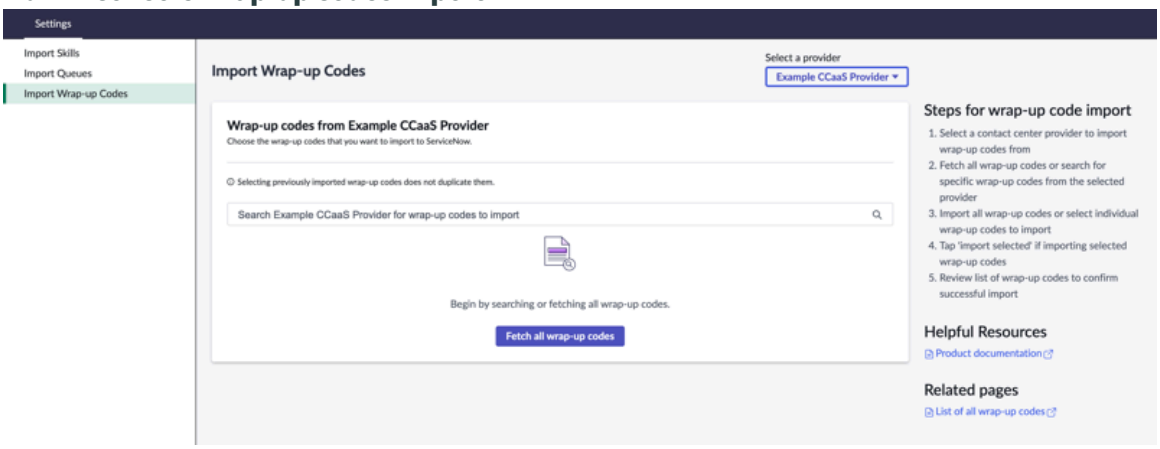
Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Contact Center Integration Center** > **CCaaS Admin Console**

Admin console wrap-up codes import



2. Select a contact center provider to import wrap-up codes from.
3. Either fetch all wrap-up codes or search for specific wrap-up codes from the provider.
4. Import all the wrap-up codes or select individual wrap-up codes to import.
5. Tap **Import selected** to import the wrap-up codes.
6. Review the list of wrap-up codes to confirm that the import was successful.

> **Note:**
> Newly imported wrap up codes and wrap up codes that previously existed in your ServiceNow® instance are shown in two separate lists on the confirmation page.

Import skills

Import skills to assign the right agent to the customer interaction so that customer inquiries can be handled efficiently.

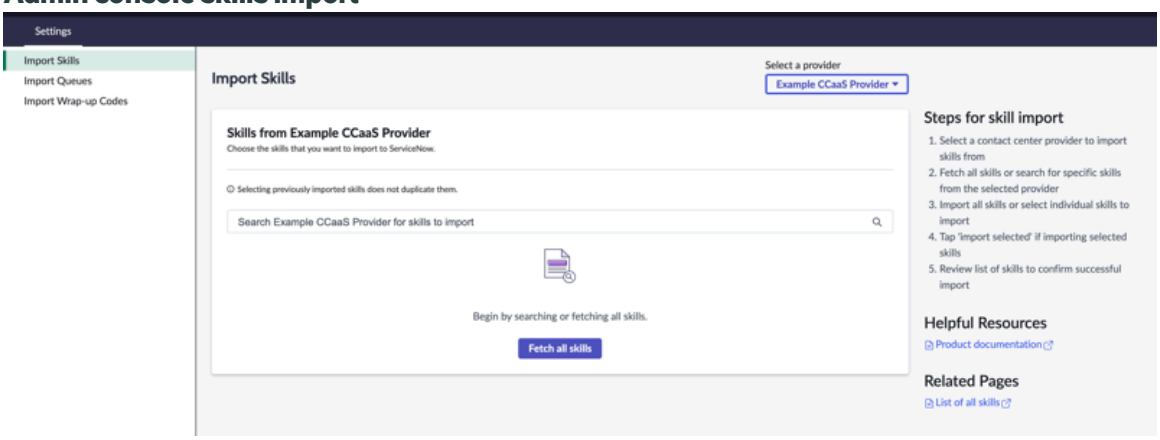
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Contact Center Integration Center** > **CCaaS Admin Console**

Admin console skills import



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select a contact center provider to import skills from.
3. Import all skills or select individual skills to import.
4. Fetch all skills or search for specific skills from the selected provider
5. Tap **Import selected** if imported selected skills.
6. Review list of skills to confirm successful import.

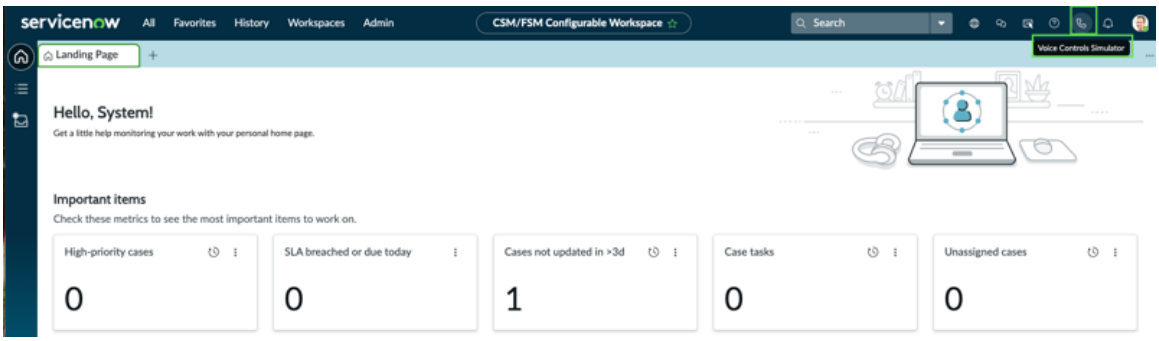
Note:
Newly imported skills and skills that previously existed in your ServiceNow® instance are shown in two separate lists on the confirmation page.

Voice Controls Simulator tool

The Voice Controls Simulator tool enables CCaaS partners and customers to simulate and test voice control UI flows within the CSM Configurable Workspace.

Voice Controls Simulator tool overview

CCaaS partners can test and validate call features within the UI to preview capabilities and verify readiness for Interaction Controls Component (ICC) voice integration. For example, CCaaS admins integrating with ICC voice capability can use this tool to view available voice features and their appearance in the UI.



Key features

The Voice Controls Simulator tool enables admins to test various voice workflows and preview how voice features display in the CSM Configurable Workspace. This capability helps streamline the configuration and validation of CCaaS voice control capabilities.

The following are key features for the Voice Controls Simulator tool capability:

- Enables you to simulate and test voice control actions within the CSM Configurable Workspace.
- Provides an agent session as a simulation for idle state.
- Enables you to view simulated phone calls in the Global Call component, Active Call component, and Call transfer.
- Supports adding participants to replicate customer or agent interactions during simulated calls.
- Offers help tips and guidance to assist users in configuring the simulator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stages of the simulator

Simulator steps	Description
Launch simulator	After meeting all prerequisites, you're ready to launch the tool in the CSM Configurable Workspace.
Set Idle state	This state is the agent's initial state in the simulator. The agent can make an outbound call using the keypad or the phone directory. Additionally, if the agent doesn't want to take anymore calls they can log out of CCaaS.
Configure Transfer capabilities	If you select **Transfer** during the **Set Agent Capabilities** step, you can configure transfer options for agents, queues, external numbers, and direct dial.
Set Agent capabilities	Set up call controls for the simulated agent flow for an active call.

See Set up the Voice Controls Simulator tool.

Set up the Voice Controls Simulator tool

Integrate with Interaction Controls Component (ICC) to manage voice call features. Then, use the Voice Controls Simulator tool to set up your call experience.

1. Open the tool: Launch the Voice Controls Simulator tool from your workspace.
2. Explore call flows: Use the simulator to try out different voice call scenarios.
3. Customize your experience: Configure call scenarios in the CSM Configurable Workspace as required.

Voice Controls Simulator tool dependencies

Before you start, make sure you have the following:

1. Required plugins: Install ICC plugin.

   Note:
   After installation, the **Voice Test Tool Config** is available in the OpenFrame configurations.

2. OpenFrame configuration:
   a. Navigate to **All** > **OpenFrame Configurations**.
   b. Search for **Voice Test Tool Config**, and set the active flag to 'true'.

      Note:
      You can access the test tool only if you have been added to the **Voice Test Tool User Group**.

   c. Verify user access:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Navigate to **Group** > **Voice Test Tool Users** and check user access or add new users here.
- Check the roles assigned to each user in the group. The key role for this tool is: `sn_int_control_sim.voice_test_tool_user`.

3. User roles: Users added to the tool inherits these roles:
   - virtual_agent_admin
   - sn_int_control_sim.voice_test_tool_user
4. Supported workspaces: This tool works only in the CSM Configurable Workspace.

You are now ready to launch the Voice Controls Simulator tool. See Launching the simulator.

Launching the simulator

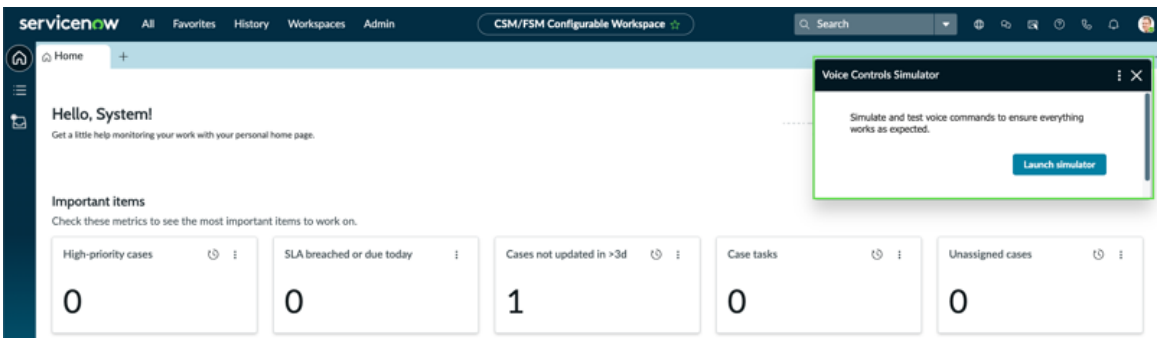
This feature lets agents set up and test their voice workflow in a simulated environment without the hassle of uploading payloads. The Voice Controls Simulator is only available in the CSM Configurable Workspace.

Before you begin

Role required: CCaaS admin

Procedure

1. Select the phone icon in the header to open the Voice Controls Simulator tool.
   If the simulator doesn't display, refresh your page.
2. Select **Launch test tool** to open the simulator in a new tab to begin configuration.



3. Begin the simulation by setting the idle state capabilities.
   For guidance, select the info icon to open the **Getting Started window**, which provides an overview of each phase in the simulator.

What to do next

Configure idle state capabilities, such as outbound call, logout, and phone directory. See Setting idle state.

Setting idle state

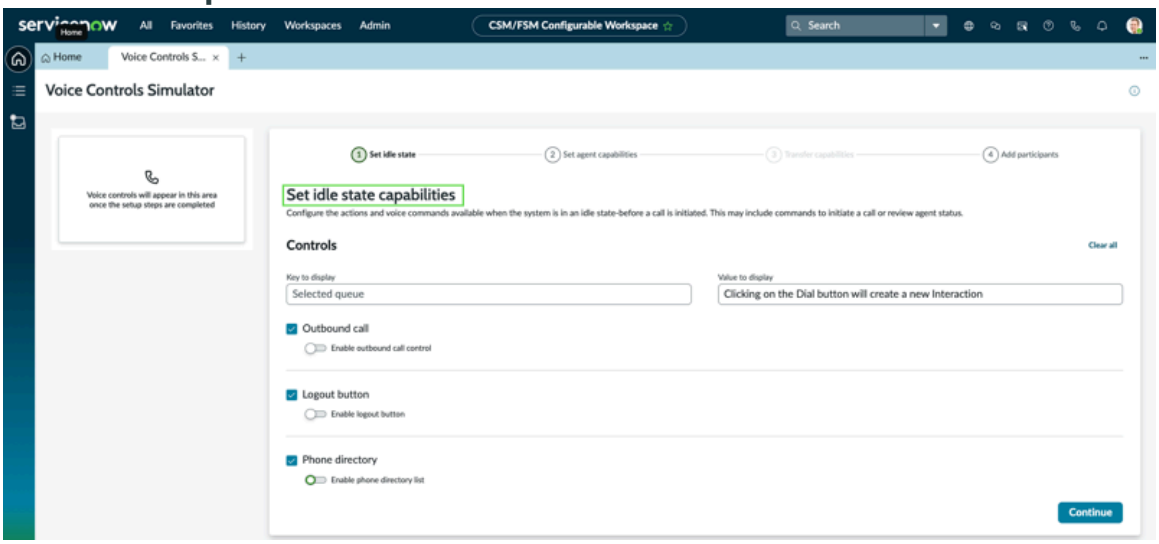
An agent in the idle state is available to receive or initiate work. Customize this state by configuring call controls such as the phone keypad for outbound calls, directory access, and the logout feature to manage the CCaaS platform session.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set idle state capabilities



Procedure

1. Configure display fields by entering a key and value in the **Key to display** and **Value to display** fields.
   This value is set by the contact center admin. For example, Key = `Selected Queue`, and Value = `Customer Inquiries`.
2. Select the **Controls** Options.
3. Select to enable the **Phone directory** option to display the **Queues**, **Agents**, **External numbers**, and **Direct dial** tabs.
4. Use the **Edit** icon to update entries.
   By default, the **Outbound call**, **Logout**, and **Phone directory** options are enabled. You can clear any options as needed. See Configuring Transfer capabilities.
5. Select **Save and continue** to set the chosen options that opens the Global call window with the updated values.
   The window displays icons for the enabled features. The **Phone directory** feature, if not selected, appears inactive.
6. Configure call controls by selecting options such as **Mute**, **Hold**, **Transfer**, **Flag**, **DTMF**, and **End call**.
7. Configure **Recording** controls by selecting options such as **Start**, **Stop**, **Pause**, or **Resume recording**.
8. Select **Save and continue** and move on to the next step for adding participants.
   - Select **Clear all** to remove all input data for the section you're updating.
   - Select the **Logout** and **Reset** options to return to the idle state setup.

What to do next

If you enable **Transfer**, the simulator guides you through the transfer capabilities setup. If you choose not to select the **Transfer** capability, select **Continue** to proceed to adding participants. See Configuring Transfer capabilities.

Configuring Transfer capabilities

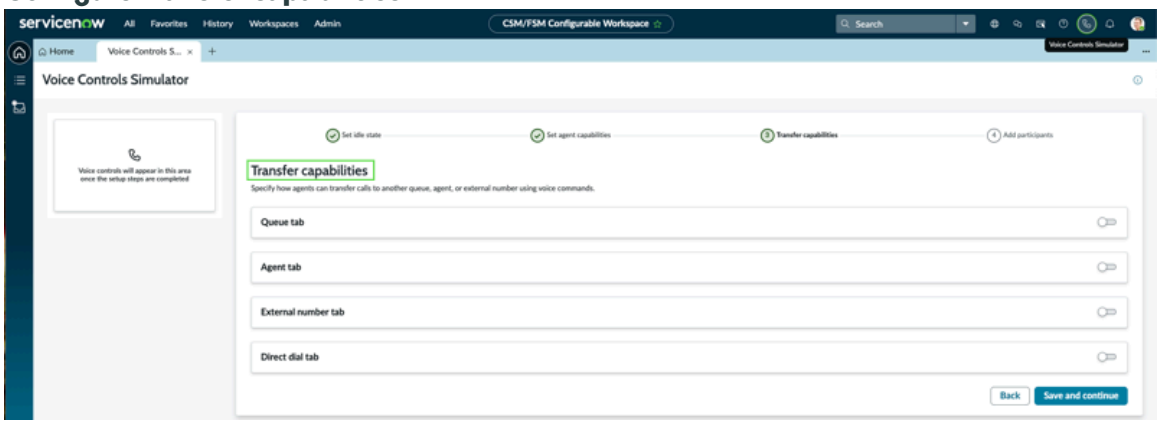
This step in the simulator doesn't display if you didn't select **Transfer capability**. Any value configured in the **Phone directory**, in the **Set Idle State capabilities** step, reflects in the **Transfer list**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

This step lets you set up transfer options for agents, queues, external numbers, and direct dial during a simulated call.

Configure Transfer capabilities



Procedure

1. Select the transfer option in the **Set agent capabilities** step to activate the **Transfer capabilities** tab.
2. Enable the **Agent**, **Queue**, **External number**, and **Direct dial** tabs.
   Each tab is pre-populated with five entries, which is also the maximum number of participants you can add.
3. Use the **Edit** icon to update or remove entries as needed.
4. Select **Save and continue** to proceed to the **Add participants** step.
5. Select **Submit** to save your selections.

What to do next
Select the phone icon in the header to view your configured voice control features in the Global call and Active call windows. See Interaction Controls Component (ICC) call features for call control feature definitions.

Continue to the final step in the simulation to Adding participants.

Adding participants

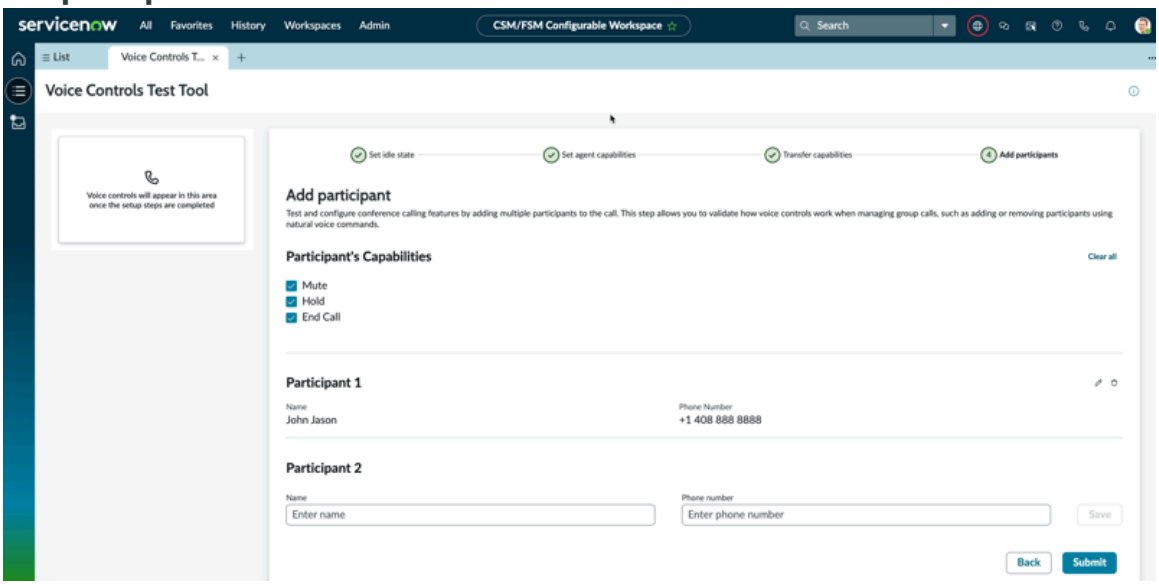
This step is the final phase in your simulation where you add agent details and assign call capabilities for each participant.

Before you begin
Role required: admin

The first participant represents the user initiating the call. Adding subsequent participants simulates a multiparty call. For example, when a second agent or supervisor joins the call, or when one agent consults with another in the same call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

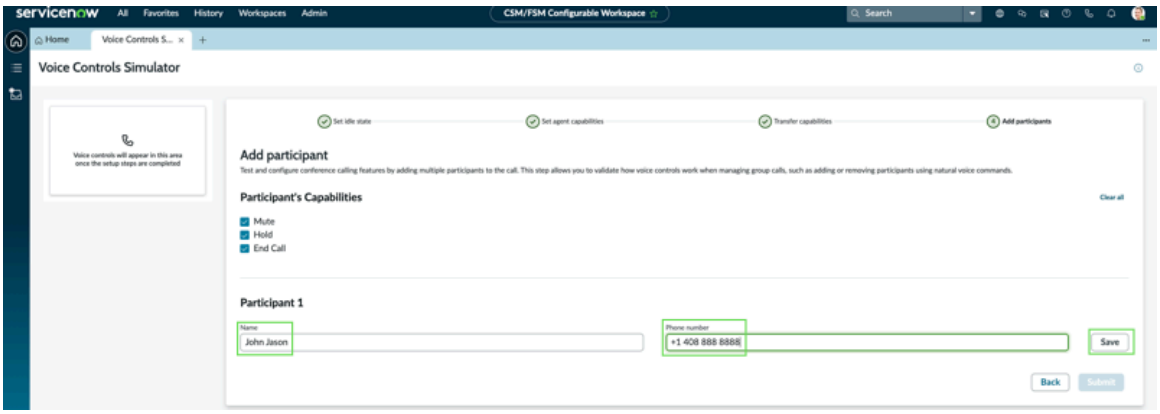
Add participants



Procedure

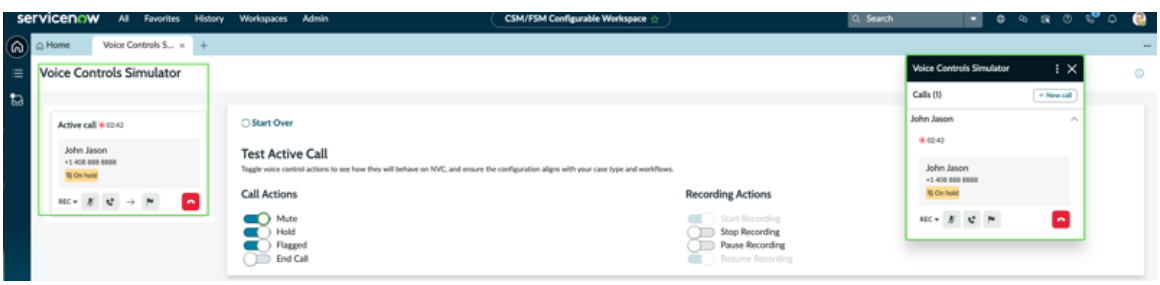
1. Fill in at least one field such as the Name or Phone Number for each participant.

   You can add up to five participants. Save each participant details before submitting your configuration.



2. Select **Submit** to display the Global call window with your updated selections.

   The Voice Controls Simulator tool provides a synchronized view across both Global Call and Active Call windows. Selecting any call button, such as hold or mute, instantly updates both call windows.



3. Select **Start Over** to reset your simulation and return to the set idle state capabilities step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The **Add participants** is the final step in the Voice Controls Simulator. After submitting your configuration, you're ready to begin using the configured call workflow in your workspace.

Interaction Controls Component (ICC) for voice calls

The ServiceNow Configurable Workspace offers voice interaction and call control capabilities to agents within a single pane view, equipping them with the tools needed to enhance agent productivity and customer experience.

Overview of ICC integration with CSM Configurable Workspace

This integration with enables agents to manage voice calls directly within their interaction screen using call controls. This feature helps reduce the need to switch between contact center applications and Configurable Workspace.

The CSM Configurable Workspace provides a unified interface that integrates contact center platform with the Customer Service Management (CSM) service offering. This integration helps you manage inbound and outbound interactions within a single interface.

With this expanded framework, voice interactions from a contact center platform and native digital channels can be routed seamlessly. Skills, queues, agents, and presence statuses can be synced automatically to optimize the admin experience and help reduce operational costs.

The following CCaaS Store Apps offer voice channel integration:

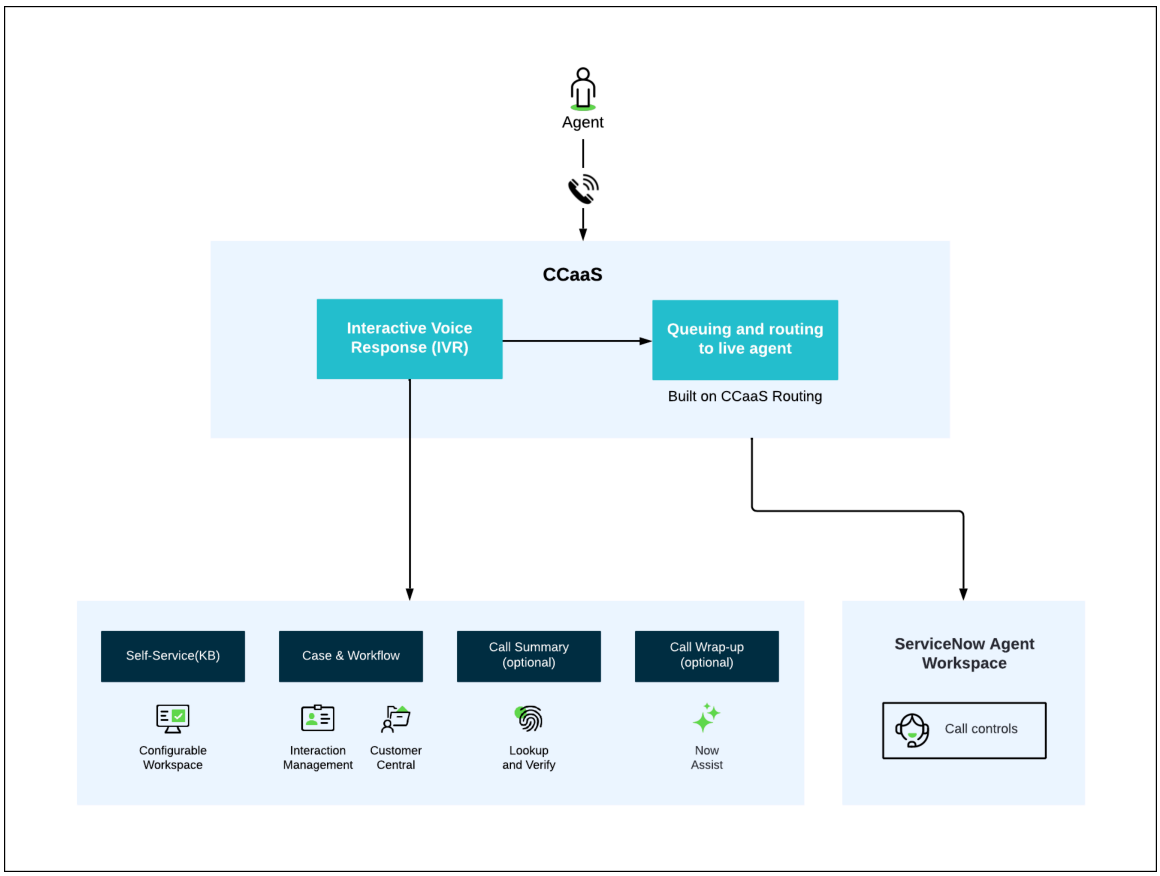
- Unified Experience from Genesys - Core
- Unified Experience from Genesys
- ServiceNow Voice for Amazon Connect

See Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration to enable ICC for CCaaS calls.

The following visual displays the voice workflow when CCaaS integrates with ICC within the CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Voice call flow



Key benefits

The primary benefits of this integration are as follows:

Centralized routing

Manages routing across departments and channels without switching interfaces.

Consistent agent experience

Promotes a consistent experience across all channels with a universal inbox.

Fast resolution

Helps reduce resolution time by reducing the need to switch between CCaaS and ServiceNow Workspace.

Enhanced efficiency

Streamlines workflows with direct access to consult and blind call transfer controls in the CSM Configurable Workspace.

Interaction Controls Component (ICC) call features

Streamline call handling and enhance the agent experience in the Agent Workspace. Integrate voice call capabilities and the core contact center features with Interaction Controls Component (ICC).

The core features and capabilities of the contact center include:

- Voice interaction feature
- Intelligent routing
- Workforce engagement management (WEM)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

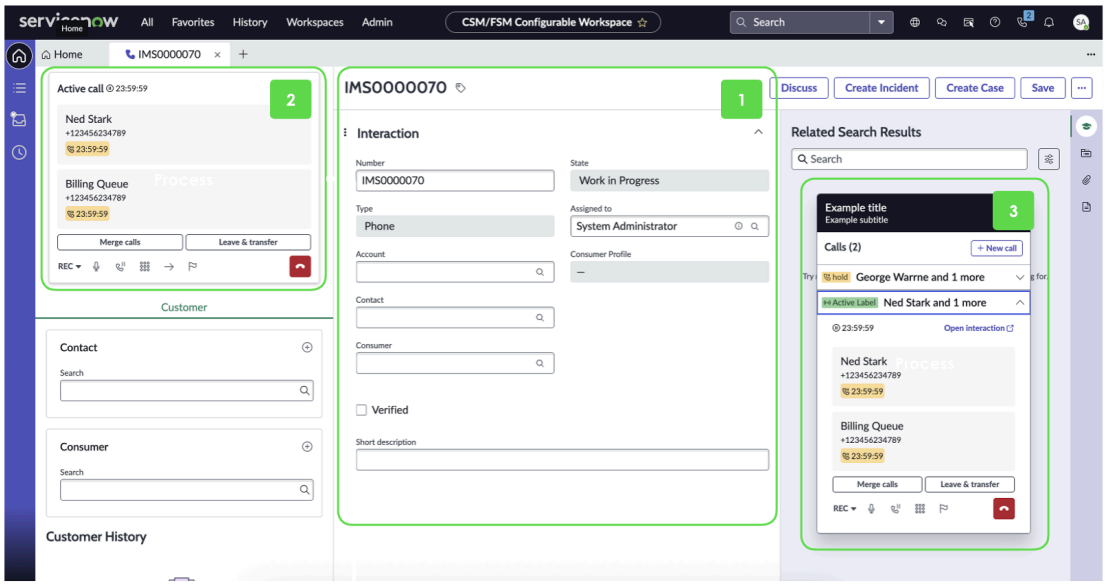
Note:

To use voice call capabilities available with Interaction Controls Component (ICC) integration, see Interaction Controls Component (ICC) for voice calls.

Use the ICC call control features with the existing contact center core features to promote streamlined operations and an enhanced agent experience. The following features are available within call interactions, and are numbered alongside the image as follows.

Overview of ICC call interaction features within CSM Configurable Workspace

ICC call features



The following table outlines the key call control features available when integrated with ICC within CSM Configurable Workspace.

Callout	Feature	Description
1	Interaction record	View an interaction record within the global call component in the supported workspaces, such as CSM. An interaction record is automatically created for each call. Opening the interaction record expands any voice interaction to show additional call details, including call transcript, wrap-up options, and customer context. The agent can view and update this record during the call and in the wrap-up interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Callout	Feature	Description
		Note: You can use an identity property and extension point to hide the conversation panel when real-time transcription is turned on or off. See: Show or hide the conversation panel The Interaction record page contains several other features that can be used to assist agents resolve customer issues while on call. Description of these features, such as record information, customer history, and KB search are available in the next table. Agents can also view interaction record details in unsupported workspaces with the call resiliency capability. See: Call resiliency.
2	Active call component	Use the active call features to manage incoming, ongoing, and outgoing calls, and is available as an embedded component within the open interaction page. The active call components are available via integration with ICC. The agent can monitor interactions and access them using the call control panel, which provides call control buttons such as record, mute, hold, and transfer (consult or blind). Additionally, real-time call data is shown, such as the call's associated interaction record, hold time, and call duration. Moving away from the interaction page to another area of the workspace automatically opens the global call component. • Active call: When an agent is in an active call, the associated interaction record displays. Selecting the link opens the interaction record in a new tab. During an active call, you can use buttons to hold, start, or stop recording, mute yourself or other parties, and transfer calls to a queue, other agents, or external

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Callout	Feature	Description
		numbers. Additionally, agents get notified when a supervisor is coaching or has joined an active call while monitoring agents directly through the CCaaS system. • Call transfer: Transfers calls using either consult or blind transfer methods. In a consult transfer, you can share the call context with the external contact before completing the transfer. A blind transfer immediately transfers the call to the external contact. Follow these steps to better assist a customer using the 'call transfer feature: **Initiate call transfer** Select the transfer icon on the active call component, which places the customer call on hold. **Select Receiving agent** Choose the agent to transfer the call to from the Agent's list. **Choose transfer method** Consult: Talk to the agent before transferring the call. You can then either 'Merge calls' by combining your call with the new agent's call, or 'Leave & Transfer calls' by disconnecting from the call and transferring the call directly. Blind: Transfer the call directly without consultation.
3	Global call component	Enable agent movement between screens in the ServiceNow instance by displaying real-time call data in the component panel. The global call component provides

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Callout	Feature	Description
		an experience that enables agents to access call controls and embedded functionality within any workspace that supports the ICC enabled features. The global call components are available via OpenFrame integration. See: Global call list. This component is used to make and manage outbound and incoming calls. Agents can switch between workspaces anywhere within the application while taking ongoing calls. If an agent switches to a non-interaction tab during an ongoing call, the call continues to be active. All other active call controls can be accessed from this component. • Outbound call: Initiates outbound calls to contact customers, using the phone keypad to dial manually, or by selecting the call icon on the record phone field for direct calls. Avail the phone directory for ease of making outbound calls. • ○ Callbacks: Outbound calls also support customer callback requests. When enabled and integrated within CSM, the agent can follow up on a callback request by manually completing an outbound call. **Note:** For more information on callbacks, view Callback interaction features ○ Phone directory: Agents can use the integrated address book to make outbound calls to queues, other agents, and external numbers. They can also enter a phone number directly in the global call list window to make calls. See: Phone directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction record page features within the CSM Configurable Workspace

The Interaction records page surfaces capabilities that assist agents both during and after calls. The following table describes additional features that are embedded within the record page.

Feature	Description
Inbox alert card	When an inbound call comes through, choosing to accept or reject the call appears as an inbox notification. Manage inbound calls by accepting or rejecting them directly from the Agent Workspace. If an agent chooses to accept a call, they're navigated to the embedded active call window within the Interaction page.
Record information	An agent is able to view and update the record during their call. This section displays details of the task or case linked to the interaction.
Contact information	This section displays customer contact details, such as phone number and email. The agent can verify, identity, and use this information for follow-ups.
Customer history	Agents can open an overview of the customer and their interaction history, as well as display a timeline of the all previous agent interactions. The agent can use this context to identify recurring issues or follow up on earlier cases.
Troubleshoot and KB search	This feature surfaces relevant knowledge articles based on the call context. The agent can browse suggested content or manually search knowledge base articles to support troubleshooting.
Wrap up	Now Assist automatically generates a call summary and adds it to the interaction. The agent can review the summary, select either suggested or generated wrap-up codes from Now Assist, add additional notes, and end the interaction. **Note:** Enable the call transcription capability to implement this feature.

Show or hide the conversation panel

Show or hide the conversation panel in the real-time transcription (RTT) interface using the *rtt_show_conversation_tab* identity property. This feature allows the contact center providers to control the visibility of the conversation panel using the identity property.

Configure and set up the conversation panel

Show or hide the conversation panel using the *rtt_show_conversation_tab* property:

- true – Displays the conversation panel
- false – Hides the conversation panel

Follow these steps to add the property to enable or disable the conversation panel feature in your application as follows:

1. Navigate to the provider application associated with your Interactions.
2. Create the property *rtt_show_conversation_tab*.

The **Call Transcript** tab doesn't show if the *rtt_show_conversation_tab* property is false or doesn't exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global call list

Use the global call list capability enabled via OpenFrame integration. Access call controls to manage voice calls using the phone icon available in any workspace within your ServiceNow instance to ensure efficient call management without losing access to call controls.

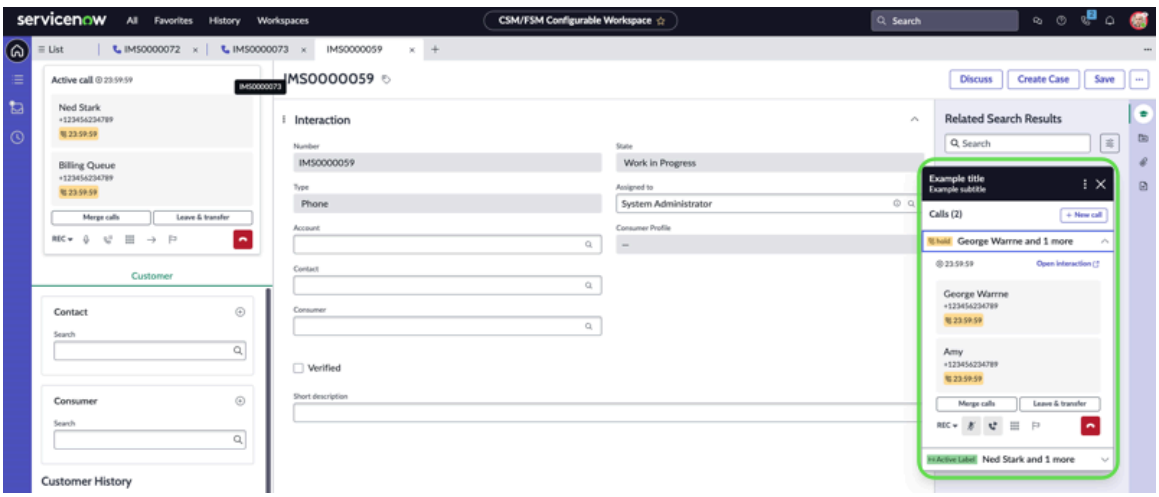
Global call list overview

Enterprises can integrate with any third-party Contact Center as a Service (CCaaS) voice call capability within their ServiceNow instance. Using the global call list call controls, agents can initiate new phone calls by using the dial pad or phone directory and manage existing calls. This capability enables agents to access their contact details, queues, and other relevant information via integrated contact center.

Every call creates an interaction record with the call details, which can be accessed by selecting the **Open interaction** link in the call window. The interaction opens in a supported or unsupported workspace based on your integration settings. The feature allows agents to access and manage call controls from a phone icon, regardless of the workspace or tab they are in. Agents can move freely between tabs or other workspaces that don't support the call control capability.

The following screenshot gives you the context for the global call list view.

Global call list view



The global call list provides the following functionality:

Switching workspaces during active calls

Agents can switch between different workspaces while on an active phone call, ensuring continued access to necessary information and tools without losing call controls.

Accepting calls outside ICC supported workspaces

Agents can accept phone calls from workspaces even if they aren't integrated with the Interaction Controls Component (ICC) voice controls.

Navigating to supported workspaces

If the current workspace is supported, agents can select the **Open interaction** link from the voice control screen to open the interaction and display the details.

Improved call management

The badge on the phone icon keeps agents informed and helps them track the number of active phone calls. The feature is particularly useful in workspaces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that do not support call controls, ensuring the agent can manage calls effectively regardless of the tab or workspace they are in.

Global call list scenarios

Before going over some typical scenarios, let's review certain terms for insight on the global call list feature:

Workspace terms	Definition
Current Workspace	Workspace the agent is currently on.
Supported Workspace	Workspace integrated with ICC call controls.
Unsupported Workspace	Workspace not integrated with ICC call controls.
Default Workspace	Workspace configured via OpenFrame enables agents to navigate to an ICC integrated workspace if they are in an unsupported workspace. See: Set default workspace for CCaaS.

Let’s go over some scenarios to understand how an agent can switch between supported and unsupported workspaces while managing inbound and outbound calls:

Scenario 1

The global call list is available from an unsupported workspace, which allows the agent to accept and manage calls. The agent can accept a call and select the **Open interaction** link to open the interaction record in the default workspace.

Scenario 2

The agent is in an active call in a supported workspace, and during the call moves to an unsupported workspace. The call control is available to the agent via the phone icon in the global call list window.

Scenario 3

The agent selects the phone icon to open the phone dial pad to make an outbound call from an unsupported workspace. The related interaction record opens in the agent’s current unsupported workspace. However, the agent must have default workspace configured to see the current call in the Interaction screen.

Note:
See: Set default workspace for CCaaS.

Scenario 4

The agent can access and display the global call list from anywhere within the ServiceNow instance by selecting the phone icon. Selecting the Open interaction link displays the call details with the global call controls in their default workspace.

Note:
The default workspace must be set by the contact center admin.

Scenario 5

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The agent ends a call from an unsupported workspace. Selecting the interaction record links from the call that just ended or for other previous calls, displays in the same unsupported workspace the agent is in.

Global call list features

The feature streamlines the call handling experience for contact center agents. Agents can access call controls and manage calls while viewing other resources in supported or unsupported tabs in their ServiceNow instance.

From the global call list view, Agents can do the following:

- Initiate new calls using either the keypad or the phone directory and view a list of queues, other agent names, and external contacts in the phone directory.
- Use Search in the phone directory to display a maximum list of 25 results at a time. The limit can be set by configuring the system property setting called *`icc_search_limit`* using an integer value. The default minimum value is 10, and a limit can be set to return a maximum of 25 results according to list of queues, agents, or external data.
- Use the phone icon next to the search input field to make outbound calls to an external number that doesn't display in the Queues, Agent, or External tab results.
- View and access call controls even when navigating to other tabs and screens. The global call list icon is available from supported and unsupported workspaces.
- View a badge count on the phone icon indicating the number of ongoing calls.
- Select the **Open interaction** link to open the interaction record details in their supported workspace in call resiliency mode. See: Call resiliency.

Note:
The Transfer function isn't supported in the global call list feature.

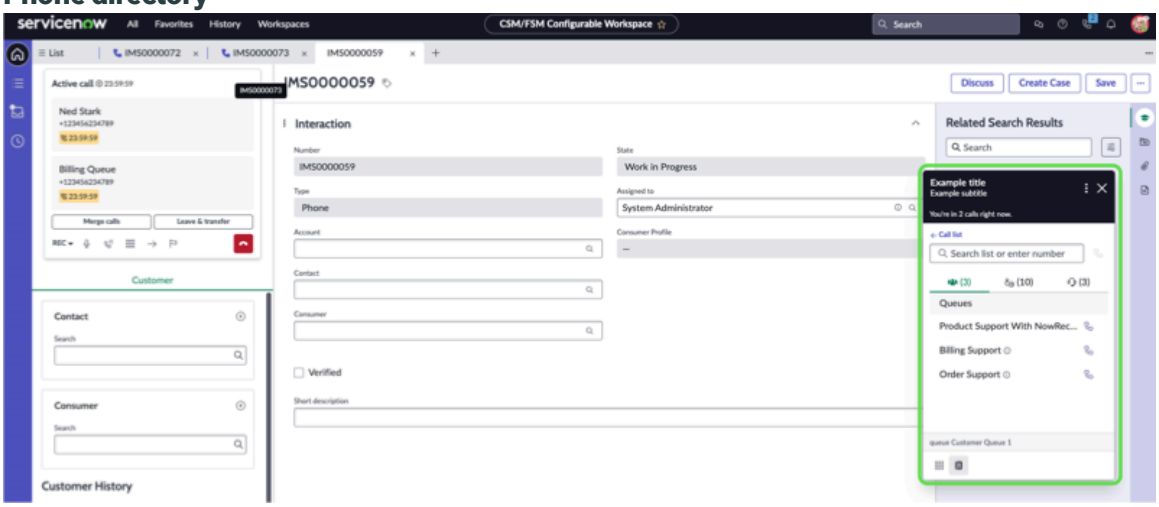
For more information on ICC call features, see Interaction Controls Component (ICC) call features.

Phone directory

Agents can use the phone directory integrated into their ServiceNow instance to make outbound calls to queues, other agents, and external numbers. They can also enter a phone number directly in the global call list window or use the phone directory to make calls.

Phone directory overview

Phone directory



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The contact center admin must enable and configure the phone directory for the agents to view and use it in their global call list from their ServiceNow instance. Once the back end integration is done, the phone directory displays in CSM Configurable Workspace.

The following CCaaS Store Apps offer voice channel integration:

- Unified Experience from Genesys - Core
- Unified Experience from Genesys

The phone directory helps agents make outbound calls to contacts within their organization and external numbers. Organizations can integrate with any third-party CCaaS call integration feature that allows agents to access their contacts and queues via their integrated contact center. The phone directory displays tabs for queue, agent contacts, and external contacts, and the contact center admin can configure the number of contacts displayed. Use **Search** on the phone directory to display a list of a maximum of 25 results at a time. The limit can be set by configuring the system property setting called 'icc_search_limit' using an integer value. The default minimum value is 10, and a limit can be set to return a maximum of 25 results according to list of queues, agents, or external data.

When a call is made, a connecting screen displays with the call context details. If the context fails to display within a few seconds, the screen defaults back to the previous view with the phone directory tabs and dial pad.

For more information on ICC call features, see Interaction Controls Component (ICC) call features and Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration.

Call resiliency

Call resiliency for Contact Center as a Service (CCaaS) delivers phone calls to Agent Workspaces without creating an Interaction in the ServiceNow instance. This capability verifies uninterrupted and reliable call management.

Call resiliency for contact center integration overview

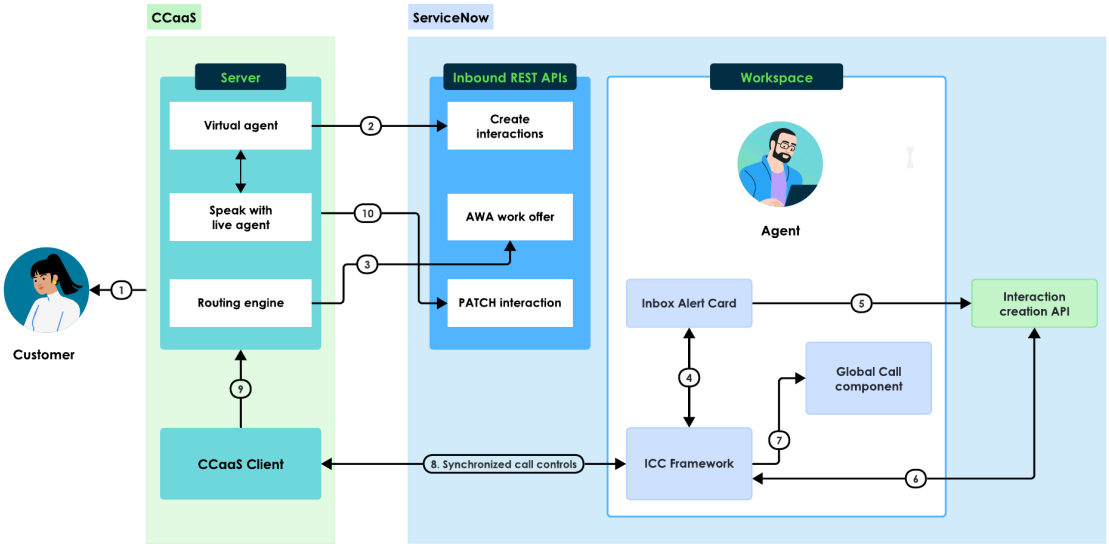
Call resiliency for CCaaS voice call integration ensures that inbound calls are delivered to agents. Inbound calls are delivered even if there are issues with creating Interactions in the ServiceNow instance. This feature routes phone calls to agents without requiring an Interaction.

When an agent accepts a call, an Interaction and a phone log record are created. If an agent rejects the call or the call times out, the contact center redirects the call to the next available agent. The integrated contact center, using the Interaction Controls Component (ICC) capability, displays call data such as the phone number and call duration, and provides basic functions such as mute, hold, and disconnect. Agents can open interactions by clicking the **Open interaction** link, although call transfer isn't possible without an Interaction record. This approach ensures seamless call handling and minimizes service disruptions.

The following call resiliency visual gives you a snapshot of the end-to-end workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Call resiliency flow



Refer to the following table for annotation description of the preceding image.

Annotation	Description
1	Incoming call
2	Create voice interaction
3	Offer voice call option to the agent
4	Agent can accept/reject a call
5	When agent accepts a call, a voice interaction is created
6	Notification is sent to OpenFrame for the successful creation of an interaction
7	Global call screen displays
8	Synchronized call occurs continuously from steps 6 to 9. Once the agent accepts a call, any action the agent takes gets synced between ServiceNow and CCaaS
9	Conversation gets updated in the interaction
10	Interaction record gets updated

Call resiliency workflow use cases

Let's go over some use cases to understand how call resiliency works for an integrated contact center.

In the call resiliency mode, calls are delivered to the Agents without interruption to call control options such as accept, hold, mute, or move calls to queues.

Accept/Auto-accept calls

Agents can accept or auto-accept calls seamlessly in the call resiliency mode even without creating an Interaction. If an Interaction record doesn't get created, the agent has the option to create one by manually clicking the **Open interaction** link during the live call.

Reject call

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a customer makes an inbound call, in the resiliency mode, CCaaS delivers the call to the agent's workspace. If the agent clicks **Reject**, the system generates an event. The event is communicated to the contact center, which in turn redirects the call to the next available agent. The contact center takes necessary actions to ensure seamless service delivery. This process verifies that the system is aware of the agent's action and can respond appropriately to maintain efficient call handling.

Call timeout

If a call times out, call resiliency promotes ensures efficient interaction management by automatically creating an interaction and a work item. This process guarantees that, even if a call times out, the necessary interactions and work items are generated and managed effectively that enables contact centers to maintain seamless service delivery.

Key Benefits of call resiliency

The call resiliency workflow improves the efficiency and reliability of handling incoming calls in a contact center. The following are some benefits:

Enhanced reliability

Calls are delivered to agents even if interaction creation fails, promoting prompt handling and continuous service.

Efficient call handling

The 'Offer API' creates interactions after the agent accepts the call, reducing wait time.

Call management flexibility

Agents can reject or let calls time out, and the system redirects them to the next available agent, promoting no call is missed.

Comprehensive call data

The ICC call controls display essential call information, such as phone numbers and duration, aiding effective call management.

Limited functionality for seamless operations

Agents can perform basic functions such as mute, hold, and disconnect, maintaining smooth call operations even in resiliency mode.

On-demand interaction creation

Interactions are created after the agent accepts the call, promoting all necessary records are generated without delay.

Improved Agent experience

A clear and efficient workflow enhances the agent's experience, making call and interaction management easier.

For more information on ICC call features, see Interaction Controls Component (ICC) call features.

Monitoring calls

Call monitoring is a feature in the Contact Center as a Service (CCaaS) solution that enables supervisors and managers to observe, monitor, and analyze customer interactions.

Contact centers integrating with ServiceNow’s native voice call capability via Interaction Controls Component (ICC) and OpenFrame have the option to enable the call monitoring feature, embedded in their CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits of call monitoring

Some of the key advantages of enabling this feature are as follows:

- Provides real-time feedback to agents, helping them improve their interactions.
- Identifies training needs for agents.
- Promotes consistent quality of customer interactions.
- Offers insights into customer preferences and sentiment, influencing strategic decisions.

Core functionality of call feature

Monitor:

Enables supervisors to listen-in to live calls for training and compliance.

Coach:

Enables supervisors to support agents during live calls via:

- Coach, where the supervisor privately coaches using a one-way whisper feature enabling the supervisor to provide guidance that only the Agent can hear.
- Barge in, where the supervisor joins the call as a participant and can speak with both the agent and customer.

Supervisor proactive call monitoring

Supervisors can monitor live customer calls enabling them to provide immediate guidance and support through listening, coaching, or intervening as needed. This helps promote high-quality customer interactions.

Dependencies

Enable the following capabilities to view and use the call monitoring features in the Active call and Global call list:

Contact Center as a Service (CCaaS) integration:

Contact centers must enable the call monitoring capability when integrating with the native call controls via Interaction Controls Component (ICC) and OpenFrame.

Role-based access and permissions:

When a supervisor with the `awa_manager` role views an interaction, the CCaaS is notified and configures the call controls accordingly.

UI controls:

On enabling the feature, the action buttons for Monitor, Coach, and Barge in display as actionable icons on the supervisors call interface.

How does the process work

The following steps define a typical workflow for a supervisor-initiated call monitoring:

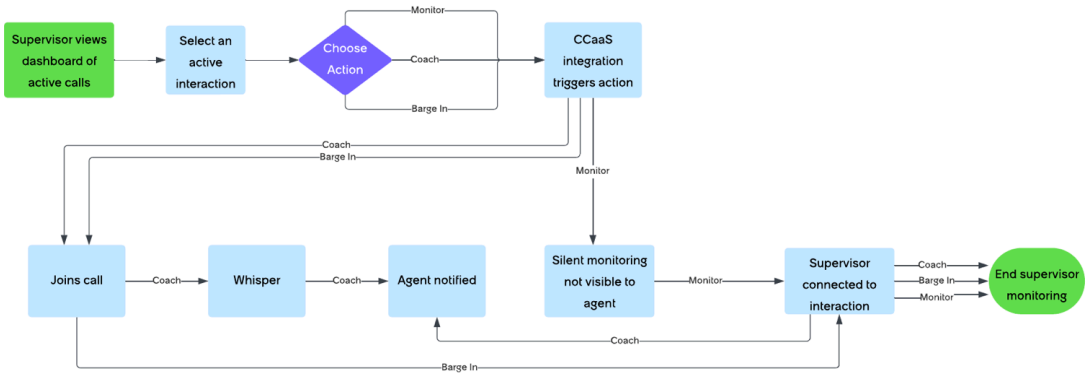
1. The supervisor views a dashboard of active calls and agent interactions. They can select an active interaction and choose to monitor, coach, or barge in, depending on the scenario and their permissions.
2. The CCaaS platform is notified when a supervisor views an interaction.
3. The CCaaS platform sets the context for the supervisor's available actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The manager selects the **Monitor** button to begin monitoring the call.

> **Note:**
> Silent monitoring isn't visible to the agent.

Supervisor call monitoring workflow



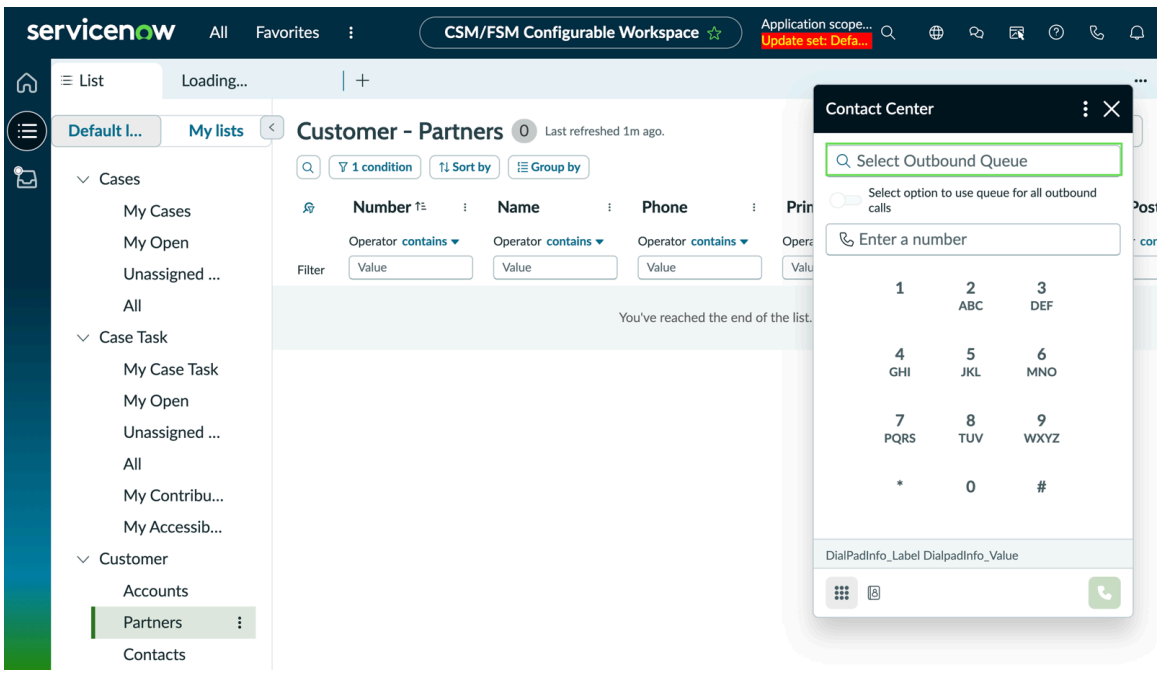
Selecting queues for outbound calls

Agents can select a queue for their outbound calls directly from the keypad or phone directory in the Global Call window to improve routing and reporting accuracy.

Queue selection overview

This feature provides a search interface that enables agents to find and select a queue, and then choose to either:

- Set it as default for all outbound dialing methods
- Apply it to the current call only



Agents can modify queue settings during the idle state or during active calls. The default queue selection persists until changed or log out, and applies across keypad, phone directory, and click-to-dial workflows. This feature is available for CCaaS partner integration.

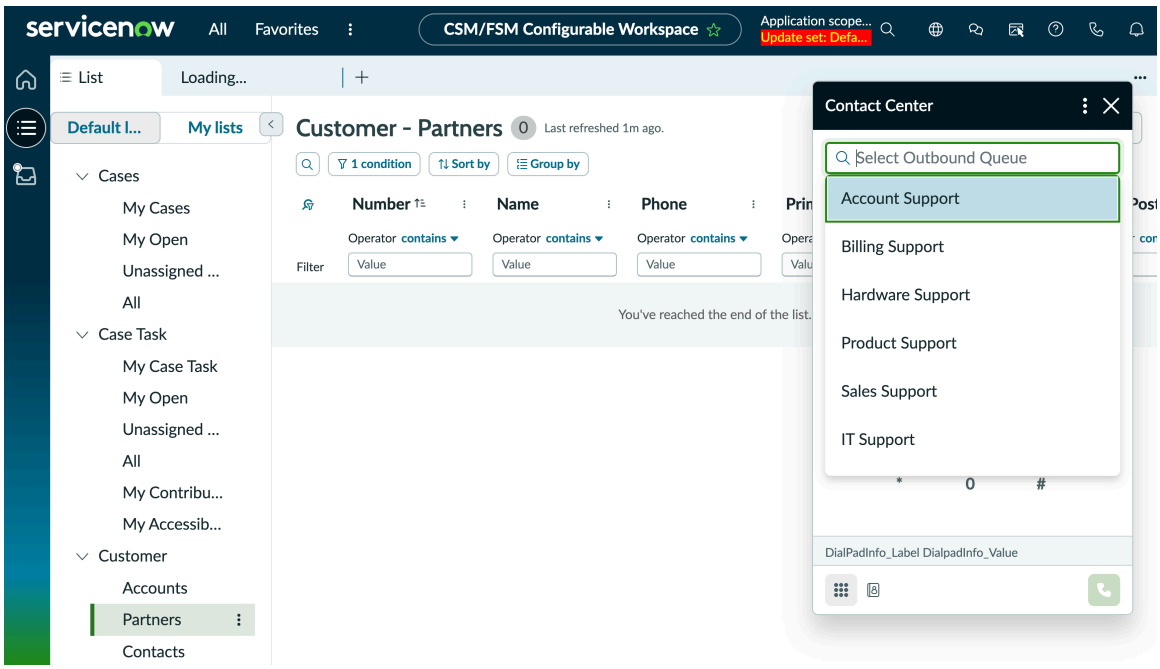
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

Queue selection for outbound calls addresses the following capabilities for contact center users:

- Easy-to-use queue selection directly from the Global Call window.
- Accurate reporting to track call outcomes by queue.
- Compliance to ensure calls meet queue-specific requirements.
- Consistent routing by applying business logic based on the selected queue.
- Efficient workflow to reduce repetitive actions and errors.

Queue selection Features



Find and select a queue in Global Call

Search for a queue by entering in the **Search** field and select the relevant queue.

Active context behavior

The selected queue applies to all subsequent outbound calls and remains active until the agent changes it or logs out. Only one queue is active at a time.

Adjust on-demand

Agents can change the active queue in the idle state or during an active call. Queue changes made during a call take effect on the next outgoing call, not the current one.

Consistency across dialing methods

The active queue persists across keypad, phone directory, and click-to-dial workflows to maintain consistent routing and reporting.

UI scope

Queue selection is embedded within the keypad and phone directory, as required by the CCaaS platform.

See Select queues for outbound calls from keypad, phone directory, and Interaction record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select queues for outbound calls from keypad, phone directory, and Interaction record

This procedure describes how to select a queue and place outbound calls using the Global Call keypad and phone directory in the CCaaS platform. It covers both standard and mandatory queue selection scenarios.

Before you begin

Role required: Agent managing voice calls

- Log in to the CCaaS platform with the required permissions.
- Confirm access to the Global Call component in your workspace.
- Ensure the Interaction Controls Component (ICC) component is enabled.
- Verify assignment to at least one queue or skill group.

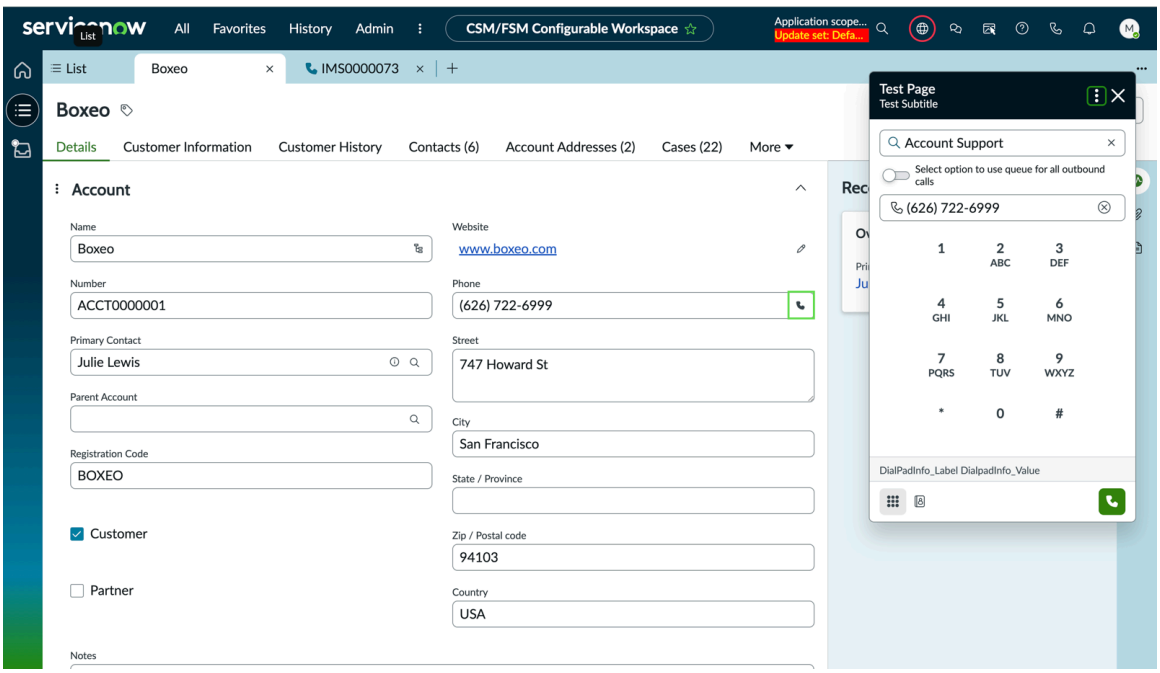
Follow these steps to select a queue and place an outbound call using the keypad, phone directory, or an Interaction record.

Procedure

1. Navigate to your configured CSM Configurable Workspace and select the phone icon to launch the call keypad.

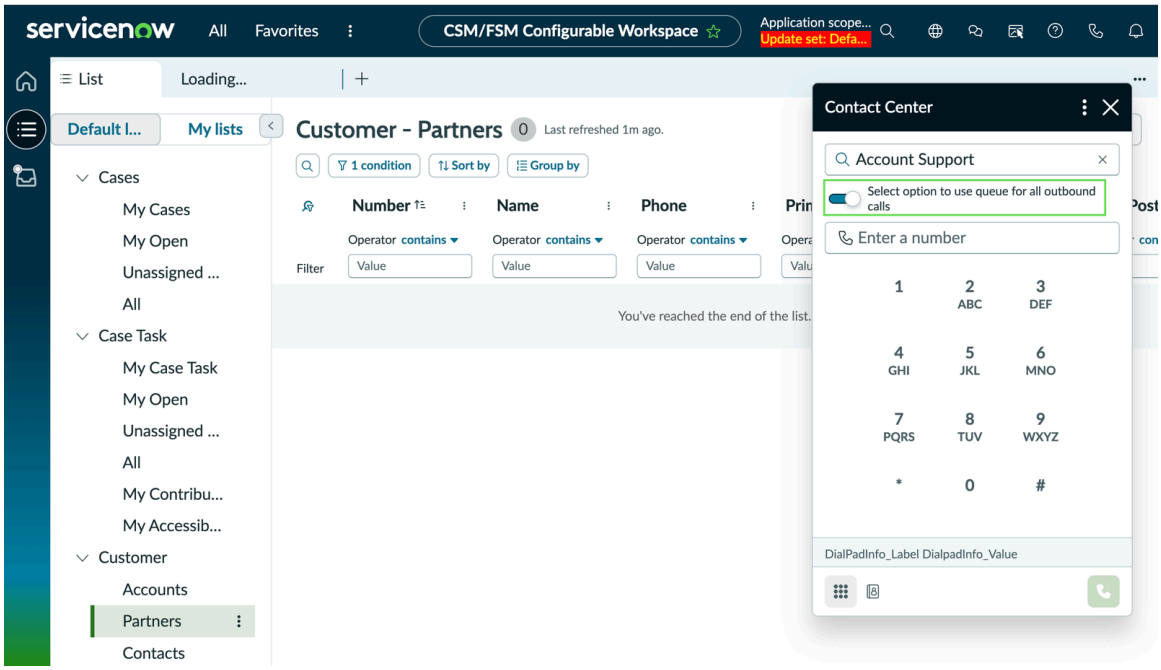
   The **Select outbound queue** field displays giving you the option to either search for a queue by name or select one from the list of available queues.

   You can also click-to-dial from an Interaction record. In the keypad, select and set a queue as default for outbound calls. Once you set a queue for outbound calls and click-to-dial from a different Interaction record, the Active Call window displays. This window is integrated with the ICC, instead of the Global Call window.



2. In the **Search** field, begin entering the name of the queue to search for it or select the queue directly from the list displaying available queues.
3. The selected queue displays in the search field, confirming your choice.
4. If you set a queue as default, it applies to all your outbound calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Use the keypad or the phone directory to enter or select the phone number.
   The dial button becomes enabled when a valid number is entered in the keypad.
6. Select the dial button to initiate the outbound call with the selected queue and the interface transitions to an active call state displaying call details.
7. After the call ends, complete any required wrap up activities, such as selecting a wrap-up code and adding notes, and select **Submit & close**.

What to do next

The queue you selected remains active for your next outbound call. You can change the queue at any time by repeating steps 2 and 3, or you can continue using the same queue for subsequent calls.

Using Interaction Controls Component (ICC) call controls with Amazon Connect

Agents can access the Active call controls directly from their CSM Configurable Workspace to manage phone interactions. This reduces context switching, improves productivity with Amazon Connect.

Amazon Connect for voice calls overview

Amazon Connect integration with ICC provides voice controls enabling agents to handle phone interactions without leaving their Workspace. Call features include actions such as answering, holding, transferring, muting, ending, and accessing the phone directory. Real-time synchronization of agent presence, compliance, and support for various call management features are key achievements of this integration.

To use this feature, complete the steps in the **Enable Interaction Controls** section of the Amazon Connect guided setup for configuring the components. See Integrate ServiceNow Voice with Amazon Connect

Key Features and Benefits of the Amazon Connect integration

Call controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents can answer, hold, transfer, mute, and end calls directly within their ServiceNow Workspace.

Real-time agent presence updates:

Agent status in Amazon Connect, is automatically updated in real-time based on Workspace status change. Amazon Connect status change by system or supervisor reflects in real-time in the agent Workspace.

Access to the phone directory for dialing calls:

Agents can use the phone directory to search for customers to make outbound calls. They can also use it on an active call to search for internal agents to transfer customer calls via Consult or Blind transfer.

An agent performs the following key actions within their Workspace:

Log in to Amazon Connect

Log in to Amazon Connect and set your status to 'Available', within your Workspace. You're now available and ready to receive inbound customer calls.

State presence

Your presence status synchronizes with Amazon Connect. Any change in your status due to system events or supervisor actions is reflected in real-time within your inbox verifying that your availability is updated.

Note:
Presence states values configured must match between ServiceNow and Amazon Connect to ensure bi-directional synchronization.

Receiving and accepting inbound calls

Use the inbox Alert Card to accept or reject calls. Manage calls via actions such as hold, transfer, mute, or access the transfer target list to transfer calls to other agents or queues. If you're away from your Workspace, the alert times out and sets you in the 'Missed call' status. Change your status back to 'Available' to continue receiving calls. Additionally, you can open or close the phone keypad during an active call.

After Call Work (ACW)

After Call Work (ACW) refers to the tasks agents complete after finishing a call. It can include documenting the conversation details, updating customer records, or following up on unresolved issues. When you hang up a call, Amazon will put the agent state into ACW. The Agent must change their status from ACW to Available to start getting new calls. To enable the agent to go immediately into the Available state after disconnecting a call, the Amazon Connect admin can set ACW to zero.

Initiating outbound calls

Make outbound calls by using the keypad, phone directory, or click-to-call. An outbound call creates an Interaction record that displays in the agent's Workspace displaying the call details.

Transferring a call to an agent or queue

Access the transfer target list with the Active call window to transfer calls to other agents or queues by searching for an agent or queue. Select the contact and begin transferring the call to other agents via Consult or Blind transfer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the second agent accepts the call, the first agent can either end the call or continue to stay in the call. If the first agent ends the call after transferring it to the second agent, the call Interaction is ready for wrap-up.

Integrating contact centers with Interaction Controls Component (ICC) for callbacks

The callback interaction feature built on the Interaction Controls Component (ICC) supports callback voice interactions directly within the ServiceNow configurable workspace. The workspace provides agents with callback voice interaction and callback control features in a unified view, resulting in improved productivity and enhanced customer experience.

Callback feature overview

Contact Center platforms provide a callback feature that lets callers keep their place in line and receive a callback when an agent is available. The callback requests are assigned to agents based on the order they are received. Alternatively, callers may select a specific date and time for a scheduled callback. The Callback functionality enables contact centers to reduce hold times and enhance customer experience by enabling customers to request a return call instead of waiting in the queue. This asynchronous communication model helps balance contact center load and improves both customer satisfaction and agent efficiency. The callback routing can be implemented in two different modes, depending on operational goals and infrastructure: Customer-first and Agent-first. These modes dictate how and when a call is established between the customer and the agent during a callback request.

Customer-first mode

In this mode, CCaaS first dials the customer and connects them to an available agent after the customer answers the call.

Callback flow: The callback request is queued. When the callback request reaches the top of the queue and an agent becomes available, the CCaaS dials the customer first. If the customer answers, the CCaaS dials and connects to an agent by routing the call to the agent's inbox in the configurable workspace. If the agent accepts, the call is bridged. This mode reduces unnecessary agent idle time and ensures that an agent is only engaged when a customer answers.

The following image shows the customer-first mode with an immediate (ASAP) callback request on IVR where a customer is dialed before agent is connected. Agent views the callback interaction as any other normal voice interaction in the CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer-first mode - Immediate callback request

Agent-first mode

In this mode, CCaaS routes the interaction first to an available agent. The Agent previews the callback context and dials the customer.

Callback flow: The callback request is queued. When the callback request reaches the top of the queue and an agent becomes available, CCaaS routes the interaction to an available agent. The agent accepts the interaction and opens it in ServiceNow configurable workspace. The agent previews the callback context card and then dial the customer. Dialing the customer can be manual or automatic based on a configuration in CCaaS. If the customer doesn't answer, the agent can redial or close the callback interaction.

The following image shows the agent-first mode with immediate (ASAP) callback request on IVR where an agent is dialed before the customer is connected.

Agent-first mode - Immediate callback request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Interaction Controls Component (ICC) for callbacks feature enables CCaaS providers to display callback interactions so agents can manage customer calls directly from their configurable workspace. For more information on how to handle CCaaS callback requests, see Manage a CCaaS callback request in the Configurable Workspace and Manage a CCaaS callback request using Global Voice Control.

Note:

To manage and activate the ICC integration for callbacks, see Implement the Interaction Controls Component (ICC) for contact center voice call and callback integration and Plugin requirements for voice and callback integrations with contact centers.

Related topics

Manage a CCaaS callback request in the Configurable Workspace

Manage a CCaaS callback request using Global Voice Control

Callback interaction features

Integrate callback voice capabilities and core contact center functions into Agent Workspace using Interaction Controls Component (ICC) to streamline call handling and enhance the agent experience.

ICC Callback interaction features

The following table shows the Interaction Controls Component (ICC) callback interaction features on the Callback actions component:

ICC callback interaction features within the Agent Workspace

Feature	Description
Callback actions component	
Initiate a call	The Call number button enables you to initiate a call with the customer by dialing the number in the **Callback number** drop-down.
Redial a number	The Retry call button enables you to redial the number in the drop-down, when the customer doesn't answer. • If the customer answers, resolve customer issue. • If customer doesn’t answer after multiple retries, agents can close the callback. The number of retries is typically left to the discretion of the agent.
Choose a callback number	The drop-down enables you to view the list of the available contact numbers of the customer. You can select any number in the drop-down to connect with the customer.
Close a call request	The Close callback button enables you to wrap up a callback request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ICC callback interaction features within the Agent Workspace (continued)

Feature	Description
Transfer callback	Enables agents to transfer an ASAP or scheduled callback to another queue or agent before the call to the customer begins.
Manual dial	In manual dial method, agent dials the customer manually after viewing callback context. In this mechanism, the timer doesn't appear on the Callback actions component.
Automatic dial	In automatic dial, the call automatically gets dialed after the countdown timer reaches zero. Alternatively, the agent can select the **Call number** button and manually dial the call before the timer reaches zero. In this mode, after the call ends, the callback is automatically wrapped up after the countdown timer reaches zero.

In the agent-first mode, the callback interaction page appears with Callback actions component and Callback context card when you accept the callback request in your inbox. In this mode, you can view the callback context card to get the callback request details before making the call. In the customer-first scenario, the callback interaction appears like any other voice interaction and the customer will already be on the call. For more information on these modes, see Integrating contact centers with Interaction Controls Component (ICC) for callbacks.

For more information on how to handle callback requests in the CSM/FSM Configurable Workspace, see Manage a CCaaS callback request in the Configurable Workspace.

When agents are working from an unsupported workspace or they aren't on the callback interaction page, they can manage callbacks through the Global Voice Control (GVC) component. This feature offers quick access to the Callback Actions component, enabling agents to initiate calls and handle active calls using the available call controls. The features described in the preceding table are available in the Global Voice control (GVC) for easy access to the agent. In addition to these features, you're provided with an **Open Interaction page** link on the global call list so that you can navigate to the current callback interaction page. For more information on how to use GVC for callback interactions, see Manage a CCaaS callback request using Global Voice Control.

© 2026 ServiceNow, Inc. All rights reserved.

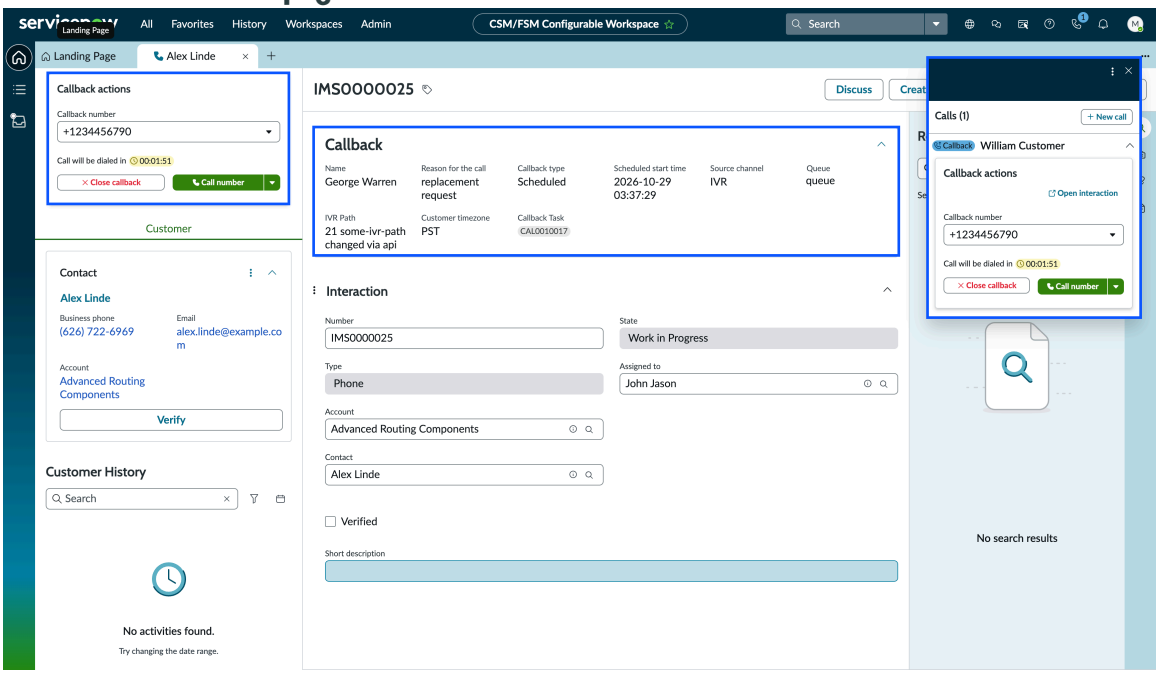
Callback interactions page with ICC Callback features and callback context card



Additional callback features

In addition to the ICC callback features, the following features are available in the callback interactions.

- Callback context card: The callback context card on the Callback interaction page provides the details of the callback request. For more information on the callback context card, see Callback context card.

  This feature uses the Interaction table, which includes a reference to the Callback [sys_cs_callback] table. The Callback table, in turn, references the Callback Context [sys_cs_callback_context] table to store the information related to the callback request.

  Agents with the callback_writer role can edit callback tasks. They can select the appropriate option from the Reason for the call field to manage callback requests effectively for both sales and customer service scenarios.

  For sales-related callbacks, the relevant options in the Reason for the call field are Customer Survey, Sales Discovery, Product Feedback, and Customer Relationship Building. For customer service-related callbacks, the relevant options in the Reason for the call field are Product Issue, Order Issue, Billing Issue, and Other issue.

  In UI Builder, the callback context card is configured to use the Lookup component, which can be used to look up a record on any table in card format. It also uses a data resource that returns the callback task for the specific interaction.

- Preview duration: The preview time measures the time between the agent accepting the callback in their inbox and the agent dialing the customer from the CSM/FSM Configurable Workspace. You can view the preview time in the Interaction table.
- Callback list: You can view the callback interactions assigned to you by navigating to the My callbacks list on the List page of the CSM/FSM Configurable workspace.

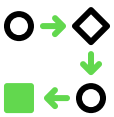
Using Customer Service Management

Agents and managers can use Customer Service Management application to create cases for customers, route cases to agents with the required skills and availability, manage customer information and case activity, and connect with other applications and departments to assist with case resolution.

Manage cases

Find tools for creating cases, interacting with customers, and resolving questions and issues

Manage schedules and sites



Find tools for managing your calendar, using the mobile app to manage work, and plan install base tasks.

Automate and optimize

Find tools to automate your work, and use AI tools to streamline cases.

Agent management

Manage tasks and schedules for agents on your team.

Customer management

Oversee customer-related tasks, including location and access management, handling contracts and entitlements, managing social media, and outsourcing customer service.

Customer communication

Learn about tools for portals and case deflection. Find examples and information on using self-service tools and contacting agents for assistance.

Manage cases

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Efficiently manage customer and consumer interactions by creating, assigning, and resolving cases received through various channels like chat, email, and calls.

Use advanced tools, configurable workspaces, and knowledge resources to streamline workflows, and ensure personalized and timely support.

Manage schedules and sites

Manage agent schedules, customer service cases, and install base plans using tools like agent calendars, Microsoft Outlook integrated with CSM, and the CSM mobile app.

You can get real-time updates, streamlined collaboration, and service contracts to enhance customer service efficiency and support.

Automate and optimize

Integrate Virtual Agent for automation and Proactive Customer Service Operations for early issue resolution. Use Task Intelligence, Guided Decisions, and Playbooks to streamline case management.

Agent management

Agent Management involves recruiting, training, and monitoring agents to improve customer service. Key tasks include time entries, case assignment, managing special handling note, chat support and overseeing outsourced service provider tasks.

Customer management

Streamline customer access, contract management, and social media integration to enhance service efficiency. Support B2B2C models for better customer relationships and improve workflows across multiple service channels.

Customer communication

Optimize customer service with Playbooks, reducing resolution time and guiding users through tasks. Empower customers with seamless service via auto-responders, omnichannel callbacks, and personalized portal experiences for faster, smarter support.

Manage cases

Case management within provides a structured and efficient approach to handling a wide variety of service requests, incidents, and inquiries. It encompasses the processes and tools used to manage individual cases from initiation through resolution, ensuring that service delivery is consistent, timely, and aligned with organizational goals.

Manage cases for Customer Service Management

Application or feature	Description
Create customer service cases	• Create a customer service case- Customer service agents and agent managers can create cases using the Customer Service Management application. • Create a customer service case of a specific type-Customer service agents can create different types of cases by making selections from the case type selector.

Manage cases for Customer Service Management (continued)

Application or feature	Description
Respond to a case using an email quick message	Use predefined quick email messages to quickly draft replies to customers. Agents can select predefined quick messages to add content into the message body of emails.
Initiate a conference call from a case	As part of resolving a customer service case, you can initiate a conference call between involved users.
Use the Activity Stream	Enhancements in the Activity stream help reduce cluttering in the Activity stream and reduce the agent effort to understand the case context.
Resolve cases with knowledge and community content	Enable agents to resolve a case more quickly by searching for information from the knowledge base and community and, if helpful, associating it to the case.
Manage skills for a customer service case	Add or remove optional and mandatory skills for a customer service case.
Using Chat Zoom Connector	As an agent you can initiate a Zoom meeting from a chat to understand and resolve customer issues faster through live interactions.
Using CSM Configurable Workspace in Customer Service Management	Use CSM Configurable Workspace to interact with customers, create and work on cases, and resolve questions and issues.
Using Business Location 360	Enable customer service agents to get a comprehensive, 360-degree view of the business location issues, so that they get the required contextual data to effectively resolve the reported issues within the Customer Service Management (CSM) application.
Outsourced Service Provider agent tasks	Outsourced service provider agents extend the capabilities and reach of an organization's customer service operations by providing basic customer service to customers and consumers.

Create a customer service case

Customer service agents and agent managers can create cases using the Customer Service Management application.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

Note:
Apart from these roles, contributor roles also can create cases. To learn more, see Contributor user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a case.

2. On the Create Case form, fill in the fields.

   To learn more about the fields on the Case form, see Case form

3. Select **Submit**.

Result

If available, the following information is associated with a newly created case:

- The name of the contact and the contact's company
- The product and contract details
- The SLA and entitlements

Create a customer service case of a specific type

Customer service agents can create different types of cases by making selections from the case type selector.

Before you begin

Role required: sn_customerservice_agent

About this task

The types of cases that agents can create depend on the configuration of the customer service case types and service definitions features. For more information, see the following topics:

- Configure customer service case types
- Manage customer service case types
- Configuring service definitions

In CSM Configurable Workspace, agents use the Case type selector to make selections and create cases.

Note:
In the Core UI, use the Case interceptor to make selections and create a case.

Procedure

1. Create a case by selecting one of the following actions.

Agent action field description

Agent action	Description
Select **New**	Select this action from case lists and case type lists such as My Cases or My Complaint Cases.
Select **Create Case**	Select this action from the following records: ○ Interaction ○ Account ○ Contact

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent action	Description
	○ Consumer ○ Sold Product ○ Install Base Item

2. Make selections from the version of the case type selector that has been configured by the system administrator.

Case selector version field description

Version	Steps
Multi-select	**a.** Select a **Case Type**. **b.** If desired, select an optional category and subtype to narrow the available choices. **c.** Select **Create Case**. **Note:** If a subtype hasn't been configured for a case type, the field for the subtype is not displayed.
Single-select	**a.** Select a **Case Type**. **b.** Select **Create Case**.
Product Service Select	**a.** Enable or disable the **This case is for an owned product** check box. This check box controls the display of the **Product** field **b.** If displayed, select a **Product**. **c.** Select a **Service**. **d.** Select a **Case type**. **e.** Select **Create Case**.

3. Fill in the fields on the Case form.
   For more information about these fields, see Create a customer service case.
4. Select **Save**.

Create an onboarding case

Create a case to onboard new customers or to onboard existing customers for new products.

Before you begin

Role required: sn_customerservice_agent

About this task

Onboarding cases appear in the Onboarding Cases module and use the ONB prefix in the case number. For example, ONB0001007.

If the case playbook for onboarding is available, you can use the playbook to guide you through the steps that need to be completed to resolve onboarding cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a case.
2. Select the case type.
3. Add the customer information.
   - If the onboarding case is for an existing customer, fill in the **Account** and **Contact** or **Consumer** fields.
   - If the onboarding case is for a new customer, enable the **New customer** check box and fill in the fields in the New Customer Information form section.
4. **Optional:** Add additional members to the case from the **Additional Members** related list. Use this related list to create the users or business entities that should be included in the onboarding case. Click **New** and fill in the fields on the Related Party form.
5. Fill in the fields on the Case form.
   For more information and field descriptions, see Create a customer service case.
6. Click **Save**.
   - If the **New customer** check box is enabled, the **Account** and **Contact** or **Consumer** fields are not required to save the case.
   - If the **New customer** check box is disabled, the **Account** and **Contact** or **Consumer** fields are required to save the case.

Create a record in CSM Configurable Workspace

Create a record in CSM Configurable Workspace from the Record tab menu.

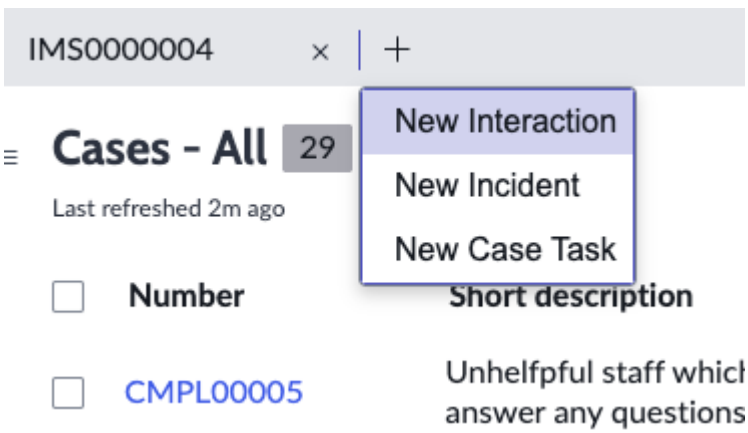
Before you begin

Role required: sn_customerservice_agent,sn_customerservice.consumer_agent

About this task

You can create records from the Add tab in CSM Configurable workspace. Select the plus sign (**+**) icon on the Add tab to see the list of records that can be created.

Record creation from Add tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users with the system administrator role can configure the types of records that appear in this list. The default is an interaction record. For more information about configuring the records that can be created from the Add tab, see Configure record creation from the new tab menu in Service Operations Workspace.

Procedure

1. In CSM Configurable Workspace, select the plus sign icon (+) icon on the Add tab.
   If you can create more than one type of record, the system displays a list of the available record types. For example, **New Interaction** or **New Incident**.

   Note:
   If you can only create one type of record, the system displays a blank form of that record type.

2. Select the type of record to create.
   The system displays a blank form of that record type in the tab.
3. Fill in the fields on the record form.
4. Select **Save**.

Create a customer service case from a chat

If a customer chat results in the need to open a case, create the case directly from the conversation.

Before you begin
Role required: sn_customerservice_agent or sn_customerservice_manager

About this task
When you create a customer service case from a support conversation, the system copies the conversation history to the case activity stream as comments and work notes. Future messages are tracked in the case as well.

Important:

Starting in Utah, Connect Support has been deprecated and is no longer supported or available for new activation. For similar capabilities, please move to Advanced Work Assignment and Agent Chat. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Procedure

1. Navigate to **All** > **Connect** > **Connect Support**.
   The Connect workspace opens in a new tab.
2. Click the support tab of the Connect sidebar, indicated by a headset icon ( ).
3. Under **Cases**, open a customer service conversation.
4. At the bottom of the conversation, click the menu icon ( ) to open the Connect actions menu.
5. In the Connect actions menu, select **Create Case**.
   The system opens a new case form in a record tab and automatically fills in some fields based on conversation details.
6. Complete the form as necessary and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Any comments or work notes in the record conversation appear as comments on the incident form. Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.

a. In the record conversation, by the text entry field, click the message type icon ( ).

b. Select **Comment** or **Work Note**.

c. Enter a message.
By default, record conversation messages are added as comments.

Note:
If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table. Any new journal fields added to the record do not appear in the chat. The system also changes the document ID for the conversation to reference the incident number instead of the entry in the Chat Queue Entry table.

Assign a customer service case

Agents can assign cases to themselves or to other customer service agents.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task
The **Assign to me** button is only visible if the current user has the customer service agent role and is not already assigned to the case.

Procedure

1. Open a customer service case.
2. Assign the case.

Option	Description
Assign the case to yourself	Click **Assign to me**.
Assign the case to another agent	Select an agent in the **Assigned to** field.

The agent's name appears in the **Assigned to** field. If the agent also belongs to an agent group, the group name appears in the **Assignment group** field.

Create a task for a customer service case

Create a task for a customer service case for additional work that needs to be completed as part of resolving the case.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you create a task, the system uses information from the case to automatically fill in fields on the Case Task form. After you create and save a task, it appears in the **Tasks** related list on the Case form.

Procedure

1. Open the desired case.
2. From the **Tasks** related list, click **New**.
3. Fill in the fields on the Case Task form.

Case Task form fields

Field	Description
Number	The automatically assigned case task number.
Parent case	The number of the parent case. This can be a case from the Case [sn_customerservice_case] table or any child tables of the Case table.
Parent	The number of the parent record if the task is created from a type of record other than a case. This field is populated when a case task is created from a non-case record such as an incident, problem, change, or request. This field is a reference to the Task [task] table. **Note:** You may need to configure the case task record to display the **Parent** field. For more information about adding fields to a form, see Configuring the form layout.
Contact	The contact for the parent case. This field is a reference to the Contact [customer_contact] table.
Account	The account for the parent case. This field is a reference to the Account [customer_account] table.
Consumer	The consumer for the parent case. This field is a reference to the Consumer [csm_consumer] table.
Subject	The subject of the case task.
Description	A description of the work that needs to be done in order to complete the case task.
Priority	The assigned priority of the case task: ○ 1 - Critical ○ 2 - High ○ 3 - Moderate ○ 4 - Low (default)
State	The current state of the case task: ○ Open ○ Closed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assigned to	The assigned user.
Service Definition	This field is a reference to the Service Definition [sn_case_type_selection] table.
Work notes list	Internal users who receive a notification about this case when work notes are added. You can only add internal users to the work notes list.
Work notes	Information about the case task, such as steps taken toward resolution. Internal users who have been added to the **Work notes list** receive a notification when work notes are added to a case task.
Additional comments	Customer-viewable comments. Each comment is inserted into the **Activity** field when the user selects **Post**.

4. Click **Update**.

Create a case task of a specific type for a customer service case

Customer service agents can create different types of case tasks by making selections from the case task type selector screen.

Before you begin

Role required:

- sn_customerservice_agent
- sn_customerservice.consumer_agent
- sn_customerservice_manager
- sn_customerservice.svc_location_agent
- sn_customerservice.case_task_agent

About this task

The types of case tasks that agents can create depends on the configuration of the customer service case types and service definitions features. For more information, see the following topics:

- Configure customer service case types
- Manage customer service case types
- Configuring service definitions

In CSM Configurable Workspace, agents use the Case type selector screen to make selections and create cases.

Procedure

1. Create a case task.
   - Select **New** from a case task list.
   - Select **New** from the Tasks related list tab on a case record.
   - Select the **+** icon on the related records task list in the Dynamic Related Records component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the Task declarative action on the activity viewer.
- Select **Create Task** in a case playbook stage.

2. Make a selection in the case task type selector.

   - If you create the case task from a case task list, the **Service task** field on the case task type selector shows all of the related services where the target table is Case Task [sn_customerservice_task] and extensions of Case Task.
   - If you create the case task from a case record, the **Case task service** field lists the task services related to the case service. If the case has no service, the **Service task** field shows all of the related services where the target table is Case Task [sn_customerservice_task] and extensions of Case Task.

3. Select **Create task**
   The case task is created with the selected task service definition. If any default values have been defined in the case task service definition, these values are populated on the case task record.

Create a work order for a customer service case

Create a work order for a customer service case as part of the case resolution process.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task

After a work order is created, it appears in the **Work Orders** related list on the Case form. The case number is also referenced on the work order.

Procedure

1. Open the desired case.
2. From the **Work Orders** related list, click **New**.
3. Fill in the fields on the Work Order form.
   For more information, see Create a work order.
4. Click **Update**.

Related topics

Manage work orders

Create a request on behalf of a customer or consumer

Customer service agents can create requests on behalf of customers from CSM Configurable Workspace or from the platform interface.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent

About this task

Customer service agents can browse the catalog and make a selection to create a request on behalf of a customer.

- From CSM Configurable Workspace, agents can create requests from case and interaction records.
- From the platform interface, agents can create requests from case records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a customer service case.
2. To create a request, do one of the following.
   - CSM Configurable Workspace: Click the More UI Actions icon (⋯) and select **Create Request**.
   - Platform interface: Click the form context menu icon and select **Create Request**.
3. Select an item or a service from the catalog to display the item page.
4. **Optional:** Select the quantity.
5. To complete the request, do one of the following.

6. From the Case form, click the **Requests** related list to see the requests associated with the case.

Add an entitlement to a case

Add one or more entitlements to a customer service case record in CSM Configurable Workspace.

Before you begin

Role required: sn_esm_agent, sn_customerservice.consumer_agent

About this task

Agents can view the available entitlements on a customer service case and associate one or more entitlements to the case. Available entitlements are associated with the account, consumer, or contract selected on the case record.

Starting with the Zurich release, the *sn_customerservice.advanced_entitlements* system property determines if agents can associate one entitlement to a case or multiple entitlements.

- If set to true, the Case Entitlements related list is visible on the Case form and the **Entitlement** field is hidden. Agents can use this list to associate multiple entitlements to the case.
- If set to false, the **Entitlement** field is visible on the Case form and the Case Entitlements related list is hidden. Agents can use this field to associate one entitlement to the case.

For more information, see Properties installed with Customer Service Management.

Procedure

1. Open a case record in CSM Configurable Workspace.
2. Add one or more entitlements to the case.
3. Select the Case Entitlements related list tab and then select **Add**.
   If the record page displays the Related Lists tab in the contextual side panel, expand the Case Entitlements list and then select **View all** to display the Case Entitlements list.
4. Select one or more entitlements from the Add case entitlements pop-up window.
   The Add entitlements pop-up window displays the entitlements associated with the account, consumer, product, and contract selected on the case record.
5. Select **Add** on the Add case entitlements pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The selected entitlements are added to the Case Entitlements list.

6. Select **Save** to save the changes to the case.

Add an entitlement to a case line

Add one or more entitlements to a case line in CSM Configurable Workspace.

Before you begin

Role required: sn_customerservice_agent

Procedure

1. Open a case line record in CSM Configurable Workspace.
2. Select the Case Line Entitlements tab.
3. Select **Add** on the Case Line Entitlements tab.
4. Select one or more entitlements from the Add entitlements pop-up window.
   The Add entitlements pop-up window displays the entitlements associated with the **Account** field on the case line record and the **Contract** field on the parent case record.
5. Select **Add** on the Add entitlements pop-up window.

   The selected entitlements are added to the Case Line Entitlements tab.

Close a customer service case

Close a case at any time, except when it is in the **Resolved** state.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task

After an agent proposes a solution for a case, the state changes to **Resolved** and the customer can either choose to accept or reject the solution. If accepted, the case is closed. If rejected, the state reverts to **Open**.

An agent or agent manager can close a case at any time, except when it is in the **Resolved** state, whereas only a customer can accept or reject the proposed solution. When an agent or agent manager closes a case, details must be included in the **Resolution notes** field.

Procedure

1. Open a customer service case in CSM Configurable Workspace.
2. Select the **Details** tab.
3. In the Closure Information section, fill in the following fields.
   a. Select a code in the **Resolution code** field that indicates the resolution state of the case.
   b. Enter any information related to the closure in the **Resolution notes** field.
4. Select **Close Case**.

Customer service satisfaction surveys

Customers can complete a satisfaction survey when they accept a case solution or close a case from the Customer Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a customer accepts a proposed solution for a case by clicking **Accept Solution** on the case record or closes a case by clicking **Close Case**, they can access a satisfaction survey in the Customer Service Portal. Customers have the option of completing or skipping the survey.

If a customer is using the email communication channel, the system sends an email with a link to a customer satisfaction survey when an agent closes a case. The customer can click on this link to complete the survey.

Note:
One survey can be generated per case. If a survey has already been generated for a case, a second survey cannot be generated even if a case is reopened and closed again.

The Customer Service application includes a default survey that you can customize as needed. To customize the default survey, navigate to **Survey** > **View Surveys** and select **Customer Service Satisfaction Survey** from the list of assessment metric types. To edit the default survey, open the survey and click the **Survey Designer** button.

You can also design your own survey using the survey designer tool. After designing a survey, be sure to select a condition for triggering the survey.

Create a consumer case from a chat

If a consumer chat results in the need to open a case, create the case directly from the conversation.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task

When you create a case from a support conversation, the system copies the conversation history to the case activity stream as comments and work notes. Future messages are tracked in the case as well.

Procedure

1. Navigate to **All** > **Collaborate** > **Connect Support**.
   The Connect workspace opens in a new tab.
2. Click the support tab of the Connect sidebar, indicated by a headset icon.
   The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a consumer starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue has the option to accept the conversation. An agent can also request to transfer a conversation directly to you.
3. Under **Cases**, open a consumer conversation.
4. At the bottom of the conversation, click the menu icon to open the Connect actions menu.
5. In the Connect actions menu, select Create Case.
   The system opens a new Case form and fills in some of the fields based on the conversation details. (For a case created from a consumer chat, the **Consumer** field is filled in and the **Short description** field displays the initial chat request from the consumer.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Complete the form as necessary and click **Submit**.
   The system shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table.

Create a consumer case from an anonymous chat

If an anonymous chat results in the need to create a consumer case, create the case directly from the conversation.

Before you begin
Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task
When you create a case from a support conversation, the system copies the conversation history to the case activity stream as comments and work notes. Future messages are tracked in the case as well.

Procedure

1. Respond to an anonymous chat request.
2. Chat with the user to determine the issue.
3. At the bottom of the conversation, click the menu icon to open the Connect actions menu.
4. In the Connect actions menu, select **Create Case for Guest**.
   The system opens a new Case form and fills in some of the fields based on the conversation details. For a case created from a guest user chat, the **Short description** field displays the initial chat request from the user.
5. Complete the form as necessary and click **Submit**.
   The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table.

Create a consumer record

Consumer service agents and managers can create consumer records from the Customer Service Management application.

Before you begin
Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Select **New**.
3. Fill in the fields on the Consumer form as necessary.
4. Fill in the fields on the Primary Address tab.
   A consumer can have multiple addresses but only one primary address. The primary address is stored in the Primary Address tab on the Consumer form and in the **Addresses** related list.
5. If desired, fill in any of the fields on the Preferences tab.
6. Select **Submit**.
   The record is added to the Consumers table (csm_consumer). The primary address is added to the **Addresses** related list and the **Primary** field is set to **true**.

Create additional consumer addresses

Create a consumer record from an anonymous chat

If an anonymous chat results in the need to create a consumer record, create the record directly from the conversation.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task

Procedure

1. Respond to an anonymous chat request.
2. Chat with the user to determine the issue.
3. At the bottom of the conversation, click the menu icon to open the Connect actions menu.
4. In the Connect actions menu, select **Create Consumer and Case for Guest**.

   The system opens a Consumer form and fills in some of the fields based on conversation details. For a consumer record created from a guest user chat, the **First name**, **Last name**, and **Email** fields display information from the initial chat request.

   Selecting this option creates a consumer record using the information provided on the record producer and then associates the case with the newly created consumer. The Case form is also populated with the information provided on the record producer.
5. Complete the form as necessary and click **Submit**.

Create additional consumer addresses

Consumers can have multiple addresses, including one primary address.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task

The primary address is stored in the Primary Address tab on the Consumer form and in the **Addresses** related list. When you fill in the fields in the Primary Address tab and click **Submit**, this information is added to the **Addresses** related list as the primary address, with the **Primary** field set to true. Any changes made to the **Primary Address** fields are also updated in the related list. A consumer can have only one primary address.

Other addresses, such as billing or shipping addresses, can be created and stored in the **Addresses** related list. For these other addresses, the **Primary** field is set to **false**.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Click the number of the desired consumer.
3. In the **Addresses** related list, click **New**.
4. Fill in the fields on the Location form.
5. To denote this address as the primary address for the consumer, enable the **Primary** check box.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A consumer can have multiple addresses but only one primary address.

6. Click **Submit**.

Respond to a case using an email quick message

Use predefined quick email messages to quickly draft replies to customers. Agents can select predefined quick messages to add content into the message body of emails.

Before you begin

Role required: sn_customerservice_agent

About this task

Business managers and admins can set up email quick messages and predefine the content for replying to cases. For example, you can predefine personal greetings, disclaimers, different types of additional information, and signatures.

You can incorporate icons, business logos, pictures, HTML layout, and rich text format. You can also configure quick messages so that only a certain user or a group can view them.

For more information, see the following topics:

- Composing emails with quick messages
- Define a quick message

Procedure

1. Open a customer service case.
2. Select the More Actions icon ( ) and then select **Email**.
3. Select the Quick Messages drop-down menu in the Compose Email header and select a predefined message.
   The content of the quick message is inserted in the message body at the cursor location.
4. **Optional:** Select additional quick messages.
5. Select **Send**.

Initiate a conference call from a case

As part of resolving a customer service case, you can initiate a conference call between involved users.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, admin

About this task

Customer service agents can initiate a conference call from a case and add participants, including on-call members of shift groups.

Note:

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows. Also ensure the property **glide.notify.task.phone_number** is set to one of these Notify phone numbers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the desired case.
2. Click the **Start Conference Call** related link.
3. Select one or more **Recipients** to participate in the conference call.
   You can add individual participants, groups, or individual phone numbers.

Related topics

Use the Activity Stream

Enhancements to Activity stream help reduce cluttering the Activity Stream and the agent effort to understand the case context.

Before you begin

Role required: admin

About this task

Enhancements in the Activity Stream include the following:

- Filter by post type
- Sort messages and events
- Improved email representation

Procedure

1. Open a customer service case.
   You would see the Activity Stream with the filter options.
2. Click the Filter icon ( ).
   The Filter sets are displayed. The conversation filter sets items such as emails, comments, and work notes.
3. Select the **Post types** filters from the drop-down list.
   For example, if you select **Work notes**, only the notes are displayed in the Activity Stream.

   Note:
   Selecting only **Field changes** displays the fields in the Activity Stream.

4. Select the **Field changes** drop-down list to filter the fields.
   For example, if you select **State**, only the state changes are visible.
5. Click the **Flagged** tab to see only the flagged messages.

   Flagged messages are visible to everyone who has access to the case.

6. Click the Sort icon ( ) to sort the events and messages based on the timeline.
7. Click the More Options icon ( ) and select **Expand all posts** to view the post details or select **Collapse all posts** to go back to the previous state.
8. Click **Show more** in an email to view the latest email response in an expanded form.
9. Click **Show full conversation** to view the whole email thread.

Configure Activity stream

Resolve cases with knowledge and community content

Enable agents to resolve a case more quickly by searching for information from the knowledge base and community and, if helpful, associating it to the case.

Before you begin

Role required: sn_customerservice_agent

About this task

The Case form displays contextual search results based on text entered in the **Short Description** field. These search results provide targeted knowledge articles, pinned articles, and community content to customer service agents.

Customer service agents can search for information that is related to a case when opening a case or in a case that is already open. If the search results in any related content, the agent can preview the content. If the information is relevant, the agent can mark it as helpful. Knowledge articles can be also attached to the case.

By default, search results include knowledge articles, pinned articles, and solved community questions and blogs. Depending on the configuration, search results can also include other types of information, such as open and resolved cases and problems. With the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml), you can also view similar cases and similar knowledge articles.

Customer service case managers can use the Demand Insights for Cases dashboard to identify which cases have no or insufficient knowledge coverage. For more information, see Demand Insights for Cases dashboard.

Procedure

1. Navigate to **All** > **Customer Service** > **Cases**.
2. Perform one of the following actions.
   - Open a new case and start typing in the **Short description** field.
   - Open an existing case and click **Related Search Results**.

   Any matching search results are displayed in the **Related Search Results** section. The content displayed depends on the permissions assigned to the agent in Knowledge and Communities.
3. Click one of the results to open the content in a pop-up window.
4. **Optional:** Perform any of the following steps.
5. Perform one of the following actions.
   - If you opened a case, click **Submit**.
   - If you updated an existing case, click **Update**.

Manage skills for a customer service case

Add or remove optional and mandatory skills for a customer service case.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Agents can also change a skill between mandatory and optional.

Procedure

1. Open the desired case.
2. Click the **Task Skills** related list.
3. To create a new skill:
   a. Click **New**.
   b. Select a skill in the **Skill** field.
   c. If mandatory, click the **Mandatory** check box.
   d. Click **Save**.
4. To switch the skill type:
   a. Click the desired skill.
   b. Enable or disable the **Mandatory** check box.
   c. Click **Save**.

Using Chat Zoom Connector

Initiate a Zoom meeting directly from a chat by using the Chat Zoom Connector application.

As an agent you can initiate a Zoom meeting from a chat to understand and resolve customer issues faster through live interactions. For more information, see Initiate Zoom meetings from chats.

By default, for each interaction record for a Zoom meeting, a Notify conference call number is also generated. As an agent, you or the agent manager can access the recording URL of the Zoom meeting from the activity stream of the interaction record. For more information, see Interaction records in Agent Workspace.

As an agent manager, you can access the details of Zoom meetings initiated from a customer chat using the Zoom interaction record. The meeting recordings are available in the interaction record created for Zoom. For more information, see View details for Zoom meetings initiated from chats.

Note:
The conference call details of a Zoom meeting are stored in the Notify Conference Calls [notify_conference_call] table.

As a user in the notify_admin or notify_view role, you can access the details of a Zoom meeting by navigating to **Notify** > **Recordings**, and selecting the corresponding conference call number. For more information, see Notify conference calls.

Chat Zoom Connector user roles

The users with the roles listed in the following table can use the Chat Zoom Connector application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required for Chat Zoom Connector

Roles	Tasks
agent_workspace_user	Initiate a Zoom meeting from a chat to understand customer issues and resolve issues faster through live interactions.
sn_customerservice_manager	View details for Zoom meetings initiated from a customer chat using the Zoom interaction record. The meeting recordings are available in the interaction record created for Zoom meetings.
notify_admin, notify_view	View details for Zoom meetings initiated from a customer chat by using Notify.

Activation information

Configure the Chat Zoom Connector application for initiating Zoom meetings from customer chats. For more information, see Configure Chat Zoom Connector.

Chat Zoom Connector

Initiate Zoom meetings from chats

Resolve issues faster by initiating a Zoom meeting directly from a customer chat using the Chat Zoom Connector application.

Before you begin

Ensure that an administrator has installed and set up the Chat Zoom Connector application. For more information, see Configure Chat Zoom Connector.

Role required: agent_workspace_user

About this task

You can use a Zoom meeting to host a screen-sharing or video conference. You can also record the meeting and save the recordings.

Procedure

1. Navigate to **Agent Workspace**.
2. Accept and respond to a chat from your agent inbox.
3. **Optional:** Ask questions and find out more about the issue.
4. To start a Zoom session with a customer, click the quick actions icon (⚡), and then select **/ zoom**.

   Tip:
   You can also enter `/zoom` in the text field of the chat.

5. Click the send icon (➤).
   A message announcing that the Zoom meeting has started and one containing the meeting URL are posted in the chat window for both agent and customer. If the session was initiated through the Private Chat tab, the session's URL isn't shared with the customer.
6. Click the URL to host the Zoom meeting and request the customer to click the URL too.
   As a host of the meeting, you can admit participants by sharing the meeting URL with them. The number of participants you can admit depends on your Zoom account settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The meeting topic is set to the number of the associated chat interaction record. The meeting description is set to the short description of the associated chat interaction record. If the short description of the associated chat interaction record is empty, the meeting description is shown as a dash (-).

7. **Optional:** Record the meeting.
   For more information, see the Zoom Help Center.

Result

An interaction record of type **Zoom** is generated for the meeting that captures the Notify conference call details for this Zoom session. A Notify administrator or agent manager can access the conference call details associated with the Zoom meeting from the interaction record.

Note:
The conference call number is a value automatically generated in the **Channel Metadata Record** field on the Interaction form. For more information, see View details for Zoom meetings initiated from chats.

The recording URL of the Zoom meeting is added to the activity stream of the interaction record. For more information, see Interaction records in Agent Workspace.

View details for Zoom meetings initiated from chats

View details for a Zoom meeting initiated from a chat by accessing the associated interaction record.

Before you begin

Role required: sn_customerservice_manager

About this task

This task provides steps for a user with the sn_customerservice_manager role to access Zoom meeting details from an interaction record. For information about how users with other Notify roles view Zoom meeting details, see Using Chat Zoom Connector.

Procedure

1. Navigate to **Interaction** > **All**.
2. In the Interactions list, click the link to an interaction record of type Zoom from the **Number** column.

Result

The recording URL of the Zoom meeting, if available, is added as a work note and displayed in the activity stream of the Interaction form.

On the Interaction form, you can view the details for a Zoom meeting.

Note:
Your administrator might have configured the interaction record to show different application-specific field values.

Interaction form

Field	Description
Number	Unique number to identify the interaction record.

© 2026 ServiceNow, Inc. All rights reserved.

Open CSM Configurable Workspace

Open CSM Configurable Workspace so that you can work on customer service cases.

Before you begin

Role required: sn_customerservice_agent

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces**.
2. Select **CSM Configurable Workspace**.

   The workspace opens in a new browser tab.

Look up and verify a contact or consumer

An agent can look up contact or consumer information from a saved interaction record, review and confirm the information, and then populate the information on the interaction record.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

About this task

Agents can search for information such as name, phone number, email address, case number, or order number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open CSM Configurable Workspace.
2. In the contextual side panel, click the Contact Verify icon ( ) or the Consumer Verify icon ( ) to access the lookup and verify feature.
3. In the **Verify Contact** or **Verify Consumer** fields, enter information such as the first few letters of a first or last name or the first few digits of a phone or case number.
   These fields use a type-ahead search feature that displays results in a list and narrows the results as more characters are entered. Multiple display fields in the search results help to differentiate contacts. When searching for a record number, the contact or consumer associated with the record is returned in the search results.

   Note:
   Delete characters from the field to clear the search results.

4. Select the desired result from the list.
   This action displays information about the selected contact or consumer in a verification card. If the information is not correct, repeat steps 2 through 4.
5. Click **Verify** to confirm the selected contact or consumer.

   This action does the following:

   - Populates the **Account** and **Contact** or **Consumer** fields on the interaction record.
   - Enables the **Verified** check box.
6. **Optional:** You can look up and verify another contact or consumer by repeating steps 2 through 4 and entering different search information.
7. Click **Save** to save the interaction record and refresh the related lists.

Related topics

Lookup and verify

Create a contact or consumer using Lookup and verify

An agent can create a contact or consumer from the Lookup and verify feature in the Contextual side panel.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

About this task

Agents can use the Lookup and verify feature to search for contacts and consumers. After verifying a user's information, agents can populate that information on the interaction record.

If an agent can't find a contact or consumer, they can create a record for that user from within the Lookup and verify feature.

Procedure

1. Open CSM Configurable Workspace.
2. From a saved interaction record, click one of the following icons in the Contextual side panel to access the Lookup and verify feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify Contact icon ( )
- Verify Consumer icon ( )

3. Enter user information in one of the following fields: **Verify Contact** or **Verify Consumer**. This information can include the first few letters of a first or last name or the first few digits of a phone or case number.
4. If you cannot locate the contact or consumer and choose to create a record, click **Create Contact** or **Create Consumer**.

   The system displays the Create Contact or Create Consumer form in the Contextual side panel.

   If the **Account** field on the Interaction record is populated when you click **Create Contact**, the **Account** field on the Create contact form is populated with the same information.
5. Add information to the fields on the form and click **Create**.
   The system performs the following actions:
   - Saves the contact or consumer record.
   - Creates and displays the contact or consumer card.
   - Adds the information to the interaction record.

View the install base in CSM Configurable Workspace

View a customer's install base in CSM Configurable Workspace to quickly identify the support they require as well as the opportunities for adoption and upsell.

Before you begin

Verify that the Customer Service Install Base Management plugin (com.snc.install_base) is activated.
Role required: sn_customerservice_agent

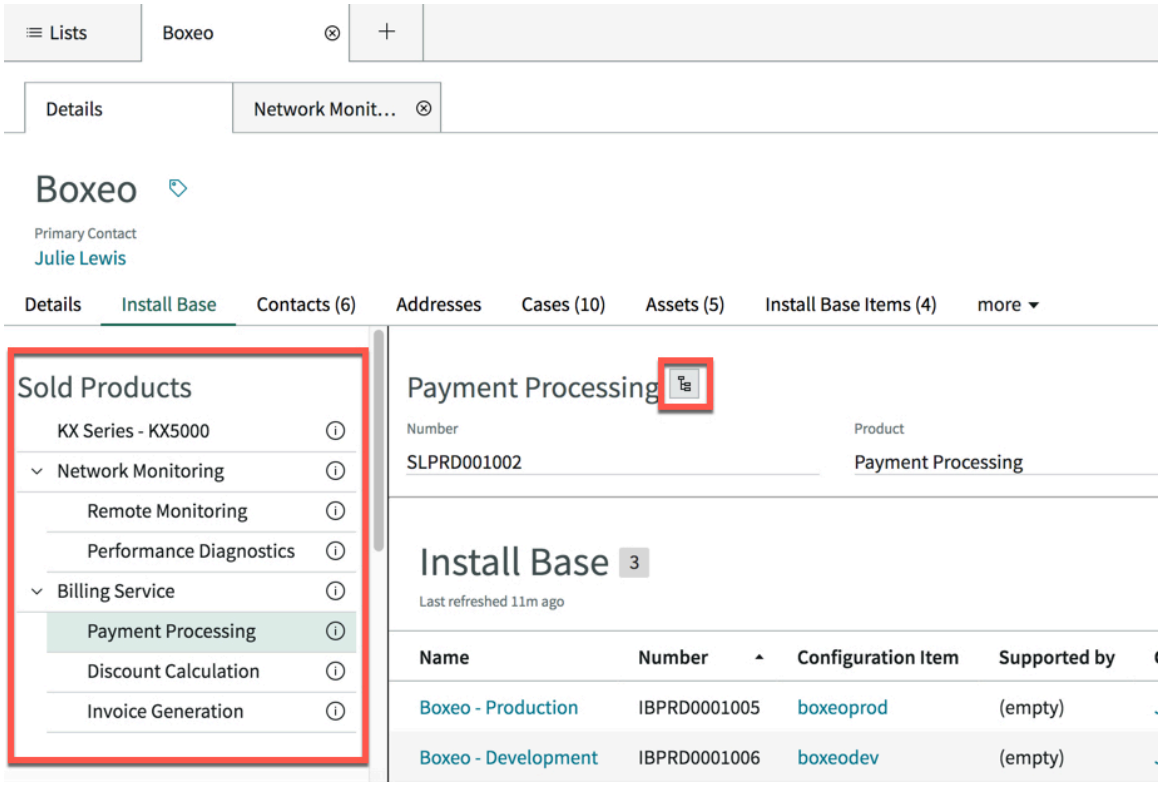
About this task

You can view information about a customer's purchased products and services, delivery details, and additional components that are available for the product models.

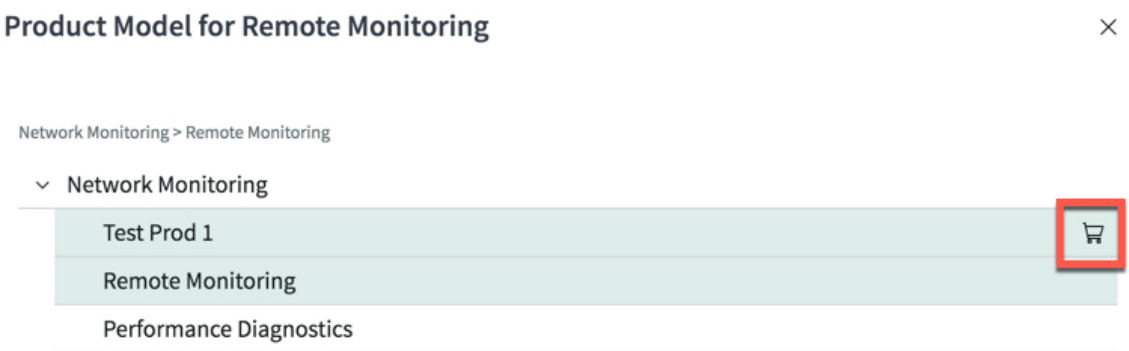
Procedure

1. Open CSM Configurable Workspace.
2. Select the account that you want to view the install base for.
3. Select the Install Base related list.
4. Scroll through the Sold Products tree view to view the details about the sold product and the list of install base items that belong to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. On the form header, select the Hierarchy icon to see the full product model that the sold product is part of.
   The product model hierarchy opens in a separate window. Unpurchased product components have a shopping cart icon next to them.



6. View the install base items and related lists in the configurable workspace by navigating to **Products** > **Install Base item**.
7. View the details of the install base item by opening an install base item.

Note:
You can also use the right navigation pane to view the install base items and related list.

View sold product information in CSM Configurable Workspace

Enable customer service agents or managers to view the sold products and the service offerings associated to the sold product for an account or consumer.

Before you begin
Role required: sn_customerservice_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Customer service agents can view which service offerings are associated to the sold products affected by an issue. They can also see the service commitments and availability.

Procedure
1. Open CSM Configurable Workspace.
2. Open a customer service case.
3. Click **Sold Products** to view the sold product associated to the case and the service offering associated to it.
4. Click the service offering to view the service commitments associated to it.

Search for knowledge articles in CSM Configurable Workspace

Search for knowledge articles in Agent Assist, including similar knowledge articles.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

About this task
Agent Assist displays contextual search results based on text entered in the **Short description** field on the Case form. These search results include knowledge articles and other types of information, such as open or resolved cases and community content. You can narrow the list of results by selecting a specific type of information to view.

> **Note:**
> With the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml), you can also view Similar Knowledge Articles.

Procedure
1. Open CSM Configurable Workspace.
2. Open a customer service case.
3. Perform one of the following.
   - In the Agent Assist panel, click the search resource icon ( ) and select a search source.
     - `Knowledge Articles`
     - `Similar Knowledge Articles`
   - In the Recommended Actions - Search tab, search with a keyword and select the **Search source** as `Knowledge` to filter the knowledge articles.

     For more information on how to enable Recommended Actions - AI Search and disable Agent Assist, see Enable AI search in Recommended Actions.
4. Select a knowledge article.
5. Click **Attach**.
   Depending on your configuration, you can add a link or embed an article directly into the Additional comments (customer visible) portion of the activity stream.

Open a knowledge article in a sub-tab

Search for a knowledge article in Agent Assist or Recommended Actions - AI Search and then open the article in a sub-tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

Procedure

1. Open CSM Configurable Workspace.
2. Open a customer service case.
3. Perform one of the following actions in the Contextual side panel:
   - In the Agent Assist tab, select an article from the default search or search for something specific using the search bar and then select an article.
   - In the Recommended Actions - Search tab, search for the desired article and select the Search source as **Knowledge** to filter the knowledge articles.

     For more information on how to enable Recommended Actions - AI Search and disable Agent Assist, see Enable AI search in Recommended Actions.
4. View the article in the Contextual side panel.
   After viewing the article, you can also perform the following actions:
   - Select **Attach** to attach the article to the case. Add any additional comments in the Attach Article pop-up window and then select **Attach Article**. The article is attached to the case and added to the Attached Knowledge related list.
   - Select **Flag** to flag the article. Add a comment in the Flag Article pop-up window and then select **Save**. This action generates a feedback task for the knowledge article.
   - Select the knowledge article link below the article title to open the article in a separate tab. You can also select the More Actions menu and then select **Full View**.
   - Select the More Actions menu and then select **Helpful** to mark the article as helpful.

Create a knowledge article from a case

Reuse information from a customer service case by creating knowledge articles from customer service cases.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

About this task

Your administrator must enable creation of articles from customer service cases.

Procedure

1. Open CSM Configurable Workspace.
2. Open a customer service case.
3. Click the More UI Actions icon (...).
4. Click **Create Knowledge Article**.
   This creates a new knowledge article in a sub-tab. By default, the new article is created from the KCS Article template. The following information is copied from the case to the knowledge article:
   - Short description
   - Source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cause
- Close notes

5. In the **Knowledge base** field, enter the name of the knowledge base in which you want this article to display.
6. **Optional:** Edit the knowledge article.
7. Click **Save**.

Report a knowledge gap

If you cannot find relevant knowledge articles that could help resolve a case, you can report a knowledge gap.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_customerservice_manager, workspace_admin, admin

About this task

You can search for and attach knowledge articles to a customer service case. If you cannot find any relevant articles, you can report a knowledge gap. If you have permission, you can also create a knowledge article.

Customer service case managers can use the Demand Insights for Cases dashboard to identify which cases have no or insufficient knowledge coverage. For more information, see Demand Insights for Cases dashboard.

Procedure

1. Open CSM Configurable Workspace.
2. Open a customer service case.
3. **Optional:** Search for existing knowledge articles or create a knowledge article to help resolve a case.
4. Click the More UI Actions icon (⋯) and then click **Report Knowledge Gap**.
   In the platform interface, click the **Report Knowledge Gap** related link on the Case form and provide information in the resulting pop-up window.
   The system opens a new knowledge feedback task in a sub-tab. The short description from the case is copied to the **Description** field on the task.
5. **Optional:** Edit the knowledge feedback task description.
6. Click **Save**.
   The task is added to the **Knowledge Gaps** related list on the Case form.

Respond to a community thread from a case

For cases that are created from a community discussion, customer service agents can view and respond to the discussion in a new browser tab.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, admin

About this task

Cases that have been created from a community discussion have the **Channel** field set to Community.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open CSM Configurable Workspace.
2. Open a case that was created from a community discussion.
3. Click the More UI Actions icon (...) and select **Show Community Thread**.
   This UI action is only available if the **Channel** is Community.
4. View the community discussion in a new browser window and respond as necessary.

Use response templates to add information to cases and case tasks

Customer service agents can copy content from response templates and add it to cases and case tasks.

Before you begin

Role required: sn_customerservice_agent with the sn_templated_snip.template_snippet_reader role

About this task

The contextual side panel in CSM Configurable Workspace gives you access to information that can help you resolve customer service cases. It includes a column of icons that you can click to access different types of information. Clicking the response templates icon shows reusable messages that you can copy and paste into cases and case tasks.

Procedure

1. Open CSM Configurable Workspace.
2. Open a customer service case or case task.
3. In the contextual sidebar, click the response templates icon ( ) to display a list of templates.
4. In the Response Templates side panel, search for a template.
5. Select a template and then click **Copy to clipboard**.
6. Paste the template text into the **Work notes** field or the **Additional comments** field.

Use Customer Central

Get a quick overview of key customer information and recent customer activity to help you find out more about the customer contacting support.

Before you begin

Role required: sn_customerservice_agent

Role required if using the Walk-up Experience for business locations: sn_customerservice.svc_location_agent, sn_customerservice.svc_location_manager, or sn_customerservice.svc_location_consumer_agent.

About this task

Use customer central to get a quick insight into key customer information and recent activity from the customer, who is contacting support. You can filter by date or facet to access the information you require.

Note:
Accounts require contact information to display account information in Customer Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In CSM Configurable Workspace, you can access Customer Central from within the Interaction, Contact, Account, or Consumer records.

Procedure

1. Open CSM Configurable Workspace.
2. On the Interaction, Contact, Account, or Consumer record, select Customer Information to view key information on the customer.
3. On the Interaction, Contact, Account, or Consumer record, select Customer History to view recent activity from the customer or chat summary between the agent and customer.
4. Create a case or close the record.

View trending case topics

Analyze the backlog of cases and identify clusters of cases that point to similar underlying issues.

Before you begin
Role required: sn_majorissue_mgt.major_issue_manager

About this task
View a list of clusters and cluster concepts.

- Cluster concepts list the top ten most recurring words that appeared in the short description of the cases.
- Cluster size indicates the number of cases in the cluster.
- Cluster quality gives a percentage value of how similar the cases are.

Procedure

1. Open CSM Configurable Workspace.
2. Navigate to **Lists** > **Trending Case Topics** > **Last 1 week**.

What to do next
Click a **Cluster Id** to view the Cluster Summary form details, Related Cases and Related Major Cases.

You can also create a major case for trending case topics.

Add trending case topics to existing major cases

Work through cases more efficiently and resolve similar cases at once by identifying any existing major cases that the backlog of cases can be linked to.

Before you begin
Role required: sn_majorissue_mgt.major_issue_manager

Procedure

1. Open CSM Configurable Workspace.
2. Navigate to **Lists** > **Trending Case Topics** > **Last 1 week**.
3. Click a **Cluster Id**.
4. On the Related Major Cases related list, check if there are any existing related major cases.
5. On the Related Cases related list, select the cases you want to add as child cases in the existing major case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Edit**.
7. In the **Parent** field, copy the number of the major case to add the child cases to.
8. Click**Update**.

Create major cases for trending case topics

Work through cases more efficiently and resolve similar cases at once by creating major cases to add the backlog of cases to.

Before you begin
Role required: sn_majorissue_mgt.major_issue_manager

About this task
If you didn't find an existing major case to add the trending case topics to and you think the cluster qualifies as a major case, you can create a major case, as applicable.

Procedure
1. Open CSM Configurable Workspace.
2. Navigate to **Lists** > **Trending Case Topics** > **Last 1 week**.
3. Click a **Cluster Id**.
4. On the Related Major Cases related list, check if there are any existing related major cases.
5. If there are no related major cases, click **Create Major Case**.
   A major case is created.

   All related child cases are linked as child cases to the major case if the **Parent** field in the case is empty and the case is in **Open** state.

What to do next
To access the major case, click the link in the confirmation message that a major case has been created.

Manage email tasks

You can compose, reply to, and preview emails directly from cases in CSM Configurable Workspace. This capability helps you save time and effort instead of having to address and send a separate email message.

You can perform the following email tasks from cases in CSM Configurable Workspace:

- Compose an email from a case
- Compose an email from the ribbon component
- Send an email response from a case activity stream
- Preview an email from the Emails related list

Compose an email from a case

As an agent, you can compose emails directly from cases within a ServiceNow instance. This capability helps you view and send emails to two different customers simultaneously which saves time and effort.

Before you begin
Role required: sn_customerservice_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can compose large emails easily in a full screen view which opens up in a new tab.

Procedure
1. Open CSM Configurable Workspace.
2. Select and open the case for which you want to compose an email.
   The case opens in a new top-level tab.
3. Select the More Actions (•••) icon and select **Compose Email**.
   The New Email screen opens in full view in a new sub-tab below the Case tab. The **To** field is pre-filled with the customer's email id and the **Subject** field contains the original case number and issue. For more information, see Compose an email.
4. Compose your email and select **Send**.

Note:
You can also select **Save** to save the email and send it later. These drafts are available in the **Draft Emails** related list. To access the draft in the email compose tab, select the More Actions (•••) icon and select **View Draft** to see the saved draft.

Related topics
Compose an email from the ribbon component

Compose an email from the ribbon component

As an agent you can compose emails directly from cases within CSM Configurable Workspace without having to use an external email client. This capability helps you view and send emails to two different customers simultaneously which saves time and effort instead of having to address and send a separate email message.

Before you begin
Role required: sn_customerservice_agent

About this task
You can compose large emails easily in a full screen view which opens up in a new tab.

Procedure
1. Open CSM Configurable Workspace.
2. Select and open the case for which you want to compose an email.
   The case opens up in a new tab.
3. In the ribbon component, click the contact's email address.
   The New Email screen opens in full screen in a new tab. The **To** field is pre-filled with the customer's email id and the **Subject** field contains the original case number and issue. For more information, see Compose an email.
4. Compose your email and click **Send**.

Note:
You can also click **Save** to save the email and send it later. These drafts are available in the **Draft Emails** related list.

Compose an email from an email template

As an agent, you can compose emails using email templates. These templates contain default values for fields that you can easily add to email messages in the Compose panel on case records.

Before you begin
Role required: sn_customerservice_agent

About this task
Default values in email templates can include the recipients (email addresses in the To, Cc, and Bcc fields), the sender, the subject of the email, and text to include in the message body. For more information, see Email templates feature.

Procedure

1. Open CSM Configurable Workspace.
2. Open a case.
3. Select the Email tab in the Compose panel.
4. Select the Email Templates tab in the contextual side panel.
   The system displays the available email templates.
5. Select the desired template.
   The selected template card expands to show the template details.
6. Select **Apply Template**.
   The system populates the values for the configured fields in the email. If these fields already contain values, applying the selected template overwrites these values.
7. **Optional:** Add text for the body of the email in the text field.
8. Select either **Save as draft** or **Send Email**.
   The system stores draft emails in the Draft Emails tab on the case record.

Send an email response from a case activity stream

Respond to cases using options within a customer email thread. You may not require using another email client which saves time and effort.

Before you begin
Role required: sn_customerservice_agent

About this task
You can read and respond to large emails easily in a full screen which opens up in a new tab. Responding to a customer's email from within a case using the reply, reply all, or forward options, includes the content from previous conversation thread. These options are available by default. An admin can disable these options. For more information, see Disable email responses from the case activity stream.

Procedure

1. Open CSM Configurable Workspace.
2. Select and open the case from the activity stream for which you want to send or forward a response.
   The case opens up in a new tab.
3. Click **Reply** in the Activity Stream to write a response to the customer or click the ⋮ icon and select **Reply All** to reply to all the customer email ids mentioned in the original email or select **Forward** to forward the email to any other email ids not mentioned earlier.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Based on the selection, the Reply Email, Reply All Emails, and Forward Email screens opens in full screen in a new tab.

   Note:

   You can click the icon to add attachments from the file system or delete attachments already associated with the existing case.

5. Compose your email and click **Send**.

Email properties

Preview an email from the Emails related list

Preview emails directly from within cases. With this capability, you can select case-related emails and read the details in full view.

Before you begin
Role required: sn_customerservice_agent

About this task
For information about adding or modifying actions on a form, see the following topics:

- Customizing your workspace with declarative actions
- Create a UXF client action for forms
- Declarative actions glossary

Procedure

1. Open CSM Configurable Workspace.
2. Select and open a case.
   The case opens up in a new tab.
3. Select the **Emails** tab.
4. Select an email to preview from the Emails list.
   The email opens in a sub tab and displays the details.
5. Select **Reply** or **Reply All** to reply to the message you're viewing or select **Forward** to forward the email.

Initiate SMS conversations from CSM Agent Workspace

Compose an SMS message from CSM Agent Workspace to interact with a customer contact or a consumer regarding customer service cases.

Before you begin
Role required: agent_workspace_user

Ensure that an administrator has configured the Conversational SMS Integration with Twilio application. For more information, see Conversational SMS Integration with Twilio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Agent Workspace Home**.
2. On the Agent Workspace Home page, navigate to **Agent Workspace** > **Lists** > **Interactions** > **My Interactions**.
3. In the My Interactions list, modify an existing interaction or create another interaction.
   - To modify an existing interaction, select the interaction number in **Number** column of the My Interactions list.
   - To create another interaction, click **New** in the My Interactions list.
4. On the Details tab of the workspace form, fill in the details for a new interaction or modify the details.
   For more information about the form, see CSM workspace form features.

   Note:
   The user profile associated with an interaction is configured by an administrator by using the `AgentInitiatedConversationUtil` extension point. By default, the `AgentInitiatedMessagingUtilExtPointImpl` script include that implements the `AgentInitiatedConversationUtil` extension point is available for the Conversational SMS Integration with Twilio application. For more information, see Associate user profiles on messaging interactions.

5. Click **Compose SMS**.
6. On the form, fill in the fields.

Compose SMS form

Field	Description
From	Provider phone number of the SMS channel. ○ If there is only one provider phone number, the From list is automatically set to the provider phone number. ○ If there are multiple providers configured for the SMS channel, you can select a phone number in the From list.
To	Phone number of the consumer or customer contact. The phone number is in the E.164 format and automatically set to the phone number of the consumer or customer contact associated with the interaction record. By default, the user profiles for consumers and customer contacts and the format of their phone numbers are validated for the SMS channel. If you select **Other** from the To list, you can manually enter a phone number of the consumer or customer contact. Any manually entered phone number is automatically converted to the E.164 format. For more information, see Phone number fields.
Message	Message to be sent to the consumer or customer contact.
Attachment	File to be sent as an attachment. Click **Attach File** to browse and select a file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: By default, you can attach only images to the message. However, an administrator can configure the Attachment API to upload more file types. For more information, see Attachment - POST /now/attachment/upload.

7. Click **Send**.

Result

The interaction record of type messaging is created or updated based on the workflow as discussed in the following table.

Messaging interaction record workflows and results

Workflow	Results
No active interaction record available	• A new interaction record of type messaging for the SMS channel is automatically created and assigned to the agent. • The agent is added to the Live Group Profile [live_group_profile] table.
An active interaction record associated with a live agent exists	• The interaction details are appended to the existing interaction record for the SMS channel. • If the message was initiated by an agent not associated with the existing interaction record, the agent is added to the Live Group Profile [live_group_profile] table. However, there's no change in assignment of the interaction.
An active interaction record associated with the virtual agent exists	• The existing interaction record with the virtual agent is closed. • A new interaction record of type messaging for the SMS channel is automatically created and assigned to the agent. • The agent is added to the Live Group Profile [live_group_profile] table.
An active interaction record associated with a different user exists	• The existing interaction record with the earlier user is closed. • A new interaction record of type messaging for the SMS channel is automatically created and assigned to the agent. • The user profile associated with the existing interaction record is deactivated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Messaging interaction record workflows and results (continued)

Workflow	Results
	• The user profile currently associated with the new interaction record is created. • The agent is added to the Live Group Profile [live_group_profile] table.

Initiate messaging conversations from CSM Configurable Workspace

Compose an SMS message from CSM Configurable Workspace to interact with a customer contact or a consumer regarding customer service cases.

Before you begin

Ensure that an administrator has completed the following tasks:

- Configured the Agent-Initiated Messaging Interface application. For more information, see Agent-initiated messaging interface.
- Configured at least one qualifying messaging channel for the agent-initiated messages. For more information, see Determine whether messaging channels are available for agent-initiated messages.

Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **CSM Configurable Workspace Home**.
2. On the CSM Configurable Workspace Home page, navigate to **Lists** > **Interactions** > **My Interactions**.
3. In the My Interactions list, select the interaction number in **Number** column of the My Interactions list.

   Note:
   Ensure that the interaction type is other than messaging and the interaction state is not closed complete or closed abandoned.

4. On the Details tab of the workspace form, fill in the details for a new interaction or modify the details.
   For more information about the form, see CSM workspace form features.

   Note:
   The user profile associated with an interaction is configured by an administrator by using the `sn_agent_initiated.AgentInitiatedMessagingUserDocument` extension point. The `AgentMessagingInteractionUserDocument` script include that implements the `sn_agent_initiated.AgentInitiatedMessagingUserDocument` extension point is available for the Agent-Initiated Messaging Interface application. For more information, see Associate user profiles with agent-initiated messages.

5. Click **Compose Message**.
6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compose Message form

Field	Description
Channel	Messaging channel that is installed with the application available for a service channel. For example, select **SMS** to send an SMS message. The SMS messaging channel is available when an administrator has installed the Conversational SMS service channel application. An administrator can configure whether a messaging channel is available for agent-initiated messages. For more information, see Determine whether messaging channels are available for agent-initiated messages.
To	Recipient ID of the consumer or customer contact, or when both are not available the recipient ID of the user for which the interaction was opened. The recipient ID is pre-populated from the User [sys_user] table record of the consumer, customer contact, or opened for user. If the entered ID is a phone number, it must be an E.164-compliant phone number or is automatically converted to the E.164 format. For more information, see Phone number fields. An administrator can configure the format of the recipient ID based on the selected channel and associate user profiles with agent-initiated messages. For more information, see Validate recipient IDs for agent-initiated messages and Associate user profiles with agent-initiated messages. If you select **Other** from the To list, you can manually enter a ID of the consumer or customer contact. Any manually entered phone number is automatically converted to the E.164 format. For more information, see Phone number fields. **Note:** The **Other** list value appears only when an administrator has configured the option to enter recipient ID manually for the messaging channel. For more information, see Set up agent-initiated message interface for a messaging channel.
From	Provider ID of the messaging channel. ○ If there is only one provider configured for the channel, the From list is automatically set to the provider ID. ○ If there are multiple providers configured for the channel, you can select an ID in the From list.
Message	Message to be sent to the recipient.
Attachment	File to be sent as an attachment. Click **Attach File** to browse and select a file. **Note:** By default, you can attach only images to the message.

7. Click **Send**.

Result
The interaction record of type messaging is created or updated based on the workflow as discussed in the following table.

Messaging interaction record workflows and results

Workflow	Results
No active interaction record available	• A new interaction record of type messaging for the channel is automatically created and assigned to the agent. • The agent is added to the Live Group Profile [live_group_profile] table.
An active interaction record associated with a live agent exists	• The interaction details are appended to the existing interaction record for the channel. • If the message was initiated by an agent not associated with the existing interaction record, the agent is added to the Live Group Profile [live_group_profile] table. However, there's no change in assignment of the interaction.
An active interaction record associated with the virtual agent exists	• The existing interaction record with the virtual agent is closed. • A new interaction record of type messaging for the channel is automatically created and assigned to the agent. • The agent is added to the Live Group Profile [live_group_profile] table.
An active interaction record associated with a different user exists	• The existing interaction record with the earlier user is closed. • A new interaction record of type messaging for the channel is automatically created and assigned to the agent. • The user profile associated with the existing interaction record is deactivated. • The user profile associated with the new interaction record is created. • The agent is added to the Live Group Profile [live_group_profile] table.

Create a work plan in Customer Service Management (CSM) Configurable Workspace

Create a work plan in the Customer Service Management (CSM) Configurable Workspace so that your agents can fulfill and implement the maintenance requirements for an install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_customerservice_agent and sn_fsm_planned_wm.planned_work_admin

Procedure
1. Navigate to **All** > **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, navigate to **Customer** > **Accounts**.
3. Open an account and navigate to the Install Base Items related list.
4. Open an install base item from the list.
5. On the **Planned Maintenance** tab, open **Work plans** and select **New**.
6. On the form, fill in the fields.

Work plan form on the Customer Service Configurable workspace

Field	Description
Name	Name of the work plan.
Type	Type of trigger that determines when work should be performed. ○ **Model based:** Base the work plan on a specified model of a CI. ○ **General:** Base the work plan on a table and filter. ○ **Install base:** Base the work plan on specified models of install base items **Note:** ○ Model-based plans apply only to hardware models, specifically ones that have at least one model category defined. ○ The Install base plan type is available only if the Customer Service Install Base Management (com.snc.install_base) plugin is activated.
Model	One or more product catalog items that you can select to identify the configuration items (CIs) or install base that require maintenance. When you select a model, the associated table appears in the Table field. For example, if you select a specific PC model, the **Table** field displays **Computer [cmdb_ci_computer]**. This field appears if you selected either the **Model based** or **Install base** type. For Install base type. The **Table** field automatically fills in an appropriate table based on the selected model.

7. Select **Save**.

Result
You created a work plan in Customer Service Management (CSM) Configurable Workspace.

Using Business Location 360

Enable customer service agents to get a comprehensive, 360-degree view of the business location issues, so that they get the required contextual data to effectively resolve the reported issues within the Customer Service Management (CSM) application.

Overview of Business Location 360

By using the Service Model Foundation data model framework, your location staff members can request assistance for their operations either from the central support team or peer business locations. To handle these cases effectively, customer service agents require a complete, 360° view of the business location.

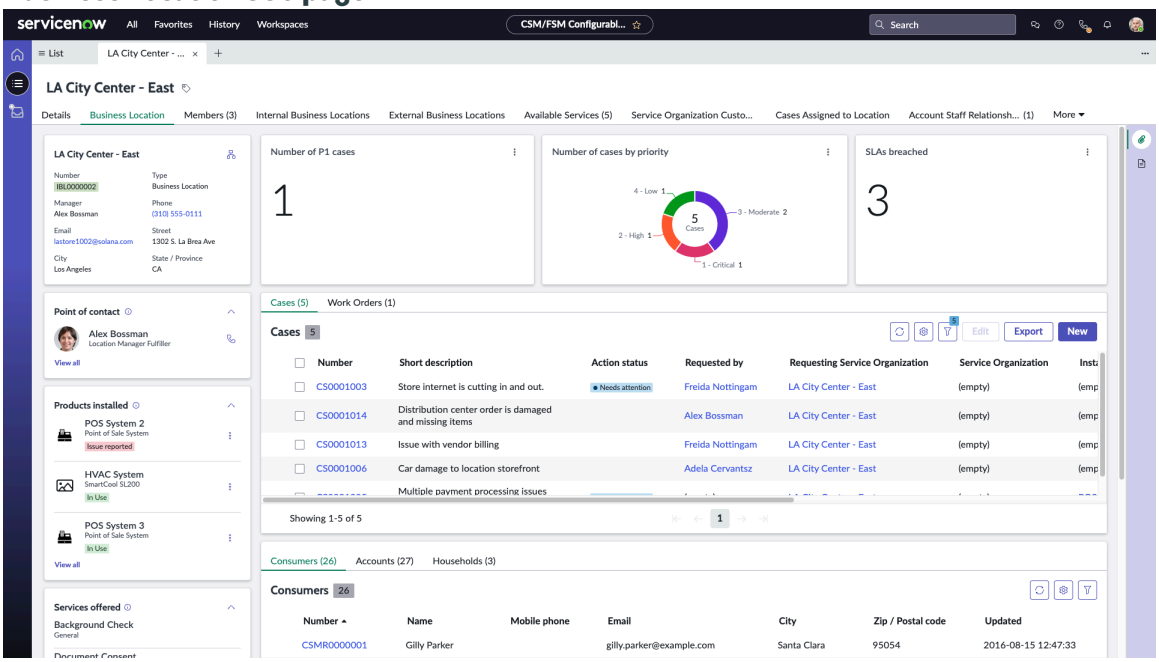
The Business Location 360 template enables agents to get a comprehensive view that includes the crucial contextual information that they need for resolving reported issues. Your administrator can customize the Business Location 360 template to add data sources, show additional information, or represent entities like stores, government agencies, healthcare organizations, automotive dealerships, or departments. For more information about configuring the Business Location 360 template, see CSM Configurable Workspace page templates.

Note:
Your administrator can activate the Business Location 360 capabilities by using the Business Location (com.snc.business_location) plugin.

This example shows the Business Location 360 page with the 360-view of different widgets like the products installed, point of contact, services offered, and more. These components enable customer service agents to get a comprehensive, 360-degree view of the business location issues to help them effectively resolve the reported issues.

Business Location 360 page



Benefits of using Business Location 360

By using the Business Location 360, your location staff members get the following benefits:

- Contextual information about an issue. Your customer service agents can view the contextual information about an issue and then create cases about a business location all from one place.
- Visibility into issues and trends. Your customer service managers can visually identify store-specific issues and broader trends.
- Ability to configure actions and pages. Your administrators can configure additional actions and pages based on the Business Location 360 template.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business Location 360 components

Customer service agents can resolve reported business location issues by using different components on the Business Location 360 page in the Customer Service Management (CSM) application.

Components on the Business Location 360 page

The following list of components are on the Business Location 360 page:

- Location information
- Point of contact
- Products installed
- Services offered
- All staff
- Key performance indicators (KPIs)
  - Number of P1 cases
  - Number of cases by priority
  - Service level agreements (SLAs) breached
- Task tab
  - **Cases**
  - **Work orders**
- Customer tab
  - **Customers**
  - **Accounts**
  - **Households**

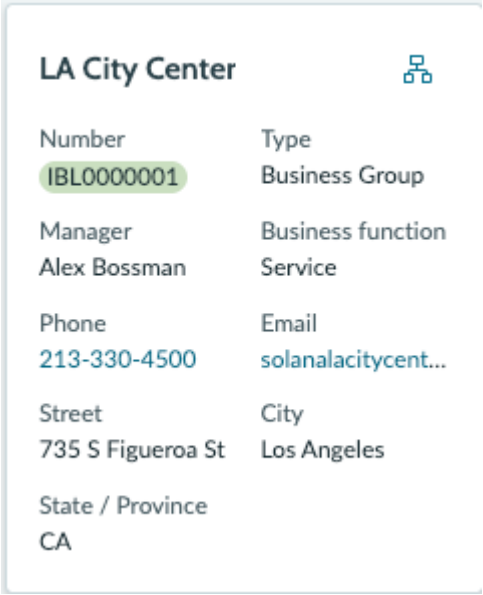
Note:
You can customize these components according to your requirements by using the Business Location 360 template. The Business Location 360 template enables agents to get a comprehensive view that includes the crucial contextual information that they need for resolving reported issues. Your administrator can customize the Business Location 360 template to add the data sources, show the additional information, or represent the entities like stores, government agencies, healthcare organizations, automotive dealerships, or departments.

Location information

The location information component displays the location information details for the record. The following example shows a location information component that displays the name and type of the location, the address, email, phone number, and the manager's name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location information component



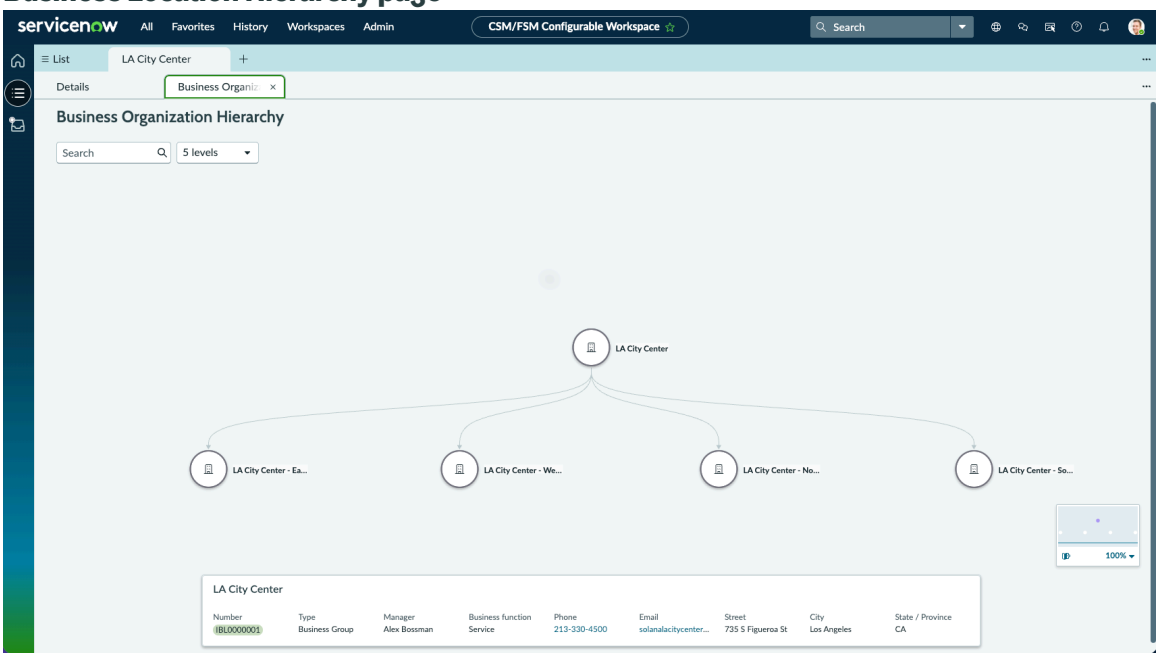
The **Email** and **Phone** links are clickable. When you select these links, the information is copied to the clipboard.

Note:
If your administrator hasn't enabled Computer Telephony Integration (CTI), your contact numbers are copied to the clipboard instead of calling the numbers directly. For more information about integrating Computer Telephony Integration (CTI), see Computer Telephony Integration.

On the location information link, navigate to the business location hierarchy view page by selecting the view hierarchy icon .

The following example shows a business location parent-child hierarchy with multiple nodes.

Business Location Hierarchy page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use this page to visualize the parent-child hierarchy structure, search for business locations, and perform different contextual actions on the nodes. You can also perform the following different contextual actions on the node:

- Set the node as a home or parent node.
- View the location details.
- Create a case from the node.

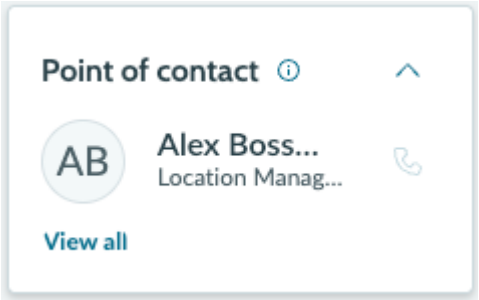
You can get the location details of the node that you select. Also, if there's a black dot on any node, it signifies a business location issue.

Note:
The business location hierarchy page displays a maximum of 250 nodes. You can use the search functionality to find the node that you're looking for.

Point of contact

The point of contact component displays the primary points of contact that are available at a business location. The following example shows that the point of contact component can display the different points of contact at a business location.

Point of contact component



Selecting **View all** takes you to the Business Location member page where you can get the details of all the points of contact at a business location.

Note:
By default, only three users are displayed.

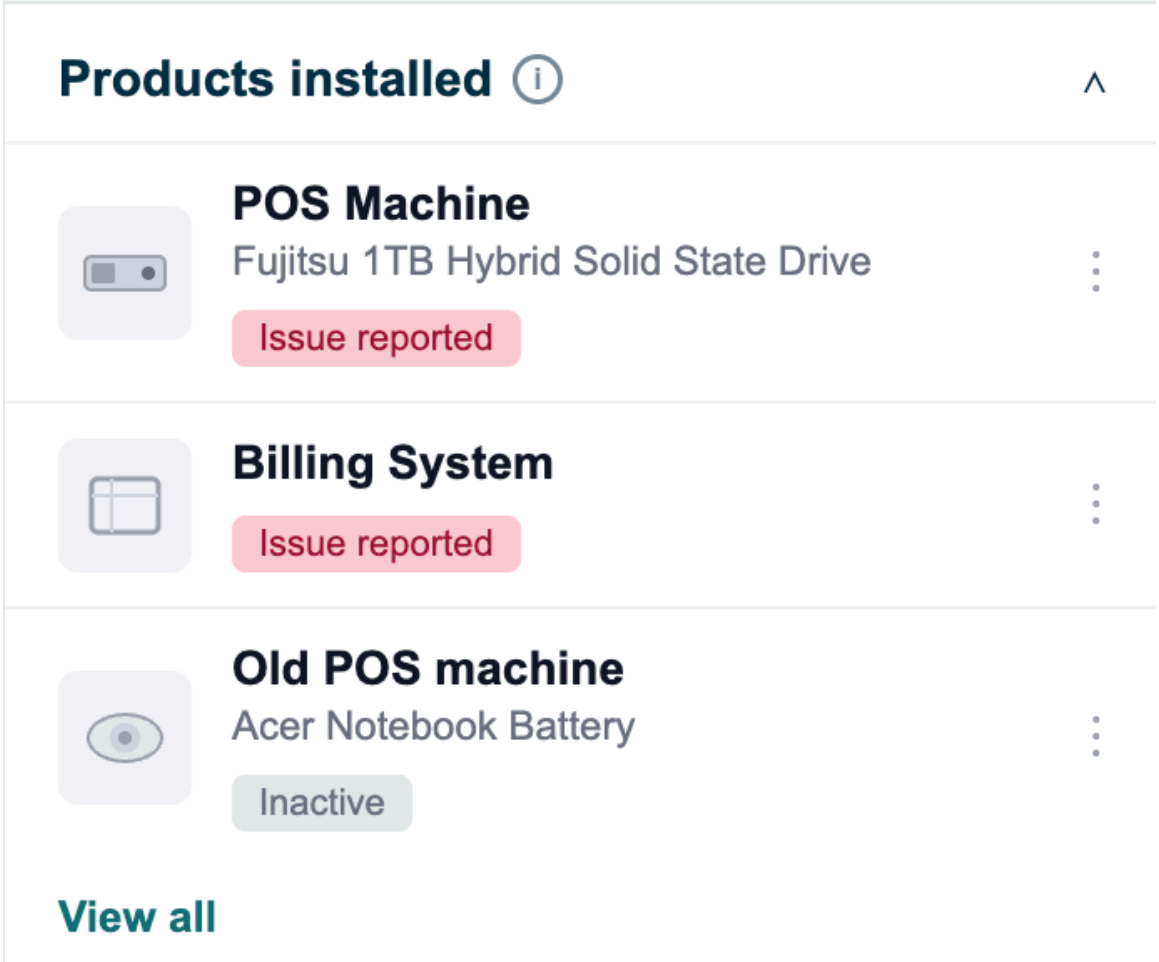
Products installed

The products installed component displays the information about the install base items at a business location. For example, you can see the install base name, product model name, and the status on this component. The following example shows the products installed component that provides information about the listed install bases at a business location.

Note:
You can access this component only after your administrator activates the Customer Service Install Base Management plugin (com.snc.install_base).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Products installed component



If the listed products display **Issue reported** in the highlighted text, it indicates that there's an active case reported for that install base item. The products within this component are sorted in the following order:

- Install base items with a recently reported case.
- Recently deployed install base items.

You can view the product details or create a case by selecting the Overflow icon ⋮.

Selecting **View all** takes you to the **Products installed** page where you can get the details of all the products installed at a business location.

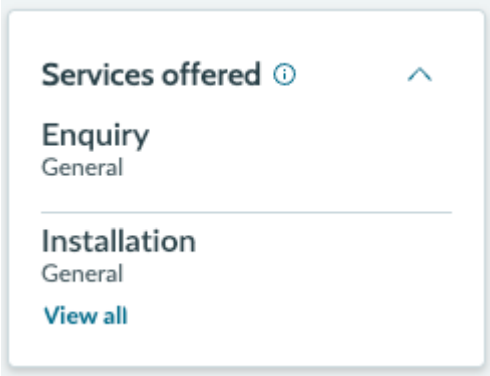
Note:
By default, only three products are displayed.

Services offered

The services offered component displays the list of services that are offered at a business location. The following example shows the Services offered component that provides information about the list of all service names and the types that are available at a business location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Services offered component

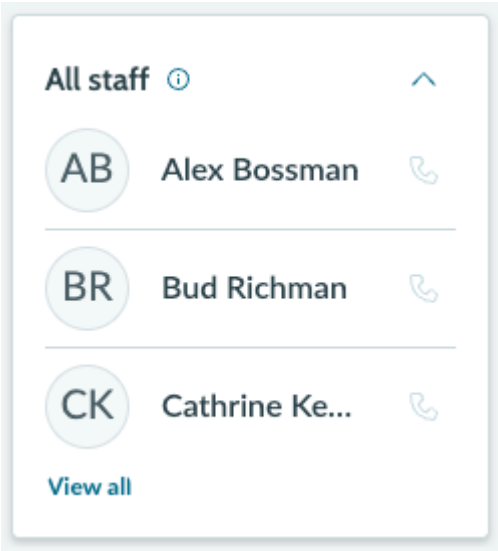


Note:
By default, only three services are displayed and these services are sorted in the ascending order.

All staff

The all staff component displays the list of the staff members who are working at a business location and includes both the internal and external staff members. The following example shows the All staff component.

All staff component



Selecting **View all** takes you to the **All staff** page where you can get the details of all the staff members that are available at a business location.

Note:
By default, only three staff members are displayed and these services are sorted in the ascending order of user name.

KPIs

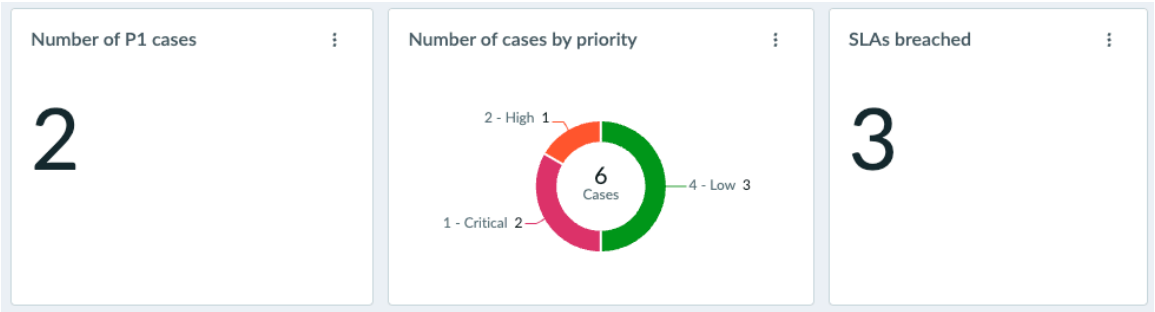
The KPI components are performance analytic indicators that display multiple types of information that are related to a case such as the following KPIs that are shipped out of the base system:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Number of P1 cases
- Number of cases by priority
- SLAs breached

The following example shows a list of the different KPIs. The list includes the number of P1 cases, the number of cases by priority, and the SLAs that were breached.

KPIs component



These KPIs are filtered to show the current business location-related details. Your administrator can customize these KPIs according to your location's requirements by using the UI Builder.

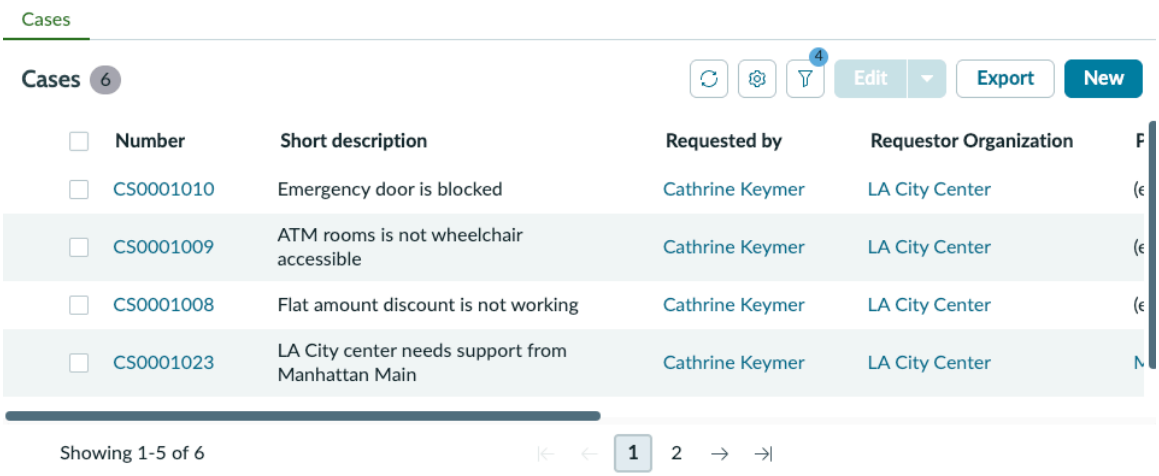
Task tab

The task tab component displays the following cases and work- order tabs where you can see the cases and work orders that are associated with a business location:

- **Cases** tab. Displays the active cases that have a requesting service organization as the current business location order by the date that the case was last updated. The account, consumer, and household fields are empty.
- **Work orders** tab. Displays the work orders that have the service organization as the current business location. For this type of work order, the household field is empty and the state field isn't completed. the state field is completed with errors, or the state field is closed.

The following example shows a list of the cases that are associated with a business location.

Task tab component



Note:
A maximum of five records are displayed per page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer tab

The customer tab component displays the list of consumers, accounts, and households that are associated with a business location:

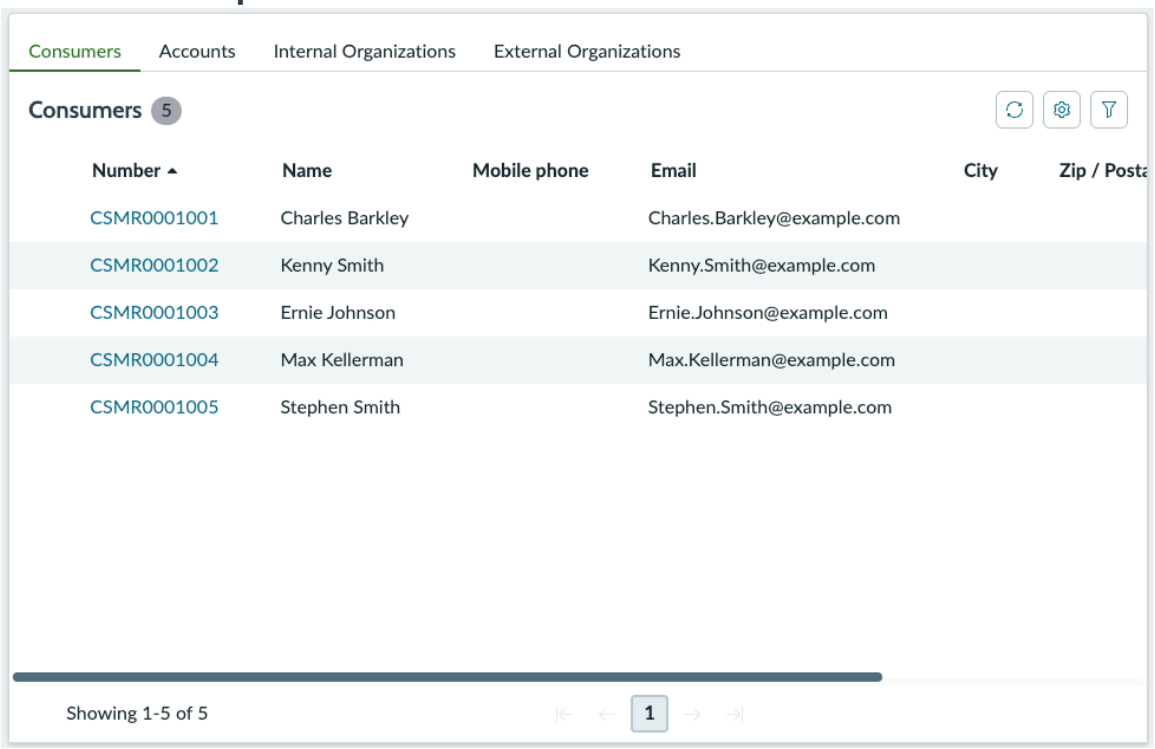
- **Consumers** tab. Displays all the consumers or a filtered list of consumers. This information is based on the supported consumers that are associated with the business location.
- **Accounts** tab. Displays all the accounts or a filtered list of accounts. This information is based on the supported accounts that are associated with the business location.
- **Households** tab. Displays all the households or a filtered list of households. This information is based on the supported households that are associated with the business location.

> **Note:**
> You can access this component only after the Customer Service Household plugin (com.snc.household) is activated.

- **Internal Business Locations** tab. Displays all the internal business locations or a filtered list of internal business locations. This information is based on the supported internal business locations that are associated with the business location.
- **External Business Locations** tab. Displays all the external business locations or a filtered list of external business locations. This information is based on the supported external business locations that are associated with the business location.

The following example shows a list of the consumers that are associated with a business location.

Customer tab component



> **Note:**
> A maximum of 10 records are displayed per page.

Outsourced Service Provider agent tasks

Outsourced service provider agents (OSPs) extend the capabilities and reach of an organization's customer service operations by providing basic customer service to customers and consumers.

Some key functions that outsourced service provider agents can perform include the following.

Outsourced service provider agent tasks

Task	Description
Create work order	An OSP agent can create a work order so that it can be assigned to a Field Service agent.
Escalate a case	An OSP agent can escalate a case when unable to resolve or fulfill a case for various reasons such as technical limitations, knowledge gaps, or access restrictions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outsourced service provider agent tasks (continued)

Task	Description
View account or consumer assets	An OSP agent can view the assets owned by an account or consumer which helps in creating or fulfilling a case.
View account contracts	As an OSP agent, you can view contracts owned by accounts or consumers in order to create or fulfill a case.
View customer or consumer data	As an OSP agent, you can view the customer or consumer data to fulfill cases.
Create a case task	An OSP agent creates a case task after a case has been assigned. As an agent, you can work on the case adding work notes and additional comments.
Assign a case	Assign a case to yourself or another Outsourced Service Provider (OSP) agent within the organization to start working on the case or to fulfill the case.
Create an appointment	As an agent, you can create an appointment for the requester of a case.
Transfer a case	The OSP agent or manager, if unable to resolve a case, transfers the case manually to an enterprise's internal agent.
View cases	As an OSP manager or agent, you can view all application modules with the list of cases for customers, consumers, and products served by your organization.
View case related emails and respond	As an OSP agent, you can view the list of emails related to a case that is assigned to you. You can respond to a case by creating a new email and sending it to the stakeholders of a case.
Report knowledge gap from a case	When an OSP agent has a knowledge gap which impacts the ability to resolve a case, the agent can report the knowledge gap.
Propose a major case	As an OSP agent, you can propose a major case from the existing customer service case assigned to you.
Close a case	Users with OSP agent role can propose a solution to a case and close the assigned cases.
Contextual search	Users with OSP agent role can search for related information to fulfill a case. The

Outsourced service provider agent tasks (continued)

Task	Description
	search results returned are the list of entities that the agent is entitled to as per the data governance.
View list of entitlements	As an OSP manager or agent, you must view entitlements for an account or consumer to create or fulfill cases.

Create work order

An OSP agent can create a work order so that it can be assigned to a Field Service agent.

Before you begin

Role required: sn_csm_ocs.ext_agent and you must have installed Customer Service Management with Field Service Management plugin.

Procedure

1. Go to **My Cases** and open a case.
2. Click **Work Orders** related list.
3. Click **New**.
4. Click **Submit**.
5. View work order status to update the customer of the status.

Note:
You cannot create a new work order until the previous one is closed or deleted.

Escalate a case

An OSP agent can escalate a case when unable to resolve or fulfil a case for various reasons such as

Before you begin

Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Click **Escalate Case** related link.
3. Fill in the fields on the Escalation form, as appropriate.
4. Click **Submit**.

View account or consumer assets

An OSP agent can view the assets owned by an account or consumer which helps in creating or fulfilling a case.

Before you begin

Role required: sn_csm_ocs.ext_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases**.
2. Open a case and click the preview icon next to the **Account** or **Consumer** field.
3. Click **Open Record**.
4. Click **Assets** related list.
   The list of assets belonging to the account or consumer is visible.
5. Click on an asset to view the read-only fields.

View account contracts

As an OSP agent, you can view contracts owned by accounts or consumers in order to create or fulfill a case.

Before you begin
Role required: sn_csm_ocs.ext_manager/sn_csm_ocs.ext_agent

Procedure

1. Open the case form.
2. Click the **Preview** icon next to the **Account** or **Consumer** field.
3. Click **Contracts** related list.
4. View the list of assets belonging to an account or consumer and fulfill a case.

View customer or consumer data

As an OSP agent, you must view the customer or consumer data to fulfill cases.

Before you begin
Role required: sn_csm_ocs.ext_manager or sn_csm_ocs.ext_agent

Procedure

1. Navigate to **Outsourced Customer Service** > **Cases** > **All**.
2. Open a case and click the preview icon next to the **Account** or **Contact** field.
3. Click **Open Record**.
   The following related lists are visible for you to work on and fulfill the cases:
   - **Contacts**
   - **Addresses**
   - **Cases**
   - **Assets**
   - **Contracts**
   - **Entitlements**
   - **Account Relationships**
   - **Sold Products** and
   - **Install Base**

Create a case task

An OSP agent creates a case task after a case has been assigned. As an agent, you can work on the case adding work notes and additional comments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases** and open a case.

   Note:
   The timeline of the case is displayed at the top of the case form.

2. Click **Tasks** related list.
3. Click **New** to create a new task.
   The **Edit** button allows you to add existing case tasks to a case from the **Collection** list.
4. Fill in the fields on the new record form, as appropriate.
5. Click **Submit**.

   Note:
   You can also close the case task.

Assign a case

Assign a case to yourself or another Outsourced Service Provider (OSP) agent within the organization to start working on the case or to fulfill the case.

Before you begin
Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **Outsourced Customer Service** > **Cases** > **All**.
2. Click and open a case from the available list.
3. Click **Assign to me**.

   Note:
   If the case is already assigned, the **Assign to me** button isn't available.

Create an appointment

As an agent, you can make an appointment with the requester of a case.

Before you begin
Role required: sn_csm_ocs.ext_manager or sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **My Cases**.
2. Open a case.
3. Click **Appointments** related list.
4. Fill in the fields on the Appointment form, as appropriate.
5. Click **Submit** and the appointment appears under **Appointments** related list in **Ready** state .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Edit the appointment and click **Send activity** to send the appointment to the specified email address.

Note:
You can also cancel the appointment using the **Cancel appointment** related link.

Transfer a case

The OSP agent or manager, if unable to resolve a case, transfers the case manually to an enterprise's internal agent.

Before you begin
Role required: sn_csm_ocs.ext_manager or sn_csm_ocs.ext_agent

About this task
You can transfer a case by selecting the reason for transfer, adding transfer notes, and transfer the case manually. The case is transferred based on the default assignment group setup while defining an OSP. Else, the case is transferred based on AWA or assignment rules, that have been previously setup.

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Open a case that you want to transfer.
3. Cick **Transfer Case**.
4. Select the reason for transferring the case from the **Reason** drop-down list.
5. Enter additional information regarding the case in the **Notes** field.
6. Click **Save**.
   The case is transferred successfully to the enterprise's internal manager. When you go back to **All** cases and view the case, you can view the transfer information under **Outsourced Case Transfer Request** related list.

View cases

OSP manager or agent, you must be able to view all application modules with the list of cases for customers, consumers, and products served by your organization.

Before you begin
Role required: sn_csm_ocs.ext_manager or sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases**.
   You must be able to see **My Cases**, **All**, **Open**, and **Unassigned** cases. Users who aren't authorized or who don't belong to this OSP won't see any case.

Note:
As an OSP manager you can view cases that are assigned to the groups you manage.

2. Select **All**, open a case, and assign the case to yourself.
   The **Assigned to** field is pre-filled with your name.

View case related emails and respond

As an OSP agent, you can view the list of emails related to a case that is assigned to you. You can respond to a case by emailing stakeholders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Open a case that you want to respond to.
3. Select **Emails** related list.
   The list of emails sent earlier if any, is displayed.
4. Select **New Email** to create an email.
   The recipient fields are pre-filled. You can add additional recipients if required.
5. Enter the body text in the Compose Email window.
6. Select the Attachment icon ( ) if you want to add an attachment to the email.
7. Select **Send**.

Report knowledge gap from a case

An OSP agent can report a knowledge gap for a case.

Before you begin
Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Open a case.
3. Is knowledge available for the case in the **Knowledge Gaps** related list.
4. Click **Report Knowledge Gap** related link.
5. Enter the description.
6. Click **Submit**.
   A knowledge gap is created and you can view it under the **Knowledge Gaps** related list.

   For more details, see Report a knowledge gap

Propose a major case

As an OSP agent, you can propose a major case from the existing customer service case assigned to you.

Before you begin
Role required: sn_csm_ocs.ext_agent

About this task
Cases in these states can be proposed as a major case candidate:

- New
- Open
- Awaiting Info

Cases that are Resolved, Closed, or Canceled can’t be proposed as a major case candidate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When proposing a case as a major case candidate, agents can specify the reason or justification for the case in the Propose Major Case pop-up window. Information provided in the **Work notes** and **Business Impact** fields are added to the Case form.

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Open a case.
3. Right-click on the case form.
4. Select **Propose Major Case**.
5. In the Propose Major Case pop-up window, enter a reason for the proposal in the **Work notes** field.
   You can also choose to enter the business impact of the selected case in the **Business Impact** field.
6. In the Propose Major Case pop-up window, enter a reason for the proposal in the **Work notes** field.
7. **Optional:** Enter the business impact of the selected case in the **Business Impact** field.
   This information is added to the Case form in the **Work notes** field and the **Business Impact** field in the Major Case Information section.
8. Select **Propose**.
   An entry is added to the **Work notes** on the Case form that the case was proposed as a major case candidate. The information entered in the Propose Major Case pop-up window is also added to the Case form.

Close a case

Users with OSP agent role can propose a solution to a case and close the assigned cases.

Before you begin

Role required: sn_csm_ocs.ext_agent

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **My Cases**.
2. Open a case.
3. Click the **Closure information** tab on the case form.
4. Select the **Resolution code** from the drop-down list.
5. Enter the cause for resolution and notes if any in the **Cause** and **Resolution notes** fields.
6. Select the **Add resolution notes to comments** check box, if desired.
7. Click **Close Case**.
   The case state changes to **Closed** state.

Contextual search

An OSP agent can search for related information to fulfill a case. The search results returned are the list of entities that the agent is entitled to according to the data governance.

Before you begin

Role required: sn_csm_ocs.ext_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Outsourced Customer Service** > **Cases** > **All**.
2. Open a case to see the related search results according to the case description.

View list of entitlements

As an OSP manager or agent, you must view entitlements for an account or consumer to create or fulfil cases.

Before you begin

Role required: sn_csm_ocs.ext_manager or sn_csm_ocs.ext_agent

Procedure

1. Navigate to **Outsourced Customer Service** > **Cases** > **All**.
2. Open a case and click the preview icon next to the **Account** field.
   The customer account page is displayed.
3. Click **Entitlements** related list.
4. Open an entitlement and view the asset details to fulfill a case.

Manage schedules and sites

Manage agent scheduling and availability, use the mobile app to perform common tasks on the go, and manage and support your customer base with install base plans and contracts.

Managing agent calendar

Customer service agents and field service technicians can use the agent calendar to see work schedules and assignments and also add personal events such as meetings or appointments.

The agent calendar provides a tool for maintaining different work schedules or shifts and assigning agents and technicians to shifts for specific time periods. The calendar has the flexibility to accommodate work schedules that are fixed or varied and shifts that rotate by week, month, or other patterns. The agent calendar administrator creates the calendar configuration, including a schedule configuration for each calendar user and the types of tasks to display on the calendar.

The schedule information stored in the agent calendar is used by other ServiceNow applications and features, such as the assignment workbench, central dispatch, and auto assignment. The assignment workbench uses agent availability, based on upcoming work schedules and personal time off, when evaluating predefined criteria and recommending agents for case assignment. Auto assignment in Service Management core applications, such as Field Service Management and Facilities Service Management, evaluate agent work schedules before assigning tasks.

The agent calendar administrator has access to the Agent Schedule menu in the application navigator. This menu includes the following modules:

- **Event Configuration**: create a configuration for each type of event or task displayed on the agent calendar.
- **Work Schedule**: create one or more work schedules for each calendar user.
- **Agent Personal Events**: create personal schedules for each agent and add events to those schedules.
- **Schedule**: create or modify schedules. For more information, see Schedules.

Viewing the calendar

Customer service agents and field service technicians with the agent_schedule_user role can access their personal calendars in the following ways:

- **Customer Service** > **My Schedule**
- **Field Service** > **Agent** > **My Schedule**

Note:
The agent calendar is supported in the mobile application and the mobile web.

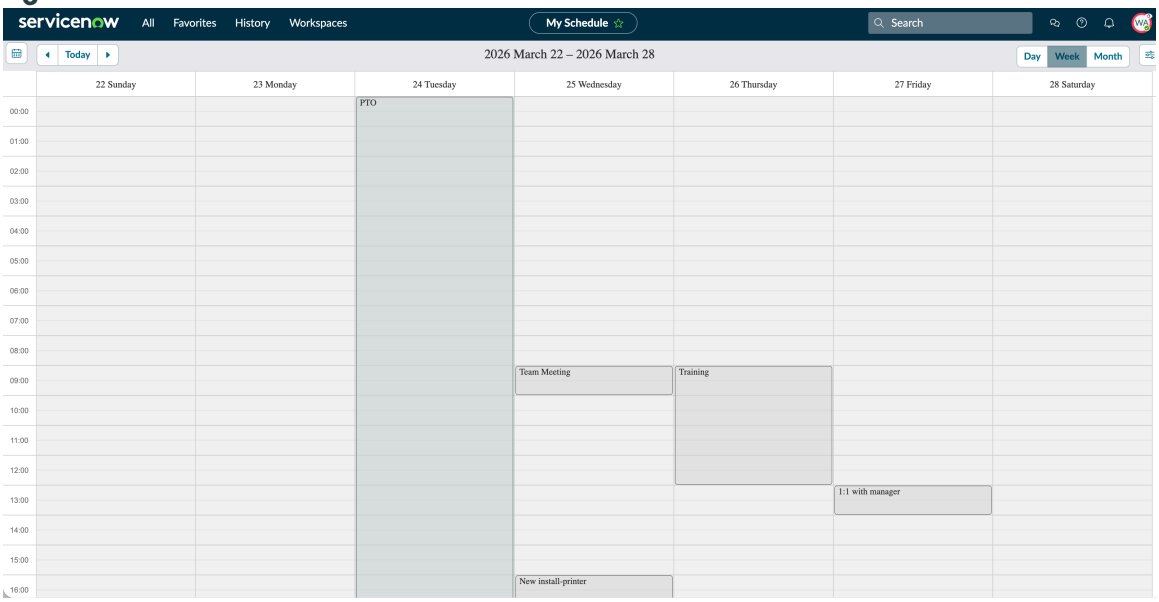
Agent Calendar



The calendar can display a single day, a week, or a month. Buttons in the calendar header allow you to switch views as well as go backward or forward in time. An agent's scheduled work hours are highlighted in gray and the current day is highlighted in blue. The agent calendar displays work or tasks assigned to the agent as well as personal events. Each type of event is displayed on the calendar using a different color.

Agents can add events to their calendars by double-clicking a specific time slot and entering the details in the New Event popup window or by clicking and dragging. Agents can also move events by dragging and dropping. Click an event to display a popup with event details and double-click an event to open the event record.

Plugins

The Agent Schedule plugin (com.snc.agent_schedule) is activated as part of the Customer Service Management and Field Service Management plugins.

Tables

The Agent Schedule plugin adds the following tables.

Tables installed with the Agent Schedule plugin

Table	Description
Agent Work Schedule [agent_work_schedule]	Stores one or more work schedules for each agent, including the date range for the schedule and the schedule type.
Agent Personal Schedule [agent_events]	Stores personal calendar events for each agent, such as training, personal time off, or meetings.
Event Configuration [agent_schedule_task_config]	Stores a configuration for each type of task displayed on the agent calendar, such as case tasks or work order tasks.
Agent Schedule User Config	Stores the agent's personalization data for the calendar. A user configuration is

Tables installed with the Agent Schedule plugin (continued)

Table	Description
[agent_schedule_user_pref]	created automatically when a user with the agent_schedule_user role accesses their personal calendar.
Agent Schedule Relationship [agent_schedule_task_config_rel_user_pref]	Stores the relationships between agent configurations and event configurations. Relationship entries are created automatically based on a user's read access to the task tables selected in the event configurations.
Agent Schedule Definition Theme [agent_schedule_definition_theme]	Stores the colors used to display different types of tasks on the agent calendar.

User Roles

The following user roles are included with the Agent Schedule (com.snc.agent_schedule) plugin.

Roles included with Agent Schedule plugin

Role	Description
Agent schedule administrator [agent_schedule_admin]	Sets up the Agent Calendar configuration. Contains roles: • agent_schedule_user • schedule_admin
Agent schedule user [agent_schedule_user]	Allows customer service agents and field service technicians to access and update their personal calendars.

Managing agent calendar

Use the agent calendar

Create an event configuration

Create event configurations to define and manage event types for the team calendar.

Before you begin

The schedule entry uses the Schedule Span [cmn_schedule_span] table to store different types of events.

The following types of schedule entries for event type configurations are available by default:

- Event — Appointment
- Event — Excluded
- Event — Meeting
- Event — Phone
- Event — Time Off
- Event — Other

These configurations are inactive by default. You can activate a configuration by navigating to **Agent Schedule** > **Event Configuration**, selecting an event type configuration, and setting the **Active** field to **true** for one or more event configuration types you would like to activate. Each configuration displays as a separate event type on the team calendar.

Role required: agent_schedule_admin

Procedure

1. Navigate to **Agent Schedule** > **Event Configuration** and perform one of the following actions.

2. Fill in the fields on the Event Configuration form, as necessary.

Event Configuration form

Field	Description
Name	A descriptive name for this configuration.
Config Label	Name displayed for this event in the agent calendar.
Color theme	Color used to display this type of schedule on the agent calendar.
Setup	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Setup	Setup method for this configuration. ○ **Simple:** use condition builder to set up this configuration. ○ **Scripted:** use advanced scripts to set up this configuration.
Table	The table where the tasks for this type of configuration are stored.
Filter	Use condition builder to create the desired conditions for the selected task type. For example, the event configuration for Case Tasks includes a filter on the task **State** field to display only those tasks that are open.
User Field	A field from the **Table** that provides the user assigned to the task. For example, the event configuration for Case Tasks uses the **Assigned To** field from the Task table [sn_customerservice_task]. When a case task is assigned, it appears on the agent calendar for the user selected in this field.
Event type	Type of schedule entry.
Display Field	A field from the **Table** that provides the information to be displayed for this event type on the agent calendar. For example, the event configuration for Case Tasks uses the **Subject** field from the Task table [sn_customerservice_task]. When a case task is assigned, the subject of the task appears on the agent calendar.
Start Date Field	A field from **Table** that provides the start date for the task. For example, the event configuration for Case Tasks uses the **Expected start** field from the Task table [sn_customerservice_task]. When a case task is assigned, it appears on the agent calendar starting on the date and time specified in this field. The **Expected start** field must contain a value for the event to appear in Workforce. If the field is empty, the event will not be displayed.
End Date Field	A field from the **Table** that provides the end date for the task. For example, the event configuration for Case Tasks uses the **Due date** field from the Task table [sn_customerservice_task]. When a case task is assigned, it appears on the agent calendar ending on the date and time specified in this field. The **Due date** field must contain a value for the event to appear in Workforce. If the field is empty, the event will not be displayed. **Note:** Because the agent schedule administrator can select any fields from the **Task Table** for the **Start Date Field** and the **End Date Field**, it is possible that the end date may be earlier than the start date. In this event, the task is displayed on the agent calendar between the two points in time.
Script	Use advanced scripts to create the event configuration.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available when the **Scripted** value is selected from the **Setup** field.

3. Perform one of the following actions:
   - If you created the configuration from an existing configuration, click **Update**.
   - If you created a new configuration, click **Submit**.

Create a work schedule for agents

Users with the agent schedule administrator role can create one or more work schedules for a customer service agent or a field service technician.

Before you begin
Role required: agent_schedule_manager, agent_schedule_admin

About this task
A work schedule includes a date range and a schedule type, such as day shift or evening shift. Agents and technicians can have multiple work schedules.

Procedure
1. Navigate to **All** > **Agent Schedule** > **Work Schedule**.
2. Click **New**.
3. Fill in the fields on the Agent Work Schedule form, as necessary.

Agent Work Schedule form

Field	Description
From Date	The first day of the work schedule.
To Date	The last day of the work schedule.
User	The selected agent or technician.
Work Schedule	The selected schedule from the Schedules list.
Type	The type of work that the agent or technician is performing during this schedule: ○ Primary work ○ Other An agent can have only one primary schedule for a specific range of dates. Primary schedules cannot overlap.

4. Click **Submit**.

Create a personal event for an agent or technician

Users with the agent schedule administrator role can create personal events that appear on an agent's personal calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_schedule_admin

About this task
Agents and technicians typically add personal events to their own calendars.

Procedure
1. Navigate to **All** > **Agent Schedule** > **Agent Personal Events**.
2. Select the personal schedule for the desired agent.
3. In the **Schedule Entries** related list, select **New**.
4. Fill in the fields on the Schedule Entry form, as necessary.

Schedule Entry form

Field	Description
Name	The name of the event.
Type	The type of event: ○ Time off ○ Appointment ○ Meeting ○ Phone call ○ Excluded ○ On call ○ Time off - in approval ○ Time off - rejected
Show as	Show this event on the agent's personal calendar as one of the following: ○ Busy ○ Free ○ Tentative ○ On call Select **Busy** to exclude the block of time from agent availability calculations for the auto- assignment and the case assignment workbench.
When	The start date and time of the personal event.
To	The end date and time of the personal event.
All day	Enable this check box if the event lasts all day.
Repeats	Create a repeating event by selecting the frequency. Depending on the selection, other fields are required to complete the frequency information. ○ Doesn’t repeat ○ Daily ○ Every Weekday (Mon-Fri) ○ Every Weekend (Sat, Sun) ○ Every Mon, Wed, Fri

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Every Tue, Thu ○ Weekly ○ Monthly ○ Yearly
Repeat every	Enter a number for the frequency of the repeated event.
Repeat on	For weekly events, select a day of the week.
Monthly type	For monthly events, select one of the following. These selections use the day and date in the **When** field as the basis for repetition. ○ Day of the month ○ Day of the week ○ Last day of the month ○ Last week of the month
Yearly type	For monthly events, select one of the following: ○ Day of the year: This selection uses the day and date in the **When** field as the basis for repetition. ○ Floating: For this selection, complete the **Float week**, **Float day**, and **Float month** fields.
Repeat until	Select a date for the end of the repeated event.
Float week	For a floating yearly repeating event, select the week.
Float day	For a floating yearly repeating event, select the day.
Float month	For a floating yearly repeating event, select the month.

5. Select **Submit**.

Create a schedule to use with the agent calendar

Users with the agent calendar administrator role can create a schedule to use with the agent calendar.

Before you begin

Role required: agent_schedule_admin

About this task

Creating a schedule for the agent calendar uses the schedule feature. For more information, see Schedules.

Schedules are configured with two types of records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Schedule records specify a time zone and a type of schedule and use one or more schedule entries. Schedule records are saved in the Schedule [cmn_schedule] table.
- Schedule entry records specify the time periods that are included or excluded from a schedule. Schedule entries are saved in the Schedule Entry [cmn_schedule_span] table.

For more information on schedule fields, see Schedule fields.

Procedure

1. Navigate to **All** > **Agent Schedule** > **Schedule**.
2. Click **New**.
3. Complete the fields on the Schedule form.

Schedule form fields and descriptions

Field	Description
Name	Enter a unique name for the schedule.
Time Zone	Select the time zone for the schedule. If you select **Floating**, the time zone will be relative to whatever is accessing the item at any given time.
Parent	Select a parent schedule to constrain the new schedule.
Type	Enter a label that describes the purpose of the schedule. You can also use one of these system terms to determine how to process certain schedules: ○ **excluded:** excludes time periods from SLA counts. ○ **maintenance:** specifies time periods where change management activities are allowed. A schedule containing maintenance schedule entries cannot also contain blackout schedule entries. ○ **blackout:** excludes time periods from change management schedules. A schedule containing blackout schedule entries cannot also contain maintenance schedule entries.
Description	[Optional] Describe the schedule.

Note:
The Schedule form displays a warning message if there are no active entries defined for the current schedule. If your schedule is a child schedule that only contains exclusions, ignore the message because exclusions are non-active entries.

4. Right-click the header bar and click **Save**.

Note:
If you create a schedule of type **maintenance** and save the record, a UI policy hides the **Type** field from the form. To view or change the value for the **Type** field, view the list of schedules rather than the schedule form and add the **Type** column if necessary. You can double-click the cell for the value in the **Type** column and modify from the list view.

5. Configure one or more schedule entries.
6. Click **Submit**.

Field	Description
Repeat every	Enter a number for the frequency of the repeated event.
Repeat on	For weekly events, select a day of the week.
Monthly type	For monthly events, select one of the following. These selections use the day and date in the **When** field as the basis for repetition. ○ Day of the month ○ Day of the week ○ Last day of the month ○ Last week of the month
Yearly type	For monthly events, select one of the following: ○ Day of the year: this selection uses the day and date in the **When** field as the basis for repetition. ○ Floating: for this selection, complete the **Float week**, **Float day**, and **Float month** fields.
Repeat until	Select a date for the end of the repeated event.
Float week	For a floating yearly repeating event, select the week.
Float day	For a floating yearly repeating event, select the day.
Float month	For a floating yearly repeating event, select the month.

4. Click **Submit**.
   The new event appears on the agent calendar and also in the **Schedule Entries** related list on the Agent Personal Schedule form.

Move an event on the agent calendar

Users with the agent schedule user role can move events on their personal calendar.

Before you begin

Role required: agent_schedule_user

Procedure

1. Navigate to your calendar.
   - **Customer Service** > **My Schedule**
   - **Field Service** > **Agent** > **My Schedule**
2. Use one of the following methods to move an event.

Option	Description
Click an event and drag it to a new day or time	The **When** and **To** fields in the event record are updated with the new information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Double-click an event to open the event record	Change the date and time information in the **When** and **To** fields and click **Submit**. The event appears on the calendar in the new lo cation.

Show or hide event types on the agent calendar

Users with the agent schedule user role can personalize their calendar and show or hide different types of events.

Before you begin

Role required: agent_schedule_user

Procedure

1. Navigate to your calendar.
   - **Customer Service** > **My Schedule**
   - **Field Service** > **Agent** > **My Schedule**
2. Click the configuration icon ( ) in the calendar header to display the Schedule Configuration menu.
3. Enable or disable the switches for the different types of events.
   An option is enabled when the switch is moved to the right and appears with a green background.
4. Click the configuration icon ( ) again to hide the Schedule Configuration menu.
   The calendar displays the enabled task types.

Using Microsoft Outlook with CSM

Integrate Customer Service Management with Microsoft Outlook to perform tasks such as managing contacts and cases from within Microsoft Outlook.

Integrating Microsoft Outlook with ServiceNow® Customer Service Management (CSM) can significantly streamline communication and enhance the efficiency of customer service operations. This integration offers several key benefits.

- Facilitates seamless communication between agents and customers by synchronizing emails, calendars, and contacts. This ensures that important information is easily accessible, reducing the risk of missed messages or appointments.
- Enhances task management by allowing agents to create, assign, and monitor tasks directly from their Microsoft Outlook interface. This means that agents can manage their workloads more effectively without needing to switch between different platforms.
- Supports automated workflows, enabling agents to respond to customer inquiries quickly and accurately. It simplifies the process of updating customer records and logging service requests, thereby improving the accuracy and reliability of customer data.
- Improve collaboration among team members. Agents can share insights, discuss complex cases, and provide updates on customer issues effortlessly, fostering a more cohesive and responsive customer service environment.

View Microsoft Outlook customer contact details in your instance

Once you have integrated Customer Service Management (CSM) with Microsoft Outlook, you can view customer details in an Outlook add-in panel to make communication easier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_customerservice.contact_manager, sn_customerservice.proxy_contact

Procedure
1. In Microsoft Outlook, open an email message you received from the contact.
2. On the Microsoft Outlook Home tab, click **View in ServiceNow**.
   The Outlook add-in panel displays the contact details.

   Note:
   If the contact details are not available, the `No contact was found` message is displayed.

3. **Optional:** If you want to perform other contact tasks, access the contact information in the CSM portal page by clicking the Pop-out icon ( ).

Create a contact in Microsoft Outlook

As an account manager, you can create a contact when you receive an email from a customer whose details aren't in the Microsoft Outlook contacts list.

Before you begin
Role required: sn_customerservice.contact_manager and sn_customerservice.proxy_contact

Procedure
1. Open an email message that you received from the contact.
2. On the Microsoft Outlook Home tab, select **View in ServiceNow**.
   The contact details aren't available and the Outlook add-in panel displays the `No contact was found` message.
3. Select the more actions icon ( ) and select **Create Contact**.
4. Fill in the contact details in the case form and select **Submit**.
5. **Optional:** If you want to perform other contact tasks, access the CSM portal by selecting the Pop-out icon ( ).

View or modify existing cases in Microsoft Outlook

As an account manager, view the five most recent cases related to a Microsoft Outlook contact to understand contact-related issues, modify any case information, and communicate more efficiently with the contact.

Before you begin
Role required: sn_customerservice.contact_manager and sn_customerservice.proxy_contact

About this task
Although you can view or modify existing cases from Microsoft Outlook, you can also access the CSM portal to work on open cases by clicking the pop-out icon ( ).

Procedure
1. Open an email message you received from the contact.
2. On the Microsoft Outlook Home tab, click **View in ServiceNow**.
3. Click **Cases** in the Outlook add-in panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The add-in panel lists the five most recent cases connected to the contact that are not closed. You can load more cases.

4. Click a case to open the case details.
5. Type your message.
6. **Optional:** If you have supporting information such as a message that you want to attach to a case, click the attachment icon ( ) and select the file.
7. Click **Send**.

Result

The newly added message is available in the activity stream.

Create a new case from an email message in Microsoft Outlook

If a customer whose contact details are available sends an email stating an issue, you can easily create a customer service case.

Before you begin

Role required: sn_customerservice.contact_manager and sn_customerservice.proxy_contact

Procedure

1. Open the email message you received from a customer.
2. On the Microsoft Outlook Home tab, click **View in ServiceNow**.
   The Outlook add-in panel opens in the right pane.
3. Click the more icon ( ).
4. Select **Create Case** from the menu.
5. Fill in the case details on the case form.
6. Click **Submit**.

Mobile experience for CSM

Manage customer service cases from a mobile device with the Customer Service Management mobile application. Stay connected and access information in real time to complete tasks quickly.

Customer service agents and managers can use the Customer Service Management mobile application to review case details quickly and complete case tasks. Agents and customer service managers can perform routine actions and approvals effectively any time and anywhere.

Activate the Customer Service Mobile plugin (com.sn_csm_mobile) to use the available features. To use the change request feature, the Customer Service with Service Management (com.sn_cs_sm) plugin is required.

Note:
The Customer Service Management mobile application supports product cases.

For more information, see Activate a plugin.

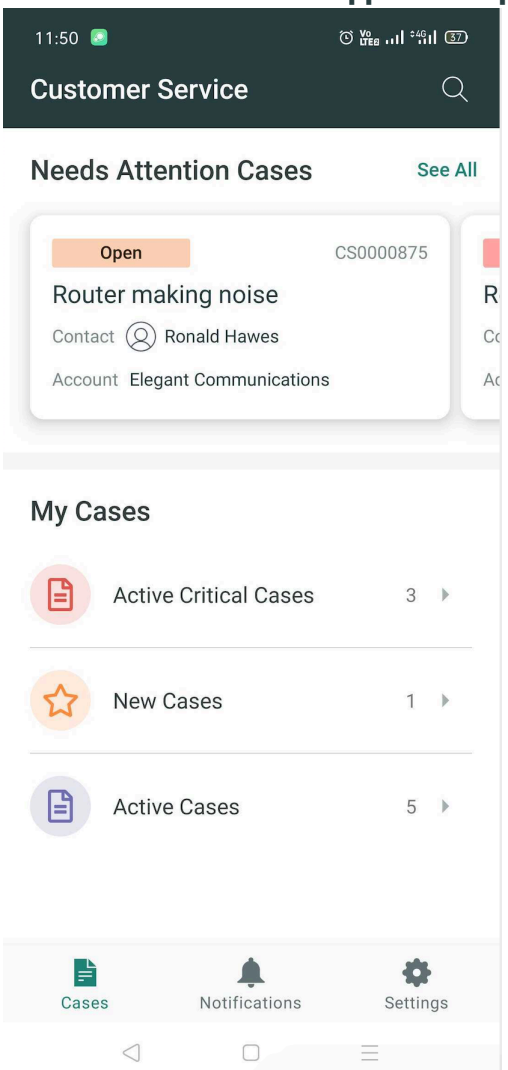
Customer Service mobile application applet launcher for agent



With the customer service agent role (sn_customerservice_agent), you can:

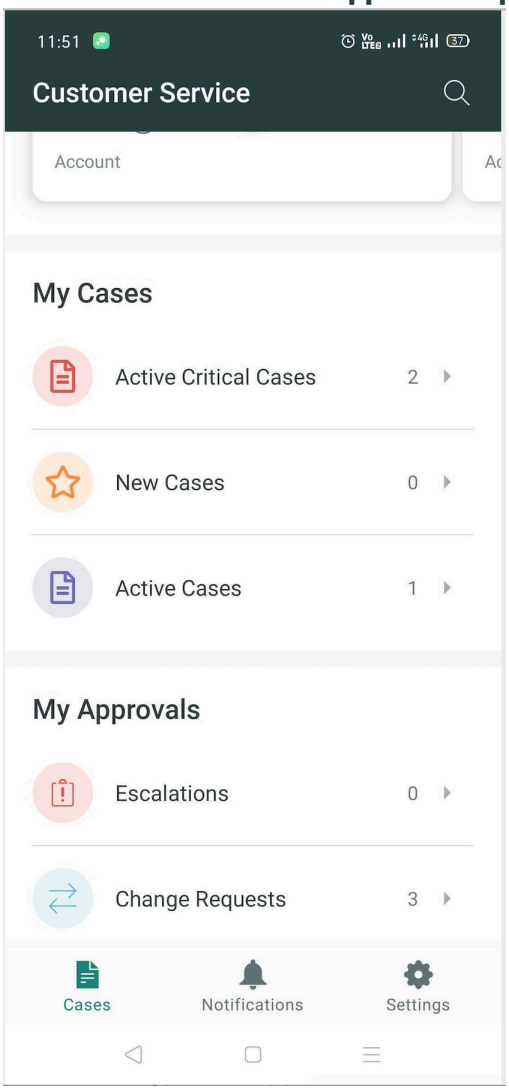
- Get a quick overview of your case load, including new cases, critical cases, and those that need attention.
- Accept and reassign cases.
- Add comments or work notes to cases.
- Review case details, activity stream, and related information such as SLAs, case tasks, and child cases.
- Edit case information such as priority.
- Propose major cases.
- Receive push notifications for assigned or updated cases.
- Search for cases using keywords

With the system administrator role, you can configure the Customer Service Management mobile application in the following ways:

- Configure pages to display the desired data.
- Configure the functions associated with swipe actions and top menu actions.
- Configure and create push notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service mobile application applet launcher for manager



With the customer service manager role (sn_customerservice_manager) you can:

- Search for cases using keywords
- Review and approve change requests
- Approve escalations

Activate the Customer Service Mobile plugin

The Customer Service Management mobile application runs on the ServiceNow® mobile platform.

To use the Customer Service Management mobile application, activate the Customer Service Mobile plugin (com.sn_csm_mobile). This plugin activates the following plugins:

- Mobile Agent Native Client plugin (com.glide.sg.agent_native_client)
- Customer Service (com.sn_customerservice)
- Customer Service Case Action Status (com.sn.csm_action_status)

To provide support for major cases, you can activate the optional Major Issue Management plugin (com.sn_majorissue_mgt).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the Customer Service Management mobile application is activated and configured, agents can download the ServiceNow Agent mobile app on their mobile devices and access ServiceNow instances.

Note:
You can activate the Customer Service Mobile plugin (com.sn_csm_mobile) from the Customer Service Management guided setup.

For more information, see Activate a plugin.

Customer service agents and managers can use the applet launcher and applets in the Customer Service mobile application to view notifications and manage customer service cases.

Applet launchers

Applet launchers serve as landing pages or home pages. When you log in to your instance, you see an applet launcher and the applets configured to display on that launcher. The system administrator configures the applet launcher and applets for the Customer Service Management mobile application.

Navigation bar

The navigation bar appears at the bottom of the mobile application screen. This bar includes the following tabs that you can use to access different applets and application launch pages:

- **Cases**: displays the main case page. Use this applet launcher to access case management functionality.
- **Notifications**: view a list of the notifications that have been pushed to the agent. Tap a notification in the list to see the details, then tap the details open the case.
- **Settings**: manage settings for the mobile application.

Applets and cards

Select an applet from the applet launcher screen. Each applet contains one or more screens used to display records that correspond to the applet function. The Active Cases applet, for example, displays a list of all active case records.

The cases in the list are displayed as cards, with the case status displayed at the top of the card. To use the cards:

- Swipe a card left or right to see the available actions, then tap the desired action.
- Tap a card to see the record details such as activity, related list, and escalations if any.
- In the detail view:
  - Tap the top menu to see additional actions, then tap the desired action.
  - Select the back button to return to the list.

Applets provide a filter option if there is more than one case in the list. When you tap the applet, you see a list of filters that you can use to narrow down the list of cases.

Agent applets

Customer service agents have access to the following set of applets.

Agent applets for My Cases

Applet	Description
My Cases	
Needs Attention Cases	Cases that are waiting for the agent to take action. Includes cases in the Open, Awaiting Info, and Resolved states.
Active Cases	Cases that are assigned to the agent. Includes cases Open, Awaiting Info, and Resolved states.
New Cases	Cases in the New state.
Active Critical Cases	Priority 1 cases in the Open, Awaiting Info, and Resolved states.

Note:
Cases in these lists are sorted by the last updated date in descending order, with the most recent updated case displayed first.

Customer service card layout

In a list view, case cards display the following information:

- Case state
- Case number
- Short description
- Contact
- Account

In the major case list view, case cards display the following information:

- Major case state
- Case number
- Short description
- Account

Case form related lists

Customer service agents can access the following Case form related lists.

Related lists and their descriptions for Case form

Related list	Description
SLAs	Displays a list of SLAs for a case. View the following information for SLAs included in this list:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists and their descriptions for Case form (continued)

Related list	Description
	• Task • SLA Stage • SLA Definition • Actual Elapsed Percentage • Actual Elapsed Time **Note:** Detail view is not available from the SLA related list.
Tasks	Displays a list of case tasks. View the following information for case tasks included in this list: • State • Number • Subject • Assigned to • Priority **Note:** Detail view is not available from the Tasks related list.
Child Cases	Displays a list of child cases for a case. View the following information for child cases included in this list: • Case number • State • Short description • Account • Contact Click a child case to view additional details on the Case form.

Notifications

Agents can receive notifications in the Customer Service mobile application when cases are assigned, are commented, or need attention. The following table lists the available notifications:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications in the Customer Service mobile application

Notification	Description
Case assignment	When a case is assigned to an agent by someone else, a notification is sent to the agent selected in the **Assigned to** field. The notification includes the case number, state, priority, and short description.
Case comments	When information is added to a case in the **Additional comments** or **Work notes** fields by someone other than the assigned agent, a notification is sent to the user selected in the **Assigned to** field. The notification includes the case number, priority, and short description.
Needs attention flag is checked	When the **Needs attention** flag is checked on the Case form, a notification is sent to the agent in the **Assigned to** field. The notification includes the case number, state, priority, and short description.
Case escalation	When an escalation is raised, users who are part of the group that has permissions to approve are notified. The approvers review and approve them.
Change requests	When a change request is raised, users who are part of the group that has permissions to approve are notified. The approvers review and approve them.

Get started with the Customer Service mobile application

Use the ServiceNow Agent mobile app to access the Customer Service mobile application. Then log in to an instance as an agent or manager and work on your customer service cases.

Before you begin

Role required: sn_customerservice_agent or sn_customerservice_manager

About this task

Procedure

1. Depending on your device, go to the Apple App Store or the Google Play Store and download the ServiceNow Agent mobile app.
2. Log in to an instance.
3. Tap **Customer Service** to open the application and display the applet launcher.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Manage your customer service cases based on your role.
   For more information about the agent and manager tasks, see Use mobile application to perform agent and manager tasks.

Related topics

Agent mobile app

Use mobile application to perform agent and manager tasks

Customer service agents manage cases and real-time notifications help in taking immediate action. Customer service managers can approve escalations and perform tasks on major issues with a swipe.

Agents (sn_customerservice_agent) and customer service managers (sn_customerservice_manager) can perform routine actions and approvals effectively anytime and anywhere.

Agent tasks

Agent tasks	Action	Description
Accept a case	Swipe left and tap **Accept**.	Accept a case that has been assigned to you.
Add comments to a case	• Swipe right and tap **Add Comments**. • Tap the top menu and select **Add Comments**.	Add information to the case **Work Notes** or **Additional Comments** fields.
Assign a case to another agent	• Swipe left and tap **Assign**. • Tap the top menu and select **Assign**.	This action is available for unassigned cases. Select to display the **Assignment Group** and **Assigned To** fields and make the assignments.
Assign a case to yourself	• Swipe left and tap **Assign to me**. • Tap the top menu and select **Assign to me**.	Assign an unassigned case to yourself.
Close a case	Tap the top menu and select **Close Case**.	Select to display the **Resolution Code** and **Resolution Notes** fields, which are mandatory fields for completing this action. Enable the check box to add the resolution code to the **Additional Comments** field.
Edit a case	Tap the top menu and select **Edit Case**.	You can edit the following fields in the Case form: • Short description • Account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent tasks (continued)

Agent tasks	Action	Description
		• Contact • Needs attention • Priority • Product • Asset • Assignment group: selecting an assignment group clears the value in the **Assigned to** field. • Assigned to: if a group is selected in the **Assignment group** field, the list of available users belong to that group.
Open a case	Tap the top menu and select **Open Case**.	Open a case and change the state from **Awaiting info** or **Resolved** to **Open**.
Propose a case as a major case	Tap the top menu and select **Propose Major Case**.	Propose a case as a major case candidate. **Note:** This action is available if the Major Issue Management plugin is activated.
Propose a solution for a case	Tap the top menu and select **Propose Solution**.	Select to display the **Resolution Code** and **Resolution Notes** fields, which are mandatory fields for completing this action. Enable the check box to add the resolution code to the **Additional Comments** field.
Reassign a case to another agent	Swipe left and tap **Reassign**.	Available for assigned cases. Select to display the **Assignment Group** and **Assigned To** fields and change the assignments.
Request more information	• Swipe left and tap **Request Info**. • Tap the top menu and select **Request Info**.	Add the request to the **Additional Comments** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent tasks (continued)

Agent tasks	Action	Description
Search for a case using keywords (role: sn_customerservice_agent or sn_customerservice_manager	Enter search keyword in the search bar.	All cases except those in "Closed" state are listed. From the top menu, you can request for information, escalate a case, propose a solution and so on.
Escalate a case (role: sn_customerservice_agent or sn_customerservice.escalation_requester)	Tap the top menu and select **Escalate Case** and fill in the required information.	Enter the following information and click **Submit**. • **Request Source** • **Reason** • **Escalation Severity** • **Escalation Template** • **Escalation Justification**
View escalation	Click **Escalations** tab.	You can view details of the escalation such as escalation justification and the requester's name.
View change request (role: sn_customerservice_agent and sn_change_read)	Click on **Change Request** field on the case form.	The Change Request form view displays details about the schedule, planning, conflicts, and details of the change activity.

Manager tasks

Manager tasks	Action	Description
Approve escalations (role: approver_user) **Note:** Agents with the approver_user role can also approve escalations and change requests.	• Navigate to **My Approvals >Escalations**. • Tap the top menu or swipe left. • Click **Reject** or **Approve**.	• Pending approvals are displayed based on the oldest request. • Click the **Approved** tab to check the escalation you approved. **Note:** When an escalation is raised, users who are part of the group that has permissions to approve are notified. The approvers review and approve them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manager tasks (continued)

Manager tasks	Action	Description
Review and approve change requests (role: approver_user) **Note:** Agents with the approver_user role can also approve escalations and change requests.	• Navigate to **My Approvals>Change Requests** on the case form. • **Approve** or **Reject** the change request that is in Assess state on the Change Requests form.	A change request requires team members or a manager to assess the change request. They evaluate the request and approve or reject. **Note:** When a change request is raised, users who are part of the group that has permissions to approve are notified. The approvers review and approve them.

Install base work plans

You can create an install base work plan on the Customer Service Management application to get the details that are related to an install base item. Work plans help you to create, maintain, and view the basic details of an install base item. You can also plan for the regular and timely maintenance of the install base item.

Overview

A work plan provides the information that you need about the regular maintenance that you must do for an install base item. You can create a work plan for a product model. All the install base items that are associated to that product model inherit the same work plan.

You assign your customer and consumer service agents with the sn_fsm_planned_wm.planned_work_read role so that they can have read access to all the planned work management tables.

You can also create a work plan in the CSM Configurable Workspace. To create a work plan in the workspace, see Create a work plan in Customer Service Management (CSM) Configurable Workspace.

Related lists for work plans

You can perform or view the maintenance operations, like device inspection and performance, for an install base item through the related lists section of the Install Base form. The following table lists the descriptions about the related lists for the work plans.

Work plans related list

Related list	Description
Work plans	Manage the maintenance requirements of an install base item. They include information on how often maintenance must be performed, what the maintenance activities are for the install base, and the order in which they must be performed. To create a work plan, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work plans related list (continued)

Related list	Description
	Create a work plan with Customer Service Management (CSM).
Planned Work Schedules	Gauge the timing and regularity of implementation of a schedule for a work plan. Planned work schedules have triggers like the duration, meter, condition, and script to determine and ensure that the work plan milestones are met. To create a planned work schedule, see Configure a work schedule.
Planned Work Schedule Templates	Describe the planned maintenance activities that must be performed for an install base item and the order in which they must occur. To create a planned work schedule template, see Associate a work order template to a work schedule.
Work Orders	Create work orders for field service agents to perform scheduled maintenance activities for the install base item. To create a work order, see Create a work order. Select the related list from the install base form to create a work order for an install base item. Select the Work order related list from the planned work schedule form to create a work order for a work plan.
Work Order Tasks	Work orders and work order tasks are related and created only if there's an existing work order for the install base item. Fill in the **Parent** field on the work order task form with the name of the work order. To create a work order task, see Create a work order task.

Create a work plan with Customer Service Management (CSM)

Create a work plan so that you can plan and delegate field service agents to fulfill the planned maintenance operations for an install base item on the Customer Service Management (CSM) (CSM) application and CSM Configurable Workspace.

Before you begin

Role required: sn_fsm_planned_wm.planned_work_admin

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Install base item**.
2. Open an install base item.
3. Open the Work Plans related list and select **New**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work plan form on the Customer Service application

Field	Description
Name	Name of the work plan.
Type	Type of trigger that determines when work should be performed: ○ **Model based:** Base the work plan on a specified model of a configuration item (CI). ○ **General:** Base the work plan on a table and filter. ○ **Install base:** Base the work plan on specified models of the install base items. **Note:** ○ Model-based plans apply only to hardware models, specifically ones that have at least one model category defined. ○ The install base plan type is available only if the Customer Service Install Base Management (com.snc.install_base) plugin is activated.
Model	One or more product catalog items that you can select to identify the configuration items (CIs) or install base that requires maintenance. When you select a model, the associated table appears in the **Table** field. For example, if you select a specific PC model, the **Table** field displays **Computer [cmdb_ci_computer]**. This field appears if you selected either **Model based** or **Install base** type. For Install base type, the **Table** field automatically fills in an appropriate table that is based on the selected model.

5. Right-click the form and select **Save**.

Result
A draft of the work plan is created. Next, you can create a planned work schedule to make the work plan active and ready for an agent. To configure a planned work schedule, see Configure a work schedule.

Create a work order

Create a work order to manage your regular maintenance and service requirements for an install base item. You can do this task by using the Customer Service Management (CSM) application.

Before you begin
Role required: sn_customerservice_agent and sn_customerservice.consumer_agent

About this task
A work order is a request for off-site work. You can create a work order for a new or an existing work plan so that you can assign work order tasks to field service agents. Users with the sn_customerservice_agent and sn_customerservice.consumer_agent roles can create the work orders and provide the information that is needed for the fulfillment of the work order tasks. If the scope of an existing work order changes during the planned maintenance stage, you can create a work order for an existing work order.

Procedure
1. Navigate to **All** > **Customer Service** > **Products** > **Install base item**.
2. Select an install base item record.
3. From the related list, select **Work Orders** and then select **New**.
4. On the Work Order form, enter the short description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Install base item** field is automatically filled in because the work order is created directly through the install base form.

5. Select **Submit**.

   A work order for the install base item is created and appears in the Work Order related list on the install base form.

   All work orders that are associated with a child install base item also appear in the work orders section of the parent install base form.

Automate and optimize

Enhance the efficiency and effectiveness of your ServiceNow® Customer Service Management platform with automated workflows, AI-powered chatbots, predictive analytics, and data analytics and reporting.

Automation and optimization applications

Topic	Description
Using Virtual Agent in Customer and Consumer Service Portals	The ServiceNow Virtual Agent platform offers user assistance through an intelligent messaging interface that helps you to deliver conversational support when integrated into your Customer and Consumer Service Portals.
Using Proactive Customer Service Operations	Monitor your customers' products and services to identify issues proactively, inform the affected customers, and fix issues quickly.
Task Intelligence	Use the Task Intelligence features to create field prediction and sentiment models, review and submit values extracted by Document Intelligence, and review task intelligence analytics and prediction history.
Guided Decisions	• Use Guided Decisions in playbooks to resolve cases- As an agent, work your way through a decision tree in a playbook to help troubleshoot a case and get recommendations on the next possible steps in solving the case. • Use Guided Decisions in recommended actions to resolve cases- As an agent, work your way through a recommended action of type decision tree to help troubleshoot a case and get recommendations on the next possible steps in solving the case.
Recommended Actions for Customer Service	Using the Recommended Actions application- Through the Recommended Actions application, use the recommended actions

Automation and optimization applications (continued)

Topic	Description
	of type guidance and guided decision tree in your workspace to resolve cases quickly. Use the field recommendation to get recommendations on the field values. Use the AI search option to search the relevant resources from various sources.
Playbooks for Customer Service Management	Using Playbooks for Customer Service Management- • Customer service agents can use playbooks to complete the tasks and activities that are needed to resolve specific types of cases. • Playbooks provide step-by-step guidance through the lifecycle of a customer service case. • Playbooks include multiple stages and each stage includes one or more activities for an agent to complete.

Using Virtual Agent in Customer and Consumer Service Portals

The ServiceNow Virtual Agent platform offers user assistance through an intelligent messaging interface that helps you to deliver conversational support when integrated into your Customer and Consumer Service Portals.

Integration of Virtual Agent

Virtual Agent is a conversational bot platform that uses a messaging interface to provide user assistance. When integrated with your portal, it helps automate customer interactions and streamline tasks on your Customer and Consumer Service Portals. It builds automated conversations with a base system that helps your users quickly obtain information, make decisions, and perform common work tasks with Virtual Agent.

With Virtual Agent, you can offer continuous support, improve response times, and ease the workload on your customer service team.

Activation

Virtual Agent activates automatically when you enable it for Customer Service Management (CSM). Once activated, by default it integrates seamlessly with your CSM and CSP portals. For more information, see Activate Virtual Agent for Customer Service Management.

Now Assist in Virtual Agent in self-service portal

Integrate the Now Assist in Virtual Agent in Virtual Agent with Customer and Consumer Service Portals to enable generative AI skills in your conversational experiences. It helps create a natural-language conversational experience that can improve the success of your self-service workflows.

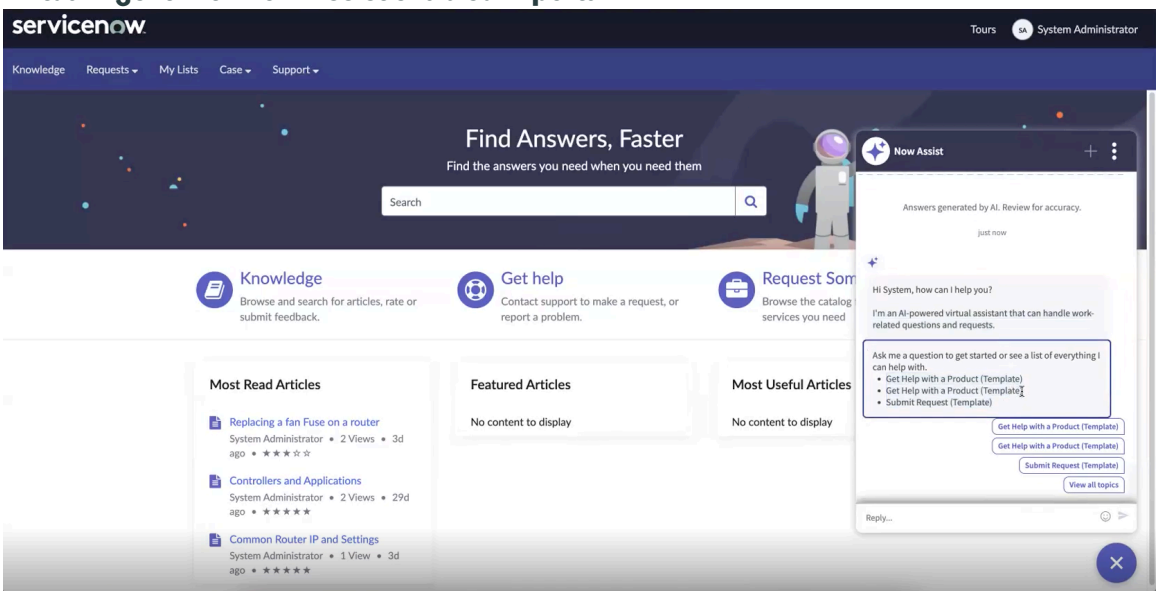
Now Assist benefits in self service Portals

The key benefits of adopting Now Assist in Virtual Agent for your portals include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Conversational responses: Now Assist in Virtual Agent uses large language models (LLMs) to deliver natural-language responses, making interactions more human-like and improving user satisfaction.
- Improved self-service: It helps improve productivity and efficiency by providing faster answers and recommended actions.
- Enhanced search: Enhances search capabilities by guiding users through more refined, AI-driven searches, helping them locate the information they need with greater accuracy and efficiency. Users can also search for public content in the Now Assist in Virtual Agent and get the search results. The source of the search results are available as internal or external with the links to it.

Virtual Agent with Now Assist enabled in portal



Getting started with Now Assist in Virtual Agent in Customer and Consumer Service portals

Understand the Now Assist in Virtual Agent in Customer and Consumer Service Portals.

- To enable Now Assist in Virtual Agent in your portals, verify that the Now Assist in Virtual Agent experience is configured by virtual_agent_admin or admin. For more information, see Configuring assistants overview.
- In the **Display experience** tab, remember to select **Customer Service for Customer Service Portal** or **Customer Support for Consumer Service Portal** from the **Portals** tab and select the Chat widget.
- In the **Information Sources** tab, you can also control the specific information available to the assistant. You can create or select the **Copy existing configuration** and select the search profile CSM Portal Default Search Application for CSM or CSP Portal Default Search Application for CSP.

> **Note:**
> Each assistant comes with its own search configuration. For a smooth experience, if the assistant appears on a portal or mobile app that already has AI search configured, consider duplicating that setup to maintain consistency.

© 2026 ServiceNow, Inc. All rights reserved.

Using Now Assist in portal case form

Guide requesters through a self-service flow to find solutions to their problems using Genius Results and reduce the number of cases created.

A guided flow enhances the user experience by assisting requester who is facing issues and are about to create a case. It helps them find solutions through genius results, thus reducing the number of cases created and the effort required by agents to close open cases.

- As a requester, you can enter your details and receive the results as part of your case creation process.
- As a requester, you can continue with the case creation even if the results don't load and create a case.
- As a requester, you can see the results on the same page until you submit the form or cancel the flow.

Note:
This record producer is available for the Customer Support portal (CSM).

Guided Flow for Case Creation

1. Enter Your Details:
   - Navigate to **Request Something** > **Support** > **Create case for a product (*Now Assist*)**.

     Note:
     Verify that AI search in portals is activated. For more info, see Enable and configure AI Search in Service Portal

   - A single Subject field appears. Start entering your issue, and genius results, sources, related catalog items, and knowledge articles are displayed under related content.

     Note:
     You can also search for public content in the portal and get the search results from within the *Now Assist* genius result. The source of the search results is available as internal or external with the links to it.

2. Review Results:
   - If no genius results are found, related content is shown.
   - If no results are found, a message appears: There's not enough description for AI to find the results. Try using different keywords or another sentence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Genius result configuration: The behavior of Now Assist results depends on the selected genius result configuration.

- When configured for Now Assist Q&A, the system generates a direct answer based on your query and displays relevant sources below the response.
- When configured for multi-content response, the system follows the same response flow as Q&A and includes additional features for displaying multiple content types in a single result.
  - Response text includes the inline citations that correspond directly to the sources listed in the **Sources** section. The citations appear as numbered references — for example, [1] and [2] — and map to sources in the order they appear in the list. You can select a source to view the referenced content.
  - You can access the Virtual Agent chat interface by selecting the chat icon under **Sources**. The Virtual Agent provides contextual follow-up questions to help resolve requests. Ensure that **Now Assist Actions** genius result configuration is setup to see this.

3. Take Action:
   - If you find a solution to your query, select the **Cancel** button to return to the home page.
   - If no results are found or you're not satisfied with the result, select the **Ask** *Now Assist* button, to open a contextual chat window in the Now Assist in Virtual Agent for additional help.

     Note:

     Enable enhanced chat experience from the Now Assist in Virtual Agent guided setup for the feature to work. For details, see Display your chat assistant on a portal, channel, or mobile app.

   - If no relevant results are found, select **Continue with case creation** to proceed. This action enables the **Submit** button and shows the additional fields needed to complete the case form.
   - Select **Submit** to create a record case.

This guided flow helps you find solutions faster, improves the user experience, and reduces case creation and agent effort.

Update the service portal chat configuration

Configure the Now Assist in Virtual Agent chat configuration to ensure Now Assist in Virtual Agent loads on your Customer and Consumer Service Portals when CSM chat is enabled.

Before you begin
Role required: workspace_admin

Procedure

1. Navigate to **All** > **Service Portal** > **Agent Chat**.
2. To configure Now Assist in Virtual Agent loading on your Customer Service Portal:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Service Portal Agent Chat Configuration page, select **Now Assist in Virtual Agent - CSM Chat Config** in the **Name** column.

b. On the form, enter a value in the **Order** field.

> **Note:**
> To display Now Assist in Virtual Agent chat configuration prominently on the portals, set the **Order** value to be either lower or better compared to the old CSM chat configuration.

c. In the script box, replace the current script with the following script.

```
(function($sp) {
 var configObj = {portal: $sp.getValue('url_suffix')},
  isVAActive =
 GlidePluginManager.isActive('com.glide.cs.chatbot');

 configObj.liveagent_application = 'csm';
 configObj.live_agent_only = !isVAActive;
 configObj.liveagent_queue =
 $sp.getDisplayValue('sp_chat_queue');

 var cc = new GlideRecord('customer_contact');
 cc.addQuery('sys_id', gs.getUserID());
 cc.query();
 if (cc.next()) {
  configObj.liveagent_interaction_contact =
 cc.getUniqueValue();
  configObj.liveagent_interaction_account =
 cc.getValue('account');
 }

 if (gs.isLoggedIn() &&
 GlidePluginManager.isActive('com.sn_csm_b2b_consumers')) {
  var consumer = new GlideRecord('csm_consumer');
  consumer.addQuery('user', gs.getUserID());
  consumer.query();
  if (consumer.next()) {
   var accounts = new
 sn_acct_consumer.AccountConsumerUtil().getAccountFromConsume
r(consumer.getUniqueValue());
   if (accounts.length > 0) {
    if (accounts.length == 1) {
     configObj.liveagent_interaction_account = accounts[0];
    }
    configObj.liveAgent_interaction_consumer =
 consumer.getUniqueValue();
   }
  }
 }

 return configObj;
})($sp);
```

d. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To configure Now Assist in Virtual Agent on your Consumer Service Portal:

   a. On the Service Portal Agent Chat Configuration page, select **Now Assist in Virtual Agent - CSP Chat Config** in the **Name** column.

   b. On the form, enter a value in the **Order** field.

   > **Note:**
   > To display Now Assist in Virtual Agent chat configuration prominently on the portals, set the **Order** value to be either lower or better compared to the old CSM chat configuration.

   c. In the script box, replace the current script with the following script.

```
(function($sp) {
 var configObj = {portal: $sp.getValue('url_suffix')},
  isVAActive =
 GlidePluginManager.isActive('com.glide.cs.chatbot');

 configObj.liveagent_application = 'csm';
 configObj.live_agent_only = !isVAActive;
 configObj.liveagent_queue =
 $sp.getDisplayValue('sp_chat_queue');

 if (gs.isLoggedIn()) {
  var consumer = new GlideRecord('csm_consumer');
  consumer.addQuery('user', gs.getUserID());
  consumer.query();
  if (consumer.next()) {
   configObj.liveAgent_interaction_consumer =
 consumer.getUniqueValue();
  }
 }

 return configObj;
})($sp);
```

   d. Select **Update**.

Result
Now Assist in Virtual Agent configuration takes precedence over the standard Virtual Agent chat configuration for the portal.

Now Assist conversational experience in self-service portals

Learn about the Now Assist enhanced chat feature in the Self-service portals.

Now Assist enhanced chat is a conversational support experience within a dynamic window that also includes the ability to have multiple active conversations and superior search capabilities.

You can enable enhanced chat experience from the Now Assist in Virtual Agent guided setup. For details, see Display your chat assistant on a portal, channel, or mobile app.

Enhanced chat experience on self-service portal

Refined portal header

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamically displays content based on the assigned taxonomy tags.

Effortless navigation

Easily navigate to topics and their subcategories in one place, providing a seamless navigation experience.

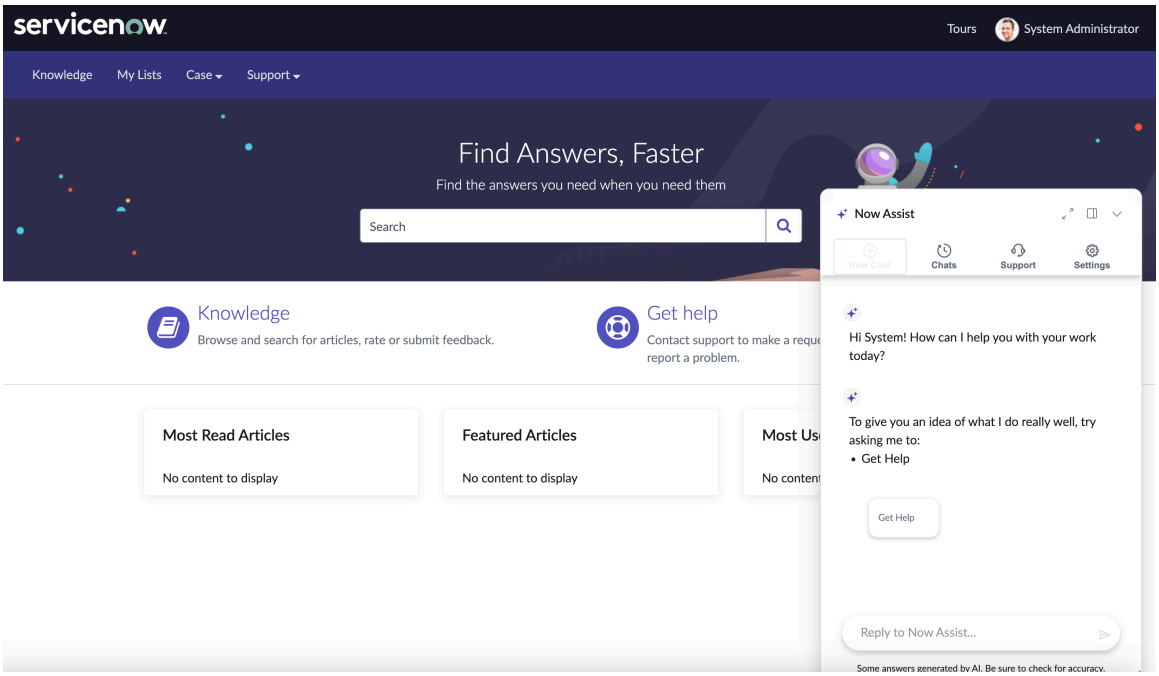
Multiple chats

Engage in multiple chat conversations instead of the existing single active conversations in the Virtual Agent.

Redefined theme

The new theme is visually appealing, engaging, and user-friendly, with a focus on enhancing productivity.

Enhanced chat with Now Assist in Portals



Search experience

When you search for information using the Now Assist enhanced chat on your self-service portals, you receive comprehensive and detailed answers compared to the traditional AI search.

Unlike the traditional AI search page, the Now Assist enhanced chat helps you find the information you need and combines them into a synthesized comprehensive answer. It searches information from KB articles, external content, Virtual Agent topics, catalog items, and people citations.

The search results include links to the sources of information and related actions. When you select the citation, different information is displayed depending on the type of source.

Using Proactive Customer Service Operations

Monitor your customers' products and services to identify issues proactively, inform the affected customers, and fix issues quickly.

There are various different roles required for Proactive Customer Service Operations based on the tasks you perform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Some tasks only apply if you are using Event Management integration on CSM Agent Workspace or the ServiceNow AI Platform interface. This is noted at the top of each task.

Roles required

Role	Tasks
evt_mgmt_admin, evt_mgmt_operator **Note:** These roles only apply if you are using the integration with Event Management.	Create alerts and proactive cases from alerts.
sn_customerservice_agent	Propose proactive cases as major case candidates, work on, and close proactive cases.
sn_customerservice_manager	Review and accept a proactive case as a major case and create child cases. Associate outages to cases or create an outage for a case. Track Key Performance Indicators (KPIs) to understand how proactive the team was in identifying and communicating issues that impact customers. For more information, see Proactive Customer Service - Advanced dashboard.
sn_majorissue_mgt.major_issue_manager	Create proactive cases. Review and accept proactive cases as major cases and create child cases. Associate outages to cases or create an outage for a case.

Create a proactive case from an alert

Create a case for customer install base affected by an alert to anticipate customer issues and address them proactively.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Note:
This task only applies if you are using Event Management integration on CSM Agent Workspace or the ServiceNow AI Platform interface.

A proactive case is a case created on behalf of customers, whose install base is directly affected by an alert. You can open a proactive case manually or through automation. Customer service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

agents then work on cases. From the Alert form, you can also track the install base items affected by the alert.

If the **Create Proactive Case** rule is enabled, a case is automatically created when an incident is created from an alert and the system has determined that there are external customer install base items affected. For more information, see Activate an alert rule to automatically create a proactive case from an alert.

ITOM Event Management calculates the services (CIs) impacted by an alert and populates the em_impacted_ci_table with the impacted services (CIs) and alert CI on the given alert.

The Affected Install Base related list on the Alert form displays the install base items that are linked to the impacted services (CIs).

The **Refresh Affected Install Base Items** button on the Alert form recalculates the impacted services (CIs) and updates the em_impacted_ci_table and affected install base items with the latest changes. For more details, see Alert Impact Calculation.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home** > **Lists** > **All Alerts**.
2. Click an alert that you want to create a case for.
3. To trace the install base items affected by the alert, click **Refresh Affected Install Base Items**. These items are listed in the Affected Install Base Items related list on the Alert form. The **Affected Install Base Items** list is not updated automatically, so refresh the install base items each time you open an alert.
4. Click **Create Case**.

   Note:
   If you don't see the **Create Case** option, click **...**.

5. Fill out the **Short Description** and other fields, as required.
6. Click **Submit**.
   A proactive case is created and the case number is added to the **Case** field on the Alert form.

   Case priority is set based on the severity of the alert. Customer service agents can then take action accordingly.

Case priority based on alert severity

Alert severity	Case priority
Critical	Critical
Major	High
Minor	Moderate
Warning	Low
Info	Low

Manage a proactive case created from an alert

Work on a proactive case and resolve the proactive case as you would other customer service cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- sn_customerservice_agent
- evt_mgmt_admin and evt_mgmt_operator have read-only access to a case created from an alert and can add work notes, as required.

About this task

Note:
This task only applies if you are using Event Management integration on CSM Agent Workspace or the ServiceNow AI Platform interface.

Review proactive cases created from alerts using Agent Workspace. Identify customers, their corresponding install base items affected by the issue causing the alert as well as the service health for each affected install base item. Depending on the number of customers affected, you can propose a proactive case as a major case.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home** > **Lists** > **Cases**. Alternatively, accept a proactive case from your Agent Workspace inbox.
2. Click the case you want to work on.
3. You can perform the following actions from the Case form.

Case form

Action	Description
Click **Refresh Install Base Health**.	Update the health status of the affected install base items to see the real-time service status of the account's install base items. **Note:** To see this UI action, there must be an account assigned to the case and at least one install base item attached to the case or account.
Click **Affected Install Base Items**.	View accounts and their corresponding install base items affected by the alert. If you don't see this option, click **more**.
Click **Add** or **Remove**.	Add or remove an affected install base item.
Click **Details**.	View the sold product associated to the case as well as the alert that the case was created from.
Click **Propose Major Case**.	Propose a major case when multiple customers are affected. **Note:** If you don't see this option, click the More UI Actions icon (⋯).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Resolve and close proactive cases in the same way as other customer service management cases.

> **Note:**
> If an alert is closed, a case is not automatically closed.

Review and accept a proactive case as a major case

Review and accept proactive cases as major cases using the major issue management process.

Before you begin
Role required: sn_majorissue_mgt.major_issue_manager or sn_customerservice_manager

Procedure

1. Open your workspace.
2. Navigate to **Major Issue Management** > **Candidates**.
3. **Optional:** Click **Major Case Information** > **Affected Customers** to view the automatically generated list of customers affected by the issue.
4. **Optional:** Click **Create Child Cases** to create a child case for each affected customer.
5. Accept or reject the proactive case as a major case.
6. Follow the major issue management process to resolve the proactive case.

> **Note:**
> If the Proactive Customer Service Operations with Event Management plugin is activated, your system administrator may have configured workflows to automate the creation of major cases depending on the number of accounts affected by an issue. If your system administrator has configured workflows, major cases are created in either **Accepted**, **Proposed**, or **Created** state depending on the settings. If **Accepted**, child cases are automatically created.

Related topics

Track the service health of install base items in Agent Workspace

Track the operational status of install base items belonging to an account, to better correlate customer issues and provide faster responses.

Before you begin
Role required: sn_customerservice_agent or sn_customerservice_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The service health status provides you with visibility into the service health of a customer's install base items. The service health status is based on the severity of the impacted services being monitored at the Network Operations Center. Refresh the service health status on the Account and Case forms to access the real-time health status of install base items.
As a customer service agent, you can view the service health status of install base items in a case or a customer account.

Procedure

1. Open your workspace.
2. Navigate to **Lists**.
3. Click an account or a case.
4. To refresh the health status of install base items on both the Account and Case form, click **Refresh Install Base Health**.
5. To view the health status of an install base item on the Account form, click the **Install Base Items** related list.
6. To view the health status of an affected install base item on the Case form, click the **Affected Install Base Items** related list.

Service health status for install base

Associate an outage to a major case

Associate an outage with a major case to keep customers informed about any issues affecting their install base items.

Before you begin

Role required: sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task

If there are any existing outages for services (CIs) on install base items related to the case, a message is displayed at the top of the screen. Review the outages and add them to the case to expose the information to customers and keep them up to date on any issues that might affect their install base items.

Procedure

1. Open your workspace.
2. Navigate to **Major Issue Management** > **All**.
3. Select the major case that you want to add outages to.
4. On the **Outages** related list, select **Edit**.
   A filter displays the outages. Only those outages related to at least one of the services (CIs) for the install base items in the case is displayed. In this case, a CI is typically a service being used by the customer.
5. Add the outages that you want to associate with the case.
6. Select **Save**.
   - The outage is associated with the case and the work notes are updated accordingly.
   - Customer service agents can view the outages for a case in the Outages related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an outage from a major case

Create an outage from a major case to keep customers informed about any issues affecting their install base items.

Before you begin
Role required: sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task
If no outages exist, you can also create outages directly from a major case to inform affected customers.

Procedure

1. Open your workspace.
2. Navigate to **Major Issue Management**.
3. Create a major case or select an existing major case with no outages associated with it.
4. Select **Create Outage**.

> **Note:**
> You can only create an outage from a case if there are no outages already associated with it and there is at least one affected install base item associated with the case. You can't create an outage on a child case.

5. Fill out the fields on the Outage form, as required.
6. Select **Submit**.
   All services (CIs) associated with the install base items in the case are associated with the outage as **Affected CIs**.

Track outages for install base items

View outages associated to a case to keep customers informed about any issues affecting their install base.

Before you begin
Role required: sn_customerservice_agent

About this task
Outages can be tracked using both proactive cases and customer-reported cases.

Procedure

1. Open your workspace.
2. Click **Lists**.
3. Click a proactive case.
4. Click the Outages related list to view all outage information related to the case.

> **Note:**
> If the Outages related list isn't displayed, click **more**.

Use Task Intelligence for Customer Service

Use the Task Intelligence features to create field prediction and sentiment models, review and submit values extracted by Document Intelligence, and review task intelligence analytics and prediction history.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Task Intelligence Admin Console to create models and Document Intelligence use cases:

- Create a model to predict record fields
- Create a model to predict case sentiment
- Create a model to detect case language
- Create a Document Intelligence use case

You can also use Task Intelligence features to complete the following tasks:

- Review and submit values predicted by Document Intelligence
- View Task Intelligence Analytics
- View Task Intelligence prediction history

Related information

For more information about Task Intelligence for Customer Service, see the following topics:

- Task Intelligence for Customer Service
- Configure Task Intelligence for Customer Service

Review and submit values predicted by Document Intelligence

Agents can extract, validate, and update the key values from valid attachments in the case using the Document Intelligence interface.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, sn_csm_ml_task.ti_admin

About this task

The task definition includes an extraction mode that determines how the system handles the extracted values: straight through processing, auto-fill, or recommendations. Regardless of the extraction mode, agents can view valid attachments in the Document Intelligence interface and confirm or correct the values.

Procedure

1. Open a case in CSM Configurable Workspace.
2. Select **Review in DocIntel** to open the Document Intelligence workspace in a separate tab and view the attachments and extracted values.
   In this tab:
   - Attachments appear in the list of attachments on the left side of the tab.
   - An image of the selected attachment appears in the center of the tab.
   - Extracted fields appear in a list on the right side of the tab.
3. Select an attachment to view an image of that attachment in the center of the tab.
4. Review the extracted fields and confirm or correct the values.
   a. If a value for a field is correct, select in the field and press Enter to confirm.
   Confirmed values have a blue check mark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. If a value for a field isn’t correct, select in the field, select the correct value from the drop-down list, and press Enter.

c. If a value for a field isn’t correct and the correct value doesn’t appear in the drop-down list, select the more actions button next to the field and select **Missing in this document**.

5. Select **Submit** to add these values to the fields on the Case form.

View Task Intelligence Analytics

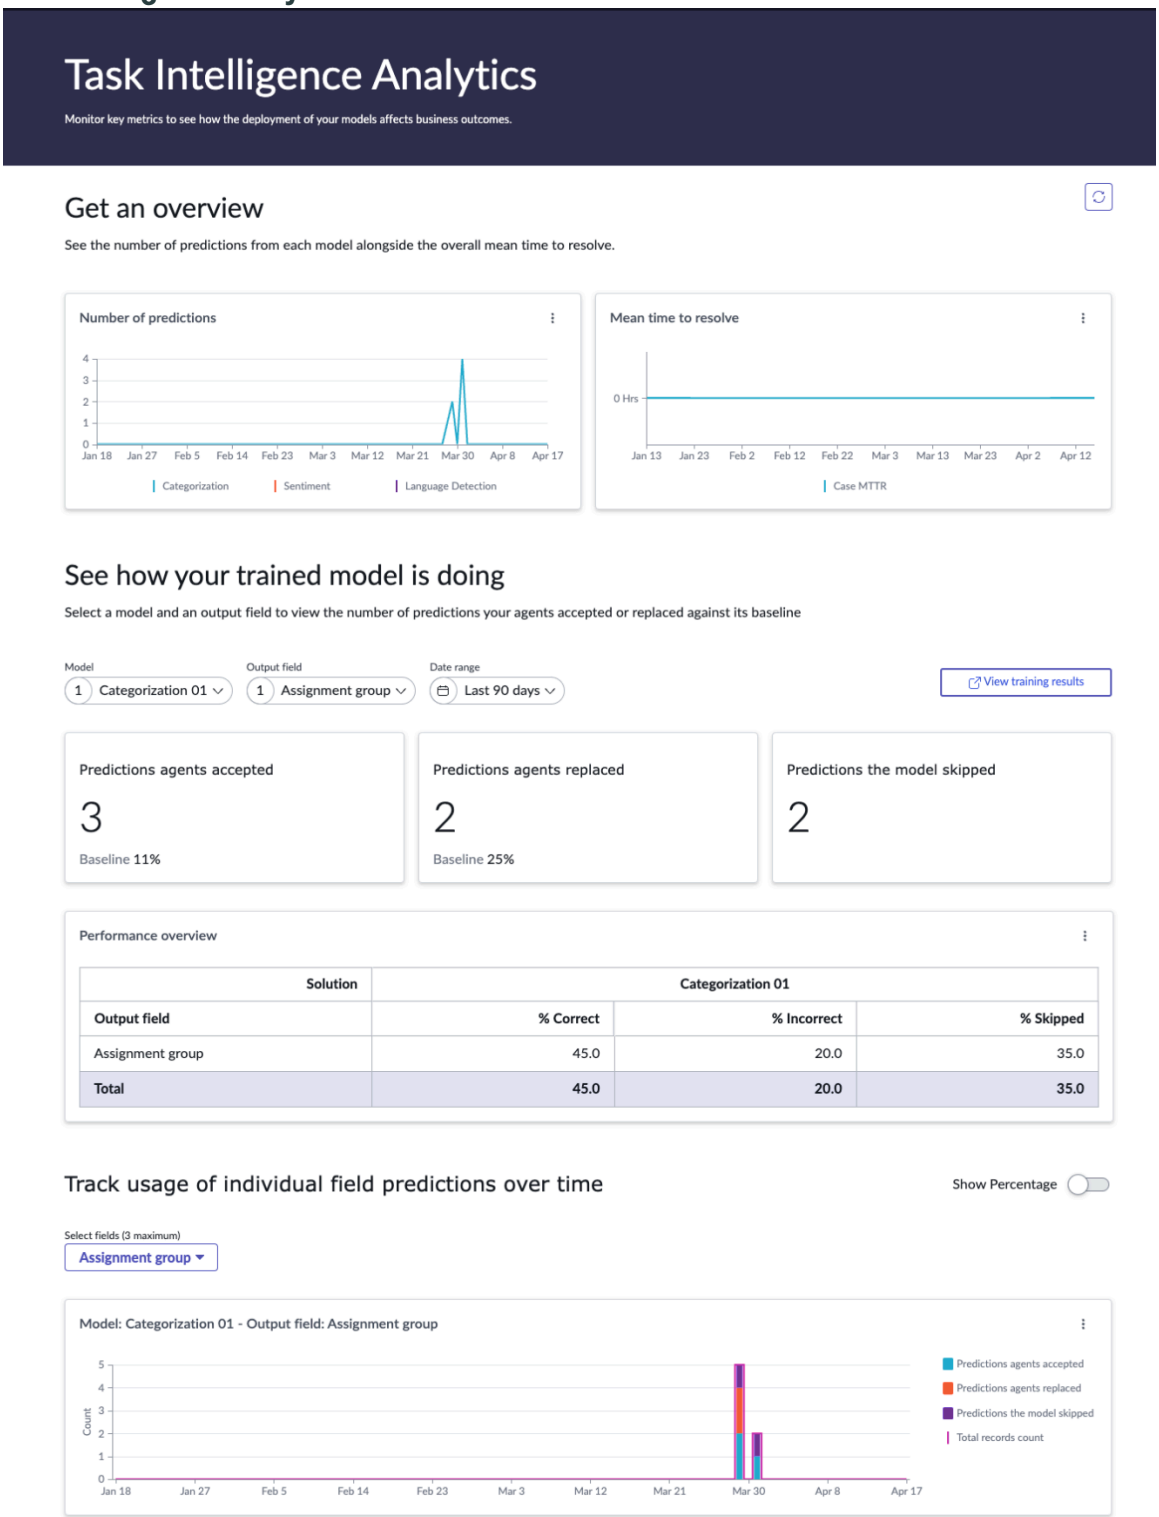
View the Task Intelligence for CSM Analytics dashboard to monitor the model performance over time, track the business value, and see what predictions your agents did or didn't use.

The dashboard uses visual representations to provide you with an overview of how each model is performing. You can see the number of predictions from each model and the overall mean time that it takes to resolve the cases in your organization.

The following example shows the Get an overview and See how your trained model is doing sections within the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task Intelligence Analytics dashboard



Get an overview

The dashboard contains visual representations that provide you with the business value of the model.

Number of predictions

The line graph shows the number of correct predictions that agents have accepted over time for all the categorization models combined. If the sentiment and language models are activated, the correct predictions for those models are shown as well. As

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the model continues to learn, it can increase the number of predictions that agents accept.

Mean time to resolve (MTTR)

The line graph shows the average amount of time that it takes to resolve cases over time. As the model makes more predictions, the MTTR should decrease as the predictions help your agents.

The Task Intelligence Analytics page includes the following data about the predicted fields and how they impact your business:

- The number of predicted fields.
- The number of predictions that agents used.
- The number of predictions that agents changed.

See how your trained model is doing

The dashboard uses visual representations to help you monitor the utilization of predictions by the model over time. By selecting a specific model and output field, you can view the number of predictions that were accepted or replaced by the agent and compare them to the baseline.

Predictions agents accepted

The widget shows the correct predictions that your agents used during case management over time. If this number is trending downward, you can look to retrain your model.

Predictions agents replaced

The widget shows the incorrect predictions that your agents removed during case management over time. If this number is trending upward, you can look to retrain your model.

Predictions the model skipped

The widget shows the number of predictions that were skipped by the model based on the model, output field, and date range selection.

Performance overview

The performance overview table shows the mean percentage values for correct, incorrect, and skipped data for each combination of model and output field.

Track usage of individual field predictions over time

The bar chart tracks the usage of the individual field predictions over time. Each bar in the chart shows three components, which are the predictions accepted, the predictions replaced, and the predictions that were skipped by the model. A red outline around each bar represents the total number of records for each day. To compare specific components, navigate to the legends and deselect the ones that you don't want to include so that you can have a more customized and focused comparison based on user preferences. By default, the view displays the number of predictions. However, you have the option to switch to the percentage view by toggling the **Show Percentage** option. In the percentage view, you can also access the information about the baseline that was replaced and accepted, which is derived from the training data. This option enables you to gain insights into the performance of the model with the baseline.

Track usage of model predictions over time

The bar chart monitors the usage of the model over time and is similar to the bar chart in the “Track usage of individual field predictions over time” data. The field selections enable users to compare predictions over time across a maximum of three fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When you refresh the page, the configurations, model selection, fields, usage type, and Show percentage toggle selection are retained.
- The Model and Output field options support multi-select functionality so that you can compare the average number of training records and analyze how your agents use the predictions of different models. When multiple models are selected, the Compare how agents used models' predictions section enables your agents to compare the selected models across different usage types. The chart also supports toggling between the count and percentage. It also displays the baselines for accepted and replaced predictions when you're using the percentage model.

Using Task Intelligence analytics

Navigate to **All** > **Task Intelligence for Customer Service** > **Monitoring** to access the Task Intelligence Analytics page.

You can view the analytics for all of your models or each individual model. To select a model, do the following actions:

1. Select **Model** to access analytics for an individual model.
2. Select a model from the list of models that have been created from the Task Intelligence Admin Console.
3. Select **Apply**.

To clear the selected model, select **Model** and then select **Clear**.

View Task Intelligence prediction history

View details about historical predictions in the Predictor Result [ml_predictor_results] table.

The Predictor Result table includes entries for each prediction result, including the predicted language, predicted and actual values, and prediction confidence. You can use the data in this table to monitor model performance.

Note:
Records are created in the Predictor Result table regardless of the model prediction behavior, including the Testing behavior that doesn't add prediction values to the case.

Viewing prediction data

Navigate to **All** > **Task Intelligence for Customer Service** > **History** to view the Predictor Result list.

Users with the following roles can access the **History** module:

- Task Intelligence admin [sn_csm_ml_task.ti_admin]
- Customer Service manager [sn_customerservice_manager]

Categorization feedback captures values when the status of a case changes to Closed. It captures these values if:

- Case categorization is active.
- The predicted field value is different from the case field value.

Categorization feedback works for record categorization solutions and for solutions with and without attachments. Email categorization solutions are trained using data from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email [sys_email] table. Case categorization solutions are trained using data from the Case [sn_customerservice_case] table or from tables that extend the Case table. Interaction categorization solutions are trained using data from the Interaction [interaction] table.

Categorization feedback is triggered by a flow.

- When email information is used for prediction, the final input values remain empty.
- When attachment information is used for prediction, the attachment sys_ids are not included in the final input values.

Categorization feedback stores the following values in the Predictor Result table:

- Predicted Output Value Name
- Predicted Input Value Names
- Predicted Output Value
- Predicted Input Values
- Final Input Value
- Final Output Value
- Predicted Confidence (percentage)

If the values for a case have been predicted using an email categorization solution:

- The Final Input Value remains empty because it is not expected that the agent will modify the values of the email, such as subject and body.
- The final value in the Predicted Output Value is stored in the Final Output Value once the case is closed.

If the values for a case or interaction have been predicted using a record categorization solution:

- The values from the fields defined in Predicted Input Value Names are stored in Final Input Value.
- The final value in the Predicted Output Value is stored in the Final Output Value once the case is closed.

Email sentiment replies

Duplicate entries can be posted in the Predictor Result table for email sentiment replies. To help prevent these duplicate entries, deactivate the *`Predict Sentiment for Cases`* inbound email action. For more information, see Inbound email actions.

View prediction on field change

Agents can use Task Intelligence to predict values for configured fields before a case is created and after a case is created.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, ti_admin

About this task

When you create a case or after a case is created, the Task Intelligence feature predicts values for the configured fields based on the short description or description.

Note:

- If you update the case, the values for these fields are not predicted again.
- View prediction on field change is also available for interaction records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a case.
2. Enter information in the **Short description** or **description** field and then tab to the next field. Based on this information, the system predicts the values for configured fields without saving the case form.

   Note:
   If the system cannot predict values based on the short description, these fields remain blank.

3. **Optional:** Change the values in the predicted fields if needed or enter values for fields where Task Intelligence has skipped prediction.

   (Optional) The system does not overwrite user-entered values for the predicted fields.

4. Select **Save**.
   The data is saved in the record and persisted in the predictions table. A message is displayed to the agent indicating that the fields may have been modified, prompting them to save the revised predictions.

View similar case recommendations

The similar case recommendation feature allows customer service agents to quickly find similar cases that can provide helpful information about a current case. This feature can also provide recommendations about cases that may be related to major issues.

By performing a contextual search based on a case's short description, the system generates a list of similar records. This provides agents with a list of cases that are similar to the current case. These similar cases may provide helpful details or resolution information for the current case. Task Intelligence can also suggest potential major issues and major cases.

With the similar case recommendation feature, customer service agents can:

- Identify cases similar to the current case.
- Copy resolution notes from resolved cases to the current case.
- Link the current case to a similar case.
- View a list of open and resolved cases similar to the current case and submit the current case as a major case candidate. Three similar open and resolved cases are displayed in the list of results.
- View one or more similar major cases, that are displayed first in the list of results. Agents can use an available action and link the current case as a child to a major case.

When using these similarity models in the workspace, the agent can open a case record, select the **Recommendations** tab in the contextual side panel, and then select the **Suggested actions** sub tab to see the following:

- One for propose major case and one for similar major case card (if enabled).
- Up to three similar open case cards (number of cards displayed is customer configurable).
- Up to three similar resolved case cards (number of cards displayed is customer configurable).

Order of cards displayed in Suggested actions:

- Similar major case (if there is a major case)
- Propose major case

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Similar resolved cases
- Similar open cases

Actions on cards:

- Propose major case: The current case is proposed as a major issue.
- Copy resolution notes: Copies resolution nodes from similar case to current case (does not copy resolution code).
- Link case: The current case is linked as a child of the similar case.

Any changes made to the current case and saved will trigger a refresh of the recommendations, checking for both new and obsolete recommendations.

Plugins: The configuration for the similar case recommendation feature is included with the Customer Service plugin (com.sn_customerservice). The similar case recommendation feature has a dependency on Major Issue Management – activate the Major Issue Management plugin (com.sn_majorissue_mgt).

For more info, see Similar case user actions

Use Guided Decisions in playbooks to resolve cases

As an agent, work your way through a decision tree in a playbook to help troubleshoot a case and get recommendations on the next possible steps in solving the case.

Before you begin

Role required: sn_customerservice_agent

About this task

A decision tree presents a series of questions that you can answer and provide inputs where required. The decision tree evaluates your answers and provides the next set of questions or gives you guidance on what to do next. For example, the guidance can be to attach a knowledge article or propose a solution to a customer to help resolve an issue.

Depending on the context of the case that you're working on, decision trees appear in playbooks in CSM Configurable Workspace or as a recommended action in CSM Configurable Workspace. For details on using recommended actions, see Use Guided Decisions in recommended actions to resolve cases.

Procedure

1. Open CSM Configurable Workspace.
2. Open a case that you want to work on.
3. Select **Playbook**.
4. Work your way through a decision tree by providing inputs and proceeding by going to the next or previous set of questions, or dismissing the decision tree flow.
5. **Optional:** In the View my responses tab, select the Edit icon) next to the node to modify your selection or entered value.
6. Select the action button or dismiss the final guidance.
   The Activity list is updated with the action taken.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Guided Decisions in recommended actions to resolve cases

As an agent, work your way through a recommended action of type decision tree to help troubleshoot a case and get recommendations on the next possible steps in solving the case.

Before you begin

Role required: sn_customerservice_agent, admin

About this task

A decision tree presents a series of questions in the contextual side panel that you can answer and provide inputs where required. The decision tree evaluates your answers and provides the next set of questions or gives you guidance on what to do next. For example, the guidance can be to attach a knowledge article or propose a solution to a customer to help resolve an issue.

Depending on the context of the case that you're working on, a decision tree can be displayed as a Recommended Actions card in the contextual side panel of the CSM Configurable Workspace.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **CSM Configurable Workspace**.
2. Open a customer service case that you want to work on.
3. Select the Recommended Actions icon ( ) in the contextual side panel.
   Depending on the case context, the side panel might display Recommended Actions cards for guidances and decision trees.
4. Review the Recommended Actions cards and determine whether you want to select a recommended action that has a decision tree.
   - To accept a recommendation, select the action button on the card.
   - To remove a recommendation from the contextual side panel, select **Dismiss** on the card.

     The recommendation card moves from the **Current** tab to the **History** tab.
5. Work your way through a decision tree by providing inputs and proceeding by going to the next or previous set of questions, or dismissing the decision tree flow.
6. **Optional:** In the View my responses tab, select the Edit icon) next to the node to modify your selection or entered value.
7. Select the action button to apply the resolution or take the action proposed.
8. **Optional:** Continue reviewing the Recommended Actions cards and accept or dismiss them as needed to resolve the issue.

Using the Recommended Actions application

Through the Recommended Actions application, use the recommended actions of type guidance and guided decision tree in your workspace to resolve cases quickly. Use the field recommendation to get recommendations on the field values. Use the AI search option to search the relevant resources from various sources.

Recommended actions

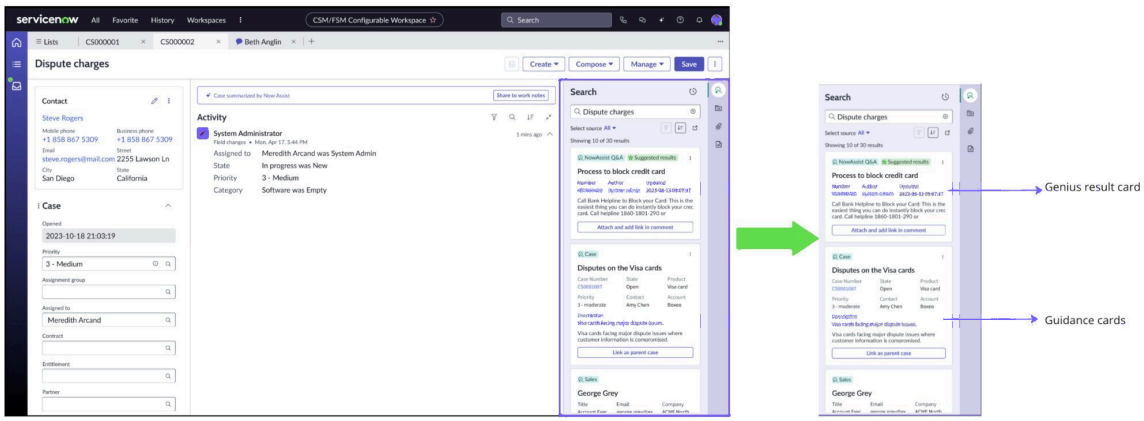
Recommended actions appear as cards in the contextual side panel of your workspace. Depending on the open record type, these cards contain information to help find the fastest resolution path, minimizing time spent researching and gathering information from different sources.

You can take three types of actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Guidance**: An action that can be performed or helpful information to share.
- **Decision tree**: A guided flow to follow that walks you through a series of questions that help you determine the appropriate action.
- **Field recommendations**: Recommended values to use for the fields in the record. Recommended field values are auto-filled or shown as messages underneath the fields for the new records. The recommended field values are shown as messages only underneath the fields for the existing records.

Recommended action cards in a workspace



Recommended action cards display the following information:

- Hint that briefly describes the recommendation.
- Preview that shows a short summary of the recommended action, which can include an image and links to helpful articles.
- Options to accept or dismiss the action.

When multiple cards are displayed, they're arranged according to the Order value set when they were created.

Primary and secondary actions

The recommendation that you select determines what is displayed next in the contextual side panel or subtab and how the record is updated. Some actions involve a single selection that is performed immediately such as **Acknowledge**, **Attach and add link in comment**. Other actions might have secondary actions that you can enable after selecting the primary action in the card. The following table explains a few primary and secondary actions.

Recommended Actions

Primary action	Secondary action	Guidance name
Select the **View and attach article** to open the knowledge article in the side panel for review.	Select secondary actions, such as **Dismiss** to cancel the recommendation or **Attach article** to attach it to the case or select an option from the More actions icon (⋮).	Review and attach article

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended Actions (continued)

Primary action	Secondary action	Guidance name
	 Select back to go back to the recommended cards list.	
Select **Attach and add link in comment** to compose a comment and **Post comments**.	Select secondary actions from the More actions menu ( )  **Note:** The primary and secondary actions are configurable.	Attach and share article

Recommended Actions process

Recommended Actions

Item	Description
Single-click action	• The guidance moves to the in-progress or completed state. • A message indicates that the action was performed or completed. The system updates the record accordingly. • The selected recommendation card moves from the **Recommended actions** or **Search** tab to **Action history**. The card displays the action performed for the recommendation and any outputs, such as a credit report and credit score generated for the customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended Actions (continued)

Item	Description
Contextual side panel or subtab action	• When the action button is selected, the guidance doesn't move to the in-progress state. Other users can still see and act on this guidance. • When the action button is selected in the detail experience, the guidance moves to in-progress or completed state. • A message indicates that the action was performed or completed. The system updates the record accordingly. • The selected recommendation card moves from the **Recommended actions** or **Search** tab to **Action history**. **Note:** For the guided decision trees, when the preview button is selected, the guidance opens in the side panel and moves to the in-progress state.
Error handling	If an action ends up in the error state, the following occurs: • An error notification is shown. The system updates the record accordingly. • The card displays the error state for the recommendation. • When dismissed, the card moves to **action history**.

Field recommendations

Field recommendations are messages that display either under fields on a form or auto-fill a recommended value within the field. For example, a field recommendation can recommend an assignment group based on the text in a case's short description.

You can read the description of the recommendation and use the recommended value in the fields.

AI search

AI search enables you to search for the relevant resources to resolve cases or customer issues. Depending on the AI search configuration, the AI search tab displays search results, genius result answers, or both. AI search results appear in the form of guidances that you can act on. Genius result answers are the most relevant answers or the top results for the search query along with the action that you can take directly from the card.

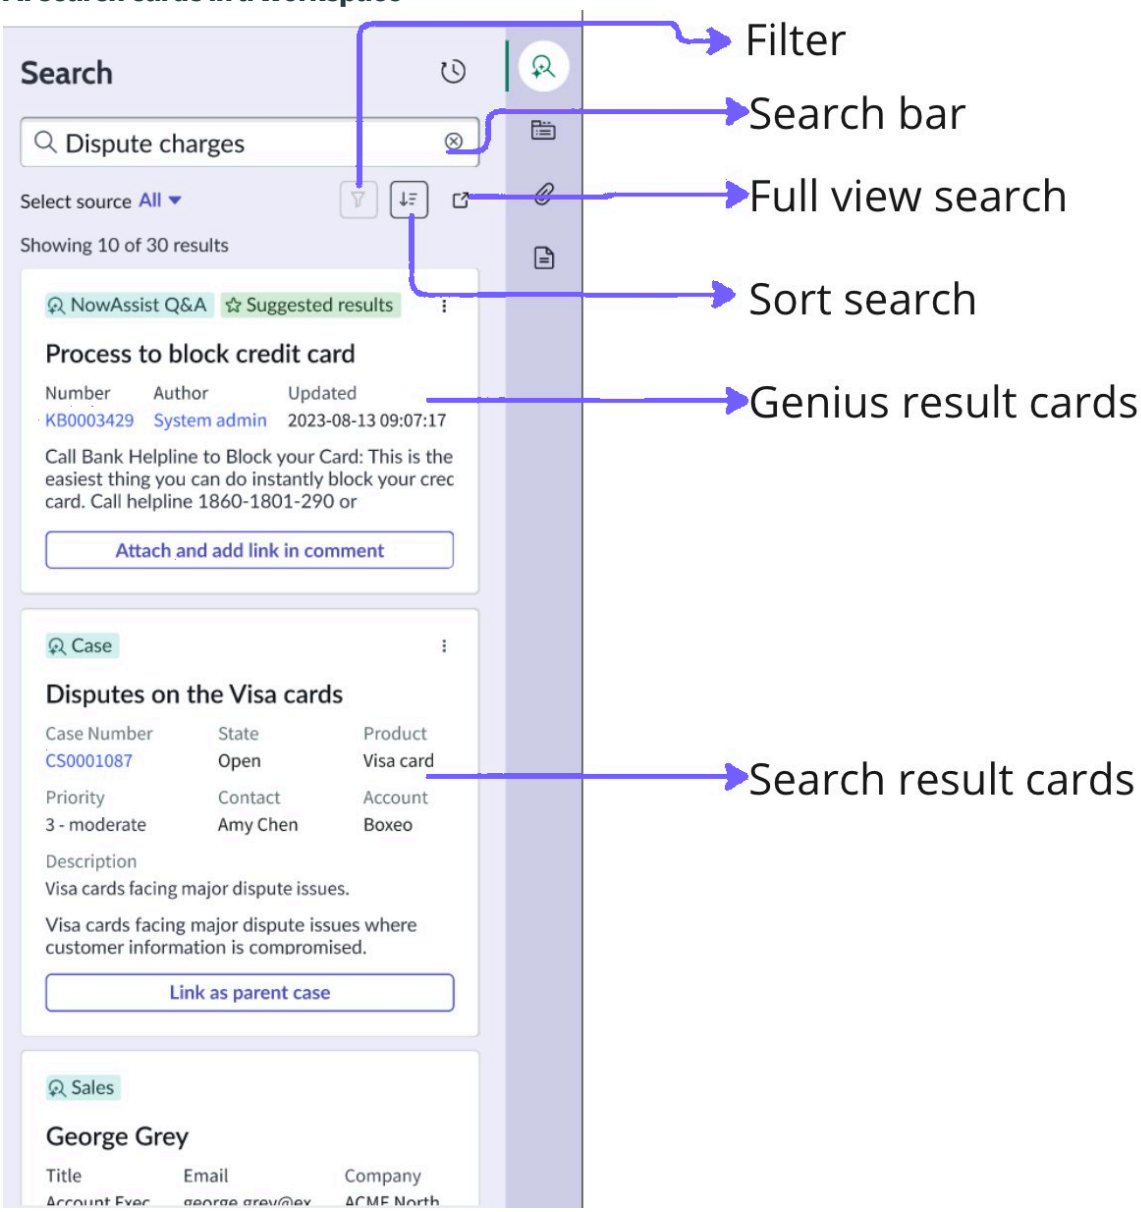
AI search cards in a workspace



Elements on the AI search cards

Element	Description
Search count	Displays counts of the total number of matching search results. The search filters show the number of matching results for each search source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements on the AI search cards (continued)

Element	Description
	Note: The Search results that are displayed and the total search count might vary due to security permissions or if the search result has already been executed. The executed guidances are moved to **Action history** and reflect in the total search count but the executed guidances won't show up in the search results.
Search bar	Accepts the search query that produces the search results. You can modify this search query and search again to view different results.
Search filters	Displays filter options for refining search results by search source.
Full view search	Displays the search results in a new subtab with an expanded view.
Sort search results	Sorts the search results based on the selected option.
Search result cards	Displays the search icon, search source, title, summary field values, and text snippet for each search result, with search query terms highlighted in title and text snippets. You can select a result to view its source record in full or select the action to act on the guidance.
Genius result cards	Displays the genius result icon, title, summary of the answer, and an action to take on the genius result card. **Note:** Genius result cards do not always show a summary of the answer.
Show more	Displays more search results.

Use Recommended Actions to resolve cases

As an agent, you can use Recommended Actions to help address customer issues and resolve cases quickly.

Before you begin

Role required: sn_nb_action.next_best_action_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **CSM Configurable Workspace**.
2. Open a customer service record that you want to work on.
3. Select the Recommended Actions icon ( ) in the contextual side panel.
4. Select the Recommended Actions tab.
   Depending on the record context, cards for guidances, decision trees, or both are displayed.
5. Review the Recommended Actions cards and do one of the following:

   a. To accept a recommendation, select the action button on the card.
   The result depends on the type of recommendation:

Recommended action results

Selected recommendation	Description	Result
Decision tree	A guided flow presents a series of questions in the contextual side panel that you can answer to get to the appropriate guidance.	After your inputs, the system provides a guidance that you can select.
Guidance	A recommendation for handling the case, for example: ▪ View and attach a knowledge article ▪ Attach and add link in comment ▪ Read article ▪ Attach and add link in email ▪ Add link in work note ▪ Copy link ▪ Submit an external request for an item, such as a credit report or loan application. ▪ Create a work order to handle the case.	The system performs the action. For example: ▪ Knowledge article guidance: The article opens in the **Current** tab of the contextual side panel or in a subtab for review. You can then choose a secondary action for handling the case. ▪ External request guidance: A subtab opens in the record to enter more information needed for the request, such as a loan application.

   b. To remove a recommendation from the contextual side panel, select **Dismiss** on the card.
   The recommendation card moves from the **Recommended Actions** tab to the **History** tab.

6. Continue reviewing the Recommended Actions cards and accept or dismiss them as needed to resolve the issue.

Use Recommended Actions to attach knowledge articles to chat

As an agent, use chat in Recommended Actions to resolve issues of the customers by attaching knowledge articles.

Before you begin

Role required: sn_nb_action.next_best_action_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **CSM Configurable Workspace** > **Inbox**.
2. Change the status from Offline to Available to see all the active chats.
3. Select **Accept** to start a chat conversation with a customer.
   The active customer chat session and corresponding chat details are displayed in a new subtab.
4. Select the Recommended Actions icon ( ) in the contextual side panel.
   Based on the issue, the Share KB in chat interactions guidance cards are displayed.
5. Review the Recommended Actions cards.
6. Select **Send in chat** from the side panel to send the respective knowledge article to the customer.
   The **Send in chat**, part of Share KB in chat interactions guidance, is disabled for the inactive or concluded chats.
   The knowledge article number and its' link is sent to the customer in the public chat, by default.
   Additionally, the used recommended card is moved to the history.
7. Following are the other secondary actions.

Secondary Actions

Actions	Description
Send in private chat	Select this action if the customer is restricted to the article and to share the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions	Description
	selected article privately to an internal agent. Copy Link	Select this action to copy the link of the selected article.
Read article	Select this action to read the article and to select a secondary action. Here, you can also **Read article in full view**,**Mark article as helpful**, **Flag article**, **Send in private chat** and, **Copy link**.

8. Continue reviewing the Recommended Actions cards and accept them as required, to resolve the issues.

Share KB in chat interactions guidance

Use AI search in Recommended Actions to resolve cases

As an agent, use AI search in Recommended Actions to help address customer issues and resolve cases quickly.

Before you begin

Role required: sn_nb_action.next_best_action_user

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **CSM Configurable Workspace**.
2. Open the customer service record.
3. Select the Recommended Actions icon ( ) in the Contextual Side Panel.
4. Select the **Search** tab.
5. In the **Search bar** field, enter your search query.
6. Select the Search icon ( ) or press Enter.
   The AI search results or genius results or both are displayed as cards.

   The relevancy score displays on the search result recommendation cards in the Search tab for following guidances provided with the base system. The relevancy score indicates how well a search result matches the agent's query.

   - Default guidance for search results
   - Attach and share article
   - Share KB in chat interactions
   - Case resolution guidance
   - All no-code guidances (Link incident to current case, Link problem to current case, and Link change request to current case).

   Note:
   The relevancy score displays only when the **Show relevancy score for results** check box is enabled in the Context form. For more information, see Create a context in Recommended Actions.

7. **Optional:** Select the **Filters** button, select a search source to filter the results and then select **Apply**.

   (Optional) The number of search sources selected appear on the Filter button once you apply the filters. The following table shows the actions that you can perform on the search results in the Filters section in the Search tab.

   Note:
   When top N results are enabled, the **Filters** button and the Sort icon does not appear. For more information, see Create a context in Recommended Actions.

Actions in the Filters section in the Search tab

Action	Description
Filter search results corresponding to multiple sources	The list of search sources of all the search results appear in the Source section in the Filters module. You can filter the search results by selecting multiple sources at the same time. The source type appears on the search results. (Optional) When one or more sources are selected, all the facets corresponding to all these selected sources appear enabling you to select field values to refine your search results further. For more information on facet filters, see the following row.
Filter search results at facet-level	(Optional) The dynamic facet filter options enable you to refine the search results by field value. The facets that appear depends on the sources you select. To expand or collapse a facet, select the + (plus) or - (minus) symbol by its name. When a field value under a facet of a source is selected, the remaining sources are deselected automatically and their respective facets also disappear. As a result, you'll be able to refine search results at facet-level for one source type only. The field values selected appear under the Any of the following selected section and its corresponding source appears under the All of the following selected section.
Sort search results	The following options are available by default: ○ Most relevant: The most relevant records are displayed on the top. This option is selected by default. ○ Updated (oldest): The least recently updated records appear on the top. ○ Updated (newest): The recently updated records appear on the top.
Remove the filters applied	Removes all the applied filters, when you select the **Clear all** button.

8. Review the search result or genius result cards and select the applicable result by selecting the action button to address the customer issue.
   The result card moves from the **Search** tab to **Action history**.
9. **Optional:** Select the full view search icon to get a detailed view of the search results in the Search page.

Display the Filters section	Displays the filters section when you select the **Show filters** button.

Using Playbooks for Customer Service Management

Customer service agents can use playbooks to complete the tasks and activities that are needed to resolve specific types of cases.

A playbook provides step-by-step guidance through the lifecycle of a customer service case.

A playbook includes multiple stages and each stage includes one or more activities for an agent to complete. When using a playbook, agents can:

- View the playbook stages and activities.
- Select an activity and perform the work necessary to complete that activity.
- Mark an activity as complete and move to the next activity or stage.
- Complete the stages and activities necessary to resolve the case.

Several features are available to agents when using a playbook, depending on the playbook configuration.

Playbooks for CSM tasks

Create a record using a playbook	If a playbook is configured to use the record generator feature, customer service agents can create a record using a playbook activity.
Filter playbook activities	Filter the activities in playbook stages by the selected user or activity state.
Using the activity stream in the contextual side panel	Customer service agents can access the activity stream in the contextual side panel to communicate with requesters and make internal notes about the work done on a record.
Viewing dynamic related records in the contextual side panel	Customer service agents can view dynamic related records that dynamically change based on the context of the current record or playbook activity.
Viewing ribbon information in the contextual side panel	Customer service agents can view ribbon information in the contextual side panel, including the case overview and timeline, Customer 360, and SLAs.
Add an optional activity	Add optional activities to different stages in a playbook as needed. For example, a customer may want to schedule an appointment to visit a location.
Summarize a case	Use the Now Assist for CSM case summarization skill to summarize the case

Playbooks in Customer Service Management

Configure Playbooks for Customer Service Management

Create a record using a playbook

Create a record using a playbook activity instead of a record form.

Before you begin

Role required: sn_customerservice_agent

About this task

If a playbook is configured to use the record generator feature, customer service agents can create a record using a playbook activity. Creating a record from a list or form, or from an activity in another playbook, opens the playbook and initiates the first activity. This activity guides an agent through the record creation process.

With additional configuration, you can also create a case from any of the following records that opens a playbook and initiates the first activity:

- Interaction
- Case
- Account
- Consumer

To create cases in this way, the following configuration is required:

- Enable the **Create Case** button from the Customer Service Case Types application for each of these records. This enables agents to create a specific type of case.

  See Configure customer service case types for more information about using the Customer Service guided setup and the Case Types category to configure case type UI actions.

- Configure the playbook to use the playbook record generator.

  For more information about configuring this feature, see Playbook record generator.

Procedure

1. Navigate to a list or form in CSM Configurable Workspace.
   For example, navigate to the All Onboarding Cases list.
2. Select **New**.
   If you selected **New** from the All Onboarding Cases list, the Onboarding playbook opens and initiates the first activity for collecting customer information.
3. Fill in the fields on the first activity card.
4. Select **Continue**.
   The system uses the customer information to create a case. The case number is added to the tab and the first activity in the first playbook stage is marked as complete. The second activity is highlighted as the current activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Collect additional customer information, if needed, and select **Save**.
6. Continue using the playbook stages and activities to resolve the customer's issue and complete the case.

Filter playbook activities

Filter the activities in the playbook stages by the selected user or activity state.

Before you begin

Role required: sn_customerservice_agent

About this task

When an agent filters the activities in playbook stages:

- The stages containing activities that match the filter conditions are automatically expanded.
- The activities that match the filter conditions are displayed within the expanded stages.

If the current activity is included in the filtered results, it remains highlighted. If it isn't included, the first activity in the filtered results is highlighted.

Procedure

1. Open a case record that has an associated Playbook and select the **Playbook** tab.
2. Select the filter icon ( ) at the top of the playbook lifecycle to open the context menu.
3. Select one or more of the following filter choices:
   - A user in the **Assigned to** section.
   - An activity state in the **State** section.
4. Click outside the context menu to close the menu and apply the filter.
5. To clear the playbook activity filter, click the filter icon and clear the current selections in the context menu.

Create a record using a playbook

Using the activity stream in the contextual side panel

Customer service agents can access the activity stream in the contextual side panel in CSM Configurable Workspace.

The activity stream enables agents to communicate with requesters and make internal notes about the work done on a record. The activity stream updates when the current activity in the playbook is updated.

Click the Activity stream icon ( ) in the contextual side panel to access the activity stream.

Agents can perform the following tasks in the activity stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What agents can do in the activity stream

Task	Description
View posts for the case or case task	The current activity in the playbook work area determines the information that is displayed in the activity stream. Scroll through the posts in the Activity section to view case or task information. Click **Case** or **Task** at the top of the activity stream to switch views.
Add work notes or comments	In the Compose section: 1. Select the type of activity: Work notes or Comments. 2. Add the information to the text field. 3. Click **Post Work Notes** or **Post Comments**. The post is added to the Activity section.
Filter posts	Click the filter icon ( ) at the top of the Activity section to display the filter selections: • **Post types:** Select the types of posts to view, such as work notes or attachments. • **Field changes:** Select specific fields to view information in posts for only those fields. • **Flagged:** Enable this button to view posts that have been flagged as important. • **Filter sets**
Sort posts	Click the Sort icon ( ) to sort posts by newest to oldest or oldest to newest.
Expand and collapse posts	Select expand icon ( ) to expand posts and collapse icon
Compose emails	Send emails from the Activity stream without leaving the case view. In the Compose section:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What agents can do in the activity stream (continued)

Task	Description
	1. Select the Email tab. An email draft opens where you can send an email. **2.** Compose your email and click **Send Email**.

Viewing dynamic related records in the contextual side panel

Customer service agents can view dynamic related records in the contextual side panel in CSM Configurable Workspace. This feature displays related records that dynamically change based on the context of the current record or playbook activity.

Agents can view, search, and sort the records in the Related Records tab in the contextual side panel. These records appear in the Related Records tab as read-only cards.

The Related Records tab displays related records that dynamically change based on the context of the current record or playbook activity. The records that are displayed in the Related Records tab depend on the following settings:

- The related record contexts and definitions that have been configured for a record or playbook activity.
- The agent's access permissions to data.

Depending on the related record configuration for the source record or playbook activity, agents can see the following types of related records:

- SLAs
- Emails
- Escalations for the case or customer (account and contact or consumer).
- Blocked By
- Sold Products
- Install Base Items
- Active Contracts
- Active Entitlements
- Special Handling Notes
- Tasks

What agents can do in Related Records

Task	Steps
View related records in the contextual side panel	Select the Related Records tab ( ) to view the Related Records list. Related records appear in the list in a card format. The initial set of records displayed in the list is determined by the record type selected. The displayed records can be changed using the filter located at the top of the list.
Select the type of related record to view	Use the filter at the top of the Related Records list to select the type of related records to view. Agents can also use the filter to see the current selection. **1.** Click the Filter icon ( ). **2.** Select a record type from the drop-down menu. The drop-down menu includes the related lists that have been configured for the parent record.
Search the related records list	Use the search field at the top of the Related Records list to perform a text search. Records that match the search text are highlighted. **1.** Enter the search text in the search field at the top of the Related Records list. **2.** Select the search icon. If the search field is grayed out, search is not available for the selected type of related records.
Open a related record in a subtab	Select a card in the Related Records list to open the record in a subtab under the parent record. In the subtab, the agent can view the record details and perform available actions.
Open the related record list in a list view in a subtab	Select the list view icon ( ) to display the related records in a list view in a subtab under the parent record.
Create a new record for the selected related list	Create a new record for the record type currently selected in the Related Records list. This action opens a new record form in a subtab under the parent record. **1.** Select the Create record icon ( ) at the top of the Related Records list. **2.** Fill in the fields on the record form and select **Save**.

Viewing ribbon information in the contextual side panel

Customer service agents can view ribbon information in the contextual side panel in CSM Configurable Workspace.

Click the Record information icon ( ) in the contextual side panel to view ribbon information.

Agents can see the following information:

- Case overview: Displays an overview of the case details, including the case priority and state.
- Customer 360: Displays customer information such as the contact or consumer name, email address, and phone numbers.
- Timeline: Displays a chronological summary of case activities, including case state changes and interactions between the agent and the customer. It also shows how much time that the agent and customer spent on the case.
- SLAs: Displays active SLAs for the case, including time remaining, the SLA state, and any breaches.

Add an optional activity

Add optional activities to different stages in a playbook. Although customer processes follow a certain structure, optional tasks may be necessary in some instances. For example, a customer may want to schedule an appointment to visit a location.

Before you begin

This feature must be configured by an administrator. If optional activities aren't configured for a playbook, the **Add Activity** menu item isn't available. For more information, see Configure playbook stage and activity visibility.

Role required: agent

About this task

You can add some optional activities to any stage while you can add others only to a single stage. You can't insert an optional activity as the first activity in a stage or between two completed activities. An approval request optional activity is supported only for a business-to-business (B2B) use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An agent or a fulfiller can insert an approval request optional activity during a playbook run in process-based page variants for complaint case type (in the triage and research stage) or onboarding case type (in the due diligence stage).

Procedure

1. Open a playbook in **CSM Configurable Workspace**.
2. Find a stage by selecting the More actions menu.
3. Select **Add Activity**.
   Add Activity isn't displayed if no optional activities are available in this stage.
4. In the location that you want to add the activity to the playbook, select **+ Add activity here**.
   In the modal that opens, you can see the placeholders where you can insert an activity.
5. Select the activity that you want to add to the playbook.
6. Select **Done**.

Summarize a case

Enable your agents to summarize the case details and to display this information on the case record by using the Now Assist for CSM case summarization skill.

Overview

The case summarization skill helps agents to come up to speed quickly on customer service cases. With this skill, agents can:

- Quickly generate the summaries of the customer service cases to understand the case context.
- Provide a summary of the actions taken and the resolution details.

Generating a case summary

Agents can use the case summarization skill to generate a case summary that includes information from the following case record fields:

- Short description
- Description
- Priority
- State

The summary also includes information from the case activity stream. Agents generate a case summary by using the Case summary by Now Assist component on the case record in CSM Configurable Workspace.

Note:
The case summary component appears below the playbook activity picker in the side panel in the process-based pages and it appears above the activity stream in the CSM default record page.

Case summary by Now Assist component

In CSM Configurable Workspace, agents use the Case summary by Now Assist component to generate a summary. The case summary component is collapsed by default. When an agent generates a case summary by selecting **Summarize**, the component expands to display the summary information, including a description of the issue, the actions taken, and the next

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

steps. For longer summaries, select **View more** and use the scroll bar to view the content. After generating a summary, the agent can:

- Review the summary information and edit as needed.
- Provide feedback on the generated summary.
- Add the summary information to the case work notes.
- Copy the summary information to the clipboard.

Agent management

Manage agents effectively to deliver exceptional customer service. Recruit, train, and monitor their performance continuously. Support your customer service agents consistently. Equip and motivate them well to enhance customer satisfaction and operational efficiency.

Agent management for customer service

Time recording for Customer Service Management	Record time worked on cases and case tasks. Time worked entries automatically generate time cards and time sheets for manager approval.
Workforce Optimization for CSM Agent Workspace	Manage your profile and schedule using Agent Workspace. Use coaching to review and complete assigned training.
Assign a case from the assignment workbench	Users with the customer service manager role can assign a case to an agent from the assignment workbench.
Manage special handling notes	Managing special handling notes is a critical component of Customer Service Management. These notes provide essential information to customer service agents about the specific needs and preferences of individual customers, ensuring that personalized and attentive service is delivered consistently. By effectively managing special handling notes, organizations can enhance the customer experience, build stronger relationships, and resolve issues more efficiently.
View team members assigned to an account	View the team members for a specific account.
Add an agent to the chat support assignment group	Agents must be added to the chat support assignment group before they can receive chat requests. This assignment group is used by theCustomer Service Management chat communication channel to route chat requests.
Approve a service contract	Approve a service contract for a customer account.
Outsourced Service Provider manager tasks	Manage various tasks as an Outsourced Service Provider (OSP) Manager, including onboarding Outsourced Service Provider

Decouple Channel Management dependencies from WFO	Unlink/ Decouple Channel Management from core Workforce Optimization (WFO) modules supports modular deployment, enabling independent updates or scaling of Channel Management without impacting other workforce engagement.

Time recording for Customer Service Management

Record time worked on cases and case tasks. Time worked entries automatically generate time cards and time sheets for manager approval.

Customer service agents (users with the sn_customerservice_agent role) can record time worked on case-related activities, create time cards and time sheets, and submit for approval. Managers can approve time sheets, define cost rates for different types of activities, and convert to expense lines.

The time recording feature extends the functionality of the Time Card Management application to Customer Service Management. Agents can record time worked on cases and tasks directly from the Case or Case Task form and time spent on other activities, such as meetings or training, from the Time Worked form. Time worked entries automatically create time cards for each task and selected work category. Time cards are automatically included in a weekly time sheet.

The time recording feature also extends the functionality of the Cost Management application to Customer Service Management. Customer service managers can create labor rate cards, which define different cost rates for different activities. Time sheets use labor rate cards to determine costs and to generate expense lines.

Agents can modify the hours recorded on time cards. Once a time sheet is approved and a time card is processed, the agent can still go back and modify the time worked. The time sheet reverts to the **Pending** state and new time cards are created. If an agent adds more time worked records to an approved time sheet for the same week, a new time sheet record is created for the current week.

Managers can view time worked records, time cards, and time sheets for agents in their assignment groups, as well as approve and reject time sheets. After a time sheet is approved, the system processes the time cards and uses rate cards based on the time card category to create expense lines.

Time recording plugin

The time recording feature requires the Customer Service Management plugin (com.sn_customerservice) and the Time Recording for Customer Service plugin (com.snc.csm_time_recording).

User roles

The time recording feature adds the following roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time recording user roles

Role	Description
Time card user [timecard_user]	Record time worked on cases and tasks. View, modify, and delete time worked entries on time cards and submit time sheets for approval. Users with the customer service agent (sn_customerservice_agent) role inherit the timecard_user role. This role restricts access to the time sheets, time cards, and time worked records created by the agent.
Time card administrator [timecard_admin]	Review, approve, and reject time sheets for customer service agents. Users with the customer service manager role (sn_customerservice_manager) inherit the timecard_admin, timecard_approver, and timecard_manager roles. This role restricts access to the time sheets, time cards, and time worked records created by the agents in a manager's assigned groups.

System properties

The time recording feature adds the following properties.

Time recording system properties

Property	Description
com.snc.time_card.time_worked	Enables the time recording feature for Customer Service Management. The default setting is **false**. **Note:** This property has been replaced by the **Auto fill time card with time worked entries** field on the Time Sheet Policy form. When this field is enabled, the user's time card is auto-filled with the information from their time worked entries.
com.snc.time_card.default_rate	The default hourly rate used when processing time cards if a rate from a labor rate card is not available.

Time Sheet policy

The time recording feature uses the **Default time sheet policy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For users with the sn_customerservice_agent role, creating time worked records automatically creates or modifies time cards regardless of the setting for the **com.snc.time_card.time_worked** system property. The time sheet policy controls this functionality. The system administrator can disable the auto-creation of time cards for a specific user with the sn_customerservice_agent role by creating a separate time sheet policy for that user.

Labor rate cards

The time recording feature provides one labor rate card: **CSM Rate Card (Default)**.

If needed, system administrators can create additional labor rate cards. Navigate to **Cost** > **Costs** > **Labor Rate Cards** and click **New** to create a labor rate card.

Record time worked for a case or activity

Customer service agents can record time worked on a case or case task as well as time spent on other activities.

Before you begin
Role required: sn_customerservice_agent

About this task
Agents can record time worked from a case or case task. Time worked can be recorded regardless of the case or task state. Agents can also record time worked from the Time Sheets module by navigating to **Time Sheets** > **Time Recording** > **My Time Worked.**

When an agent creates a time worked record, a time card and time sheet are automatically created for the week based on the work date. The time card is created for the task and the category type. The total hours recorded on each time card are recorded on the current time sheet in the **Time Cards** related list.

Procedure

1. To record time worked from a Case form or Case Task form.

Option	Description
Platform interface	Navigate to a case or task and select **Record Time**.
Agent Workspace	Navigate to a case or task, select the more UI actions icon (···), and select **Record Time**.

   This action opens a Time Worked form with the **Task** and **User** fields already populated.

2. To record time worked from the Time Sheets module.

   a. Navigate to **Time Sheets** > **Time Recording** > **My Time Worked** and select **New**.
   This action opens a Time Worked form with the **User** field already populated.

   b. Select a task number in the **Task** field.

3. Select the **Work Date**.
4. Select a **Category** for the time being recorded.
5. Fill in the **Time worked**.
6. Provide any additional information in the **Comments** field.
7. Select one of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Platform interface	Select **Submit**.
Agent Workspace	Select **Save**.

The Time Worked form is saved and added to the following lists:

- The **Time Worked** related list on the Case or Case Task form.
- The **Time Cards** related list on the current Time Sheet form.
- The Time Worked list in the Time Sheets module.

If this entry is the first time worked entry for the selected category, a time card is created for that category. If a time card for the category already exists, the time worked record is added to that card.

Review time worked for a case or activity

Customer service agents can review time worked on cases and case tasks.

Before you begin

Role required: sn_customerservice_agent

About this task

The **Time Worked** related list on the Case and Case Task form displays the time worked records that have been created for the case or task. From this related list, agents can review their recorded time, add new time worked records, and also delete records.

Procedure

1. Navigate to the desired case or case task.
2. Go to the **Time Worked** related list.
3. To view a time worked record, click the **Comments** for that record.

Modify or delete time worked entries for cases or activities

Agents can modify and delete existing time worked entries and create new entries after a time sheet has been approved.

Before you begin

Role required: sn_customerservice_agent

About this task

An agent can modify or delete time worked entries for an approved time sheet. Any changes to these entries update existing time cards, creates new time cards if needed, and generates an updated time sheet.

Note:
Don’t manually edit time cards. Edit the original time worked entries, which generate updated time cards and time sheets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To modify or delete a time worked entry:
   - Navigate to the desired case or case task, select the **Time Worked** related list, and select the desired entry.
   - Navigate to **Time Sheets** > **My Time Worked** and select the desired entry.
2. To modify the entry, change the desired fields and select **Update**.
3. To delete the entry, select **Delete**.

Review a time card

Customer service agents can review time cards created from time worked records.

Before you begin
Role required: sn_customerservice_agent

About this task
The **Time Worked** related list on the Case and Case Task form displays the time worked records that have been created for the case or task. This list also displays the time cards created from the time worked records.

Procedure

1. Navigate to the desired case or case task.
2. Go to the **Time Worked** related list.
3. To view a time card, click the **Time Card** for that record.
   The time card provides a breakdown of the time worked for this case or case task by day.

Review and submit a time sheet for a customer service agent

Agents can review and submit time sheets to managers for approval.

Before you begin
Role required: sn_customerservice_agent

About this task
The total hours worked for each category are recorded on the time card and on the time sheet. From the time sheet, you can see total hours by day and by category.

Procedure

1. Navigate to **All** > **Time Sheets** > **My Time Sheets** > **Current Time Sheet**.
2. If desired, review the time cards associated with the time sheet in the **Time Cards** related list.
3. Click **Submit Time Sheet**.
   The time sheet is submitted to the manager for approval. The state of the time sheet changes from **Pending** to **Submitted** and the form becomes read-only. The state of the associated time cards also changes to **Submitted**.

Review and approve time sheets for customer service agents

Managers can review time cards and time sheets for agents in their assignment groups.

Before you begin
Role required: sn_customerservice_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
When a time sheet is approved, the time cards are processed and used to create expense lines that reference the defined labor rate cards.

Procedure
1. Navigate to **All** > **Customer Service** > **Manager** > **Time Sheets - Pending Approval**.
2. Select a time sheet.
3. If necessary, review the time cards associated with this time sheet in the **Time Cards** related list.
4. Click one of the available actions.

Option	Description
Approve	The state of the time sheet and the associated time cards changes to **Processed** and these records become read-only.
Reject	The state of the time sheet and the associated time cards changes to **Rejected**. The customer service agent can modify the time sheet and submit again for approval.

Review expense lines created from time cards

Review the expense lines created from the time cards and time sheets submitted by customer service agents.

Before you begin
Role required: financial_mgmt_user

Procedure
1. Navigate to **All** > **Cost** > **Costs** > **Expense Lines**.
2. Select the desired expense from the Expense Lines list and view the details.

Workforce Optimization for CSM Agent Workspace

Manage your profile and schedule using Agent Workspace. Use coaching to review and complete assigned training.

Important:
To access the next generation of the Workforce Optimization for Customer Service application, transition to the Workforce Optimization for Customer Service application that is available from the ServiceNow Store. You can now configure Workforce Optimization for Customer Service using the UI Builder. For more information see, Workforce Optimization for Customer Service.

© 2026 ServiceNow, Inc. All rights reserved.

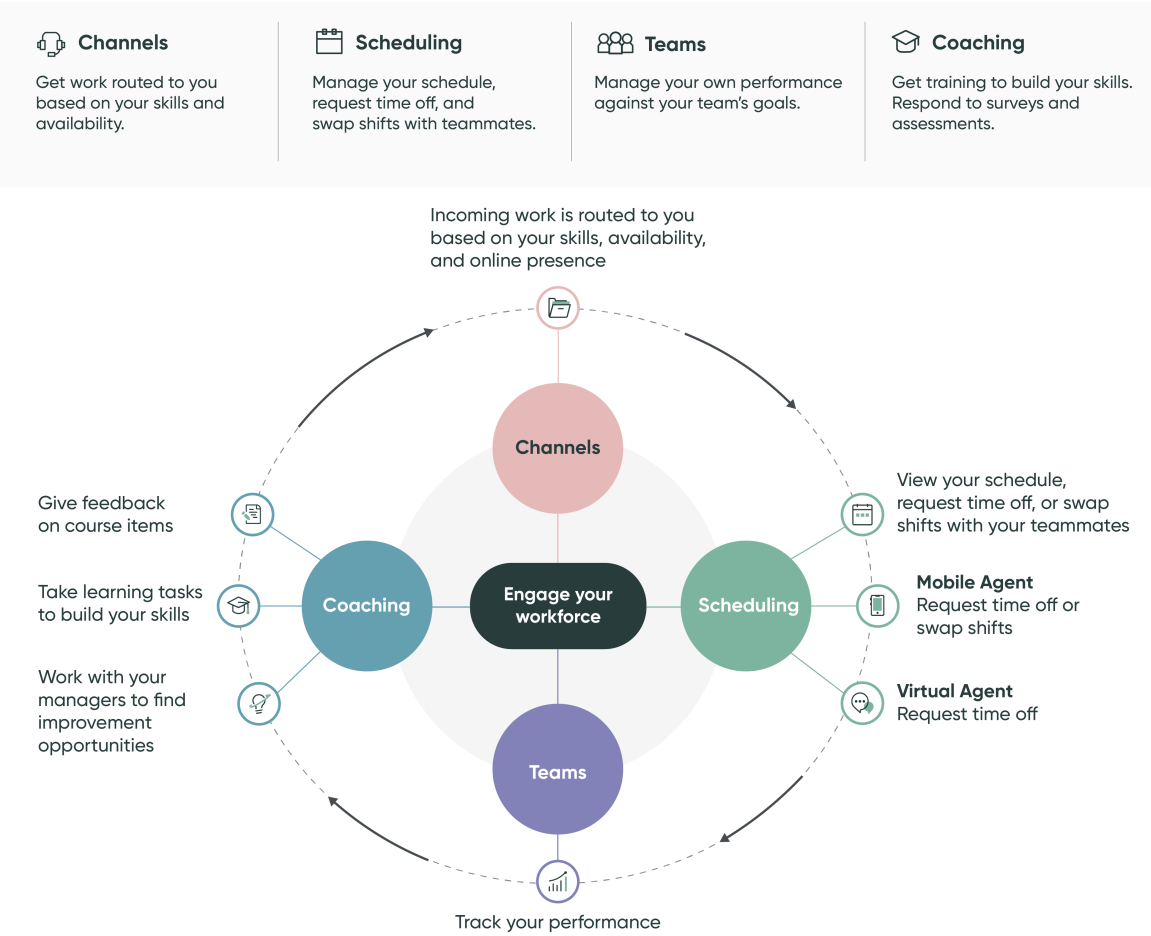
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The image below displays the agent work flow between the different modules in Workforce Optimization for Customer Service.



The Workforce Optimization for Customer Service features are accessible when the administrator activates the plugin (com.snc.wfo_csm). This plugin activates related plugins that enable agents to use the Channel Management, Scheduling, Coaching, and Teams applications in Workforce Optimization for Customer Service.

Access your profile from CSM Agent Workspace

Track and monitor the real-time status of your work by accessing your profile in CSM Agent Workspace. You can track information such as how many cases and interactions you have closed and how many you are actively working on. You can also view the roles and groups to which you belong and see information about your manager and teammates.

Before you begin

Important:
To access the next generation of the Workforce Optimization for Customer Service application, transition to the Workforce Optimization for Customer Service application that is available from the ServiceNow Store. You can now configure Workforce Optimization for Customer Service using the UI Builder. For more information see, Workforce Optimization for Customer Service.

Role required: sn_wfo_csm.employee

About this task

Access your profile to analyze information such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

- Key performance indicators that matter most to you.
- Pending training that has been assigned to you and when they're due.
- The service channels you are assigned to and their current utilization.
- Skills and skill levels that you currently use and skill gaps that you may want to address.
- Upcoming PTO.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Agent Workspace Home**.
2. Click the Lists icon.

Manage your schedule from CSM Agent Workspace

Look up your schedule, request time off, or swap your shift with your peers using the calendar in CSM Agent Workspace. If you can work during the requested shift, you can also approve your peer's request for shift swap.

Before you begin

Important:
To access the next generation of the Workforce Optimization for Customer Service application, transition to the Workforce Optimization for Customer Service application that is available from the ServiceNow Store. You can now configure Workforce Optimization for Customer Service using the UI Builder. For more information see, Workforce Optimization for Customer Service.

Role required: sn_shift_planning.agent

About this task

You can swap shifts with agents that are within your assignment group.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Agent Workspace Home**.
2. Click the Calendar icon.

   You can access your schedule in the **My Calendar** tab. If you want to see a list of all agents in your assignment groups and their schedules, click the **Team Calendar** tab.

   To view your schedule or another agent's schedule, you can:

   - View your schedule by clicking the **My Calendar** tab. Then, use the list menu to select the schedule that you want to view by day, week, or month.
   - View another agent's schedule by clicking the **Team Calendar** tab. Then, click an agent's schedule to see that agent's work and break times by day, week, or month.

     Select one of the following in the drop-down:

Calendar views on the Team Calendar tab

Calendar view	Description
Day	The hourly calendar of the current day displays. In the calendar drop-down,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calendar view	Description
	select a date to view the respective day's schedule.
Week	The current week's calendar displays. In the calendar drop-down, select a date to view the weekly schedule containing the selected date.
Month	The current month's calendar displays which includes current week and upcoming three weeks (28 days) in a single view. In the calendar drop-down, select a date to view that respective month's calendar.

Select the **Today** button to view the current day.

3. Make a request.

You can communicate with other agents by using Connect Chat or the activity stream on the record to make sure that they would like to swap the requested shift with you.

Connect Chat and activity stream request options

To	Do this
Request a shift swap	**a.** Click **Request shift swap**. **b.** From the Shift menu for your shift, select the shift that you want to swap with another agent. **c.** In the**Agent** field for the requested shift, select the agent that you want to swap with. **d.** From the Shift menu for the requested shift, select the agent's shift that you want to swap with. **e.** Click **Submit**.
Request a time off	**a.** Click **Request time off**. **b.** From the **Start time** field, enter the time that you want your time off to start. **c.** From the **End time** field, enter the time that you want your time off to end. **d.** Click **Submit**.

- The shift-swap request moves to the approval queue of the agent that you have requested to swap with.
- The time-off request moves to your direct manager's approval queue.

Clock-in and clock-out your work shift

Clock in and clock out your work shifts using CSM Agent Workspace. You can track your details, such as time attendance and time worked summary, to know how close you are adhering to your schedules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
To access the next generation of the Workforce Optimization for Customer Service application, transition to the Workforce Optimization for Customer Service application that is available from the ServiceNow Store. You can now configure Workforce Optimization for Customer Service using the UI Builder. For more information see, Workforce Optimization for Customer Service.

Role required: sn_shift_planning.agent

About this task

The clock-in event is generated when you either login or set your status as **Available** in CSM Agent Workspace. The clock-out event is generated when you either logout from CSM Agent Workspace or set your status as **Offline** or **Break**.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Agent Workspace Home**.
2. Click the Inbox icon.
   - To clock-in your shift, set your status to **Available**.
   - To clock-out from your shift, set your status to **Offline** or **Break**.

Result

You can view your time attendance and adherence in **Lists** > **Schedule Adherence** > **Time Attendance** and **Time Worked Summary** lists.

Approve or reject a shift swap from CSM Agent Workspace

You can approve a shift swap requested by your peer if you are available to work for that time period. You can reject it if you are unable to work then.

Before you begin

Important:
To access the next generation of the Workforce Optimization for Customer Service application, transition to the Workforce Optimization for Customer Service application that is available from the ServiceNow Store. You can now configure Workforce Optimization for Customer Service using the UI Builder. For more information see, Workforce Optimization for Customer Service.

Role required: sn_shift_planning.agent

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Agent Workspace Home**.
2. Click the Lists icon.
3. Go to **Approvals** > **My Approvals**.
4. Select the request you want to approve or reject.
5. Review the details of the shift swap request and do one of the following:
   - To approve the request, click **Approve**.
   - To reject the request, click **Reject**.

   If you approve a shift swap, the application moves the request to your manager's approval queue. For more information, refer to Scheduling in Workforce Optimization for Customer Service.

Assign a case from the assignment workbench

Users with the customer service manager role can assign a case to an agent from the assignment workbench.

Before you begin

Role required: sn_customerservice_manager

About this task

Note:
The Find Agents feature is available only in the classic environment.

Procedure

1. Open a customer service case.
2. Select the Find Agents icon ( ) next to the **Assigned to** field to open the assignment workbench.
   If the case has an **Assignment group**, the agents from that group are listed on the workbench.
   If the case doesn't have an assigned group, no agents are displayed.

   Note:
   The state of the current record determines the availability of the Find Agents icon. The icon is available for records in the **Open**, **Awaiting**, and **Cancelled** states, and if the user has write access for the **Assigned to** field. The icon isn't available for records in the **New** or **Closed** states or when the **Assigned to** field is read only for the current user.

3. **Optional:** Select an assignment group from the **Group** list.
   The list of agents updates based on the selected group.
4. **Optional:** Add or remove skills from the **Skills** list.
   The selected skills appear in a list below this field. The **Matching Skills** column updates to reflect the selected skills.

   Note:
   Mandatory skills can't be changed.

5. **Optional:** Sort the agents by selecting the column header for the desired matching criteria.
6. Select an agent by enabling the check box by the agent's name and then select **Assign**.
   The assignment workbench closes and the name of the selected agent appears in the **Assigned to** field on the Case form.
7. Select **Update** to save the agent assignment.

Manage special handling notes

Get critical information about specific customers and empower agents in delivering personalized and efficient service with special handling notes.

Use the Special Handling Notes application to generate notes that highlight crucial information about individual records, like case or account records, ensuring users are well informed. For more info, see Special handling notes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage special handling notes

Create a special handling note	Create a special handling note for a record, such as a customer service case.
Update a special handling note	Update a special handling note for a record.
Delete a special handling note	Delete a special handling note for a record.
Delete a special handling note from a form	Delete a special handling note for a record from the Special Handling Notes list on the form.

Create a special handling note

Create a special handling note for a record, such as a customer service case.

Before you begin

Role required: sn_shn.admin or sn_customerservice_manager

About this task

Use special handling notes to highlight important information about individual records, such as a case or account record.

You can create special handling notes from the Special Handling Notes module in the application navigator or from a record that has been configured to use special handling notes.

Important:
While this feature provides the flexibility to create complex conditions, it is recommended that you keep the configuration simple and use dot walking sparingly. Creating complex conditions for special handling notes can affect the load time.

Procedure

1. Perform one of the following actions.
   - **CSM Configurable Workspace**: Navigate to the desired form, select the More actions menu in the record header and then select **Special Handling Notes**.
   - **Core UI**: Navigate to the desired form and select the **Create Special Handling Notes** related link. You can find these links in the Related Links section at the bottom of the form.
   - Navigate to **All** > **Special Handling Notes** > **Special Handling Notes** and select **New** in the Special Handling Notes list form header.
2. Fill in the fields, as necessary.

Special Handling Notes form fields

Field	Description
Short Description	A brief description of the note which is displayed in the Special Handling Notes list.
Message	The detailed content of the note.
Display as pop-up alert	Displays this note in the Special Handling Notes pop-up window.
Type	The type of special handling note:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Standard**: Create a note for a specific record, which you select in the **Related record** field. ○ **Conditional**: Create a note for multiple records which meet certain conditions. Select a **Table name** and then create **Conditions**.
Priority	The priority of the note: ○ 1-Critical ○ 2-High ○ 3-Moderate ○ 4-Low
Status	The status of the special handling note: ○ **1-Active**: The note is active and appears in the Notes list or pop-up window. ○ **2-Inactive**: The note is inactive and does not appear in the Notes list or pop-up window. Inactive notes are removed from the Notes list but can be seen by navigating to **Special Handling Notes** > **Special Handling Notes**. ○ **3-Expired**: The note has reached its expiration date.
Effective immediately	Check box to make the special notes effective immediately. The status is set to **1 -Active**. Deselect this check box to display the **Effective on** field.
Effective on	The date on which the special notes become effective. Enter a date for the special notes to become effective and click **Update**. The status is set to **2 - Inactive** until the date is reached.
Expires on	The date on which the note expires. Select a date from the calendar and click **Save**. The **Deactivate Special Handling notes** scheduled job runs daily at midnight and checks all active alerts. If the notes have reached their expiration date, it sets the status to **Expired**. The **Deactivate Special Handling notes** scheduled job also checks the **Effective on** field. If the status is active or inactive and the expiry date has been reached, it sets the status to **Expired**. If the status is inactive and the effective on date has been reached, it sets the status to **Active**.
Related record	The record for which this note is created. This field appears when you select **Standard** in the **Type** field. If you access this form from the **Create Special Handling Notes** related link, the record number is automatically filled in. To select a record, select a **Table name** and a **Document** from the pop-up window. The tables available for selection have been configured to use special handling notes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table name	The table that stores the entity for which the note is being created. This field appears when you select **Conditional** in the **Type** field. The default is the first table which has been configured to use special handling notes. After you select a table, a link is displayed with the number of matching records. This link is updated after you select one or more conditions. Click the link to display these records in a list.
Conditions	This field appears when you select **Conditional** in the **Type** field. Use the buttons in this field to build one or more conditions on the selected table. A condition is made up of a selected field, an operator, and a value. Add conditions using the **AND** and **OR** buttons. Delete conditions by clicking the **Delete** button to the right of a condition.

3. Click **Submit**.

Special handling notes

Update a special handling note

Update a special handling note for a record.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, sn_shn.editor, or sn_shn.admin

About this task

Users with the sn_customerservice_manager role can update a special handling note for a record if they can update a record for the underlying table.

Procedure

1. Navigate to **All** > **Special Handling Notes** > **Special Handling Notes**.
   You can also update a note from the Special Handling Notes list on a form.
2. In the Special Handling Notes list, click the note to be updated.
3. Make any necessary changes to the fields on the Special Handling Notes form.
4. Click **Update**.

Delete a special handling note

Delete a special handling note for a record.

Before you begin

Role required: sn_customerservice_manager or sn_shn.admin

About this task

Users with the sn_customerservice_manager role can delete a special handling note if they can delete a record for the underlying table.

Outsourced service provider manager tasks (continued)

Assign a case to an OSP agent	As an Outsourced Customer Service external manager you can assign a case to an agent under your group.

Onboard an Outsourced Service Provider agent

An Outsourced Service Provider (OSP) manager can onboard OSP agents to manage and fulfill cases.

Before you begin

Role required: sn_csm_ocs.ext_manager

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Onboard Agent**.
2. Fill in the fields on the Onboard Outsourced Service Provider agent or manager form, as appropriate.
3. Click **Submit**.

Note:
Once onboarding is complete, a password reset email is sent to the agent's email address.

Assign a case to an OSP agent

As an Outsourced Customer Service external manager, you can assign a case to an agent under your group.

Before you begin

Note:
The outsourced customer service external managers [sn_csm_ocs.ext_manager] can perform their designated tasks using the Core UI as workspaces are not currently supported.

Role required: sn_csm_ocs.ext_manager

Procedure

1. Navigate to **All** > **Outsourced Customer Service** > **Cases** > **Unassigned**.
2. Open a case.
3. Enter the name of the agent in the **Assigned to** field and select the agent from the list displayed.

   You can also click the Lookup using list icon ( ) and select the agent.

   Note:
   The **Assignment group** field is pre-populated with the group name. The list of agents belonging to that group is displayed when you lookup.
4. Click **Update**.

Overview of customer access management

Customer access management enables you to support multiple contacts and consumers on cases and sold products, providing them with varying levels of access to the case. You can also add additional internal users to a case.

Related topics

Configuring customer access management

Restrict contact access

Add related parties to a case

Add related parties to a case to help provide the access level to the related parties, such as contacts or consumers on a case.

Before you begin

Role required: sn_customerservice_agent

About this task

Related parties and their assigned responsibilities are part of the Customer Access Management feature. Customer access management enables you to support multiple contacts and consumers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on cases and sold products, providing them with varying levels of access to the case. For more information, see Configuring Customer Access Management.

Related parties that are added to cases must also be assigned the sn_customerservice.case_authorized_contributor role.

Procedure

1. Navigate to **All** > **Customer Service** > **Cases** > **All**.
2. Select the case where you want to add related parties.
3. From the Related Parties related list, select **New**.
4. On the form, fill in the fields.

Related Party record form

Field	Description
Type	Related party type. The related party type can be a contact, consumer, or a contributor user. You can select from the list of related party configurations for the cases that are provided with the base system. ○ Authorized Contact ○ Authorized Consumer ○ Authorized Contributor ○ Listed Contact ○ Listed Consumer
Case	Case number.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   Related parties are added to the case.
6. Confirm that the contact or consumer selected in step 4 is assigned to the sn_customerservice.case_authorized_contributor role.

Result

Once related parties are added to the case with a proper functional role having Authorized Representative responsibility, they can perform the following actions.

- Close a case.
- Update customer-visible case tasks.
- Add additional comments and attachments.
- Accept or reject a solution.
- Receive notifications on case updates. To confirm that related parties receive email notifications, add them to the email notification configuration.
  1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
  2. Select a notification.
  3. In the Who will receive related list, select the lock icon next to **Users/Groups in fields**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Available column, select **Related Party Users** and/or **Related Party Consumers** and move them to the Selected column.
5. Select the lock icon again and update the record.
6. Repeat these steps for each of the desired notifications.

Related topics

Case update notifications

Case update notifications

Contacts, consumers, and contributor users assigned the Authorized Representative responsibility on a case receive all email notifications sent to the case's primary contact.

Contacts added as additional contacts to the sold product with the Authorized Representative responsibility receive all email notifications sent to the case's primary contact.

Consumers added as an additional consumer to the sold product with the Authorized Representative responsibility receive all email notifications sent to the case's primary consumer.

Internal users added as related parties to a case with the Authorized Representative responsibility receive all email notifications sent to the case's primary contact or consumer.

For case resolved emails, related parties with the Authorized Representative responsibility can accept or reject the proposed solution. The responses of emails from related parties are treated similarly to the primary contact or consumer on the case. For more information, see Create an email notification.

Enable case update notification

To receive notifications when a customer replies to a case, related parties added to cases must be assigned a Customer Access Management (CAM) role, such as the sn_customerservice.case_authorized_contributor role. For more information, see Roles installed with Customer Access Management.

Configure notifications for related parties

Related parties added to cases can receive email notifications on case updates. To enable the configuration, add related parties to the email notification configuration.

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select a notification.
3. In the Who will receive related list, select the lock icon next to **Users/Groups in fields**.
4. In the Available column, select **Related Party Users** and/or **Related Party Consumers** and move them to the Selected column.
5. Select the lock icon again and update the record.
6. Repeat these steps for each of the desired notifications.

Adding related parties to a sold product

Add related parties to a sold product to help provide the access level to the related parties, such as contacts, consumers, or accounts.

For example, products purchased by a customer can be tracked by multiple departments, such as the finance team monitoring renewals and the operations team overseeing maintenance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With Customer access management, you can add multiple related parties and provide them with varying levels of access to the sold product. While adding related parties, you can select the related party type and responsibility.

Task	Description
Add additional consumers for the sold product	Add additional consumers for sold product and the related entities by defining the type and responsibility of additional consumers.
Add additional contacts for the sold product	Add additional contacts for sold product and the related entities by defining the type and responsibility of additional contacts.
Add additional accounts for the sold product	Add additional contacts for sold product and the related entities by defining the type and responsibility of additional accounts or contacts.

Add additional consumers for the sold product

Add additional consumers for your business-to-consumer (B2C) or business-to-business-to-consumer (B2B2C) sold products by defining the type and responsibility of additional consumers. After you add this information, additional consumers can have the same access to the consumer associated with the sold product and the related entities.

Before you begin

Role required: admin and sn_customerservice_manager

About this task

The responsibility assigned to the additional consumer that is associated with a sold product gets access to the sold product and the related entities, which include installed products, install base items, and cases associated with sold products.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Sold Products**.
2. Select the desired record where you want to add additional consumers.
3. From the Additional Consumers related list, select **New**.
   Starting with the Utah release, the Additional Consumers related list has been deprecated for new customers. For upgrade customers, the Additional Consumers related list continue to be supported along with the Sold Product Related Parties related list.
4. On the form, fill in the fields.

Consumer Sold Product record form

Field	Description
Sold Product	Products and components sold to a consumer.
Type	Related party type. **Note:** By selecting the related party type, the default responsibility mentioned in the type is added in the related party responsibility.
Consumer	Contact responsible for the sold product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Responsibility	Access level to sold product and related information. Additional consumer with Authorized Representative responsibility requires the sn_install_base.sold_product_authorized_consumer role to get access to associated sold product and related entities. For details, see Roles installed with customer access management. **Note:** If the **Responsibility** field is empty, consumers can't access the sold product and associated case.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   Additional consumers are added to the consumer sold product.

Result

Once additional consumers are added to the sold product with a proper functional role having Authorized Representative responsibility, they can perform the following actions.

- View the list of sold products and associated install base items.
- Create cases by selecting sold products or install bases.
- View the list of cases related to the sold products or affected install bases.
- View the list of installed products.
- Access cases associated with the sold product.
- Manage service catalog requests from the sold product.

Note:

- While creating a case for a sold product, you can only see authorized consumers on the consumer sold product.
- If you choose someone as a consumer, you can only associate the sold products they have full access to on the case.

Add additional contacts for the sold product

Add additional contacts for the B2B (accounts or contacts) or B2B2C sold product by defining the type and responsibility. Once added, additional contacts have the same access to the contact associated with the sold product and the related entities.

Before you begin

Note:
Additional contacts can be enabled using the **Restrict Contact Access** field. For details, see Restrict contact access.

Role required: admin and sn_customerservice_manager

About this task

The responsibility assigned to the additional contact that is associated with a sold product gets access to the sold product and the related entities, which include installed products, install base items, and cases associated with sold products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Additional Contacts related list, select **New**.
   Starting with the Utah release, the Additional Contacts related list has been deprecated for new customers. For upgrade customers, the Additional Contacts related list continue to be supported along with the Sold Product Related Parties related list.
4. On the form, fill in the fields.

Contact Sold Product record form

Field	Description
Sold Product	Products and components sold to an account.
Type	Related party type. **Note:** By selecting the related party type, the default responsibility mentioned in the type is added in the related party responsibility.
Contact	Contact responsible for the sold product.
Responsibility	Access level to the sold product and related information. Additional contact with Authorized Representative responsibility requires the sn_install_base.sold_product_authorized_contact role to get access to associated sold product and related entities. For details, see Roles installed with customer access management. **Note:** If the **Responsibility** field is empty, contacts won't have any access to the sold product and associated case.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   Additional contacts can be added to the B2B sold product.

Note:
Added contacts can be from the same account, partner account, or from contact relationships.

Result

Once additional contacts are added to the sold product with a proper functional role having Authorized Representative responsibility, they can perform the following actions.

- View the list of sold products and associated install base items.
- Create cases by selecting sold products or install bases.
- View the list of cases related to the sold products or affected install bases.
- View the list of installed products.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Access cases associated with the sold product.
- Manage service catalog requests from the sold product.

Note:

- While creating a case for a sold product, you can only see authorized contacts.
- If you choose someone as a contact, you can only associate the sold products they have full access to on the case.

Add additional accounts for the sold product

Add additional accounts or contacts for your business-to-business (B2B) or business-to-business-to-consumer (B2B2C) sold products by defining the type and responsibility of additional accounts or contacts. Once you add accounts as related parties, all contacts associated with the related party account can access the sold product.

Before you begin

Role required: admin and sn_customerservice_manager

About this task

The responsibility assigned to the additional accounts that is associated with a sold product gets access to the sold product and the related entities, which include installed products, install base items, and cases associated with sold products.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Sold Products**.
2. Select the record that you want to add the additional account to.
3. From the Sold Product Related Parties related list, select **New**.
4. On the form, fill in the fields.

Sold Product Related Party record form

Field	Description
Sold Product	Products and components that are sold to an account.
Type	Related party type. **Note:** By selecting the related party type, the default responsibility that is mentioned in the type is added in the related party responsibility.
Account	Contacts of the account responsible for the sold product.
Responsibility	Access level to the sold product and related information. Additional account with the Authorized Account responsibility requires the sn_install_base.sold_product_authorized_contact role to get access to the associated sold product and related entities. For details, see Roles installed with customer access management. **Note:** If the **Responsibility** field is empty, the accounts don't have any access to the sold product and associated case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   You can add additional accounts to the B2B sold product.

Note:
Added accounts can be from the same account, partner account, or from contact relationships.

Result
After additional accounts are added to the sold product with Authorized Account responsibility, the contacts of those accounts having a required functional role can perform the following actions:

- View the list of sold products and associated install base items.
- Create cases by selecting sold products or install bases.
- View the list of cases that are related to the sold products or affected install bases.
- View the list of installed products.
- Access cases that are associated with the sold product.

Note:

- While creating a case for a sold product, you can only see the authorized accounts on the account's sold product.
- If you choose an account, you can only associate a sold product that you have full access to on the case.

Add related parties to an install base item

Add related parties to an install base item in the Customer Service Management application so that you can enable another party to have access to an install base.

Before you begin
Role required: admin and sn_customerservice_manager

About this task
An install base-related party is a list of contacts, consumers, contributors, service organization members, accounts, or service organizations. You add a related party to enable access to another party that isn't the owner of the install base. Related parties associated with an install base can access it and its related entities, including installed products, sold products, and associated cases.

Note:
You can enable additional contacts by using the **Restrict Contact Access** field. For details, see Restrict contact access.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Install Base Items**.
2. Open an install base item from the list.
3. Select **Install Base Related Parties**, and select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. From the **Type** drop-down, select the type of related party that you want to add to the install base item.
   Based on the selection that you chose, you can assign one of the combinations in the following table:

Related Type list

Type	Functional Role	Entity
Authorized Account	Install Base Authorized Contact (sn_install_base.install_base_authorized_contact)	Account
Authorized Contact	Install Base Authorized Contact (sn_install_base.install_base_authorized_contact)	Contact
Authorized Consumer	Install Base Authorized Consumer (sn_install_base.install_base_authorized_consumer)	Consumer
Authorized Contributor	Install Base Authorized Contributor (sn_install_base.install_base_authorized_contributor)	User
Authorized Member	Install Base Authorized Member (sn_install_base.install_base_authorized_member)	Service Organization
Authorized Service Organization	Install Base Authorized Member (sn_install_base.install_base_authorized_member)	Service Organization
Listed Account		Not applicable
Listed Contact		Not applicable
Listed Consumer		Not applicable
Listed Contributor		Not applicable
Listed Member		Not applicable
Listed Service Organization		Not applicable

Note:
The **Responsibility** field on the Install Base-Related Parties form is automatically populated based on the type of related party that is selected. For information on the type of related parties, see Create related party configurations.

5. To use the **Order** field to specify the sequence in which records are displayed, organized according to business preferences.
6. Select **Submit**.

Result
The contact is assigned as a related party to the Install base item. The contact gets access to all the corresponding items, such as the child install base items and the cases on the install base item form.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restrict contact access

Restrict contact access to sold products and install bases by limiting the access for associated contacts and their access levels for customer access management.

Before you begin

Role required: sn_customerservice_manager and sn_customerservice.customer_admin

About this task

By restricting contact access, you can limit access to entities that are based on the contacts that are assigned to the sold products and install bases. You can't create duplicate account access records with the same account.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Manage Account Access**.
2. Select **New**.
3. On the form, fill in the fields.

Account Access record form

Field	Description
Account	Accounts that have restrictions for access to the sold products and install bases that are based on the associated contacts and the access level.
Restrict Contact Access	Access that is restricted to entities based on associated contacts. If the value of the field is **False**, the contacts that are associated with the account can read the sold products and install bases that are associated with the account. If the value of the field is **True**, the contacts that are associated with the accounts don’t get access to the sold products and install bases, unless they're added as a contact on the record or as a related party. The following contacts get access to the sold products and install bases: ○ Contacts that are associated with the sold product and install base records. ○ Contacts that are added as related parties with an Authorized Representative responsibility. ○ Contacts belonging to accounts that are added as related parties with an Authorized Account responsibility.

4. Select **Submit**.

Add additional contacts for the sold product

Using Customer Contracts and Entitlements

Learn how consumers, managers, agents, and administrators use the Customer Contracts and Entitlements application to generate customer contracts and contract lines.

Service contracts, service contract lines, and entitlements can be created in the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Via workflows: You can create service contracts, service contract lines, and entitlements by using the contracts and entitlements workflow. For more information, see Creating contracts and entitlements using workflows.

  Note:
  When a service contract line or entitlement is created via the Sales Customer Relationship Management workflow, the account/consumer/household details are copied from the sold product and it inherits the state of the sold product. Further, when the state of the contract line changes, the same state is synced back to the parent sold product.

- Via API integrations:
  - Service Contract API
  - Entitlement API

You can perform the following features using Customer Contracts and Entitlements Workflows:

- Standard renewals: A standard renewal occurs when a contract is renewed on schedule. The system creates a new contract with the existing contract lines, entitlements, and child records, with the new term starting immediately after the original contract ends. There is no pricing adjustments that are needed beyond the agreed renewal terms.
- Non-standard renewals: A non-standard renewal occurs when a contract is renewed outside of the renewal cycle. This covers three scenarios: an early renewal, a late renewal, and a short-term renewal. For more info, see Renew a service contract line.
- Consolidation of Contracts: You can merge multiple contracts for the same account into a single contract. Use contract consolidation during renewal to align contract terms and combine subscriptions into one contract. For more info, see Renew a service contract line.
- Upsell or Downsell: You can add or reduce the quantity to an existing contract during its term.

Using Contracts and Entitlements Workflows

Learn how contracts and entitlements using workflows enable you to create and manage service contracts, service contract lines, and entitlements.

You can manage the life cycle of customer service contracts and entitlements from offer creation to contract generation using contracts and entitlements workflows. Using workflows you can suspend, resume, cancel, and renew multiple entities at once. You can also perform the following functions using workflows:

- Create, suspend, resume, cancel, and renew service contracts.
- Create, modify, suspend, resume, cancel, and renew service contract lines, and entitlements.

Automatic renewal of service contracts

While creating service contracts from quote or orders, you can select the **Auto-renew contract** option on a quote or order to automatically renew the contracts. When you add or delete a contract line from these service contracts, the renewed quotes and opportunities are updated. You can configure the auto-renewal date of the contract in the Customer Life Cycle Workflows Policy decision table. By default, you can choose to initiate the auto-renewal 90, 60, or 30 days before the contract end date, or on the contract creation date. For more info, see Creating contracts and entitlements using workflows.

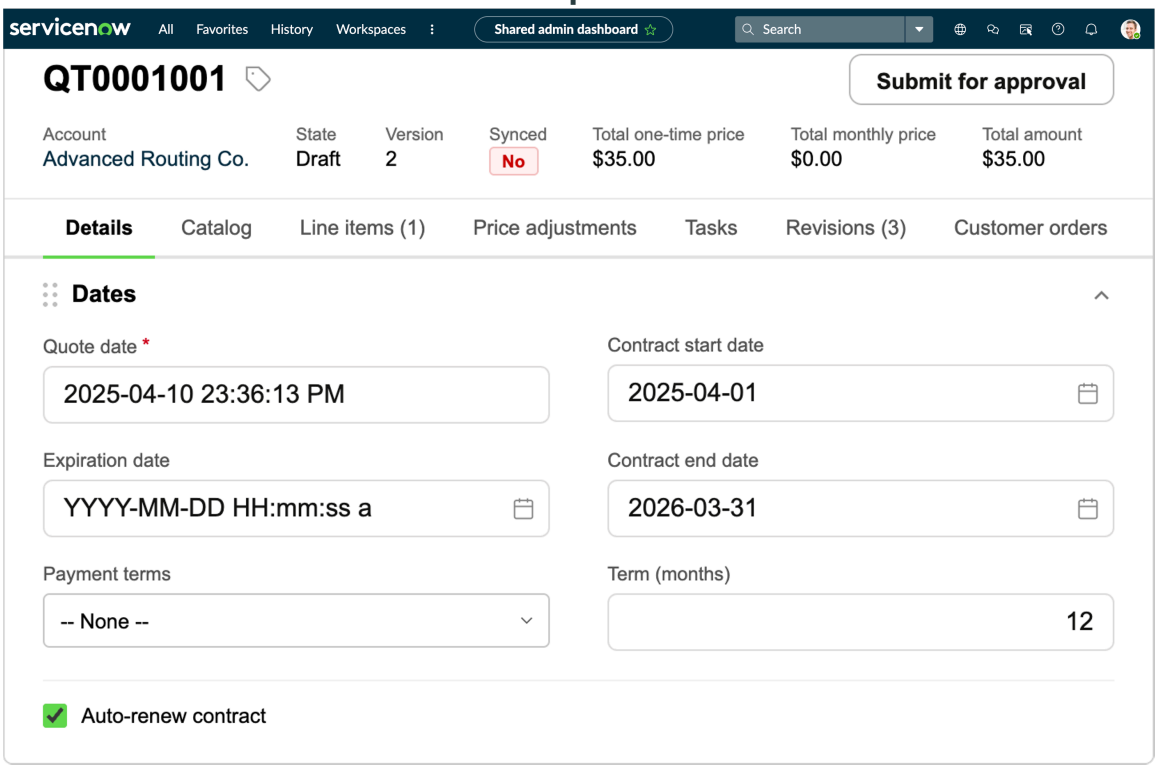
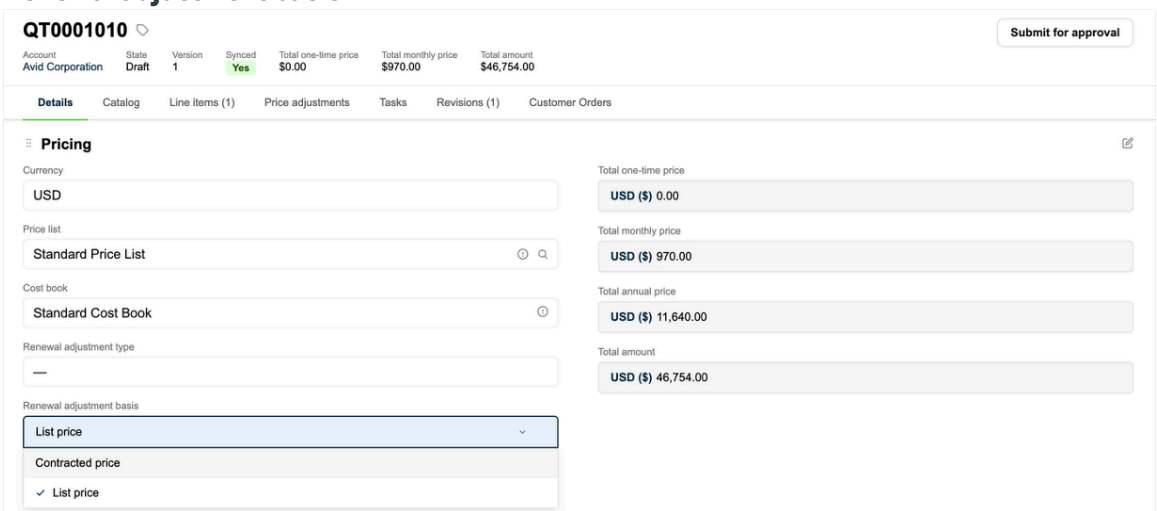
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic renewal for service contracts on quotes



In the Renewal adjustment basis field, you can select **List price** or **Contracted price**. Selecting List price renews the contract at the market price of the contract at the time of the renewal date.

Renewal adjustment basis



Selecting Contracted price gives you the option to renew the contract at Markdown % or Markup % of the current contract price. For example, if you select **Markup %** field and you enter 10 in **Renewal adjustment value**, the service contract is renewed at 10% above the current contract price.

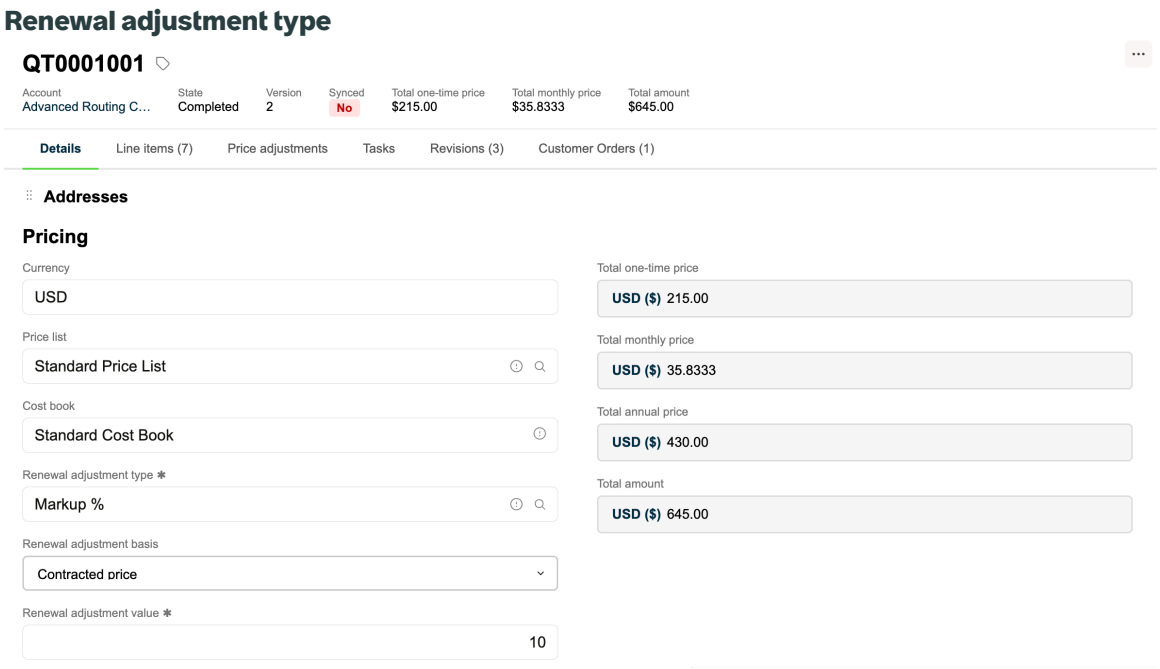
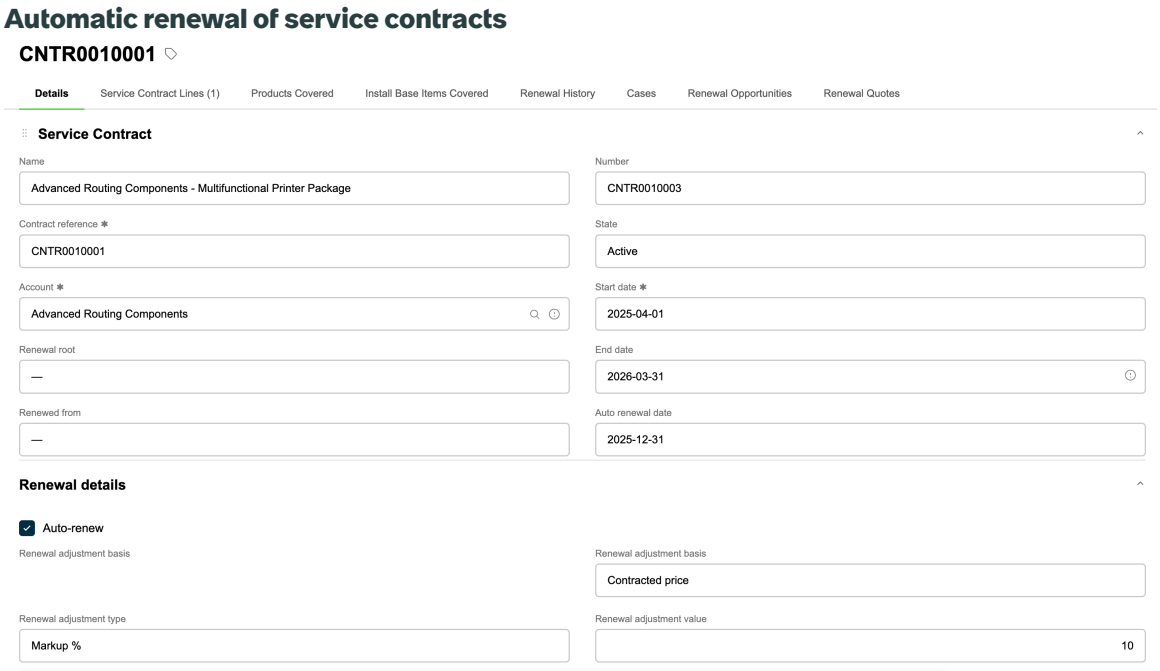
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



That exact renewal date and the renewal adjustments for that service contract will be visible on the service contract form in the **Auto renewal date** field.



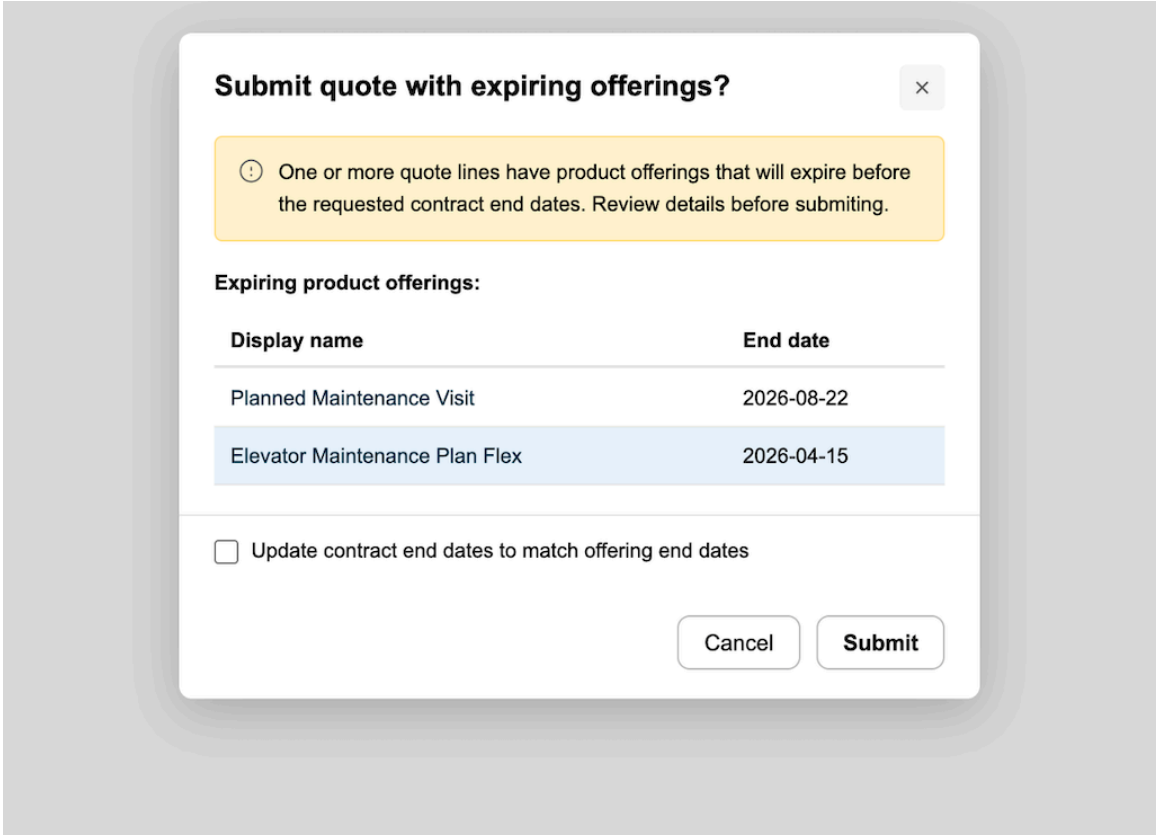
You cannot modify the renewal adjustment fields on the service contract. You can only modify the renewal adjustment values on the quote and orders.

Updating contract end date

During quote processing, the system alerts you when the contract end date is exceeding the product offering end date. When you submit quotes for approval, a dialog box appears alerting you. You can select the option **update contract end dates to match offering end dates** to match the contract end date to the product offering end date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Matching the contract and product offering end dates

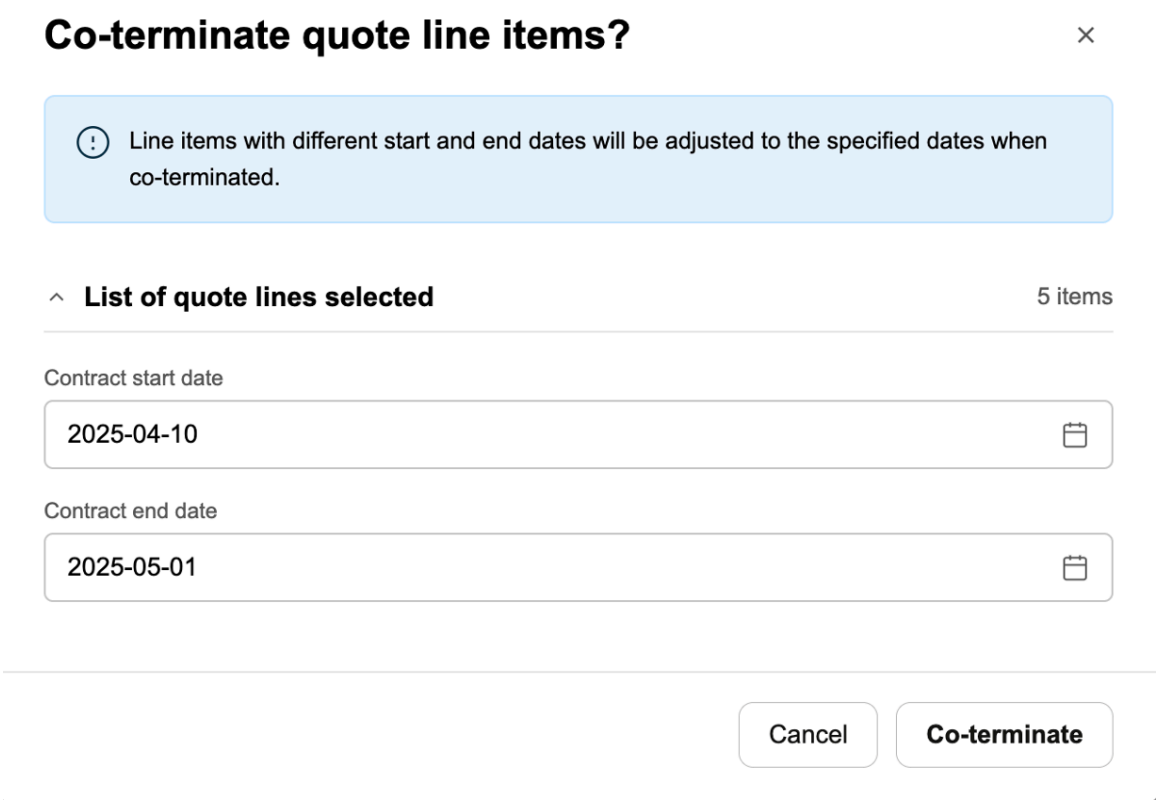


If you do not select this option and approve the quote, the contract end date remains the same.

Co-terminate quote lines

You can assign the same start and end dates to multiple quote lines while creating or renewing a quote. On the **Line items** tab on the quote details page, select multiple quote lines and then select **Co-terminate**. All the selected quote lines have the same start and end date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Viewing price ramps

Customers can scale their purchases by adjusting the pricing and quantity throughout the contract or subscription term by using Ramps feature. For more info, see Add price ramps on a quote line item. You can view the price ramp details on the contract line. Only the active price ramp segment is displayed on the contract line. Select a contract line and select **Ramps** to view all the details of the price ramp for that contract line. You can view start and end date, term period, ramp type (yearly or quarterly), ramp segments, and Annual percentage increase (API%).

Suspend a service contract

Suspend a service contract and its child service contract lines by creating an order on the CSM Configurable Workspace. Suspending a service contract suspends or disables the services specified in that service contract.

Before you begin

You can suspend a service contract when at least one of the associated root sold products is in Active state. For product inventory records, you can suspend a service contract when the associated product inventory record is in Active state.

Note:
If you don't create a resume order, the service contract is indefinitely suspended.

Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Suspend**.
5. In the Suspend service contract window, enter the period of suspension for the service contract in the **Start date and time** and **End date and time** fields.

   Note:
   If you do not enter a value in the **End date and time** field, the service contract is suspended indefinitely. You can resume the service contract manually. For more info, see Resume a service contract.

6. Add a reason for a suspension in the **Reason for suspension** field.
7. Select **Suspend**.
   An order with the suspend action is created for that service contract.
8. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract.

Result

With the service contract, all the associated service contract lines and entitlements are also suspended. However, the service contract stays in the current state. If you specify an end date and time, a resume order line item is created as a part of the same order. After this period of suspension, the service contract and all its associated child service contract lines and entitlement will be in Active or Draft state again. After the end date of the service contract, the suspended service contract and all its associated child service contract lines and entitlement move to Expired state.

Modify a service contract

Modify a service contract so that you can update its existing configurations.

Before you begin

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. Select **Modify all lines** to modify the service contract.
5. On the Configurator UI, modify the existing configurations for the service contract line.
   To learn more about the Configurator UI, see .

   Note:
   The Configurator UI is displayed only if the service contract has a single service contract line. For multiple service contract lines, a quote or an order will be created with contract lines in Draft or Active state.

6. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An order or a quote will be created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.

- If the selected target entity is a quote, a quote to modify the service contract is created. You can select the quote number from the confirmation message to view the modified quote line items. The quote is approved and the status changes to **Complete** to create an order.
- If the selected target entity is an order, an order to modify the service contract is created. You can click the order number from the confirmation message to view the modified order line items.

7. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract.

Resume a service contract

Resume a service contract and its child service contract lines by creating an order on the CSM Configurable Workspace. By resuming a service contract, you are restarting the services specified in that service contract.

Before you begin

You can resume a service contract when at least one of the associated root sold product is in Inactive, Canceled, or Suspended state. For product inventory records, you can resume a service contract when the associated product inventory record is in Suspended state.
Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. Select **Resume**.
5. In the Resume service contract window, in the **Start date and time** field, enter when you want to resume the service contract.
6. Add a reason for a resuming the service contract in the **Reason for resumption** field.
7. Select **Resume**.
   An order for resuming the service contract is created.
8. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract.

Result

The service contract and all its associated child contract lines and entitlements are back in Active or Draft state, depending on the start date of the respective entity.

Renew a service contract

Renew a service contract on the CSM Configurable Workspace before the service contract expires.

Before you begin

You cannot renew a service contract when it is in Canceled state or it does not have an end date. The order processing for product inventory based contracts are executed according to the fulfillment flow defined by the customer for these offerings being renewed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote or opportunity, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. Select **Renew**.
   The target entity is created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to renew the service contract is created. You can select the quote number from the confirmation message to review the renewal quote. After the quote is approved and the status is updated to **Complete**, an order is created for further processing.
   - If the selected target entity is an order, an order to renew the service contract is created. You can select the order number from the confirmation message to review the renewal order.
   - If the selected target entity is an opportunity, an opportunity to renew the service contract is created. You can select the opportunity number from the confirmation message to review the renewal opportunity.
   - If the selected target entity is an opportunity and a quote, both opportunity and quote to renew the service contract are created. You can navigate to the opportunity and quote by selecting the numbers from the confirmation message.
5. After the order line items are fulfilled, set the status to **Completed**.
   A new service contract is created.

Result

A new service contract is created in the Draft state. You can view more details in the Renewal History related list.

Cancel a service contract

Create an order to cancel a service contract and its child service contract lines on the CSM Configurable Workspace. By canceling a service contract, you are terminating the services specified in that service contract.

Before you begin

You can cancel a service contract when at least one of the associated root sold product is in Active or Suspended state. For product inventory records, you can cancel a service contract when the associated product inventory record is in Active or Suspended state.
Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. Select **Cancel**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All the associated service contract lines and entitlements will also be cancelled and will be set to the Cancelled state.

5. In the Cancel service contract window, in the **Start date and time** field, enter the date when the service contract will be cancelled.
6. Add a reason for a cancellation in the **Reason for cancellation** field.
7. Select **Cancel**.
   An order with the cancel action is created for that service contract.
8. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract.

Result

With the service contract, all the associated service contract lines and entitlements are also cancelled and will be in **Cancelled** state.

Suspend a service contract line

Suspend a service contract line and its child service contract lines by creating an order on the CSM Configurable Workspace. By suspending a service contract line, you are suspending or disabling the services and characteristics associated with that service contract line.

About this task

Before you begin

You can suspend a service contract line when the associated root sold product is in Active state. For product inventory records, you can suspend a service contract line when the associated product inventory record is in Active state.

Note:
If you don't create a resume order, the service contract line is indefinitely suspended.

Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. Select the service contract line from the service contract lines related list, that you want to suspend.
5. Select **Suspend**.
6. In the Suspend service contract line window, enter the period of suspension for the service contract line in the **Start date and time** and the **End date and time** field.

   Note:
   If you do not enter a value in the **End date and time**, the service contract line will be suspended. You can manually resume the service contract by using the resume option. For more info, see Resume a service contract line

7. Add a reason for a suspension in the **Reason for suspension** field.
8. Select **Suspend**.
   An order with the suspend action is created for that service contract line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract line.

Result

With the service contract line, all the associated entities in the hierarchy are also suspended. If you specify an end date and time, a resume order line item is created as a part of the same order. After this period of suspension, the service contract line will be in Active state again. After the end date of the service contract, the suspended service contract line and all its associated child service contract lines and entitlement move to Expired state.

Modify a service contract line

Modify a service contract line so that you can update its existing configurations.

Before you begin

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. In the service contract lines related list, select one ore more service contract line that you want to modify the characteristics and line items for.
5. Select **Modify** to modify the selected service contract lines.
6. On the Configurator UI, modify the existing configurations for the service contract line.
   To learn more about the Configurator UI, see .

   Note:
   The Configurator UI is displayed only if you select a single service contract line. If you selected multiple service contract lines, the order or quote created is displayed.

7. Select **Update**.
   An order or a quote will be created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to modify the service contract line is created. You can click the quote number from the confirmation message to view the modified quote line items. The quote is approved and the status changes to **Complete** to create an order.
   - If the selected target entity is an order, an order to modify the service contract line is created. You can click the order number from the confirmation message to view the modified order line items.
8. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resume a service contract line

Create an order to resume a service contract line and its child service contract lines on the CSM Configurable Workspace. By resuming a service contract line, you are restarting the services specified in that service contract line.

Before you begin

You can resume a service contract line when the associated root sold product is in Inactive, Cancelled, or Suspended state. For product inventory records, you can resume a service contract line when the associated product inventory record is in Suspended state.
Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. In the service contract lines related list, select the service contract line that you want to resume.
5. Select **Resume**.
6. In the Resume service contract line window, in the **Start date and time** field, enter when you want to resume the service contract line.
7. Add a reason for a resuming the service contract line in the **Reason for resumption** field.
8. Select **Resume**.
   An order for resuming the service contract line is created.
9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract line.

Result

With the service contract line, all the associated entities in the hierarchy are also back in Active or Draft state, depending on the start date of the respective entity.

Renew a service contract line

Renew a service contract line on the CSM Configurable Workspace. You can renew the services specified in the service contract line and its associated child service contract lines and entitlements.

About this task

You cannot renew a service contract line when it is in Canceled state or it does not have an end date.
The order processing for product inventory based contract lines are executed according to the fulfillment flow defined by the customer for these offerings being renewed.

Before you begin

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote or opportunity, you need sn_customerservice_manager and sn_sales_common.sales_agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, navigate to **Contracts and Entitlements** > **Service Contracts**.
3. In the service contract lists, select the service contract that you want to renew.
4. In the service contract lines related list, select the service contract line that you want to renew.
5. Select **Renew**.
   The target entity is created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to renew the service contract line is created. You can select the quote number from the confirmation message to review the renewal quote. After the quote is approved and the status is updated to **Complete**, an order is created for further processing.
   - If the selected target entity is an order, an order to renew the service contract line is created. You can select the order number from the confirmation message to review the renewal order.
   - If the selected target entity is an opportunity, an opportunity to renew the service contract is created. You can select the opportunity number from the confirmation message to review the renewal opportunity.
   - If the selected target entity is an opportunity and a quote, both opportunity and quote to renew the service contract are created. You can navigate to the opportunity and quote by selecting the numbers from the confirmation message.
6. Perform an early or late renewal on the service contract line.
   In early renewal, users can terminate the contract before the expiry date and create a new contract with the desired start date. For late renewal, users can renew expired contracts that are not renewed.
   - Select a date before the contract expiry date in the **Renew from** field to perform an early renewal. Two quote or order line items are created. One change order or quote line is created with the modified expiry date of the current service contract line. A new renewal quote or order line is created is created with the new start date.
   - For an expired contract line, enter a new date to renew the service contract line in the **Start from** field. A new renewal quote or order line is created with a new start date.
7. After the line items are fulfilled, set the status to **Completed**.
   A new service contract line is created.

Result

The new service contract line is created with the renewed contract line in the Draft state. You can view the new renewal line items in the Renewal History related list.

Cancel a service contract line

Create an order to cancel a service contract line and its child service contract lines on the CSM Configurable Workspace. By canceling a service contract line, you are canceling or disabling the services and characteristics associated with that service contract line.

Before you begin

You can cancel a service contract line when the associated root sold product is in Active or Suspended state. For product inventory records, you can cancel a service contract line when the associated product inventory record is in Active or Suspended state.
Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract.
4. In the service contract, select the service contract line from the service contract lines related list, that you want to cancel.
5. Select **Cancel**.
6. In the Cancel service contract line window, in the **Start date and time** field, enter the date when the service contract line will be disabled.
7. Add a reason for a cancellation in the **Reason for cancellation** field.
8. Select **Cancel**.
   An order with the cancel action is created for that service contract line.
9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the service contract line.

Result

With the service contract line, all the associated entities in the hierarchy are also cancelled and move to Cancelled state.

Upsell or Downsell a service contract line

Upsell or downsell a service contract line on the CSM Configurable Workspace. You can reduce or increase the quantities of the products specified in the service contract line.

Before you begin

Role required:

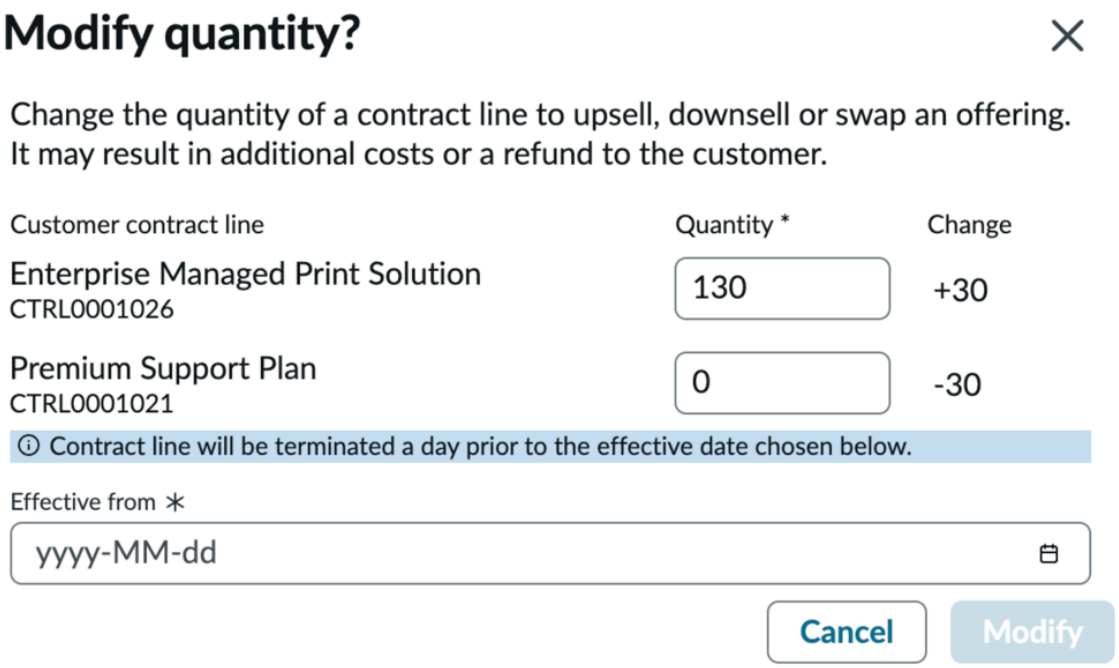
- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, navigate to **Contracts and Entitlements** > **Service Contracts**.
3. In the service contract lists, select the service contract that you want to update.
4. In the service contract lines related list, select one or more service contract lines that you want to modify.
5. From the **Modify entire line** list, select **Modify quantity**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Modify quantity dialog box, you can swap the values fully or partially in the **Quantity** field for both the contract



lines.

For example, if one product has a quantity of 100 and another has 30, you can perform either a full swap or a partial swap. In the screenshot above, a full swap is completed by updating the Quantity field of the first contract line to **130** (adding the 30 units from the second line) and setting the second contract line's quantity to 0. The Change field reflects the change in quantity.

You can also perform a partial swap. For instance, you can update the second contract line from 30 to 20, and add the remaining 10 units to the first contract line, increasing it from 100 to 110.

7. Select the start date of the new service contract line from the **Effective from** field.
8. Select **Modify**.
   The target entity is created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - In case of a partial swap, three quote lines are created. You can select the quote number from the confirmation message to view the quote line items. The quote is approved and the status changes to **Complete** to create an order with three order line items.
   - In case of a full swap, two quote lines are created. You can select the quote number from the confirmation message to view the quote line items. The quote is approved and the status changes to **Complete** to create an order with two order line items.
9. In the Line Items related list, select the State value of the parent order lines and set them to **Completed**.
   In case of partial swap, two new service contract lines with the modified quantities are created with the Start date as the **Effective from** date. The end date of the existing contract line is updated. In case of full swap, one new service contract line with the modified quantity is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

created with the Start date as the **Effective from** date. The end date of the existing contract line is updated.

> **Note:**
> You can perform a partial or a full swap with a new product from the catalog by following the same procedure.

Modify an entitlement

Modify an entitlement associated to an account so that you can update its existing configurations.

Before you begin

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the entitlement belongs to.
4. In the entitlements related list, select the entitlement that you want to modify the characteristics for.
5. Select **Modify**.

> **Note:**
> You can only modify entitlements associated with an account. You cannot modify entitlements associated to service contract lines.

6. On the Configurator UI, modify the existing configurations for the selected entitlement.
   To learn more about the Configurator UI, see Exploring Sales Customer Relationship Management.
7. Select **Update**.
   An order or a quote will be created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to modify the entitlement is created. You can click the quote number from the confirmation message to view the modified quote line items. The quote is approved and the status changes to **Complete** to create an order.
   - If the selected target entity is an order, an order to modify the entitlement is created. You can click the order number from the confirmation message to view the modified order line items.
8. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the entitlement.

Suspend an entitlement

Suspend an entitlement by creating an order on the CSM Configurable Workspace. By suspending an entitlement, you are suspending or disabling the services and characteristics associated with that entitlement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You can suspend an entitlement when the associated root sold product is in Active state. For product inventory records, you can suspend an entitlement when the associated product inventory record is in Active state.

Note:
You can only suspend entitlements associated with an account. You cannot suspend entitlements associated to service contract lines.

Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the entitlement belongs to.
4. In the entitlements related list, select the entitlement that you want to suspend.
5. Select **Suspend**.
6. In the Suspend entitlement window, enter the period of suspension for the entitlement in the **Start date and time** and the **End date and time** field.

   Note:
   If you do not enter a value in the **End date and time**, the entitlement will be suspended You can resume the entitlement manually by using the resume option. For more info, see Resume an entitlement.

7. Add a reason for a suspension in the **Reason for suspension** field.
8. Select **Suspend**.
   An order with the suspend action is created for that entitlement.
9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the entitlement.

Result

If you specify an end date and time, a resume order line item is created as a part of the same order. After this period of suspension, the entitlement will be in Active state again. After the end date of the entitlement, the suspended entitlement will move to Expired state.

Resume an entitlement

Resume an entitlement by creating an order on the CSM Configurable Workspace. By resuming an entitlement, you are restarting the services and the characteristics specified in that entitlement.

Before you begin

You can resume an entitlement when the associated root sold product is in Inactive, Cancelled, or Suspended state. For product inventory records, you can resume an entitlement when the associated product inventory record is in Suspended state.

Note:
You can only resume entitlements associated with an account. You cannot resume entitlements associated to service contract lines.

Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the entitlement belongs to.
4. In the entitlements related list, select the entitlement that you want to resume.
5. Select **Resume**.
6. In the Resume entitlement window, in the **Start date and time** field, enter when you want to resume the entitlement.
7. Add a reason for a resuming the entitlement in the **Reason for resumption** field.
8. Select **Resume**.
   An order for resuming the entitlement is created.
9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the entitlement.

Result

The entitlement is back in Active or Draft state, based on the start date of the entitlement.

Renew an entitlement

Renew an entitlement on the CSM Configurable Workspace.

Before you begin

You cannot renew an entitlement when it is in Canceled state or it does not have an end date. The order processing for product inventory based entitlements are executed according to the fulfillment flow defined by the customer for these offerings being renewed.

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote or opportunity, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the entitlement belongs to.
4. In the entitlements related list, select the entitlement that you want to renew.
5. Select **Renew**.
   The target entity is created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to renew the entitlement is created. You can select the quote number from the confirmation message to review the renewal quote. After the quote is approved and the status is updated to **Complete**, an order is created for further processing.
   - If the selected target entity is an order, an order to renew the entitlement is created. You can select the order number from the confirmation message to review the renewal order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the selected target entity is an opportunity, an opportunity to renew the service contract is created. You can select the opportunity number from the confirmation message to review the renewal opportunity.
- If the selected target entity is an opportunity and a quote, both opportunity and quote to renew the service contract are created. You can navigate to the opportunity and quote by selecting the numbers from the confirmation message.

6. After the order line items are fulfilled, set the status to **Completed**.
   A new entitlement is created.

Result
The new entitlement is created in the Draft state. You can see more details in the Renewal History related list.

Cancel an entitlement

Cancel an entitlement by creating an order on the CSM Configurable Workspace. By canceling an entitlement, you are canceling or disabling the services and characteristics associated with that entitlement.

Before you begin
You can cancel an entitlement when the associated root sold product is in Active or Suspended state. For product inventory records, you can cancel an entitlement when the associated product inventory record is in Active or Suspended state.

Note:
You can only cancel entitlements associated with an account. You cannot cancel entitlements associated to service contract lines.

Role required: sn_customerservice_manager and sn_ind_tmt_orm.order_agent

Procedure
1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the entitlement belongs to.
4. In the entitlements related list, select the entitlement that you want to cancel.
5. Select **Cancel**.
6. In the Cancel entitlement window, in the **Start date and time** field, enter the date when the entitlement will be disabled.
7. Add a reason for a cancellation in the **Reason for cancellation** field.
8. Select **Cancel**.
   An order with the cancel action is created for that entitlement.
9. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   The modifications are visible on the entitlement.

Result
The entitlement is permanently cancelled and will move to Cancelled state.

Add contract lines to a service contract

Add one or more contract lines to a service contract on the CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- To create an order, you need sn_customerservice_manager and sn_ind_tmt_orm.order_agent.
- To create a quote, you need sn_customerservice_manager and sn_sales_common.sales_agent.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. In the Contracts and Entitlements list, select **Service Contracts**.
3. In the Contracts and Entitlements - Service Contracts list, select the service contract to add more contract lines.
4. On the Service Contract form, select **New**.
   The target entity is created depending on the rules set in the Customer Life Cycle Workflows Policy decision table. For more info, see Configuring Customer Life Cycle Workflows Policy decision table.
   - If the selected target entity is a quote, a quote to create new service contract line is created.
   - If the selected target entity is an order, an order to create new service contract line is created.
   - If the selected target entity is an opportunity, an opportunity to create a new service contract line is created.
   - If the selected target entity is an opportunity and a quote, both opportunity and quote to create the service contract are created. You can navigate to the opportunity and quote by selecting the numbers from the confirmation message.

   The Existing contract field will refer the current service contract. All the other fields like Contract start date, Contract end date, and contract renewal fields will be auto-populated with the current contract details.
5. In the Catalog tab, add products to the new quote or order that is created.
   For more info, see Add products to a quote.
6. Select **Submit for approval**.
7. In the Order Line Items related list, double-click the State value of the parent order line and set it to **Completed**.
   On the Service Contract Line related list, a new service contract line is created and added.

Result

The new service contract line is added to the contract and is visible on the selected target entity.

Add Covered Products using Contracts and Entitlement Workflow

Covered products refers to specific products or order line items that are included in a service contract. These items are linked to the contract to define what is covered for service or maintenance. Covered products can be directly tracked through the contract records, facilitating changes and visibility of what is covered.

Agents in Order management can select the products to be covered by a contract when the order is captured for the contract offering. To manually associate a covered product with a contract line, see the Add covered products to order line items

You can also modify the covered products added to a contract line. You can add new covered products to that contract line or entitlement and remove the existing covered products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a sold product or install base item to a service contract

Add the sold products or the install base items covered to service contracts, contract lines, or entitlements.

Before you begin
Role required: sn_customerservice_manager

About this task
Sold products are products and components that have been sold to an account or a consumer and can have multiple contracts. An install base item is an instance of sold product that has been provisioned for an account or consumer.

Associating sold products or install base items to a Customer Contracts and Entitlements entity helps keep a track of the products or install base items that are serviced to a customer under that entity.

A sold product or an install base item can be added to a Customer Contracts and Entitlements entity in the Draft, Active, or Suspended states.

Note:
If an entity is deleted, the related sold product or install base item covered is also deleted.

Procedure

1. Navigate to the ServiceNow AI Platform interface or the CSM Configurable Workspace.
2. Add the sold product or install base item covered to service contracts, contract lines, or entitlements.

   Note:
   - You can either add a sold product or an install base item to the Customer Contracts and Entitlements entity.
   - The state of the entity shouldn't be Expired or Cancelled.

3. On the Sold Product Covered form, fill in the fields.
   For a description of the field values, see Sold product form.
4. Select **Submit**.

Record the usage on the entitlement

Record the consumption or usages made out of the total characteristic quantities allotted for an entitlement.

Before you begin
Role required: sn_customerservice_manager, sn_customerservice_agent and sn_customerservice.consumer_agent

About this task
When an entitlement moves to the Active state, usage records are created. You can update the usage records on the basis of units or quantities used as and when the customer uses the services. For example, if a characteristic includes 50 visits to the customer, then the Total units field displays 50 and the Used units field is updated after each visit. Managers can create and update usage records for an entitlement but agents can only update the Used units field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the ServiceNow AI Platform interface or the CSM Configurable Workspace.
2. Record the usage on an entitlement.
3. On the Entitlement Usage form, fill in the **Used units** field.
4. Select **Update**.
5. On the Entitlement page, select **Update** to save the entitlement.
   If you have used the Service Contracts menu to record the usage, then select **Update** to save the contract line and then the service contract.

Create a social media profile

Users with the customer service manager role can create a social media profile for an account, contact, or consumer.

Before you begin

Role required: sn_customerservice_manager or admin

Procedure

1. Navigate to an Account, Contact, or Consumer record.
   - **Customer Service** > **Customer** > **Accounts**
   - **Customer Service** > **Customer** > **Contacts**
   - **Customer Service** > **Customer** > **Consumers**
2. In the **Social Profiles** related list on the selected record, click **New**.
3. Fill in the fields on the Social Profile form, as appropriate.

Social Profile form fields and definitions

Field	Definition
Channel	The social media channel for this profile. For example, Twitter or Facebook. **Note:** This field is a reference to the Social Channels [sn_app_cs_social_social_channel] table.
Social ID	The user's name or handle for the selected social media channel.
Contact	If created from the Contact form, this field displays the name of the contact.
Consumer	If created from the Consumer form, this field displays the name of the consumer.
Account	If created from the Account form, this field displays the name of the account.
Profile URL	The link to the user's social media account.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Social media integration

Create a social media log entry

Users with the customer service manager role can create a social media log entry for a case.

Before you begin

Role required: sn_customerservice_manager or admin

About this task

If necessary, a customer service manager or administrator can create an entry on the **Social Logs** related list. The entries on this list are typically populated by the social integration tool.

Procedure

1. Navigate to the desired Case form.
2. From the **Social Logs** related list, click **New**.
3. Fill in the fields on the Social Log form, as appropriate.

Social Log form fields and definitions

Field	Definition
Social Profile	The social profile for the customer contact or consumer.
Agent	The agent participating in the conversation.
Social URL	The URL for the social conversation. Clicking this URL opens the conversation in a new tab.
Document	The related case number.
Message	The details of the conversation.

4. Click **Submit**.

Using customer data models for B2B2C

With the business-to-business-to-consumer (B2B2C) model, organizations across industries can easily configure multi-level customer relationships and support business customers who can support their end consumers.

Understanding the B2B2C model

The B2B2C model involves interactions where a business sells products or services to another business, which then provides these products or services to the end consumer. The functionality supports multi-layered relationships by capturing and organizing relevant data across both business entities and end consumers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits

- Improved Data Accuracy: By structuring data methodically, it confirms that information is accurate and up-to-date, reducing errors and enhancing decision-making capabilities.
- Enhanced Customer Insights: The data models provide a holistic view of both business customers and end consumers, enabling a better understanding of customer needs and preferences.
- Operational Efficiency: Streamlined data management processes lead to faster service delivery and issue resolution, improving overall operational efficiency.
- Scalability: As businesses grow, the data models can be scaled to accommodate more customers and complex relationships without compromising on data integrity.
- Personalized Service: With detailed customer data, businesses can offer tailored services and solutions, leading to higher customer satisfaction and loyalty.

Associating entities with account consumers

Topic	Description
Associate an account with consumers	Enable customer service managers to identify the end consumers who are using products or services and track customer information.
Associate sold products with account consumers	Enable customer service managers to track sold products or services by associating sold products or services with account consumers.
Associate install base items with account consumers	Enable customer service managers to track the instances provisioned by associating install base items with account consumers.
View install base information as an account consumer	Track the instances provisioned for your account and which products or services run on them by viewing a list of install base items.
View sold products information as an account consumer	Track the products or services sold to your account by viewing the list of sold products from the Customer Service Portal.

Associate an account with consumers

Enable customer service managers to identify the end consumers who are using products or services and track customer information.

Before you begin

Role required: sn_customerservice_manager

Procedure

1. Navigate to **All** > **Customer Service** > **Accounts**.
2. Select an account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Consumers** related list.
4. Select **New** to add an existing or new consumer.

Options and procedure

Option	Procedure
Add an existing consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select a consumer from the list.
Add a new consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select **New**. **c.** On the Consumer form, fill in the fields. **d.** Select **Submit**.

5. Select **Submit**.

Result
The selected consumer is associated with the account.

Associate sold products with account consumers

Enable customer service managers to track sold products or services by associating sold products or services with account consumers.

Before you begin
Role required: sn_customerservice_manager

Procedure
1. Navigate to **All** > **Customer Service** > **Products** > **Sold Products**.
2. Select a product that doesn't have a consumer associated with it yet.
3. Either add an existing consumer or a new one.

Options and procedure

Option	Procedure
Add an existing consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select a consumer from the list.
Add a new consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select **New**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	c. On the Consumer form, fill in the fields. **d.** Select **Submit**.

4. Select **Update**.

Result
The product is associated with the consumer.

Associate install base items with account consumers

Enable customer service managers to track the instances provisioned by associating install base items with account consumers.

Before you begin
Role required: sn_customerservice_manager

Procedure
1. Navigate to **All** > **Customer Service** > **Products** > **Install Base Items**.
2. Select an item that doesn't have a consumer associated with it yet.
3. Either add an existing consumer or a new one.

Actions and procedure

Action	Procedure
Add an existing consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select a consumer from the list.
Add a new consumer	**a.** In the **Consumer** field, select the Lookup using list icon ( ). **b.** Select **New**. **c.** On the Consumer form, fill in the fields. **d.** Select **Submit**.

4. Select **Update** to save your changes.

View install base information as an account consumer

Track the instances provisioned for your account and which products or services run on them by viewing a list of install base items.

Before you begin
Role required: sn_acct_consumer.consumer

About this task
View the list of install base items information from the Customer Service Portal.

Note:
The **Entitlements** widget and the **Contracts** widget aren't visible for account consumers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Customer Service Portal.
2. Select **Support** > **Install Base**.
   The system displays a list of install base items that belong to your account.
3. Select an install base to view its details.

> **Note:**
> The default view is the form view. If you switch to the list view, the **Account** and **Consumer** fields aren't displayed. See Configure the Install Base items and Sold Products lists for details.

View sold products information as an account consumer

Track the products or services sold to your account by viewing the list of sold products from the Customer Service Portal.

Before you begin

Role required: sn_acct_consumer.consumer

About this task

View a list of sold products to track the products or services sold to your account.

> **Note:**
> The **Entitlements** widget and the **Contracts** widget aren't visible for account consumers.

Procedure

1. Navigate to the Customer Service Portal.
2. Select **Support** > **Products**.
   The system displays a list of products that belong to your account.
3. Select a product to view its details.

> **Note:**
> The default view is the form view. If you switch to the list view, the **Account** and **Consumer** fields aren't displayed. See Configure the Install Base items and Sold Products lists for details.

Using CSM Data Classification

Introduced a new CSM Data Classification (sn_csm_dataprivacy) Store application that provides base system classifications for customer relationship management (CRM) data, categorizing it as internal, personally identifiable information (PII), confidential, and more. The solution leverages the ServiceNow AI Platform data privacy capabilities to apply appropriate protection measures and enhance data security.

Data Classification

As your organization imports and generates significant amounts of sensitive data, including PIIs, it's essential to conform with various privacy laws and security regulations for data protection. With CSM Data Classification, you can identify, categorize, and secure sensitive CRM data.

As an administrator, you can classify sensitive data based on predefined criteria that reflect the sensitivity levels of different data types within your instance. The CSM Data Classification application includes out of the baseline templates for several key plugins. For more details on creating custom templates, see Data classification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Protection

Once data is classified, you can apply appropriate security controls and policies based on classification levels. These templates help administrators review classifications and apply appropriate data protection measures. These data protection measures might include techniques such as anonymization, encryption, or implementing a zero trust architecture.

The solution leverages Data Classification capabilities to automate data handling policies at the ServiceNow AI Platform level through ServiceNow Vault. For detailed guidance on applying data protection measures, see ServiceNow Vault.

Customer communication

Prioritize clear, timely, and meaningful customer interactions to ensure satisfaction and loyalty. Leverage comprehensive suite of tools to facilitate robust customer communication and enhance service management practices.

Different ways of customer communication

Using Playbooks for Portals	Whether you're a customer service agent or a customer, you can use Customer Service Management (CSM) playbooks on service portals to complete the tasks and activities that you need to resolve your cases.
Using Walk-up Experience	Use the Walk-up Experience feature to check-in at a walk-up location, book appointments from the customer service portal, and monitor queues.
Using Auto-Responder for case deflections	Deflect cases by automatically sending relevant content through the Auto-Responder feature after a customer contact or consumer creates a case.
Using Omnichannel Callback for Customer Service Management	The ServiceNow Omnichannel Callback for Customer Service Management app enables a callback option for customers when there's a long wait time for a live agent.
Using the Customer Service Portal	Search for information about a question or an issue, or request assistance from a customer service agent.
Using the Consumer Service Portal	The Consumer Service Portal is a web interface that your company can use to provide information and support to consumers.
Using Conversational Appointment Booking	Customers can initiate an appointment booking conversation in a chat on your support portal using a Virtual Agent, and Agents can use Autopilot to display Virtual Agent topics during conversations.
Using the Business Location Service Portal	Use the Business Location Service Portal (BLSP) available with the Customer Service Management (CSM) application as a one-

Different ways of customer communication (continued)

	stop shop to manage the internal and external business locations.

Using Playbooks for Portals

Whether you're a customer service agent or a customer, you can use Customer Service Management (CSM) playbooks on service portals to complete the tasks and activities that you need to resolve your cases.

With Playbooks for Portals, you get a guided interface where you can take prompt actions on the pending tasks and activities that are related to your cases. You get the following key benefits by using Playbooks for Portals:

- Enhanced experience. Follow the step-by-step process that has features, such as save and resume, where you can initiate work on a case and then resume it later.
- Decreased case resolution time. Track and complete the requested tasks promptly and accurately. You can get a faster case resolution with Playbooks for Portals.
- Increased visibility. Get visibility into the status of the case and get insights into the expected resolution time.

The playbook includes multiple stages. Each stage has one or more activities to complete. You can see the activity stream against the case playbook, the task on the playbook, and the related information for the case as available. When using a playbook, you can do the following actions:

- View the stages and activities outlined in the playbook.
- Select an activity and carry out the required tasks to complete it.
- See the status indicators that display the current state of each activity or step.
- See the check boxes and counters that indicate where you are in the workflow.
- Mark an activity as complete and proceed to the next activity or stage.
- Continue completing the stages and activities necessary to submit the case.

Creating an onboarding case with Playbooks for Portals

Creating a guided onboarding case from CSM Configurable Workspace

Create an onboarding request from the service catalog

Creating an onboarding case with Playbooks for Portals

Whether you're a contact or a consumer, you can create an onboarding case with a case type that is based on the issue or request in either the Customer Service Portal or Consumer Service Portal.

Playbooks for Portals overview

With Playbooks for Portals, you get a clear roadmap where you can see your progress in the submission process and in the remaining steps that you have left to complete. If needed, you can easily navigate back to a previous step. To expedite the process, you’re presented with the options and input controls so that you can quickly and accurately input your information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additionally, you can save an application or form that is not yet ready for submission so that you can resume work on it later. After saving the case, you can access the playbook through the case lists and find your saved drafts in the case list view on the **My Draft Cases** tab.

These playbooks are designed to guide you through the steps of the intake process. Within the playbooks, you can locate the tasks that are assigned to the case, view all ongoing activities with the associated actions, and do the actions on the assigned tasks. The activity stream for the case playbook enables you to track your progress. If it's available, you can also see the related information about the case.

Navigating the catalog to create an onboarding request

You can navigate the catalog to create a new onboarding request from the Customer or Consumer Service Portals. For detailed steps, see Create an onboarding request from the service catalog.

Workflow steps

Let's see how a customer creates an onboarding case from Playbooks for Portals. The customer does the following actions:

1. Enters the basic information about themselves in a catalog item on one of the portals to open a new case.
2. Adds the details about their application.
3. Uploads the required documents that are needed to process their application.
4. Reviews and edits all the data before submitting the application.
5. Saves all changes and submits the case.

When the customer submits the case, the status of the case changes from Draft to New.

Note:
After an application is submitted, the customer can find and view the case updates in the portal by navigating to **My Lists** > **My Draft Cases**.

The following diagram shows how a customer creates a case.

Related topics

Creating a guided onboarding case from CSM Configurable Workspace

Create an onboarding request from the service catalog

Creating a guided onboarding case from CSM Configurable Workspace

An agent can create a case for a contact or a consumer when the contact or consumer reaches out through a phone call, email, or chat from the CSM Configurable Workspace.

Overview

If you're a customer accessing a playbook, you can track your progress in the submission process and see the step you’re on and the number of remaining steps that you have to do. Additionally, you can navigate back to a previous step, if needed. To expedite the process, you’re presented with some options and inputs that enable you to enter the correct information.

Creating a case

Let's see how an agent creates a case from Playbooks for Portals. The agent does the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Creates a case on behalf of the customer.
2. Collects the basic information about the customer to start the case.
3. Adds additional contacts to the application on behalf of the customer.
4. Uploads the documents that the customer may have sent.
5. Reviews and edits all the data for accuracy before submitting the application.

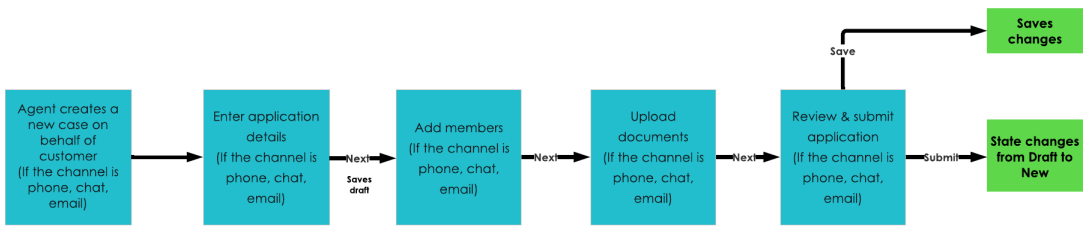
Note:

- The case status changes from Draft to New when it's submitted. The agent must review and choose whether to assign the case to themselves. If the case is assigned to another agent, the new agent must review the context of the case before assigning or accepting the case. The case status changes from New to Open when the case is assigned to an agent.

- If a case is created by an agent, a customer can later find and view the case from the portal for updates by navigating to **My Lists** > **My Draft Cases**.

The following diagram shows how an agent creates a case.

Agent creates a case



Processing a case

Let's see how an agent processes a case from Playbooks for Portals. The agent does the following actions:

1. Initiates the processing for a case by adding members, uploading documents, reviewing and submitting paperwork, and reviewing the case.
2. Pre-approves the case by checking the approval status, customer information, and customer record.
3. Checks the document checklist against the uploaded documents and then sends an email to the customer if there's a missing or invalid document.
4. Performs background checks, initiates legal verifications, and reviews the credit history.
5. Proposes a solution. The customer can accept the solution and then the agent closes the case. If the customer isn't satisfied with the proposed solution and rejects it, the case goes back to the **Open** state and the customer is notified of the status. The agent then needs to provide a new solution based on the customer input.

The following diagram shows how an agent processes a case.

3. In the case intake draft page, fill in the information that is related to the request.
4. Select **Submit**.

Result

The system processes the request, creates the request and any other related records, and displays the details in the Related Records widget on the case view page.

Using Walk-up Experience

Customers can use the Walk-up Experience feature to check in at a walk-up location and schedule or modify appointments from the Customer Service Portal. Walk-up Experience managers can access the CSM Walk-up Experience dashboard to monitor the performance of agents and service locations.

Customers can use the Walk-up Experience feature to complete the following tasks:

- Check in at a walk-up location and join a requester queue.
- Schedule an appointment or join a requester queue from the Customer Service Portal.
- Schedule an appointment as a guest user.
- Modify or cancel a walk-up appointment as a guest user.
- Monitor requester queues.

Walk-up experience technicians and managers can view and manage walk-up interactions and queues and view the CSM Walk-up Experience dashboard.

- CSM Walk-up Experience dashboard
- Manage queues and interactions

Check in at a walk-up location

As a store representative, you can enable customers to check in on arrival at your service location. The user is added to the requester queue after filling in some details and a reason for the visit.

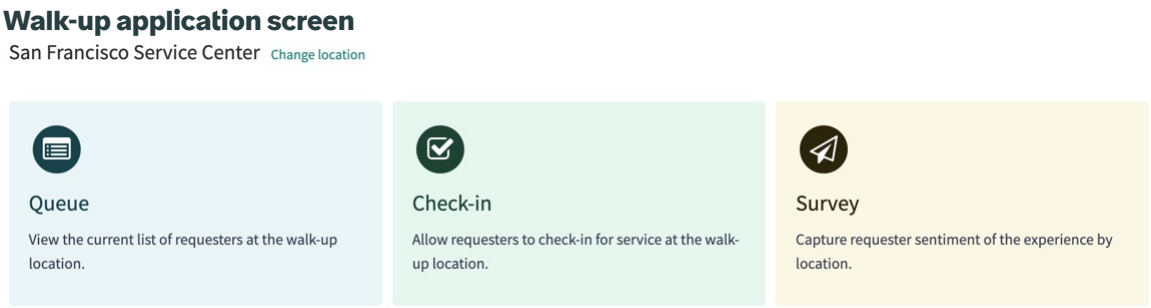
Before you begin

Role required: sn_walkup.walkup_login

About this task

A device at the store location runs the Walk-up application. The application welcome screen includes selections to check in for a service, view the list of requesters currently in the queue, and complete a survey. Both guest users and registered users can access the selections on the welcome screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Select **Check-in** from the Walk-up application screen.
2. Add details in the Check-in screen.

   If the system already has a contact or a consumer with the same details, it associates the interaction with that particular contact or consumer in the system.

   Check-in screen

3. Following check-in, you can view the queue status by selecting **Queue** from the Walk-up application screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Queue** widget enables you to view the list of requesters at the walk-up location. For more information, see Monitor Walk-up Experience queues.

Queue status screen

The **Survey** widget allows you to request the requester for feedback about the experience at the location. For more information, see CSM Walk-up Experience customer satisfaction surveys.

Schedule appointments or join a queue from the Customer Service Management portal

Customers must invest time in coming to a physical location for service. Ability to book appointments at a specific time helps plan visits to the service location. A slot is pre-assigned based on the appointment booking.

Before you begin

Role required: sn_walkup.walkup_login

Procedure

1. Log in to the customer portal.
2. Navigate to **Support**>**Walk-up Check In** from the portal header.
   The application searches for your nearest service center.
3. Select **Change location** and select the location you prefer from the drop-down list if you want to change the default location.

   The default location is set to the nearest service center based on your location information, once you allow the browser to access your location. You can pick the location manually if do now want to allow browser to detect your location.
4. Go to the **Schedule an appointment** tab to book an appointment.
5. Select a reason for your visit from the drop-down list.
   Related content that may help with your issue is listed at the bottom of the screen.
6. Select a reason for your visit from the drop-down list.
7. Select the Calendar icon ( ) and select the date and time of the appointment.
8. Select **Schedule Appointment**.

   You'll receive the following notifications by email when you perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Appointment confirmation, reminder, and cancellation.
- Survey email.

Note:
You can come back to the portal to reschedule or cancel the appointment if the appointment date hasn't passed.

Schedule a walk-up appointment as a guest user

Schedule walk-up appointments as a guest user from either the Customer Service Portal or Consumer Service Portal.

Before you begin
Role required: none

Procedure

1. Go to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.
2. Select **Walk-up Check-in**.
3. Select **Allow** to use your current location or select the location you prefer from the **Select the location** drop-down list.
   The Welcome to Walk-up Check-in screen is displayed.

   Note:
   A user with login credentials can also log in through the guest Walk-up Check-in link to book an appointment.

4. Select the **I'm not a robot** check box and verify that you aren't a robot.
5. Fill in the fields.

Guest user appointment fields

Field	Description
Enter your name	Your first name and last name.
Enter your email address	Your email address.
Enter your phone number (optional)	Your phone number. **Note:** This field doesn't accept alphabetical characters.
What is the reason for your visit?	The reason for your visit.
When do you want to visit?	The date you want to visit. Click the calendar icon, select the desired date and time for the appointment, and click **Select**.

The default location name, description, hours of operation, and **Get Directions** link are displayed on the right.

Note:
If you have chosen to select a location, the **View on map** link appears instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** Change the location manually.
   a. Click **Change Location**.
   b. Select a location from the drop-down list.
7. Click **Schedule appointment**.
   You'll receive a verification email.

   Note:
   You can also select **Cancel appointment** on the same Welcome to Walk-up Check-in screen. Confirm the cancellation in the dialog box that appears and cancel the appointment.

8. Select **Verify** or select the link to confirm your appointment from the email you receive.
   The appointment is confirmed and the details are displayed on the confirmation screen. If you want to verify your appointment once this screen Is no longer displayed, you can select the link in the appointment confirmation email to display it again.

Modify or cancel a walk-up appointment as a guest user

Modify or cancel walk-up appointments that you have scheduled.

Before you begin

Role required: none

Procedure

1. Open the appointment confirmation email that you received.
2. Click the link in the email to modify or cancel your appointment.
   A One-time Passcode Verification tab opens in the browser and an email containing a one-time passcode (OTP) and a link to verify your appointment is sent.
3. Enter the OTP in the verification tab and click **Continue** or click **Verify your Appointment** in the email.
   The OTP option is useful when you are handling multiple devices to check emails and book appointments. For example, you can view the email with the OTP on your mobile and enter the OTP while booking an appointment on your desktop.

   Note:
   The link expires after a certain time.

   The Your Appointment details screen opens.
4. Either cancel the appointment or modify it.
   - To cancel the appointment, click **Cancel appointment**. You will receive an email to confirm that your appointment is cancelled.
   - To modify the appointment, modify the details and click **Update**.

Monitor Walk-up Experience queues

Once you check in at a location, you are notified of the wait time and your position in the queue. You can view the issues being serviced and the queue.

Before you begin

Role required: Customers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the customer service portal.
2. Select your location.
3. Click the **Queue** widget.
4. You can view the following information:
   - queue of everyone waiting for service
   - names of people who are ahead of you
   - status of people currently served and waiting in the queue
   - respective agents who are serving the customers

CSM Walk-up Experience dashboard

As a service manager you can see key metric reports for walk-up interactions which helps in monitoring the performance of agents and service locations.

Access the dashboard by navigating to **All** > **Platform Analytics** > **Library** > **Dashboards**. To view detailed information, hover over any report graphic. You can save graphs as PNG or JPEG files and attach them to emails or include in reporting presentations. All graphs can be refreshed for the latest data. The following screen is an example of how the dashboard appears.

Average Service Time by Location		Average time it takes to close an interaction, by location. Time average shown as a spline by month.
Average Wait Time by Location		Average time a walk-up guest waits for service, by location. Data shown as a bar chart.

Walk-up Experience queue and interaction management

Walk-up Experience managers and technicians can efficiently manage all aspects of a walk-up location queue and interaction demand. Technicians can view assigned walk-up locations and interactions for walk-up fulfillment.

Walk-up Experience provides technicians with inclusive fulfiller resources to organize and manage a walk-up queue.

As a Technician you can access CSM Configurable Workspace to manage a walk-up interaction. Using CSM Configurable Workspace you can:

- Access a personal inbox to view work assigned from multiple service channels, including the Walk-up Service Channel.
- Get assignments automatically pushed to your inbox from the walk-up interaction queue.
- Work on concurrent or multiple interactions at the same time.
- Promote interactions to cases.
- Work with any requester in the queue at any time by pulling from anywhere in the queue list, as well as from the top of the list.
- Create cases for interactions
- Manually pick an interaction specific to a requestor
- Use Agent Assist to expedite fulfillment.

As a technician you can typically fulfill interactions on a first-come-first-served basis as interactions are pushed to individual walk-up inbox. Interactions are distributed to the walk-up agent inbox based on assignment rule configurations in the Advanced Work Assignment feature.

Technicians can directly open cases in CSM Configurable Workspace when an issue is not resolved at the walk-up location.

Walk-up Experience also includes a **Technician** module in the application navigator where agents supporting a walk-up queue can perform the following actions:

- Access the personal walk-up inbox linking directly to Agent Workspace.
- View assigned walk-up interactions.
- Reassign and modify walk-up interactions when necessary.
- View all scheduled and upcoming appointments.
- View walk-up queue locations.
- Transfer walk-up interactions to other technicians or queue locations when necessary.

The following applications are included in the platform **Technician** module of the CSM Walk-up Experience navigation bar as well as viewed in the CSM Configurable Workspace under Walk-up:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Walk-up Experience technician applications

UI view and application	Description
Platform: **My Walk-up Inbox** CSM Configurable Workspace: **Inbox**	View walk-up interactions assigned to you in your personal inbox in CSM Configurable Workspace. Advanced Work Assignment pushes interactions to your inbox according to assignment rule configurations.
Platform: **My Walk-up Locations** CSM Configurable Workspace: **Walk-up Locations**	View walk-up queue locations that you are assigned to support by physical address.
Platform and CSM Configurable Workspace: **My Assigned Walk-ups**	View walk-up interactions you are assigned to resolve or fulfill. These interactions have a **Work in Progress** state. You can also see your assigned interactions in your personal inbox on Agent Workspace.
Platform and CSM Configurable Workspace: **Open - Unassigned**	View all open and unassigned walk-up interactions for your queue locations. These interactions have either a **New**, **Queued**, or **Work in Progress** state.
Platform and CSM Configurable Workspace: **Closed Walk-ups**	View all closed walk-up interactions. Closed interactions have either a **Closed Complete** or **Closed Abandoned** state.
Platform: **Scheduled Appointments** CSM Configurable Workspace: **Appointments**	View all upcoming appointments scheduled for your walk-up queue.

View assigned Walk-up Experience location

Walk-up Experience technicians can view a list of the walk-up queues they're assigned to support. Location queues reveal all the information that a technician must know to operate the queue efficiently.

Before you begin

Role required: sn_csm_walkup.walkup_technician

About this task

There are two ways technicians can view the walk-up location queues they're assigned to support. Technicians primarily access CSM Configurable Workspace for all CSM Walk-up Experience related information, including locations. However technicians can also access CSM Walk-up Experience in the application navigator, or side navigation bar, to view assigned queue locations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To view walk-up locations, open CSM Configurable Workspace.
2. Select **List** in the left navigation bar.
3. Under **Walk-up**, select **Walk-up Locations**.
   Walk-up locations you're assigned to support are listed.
4. Select a queue name to view details about the location, such as, interactions, appointments, reasons for visits, and more.
5. Alternatively, to view walk-up locations via the application navigator, navigate to **CSM Walk-up Experience** > **Technician** > **My Walk-up Locations**.
6. Select a queue name to see details about the location, such as, interactions, appointments, reasons for visits, and more.
   If interactions are leftover from a previous day or are still queued in the end with no associated guests at the queue, you can select **Abandon All** to cancel these interactions.

View Walk-up Experience inbox

View a personal inbox of automatically assigned Walk-up Experience interactions using the CSM Configurable Workspace feature interface.

Before you begin
Role required: sn_csm_walkup.walkup_technician

About this task
There are two ways technicians can view the walk-up inbox. Technicians primarily access CSM Configurable Workspace for all Walk-up Experience related information, including the inbox. However technicians can also access CSM Walk-up Experience in the application navigator, or navigation bar, to link to and view the inbox in CSM Configurable Workspace.

Procedure

1. To view the walk-up inbox, open CSM Configurable Workspace.
2. Select **Inbox** in the navigation bar of the interface.
   Automatically pushed interaction assignments appear in the inbox based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature. Technicians can set an inbox status of **Available**, **Away**, and **Offline**.
3. Alternatively, to view the walk-up inbox via the application navigator, navigate to **CSM Walk-up Experience** > **Technician** > **My Walk-up Inbox**.
   You're linked directly to your personal inbox in CSM Configurable Workspace. Automatically pushed interaction assignments appear in the inbox based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature.

Manage automatically assigned Walk-up Experience interactions

Technicians supporting CSM Walk-up Experience locations can view and manage interactions automatically pushed to the CSM Configurable Workspace inbox.

Before you begin
Role required: sn_csm_walkup.walkup_technician

About this task
Walk-up Experience interactions can be automatically pushed to a personal inbox in CSM Configurable Workspace based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature. Technicians fulfill interactions on a first-come-first-served basis as they appear in the inbox.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To manually assign and manage interactions using the CSM Walk-up Experience Technician modules found in the application navigator, refer to Manage Walk-up Experience interactions manually.

Technicians set a status in the CSM Configurable Workspace inbox to indicate readiness to accept interactions. Status choices are **Available**, **Away**, and **Offline**.

Even though interactions are automatically pushed to the walk-up inbox, agents can work with anyone in the walk-up queue at any time.

View walk-up queue interactions assigned to you automatically in your walk-up inbox or in your **My Assigned Walk-ups** list. You can also view all **Open - Unassigned** interactions for the queue you support.

With CSM Configurable Workspace you can view lists of all your related walk-up interactions and appointments, your cases, customer accounts and contacts, incidents, requests, and more using one convenient interface. The Walk-up Experience related interaction list includes the following items:

Walk-up Experience related interaction list

List item	Description
My Assigned Walk-ups	Interactions you assign to yourself when you accept an active interaction or that are assigned to you. Agents assign interactions to themselves when they accept a queued interaction. Managers can assign interactions to specific agents. These interactions are in a Work in Progress state. Once assigned, an agent can transfer the interaction to another agent or queue to complete the work, if necessary.
Open — Unassigned	All open but unassigned interactions associated with your specific walk-up queue location. When a guest checks into a walk-up queue, an interaction is created. The interaction is Queued until an agent accepts it or is assigned the interaction. At that point, the state changes to Work in Progress.
Closed Walk-ups	All Closed Complete and Closed Abandoned interactions assigned to a specific walk-up location queue. Agents can abandon an interaction when a guest leaves the queue before receiving support.

Procedure

1. To begin supporting a walk-up queue guest, open CSM Configurable Workspace.
2. Select **Inbox** and ensure your status is set to **Available**.
   You can view interactions in your inbox that are automatically assigned to you.
3. Select the interaction at the top of the list and begin resolving the issue or fulfilling the request.

   When you create an associated case, a **New Case** tab opens next to the **Details** tab of the original interaction. Fill out the new case form. Select **Save** to save the new case.

   If an interaction requires an unusual amount of time to resolve or fulfill, you can place the interaction on hold. The requester does not lose position in the queue and you can help another requester simultaneously. Placing an interaction on hold does not affect your capacity for new interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To put an interaction on hold, select **Put on Hold**.

b. You can associate the interaction with another record by selecting **Associate Record** from the more UI actions icon ( ) in the interaction header.

c. If you cannot resolve an issue, select **Create Case** in the interaction header.

When you create an associated case, a **New Case** tab opens next to the **Details** tab of the original interaction. Fill out the new case form. Select **Save** to save the new case.

4. When you finish resolving the interaction, select **Close** in the interaction header.
Closing an interaction affects your capacity and can result in new interactions being pushed to your inbox.

Manage Walk-up Experience interactions manually

Technicians supporting walk-up locations can manually manage queue requests with several CSM Walk-up Experience interaction-related modules.

Before you begin

Role required: sn_csm_walkup.walkup_technician

About this task

Manage interactions manually using the CSM Walk-up Experience Technician modules found in the application navigator. To manage automatically assigned interactions from the CSM Configurable Workspace inbox, refer to Manage automatically assigned Walk-up Experience interactions.

Walk-up queues support guests in the order that they check into the queue — first come, first served. Technicians supporting the queue can decide who will work the first interaction. As new guests enter the queue and submit interactions, technicians share the workload, assigning queued interactions to themselves.

View walk-up queue interactions using several Walk-up Experience modules:

Walk-up Experience interaction modules

Module	Description
My Assigned Walk-ups	Interactions you assign to yourself when you accept an active interaction or that are assigned to you. Agents assign interactions to themselves when they accept a queued interaction. Managers can assign interactions to specific agents. These interactions are in a Work in Progress state. Once assigned, an agent can transfer the interaction to another agent or queue to complete the work, if necessary.
Open — Unassigned	All open but unassigned interactions associated with your specific walk-up queue location. When a guest checks into a walk-up queue, an interaction is created. The interaction is Queued until an agent accepts it or is assigned the interaction. At that point, the state changes to Work in Progress.
Closed Walk-ups	All Closed Complete and Closed Abandoned interactions assigned to a specific walk-up location queue. Agents can abandon an interaction when a guest leaves the queue before receiving support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To begin supporting a walk-up queue guest, navigate to > **CSM Walk-up Experience** > > **Technician** > **Opened - Unassigned**.
   The Interactions list opens.
2. Find the guest name under the **Opened for** column of the Interactions list.
3. Click the interaction **Number** associated with the guest.
4. Enter your name in the **Assigned to** field on the form, change the **State** to **Work in Progress**, and click **Update**.
   a. To close an interaction if the guest has left the queue, click **Abandon** in the form header or choose **Closed Abandoned** from the **State** form field and click **Update**
   b. Alternatively, you can associate the interaction with another record by clicking the **Associate Record** button in the interaction header.
5. To resolve the interaction, navigate to **Walk-up Experience** > **Technician** > **My Assigned Walk-ups**.
6. Click the interaction number from the list to open the Walk-up Interaction form.
7. Resolve the issue or fulfill the request.
   a. Change the interaction status to **On Hold** if the requester is not present for an appointment or if the interaction entails a lengthy process, for example, an OS upgrade.
   b. If you cannot resolve the issue or fulfill the request, click the **Create Case** related link to create a case.

   When you create a case, the associated related lists on the form populate. Related lists include the following details:
   - Cases for Interaction: Cases associated with the interaction
   - Cases by Same Caller: Cases created for a walk-up guest

   When you finish resolving the interaction, change the interaction **State** to **Closed Complete** and click **Update** to update the interaction. Alternatively, you can click **Close** to complete the interaction.
8. When you finish resolving the interaction, change the interaction **State** to **Closed Complete** and click **Update** to update the interaction.
   You can also click **Close** to complete the interaction.

View and manage Walk-up Experience appointments in Agent Workspace

Viewing upcoming scheduled CSM Walk-up Experience appointments provides technicians with an estimate of future queue demand and workload. Managers can view future appointments and adjust staffing at walk-up queue locations to best support demand.

Before you begin

Role required: sn_csm_walkup.walkup_technician

About this task

Technicians and managers primarily use CSM Configurable Workspace for all Walk-up Experience related information, including viewing and managing scheduled appointments.

Note:
You can also view and manage scheduled appointments from the CSM Walk-up Experience in the application navigator, or left navigation bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Appointments are automatically routed to your CSM Configurable Workspace inbox based on availability. You can also view a list of scheduled appointments and choose which one to accept.

Upcoming appointments also display with a small calendar icon next to the user name on the onsite walk-up location queue wall monitor. The user with an appointment appears on the monitor a short time before the appointment is scheduled to begin.

Note:
Upcoming appointments are also displayed on the online check-in screen with the same calendar icon next to the user name.

Procedure

1. Open CSM Configurable Workspace.
2. Select **List** in the left navigation bar.
3. Under **Walk-up**, select **Appointments**.
   Walk-up appointments assigned to your queue are listed.
4. Select an appointment number to view details, such as the requester name, the interaction number and description, and the appointment time.

   a. To open the associated interaction to view details, select the Open record icon next to the interaction number.

   b. Select **Accept appointment** to begin working on the interaction.

      If necessary, you can assign the appointment to another agent and add work notes.

      If a significant amount of time has passed and the requester doesn't show up for the appointment, you can delete the appointment by selecting the More UI actions icon in the interaction header and choosing **Delete**.

   c. Select **Save** to save any changes you make to the appointment interaction.

Manage appointments in the navigator

Viewing upcoming scheduled Walk-up Experience appointments provides technicians with an estimate of future queue demand and workload. Managers can view future appointments and adjust staffing at walk-up queue locations to best support demand.

Before you begin
Role required: sn_csm_walkup.walkup_technician

About this task
Technicians and managers can view and manage scheduled walk-up appointments from Walk-up Experience in the application navigator, or left navigation bar.

Note:
Primary access is through CSM Configurable Workspace for all Walk-up Experience related information, including scheduled appointments.

Upcoming appointments also display with a small calendar icon next to the user name on the onsite walk-up location queue wall monitor. The user with an appointment appears on the monitor a short time before the appointment is scheduled to begin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CSM Walk-up Experience** > **Technician** > **Scheduled Appointments**.
   All walk-up appointments scheduled for the upcoming 14 days display.
2. Click an appointment number to view details, such as the requester name, the interaction number and description, and the appointment time.

   a. If desired, to preview the associated interaction details, click the preview record icon next to the appointment number.

   b. To begin working on the interaction, click **Accept appointment** on the **Walk-up Appointment** form.

      If necessary, you can assign the appointment to an agent and add work notes.

      If a significant amount of time has passed and the requester does not show up for the appointment, you can delete the appointment by clicking **delete**.

   c. Click **Update** to save any changes you make to the interaction form.

Using Auto-Responder for case deflections

Deflect cases by automatically sending relevant content through the Auto-Responder feature after a customer contact or consumer creates a case.

Whenever a case is created, the Auto-Responder feature sends an email notification containing a list of relevant knowledge articles. The email notifications are sent to the case submitter and watchlist users associated with the case.

By default, the feature sends the email notification for customer service cases logged using emails by users with the snc_external role. Your administrator can also configure the feature for customer service cases logged using other communication channels such as web, phone, chat, social, community, alert, and virtual agent.

The knowledge articles in an Auto-Responder email notification are included based on contextual search results of the short description of the case. By default, the articles that a case submitter viewed in the last 30 days aren't included. Your administrator can configure the duration of last viewed content by using a scripted extension point. For more information, see Include advanced contextual search results in Auto-Responder notifications.

As a case submitter or watchlist user, you can determine whether you receive any Auto-Responder notifications by setting notification preferences. For more information, see Set Auto-Responder notification preferences.

Activation information

Activate the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml) and enable the **Enable auto-responder recommendations** property (*sn_customerservice.case.autoresponder.enable*). For more information, see Configure Auto-Responder notifications.

Close a case from a knowledge article recommended in an Auto-Responder notification

View knowledge articles included in the email notification sent by the Auto-Responder feature for a customer service case and close the case from within a helpful knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: snc_external role or watchlist users associated with the customer service case

Log in to your portal containing the case.

About this task
By default, the Auto-Responder feature sends knowledge articles as helpful content to solve a customer service case submitted using an email.

Procedure
1. Open the knowledge article link from the email notification sent by Auto-Responder.
2. Read the knowledge article to see whether it resolves a case.
3. If the knowledge article provides a solution, in the Related Case section of the article, click **Close Case**.
4. In the message window that appears, click **Close Case**.

Result
An information message about the case being closed appears. If any case was closed by using a knowledge article link accessed from an Auto-Responder email notification, a **View Case** button appears in that article. Click the button to view the details of the case that was closed.

Set Auto-Responder notification preferences

Set notification preferences for receiving Auto-Responder recommendations on customer service cases you submitted or for which you are on the watchlist.

Before you begin
Role required: snc_external role or watchlist users associated with the customer service case

Ensure that an administrator has configured the Auto-Responder feature. For more information, see Configure Auto-Responder notifications.

Procedure
1. Navigate to your portal page.
2. Click your username or photo in the portal header, and then click **Profile**.
3. On the User Profile page, scroll down to the Actions section, and click **Notification Preferences**.
4. On the Notification Preference window, select or clear the **Case auto-responder recommendations** check box to turn the Auto-Responder notifications on or off for you.

Using Omnichannel Callback for Customer Service Management

The ServiceNow® Omnichannel Callback for Customer Service Management app enables a callback option for customers when there's a long wait time for a live agent.

For more information, see Omnichannel Callback.

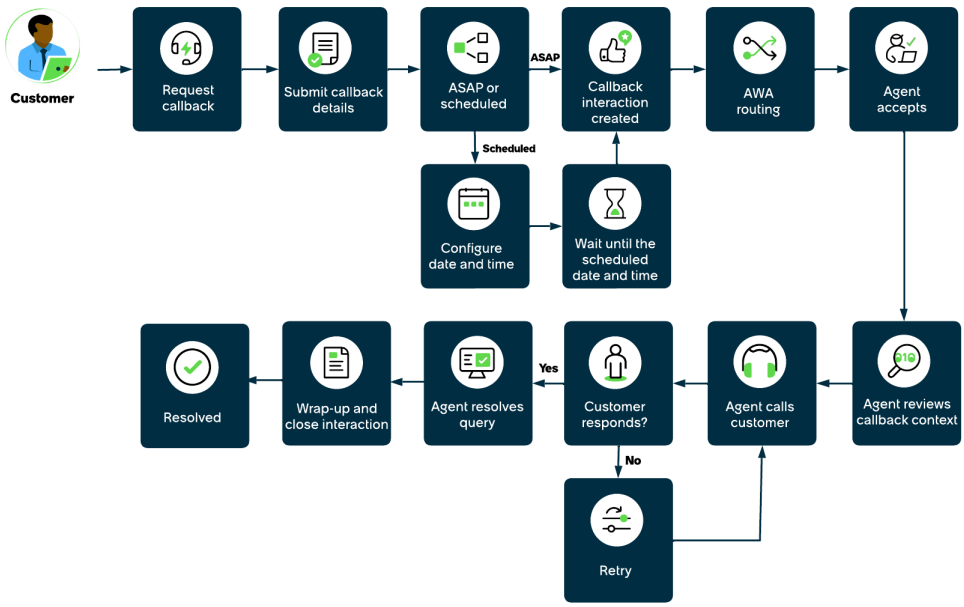
Callback flow

The callback workflow proceeds as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Customers are presented with an option to request a callback when the estimated wait time to reach an agent is too long or when agents are unavailable.
2. The customer enters callback details such as name, contact details, and the reason for the callback.
3. Customers request a callback as soon as possible or at a specified date and time.
4. A callback interaction is created immediately for an immediate callback request or a minute before the selected time for a scheduled callback request.
5. The ServiceNow® Advanced Work Assignment (AWA) application determines the availability of agents and creates a callback work item for an available agent. AWA adds the callback task to the callback queue. The agent then receives a Callback notification in the workspace inbox.
6. The agent can choose to review the callback context such as knowledge base article views, searches, and Virtual Agent conversation before calling the customer.
7. The agent calls the customer.
   - If the customer accepts the call, the interaction is marked as complete when the call ends.
   - If the customer doesn't accept the call, the agent can retry the callback later.
8. The agent can decide to close the interaction or queue the callback again manually from the workspace.

Callback flow diagram



Callback requests

Immediate callback request

Customers can request a callback immediately. The customers are shown the average time that the agent will take to call back. This request prevents them from having to wait in the queue to connect with an agent.

Scheduling a callback request

Customers can request a callback by selecting the preferred date and time. The customer will receive a confirmation of the scheduled callback request via email.

Rescheduling a callback request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customers can reschedule the callback request by choosing from a list of upcoming dates and times for callback requests.

Cancelling a callback request

Customers can cancel scheduled callbacks from the self-service channel they requested the callback from.

Callback channels

Customers can request a callback during a chat on Virtual Agent or Engagement Messenger, or from Customer Service Portal. They can request either a phone callback or a video callback on Zoom. Video callbacks must be scheduled but phone callbacks can be requested immediately or scheduled.

Working with callback requests from an agent

Customers can request a callback from an agent when the wait time to reach an agent is too long or agents are unavailable.

Callback requests by customers

Customers can request a callback either as soon as possible or at a preferred date and time from one of the following channels:

- Virtual Agent
- Customer Service Portal
- Engagement Messenger

Customers can request an immediate callback on a voice channel such as phone or schedule a video callback over Zoom.

Callback requests for agents

The agents can perform the following actions:

- Review the context of the interaction such as knowledge base article views, search history, and the Virtual Agent conversation before calling the customer to become familiar with the context.
- Use the **Click-to-call** button to make a voice call to a customer either as soon as possible or at a scheduled date and time.
- Use the Zoom meeting URL to make a video call to a customer at a scheduled date and time.
- Retry the callback if the customer does not accept the call.
- Reroute the callback request to a different agent.

Working with callback requests using Virtual Agent

As a customer, you can request a callback from a customer service agent through a Virtual Agent conversation. You can request an immediate voice callback or schedule a voice or video callback that you can reschedule or cancel.

For more information about setting up Omnichannel Callback, refer to Configuring Omnichannel Callback

Request a callback from a Virtual Agent chat

Request an immediate voice callback or schedule a voice or video callback from a Virtual Agent chat on the ServiceNow portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
You can request an immediate callback only for a voice channel. Use the **Schedule for later** option to request a video call.

Procedure
1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select the Chat icon ( ) to open the chat window and begin a Virtual Agent chat.
3. Select **Show me everything**.
4. Select **Request a callback**.
5. Enter your phone number and a reason for requesting the callback.
6. Select whether to receive an immediate voice callback from an agent or schedule a voice or video callback for later.

Result
- A callback request is created.
- The chat shows the details of the callback time, either the estimated time until the agent phones back or the scheduled date and time set for the phone or video call.
- A confirmation email is sent.

Reschedule a callback from a Virtual Agent chat

Reschedule a callback from a Virtual Agent chat on the ServiceNow portal.

Before you begin
Role required: none

About this task
Only logged-in users can reschedule callbacks.

Procedure
1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select the chat icon ( ) to open the chat window and begin a Virtual Agent chat.
3. Select **Show me everything**.
4. Select **Reschedule a callback**.
5. Reschedule the upcoming callback request or a different request.
   - To reschedule the upcoming callback request, select **Yes**.
   - To reschedule a different request, select it from the list of requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Choose a date and time from the calendar and click **Schedule**.
   The date and time slots indicate the agent's availability.

Result
The request is rescheduled.

A confirmation message is displayed in the chat.

A confirmation email is sent.

Cancel a callback from a Virtual Agent chat

Cancel a callback from a Virtual Agent chat on the ServiceNow portal.

Before you begin
Role required: none

Procedure
1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select the chat icon ( ) to open the chat window and begin a Virtual Agent chat.
3. Select **Show me everything**.
4. Select **Cancel a callback**.
5. Cancel the upcoming callback request or a different request.
   - To cancel the upcoming callback request, select **Yes**.
   - To cancel a different request, select it from the list of requests.
6. Confirm the cancellation in the confirmation message.

Result
- The callback request is canceled.
- The chat shows the details of the canceled callback request.
- A confirmation email is sent.

Working with callback requests using the Customer Service Portal

As a customer, you can request a callback from a customer service agent using the Customer Service Portal. You can request an immediate callback or schedule a voice or video callback that you can reschedule or cancel.

Request a callback using the Customer Service or Consumer Service Portal

Request an immediate voice callback or schedule a voice or video callback from an agent using the Customer or Consumer Service Portal.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.consumer

About this task
You can request an immediate callback only for a voice channel. Use the **Call me later** option to request a video call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select **My Lists** in the portal header and then select **My cases**.
3. Select the case for which you need support.
4. In the **Actions** section, select **Request callback**.
5. In the Request a callback pop-up window, enter your name, phone number, issue type, and description.
6. Select whether to receive an immediate voice callback from an agent or schedule a voice or video callback for later.
7. Select **Submit**.

Result

- A callback request is created.
- The details of the callback request are available in the Callback tab.
- A confirmation email is sent.

Reschedule a callback using the Customer Service or Consumer Service Portal

Reschedule a callback from an agent using the Customer or Consumer Service Portal.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.consumer

About this task

You can reschedule a callback request to receive a phone or video call from an agent.

Procedure

1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select **My Lists** in the portal header and then select **My cases**.
3. Select the case for which you need support.
4. In the **Callbacks** tab, select the callback request that you want to reschedule.
5. Select **Reschedule**.
6. Choose a date and time from the calendar.
   The date and time slots indicate the agent's availability.
7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The callback request is rescheduled.
- The pop-up window shows the details of the rescheduled callback.
- A confirmation email is sent.

Cancel a callback using the Customer Service or Consumer Service Portal

Cancel a callback from an agent using the Customer or Consumer Service Portal.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.consumer

Procedure

1. Navigate to the Customer Service Portal or Consumer Service Portal home page by adding the suffix `/csm` or `/csp` to your instance URL.

   Example
   For example: `https://yourportalurl.com/csm`
2. Select **My Lists** in the portal header and then select **My cases**.
3. Select the case for which you need support.
4. In the **Callbacks** tab, select the callback request that you want to cancel.
5. Select **Cancel**.
6. Confirm the cancellation in the confirmation message.

Result

- The callback request is canceled.
- The details of the canceled callback request are available in the **Callbacks** tab.
- A confirmation email is sent.

Working with callback requests using Engagement Messenger

As a customer, you can request a callback from a customer service agent using Engagement Messenger. You can request an immediate callback or schedule a voice or video callback that you can reschedule or cancel.

Request a callback using Engagement Messenger

Request an immediate voice callback or schedule a voice or video callback from an agent using Engagement Messenger.

Before you begin

Role required: none

About this task

You can request an immediate callback only over a voice channel. Use the **Call me later** option to request a video call.

Procedure

1. In Engagement Messenger, select the **Request a callback** card.
2. In the Callback requests page, select **Request a callback**.
3. Enter your name, phone number, issue type, and description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select whether to receive an immediate voice callback from an agent or schedule a voice or video callback for later.

5. Select **Submit**.

Result

- A callback request is created.
- A confirmation email is sent.

Reschedule a callback using Engagement Messenger

Reschedule a callback from an agent using Engagement Messenger.

Before you begin
Role required: none

Procedure

1. In Engagement Messenger, select the **Request a callback** card.
2. In the Callback requests page, select the callback request that you want to reschedule.
3. Select **Reschedule**.
4. Choose a date and time from the calendar.
   The date and time slots indicate the agent's availability.
5. Select **Submit**.

Result

- The callback request is rescheduled.
- A confirmation email is sent.

Cancel a callback using Engagement Messenger

Cancel a callback from an agent using Engagement Messenger.

Before you begin
Role required: none

Procedure

1. In Engagement Messenger, select the **Request a callback** card.
2. In the Callback requests page, select the callback request that you want to cancel.
3. Select **Cancel** .
4. Confirm the cancellation in the confirmation message.

Result

- A callback request is canceled.
- A confirmation email is sent.

Address a callback request from a customer

As a customer service agent, call a customer back either immediately or at the date and time requested by the customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_customerservice_agent

About this task
Depending on the type of request, you can call the customer on the phone or over Zoom.

If the callback is requested from the Customer Service or Customer Service Portal, you can look into the customer's issue by going through the chat, related cases, knowledge base searches, and history to become familiar with the context before making the call.

Procedure
1. Open your workspace.
2. When an interaction request comes in, accept it from your inbox.
   The interaction card shows the following information:
   - The type of callback and interaction number
   - The name of the customer
   - The type of issue
3. Call the customer back on the requested channel.
   If the customer doesn't accept the call:
   - Retry the callback later by clicking **Re-attempt Callback**.

     The number of retry attempts is updated.
   - If necessary, assign the callback task to another agent by selecting **Requeue Callback** from the **More actions** menu.
4. End the call.
   - The state of interaction changes to **Close complete**.
   - If you have the notify_view role, you can see the video meeting participants in the **Video participants** tab.
   - The meeting recording and transcript are attached to the interaction. The inserted transcripts are not sentiment analyzed.
5. If the issue is resolved, close the callback task by selecting **Close Callback**.

Manage a CCaaS callback request in the Configurable Workspace

As a customer service agent, view the callback context information and dial the customer immediately in the CSM/FSM Configurable Workspace.

Before you begin
Role required: sn_customerservice_agent

You must log in to your CCaaS account and ServiceNow Configurable Workspace to receive the callback requests on the Configurable Workspace.

About this task
The callback interaction is either routed in the customer-first or agent-first method by CCaaS to the agent. The interaction appears like any other voice interaction in a customer-first scenario. The interaction appears with callback actions component and callback context card for an agent-first scenario. For more information on the agent-first and customer-first modes, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrating contact centers with Interaction Controls Component (ICC) for callbacks. The following procedure is applicable for the agent-first scenario.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.

   Note:
   The AWA inbox card displays the following information for callbacks:
   - Name of the customer
   - Queue to which the callback is assigned
   - Type of callback (ASAP and Scheduled)
   - Reason for callback

2. Perform one of the following in your inbox when you receive a callback interaction request.

3. View the Callback context card for the details of the callback.
   For more information on the Callback context card, see Callback context card.
4. Use the callback actions card to perform the following actions.

Conversation scenarios	Actions
Talk to the customer and try to address the customer issue	**a.** Select the **Call number** button on the Callback actions component. **Note:** When the timer turns down to zero on the Callback actions component, the call is automatically dialed to the number in the drop-down. The timer must be enabled by the contact center provider for auto-dialing capability. If you get to know that the issue is resolved and the callback isn't required, you can select **Close Callback** and wrap up the interaction. Subsequently, the callback task is closed by CCaaS. **b.** If the customer answers the call, resolve the customer's issue.
Transfer the callback before dialing the call when it falls outside the agent's scope of responsibility to ensure that it reaches the appropriate agent or queue for resolution.	**a.** Select the **Transfer callback** button on the Callback actions component to transfer an ASAP or Scheduled callback to another queue or agent before the call to the customer begins. When you select the Transfer callback button, the Transfer callback subcomponent appears, which includes the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation scenarios	Actions
	▪ In the search field, select from the list or to transfer the callback. ▪ In the Queues list, select the queue for transfer to which you want to transfer the callback. ▪ In the Agents list, select the agent to whom you want to transfer the callback. **b.** Select the → icon to initiate the transfer callback. When transferring a callback, the Callback actions component displays a Transferring callback, please wait... message and a 'Cancel callback transfer' button. **c.** Select the **Cancel callback transfer** button to cancel the transfer before the receiving agent accepts the request. For more details on how it's displayed in the UI, see CSM voice interaction record page.
Retry callback in case the customer doesn't answer the call	**a.** Select the **Retry call** button on the Callback actions component. **b.** If a customer answers the call, address the customer request.
Transfer the call when another agent is better equipped to assist the customer	**a.** Select the transfer icon on the active call component. The call with the customer is placed on hold while you transfer the call to another agent. **b.** In the Agents list, select the agent to whom you want to transfer the call to. **c.** Select the three dot menu and perform one of the following: ▪ Select **Consult** to talk to the agent and provide the context of the callback request. Once the new agent accepts the call, you can select **Merge calls** to merge your current customer call with the new agent or select **Leave & transfer** to disconnect the call with the customer and transfer it to the new agent directly. ▪ Select **Blind** to transfer the call directly to the agent without any consultation. The call gets transferred to the agent directly, and you get disconnected from the call. Upon successful transfer of call to another agent, the callback interaction is assigned to the receiving agent. The callback task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation scenarios	Actions
	remains assigned to the original agent and can be wrapped up.

5. Mute, hold, and record the calls if necessary while you are on an active call with the customer.

The following table provides a description for the annotations in the preceding image:

Annotation in the preceding image	Description
1	Use the record icon to record the conversation. The recording is saved automatically when you end the conversation.
2	Use the mute icon to mute or unmute the conversation.
3	Use the hold icon to hold or resume the conversation.
4	Use the dialpad to enter a phone number of your choice and press the dial button to make a call.
5	To transfer the call to another agent, select the transfer icon. For more details, see #unique_609_Connect_42_entry-transfer-call.
6	Use the flag icon to escalate customer issue.

6. Update the **Reason** and **Notes** appropriately and select **Submit & close** in the Wrap up modal after ending the call.
   After submitting wrap up, CCaas closes the interaction and callback task.
7. Select **Close callback** on the Callback Action component to close the callback.
   In the automatic dial, the callback gets closed when the timer for closing the callback goes down to zero.
8. Close the interaction page.

© 2026 ServiceNow, Inc. All rights reserved.

Manage a CCaaS callback request using Global Voice Control

As a customer service agent, when you leave the callback interaction page on the CSM/FSM Configurable Workspace during a call, you can use Global Voice Control (GVC) to continue with callback actions. You can return to the interaction page by selecting the **Open interaction** link.

Before you begin

Role required: sn_customerservice_agent

You must log in to your CCaaS account and CSM/FSM Configurable Workspace to receive the callback requests on the CSM Configurable Workspace.

About this task

The callback interaction is either routed in the customer-first or agent-first method by contact center providers to the agent. In the customer-first scenario, the interaction appears like any other voice interaction. In the agent-first scenario, the interaction appears with a callback actions component and callback context card. For more information on the agent-first and customer-first modes, see Integrating contact centers with Interaction Controls Component (ICC) for callbacks. The following procedure is applicable for the agent-first scenario.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.

   Note:
   The AWA inbox card displays the following information for callbacks:
   - Name of the customer
   - Queue to which the callback is assigned
   - Type of callback (ASAP or Scheduled)
   - Reason for callback

2. Perform one of the following in your inbox when you receive a callback interaction request.

3. View the Callback context card for the details of the callback who requested a callback. For more information on the Callback context card, see Callback context card.
4. Select the GVC icon on the unified navigation bar to perform call-related actions when you are on other pages.

   You might have to open a knowledge article or case to address a customer request. While on a different page, you need not come back to the interaction page to control the call. Instead, you can use the GVC to control the call.

   You can use the callback actions such as Call number, Close Callback, Retry call, and so on, on the GVC in the same way as you use them on the Callback Actions component. For more information on how to use the callback actions component for callback interactions, see Manage a CCaaS callback request in the Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Transfer function isn't supported in GVC.

5. Select the **Open interaction** link on GVC to open the callback interaction record.
6. Update the **Reason** and **Notes** appropriately and select **Submit & close** in the Wrap up modal after ending the call.
   After submitting wrap up, CCaas closes the interaction and callback task.
7. Select **Close callback** on the Callback Action component to close the callback.
   In the automatic dial, the callback gets closed when the timer for closing the callback reaches zero.
8. Close the callback interaction page.

Using Email Interaction for Customer Service Management

Email Interaction for CSM application enables agents to create interactions from customer emails, helping them resolve simple customer queries through these interactions. They can create a case from an interaction when further investigation is needed for resolving the customer query. This process provides clarity of the effort needed for customer query intake and actual investigation needed for query resolution.

The Email Interaction for CSM application offers several key benefits:

- Streamlines operations by helping to prevent the creation of duplicate or unnecessary cases.
- Consistent experience for agents across channels by modeling emails also as an interaction, such as voice, chat, and messaging channels.
- Clarity of effort needed for customer problem intake, represented by interactions.
- Clarity of effort needed for investigation and resolution, represented by cases.

Routing and assigning an email interaction to agents

Route and assign email interactions to the appropriate agents based on predefined rules and criteria.

When agents accept email interactions routed by Advanced Work Assignment (AWA), the interaction state changes from New to Work in progress and it's assigned to the agent.

For more information on the configuration required to route and assign email interactions, see Configure Advanced Work Assignment for routing email interactions.

Alternatively, agents can assign the email interactions manually. For more information on how to assign email interactions, see Assign an interaction manually.

Agents can send emails to the customer requesting for more information. Agents can keep the interactions On Hold while waiting for the customer response. While an email interaction is on hold, customers receive periodic reminders prompting them to respond quickly.

Once a customer replies to the on-hold email interaction, the interaction's status is automatically updated to Work in progress. At this point, if the agent to whom the interaction is assigned isn't available, the email interaction can be optionally rerouted to the next available agent. This behavior occurs when the system property *sn_eaai_csm.email.reroute.enabled* is set to true. By default, it is set to false. The automated rerouting process confirms that customer inquiries are addressed promptly. Enterprises can unify routing of omnichannel interactions within CCaaS to reduce admin effort. For more information about unified routing of email interactions, see Unified routing of email interactions via CCaaS.

System properties for configuring Email Interaction

Unified routing of email interactions via CCaaS

Assign an interaction manually

Manually assign an interaction that is in the New state to yourself or another agent.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or sn_customerservice.consumer_agent

About this task

The **Assign to me** button is only visible if the interaction is in the New state and the **Assigned to** field is empty.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. From the Interactions section, select **My Interactions**.
4. Open an interaction.
5. Assign the interaction in one of the following ways.

Unified routing of email interactions via CCaaS

Leverage a unified routing solution through Contact Center as a Service (CCaaS) to streamline email interactions using consistent routing logic across voice, chat, and other digital channels. This centralized approach eliminates the need for disparate systems, instead routing all interactions through a single, unified engine.

CCaaS routing benefits

CCaaS routing offers the following benefits:

- Unified routing across channels: CCaaS uses a single routing engine to manage channels like email and voice, making customer interactions easier to handle. This unified system provides a smooth omnichannel experience for agents and customers.
- Reduced configuration and administrative effort: CCaaS unified routing streamlines operations by automating interaction assignments, minimizing the need for complex setup and ongoing management, and reducing manual workload.

Managing email interactions on hold and rerouting

Agents can place email interactions on hold while they wait for customer responses. When an interaction is placed on hold, CCaaS is notified of this status change, which enables the system to reassign the agent's capacity to other tasks.

When a customer responds to the On Hold email, the interaction status is automatically changed to Work in progress. At this point, if the agent to whom the interaction is assigned isn't available, the email interaction can be optionally rerouted to the next available agent. This feature can be enabled by setting the system property *sn_eaai_csm.email.reroute.enabled* to true. By default, it is set to false. When enabled, the **Assigned to** field is cleared, and an event is

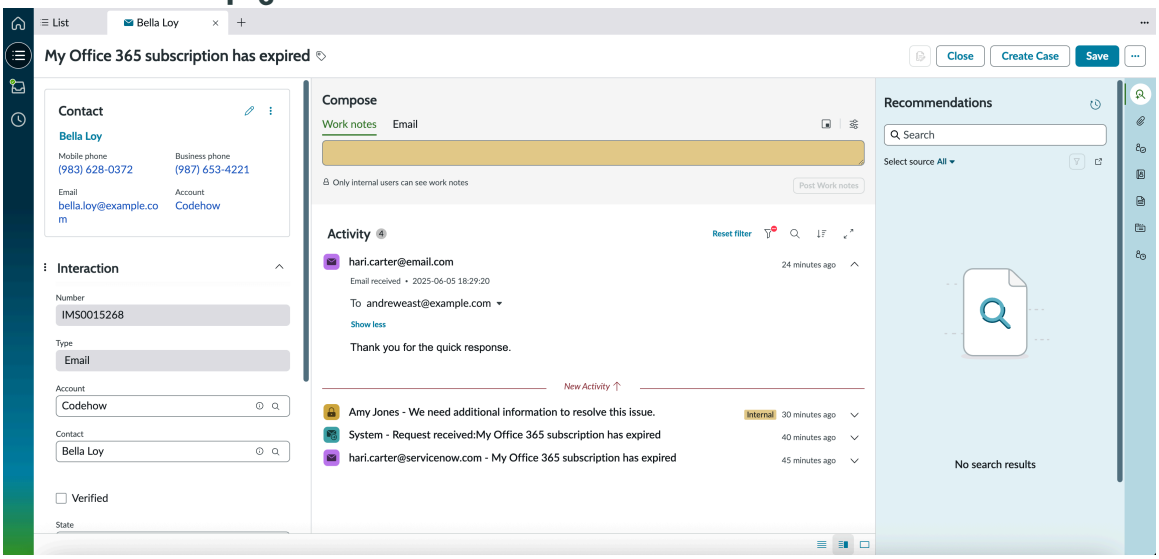
- Routing and assigning an email interaction to agents

Using the email interaction page

The email interaction page enables agents to view incoming and outgoing emails, attachments, work notes, and other related information in one location. Agents can review and respond to emails efficiently, helping resolve customer inquiries in a timely manner.

The email interaction page consists of various sections.

Email interaction page



The following are the key features of the email interaction page:

- Manage and send email responses to customers from a single location.
- Simplified filters , modeless dialog, and compact email header to keep the focus on email communication.
- View the email conversation between the customer and the agent in the Activity stream that provides complete context.
- Identify the most recent conversation with using annotated new emails, the latest reply, and work notes.

The email interaction page consists of sections such as Contact, Interaction form, Compose, and Activity stream, and the contextual side panel. For more information, see Email interaction sections.

Note:
Agents can use the Contact component to do the following:

- Search for a contact.
- Add a contact.
- Edit and save a linked contact record.
- View a contact.

Engaging with the customer using email interaction

Engaging with customers through email interaction involves verifying customer details as well as creating and updating consumer or contact records. It also includes viewing past emails in the **Activity** stream. Agents can compose email responses using email and response templates, add internal work notes, and track activity history for better context.

Agents are notified of email responses received from customers in the **Ongoing** tab ( ) on the agent workspace. This feature enables agents to view and respond to customer inquiries.

For more information, see View notifications on email response.

Verify a contact, consumer, or guest user

Look up users and manage their information. As an agent, you can find the consumer and contact information from an interaction record, review and verify the information, and then update the interaction record. If the customer is a guest user without an existing consumer or contact record, you can create a record by capturing necessary information.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, or admin

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. In the contextual side panel, select the Consumer Verify icon ( ) or the Contact Verify icon ( ).

   Note:
   For more information, see Lookup and verify.

6. Search for a consumer or contact by entering the person's name, phone number, email address, or record number.
7. Select the desired result from the list.
   This action displays information about the selected consumer or contact in a verification card.
8. Confirm the selected consumer or contact by selecting **Verify**#.
   When you perform this action, the following occurs:
   - The#**Account** #and either **Consumer** #or#**Contact**#fields are populated on the interaction record.
   - The#**Verified** #check box is enabled.
9. Select#**Save**#o save the interaction record and refresh the related lists.

Create a consumer or contact record

Create a consumer or contact from the Lookup and Verify feature in the contextual side panel.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice.consumer_agent, workspace_admin, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

As an agent, you can use the Lookup and Verify feature to search for consumers and contacts. After verifying a customer's information, you can populate that information on the interaction record.

If you can't find a consumer or contact or if the customer is a guest, you can create a record for that customer using the feature.

Procedure

1. Navigate to **Workspaces** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. In the contextual side panel, select the Consumer Verify icon ( ) or the Contact Verify icon ( ).
6. Enter name, phone number, email address, or record number to search for a consumer or contact.
7. If you can't locate the consumer or contact and choose to create a record, select **Create Consumer** or **Create Contact**.
   The system displays the Create Consumer or Create Contact form in the contextual side panel.
8. Add information to the fields on the form and select#**Create**.

Result

The system performs these actions:

- Saves the consumer or contact record.
- Creates and displays the consumer or contact card.
- Adds the information to the interaction record.

Create a customer contact

Use the Contact card on the email interaction page to create a customer contact and add the customer contact into the interaction record.

Before you begin

Role required: sn_customerservice_agent, workspace_admin, or admin

About this task

Agents can use the contact lookup component to search for contacts. If an agent can't find a contact or if the customer is a guest, the agent can create a record for that customer from the contact lookup component.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. On the Lists section, in the Interactions section, select **My Interactions**.
4. In the My Interactions page, select an email interaction.
5. In the Contact card section, select the Create new icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the Contact form, fill in the fields.
   For a description of the field values, see Contact form for Email Interaction for CSM.
7. Select **Save**.

Result

The system performs these actions:

- Saves the contact record.
- Creates and displays the contact card.
- Adds the information to the interaction record.

Using the activity stream in an email interaction

View an email conversation between an agent and a customer in the activity stream of the email interaction. The activity stream enables agents to communicate with customers and make internal notes about the work done on an interaction. The activity stream updates when an email is sent or received, or when a work note is posted.

Agents can perform the email interaction related tasks in the activity stream.

Role required: sn_customerservice_agent or sn_customerservice.consumer_agent.

Actions agents can perform in the activity stream

Task	Description
View emails, work notes, and field changes associated with the email interaction	The activity in the interaction shows emails and work notes by default. **Note:** In the activity stream, each email response displays only the latest message in the conversation. To view entire email thread, enable the Email Show Full Conversation property using UI Builder. For more information, see Customize showing a full conversation in UI Builder.
Add work notes	In the Compose section: **1.** Select Work notes. **2.** Add the information to the text field. **3.** Select **Post Work Notes**. The post is added to the activity stream. Alternatively, select the Pop out in modeless window icon ( ) to compose worknote in a separate dialog. (include icon) The latest work note is annotated with the New Activity marker.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions agents can perform in the activity stream (continued)

Task	Description
	Compose emails	Send emails from the activity stream without leaving the interaction view. In the Compose section: **1.** Select the **Email** tab. An email draft opens. **2.** Compose your email. **3.** Select#**Send Email**. The email is added to the activity stream. Alternatively, select the Pop out in modeless window icon ( ) to compose email in a separate dialog. (include icon) The latest email is annotated with the New Activity marker. View email information with compact header	Select the show email details icon ( ) to view the email information such as subject of the email, sender, and receiver. Filter posts	Select the filter icon ( ) at the top of the activity stream to display the filter options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions agents can perform in the activity stream (continued)

Task	Description
	• Post types: Select the types of posts to view, such as emails, work notes, or field changes.  • Field changes:#Select specific fields to view information in posts for only those fields.  • Flagged: View posts that have been flagged as important. • Filter sets: Select a filter set to filter the items based on the defined criteria or select **Create Filter** to create a filter. Search	Select the search icon ( ) to search for a message.
Sort posts	Select the Sort icon ( ) to sort posts from newest to oldest or oldest to newest.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions agents can perform in the activity stream (continued)

Task	Description
Expand and collapse posts	Select the Expand all activity post icon ( ) to view additional details in posts or select the Collapse all activity post icon ( ) to go back to the previous state.

Compose an email or a work note

Use the Compose section in the email interaction to draft emails, create internal work notes, or draft email responses using response templates.

Compose an email response

Use the compose section to draft an email response to customers, addressing their inquiry or providing the necessary information.

Before you begin

Role required: sn_customerservice_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. In the Compose section, select **Email**.
   The **To** and **Subject** fields are auto-populated with the relevant details.
6. **Optional:** Select the Pop out in modeless window icon ( ) to compose your email in a separate dialog.
7. Enter the email content.

   Note:

   Selecting the More Actions icon ( ) in the Email section displays the email activity history, enabling you to view past emails related to the email interaction. Additionally, you can share links to public articles in the email message.

8. Select **Send Email**.

Result

As an agent, you have successfully drafted a suitable email response to the customer.

Use a response template to compose an email or a work note

Use response templates to access predefined messages and compose emails. Agents can copy content from a template and add it to an email to save time.

Before you begin

Role required: sn_customerservice_agent with the sn_templated_snip.template_snippet_reader role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The contextual side panel provides access to response templates that can help you efficiently compose an email response. Selecting the Response Template icon ( ) shows reusable messages that you can copy and paste into emails.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. In the contextual side panel, select the Response Template icon ( ).
6. In the Response Templates side panel, search for a template.
7. Select a template and then select **Copy to clipboard**.
8. Paste the template text into the **Work notes** field or the **Email** field.

Compose a work note for internal use

Compose a work note to document important information for internal reference. The information should be clear, concise, and relevant. This work note isn't shared with customers.

Before you begin
Role required: sn_customerservice_agent

About this task
The work note is visible exclusively to the agent and remains private from the customer.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. In the Compose section, select **Work notes**.
6. **Optional:** Select the Pop out in modeless window icon ( ) to compose worknote in a separate dialog.
7. Enter the relevant content.
8. Select **Post Work notes**.

Result
The work note is posted on the **Activity** stream of the email interaction and is marked with the New Activity marker.

View notifications on email response

View notifications on email responses that are received from the customer in the ongoing email conversation.

Before you begin
Role required: sn_customerservice_agent, or sn_customerservice_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the ongoing tab icon ( ).
   A list of ongoing email interactions is displayed.
3. Select the relevant email interaction.

Result

The interaction record displays the latest email responses.

Close an email interaction

Close the email interaction after the customer accepts the resolution. The email interaction also automatically closes due to customer inactivity.

> **Note:**
> After an email interaction is closed, sending emails or composing worknotes within that interaction is no longer available.

Close an email interaction after the customer accepts a resolution

Close an email interaction after receiving the customer's confirmation of the resolution.

Before you begin

Role required: sn_customerservice_agent, or sn_customerservice_manager

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. Select **Close**.

Result

The email interaction is closed and marked as Closed Complete.

Close an email interaction due to customer inactivity

An email interaction gets closed automatically when there's no response from the customer within a certain period. By default, the period of inactivity is set to a value of five days.

If a consumer, contact, or guest user doesn't respond within five days, the email interaction automatically closes. Any subsequent email from the customer creates an email interaction. For more information on configuring the inactivity period property, see System properties for configuring Email Interaction.

When a customer replies on top of a closed email interaction, a new email interaction is created and linked to the closed interaction.

Creating a case from an email interaction

Create a case from an inbound email interaction when the customer query requires further investigation. The case and interaction are linked to each other. All communication and case details are easily accessible for more efficient resolutions.

After a case is created from an email interaction, the email interaction is automatically closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a case

Create a case from an inbound email interaction to make sure that issues are addressed and routed for resolution.

Before you begin
Role required: sn_customerservice.consumer_agent, or sn_customerservice_manager

About this task
When you create a case from an inbound interaction, the system links the interaction to the case. All future communication related to the case is stored within the case.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. Select **Create case**.
   The system opens a new case form, automatically filling the Contact or Consumer field and setting the channel to Email. The system then populates the Short Description with the email subject.
6. Enter the case details.
7. Select **Save**.

Result
The process generates a case from an email, linking them for future communication. For more information, see Accessing associated cases and interaction emails.

Associate an existing case with an email interaction

Avoid duplicate case creation by associating an existing case with an email interaction.

https://player.vimeo.com/video/1161557435?h=c750bccd07&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin
Role required: sn_customerservice_agent or sn_customerservice_manager

About this task
The interaction must be in a closed complete state before it can be linked to an existing case.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. From the top section, select the More Actions icon ( ).
6. Select **Associate Record**.
   The **Create New Interaction Related Record** tab is displayed.
7. Select the case number from the Task drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select the search icon ( ) to view additional information about the task.

8. Select **Save**.

Result
The email interaction has been linked to an existing case and displays in the Related Tasks section.

Accessing associated cases and interaction emails

Access the associated case from the email interaction and vice versa. From the email interaction, agents can view the linked case for additional context. While from the case, they can access all related email interactions. This smooth navigation helps agents manage customer issues more effectively.

Access a case from an email interaction

View the linked case to get additional context on the email interaction.

Before you begin
Role required: sn_customerservice_agent or sn_customerservice_manager

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. In the Interactions section, select **My Interactions**.
4. Open an email interaction.
5. From the contextual side panel, select **Related Lists**.
6. From the Related lists section, select **Related Tasks**.

Result
All cases associated with an email interaction and their details are displayed.

Access an email interaction from a case

View the linked email interaction to access all information related to the case.

Before you begin
Role required: sn_customerservice_agent or sn_customerservice_manager

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. Select the List icon ( ).
3. From the Cases section, select **My Cases**.
4. Open a case.
5. Select the **Interactions** tab.

Result
All email interactions associated with the case and their details are shown.

Using the Customer Service Portal

Search for information about a question or an issue, or request assistance from a customer service agent.

Your Customer Service Management Service Portal activity usually begins on the homepage. Organizations usually customize their landing pages, and logged-in users often see different information than users who are not logged in.

Note:
If any active outages exist for your install base, they are displayed on the homepage.

Note:
A new customer service portal experience is available on the business portal. For details, see Using the Business Portal.

From the Customer Service Portal homepage, you can access and use the following features:

Customer Service Portal homepage for logged-in users

UI component	Description
Knowledge	Clicking **Knowledge** on the header or the main page takes you to the Knowledge homepage. You can search the knowledge base or view a list of top-rated or most viewed knowledge base articles.
Requests	Displays all your requests. You can also request items and services from the catalog.
My Lists	Lists all your cases.
Case	Provides access to all cases and quick links to create a product or order case.
Support	Navigate to appointments, contacts, work orders, install base, and other quick links. The list view of the Install Base items provide details related to customers like account and contact.
Notification	Displays notifications sent for resolved cases, cases awaiting information, publications, and approvals.
Tours	View a tour for additional guidance on how the Customer Service Management application works. Your administrator determines whether tours appear on pages.
Live Chat	Click **Live Chat** to chat with a virtual agent or a customer service agent.
Callback request	Request a callback when the wait time to reach agents is long or agents are unavailable.
Profile menu	Click your profile photo to either view your profile or log out.
Search	Enables you to search. Either enter a keyword to use the type-ahead search or enter one or more words to view all search results.
Ask the Community	Provides access to the Community homepage where you can ask questions and get answers fast, connect with people who share similar expertise, and join forums and participate in discussions.
Get help	Click **Get help** to make a request or report a problem by opening a case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Portal homepage for logged-in users (continued)

UI component	Description
Request something	Request items and services from the catalog.
Most viewed articles	View a list of the most viewed articles.
Featured articles	View featured Community content.
Most useful articles	View the most useful knowledge articles based on the usage count of the articles.
The following components are available if you have installed the Communities application:	
Recent solved discussion	View a list of recently solved discussions.
Recent community blog	View a list of recently published community blogs.
Community featured content	View a list of featured community content.

Note:
You can view the metadata for each entry in the widgets, such as the number of views, number of days from the time the article or feature was published, and rating for the article.

Manage contacts from the customer portal

Create and update customer contacts, assign roles to contacts, and enable or disable contact logins from the customer portal.

Create a customer contact

Use the **Create Contact** catalog item to create a contact from the customer portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

About this task

By selecting the **Create Contact** catalog item, you can add the details for a contact and create the contact record. After saving the record, you can perform the following actions depending on your role.

- Users with the sn_customerservice.customer_admin or sn_customerservice.partner_admin can update the contact's user ID and enable or disable notifications.
- Users with the admin role can set a password for the contact and require the contact to reset their password.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
These actions are available while you are creating the contact record.

Procedure

1. Click **Requests** > **Request Something** in the portal header.
2. In the Categories list, click **Services** and then click the **Create Contact** catalog item to display the Create Contact form.
3. Fill in the fields on the Create Contact form.

Contact form

Field	Description
First name	The customer's first name.
Last name	The customer's last name.
Title	The customer's job title.
Language	The customer's preferred language.
Account	The customer's account.
Email	The customer's email address.
Business phone	The customer's business phone.
Mobile phone	The customer's mobile phone.

4. Click **Submit**.
The system creates the contact and updates the Contact form.
5. **Optional:** Update the information in the following fields.

Additional Contact fields

Field	Description
Notification	Enable or disable notifications for this customer.
User ID	A unique identifier for this user. The user ID should follow this format: *`firstname.lastname`*

6. **Optional:** With the admin role, you can update password information for the contact.

Contact password information

Field	Description
Password	Set a password for the contact.
Password needs reset	Requires the contact to reset their password when they log in to the portal.

7. Click **Save** to update the record.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update contact information for a user

Update the contact information for a user from the customer portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

Procedure

1. Click **Support** > **Contacts** in the portal header.
2. Select a contact from the Contacts list.
3. Make the desired changes to the fields on the Contact form.

Contact form

Field	Description
First name	The customer's first name.
Last name	The customer's last name.
Title	The customer's job title.
Language	The customer's preferred language.
Time zone	The time zone for this customer's location.
Account	The customer's account.
Email	The customer's email address
Business phone	The customer's business phone.
Mobile phone	The customer's mobile phone.
Notification	Enable or disable notifications for this customer.
User ID	A unique identifier for this user. The user ID should follow the format *`firstname.lastname`*.

4. Click **Save**.

Enable or disable the login for a contact

Enable or disable the login for a contact from the customer portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

Procedure

1. Select **Support** > **Contacts** in the portal header.
2. Select a contact from the Contacts list.
3. In the Actions list, select one of the following links.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assign a user role to a contact

Assign one or more user roles to a contact from the customer portal.

Before you begin
Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

About this task
Use the Edit Role pop-up window to manage the roles for a contact. Contacts must have at least one assigned user role. If there are no roles in the **Selected** column on the pop-up window, you cannot update the record.

> **Note:**
> The roles available in the Edit Role pop-up window are configured using the **sn_customerservice.contact_role_assignment** property.

Procedure

1. Click **Support** > **Contacts** in the portal header.
2. Select a contact from the Contacts list.
3. In the Actions list, click the **Edit Roles** link.
4. In the Edit Role pop-up window, select a role in the **Available** column and move it to the **Selected** column.
5. Click **Update** on the Edit Role pop-up window.

   > **Note:**
   > If there are no roles in the **Selected** column, the system displays an error message and the column resets to display the originally assigned roles.

6. Click **Save** on the Contact form.

Manage customer registration requests

Users with the customer administrator role can approve or reject registration requests that customers submit from the Customer Service Portal.

Approve a registration request with a valid registration code

Approve a registration request from a user that was submitted from the Customer Service Portal with a valid registration code.

Before you begin
Role required: sn_customerservice.customer_admin

Procedure

1. Navigate to the customer portal.
2. Click **Approvals**.
   The Approvals list displays registration requests with these states: **Requested** and **No Longer Required**.
3. Click a request in the Approvals list with a state of **Requested**.
4. If desired, add any **Comments** to this request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Approve**.
   A user account is created and an email is sent to the contact's email address with a user ID and temporary password. The user is also assigned these roles: sn_esm_user and snc_external.

Reject a registration request

Reject a registration request from a user that was submitted from the Customer Service Portal.

Before you begin
Role required: sn_customerservice.customer_admin

Procedure

1. Navigate to the customer portal.
2. Click **My Approvals**.
3. Click a request in the Approvals list with a state of **Requested**.
4. Click **Reject**.
   An email regarding the rejection is sent to the requestor's email address.

Assign a contact to an asset from the customer portal

Users with the customer administrator role can assign a contact to an asset from the customer portal.

Before you begin
Role required: sn_customerservice.customer_admin

Procedure

1. Log in to the customer portal.
2. Click **Support** > **Assets** from the portal header menu.
3. Click the desired asset.
4. Click **New** in the **Asset Contacts** related list.
   This displays a new Asset Contact form. The **Asset** field displays the selected asset and is read-only.
5. Select a **Contact**.
   The contacts available for selection are the contacts from the asset's account.
6. Click **Submit**.
   The contact is added to the **Asset Contacts** related list.

Search for information on customer service portal

Use the search feature on the customer portal to find information about a question or an issue.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task
The portal has a search feature that you can use to search for information across several repositories. Enter a search term in the **Search** field and then click **Search** to display a list of related articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter a search term into the **Search** field.
2. Click **Search**.
   A list of articles related to the search term is displayed.
3. Click a link to view an article.

Search the knowledge base

Use the customer portal to search the knowledge base or view a list of popular knowledge base articles.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task

The customer service portal includes a link to the knowledge base that you can use to search for information, read and rate articles, and submit feedback. Under this link, the portal displays a list of popular knowledge base articles. If the information that you need is not included in this list, you can search the knowledge base for the desired information.

Procedure

1. Navigate to the customer service portal.
2. Click **Knowledge**.
   The knowledge page displays a separate category for each of the products purchased by this customer. It also displays lists of articles by:
   - Featured content
   - Most useful
   - Most viewed
3. Do one of the following,

Option	Description
Click a product to display more specific in formation	Displays a list of categories on the left and arti cles on the right. Click a category to drill down even further.
Click a link from one of the lists	Displays the article.
Type a topic in the Search field and press the Enter key	Displays a list of related articles. Click a link to display the desired article.

Search the customer service community

Use the customer service portal to search the community site or view a list of recent discussion topics.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the customer service portal.
2. Click **Ask the Community**.
   This brings up the Ask a Question page.
3. Enter a question in the **Title** field.
4. Select a knowledge base in the **Knowledge Base** field.
5. If desired, select a category in the **Category** field.
6. If desired, add one or more tags to your question in the **Tags** field.
7. Click **Post Question**.
   The question appears on the search results page under the **Questions** category.

Deflect cases with knowledge and community content

Enable customers to search for information from the knowledge base and community and find solutions to their issues.

Before you begin

Role required: sn_customerservice_customer or sn_customerservice_consumer

About this task

The Service Portal Case form displays contextual search results based on text entered in the Subject field. These search results provide targeted solutions to customers. Customers can search for information that is related to a case when opening a case. If the search results in any related content, the customer can preview the content.

Note:
By default, search results include knowledge articles, solved community questions and blogs, and pinned articles.

Procedure

1. Navigate to the Customer Service Management Service Portal and then **All** > **Support** > **New Cases**.
2. Click **Product Case** or **Order Case**.
3. Start typing in the **Subject** field.

   If there are any search results that match, they are displayed in the **Related Search Results** widget.

   Note:
   If embedded search has been enabled, the results are displayed inline in the Case form in a **Knowledge results** section and are read-only.

4. Perform one of the following actions.
   - Click one of the content links in the **Related Search Results** widget to enter the content directly.
   - Click one of the content links in the embedded **Knowledge results** section to open the content inline as read-only.
5. **Optional:** Click **This helped** to mark the content as helpful for resolving the associated case.
6. Click **Submit**.

View asset information from the Customer Service Portal

View a list of assets for the current user's account.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

Procedure

1. Click **Support** > **Assets** in the portal header.
   This displays a list of assets that belong to the current user's account, including the name and serial number of the asset and the product model category and account to which it belongs.
2. Click one of the following to view more information.

Option	Description
Display name	Displays the asset information.
Account	Displays the account information.
Model category	Displays the product model information for this asset.

3. Click the Back button to return to the list of assets.

View or update customer contact information

View or update your contact information from the customer portal.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

Procedure

1. Navigate to the customer portal.
2. Select **support** > **Contact**.
3. Select the required contact.
4. Make any desired changes to the fields on the Contact form.

Contact form

Field	Description
First name	The customer's first name.
Last name	The customer's last name.
Title	The customer's job title.
Language	The customer's preferred language.
Time zone	The time zone for this customer's location.
Account	The customer's account.
Email	The customer's email address

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Business phone	The customer's business phone.
Mobile phone	The customer's mobile phone.
Notification	Enable or disable notifications for this customer.
User ID	A unique identifier for this user. The user ID should follow the format *firstname.lastname*.

5. Select **Save**.

Customer notification preferences

Customers can set preferences for email notifications.

Email notification preferences are set to control email notifications that are sent to the customer when an agent performs one of the following case activities:

- Opens a case for a customer
- Comments on a customer's case
- Provides a resolution for a customer's case
- Closes a customer's case
- Escalates a customer's case
- Assigns case to a new group

Set email notification preferences

Customers can set preferences for email notifications that are sent when customer service agents perform different actions on cases.

Before you begin

Ensure that you have received at least one email for the case to set the email notification preferences.

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

Procedure

1. Navigate to the customer service portal.
2. Click your user name or photo in the portal header to display your user profile information.
3. Click the **Notification Preferences** related link to display the Notification Preferences form.

   Note:
   The **Notification Preferences** link is available only after receiving the first email for the case.

4. Enable or disable the following email notifications for your primary email address.
   The notifications are available based on the actions performed by customer service agents on the case.
   - Case closed for customer
   - Case commented for customer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Case escalated for customer
- Case assigned to a new group
- Case opened for customer
- Case resolved for customer

For details about notifications and creating new notifications, see Send Notification action.

Change your password directly from the Customer Service Portal

Change your password directly from the Customer Service Portal. Users with the required roles can change their passwords from the Customer Service Portal.

Before you begin

Role required: none

About this task

Users with the required roles can change their passwords from the Customer Service Portal.

Procedure

1. Go to the Customer Service Portal page by accessing your instance URL and adding a /csm suffix.
   For example, https://example.com/csm.
2. Click your user name in the portal header.
3. Click **Profile** to display the user profile information.
4. Click **Change Password** under **Security**.
5. On the form, fill in the fields.

Change Password form

Field	Description
Current Password	The current password. This field is automatically filled in.
New Password	The new password, which must meet the following requirements: ○ Be a minimum of eight characters long ○ Include at least one uppercase and one lowercase letter ○ Include at least one number
Confirm Password	The new password.

6. Click **Change**.

Customer contact self-registration

The self-registration feature enables new customer contacts to submit registration requests through the customer portal.

A customer contact can submit a registration request using a valid registration code. The request is then sent to the customer administrator of that account for approval. For details, see Approve a change request, or registration request.

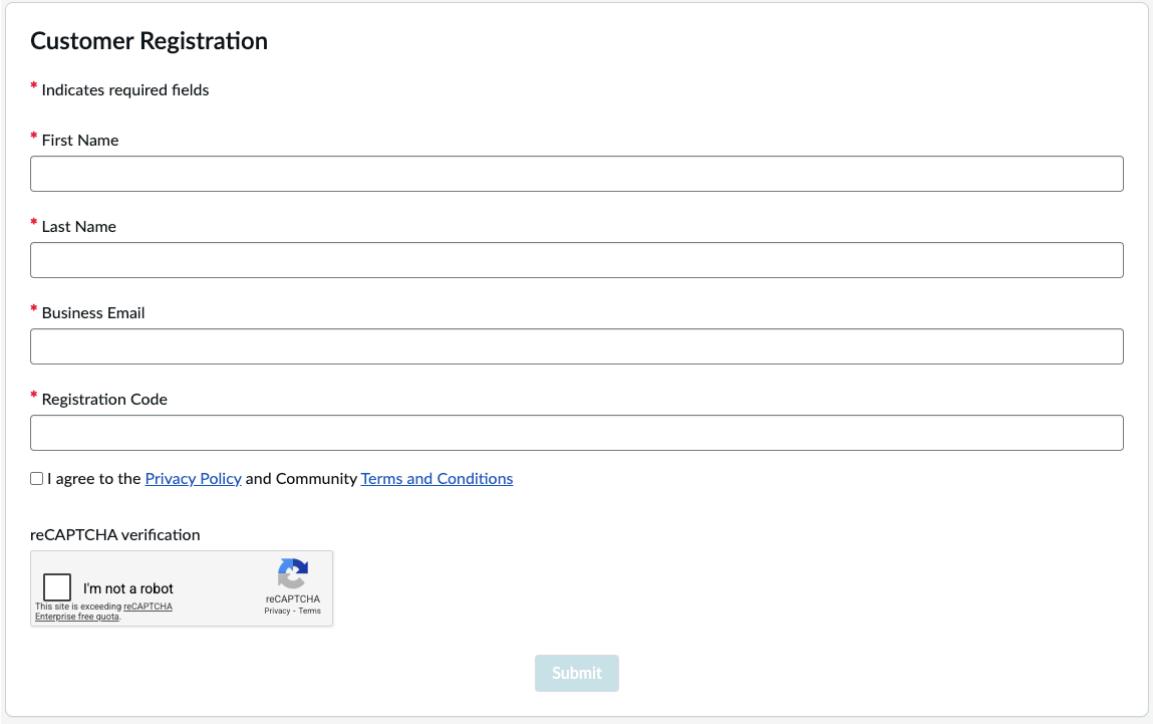
If an account has multiple customer administrators, they all receive the registration request, but only one approval is necessary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The request is either accepted or rejected. If accepted, a new account is created, and the customer contact gets an email with a user ID and a temporary password. When logging in to the portal for the first time, the customer contact needs to change the temporary password. If rejected, the customer contact gets an email notification.

Note:
If a request is submitted with an incorrect registration code, a notification message appears `Invalid Registration Code`.

Customer contact self-registration form



The administrator creates a unique registration code for each account and stores it in the **Registration Code** field on the Account form. After the code is created, customer administrators can distribute the code to customers as needed.

Related topics

Example: The default self-service Password Reset process

Submit a self-registration request

Submit a registration request from the Customer Service Portal.

Before you begin

Role required: none

Procedure

1. Navigate to the customer portal login page.
2. Request a login by selecting **Register** from the portal header.
3. Fill in your **First Name**, **Last Name**, **Business Email**, and **Registration Code**.
4. Enable the check box to agree to the privacy policy and to the community terms and conditions.
   Select the links to access more information about these policies.
5. Enable the Security Code check box, complete the CAPTCHA validation, and select **Verify**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Customer Service application uses the Google re-CAPTCHA service.

6. Select **Submit**.
   You're returned to the portal login page.

   If you entered a valid registration code, you see this message: "Your request has been submitted and is pending review. You receive an email when your request is processed".

   If the code was incorrect, you see this message: "Incorrect Registration Code".

Request a password reset

If you forget your password, you can request a new password from the customer portal login screen.

Before you begin
Role required: none

Procedure

1. Navigate to the customer portal login page.
2. Click the **reset your password here** link.
3. Enter your **User name** and **Email address**.
4. Click **Reset Password**.
5. Create a new password before continuing.
6. Enter the new password in the **Password** field.
7. Enter the new password again in the **Validate Password** field.
8. Click **Submit**.

Log in to the Customer Service Portal for the first time

After a registration request is approved, the customer contact receives an email with a user ID and temporary password. When logging in for the first time, the contact is asked to change the password.

Before you begin
Role required: none

Procedure

1. Navigate to the Customer Service Portal login page.
2. Enter your user ID in the **User name**.
3. Enter your temporary password in the **Password** field.
4. Select **Login**.
   You're prompted to change your password.
5. Enter your temporary password in the **Current Password** field.
6. Enter your new password in the **New Password** field.
7. Reenter your new password in the **Confirm New Password** field.
8. Select **Submit**.

View product information from the Customer Service Portal

View a list of products to track the products or services sold to your account and manage your services using service catalogs.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task

You can view a list of products or services that have been sold to your account. You can also view any cases created on the product and all active contracts and entitlements for the product.

Note:
When the Customer Data Models for B2B2C plugin installed, contacts are able to access the list of sold products belonging to account consumers.

An entitlement is active if:

- Its end date is not in the past or it has no end date.
- The contract it is linked to is also active.

A contract is active if:

- Its state is set to active
- It is linked to a product with an active entitlement.

You can modify the **Active Entitlements** widget to define your own filters for active entitlements.

If product catalog items have been set up in your instance, you can use the **Service Catalogs** widget to view context-sensitive service catalogs based on the services you are subscribed to. Extend your services using service catalogs and request additional items on the services you have subscribed to.

Procedure

1. Navigate to the Customer Service homepage.
2. Click **Support** > **Products** in the header menu.
   The system displays a list of products or services sold to your account.
3. Click a product to view the details and any cases created on the product in the last 30 days.
4. View all active contracts and entitlements for the sold product.
5. **Optional:** You can also create a case directly from the product details.
6. **Optional:** View all catalog items associated to sold products and request additional services, as required.

Create a product case from the Customer Service Portal

Create a case about a question or issue on a product from the Customer Service Portal.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.partner, sn_customerservice.customer_admin, or sn_customerservice.partner_admin, sn_acct_consumer.consumer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Go to the Customer Service Portal by accessing your instance URL and adding a /csm suffix.
2. Right-click in the form header and choose **Case** > **Create Product Case**.
3. On the form, fill in the fields.

Note:
Depending on your role, you might not see the **Account** and **Contact** fields.

Create Case form

Field	Description
Account	The account for which the case is being created.
Contact	The name of the customer contact for this case.
Consumer	The name of the consumer for this case. **Note:** This field is active only when the Customer Data Models for B2B2C plugin is installed. Once Account is selected, only consumers belonging to the account are displayed.
Asset	The asset tag number or the serial number of the asset associated with this case.
Product	The product model of the asset. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). If you select an asset in the **Asset** field, this field is auto-populated if the associated product information is available in the asset record. A product may be associated with multiple assets.
Priority	The available assigned priorities are: ○ 1 - Critical ○ 2 - High ○ 3 - Moderate ○ 4 - Low (default)
Subject	A brief description of the customer question, issue, or problem. **Note:** When you start entering the subject, the application searches for relevant content in the knowledge bases configured for the portal. the results are displayed in the **Related Content** list.
Description	A detailed description of the customer question, issue, or problem.

Note:
Currently, the **Save as Draft** option is not optimized for Customer Service Management portals and, it is inactive by default.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The case is created, assigned a case number, and added to the creator's case list. To view this list, select the **My Lists** tab on the Customer Service Portal header and select **All Cases** in the left pane.

Chat with an agent from the Customer Service Portal

Chat with a virtual agent or a customer service agent from the Customer Service Portal to resolve issues quickly.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.partner_admin

Procedure

1. Select the Chat icon ( ) in the Customer Service Portal to start a conversation.
   A virtual agent or a customer service agent responds.
2. **Optional:** To talk to a person instead of a virtual agent, select and then **Contact Support**.
3. When you're finished with the chat, select **End Conversation**.

What to do next
If the agent creates a new case or links the discussion to an existing case, you can view these cases from the customer portal by selecting **My Cases** and displaying the case list.

Get help using virtual agent conversations

Predefined Customer Service Virtual Agent chatbot conversations help your customers complete common self-service tasks, such as getting help with a product or checking the status of a case. Use predefined NLU with your virtual agent chatbot topics to enable the chatbot to assess user intent and provide the best response based on the conversation's context.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.consumer

If you're an anonymous user not logged in to the application, you can get help by entering keywords for an issue and choose to get transferred to a live agent.

A user with a proxy_contact role can also check the case status for a customer.

About this task
The information exchanged during the conversation flow (user inputs and bot responses) enables the chatbot to fulfill a user request or assist a user in completing a task. If you have a question or an issue with an existing product or order, the virtual agent searches the keyword and displays relevant knowledge articles that can help resolve the issue. If there are no relevant articles, it creates a case.
ServiceNow NLU enables discovery of the chatbot topics based on either the keywords entered in the chat or the user-intent and matches an entity with the user input. If there's a match, it also makes the entity available to the topic.

Procedure

1. Navigate to the Customer Service Management portal.
2. Select **Chat**.
   You can select **Show Me Everything** to display all available topics or enter keywords to narrow down the results to relevant topics.
3. If you're a logged-in user, enter keywords to get help on a case, an issue, or an order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an NLU is enabled, it guides you through the right topic based on the utterance.
- If an NLU isn't enabled, it displays topics based on the match for the entered keywords. You can make a selection from all available topics displayed.

Note:
Contact your administrator to determine whether the topics are NLU-enabled.

4. Use

5. To exit a chat conversation, select **I'm done**.

Related topics

Customer Service Virtual Agent conversations

Maximizing code reuse with topic blocks

View or modify a case from the Customer Service Portal

View or modify the information in a selected customer service case.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.partner_admin

About this task
Depending on the role of the current user, the Case list displays:

- Cases created by the current user (sn_customerservice.customer)
- Cases related to the current user's account (sn_customerservice.customer_admin)
- Cases related to the current user's account as well as partner accounts (sn_customerservice.partner, sn_customerservice.partner_admin)

Procedure

1. Click **Case** > **All Cases** in the portal header.
   Cases are ordered in the list with the most recently updated at the top.
2. Click the desired case number to open the Case form.
3. Make any necessary changes to the **Additional comments** field.
   All other fields on the form are read-only.
4. Click **Update**.

View a publication on the Customer Service Portal

View the details of a publication on the Customer Service Portal and download any attachments.

Before you begin
Role required: sn_customerservice.customer

About this task
The **Publications** link on the customer service portal displays a list of current publications that is sorted by publication number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
After a publication reaches its expiration date, it is automatically removed from the Publications list.

Procedure

1. Navigate to the customer service portal.
2. Click **Support** > **Publications** in the portal header.
   This displays a list of current publications. The information displayed for each publication includes the title, publish date, expiration date, and a brief description.
3. If desired, search the Publications list by entering the search term in the search field at the top of the list.
4. Click a publication name to open.
5. If the publication has attachments, select the attachments to download from the pop-up window.
6. Close the pop-up window.
7. Click the return arrow at the top of the publication to return to the Publications list.

Complete a customer service satisfaction survey

After accepting a proposed solution for a case, complete a customer service satisfaction survey.

Before you begin
Role required: none

When a customer accepts a proposed solution for a case by clicking **Accept Solution** on the case form, a satisfaction survey is displayed in the portal. The customer has the option of completing or skipping the survey. Either choice returns the customer to the list of cases on the self-service portal.

To complete the survey:

Procedure

1. Answer each of the survey questions.
2. Click **Submit**.

Request an item or service from the Customer Service Portal

Browse the catalog and create a request from the Customer or Consumer Service Portals.

Before you begin
Role required: sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.customer_case_manager, sn_customerservice.customer, sn_customerservice.consumer, sn_customerservice.proxy_contact

About this task
Customers and consumers can make requests from the Customer and Consumer Service Portals. Customer administrators, partners, and case managers can also make requests.

Note:
Creating a request from the Customer and Consumer Service Portals requires activation of the Customer Service with Request Management plugin (com.sn_cs_sm_request). It also requires that the system administrator provide external customers with access to request records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Do one of the following to create a request:
   - Click the **Request Something** link on the portal landing page.
   - Click **Requests** > **Request Something** in the portal menu header.
2. Browse the service catalog and select the desired item or service.
   You can also use the Category filters to filter the available items.
3. Fill in any necessary information related to the request.
4. Click **Submit**.
   The system processes the request, creates the request and any other related records, and displays the details in the Related Records widget on the case view page.

View case records from the Customer and Consumer Service Portals

View case records such as requests, changes, or problems, from the Customer or Consumer Service Portals.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.customer_case_manager, sn_customerservice.customer, sn_customerservice.consumer

About this task

If a case has one or more related records, a Related Records widget is displayed on the case view page that lists those records.

Procedure

1. Navigate to the Customer or Consumer Service Portal.
2. Click **My Lists** in the portal header and then select a case.
   You can use the **My Lists** filter to narrow the list of records before selecting a case.
3. In the Related Records widget, click a record to view its details.
4. **Optional:** For request records, expand the **Stage** field to display more details about the request process.
5. Click the **X** in the upper corner to close the details window.

Close a case from the Customer Service Portal

Customers and consumers can close cases from the Customer and Consumer Service Portals.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.consumer

About this task

This feature is available for the Customer Service Portal (B2B) for product and order cases and for the Consumer Service Portal (B2C).
The **Close Case** button is not available for cases in the **Resolved** or **Closed** states.

Procedure

1. Click **Cases** in the portal header to open the Case list.
2. Open the desired case.
3. In the Actions section, click **Close Case**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the confirmation pop-up window, click **Close Case**.
   When a case is closed from the portal:
   - The case status in the Case details section is updated to **Closed**.

     Note:
     You cannot add comments after the case is closed. You can only view the previous comments in the activity stream.

   - The case additional comments and resolution notes are updated with **Closed by customer**.
   - The case resolution code is set to **Solved by customer**
   - A message at the top of the portal confirms that the case has been closed.
   - The system displays a customer satisfaction survey.
5. Complete the customer satisfaction survey.
   You can also choose to skip the survey. Either choice returns you to the case list on the portal.

View install base information from the Customer Service Portal

View a list of install base to track the instances provisioned for your account and which products or services run on them.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task

You can view all cases and the service status from the last 30 days as well as all active, past, and planned outages. You can also view any active entitlements for the install base. An entitlement is active when its end date isn't in the past or it has no end date. If it's linked to a contract, the contract must also be active.

Note:
When the Customer Data Models for B2B2C plugin installed, contacts are able to access the list of install base items belonging to account consumers.

Note:
You can modify the **Active Entitlements** widget to define your own filters for active entitlements.

Procedure

1. Navigate to the Customer Service Portal.
2. Click **Support** > **Install Base** in the header menu.
   The system displays a list of install base items that belong to your account.
3. Select an install base to view the details, including cases created on the install base in the last 30 days, active entitlements, as well as service status and outage history.
4. **Optional:** You can also create a case directly from the install base details.

Create a case for install base from the Customer Service homepage

Create a case about a question or issue on your install base from the Customer Service homepage.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.partner, sn_customerservice.customer_admin, or sn_customerservice.partner_admin

About this task
Install base enables you to track which instances have been provisioned for your account and the products and services that run on them.

Procedure
1. Navigate to the Customer Service homepage.
2. Click **Create Case for Install Base**.
3. Fill out the fields on the form, as required.

Create Case form

Field	Description
Product	The sold product you have a question on or issue with.
Install Base	The install base item you have a question on or issue with.
Priority	The assigned priority: ○ 1 — Critical ○ 2 — High ○ 3 — Moderate ○ 4 — Low (default)
Subject	A brief description of the question, issue, or problem.
Description	A more detailed description of the customer question, issue, or problem.

Note:
Currently, the **Save as Draft** option is not optimized for Customer Service Management portals and, it is inactive by default.

4. Select **Submit**.
The case is created, assigned a case number, and added to the user's case list. Click **My Cases** at the top of the customer portal to view the Cases list.

Approve a change request, or registration request

Users with the snc_external role can view and approve registration requests and change requests from the Customer Service Portal.

Before you begin
Role required: snc_external

About this task
A registration request or a change request may require approval from another employee within the same organization. For details on registration request, see Customer contact self-registration.

Procedure
1. In the Customer Service Portal header, click **Notification** > **View all notifications**.
2. Click a record in the Approvals section of the Notifications page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays a read-only view of the record approval form. For requests that include one or more items, these items appear in a collapsible list at the bottom of the Request form.

3. **Optional:** Click a requested item at the bottom of the Request form to view the details in a pop-up window.
4. Click **Approve**.
   The system makes the following updates:
   - The record status is set to **Approved**.
   - The record status is displayed after the record number in the Related Records widget on the Case form.
   - The record status is added to the Case form.
     - If the record is approved by the customer administrator or if the customer self-approves the request, the change in status is added to the **Additional comments** field.
     - For other approvers, the change in status is added to the **Work notes** field.
   - The approval record is updated in the Approval table.

View the status of a request, change request, or registration request

Users with the snc_external role can view the status of requests and change requests from the Customer Service Portal.

Before you begin

Role required: snc_external

Procedure

1. In the Customer Service Portal header, click **My Lists**.
2. In the My Lists filter, click **My Cases**.
3. Click a case in the Cases list.
4. View the record status after the record number in the Related Records widget.

Enable language selection for guest users

The language selector widget enables guest users and unauthenticated users to select, view, and update content in their preferred language.

When a user selects a preferred language, the portal content reloads into the selected language. The widget is enabled by default on the Knowledge portal, the Customer Service Management portal, and the Consumer Service portal. Users can map their languages with regions to view all available languages in the form of a pop-up on the same screen. The widget appears only if a language other than English is active on the instance.

Using the Business Portal

Search for information about a question or an issue, or request assistance from a customer service agent.

Your Business Portal activity usually begins on the home page. It has configurable widgets to display information.

From the Business Portal home page, you can access and use the following features:

Business Portal home page for logged-in users

UI component	Description
Browse services	Browse through topics and request services.
Frequently asked questions	Get quick answers to common questions.
Resources	Navigate to the Knowledge, Publications, or FAQs pages.
Requests	Submit a request or View submitted requests.
My hub	Manage products and install base items.
My company	Create or manage contacts.
Notification	Displays notifications sent for resolved cases, cases awaiting information, publications, and approvals.
Tours	View a tour for additional guidance on how the Customer Service Management application works. Your administrator determines whether tours appear on pages or not.
Live Chat	Chat with a virtual agent or a customer service agent.
Callback request	Request a callback when the wait time to reach agents is long or agents are unavailable.
Profile menu	View your profile or log out.
Search	Enables you to search. Either enter a keyword to use the type-ahead search or enter one or more words to view all search results.
Track your case updates	View updates on your case.
Browse topics	Navigate through topics to explore our services and resources.
Quick links to get you started	View links to knowledge articles,catalogs, and external links.

Business Portal home page for logged-in users (continued)

UI component	Description
Most trending articles	View a list of the most viewed articles.
Most popular services	Request items and services from the catalog.
Footer	Contains important links, contact information, and legal details for easy access.

Manage contacts from Business Portal

Create and update customer contacts, assign roles to contacts, and enable or disable contact login from the business portal.

Create a customer contact

Use the **Create Contact** catalog item to create a customer contact from the business portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

About this task

By selecting the **Create Contact** catalog item, you can add the details for a contact and create the contact record. After saving the record, you can perform the following actions depending on your role.

- Users with the sn_customerservice.customer_admin or sn_customerservice.partner_admin can update the contact's user ID and enable or disable notifications.
- Users with the admin role can set a password for the contact and require the contact to reset their password.

Note:
These actions are available while you're creating the contact record.

Procedure

1. Navigate to the business portal.
2. Select **My company** > **Create a contact** in the portal header.
3. Fill in the fields on the Create Contact form.

Contact form

Field	Description
First name	The customer's first name.
Last name	The customer's last name.
Title	The customer's job title.
Language	The customer's preferred language.
Account	The customer's account.
Email	The customer's email address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Business phone	The customer's business phone.
Mobile phone	The customer's mobile phone.

4. Select **Submit**.
   The system creates the contact and updates the Contact form.
5. **Optional:** Update the information in the following fields.

Additional Contact fields

Field	Description
Notification	Enable or disable notifications for this customer.
User ID	A unique identifier for this user. The user ID should follow this format: *firstname.lastname*

6. **Optional:** With the admin role, you can update the password information for the contact.

Contact password information

Field	Description
Password	Set a password for the contact.
Password needs reset	Requires the contacts to reset their password when they log in to the portal.

7. Select **Save** to update the record.

Update contact information for a user

Update the contact information for a user from the business portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

Procedure

1. Navigate to the business portal.
2. Select **My company** > **Manage contacts**.
3. Select the desired contact from the Contacts list.
4. Select **Edit details**.
5. Make the desired changes on the Contact form.

Contact form

Field	Description
First name	The customer's first name.
Last name	The customer's last name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Title	The customer's job title.
Language	The customer's preferred language.
Time zone	The time zone for this customer's location.
Account	The customer's account.
Email	The customer's email address
Business phone	The customer's business phone.
Mobile phone	The customer's mobile phone.
Notification	Enable or disable notifications for this customer.
User ID	A unique identifier for this user. The user ID should follow the format *`firstname.lastname`*.

6. Select **Save**.

Enable or disable the login for a contact

Enable or disable the login for a contact from the business portal to control user access to the portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

Procedure

1. Navigate to the business portal.
2. Select **My company** > **Manage contacts** in the portal header.
3. Select a contact from the Contacts list.
4. In the Actions list, select one of the following links, as required.

Assign user roles to a contact

Assign one or more user roles to a contact from the business portal.

Before you begin

Role required: sn_customerservice.customer_admin, sn_customerservice.partner_admin, or admin

About this task

Use the Edit Role pop-up window to manage the roles for a contact. Contacts must have at least one assigned user role. If there are no roles in the **Selected** column on the pop-up window, you can't update the record.

Note:
The roles available in the Edit Role pop-up window are configured using the **sn_customerservice.contact_role_assignment** property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the business portal.
2. Select **My company** > **Manage contacts** in the portal header.
3. Select a contact from the Contacts list.
4. In the Actions list, select the **Edit Roles** link.
5. In the Edit Role pop-up window, select a role in the **Available** column and move it to the **Selected** column.
6. Select **Update** on the Edit Role pop-up window.

> **Note:**
> If there are no roles in the **Selected** column, the system displays an error message and the column resets to display the originally assigned roles.

Manage customer registration requests from Business Portal

Users with the customer administrator role can approve or reject registration requests that customers submit from the business portal.

Approve a registration request with a valid registration code on Business Portal

Approve a registration request from a user that was submitted from the business portal with a valid registration code.

Before you begin

Role required: sn_customerservice.customer_admin

Procedure

1. Navigate to the business portal.
2. Select **Notifications** > **View all notifications**.
   The Approvals card displays registration requests.
3. Select the desired request from the Approvals card.
4. Select **Approve**.
   A user account is created and an email is sent to the contact's email address with a user ID and temporary password. The user is also assigned these roles: sn_esm_user and snc_external.

Reject a registration request

Reject a registration request from a user that was submitted from Business Portal.

Before you begin

Role required: sn_customerservice.customer_admin

Procedure

1. Navigate to the business portal.
2. Select **Notifications** > **View all notifications**.
   The Approvals card displays registration requests.
3. Select the desired request from the Approvals card.
4. Select **Reject**.
   A rejection email is sent to the requester's email address.

Customer contact self-registration on Business Portal

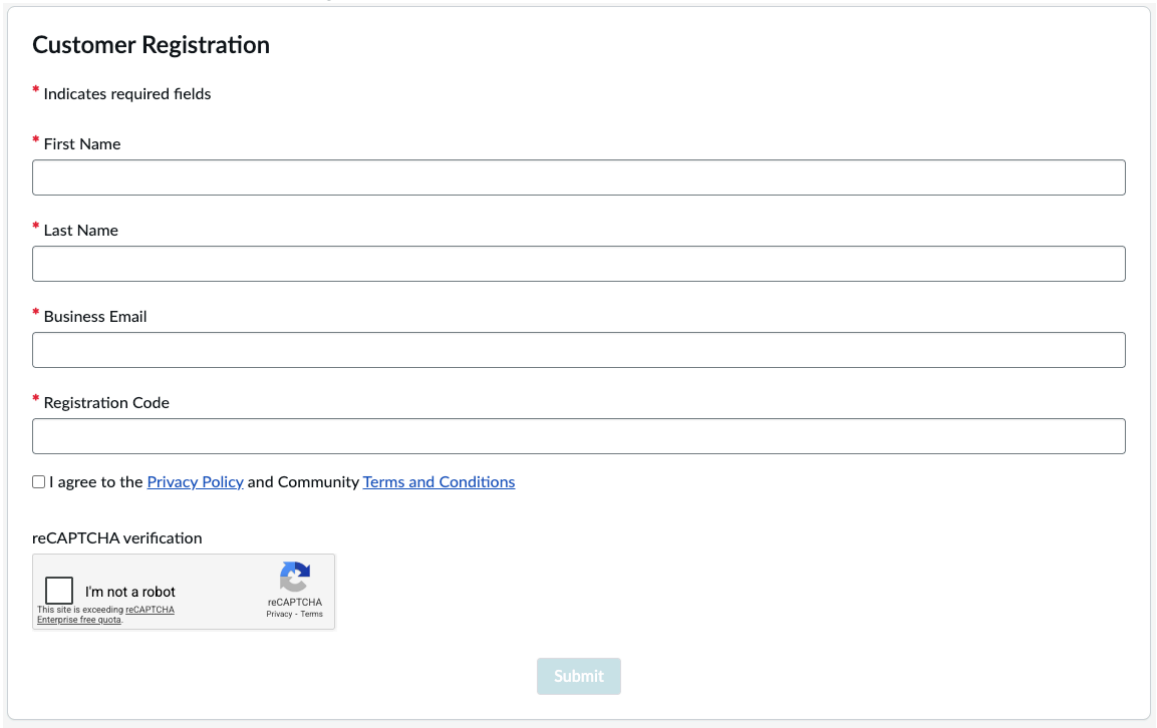
The self-registration feature enables new customer contacts to submit registration requests through the business portal.

A customer contact can submit a registration request using a valid registration code. The request is then sent to the customer administrator of that account for approval. If an account has multiple customer administrators, they all receive the registration request, but only one approval is necessary.

After the request is submitted, it goes through an approval process and is either accepted or rejected. If accepted, a new account is created, and the customer contact gets an email with a user ID and a temporary password. When logging in to the portal for the first time, the customer contact is asked to change the temporary password. If rejected, the customer contact gets an email notification.

Note:
If a request is submitted with an incorrect registration code, a notification message appears `Invalid Registration Code`.

Customer contact self-registration form



The administrator creates a unique registration code for each account and stores it in the **Registration Code** field on the Account form. After the code is created, customer administrators can distribute the code to customers as needed.

Example: The default self-service Password Reset process

Submit a self-registration request

Submit a registration request from the business portal.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the business portal.
2. Request a login by selecting **Sign up** from the portal header.
3. On the Customer Registration form, fill in your **First Name**, **Last Name**, **Business Email**, and **Registration Code**.
4. Enable the check box to agree to the privacy policy and to the community terms and conditions.
   Select the links to access more information about these policies.
5. Select the reCAPTCHA verification check box.
   The Customer Service application uses the Google re-CAPTCHA service.
6. Select **Submit**.
   The page redirects you to the portal login page.
   - If you entered a valid registration code, you see the message: “Your request has been submitted and is pending review. You’ll receive an email when your request is processed".
   - If you entered an invalid registration code, you see the message: “Incorrect Registration Code".

Log in to the Business Portal for the first time

Use your user ID and temporary password to login to the business portal for the first time.

Before you begin
Role required: none

About this task
After a registration request is approved, the customer contact receives an email with a user ID and temporary password. When logging in for the first time, the contact is asked to change the password.

Procedure

1. Navigate to the business portal login page.
2. Enter your user ID in the **User name**.
3. Enter your temporary password in the **Password** field.
4. Select **Login**.
   You’re prompted to change your password.
5. Enter your temporary password in the **Current Password** field.
6. Enter your new password in the **New Password** field.
7. Reenter your new password in the **Confirm New Password** field.
8. Select **Submit**.

Request a password reset

If you forget your password, request a new one from the business portal login screen.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Request reset password email.
   a. Navigate to the business portal.
   b. Select **Log in** in the portal header.
   c. Select the **Forgot Password?** link.
   d. Enter `Username` and complete CAPTCHA verification.
   e. Select **Next**.
   f. Enter your registered email id.
   g. Select **Next**.
   You will receive an email instructions to reset your password.
2. Reset your new password.
   a. Select the **Click here to reset your password** link in the email
   b. On the Reset Password page, enter a new password in the **New Password** and **Retype Password** fields.
   c. Select **Reset Password**.

Result
Your new password is set.

Change password on Business Portal

Change your password directly from the business portal to secure your account.

Before you begin
Role required: none

About this task
Users with the required roles can change their passwords from the business portal.

Procedure

1. Navigate to the business portal.
2. Select your user name in the portal header.
3. Select **Profile** to display the user profile information.
4. Select **Change Password** under Security.
5. On the Change Password pop-up, fill in the fields.

Change Password form

Field	Description
Current Password	The existing password.
New Password	The new password, which must meet the following requirements: ○ Be a minimum of eight characters long ○ Include at least one uppercase and one lowercase letter ○ Include at least one number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Confirm Password	The new password.

6. Select **Change**.

Customer notification preferences

Customers can set preferences for email notifications.

Email notification preferences are set to control email notifications that are sent to the customer when an agent performs one of the following case activities:

- Opens a case for a customer
- Comments on a customer's case
- Provides a resolution for a customer's case
- Closes a customer's case

Set email notification preferences

Customize email notifications to stay informed about specific actions taken by customer service agents on cases, based on your preferences.

Before you begin

Make sure that you have received an email for the case to set the email notification preferences.

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

Procedure

1. Navigate to the business portal.
2. Select your user name or photo in the portal header and select **Profile** to display your user profile information.
3. Select the **Notification Preferences** link under Actions to display the Notification Preferences pop up.

   Note:
   The **Notification Preferences** link is available only after receiving the first email for the case.

4. Enable or disable the following email notifications for your primary email address.
   The notifications are available based on the actions performed by customer service agents on the case.
   - Case closed for customer
   - Case commented for customer
   - Case escalated for customer
   - Case assigned to a new group
   - Case opened for customer
   - Case resolved for customer

Approve, change, or registration request from Business Portal

Users with the snc_external role can view and approve requests and change requests from the business portal.

Before you begin
Role required: snc_external

About this task
A request or change request may require approval from another employee within the same organization.

Procedure

1. Navigate to the business portal header,
2. Select **Notification** > **View all notifications**.
3. Select a record in the Approvals section of the Notifications page.
   The system displays a read-only view of the record approval form. For requests that include one or more items, these items appear in a collapsible list at the bottom of the Request form.
4. **Optional:** Click a requested item at the bottom of the Request form to view the details in a pop-up window.
5. Select **Approve**.
   The system makes the following updates:
   - The record status is set to **Approved**.
   - The record status is displayed after the record number in the Related Records widget on the Case form.
   - The record status is added to the Case form.
     - If the record is approved by the customer administrator or if the customer self-approves the request, the change in status is added to the **Additional comments** field.
     - For other approvers, the change in status is added to the **Work notes** field.
   - The approval record is updated in the Approval table.

Search for information using Business Portal

Use the search feature on the business portal header and home page to find information about a question or an issue.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task
The portal has a search feature that you can use to search for information across several repositories. You can use the search feature on the home page or on the business portal header.

Procedure

1. Navigate to the business portal.
2. Enter a search term into the **Search** field.
3. Select the search icon.
   A list of articles related to the search term is displayed.
4. Select a link to view an article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search the knowledge base on Business Portal

Use the business portal to search the knowledge base or view a list of popular knowledge base articles.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, or sn_customerservice.partner_admin

About this task

The business portal includes a link to the knowledge base that you can use to search for information, read and rate articles, and submit feedback. Under this link, the portal displays a list of popular knowledge base articles. If the information that you need isn't included in this list, you can search the knowledge base for the desired information.

Procedure

1. Navigate to the business portal.
2. Select **Resources** > **Knowledge**.
   The knowledge page displays a separate category for each of the products purchased by this customer. It also displays lists of articles by:
   - Featured content
   - Most useful
   - Most viewed
3. Do one of the following,

Option	Description
Click a product to display more specific in formation	Displays a list of categories on the left and ar ticles on the right. Select a category to drill down even further.
Click a link from one of the lists	Displays the article.
Type a topic in the Search field and press the Enter key	Displays a list of related articles. Select a link to display the desired article.

Chat with an agent from the Business Portal

Chat with a virtual agent or a customer service agent from the business portal to resolve issues quickly.

Before you begin

Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.partner_admin

Procedure

1. Select the Chat icon in the business portal to start a conversation.
   A virtual agent or a customer service agent responds.
2. **Optional:** To talk to a person instead of a virtual agent, select the kebab menu ( ) then select **Call Support (Daily 5AM - 11PM)**.
3. To end the chat, select End Conversation icon ( ).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
If the agent creates a case or links the discussion to an existing case, you can view these cases from the business portal. To display the case list, select **Requests** > **View submitted requests** > **View cases & tasks**.

Get help using virtual agent conversations from Business Portal

Predefined Customer Service Virtual Agent chatbot conversations help your customers complete common self-service tasks, such as getting help with a product or checking the status of a case. Use predefined NLU with your virtual agent chatbot topics to assess the intent of the user input and provide the best response based on the context of the conversation.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.consumer

If you're anonymous (not logged in to the application), get help by entering keywords for an issue and choose to get transferred to a live agent.

Install the plugin Customer Service Virtual Agent Conversations (ID: com.sn_csm.virtualagent) to view the chatbot topics.

A user with a proxy_contact role can also check the case status for a customer.

About this task
The information exchanged during the conversation flow (user inputs and bot responses) enables the chatbot to fulfill a user request or assist a user in completing a task. If the user has a question or an issue with an existing product or order, the virtual agent searches the keyword and displays relevant knowledge articles that can help resolve the issue. If there are no relevant articles, it creates a case.
ServiceNow NLU enables discovery of the chatbot topics based on either the keywords entered in the chat or the user-intent and matches an entity with the user input. It also makes the entity available to the topic if there's a match.

Procedure
1. Navigate to the business portal.
2. Select **Chat**.
   You can select **Show Me Everything** to display all available topics or enter keywords to narrow down the results to relevant topics.
3. If you're a logged-in user, enter keywords to get help on a case, an issue, or an order.
   - If NLU is enabled, it guides you through the right topic based on the utterance.
   - If NLU isn't enabled, it displays topics based on the match for the entered keywords. You can make a selection from all available topics displayed.

   Note:
   Contact your administrator to determine whether the topics are NLU-enabled.

4. Use

5. To exit a chat conversation, select **I'm done**.

View a publication on Business Portal

View the details of a publication on the business portal and download any attachments.

Before you begin
Role required: sn_customerservice.customer

About this task
The **Publications** link on the business portal displays a list of current publications that is sorted by publication number.

> **Note:**
> After a publication reaches its expiration date, it is automatically removed from the Publications list.

Procedure

1. Navigate to the business portal.
2. Select **Resources** > **Publications** in the header.
   This displays a list of current publications. The information displayed for each publication includes the title, publish date, expiration date, and a brief description.
3. If desired, search the Publications list by entering the search term in the search field at the top of the list.
4. Select a publication name to open.
5. If the publication has attachments, select the attachments to download from the pop-up window.
6. Close the pop-up window.
7. Select the return arrow at the top of the publication to return to the Publications list.

Request an item or service from the Business Portal

Browse the catalog and create a request for an item or a service from the business portal.

Before you begin
Role required: sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.customer_case_manager, sn_customerservice.customer, sn_customerservice.consumer, sn_customerservice.proxy_contact

About this task
Users can make requests for a product or service from the business portal. Customer administrators, partners, and case managers can also make requests.

> **Note:**
> Creating a request from the business Portal portal requires activation of the Customer Service with Request Management plugin (com.sn_cs_sm_request). It also requires that the administrator to provide external customers with access to request records.

Procedure

1. Navigate to the business portal.
2. Select **Requests** > **Submit a request** > **Submit any request**
3. Browse the service catalog and select the desired item or service.
   Select topics from the navigation menu to view related articles and catalog items.
4. On the form, fill in any necessary information related to the request.

5. Select **Submit**.
   The system processes the request, creates it along with related records, and shows the details on the record view page.

View cases and case tasks from the Business Portal

View the list of cases and case task from the business portal to view its details.

Before you begin
Role required: sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.customer_case_manager, sn_customerservice.customer, sn_customerservice.consumer

About this task
If a case has one or more related records, a Related Records widget is displayed on the case view page that lists those records.

Procedure

1. Navigate to the business portal.
2. Select **Requests** > **View submitted requests** > **View cases & tasks** in the portal header.
   You can select the case type from Categories and filter the list of records before selecting a case.
3. Select a case to view its details.
4. **Optional:** For My requests, expand the **Stage** field to display more details about the request process.
5. Select the **X** in the upper corner to close the details window.

View or modify a case from the Business Portal

View or modify the information in a customer service case.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.customer_admin, sn_customerservice.partner, sn_customerservice.partner_admin

About this task
Depending on the role of the current user, the Case list displays:

- Cases created by the current user (sn_customerservice.customer)
- Cases related to the current user's account (sn_customerservice.customer_admin)
- Cases related to the current user's account as well as partner accounts (sn_customerservice.partner, sn_customerservice.partner_admin)

Procedure

1. Select **Requests** > **View submitted requests** > **View cases & tasks** in the portal header.
2. Select the desired case number to open the case view page.
3. Post required comment on the Activity tab or upload attachment on the Attachments tab.
   All other fields on the form are read-only.
4. Select **Send**.

Close a case from the Business Portal

Close completed or resolved cases from the business portal.

Before you begin
Role required: sn_customerservice.customer, sn_customerservice.consumer

About this task
This feature is available for the business portal (B2B) for product.
The **Close Case** button is not available for cases in the **Resolved** or **Closed** states.

Procedure
1. Navigate to the business portal.
2. Select **Requests** > **View submitted requests** > **View cases & tasks** in the portal header.
3. Open the desired case.
4. Select **Actions** > **Close Case**.
5. In the confirmation pop-up window, select **Close Case**.
   When a case is closed from the portal:
