Administer the ServiceNow AI Platform

As a platform administrator, you have the power of the ServiceNow AI Platform at your fingertips. The ServiceNow AI Platform is an application platform as a service that automates business processes across the enterprise.

Get started

Choose one of these tiles to get started.

Start here to learn about the ServiceNow AI Platform

Learn how the ServiceNow AI Platform works.

Configure ServiceNow AI Platform core features

Configure settings that affect global ServiceNow AI Platform behavior and behavior for ServiceNow AI Platform applications.

Maintain and monitor the ServiceNow AI Platform

Identify health issues and settings that you need to change. Optimize ServiceNow AI Platform performance using performance monitoring and diagnostics.

Upgrade to the latest version

Plan and manage your ServiceNow AI Platform upgrades using Upgrade Center. Monitor upgrade progress and view a summary of upgrade results with Upgrade Monitor.

Additional Resources

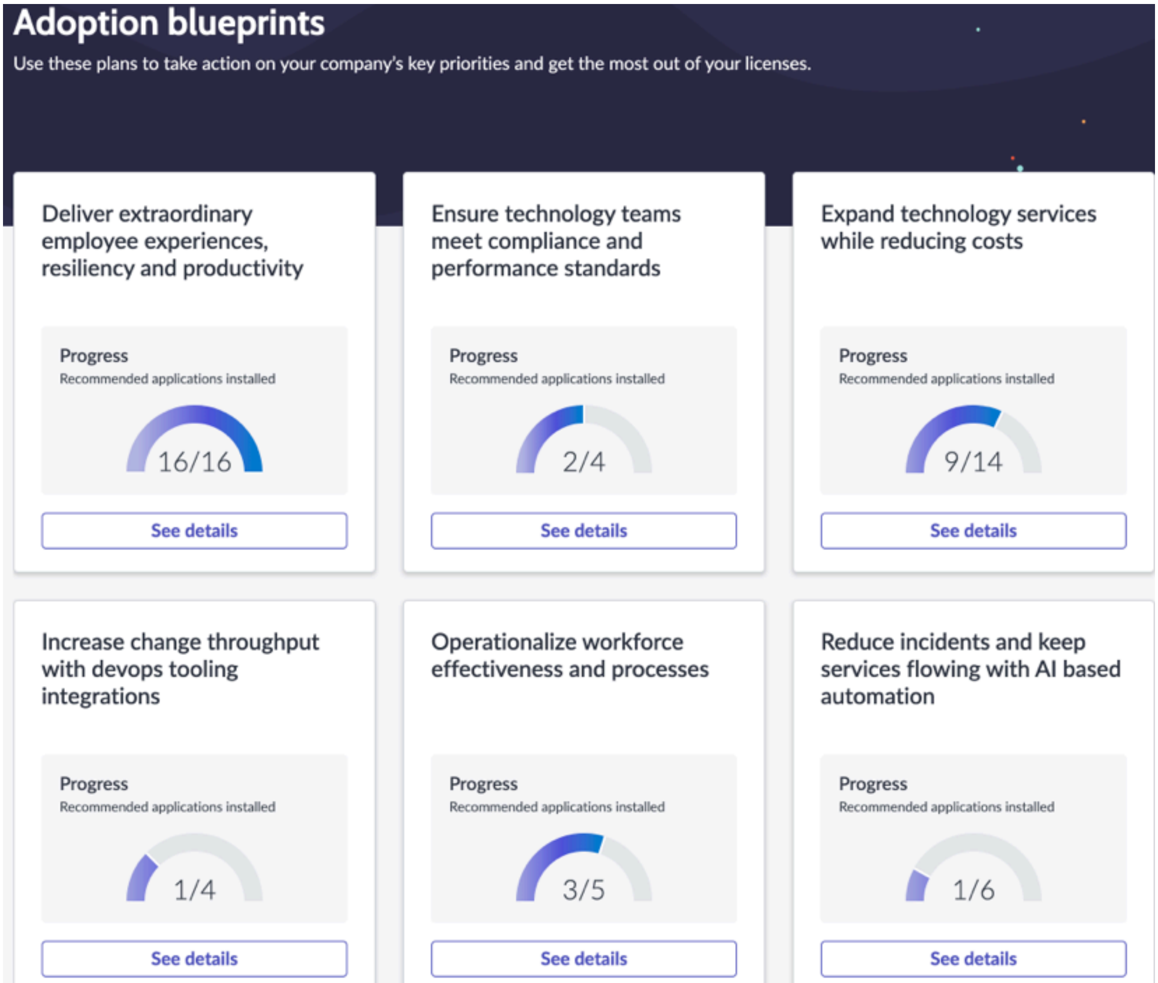
Upgrade your platform administrator experience to the next level

Start here to learn about the ServiceNow AI Platform

Learn about the ServiceNow AI Platform and these important applications:

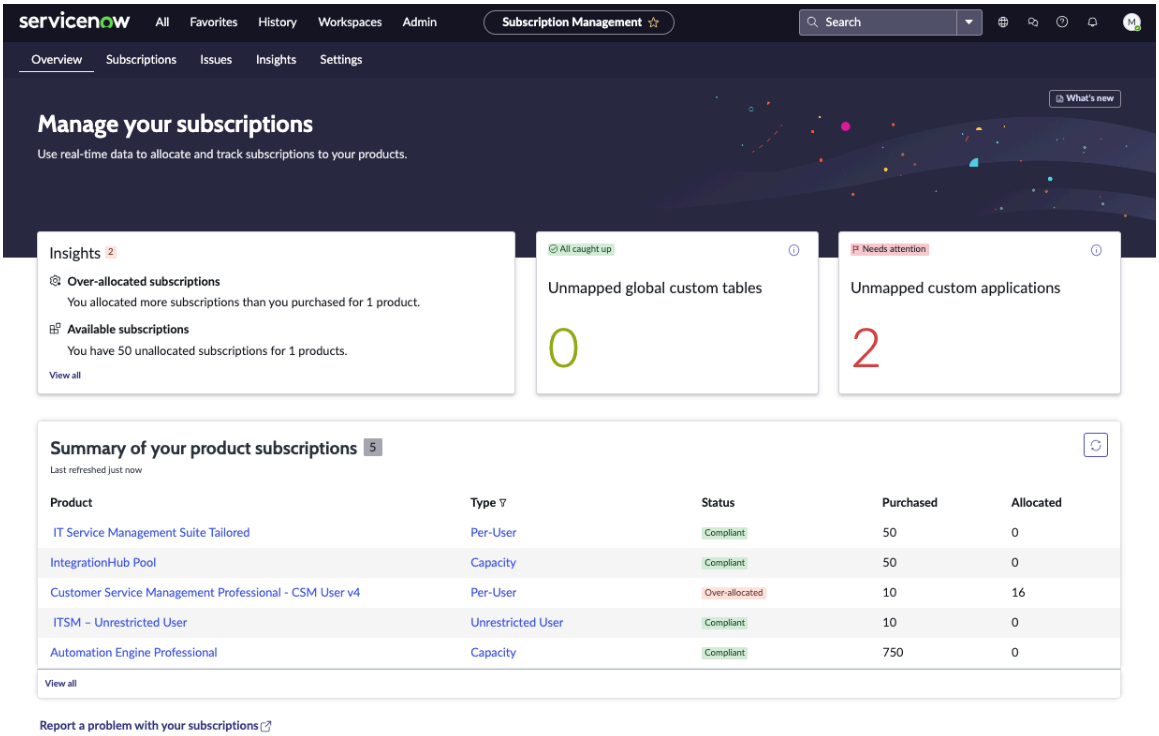
Admin Center

A central hub for platform owners and admins to access platform capabilities, discover new applications, and get intelligent, actionable insights. Start with Adoption blueprints, which tell you which plugins to install to meet business objectives.



Subscription Management

A centralized management experience to help you understand your subscriptions and entitlements.



Configure ServiceNow AI Platform core features

Explore core features that affect global ServiceNow AI Platform behavior as well as behavior in some ServiceNow AI Platform applications.

User administration

Configure users, groups, and roles to provide access to ServiceNow AI Platform applications and settings.

Now Platform tables and data

Learn how to work with ServiceNow AI Platform records in the classic environment.

Search administration

Configure search engines and interfaces for the ServiceNow AI Platform. Select AI Search for a consumer-grade search experience, or use the legacy Zing text search engine. Use Contextual Search to let service agents view relevant results based on an Incident or Problem record's query context and user intent.

Time configuration and currency configuration

Configure data and time fields, time zones for your users, and calendars.

Translation and localization

Provide service around the globe with language translation and localization for specified regions.

Integrations

Learn about integrating third-party applications into the ServiceNow AI Platform.

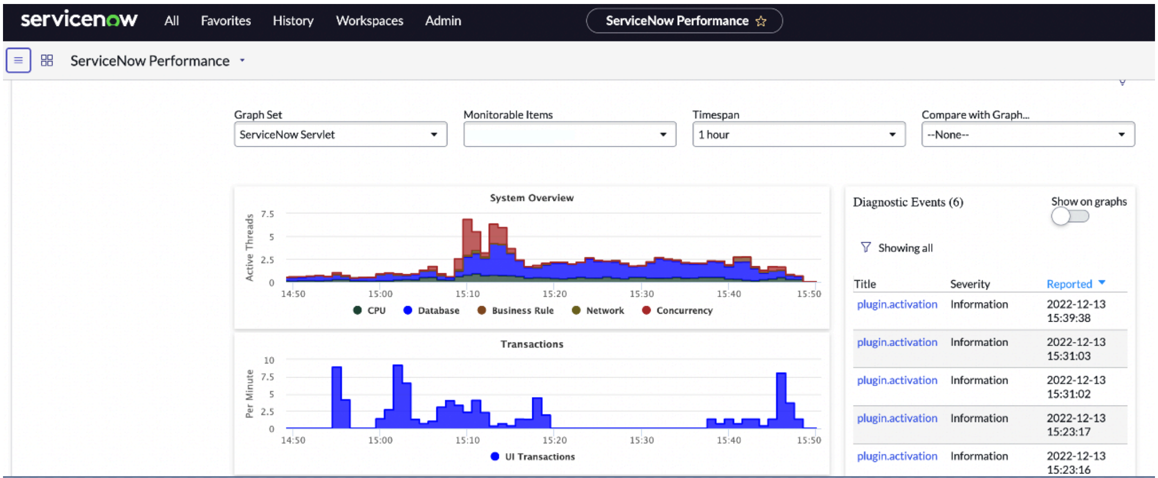
Notifications

Use Notifications to manage system email, create system notifications, and configure how your system responds to inbound email.

Service Level Management

Configure the Service Level Management (SLM) application to gather your service requirements, monitor your SLAs, and report on your SLA compliance.

Maintain and monitor the ServiceNow AI Platform



Instance Scan

Identify ServiceNow AI Platform health issues and incorrectly configured settings.

Events

Monitor system events and determine which the system should process them.

Platform performance

Ensure system optimization through performance monitoring and diagnostics.

Plan and manage your ServiceNow AI Platform upgrade

Upgrade Center and Upgrade Monitor

Plan and manage your ServiceNow AI Platform upgrades using Upgrade Center. Use Upgrade Monitor to monitor the progress of your upgrade. After the upgrade completes, you can view a summary of upgrade results.

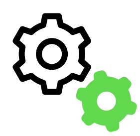
Getting started on the ServiceNow AI Platform

ServiceNow AI Platform is the exclusive ServiceNow platform. It provides a range of options to improve and automate your business processes.

How the ServiceNow AI Platform works

The ServiceNow AI Platform is the foundation of ServiceNow. It enables data to flow seamlessly across applications and existing systems.

Basic system configuration

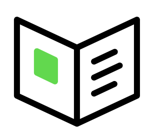


Customize UI and forms, create a mobile experience, and adjust other settings in applications across the ServiceNow AI Platform.

Admin Center

Admin Center provides a central hub for you to access platform capabilities, discover new applications, and get intelligent, actionable insights.

Subscription Management



With the ServiceNow® Subscription Management application, you can manage how your ServiceNow subscriptions are used on your instances.

How the ServiceNow AI Platform works

Learn how the ServiceNow AI Platform can provide the solutions that you need to improve your business and manage risk effectively. Powerful automation, AI, and embedded analytics optimize your workflow processes, with a wide variety of resources made to help you respond to business changes quickly and easily.

Basic system configuration

Modify your UI to suit your business operations, with various core configuration settings at your disposal. Use Form Administration to customize the appearance of forms and lists. Provide tailored UI through User Interface Configuration, and improve the navigation and search experience for users with Navigation and UI. Enhance your instance and applications with Localization and Time settings, and stay on the go with Mobile Device Support. A wide range of plugins expand the platform even further, with each customizable to your needs.

Admin Center

Discover the capability of available applications and how to implement them to work toward achieving your business goal. Your administrators will be able to get started quickly with setting up apps, loading initial data, and establishing roles, groups, and users. The admin center gives your team the power to customize user interfaces, update versions, applications, and modules configurations, handle user access, monitor system performance and UI policies, and much more.

Subscription Management

Manage your ServiceNow subscriptions and how they're used on your instances with Subscription Management. This app helps you allocate and monitor subscriptions, and display current subscriptions in your instance. Active management of user-based subscriptions and monitoring of capacity subscriptions lets you track usage and adjust allocation efficiently. Enabled by default, this management app means you can plan for subscription renewals with no added costs.

How the ServiceNow AI Platform works

ServiceNow® offers a flexible, secure platform with a vast set of options, all following a single data model. Begin here to learn more about the platform.

https://player.vimeo.com/video/980759261?badge=0&autopause=0&player_id=0&app_id=58479

Watch the video above for an introduction to ServiceNow AI Platform architecture.

ServiceNow Mobile Apps Overview

Watch the video above for an introduction to the Now Mobile app.

Overview

The ServiceNow AI Platform is a highly versatile, scalable cloud solution enterprise for IT, operations, and business management, and process automation.

"The single source of truth" in your business is your data, and ServiceNow holds all your data on a single, secure platform, using a singular data model for all operations. Enterprise applications are delivered through this system, integrating seamlessly with each other and with external services. The ServiceNow AI Platform helps you address your business needs, boosting efficiency and productivity from the individual user through your entire enterprise, saving time and money.

Architecture

The ServiceNow AI Platform offers easy customization, live reports and monitoring, and strong data privacy to save your business money and boost productivity. Services on the ServiceNow

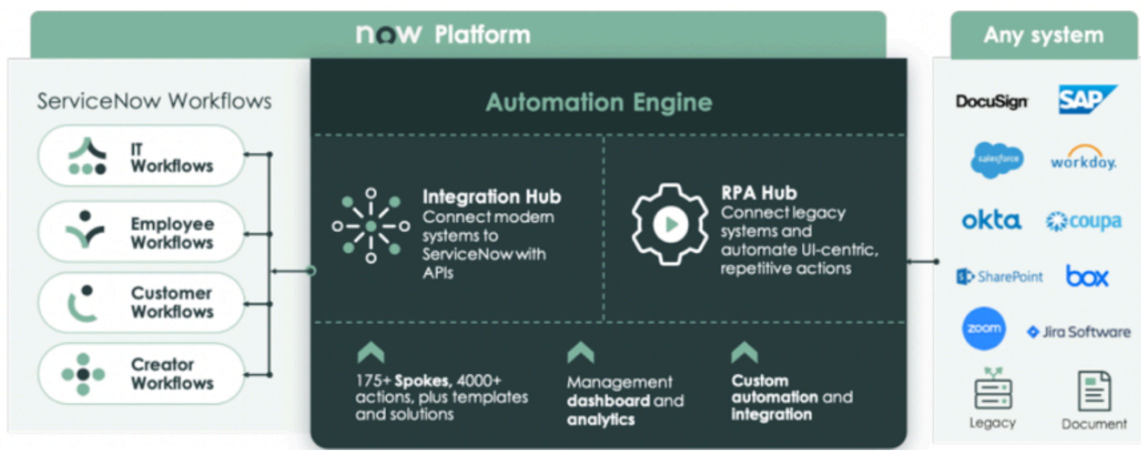
AI Platform are provided on a multi-instance basis, instead of running one instance with multiple users. Administrators can segregate their data between business entities in a multi-instance architecture, offering different experiences per instance while they all remain centrally managed through the platform. Deep customizability is available in all your instances, with easy software installation, data importing, and creation of workflows, processes, applications, or UIs.

Administration

The ServiceNow AI Platform Admin Center gives business administrators easy subscription management, a full-service catalog for services and products, and total control over workflow process optimization. Localization is available in more than a dozen languages and currencies. In-house and third-party translation services handle communications, virtual agent chat, user input translation, and more. Analytics tools provide detailed feedback on user activity, security, and other important aspects of your digital enterprise.

Integration

The Automation Engine enables connections between instances and external services on the ServiceNow AI Platform. Both unidirectional and bidirectional data integrations are available, along with email-based connection, and various other methods and technologies, all through the platform's MID Server system. Connection and automation occur in one place, with full instance and data replication, importing and exporting, and pre-built processes to address various tasks and third-party services.



Tools

ServiceNow has a full series of options available to ServiceNow AI Platform subscribers. Ready-made tools and templates all mean easy and fast setup of your instance from the start, along with quick creation of interfaces and applications.

App Engine Studio

Speed up—and scale up—low-code development for your instance.

Flow Designer

Recreate processes as digital workflows.

UI Builder

Create user interfaces and improve user experiences.

Integration Hub

Natively integrate ServiceNow with any external service or product.

Predictive Intelligence

Perform smart automation of workflows.

Virtual Agent

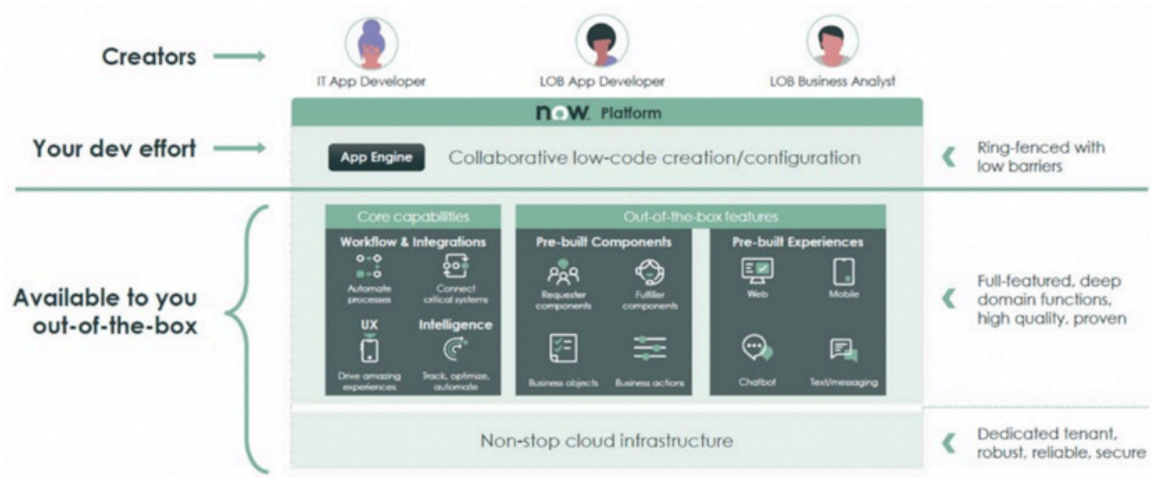
Create intelligent chatbots to address users' problems and services.

Performance Analytics

Analyze and maximize workflow performance.

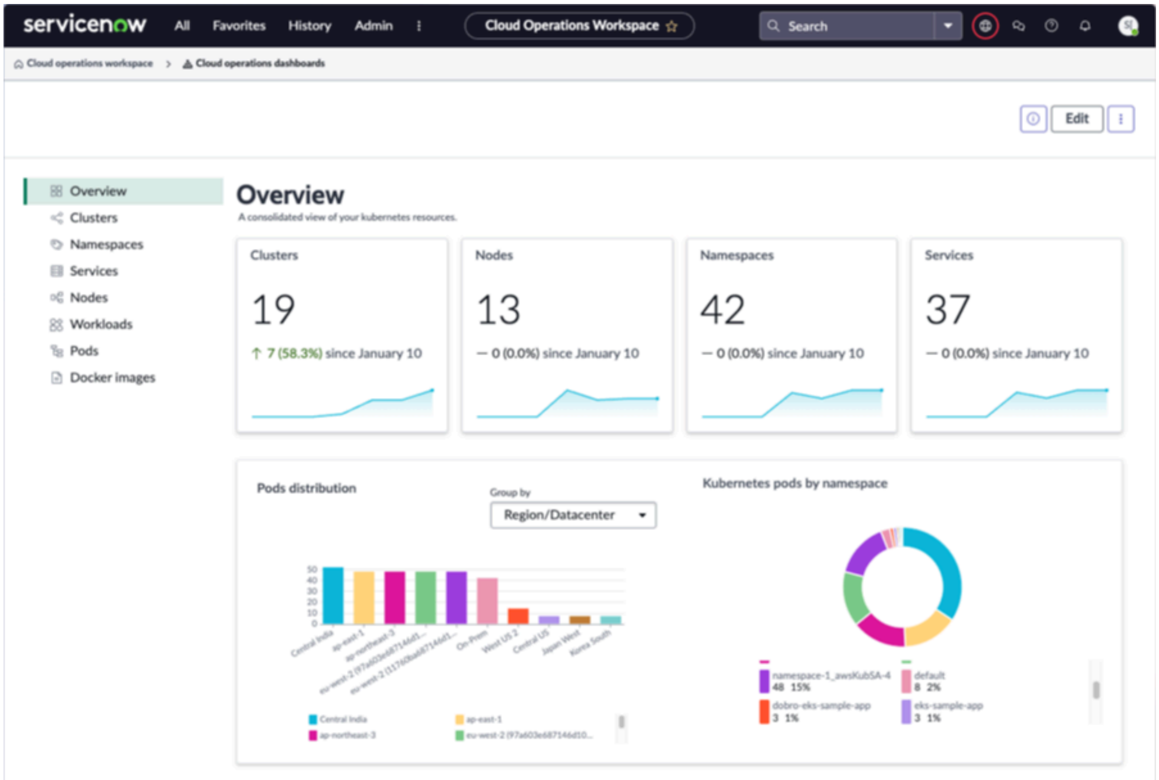
AI Search

Offer a consumer-grade search experience for users.



Platform Analytics

Distribute and consume Platform Analytics through data visualizations and dashboards with optional filters. Explore KPIs and receive insights into significant events in the data. Use dashboards to create a visual story with Platform Analytics data that you can share with multiple users. Use data visualizations based on table, indicator, or other data in dashboards across the Analytics Center. Administrators can leverage Usage Insights to get information on user engagement with both mobile and web applications, including user population, retention, and behavior. Process Mining helps you discover ways to streamline your business, find bottlenecks and deviations in workflows, filter and compare processes.



Mobile

Desktop access to the ServiceNow AI Platform is matched by our mobile applications. The Now Mobile app offers a consumer-grade experience for your customers and users to access available services, including help articles and live or virtual agents. ServiceNow mobile, geared toward service providers in your enterprise, provides tools for task scheduling and handling, communications, GPS and mapping, multimedia uploading, and offline services. Easy no-code configuration and in-depth developer tools, including reusable components, views, and a robust mobile publishing system, give you the tools to build mobile apps yourself.

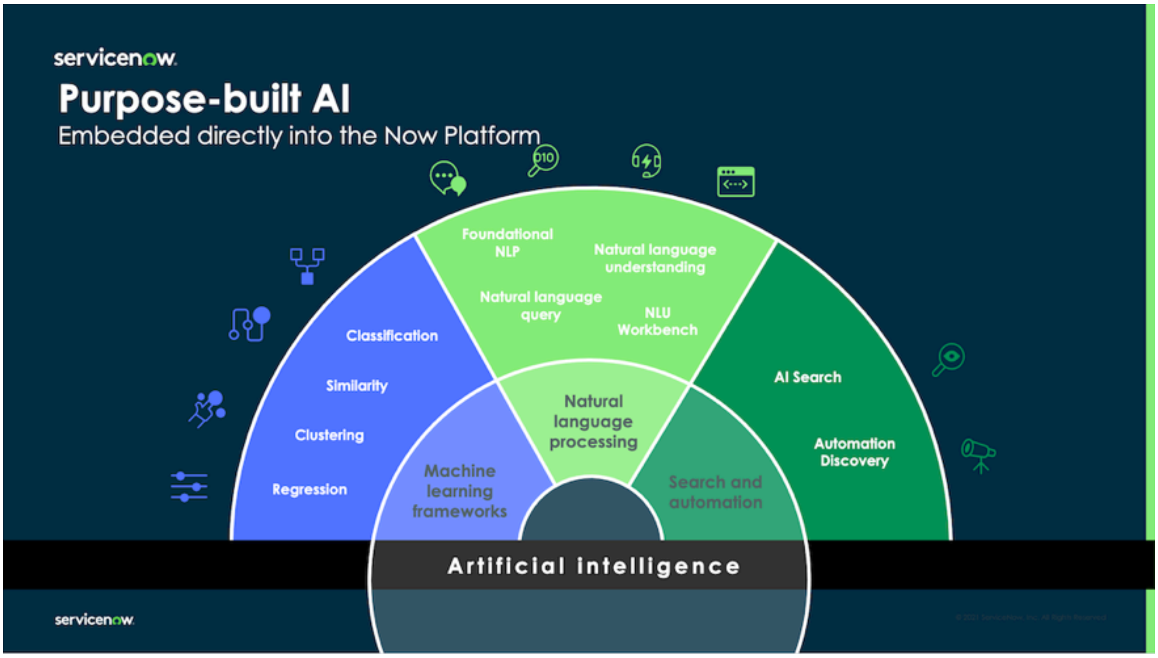
Knowledge

ServiceNow provides not only the tools you need for your business to thrive, but the know-how to make use of all the options on the platform. Detailed knowledge base articles enable users and agents to get the information they need, to handle specialized tasks or processes, troubleshoot, or find other help. The Knowledge Management system enables you to create, store, and share information easily within your organization, monitor usage, and collect feedback (including full analytics) to improve your knowledge base.

For more information, see Knowledge Management.

Artificial Intelligence

AI is standard across the ServiceNow AI Platform with Intelligent Experiences. This purpose-built AI interprets user requests and messages, assists agents with task management and service owners with oversight and knowledge management. You can tailor the AI to meet instance demands for Natural Language Understanding or database querying, data extraction from documents, and prediction of future data trends. AI Search is part of the standard ServiceNow AI Platform package, for easy filtering of information according to user needs. Customized Virtual Agent help is available 24/7. Full AI-based analytics give you detailed data on the lifecycle of workflows and processes in your business.



Basic system configuration

Basic system configuration encompasses changes made to the platform as well as supporting applications. These changes can affect global settings as well as settings for particular applications.

Learn about these ServiceNow AI Platform basic system components and settings:

- ServiceNow plugins
- Find components installed with an application
- Available system properties
- Query join and complexity size limits
- Web proxy

ServiceNow plugins

Plugins are software components that provide features and functionalities within a ServiceNow instance.

Plugins and applications video, approximately two minutes long.

Differences between plugins and applications

Plugins and applications are separate components on the ServiceNow AI Platform.

- A plugin adds features to installed applications and extends functionality on the ServiceNow AI Platform. For additional details about plugins, see KB0716626.
- An application is a standalone piece of code that implements a collection of features on the ServiceNow AI Platform. You can install applications from the ServiceNow Store or create your own applications.

Activating plugins

All plugins are provided by ServiceNow, but some plugins are activated differently.

- A set of plugins are activated on your instance by default. You can activate additional plugins on your instance depending on your business needs. For details, see Activate a plugin.
- Other plugins require activation by ServiceNow personnel. To request activation, follow the steps in Request a plugin.

There are some plugins that you can't activate or upgrade on your instance and the button is greyed out. This situation can happen in the following cases:

- The plugin requires a subscription that you haven't purchased. To purchase a subscription, contact your ServiceNow account manager.
  - Some features are not included in the ServiceNow AI Platform and require a separate subscription. To purchase a subscription or to find plugin costs, contact the account manager in your company.
  - When you purchase a subscription, certain plugins are activated automatically. If a paid plugin isn't activated automatically, you can manually activate it from the All Applications list in your instance. If the plugin doesn't appear in the instance, submit a request via the Now Support Service Catalog.
  - You can't activate a plugin in your production instance. However, you can test a plugin by activating it in a non-production instance. This includes plugins that are associated with a for-fee subscription. When you're ready to activate the plugin in your production instance, request the plugin from Now Support.
- The plugin depends on other plugins being activated.
  - When you activate a plugin with dependent plugins, the system notifies you of the dependencies before it completes the activation. If you opt to continue with activation, the system automatically activates all the plugins required.
  - In some cases, the plugin works, but certain features that don't apply to your system aren't installed. When you ask to activate a plugin in this category, the system notifies you of the dependencies before it completes the activation. If you opt to continue, the system activates the requested plugin but doesn't include the features that depend on other plugins.
- The plugin is already activated on your instance.
  - To determine if a plugin is already activated, see Plugin Activation Status [KB0678767].
  - After a plugin is activated, you can't disable or deactivate it. If needed, you can hide the functionality. You should thoroughly test, in a non-production instance, the features that are installed when you activate the plugin before using them in a production instance.

After a plugin is activated, you cannot disable or deactivate it. You should thoroughly test, in a non-production instance, the specific features and functionalities that are installed when you activate the plugin before using them in a production instance. See Uninstall a ServiceNow plugin [KB0716414].

- If necessary, you can hide or disable the functionality by restricting access through the use of roles and ACLs.
- Some plugins support rollback contexts. For details on using rollback contexts, see .

A warning message appears if the alter table or create table operation fails when you activate or upgrade a plugin. Contact Customer Service and Support for help with processing any skipped tables.

Personal developer instances

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance. If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the ServiceNow® *Developer Site*. For more information, see Activate a plugin on a personal developer instance.

Note:
Some plugins aren't available for activation on PDIs.

Related topics

List of plugins (Washington DC)

Activate a plugin

You can activate most plugins to expand features and functionalities in the ServiceNow AI Platform.

Before you begin
Role required: admin.

Note:
Before requesting or activating a plugin, check whether the plugin has already been activated on your instance. For details on how to check a plugin activation status, see the Plugin Activation Status [KB0678767] article in the Now Support knowledge base.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins (Washington DC)

Activate a plugin on a personal developer instance

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance.

Before you begin

Request a PDI on the ServiceNow® *Developer Site*.

About this task

If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

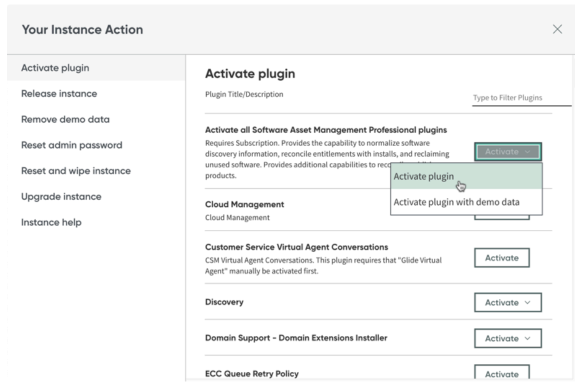
To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the ServiceNow® *Developer Site*.

Note:
Some plugins aren't available for activation on PDIs.

Procedure

Activate the plugin from the All Applications page or the Developer Site.

Activation method	Procedure
All Applications page	In your PDI, navigate to **System Applications** > **All Available Applications** > **All**. Find the plugin and then activate it. For more information on using the All Applications page, see Activate a plugin.
Developer Site	**a.** Sign in to the ServiceNow® *Developer Site*. **b.** On the home page, go to the Instance Management widget and select **Manage** > **Activate plugin**. The Instance Management widget is titled **Your Instance**. It contains information such as the status, URL, and release version of your PDI.  **c.** On the window, locate the plugin to activate. **d.** Next to the plugin listing, select **Activate**.

<table>
<tr><th>Activation method</th><th>Procedure</th></tr>
<tr><td></td><td>If available, you can further select to activate the plugin only or include demo data.


</td></tr>
</table>

Request a plugin

If a plugin does not appear on the All Applications page, you cannot activate it yourself. Request activation of the plugin by ServiceNow personnel.

Before you begin

Note:
Before requesting or activating a plugin, check whether the plugin has already been activated on your instance. For details on how to check a plugin activation status, see the Plugin Activation Status [KB0678767] article in the Now Support knowledge base.

Role required: admin

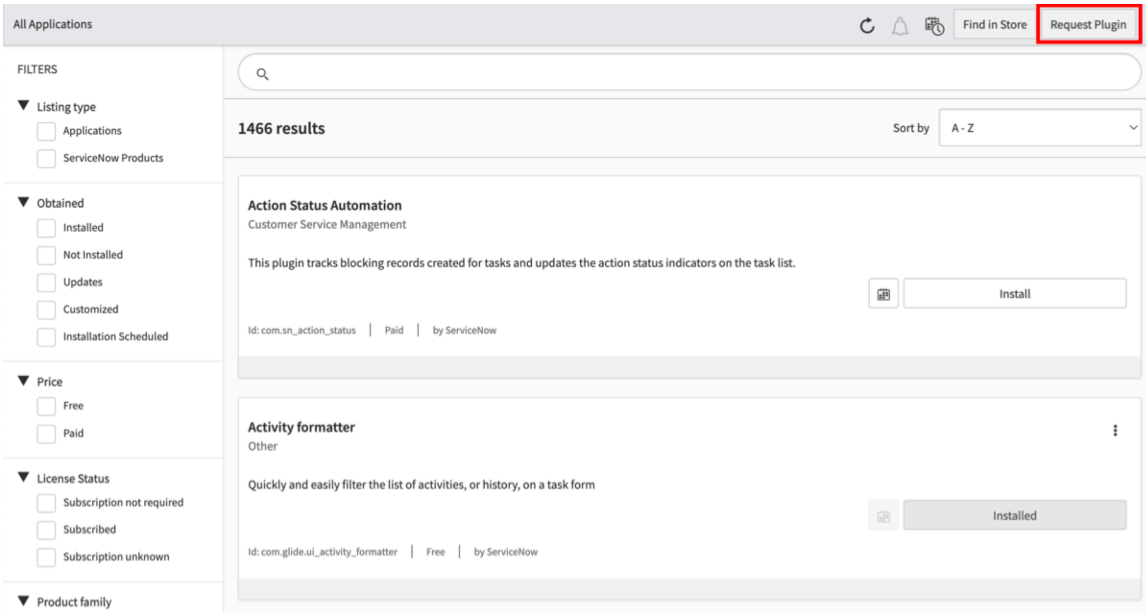
About this task

There are two ways to request a plugin:

- Access the Now Support Service Catalog on Now Support. Open the Activate Plugin page using this link: Activate Plugin.
- Access the Now Support Service Catalog through the All Applications page on your instance by following the procedure.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, click **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form on Now Support, provide the following information.

Activate Plugin request form

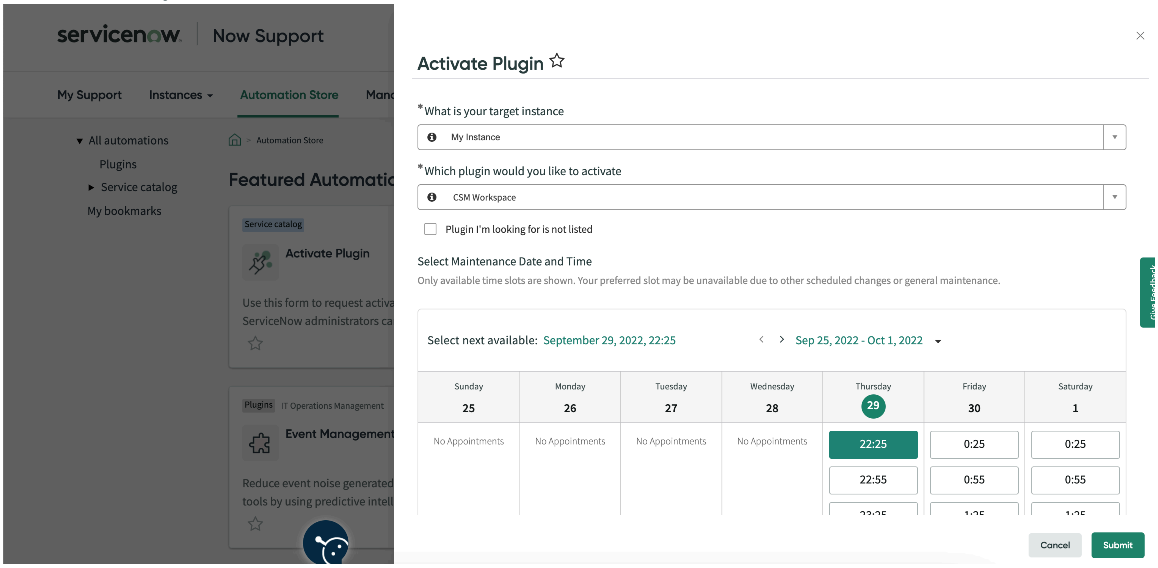
Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following request to activate the CSM Workspace plugin on an instance named My Instance.

servicenow.

Activate Plugin form



4. Click **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

List of plugins (Washington DC)

List of all plugins that you can activate if you have the admin role.

If a plugin does not appear on this list, it may require activation by ServiceNow personnel. Request these plugins through the Now Support Customer Service System instead of activating them yourself.

- For steps on activating a plugin yourself, see Activate a plugin.
- For steps on requesting a plugin that you cannot activate yourself, see Request a plugin.
- For steps on installing a ServiceNow Store application, see Install a ServiceNow Store application.

Note:
For a list of all new and changed plugins for this release, see Changes to plugins in the Washington DC release.

New plugins in Washington DC

This table lists all plugins and ServiceNow Store applications that have been introduced in Washington DC. You can activate or install these plugins or applications if you have the admin role.

Note:
By default, all ServiceNow Store applications listed in this table are compatible with Washington DC unless a note is mentioned for the application.

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
API Key and HMAC Authentication [com.glide.tokenbased_auth] (New in Washington DC)	Support API tokens for REST API endpoints. Enable API key-based authentication to securely authenticate inbound webhook URL.	Active	false	• com.glide.auth.scope • com.glide.rest.policy • com.glide.rest.auth.scope
Asset Warranty - Lenovo [com.sn_warranty_integrations_lenovo] (Available in the ServiceNow Store)	Get the warranty information of hardware assets by connecting to the Lenovo Warranty API.	Inactive	false	• sn_hamp • sn_lenovo_spoke
Capacity management [sn_cap_mgmt] (Available in the ServiceNow Store)	Enables an inventory user to view and action on the utilization of a resource. Any resource consumption will be tracked and provides a mechanism to trigger further inventory request based on capacity constraints defined.	Active	true	None
Collaborative Work Management [com.snc.cwm] (Available in the ServiceNow Store)	Provides a central hub to plan, visualize, and collaborate on work with members across the organization. API Analytics [com.glide.api_analytics]	Allows admins to view API Analytics statistics for web services.	Active	false	• com.glide.db.query_stats • com.snc.pa • com.glideapp.canvas

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
API Stats [com.glide.stats.api]	API Stats	Active	false	• com.glide.db.query_stats • com.snc.pa • com.glideapp.canvas
App APIs [com.glide.app_api]	APIs for fetching Application and Application Rollback related information.	Active	true	
App Collaboration [com.glide.app_collaboration]	Plugin that complements Delegated Developer for facilitating application collaboration. Requires App Engine license.	Active	false	com.glide.delegated_development
App Dependency Client [com.sn_dependentclient]	Plugin to provide list of store applications/ integrations based on their active plugins. Uses store's web service to create a cache of such applications on the customer instances itself.	Inactive	false	
App Engine Management Center [com.sn_aemc]				
App Engine Studio [com.snc.app-engine-studio]	Installs and enables App Engine Studio, a development tool for creators of varying skill levels to build applications that meet the immediate needs of your organization.	Inactive	true	
Application Authorization [com.glide.sys.app_authorization]		Inactive	false	
Application Creator [com.snc.apps_creator]	Retired. Replaced by the Platform as a Service plugin.	Active	false	• com.glide.ui.angular • com.glide.ui.heisenberg

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Application Creator Templates [com.snc.apps_creator_template]	Hosts system application creator templates.	Active	false	
Application Design Restrictions [com.glide.scope.design]	System for restricting and capturing tables augmented by an application	Active	false	
Application Diagnostics Tool [com.snc.app_diagnostics_tool]	Helps you to diagnose the PPM Applications, with quick diagnostic scans and resolve the issues with fix scripts.	Active	false	
Application File [com.snc.apps_file]	Associates configuration records with an application and tracks record metadata.	Active	false	
Application Insights [sn_app_insights] (Available in the ServiceNow Store)	Provides a centralized location where you can visualize and monitor system health.	Active	false	com.snc.clotho
Application Metadata [com.snc.metadata]	Adds relationships and UI actions to work with metadata.	Active	false	
Application Portfolio Management [com.snc.apm]	Helps enterprises have visibility into their business applications inventory and enables analysts to rationalize business applications. Provides Performance Analytics dashboards like Application 360, Landscape Analysis, and associated dashboards of Business Applications with Change requests, Incidents, and Problems. This plugin	Active	true	• com.snc.certification_v2 • com.snc.fiscal_calendar • com.snc.treemap • com.snc.sp_workbench_widgets • com.snc.apm.business_planner • com.snc.pa.apm • com.snc.demand_core • com.snc.apm.predictive_intelligence

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	activates the following related plugins if they are not already active: • Application Portfolio Management – Predictive Intelligence (com.snc.apm.predictive_intelligence): Predicts application category by applying algorithms like similarity on business applications-related data. • Business Planner: Enables access to the Business Planning portal.			
Application Portfolio Management – ATF Test [com.snc.apm.atf]	Validates ATF tests for Application Portfolio Management	Active	false	com.snc.apm
Application Portfolio Management - Technology Reference Model (TRM) [com.snc.apm_trm] (New in Tokyo)	Allows enterprise architects to approve or restrict the use of a software product within the organization.	Active	true	com.snc.apm
Application Portfolio Management Core [com.snc.apm_core]	Enables register a new business application	Active	false	• com.glideapp.servicecatalog.platform • com.glide.hub.designer_backend.model
Application Portfolio Management Digital Integration Management [com.snc.apm_digital_integration]	Enables APM users to manage integrations in Application Portfolio Management.	Active	true	com.snc.apm

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
(Available in the ServiceNow Store)				
Application Portfolio Management Workspace [sn_apm_ws] (Available in the ServiceNow Store)	Enables Enterprise Architects to have a visibility in to all the important aspects of their applications in Application Portfolio Management.	Active	false	com.snc.apm
Application Service [com.snc.cmdb.it_service]	Provides functionality and view for Application Service creation, editing and history view.	Active	false	• com.snc.itom.ui • com.snc.cmdb • com.snc.cmdb.service.modeling • com.glide.ui.list_v3_components
Applications Access Control [com.snc.apps_access]	Implements file-level access for application development.	Active	false	• com.snc.apps • com.snc.apps_picker
Applications Picker [com.snc.apps_picker]	Allows users to select the desired application during application development.	Active	false	
Apply Once APIs [com.glide.system_apply_once]	APIs for altering the behavior of any 'apply_once' update in a plugin during plugin activation/upgrade	Active	false	
Appointment Booking [com.snc.appointment_booking]	Enables customers to book service appointments from the Customer and Consumer Service Portals.	Inactive	true	
Appointment Booking Demo Data [com.snc.appointment_booking_demo]	Provides demo data for the appointment booking feature.	Inactive	false	
Approvals with e-Signature	Adds a prompt for credentials when an	Inactive	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.e_signature_approvals]	approver attempts to approve a request via the list context menu or Approve UI Action on the Approval form.			
Architecture Compliance [com.snc.architecture_compliance]	Manages scheduled or on-demand audits of CMDB records, to determine if configuration items (CI) match expected attributes.	Inactive	true	com.snc.certification_core
Assessment [com.snc.assessment_core]	Provides capabilities to use custom questionnaires and scripted queries to evaluate, score, and compare any records in ServiceNow.	Active	true	• com.glideapp.workflow • com.glideapp.survey • com.snc.bestpractice.task_survey • com.glide.survey_designer
Assessment Designer [com.glide.assessment_designer]	Activates assessment designer that is a drag-and-drop interface to create assessments.	Active	false	com.glide.assessment_designer.common
Assessment Designer Common [com.glide.assessment_designer.common]	Base plugin for assessment related designers like Quiz Designer, Survey Designer, Assessment designer. You must activate Assessment Designer Common plugin before using Quiz Designer, Survey Designer, or Assessment Designer. By default, this plugin is activated.	Active	false	com.glide.ui.ng.dc
Asset Management [com.snc.asset_management]	Lets you manage all your assets, consumables, and software licenses.	Active	true	• com.snc.expense_line • com.snc.model • com.snc.organization_management • com.snc.fixed_asset • com.snc.depreciation • com.snc.automation • com.glideapp.home

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Asset Management Common [com.sn_itam_common]				
Asset Management Performance Analytics [com.snc.ast_mgmt_pa]	Performance Analytics for Asset Management out-of-the-box KPIs.	Active	false	
Asset Management Workspace [com.sn_itam_workspace]	Enables ITAM capabilities in Workspace.	Active	false	• com.sn_itam_recomm • com.snc.app_shell_aw • com.snc.uib.base_agent_workspace
Asset Management Workspace - Recommendations [com.sn_itam_recomm]	Recommendations feature for workspaces.			
Assignment Workbench [com.snc.assignment_workbench]	Provides a workbench that customer service managers can use to evaluate agents based on configurable criteria, such as skills and availability, and then assign tasks to the desired agents.	Inactive	false	com.snc.matching_rule
ATF Test Generator and Cloud Runner [sn_atf_tg] (Available in the ServiceNow Store)	One-click test generation and cloud execution for ATF.	Inactive	false	• com.glide.automated_testing_framework • com.glide.auth.mutual
Availability [com.snc.availability] (New in Tokyo)	Allows organization to calculate availability for select configuration items.	Active	false	• com.snc.cmdb • com.snc.service_portfolio_core
Auto Recovery	Enables Auto Recovery functionality.	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.autorecovery]				
Automated Test Framework [com.glide.automated_testing_framework]	Testing framework and tools for creating automated tests	Active	true	• com.glide.rollback • com.glide.ui.angular • com.glide.element_mapping • com.glide.vars
Automated Test Framework - Application Navigator [com.glide.automated_testing_impl.left_nav]	Provides ATF steps that validate access to the application navigator.	Active	false	com.glide.automated_testing_framework
Automated Test Framework - Custom UI [com.glide.automated_testing_impl.custom_ui]	Adds ability to test custom UI.	Active	false	com.glide.automated_testing_framework
Automated Test Framework - Parameters [com.glide.automated_testing_impl.parameters]	Adds ability to parameterize ATF tests.	Active	false	com.glide.automated_testing_framework
Automated Test Framework - Reporting [com.glide.automated_testing_impl.report]	Automated Testing Framework Reporting test step configuration.	Active	false	• com.glide.automated_testing_framework • com.glideapp.report
Automated Test Framework - Responsive Dashboards [com.glide.automated_testing_impl.dashboards]	Automated Testing Framework Responsive Dashboard test step configuration.	Active	false	• com.glide.automated_testing_framework • com.glideapp.dashboards
Automated Test Framework - REST Inbound [com.glide.automated_testing_impl.rest_inbound]	Automated Test Framework for inbound REST requests.	Active	true	com.glide.automated_testing_framework

servicenow

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Automated Test Framework - Schedule [com.glide.automated_testing_impl.schedule]	Tools for scheduling automated tests.	Active	false	com.glide.automated_testing_framework
Automated Test Framework - Allowed Errors [com.glide.automated_testing_impl.wce]	JavaScript errors found during UI test execution can be ignored or tracked as warnings. Test designers can complete their work while developers investigate and resolve scripting issues.	Active	false	com.glide.automated_testing_framework
Automated Test Framework Service Catalog [com.glide.automated_testing_impl.service_catalog]	Automated Testing Framework Service Catalog test step configuration.	Active	true	• com.glide.automated_testing_framework • com.glideapp.servicecatalog
Automated Test Framework Service Catalog Service Portal [com.glide.automated_testing_impl.service_catalog_portal]	Automated Testing Framework for Service Catalog widgets in Service Portal test step configuration.	Active	true	com.glide.automated_testing_impl.service_cat
Automated Test Framework Service Portal [com.glide.automated_testing_impl.service_portal]	Automated Testing Framework Service Portal test step configuration. This plugin can only be activated by activating the "Service Portal - Core" plugin.	Active	false	com.glide.automated_testing_framework
Automated Test Scripts For Survey [com.glide.automated_testing_impl.survey]	Automated Test Scripts For Survey.	Active	false	• com.glide.automated_testing_framework • com.snc.assessment_core
Automated Testing for Virtual Agent [com.glide.cs.atf]	Activates the Automated Testing capabilities for Virtual Agent.	Active	false	com.glide.cs

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
(New in Utah)				
Automatic Assignment [com.snc.automatic_assignment]	Allows any application that uses tables that are children of Task [task] to use auto-assignment to automatically find eligible assignees for any task.	Inactive	false	
Automation Center [com.sn_coe] (Available in the ServiceNow Store)	Integrates islands of automation and delivers centralized governance and management of cross-enterprise, multi-vendor automation in a single workspace.	Active	true	sn_cmdb_ci_class (1.38.0)
Automation Center [com.sn_ac] (Available in the ServiceNow Store)	Manages and monitors your entire hyperautomation landscape.	Active	true	com.sn_cmdb_ci_class
Automation Discovery [sn_auto_discovery] (Available in the ServiceNow Store)	Creates reports from your data to show opportunities for automation.	Active	false	• com.glide.nlu • com.glide.platform_ml
AWA Channel Management [com.sn_channel_management]	Main plugin that supports various functionalities for AWA Service Channels and Queues under Manager Workspace	Active	false	• com.glide.awa • com.snc.wfo
Azure Active Directory User Mapping [sn_now_azure] (Available in the	Contains workflows and mappings for ServiceNow user to Azure Active Directory user.	Inactive	false	• com.glide.channelproxy • com.snc.msteams.app.core

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
ServiceNow Store)				
Badge Reader Integration [com.snc.badge_reader]	Badge Reader Integration Framework which allows other applications to integrate with badge reader hardware.	Inactive	false	
Base Upgrade Logger [com.glide.base_upgrade_logger]		Active	false	• com.glide.ui.mergetool • com.glide.ui.diagnostics
Basic Export Set Functionality [com.glide.system_export_set]		Active	false	
Benchmark Client [com.sn_bm_client]	Benchmark Insights for Customers.	Active	false	com.sn_bm_common
Benchmark Common [com.sn_bm_common]	Common code for Benchmark Insights.	Active	false	
Benchmarks Spoke [com.sn_bm_client.spoke]	Contains the evaluation framework for Benchmarks Recommendations.	Active	false	com.glide.hub
Best Practice - Bulk CI Changes [com.snc.bestpractice.bulkchange]	This plugin is intended to be used with the legacy Change Management state models, which were used prior to the Geneva release. It allows CMDB updates to be proposed and applied to one or more in scope configuration items as part of your change management process.	Inactive	false	
Best Practice - Change Risk Calculator [com.snc.bestpractice.change_risk]	Simple risk and impact calculations for change management.	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Best Practice - Incident Resolution Workflow [com.snc.bestpractice.incident]	Best practices for incident resolution dictate that rather than closing the incident, the incident should have a state of Resolved. This state gives the service desk a mechanism to verify that caller is satisfied with the resolution, and that the customer agrees with closing the incident.	Active	false	
Best Practice - ITIL KPI Reports [com.snc.bestpractice.itil_kpi]	Provides a series of reports that track the Key Performance Indicators (KPI) of incident management and problem management.	Active	true	com.glide.metrics
Business Location [com.snc.business_location]	This plugin supports a data model where the corporation does business with customers through physical channels such as stores and branches.	Active	true	• com.snc.service_organization • com.snc.cs_base_extension
Business Roles [com.snc.businessroles]	Activates the Business Roles module. Combined with other licensed applications, provides business roles and hierarchy for employees with integration to Okta for access provisioning during onboarding.	Inactive	false	com.sn_content_delivery
Business Rule V2 [com.glide.business_rule_v2]	Enhances business rules to support script-free conditions and behaviors.	Active	false	
Business Stakeholder [com.snc.business_stakeholder]	Contains the Business Stakeholder role which authorizes the users to approve, view/read records across the organization and view	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	reports. Note there is a fee associated with the Business Stakeholder role. Do not assign it to users without confirming your organization has the appropriate entitlement.			
Cache build stats [com.glide.stats.cache_build]	Cache build stats.	Active	false	com.glide.stats
Card Operations [com.sn_bom_credit_card]				
Case Assignment Workbench Demo [com.snc.case_assignment_workbench_demo]	Provides demo data, such as sample cases and users, so that the Assignment Workbench product features can be demonstrated on a non-production instance. Not for use on customer production instances.	Inactive	true	• com.snc.customerservice.demo • com.snc.assignment_workbench
Case Digests [com.sn_csm_case_digest]	Enables users to send case status updates and root cause analysis to customers and key internal stakeholders.	Inactive	true	• com.sn_customerservice • com.sn_csm_doc_template • com.snc.documentviewer • com.sn_publications
Case Playbook for Complaints [com.sn_csm_complaint_caseflow]	Provides a complaint case type to capture the details for a customer complaint and a playbook that provides step-by-step guidance through the lifecycle of the complaint.	Active	true	
Case Playbook for Onboarding [com.sn_csm_onboarding_caseflow]	Provides an onboarding case type to capture the details when onboarding customers for a product or service	Active	true	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	and a playbook that provides step-by-step guidance through the lifecycle of the onboarding process.			
Case Playbook for Product Support [com.sn_csm_product_support_playbook]	Case Flow for Product Support guides customer service agents through the steps needed to resolve product issues.	Active	true	
Catalog Designer Common [com.glide.ui.ng.cc]	Catalog Designer Common.	Active	false	• com.glide.ui.ng.dc • com.glideapp.workflow
CCG Content Pack [sn_itom_ccg_cp] (Available in the ServiceNow Store)	Provides the base system contents such as policies, resource collectors, configuration collectors, and remediation actions for the Cloud Configuration Governance application.	Active	false	• com.snc.cloud.core • com.glide.hub.action_step.payload • com.glide.hub.action_step.script_mid • com.snc.itom.license • com.glide.hub.action_step.get_connection_i • com.glide.hub.action_step.rest • com.glide.hub.action_step.xmlparser • com.glide.hub.action_type.datastream • com.glide.hub.integration.runtime
Central Dispatch [com.snc.central_dispatch]	Allows visually allocating tasks to agents for a logged in dispatcher.	Inactive	true	com.snc.dhtmlx.scheduler
Centralized Connection and Credential [com.snc.core.automation.connection_credential]	Centralized Connection and Credential components.	Active	false	
Certification Core [com.snc.certification_core]	Core certification structures such as filters and templates. Certification Core is activated automatically when any of these applications are activated:	Active	false	• com.glide.list_v2 • com.snc.version

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	• Desired State Certification (active by default) • Architecture Compliance • Data Certification • IT Governance Risk and Compliance			
Change Management - Approval Policy [sn_chg_pol_appr]	Change Management feature that helps in generating and configuring approvals using the Change Approval policies.	Active	false	
Change Management - ATF Tests [com.snc.change_management.atf]	This plugin loads ATF tests for Change Management when the Change Management State Model plugin is active. The demo data for this plugin is required to successfully execute these ATF tests.	Inactive	true	
Change Management - CAB Workbench [com.snc.change_management.cab]	Change Management feature which allows CAB Managers to schedule, plan and manage CAB Meetings all on the ServiceNow AI Platform.	Active	true	• com.snc.change_management.cab.form_lay • com.snc.app.calendar • com.glide.service-portal • com.snc.app_common.service_portal • com.glide.editor.tinymce
Change Management - Case Intelligence [com.snc.change_management.ml.ccbc]	Change Management feature that uses Predictive Intelligence to automatically identify cases that may have been caused by change.	Inactive	false	• com.snc.change_management.ml • com.sn_customerservice
Change Management - Change Model Foundation Data [com.snc.change_management.change_model.foundation]	Foundation data for Change Models, including State transitions and supporting flows.	Active	false	• com.snc.change_management.change_mod • com.glide.hub

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Change Management - Change Models [com.snc.change_management.change_model]	Change Models allow flexible configuration of state and transition models for Change Requests.	Active	false	• com.snc.itsm.state_transition_model • com.snc.itsm.state_transition_model.founda
Change Management - Change Models Landing [com.snc.change_management.change_model.landing]	Comprises the user interface used to create Change Requests based on Change Models.	Active	false	com.snc.change_management.change_model
Change Management - Foundation Data [com.snc.change_management.foundation]	Provides the Change Management foundation data, new states, priorities.	Active	true	com.snc.change_management
Change Management - Change Related Incidents (Maintenance mode) [com.snc.change_management.icbc]	UI and configuration for Change Related Incidents Classic environment	Active	false	com.snc.change_request
Change Management - Change Schedule [com.snc.change_management.soc]	Change Schedule.	Active	false	• com.snc.dhtmlx.gantt • com.snc.change_request • com.snc.change_management.soc.color_pic
Change Management - Change Schedule foundation [com.snc.change_management.soc.foundation]	Change Management - Change Schedule Foundation Data.	Active	false	com.snc.change_management.soc
Change Management - Change Success Score [com.snc.change_management.change_success_score]	Change Success Score is a numerical expression that represents the change success history for a particular group. It can be used to evaluate the	Active		• com.snc.change_request • com.snc.pa • com.snc.change_management.change_succ

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	likelihood of future success and help determine the level of change rigor required.			
Change Management - Collision Detector [com.snc.change.collision]	Conflict Detection is a feature of the Change Management application that identifies potential scheduling conflicts based on the configuration items in scope for the change or user or group assigned to fulfill a change.	Active	true	com.snc.maintenance_schedules
Change Management - Color Picker [com.snc.change_management.soc.color_picker]	Color Picker	Active	false	
Change Management - Core [com.snc.change_management]	Core change management plugin which both Change Management State Model and Standard Change Catalog plugins depend on. This plugin updates the **Type** field on Change Request to have the values **Normal**, **Standard**, and **Emergency**. The Type value on existing Change Requests is updated: • Routine com.glide.context_help-> standard (Standard) • Comprehensive -> normal (Normal) • Emergency -> emergency (Emergency)	Active	true	• com.snc.change_request • com.snc.change.collision

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	When creating a Change Request, an interceptor prompts you for the type of Change you want to create.			
Change Management - Incident Intelligence [com.snc.change_management.ml.icbc]	Change Management feature that uses Predictive Intelligence to automatically identify incidents that may have been caused by change.	Active	false	• com.snc.change_management.ml • com.snc.change_management.icbc
Change Management - Mass Update CI [com.snc.change_management.mass_update_ci]	Change Management feature which allows change requesters to propose and apply updates associated with a change request to one or more configuration items in scope for a change.	Inactive	false	• com.snc.change_management.state_model • com.snc.bestpractice.bulkchange
Change Management - Predictive Intelligence Core (maintenance mode) [com.snc.change_management.ml]	Core plugin containing the common components used by the Change Management Intelligence features.	Active	false	• com.snc.change_request • com.glide.platform_ml
Change Management - Risk Assessment [com.snc.change_management.risk_assessment]	Change Management feature which allows risk assessment questionnaires to be created and required to drive the assessment of risk associated with a requested change.	Inactive	true	• com.snc.bestpractice.change_risk • com.snc.assessment_core • com.glide.assessment_designer
Change Management - Standard Change Catalog [com.snc.change_management.standard_change_catalog]	Change Management feature which allows Standard change templates to be proposed, approved, and published in the ServiceNow Service Catalog.	Active	true	• com.snc.change_management • com.glideapp.servicecatalog

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Change Management - State Model [com.snc.change_management.state_model]	This plugin provides the current Change Management state models for Standard, Normal and Emergency change types, originally released in the Geneva release.	Active	true	• com.snc.change_management • com.snc.process_flow_formatter
Change Management - Success Probability [com.snc.change_management.success_probability] (New in Tokyo)	Calculates a probability to indicate what are the chances of the Change Requests completing successfully without issues.	Active	false	com.snc.change_management.change_succes
Change Management Overview Homepage [com.glideapp.report.itsm.change.overview]	Activates a Change Management Overview Dashboard in the Change Management application navigator.	Active	false	com.glideapp.report
Change Management - Risk Intelligence (maintenance only) [com.snc.change_management.ml.risk]	Change Management feature that augments existing risk assessment capabilities with Predictive Intelligence to predict change risk.	Active	false	com.snc.change_management.ml
Change Management - Standard Change Template Intelligence [com.snc.change_management.ml.sctp]	Change Management feature that uses Predictive Intelligence to identify change clusters that may be candidates for standard change templates.	Active	false	com.snc.change_management.ml
Change Management Workflows [com.glideapp.workflow.change_management]	This plugin activates the workflows which control the change processes associated with the Emergency, Standard, and Normal change types introduced in the Geneva release.	Active	true	com.glideapp.workflow

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Change Request [com.snc.change_request]	The base Change Request plugin that contains the core tables for Change Management, including the change request and change task tables.	Active	true	com.glideapp.report.itsm.change.overview
Change Request Calendar [com.snc.change_request.calendar]	This plugin activates the Change Conflict Calendar introduced in the Kingston release. It enables you to view a change request and its potential conflicts once a primary configuration item, planned start date, and planned end date have been provided within a Change request.	Active	false	com.snc.app.calendar
Channel Proxy [com.glide.channelproxy]	Contains the Business Stakeholder role which authorizes the users to approve, view/read records across the organization and view reports. Note there is a fee associated with the Business Stakeholder role. Do not assign it to users without confirming your organization has the appropriate entitlement.	inactive	false	com.glide.external.app
Checklist [com.glide.ui.checklist]	Provides a simple way to track the progress of tasks without creating additional records, using checklists that can be added to any form.	Active	false	• com.glide.ui.ng • com.glide.rest.service
CI Metrics and Remediation - MECM Adapter [sn_mecm_adapter]	Enables you to retrieve and display the CI metrics information of the affected CIs.	Active	true	None

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
(Available in the ServiceNow Store)				
CIDC Spoke [com.sn_cicd_spoke]	Provides subflows and actions to call the Continuous Integration Continuous Delivery REST API endpoints included in the com.glide.continuousdelivery plugin.			
CIWF UI Components [com.sn_ciwf_ui_cmpnt]				
Client Transaction Timings [com.glide.client_transaction]	The Client Transaction plugin provides support to track client rendering times at the server, lining the values up with the server transaction times.	Active	false	
Cloud Action Library [sn_itom_cal] (Available in the ServiceNow Store)	Use the ready-to-use actions and subflows of the Cloud Action Library application to interact with the cloud resources of the organization. The ITOM Governance features, such as Cloud Configuration Governance, use these actions to operate. Cloud Provisioning and	Cloud Provisioning and Governance Core - Discovery and Resource Blocks.	Inactive	false	• com.snc.discovery.core • com.snc.cloud.api

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Governance Core [com.snc.cloud.core]				
Cloud Provisioning and Governance: Google Cloud Connector [sn_cmp_gcp] (Available in the ServiceNow Store)	Enables integration with Google Cloud Platform.	Active	false	• com.snc.cloud.mgmt • com.snc.pattern.designer • com.snc.ng.pattern.designer
Cloud Provisioning and Governance: Terraform Connector [sn_cmp_terraform] (Available in the ServiceNow Store)	Offers ability to provision to AWS, Azure, VMware and IBM Cloud. Develop at speed, ingest your Infrastructure as Code (IaC) template and create a ServiceNow catalog item in minutes.	Active	false	com.snc.cloud.mgmt
Cloud Spend Dashboard [sn_sam_cld_spend] (Available in the ServiceNow Store)	This plugin provides Insights into SaaS, IaaS and PaaS Spend and Savings	Active	false	• com.snc.cloud.api • com.snc.cmdb.scoped • com.snc.discovery • com.itom.jutils • com.sn_itom_opt_licensing • com.snc.clotho • com.glide.hub.integration.runtime • com.glide.hub.integrations.standard • com.sn_sam_saas
CMDB-ATF Tests [com.snc.cmdb.atf]	Provides the CMDB Automated Test Framework (ATF) tests.	Inactive	false	com.snc.cmdb
CMDB and CSDM Data	Provides insights into the key foundational indicators of your	Active	false	None

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Foundations Dashboard [sn_getwell] (Available in the ServiceNow Store)	CMDB and Common Service Data Model (CSDM) as well as recommendations to ensure that the CMDB and CSDM are properly configured for optimal usage and to mitigate any potential risks.			
CMDB Dashboard [com.snc.cmdb.dashboard]	Report overall CMDB and class level aggregated CI health.	Active	false	• com.snc.cmdb • com.snc.pa • com.glideapp.canvas
CMDB Group [com.snc.cmdb.group]	Provides Configuration Item grouping capabilities.	Active	false	
CMDB Group Dashboard [com.snc.cmdb.group.dashboard]	Report the health of CIs in CMDB Groups, on a dashboard.	Active	false	• com.snc.cmdb • com.snc.pa • com.glideapp.canvas • com.snc.cmdb.group
CMDB Mainframe [com.snc.cmdb.mainframe]	One of the plugins included in the Extended CMDB plugin, used for mainframe configuration items.	Inactive	false	com.snc.cmdb
CMDB Radio Category [com.snc.cmdb.radio.category]	One of the plugins included in the Extended CMDB plugin, used for radio configuration items.	Inactive	false	com.snc.cmdb
CMDB Search [com.snc.cmdb_search]	Query-like search on CMDB CIs and relationships. Converts a free-style query with configurable synonyms and stop words, into a properly formulated query on CMDB tables.	Active	false	com.snc.cmdb
CMDB Telecom Category	One of the plugins included in the Extended CMDB plugin, used for	Inactive	false	com.snc.cmdb

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.snc.cmdb.telecom.category]	telecom configuration items.			
CMDB Test Equipment [com.snc.cmdb.test_equipment]	One of the plugins included in the Extended CMDB plugin, used for test equipment configuration items.	Inactive	false	com.snc.cmdb
CMDB Agent Workspace [com.cmdb-workspace]	Enables CMDB capabilities in Agent Workspace.	Active	false	com.snc.agent_workspace.itsm
CMS User Interface - Service Management Core [com.snc.service_management.core.cms]	All Content Management System items (blocks, pages, and menus) used to reference core IT self-service applications are packaged in this plugin. It is also the core foundation for all Service Management applications.	Inactive	false	• com.glide.cms • com.glide.cms.extensions • com.glide.db_images
CMDB Workspace [sn_cmdb_ws] (Available in the ServiceNow Store)	A modern workspace where you can search the CMDB, understand CMDB health and CIs and access common tools	Active	true	• sn_cmdb_pg_templts • sn-cmdb-nlq-search
Coaching [com.sn_coaching]	The Coaching module facilitates the coaching of employees on their work through the use of coaching opportunities (critical moments in a process) that can be conditionally configured.	Active	true	• com.snc.planned_task_v2 • com.snc.skills_management • com.snc.organization_management
Code Search [com.glide.code-search]	A configurable Code Search API.	Active	false	
Collaboration	Retired. Replaced by the Connect plugin.	Inactive	false	com.glide.connect

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.collaboration]				
Collaboration Services [sn_tcm_collab_hook] (Available in the ServiceNow Store)	Provides the ability to communicate over Slack. The application integrates collaboration tools with ServiceNow. You can directly use a collaboration tool from task records and as a channel within communication plans. You can Initiate a conversation from a task record with the collaboration tool of your choice. Enable Collaboration Services for communication plans to pre-define Slack or Microsoft Teams as a real-time collaboration and communication channel.	Inactive	false	None
Collision APIs [com.glide.collision_detector]	APIs for predicting the behavior of the upgrade engine with regard to customizations.	Active	false	
Column Level Encryption [com.glide.now.platform.encryption]	Allows text fields and attached files to be encrypted.	Active	false	com.glide.encryption.core
Column Statistics [com.glide.column_statistics]	Column statistics used to suggest database indexes.	Active	true	
Commercial Lines Claims [com.sn_ins_claim_cml] (Available in the ServiceNow Store)	Commercial claims process digitization from First Notice of Loss (FNOL) through settlement.	Active	true	• com.snc.csm_contributor_user • sn_csm_playbook (2.0.2) • sn_bom (1.8.0) • sn_ins_siu (1.0.0)

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Commercial Lines Servicing [com.sn_ins_policy_b2b]	Enables insurance carriers to be agile and responsive in resolving mid-term policy changes and requests from commercial customers. Carriers can prioritize underwriting cases by premium value with intelligent business rules and eliminate low-value manual work from underwriting queues.		Yes	• com.sn_csm_playbook • com.snc.csm_contributor_user • com.sn_bom • com.sn_bom_document • com.sn_ins_uw_b2b
Commercial Lines Underwriting [com.sn_ins_uw_b2b]	Enables insurance carriers to route complex service requests instantly to underwriters based on their existing underwriting guidelines and rules. Underwriters can collaborate with distribution and servicing teams through an efficient and transparent workflow.		No	• com.snc.csm_contributor_user • com.sn_bom
Common ITSM Service Portal Application Components [com.snc.app_common.service_portal]	Common Application Components for Service Portal.	Active	false	com.glide.service-portal
Communities [com.sn_communities]	Communities enable customers to interact with each other and share knowledge. There is no structured way to disseminate knowledge or capture knowledge from communities and make it a part of customer service and customer success.	Inactive	false	• com.glide.service-portal • com.sn_communities_global • com.snc.activity_subscriptions • com.snc.gamification • com.snc.csm_unified_theme • com.snc.assignment_workbench • com.glide.processor.ics

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Communities Demo Data [com.sn_communities_demo]	Loads demo data for the community application.	Inactive	false	• com.sn_communities • com.snc.csm_unified_theme.demo
Company extension [com.glide.company]	Adds currency columns to the Company [core_company] table.	Active	false	com.glide.currency
Configuration Compliance [snc_vulc] (Available in the ServiceNow Store)	Exposes your high-impact configuration-related security vulnerabilities, and orchestrates their remediation across frequently isolated information security, IT operations, and business process areas. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.	Inactive	true	com.snc.security_support.common
Configuration Compliance Dependencies [snc_vulc_dep]	System dependencies required by Configuration Compliance. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.		false	
Configuration Management (CMDB Enterprise Edition) [com.snc.cmdb.enterprise]	A collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.	Active	false	com.snc.cmdb
Configuration Management (CMDB) [com.snc.cmdb]	Provides core functionality for the configuration management database, including enterprise hardware	Active	true	• com.glide.custom_web_service • com.sn_cmdb_content • com.snc.db.rotation • com.glide.ui.list_v3_components

servicenow

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	and configuration item relationships.			
Configuration Management For Scoped Apps (CMDB) [com.snc.cmdb.scoped]	Enables scoped apps access to Identification Engine APIs.	Active	false	com.snc.cmdb.enterprise
Connect [com.glide.connect]	Provides a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.	Active	false	• com.glideapp.live_feed • com.glideapp.live_common • com.glide.ui.ng • com.glide.ui.angularui • com.glide.ui.ng.amb • com.glide.notification.push • com.glide.db_audio
Connect Interaction UI [com.connect-interaction-ui]	User interface components to adapt Connect Support to use the interaction table as a source of truth.	inactive	false	• com.glide.interaction • com.glide.graphql • com.glide.connect.support • com.glide.connect.ui_components
Connect Scriptable APIs [com.glide.connect.scriptable]	Scriptable APIs for Connect.	Active	false	
Connect Service Portal Widgets [com.glide.connect.sp_widgets]	Connect Service Portal Widgets.	Inactive	false	• com.glide.service-portal • com.glide.connect • com.glide.connect.ui_components
Connect Spoke for Flow Designer [com.glide.connect_v3plus.core.ah]	The Connect Spoke for the Flow Designer provides actions that a process analyst can use when designing flows. The actions allow them to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with	Active	false	com.glide.connect.scriptable

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	Connect API version 3 and later.			
Connect Support [com.glide.connect.support]	Builds on the Connect messaging platform and enables support agents to provide real-time assistance to end users, using queues.	Inactive	true	com.glide.connect
Connect Support and Service Portal Integration [com.glide.connect.support.service-portal]	Adds Connect Support components for use in the Service Portal.	Inactive	true	• com.glide.service-portal • com.glide.connect.support
Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard]	Provides a homepage and all the configuration records required to analyze Connect Support in reporting.	Inactive	false	com.glideapp.report
Connect Support Routing [com.glide.connect.support.routing]	Plugin to enable processor for Routing Connect Support request to appropriate Chat Queue.	Inactive	false	• com.snc.matching_rule • com.glide.connect.support
Consumer Service Portal [com.glide.service-portal.consumer-portal]	Enables the Consumer Service Portal, a web-based portal based on the Service Portal application that your company can use to provide information and support to consumers.	Inactive	false	• com.glide.service-portal.customer-service-base • com.glide.connect.anonymous_support
Content Analytics [com.sn_content_analytics]	Content Analytics	Active	false	com.glide.scope.access.restricted_caller
Content Automation [com.sn_content_automation]	Content automation functionality.	inactive	true	• com.sn_content_delivery • com.glide.scope.access.restricted_caller

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Content Delivery [com.sn_content_delivery]	Content Delivery	inactive	true	• com.glide.db_images • com.glide.scope.access.restricted_caller • com.glide.service-portal
Content Experiences [com.sn_content_automation]	Set up and package your content into a campaign using multiple channels to deliver the right message to the right audience at the right time.	Active	true	
Content Governance [sn_cg]	Content Governance provides communication employees a streamlined method to request content to be created for Content Publishing or Content Experiences.	Active	true	com.sn_content_publishing_store
Content Management [com.glide.cms]	Allows administrators to create custom, branded, web user interfaces on top of an existing ServiceNow instance. Use Service Portal for new development instead of CMS. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. For more information, see Service Portal and Content Management and Service Portal.	Inactive	false	• com.glideapp.home • com.glide.text_search • com.glide.db_images
Content Management Extended Types [com.glide.cms.types]	An extension to Content Management that adds iFrames and Flash frames. Use Service Portal for new development instead of CMS. Service Portal is an	Active	false	• com.glide.cms.type.flash • com.glide.cms.type.iframe

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	alternative to CMS with a refined user experience, and is active by default in the base system. For more information, see Service Portal and Content Management and Service Portal.			
Content Publishing [com.sn_content_publishing_store]	Content Publishing allows you to communicate with your employees using different methods.	Active	true	
Context Ranking [com.glide.sorting]	Support for drag-and-drop lists and ranking dialog. Context ranking allows a user to sort a collection of records independently of the attributes of those records. Context Ranking is activated automatically with the SDLC - Scrum Process Pack plugin.	Inactive	false	com.glide.list_v2
Context-Sensitive Help [com.glide.context_help]	Provides a context-sensitive help system, providing links to specific help pages. These help pages can be linked to the list or form view of any table, or to the form view of a specific record in a table.	Active	false	
Context-Sensitive Help Rest API [com.glide.context_help.rest_api]	REST API for the context-sensitive help system	Active	false	• com.glide.context_help • com.glide.scripted_rest_services
Contextual Search [com.snc.contextual_search]	Display related articles or service catalog items within a form or record producer.	Active	false	com.snc.application.json_service

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Contextual Search - Internal [com.snc.contextual_search.internal]	An internal plugin component for Contextual Search.	Active	false	
Contextual Search - Service Portal [com.snc.contextual_search.service-portal]	Service Portal components for Contextual Search.	Active	false	• com.snc.contextual_search • com.snc.app_common.service_portal
Contextual Security: Role Management [com.glide.role_management]	Provides the flexibility and power to protect information by controlling read/write/create/delete authorization.	Active	false	• com.glide.db_view • com.glide.ui_page
Contextual Security: Role Management V2 [com.glide.role_management.inh_count]	Prevents duplicate entries in sys_user_has_role for inherited roles, based on the value of the inh_count column.	Active	false	com.glide.role_management
Contextual Security: Role Management V2 REST API [com.glide.role_management.inh_count.rest_api]	Prevents duplicate entries in sys_user_has_role for inherited roles, based on the value of the inh_count column.	Active	false	• com.glide.role_management.inh_count • com.glide.scripted_rest_services
Continual Improvement Management (CIM) [com.sn_cim]	Core plugin for Continual Improvement Management (CIM)	Active	true	• com.snc.organization_management • com.snc.planned_task_v2 • com.snc.pa • com.snc.pa.spotlight • com.sn_coaching • com.sn_cim_atf
Continual Improvement Management Automated Tests [com.sn_cim_atf]	ATF plugin for Continual Improvement Management (CIM)	Active	true	
Contract Management	Provides the ability to manage all types of contracts.	Active	true	com.snc.asset_management

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.snc.contract_management]				
Contract Management - Form Layouts and Behavior [com.snc.contract_management.form_layouts]	Provides the ability to customize the Contract Management form layout.	Inactive	false	
Conversation Branding Settings [com.glide.cs.branding]	Conversation Branding Settings for web chat client.	Active	false	
Conversation General Settings [com.glide.cs.settings]	Conversation General Settings for Virtual Agent.	Active	false	
Conversational Analytics [sn_ci_analytics] (Available in the ServiceNow Store)	A dashboard that helps you improve Virtual Agent (VA) interactions with users by providing deep insights into conversational data, discover which topics confuse users, and find out where users often transfer to live agents.	Active	false	• com.glide.cs • com.glide.appsee
Conversational Integration with Alexa [com.sn.va.alexa] (Available in the ServiceNow Store)	Enables Virtual Agent to interact with requesters through the Amazon Alexa's voice interface using the Virtual Agent topics.	Active	false	
Conversational Integration with LINE [sn_va_line]	The plugin helps engage with requesters who prefer the LINE messaging app to interact with your business. Requesters include customer contacts and consumers.	Active	true	• com.glide.cs.custom.adapter • com.glide.hub.integration.runtime • com.snc.ihub_spoke_util_pack • sn_agent_initiated

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Conversational Integration with Microsoft Teams [sn_va_teams] (Available in the ServiceNow Store)	Enable requesters to chat with Microsoft Teams or live agents using the Microsoft Teams application.	Active	true	
Conversational Interfaces - Diagnostics [sn_ci_diagnostics]	The CI Diagnostic Tool is a framework that allows a privileged user (admin) to perform a diagnosis of various products through scripts and powerful VA topics.	Active	false	com.glide.cs.chatbot.lite
Virtual Agent Topic Recommendations [sn_topic_recommend]	The plugin helps identify pre-built Virtual Agent topics that can be quickly implemented in your organization.	Active	false	
Conversational Integration with WhatsApp (powered by Twilio) [sn_va_whatsapp_twi]	The plugin enables customer engagement over the WhatsApp messaging app.	Active	true	• sn_twilio_spoke • com.glide.hub.integration.runtime • com.glide.cs.custom.adapter • sn_agent_initiated • com.glide.cobject • com.glide.messaging.awa
Bot Interconnect [sn_va_bot_ic] (Available in the ServiceNow Store)	Virtual Agent Bot Interconnect functions as the primary bot in a diverse chat environment. It can help you reduce complexity and create a unified chat experience for your end users. Virtual Agent Bot Interconnect gives your end users access to multiple channels and a wide variety of enterprise tasks	Active	false	com.glide.cs.chatbot

Customer Service with Field Service Management [com.snc.csm_fsm_integration]	Enables Account, Contact, Partner, Partner Contact, Consumer information from Customer Service to Field Service Management.	Inactive	false	• com.snc.work_management • com.sn_customerservice • com.glide.service-portal.customer-portal
Customer Service with Request Management [com.sn_cs_sm_request]	Provides an integration between Customer Service Management and the Request Management application. Enables users to create request records from a Customer Service case.	Active	true	com.sn_customerservice
Customer Service with Service Management [com.sn_cs_sm]	Provides an integration between Customer Service Management and the Incident, Problem and Change Management applications. Enables users to create incident, problem and change records from a Customer Service case.	Active	true	com.sn_customerservice
Customer Service Install Base Management [com.snc.install_base]	Enables customers to capture the current state of their install base and establish the relationship to any downstream entities that might impact their functioning.	Inactive	false	com.sn_customerservice
Dashboard for Assessment and Survey [com.snc.assessment_core.dashboards]				
Dashboard for Service Catalog [com.glideapp.servicecatalog.dashboard]				
Data Archiving [com.glide.auxdb]	Provides the ability to move a subset of data from large tables	Active	false	com.snc.db.replicate

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	into the data archive. Typical candidates include historical ITIL documents such as incidents that were closed last year, but the functionality supports archiving of non ITIL documents as well.			
Data Classification [com.glide.data_classification]		Active	true	
Data Certification [com.snc.certification_v2]	Enables field-level certification of data, either scheduled or on-demand.	Inactive	true	• com.glide.list_v2 • com.snc.certification_core
Data Discovery APIs [com.glide.data_discovery]	Provides the APIs to discover sensitive data.	Active	false	
Data Filtration [com.glide.data_filtration] (New in Tokyo)	Controls the access to tables and records based on subject attributes when performing read queries.	Inactive	false	None
Data Lookup and Record Matching Support [com.glide.data_lookup]	Allows administrators to define rules that automatically set one or more field values when certain conditions are met. This plugin completely replaces Priority Lookup. Any custom logic defined in the CalculatePriority business rule must be manually translated into the new priority data lookup definition.	Active	true	
Data Lookup and Record Matching Support for Service Catalog	Allows administrators to perform data lookups for variables on service catalog item screens, on requested items, and on catalog tasks as	Active	false	• com.glideapp.servicecatalog.platform • com.glide.data_lookup

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.data_lookup.catalog]	a user fills out the values contained in variables.			
Data Policy 2 [com.glide.data_policy2]	Defines mandatory or read-only requirements for table fields.	Active	false	
Data Structures [com.snc.datastructure]	Provides element types: DataStructure and DataObject for flyweight data that can be stored internally as JSON and utilized via the DataStructure API.	Active	false	
Database Column Offrow Migration [com.glide.db.offrow_migration]	UI/Script elements to allow for compatible columns to be moved offrow.	Inactive	false	
Database Rotation [com.snc.db.rotation]	Provides the ability to break large tables into smaller, more manageable tables â€“ these smaller tables contain a specified period of data and the table with oldest data is purged on an on-going basis.	Active	false	
Database Rotation with Default Tables [com.snc.db.rotation_default_tables]	Adds database rotation functionality to default tables.	Active	false	com.snc.db.rotation
Database Storage for Audio Files [com.glide.db_audio]	Allows audio files to be uploaded and stored in the database, and referenced in HTML.	Active	false	
Database Storage for Images [com.glide.db_images]	Allows images to be uploaded and stored in the database, and referenced in HTML.	Active	false	
Database Storage for Video Files	Allows video files to be uploaded and stored in the	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.db_video]	database, and referenced in HTML.			
Database Views [com.glide.db_view]	Allows you to define table joins for reporting purposes.	Active	false	
Database Views for Service Management [com.snc.service.db_views]	Predefined Database Views for Service Management.	Active	false	• com.glide.db_view • com.snc.service • com.snc.problem • com.snc.incident • com.glide.metrics
DataTables 1.1.0 Components [com.glide.ui.ng.datatables]	DataTables 1.1.0 Components	Inactive	false	
Default Financial Management Cost Model [com.snc.financial_management_model]	Provides a preconfigured Cost Model and artifacts to enable Financial Analysts to assess spending data and generate reports. Activation of this plugin on production instances may have licensing implications. Contact your ServiceNow account team for details.	Inactive	true	com.snc.financial_management
Delegated Dev User Administration [com.sn_dd_user_admin]	Delegated Dev User Administration.	Active	false	
Delegated Development [com.glide.delegated_development]	Support for controlled development by users who do not have full administrative rights.	Active	false	
Delegated Request Experience (Maintenance mode)	Enables delegated requests for catalog items and activates the Requested For variable type and the	Active	false	• com.glideapp.servicecatalog.platform • com.glideapp.servicecatalog.requested_for

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glideapp.servicecatalog.request_management.delegated_request_experience]	Requested For field in Requested Item			
Delete Recovery [com.glide.delete_recovery]	Provides the ability to recover individual deleted items including all related cascaded deleted items.	Active	false	
Delete Recovery: Partial Undelete Support [com.glide.delete_recovery.partial_undelete]	Extends the Delete Recovery plugin to support partially undeleting records from a transaction.	Active	false	com.glide.delete_recovery
Demand Core [com.snc.demand_core]	Demand Core Plugin aids in planning, organizing, and managing Demands with basic features.	Active	false	
Demand Management [com.snc.demand_management]	Aids with capturing the demand and provides tools to screen, assess, and prioritize it. Only upgrade is allowed for this plugin. Activation should be done through PPM Standard plugin.	Inactive	true	• com.snc.process_flow_formatter • com.snc.assessment_core • com.snc.timeline_visualization • com.snc.bubblechart_workbench
Depreciation [com.snc.depreciation]	Core depreciation capabilities.	Active	false	
Designer Common [com.glide.ui.ng.dc]	Provides common components required by designers such as the form designer and the quiz designer.	Active	false	• com.glide.ui.tablet.theme • com.glide.ui.ng • com.glide.ui.themes.doctype
Desired State Certification [com.snc.certification_desired_state]	Evaluates records to see if they match a desired state, scheduled or on demand.	Active	true	com.snc.certification_core
DevOps [sn_devops] (Available in the	Provides data insights, accelerates change, and increases visibility into your DevOps environment.			

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
ServiceNow Store)				
DevOps Config [sn_devops_config] (Available in the ServiceNow Store)	Manages and validates configuration data in your DevOps environment using a single system.	Active	false	sn_cdm
DevOps Insights [sn_devops_insights] (Available in the ServiceNow Store)	Shows the results of your overall DevOps process in a data-driven dashboard.			
DevOps Integration with Rally [sn_devops_rally] (Available in the ServiceNow Store)	Provides integration with Broadcom Rally to expose data like projects, user stories, and defects from the Rally tool in DevOps Change acceleration. You can then associate these Rally planning objects to commits and pipelines for full change traceability and acceleration.	Active	false	com.sn_devops
DevOps Util [com.snc.sn_devops_util] (New in Tokyo)	Serves as an interface to call global APIs from DevOps.	Active	false	
DHTMLX Gantt Library [com.snc.dhtmlx.gantt]	DHTMLX Gantt library.	Inactive	false	
DHTMLX Scheduler Library [com.snc.dhtmlx.scheduler]	DHTMLX Scheduler library.	Active	false	
Diagnostic Monitoring	Provides advanced diagnostic monitoring	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.monitor.diagnostics]	of each node in a ServiceNow instance.			
Dictionary overrides [com.glide.dictionary_override]	Allows specific Dictionary values to be overridden for extended table elements. For example, this plugin allows the default value for the Assigned To field in the Incident table to be different than the default value specified for the Assigned To field in the Task table.	Active	false	
Discovery and Service Mapping Patterns [com.sn_itom_pattern] (Available in the ServiceNow Store)	Deploys additional Discovery and Service Mapping Patterns.	Active	false	None
Discovery for Operational Technology [com.sn_otsm_discovery]				
Distribution Download Proxy [com.glide.dist_download_proxy]	Proxy for downloading a distribution. This plugin is activated automatically when the MID Server is activated, to handle the REST requests for file downloads that a MID Server sends to the instance.	Active	false	
Document Intelligence Administration [com.snc.docintel_admin] (Available in the	Better administration experience for Document Intelligence.	Active	false	• Document Intelligence (sn_docintel) • Predictive Intelligence (com.glide.platform_ml)

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
ServiceNow Store)				
Document Service [com.sn_bom_document]				
Document Templates [com.snc.document_templates] (Available in the ServiceNow Store)	Enables you to create HTML and PDF document templates to generate standard letters or documents. Automates and simplifies the process of filling, signing, and reviewing a document online.			
Document Template Integration with AdobeSign [sn_dt_adobesign] (Available in the ServiceNow Store)	Enables you to use the Adobe Sign application for signing documents that are generated from ServiceNow Document Templates.	Active	true	None
Document Template integration with DocuSign [sn_dt_docusign] (Available in the ServiceNow Store)	Enables you to use the DocuSign application for signing documents that are generated from ServiceNow Document Templates.	Active	true	None
Documents Configuration [com.glide.doc.config]	Provides a feature to create a Table of Contents configuration (that is adding table of contents) and a document configuration such as page numbers to a PDF document that is generated from an HTML	Active	false	None

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	document. The plugin provides features to navigate easily through the PDF using Table to Contents and Document Configuration.			
Domain Support - Domain Extensions Installer [com.glide.domain.msp_extensions.installer]	Enables domain separation for Cloud Provisioning and Governance. Instances activating Domain separation should use this plugin. In addition to functionality in the Domain Support plugin, this plugin installs Domain Support - Domain Extensions that include further domain separation enhancements for all domain customers including Managed Service Providers. If the Domain Support plugin is already active, content in the Domain Support - Domain Extensions plugin will not be installed to the instance.			
Dynamic Related Records for Configurable Workspace [com.snc.uib.sn_dyn_rel_rec]	Dynamic related records provide agents with access to relational information based on the context of the current record. Admin can configure related record definitions that increase agent productivity by making data available in context to the action that the agent is performing.			

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Dynamic Scheduling [com.snc.dynamic_scheduling]	Dynamic scheduling for Service Management Applications with support for bulk task recommendations and interval based auto assignment.	Inactive	false	• com.snc.matching_rule • com.snc.service_management.core
Dynamic Translation [com.glide.dynamic_translation]	Adds ability to translate the given text from source language to target language using external machine translation providers.	Active	false	com.glide.hub.integrations
Dynamic Translation for Virtual Agent [com.glide.cs.dynamic.translation.virtual_agent] (New in Tokyo)	Activates the Dynamic Translation for Virtual Agent.	active	false	• com.glide.dynamic_translation • com.glide.dynamic_translation.va_async
Dynamic Translation Spoke [com.glide.dynamic_translation_spoke]	Provides actions that enable the ability to translate text(s) from one language to other language(s) and to detect the language of given text.	Active	false	• com.glide.hub • com.glide.hub.integration.runtime
E164 Compliant Phone Number [com.glide.phone_number]	Ensures that all necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network.	Active	true	
Email - OAUTH support for IMAP and SMTP [com.glide.email.oauth]	Support for XOAUTH and XOAUTH2 email authentication.	Inactive	false	• com.glide.email_accounts • com.snc.platform.security.oauth
Email - Support for Email Processing by Microsoft Graph API	Processes inbound emails using Microsoft Graph API.	Active	false	• com.glide.email_accounts • com.snc.platform.security.oauth • com.glide.email.oauth

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[glide.email.graph] (New in Tokyo)				
Email Access Restriction [com.glide.email_access_restriction]	Allows email table ACL conditional overrides	Active	false	
Email Accounts [com.glide.email_accounts]	Enables you to define email accounts and settings in individual records.	Active	false	
Email Address Filter [com.glide.email_address_filter]	APIs and data structures for email address filtering	Active	false	
Email Automatic User Creation [com.glide.email_createuser]	Sets glide.email.create_userid_from_email=true so that when automatic user creation is enabled, the UserID of newly-created users matches the user's email address. Also widens sys_user.user_name column to 100 bytes to accommodate longer UserIDs based on email addresses.	Active	false	
Email Client [com.glide.email_client]	Enables you to send email directly from any record	Active	false	com.glide.email_address_filter
Email Client Template [com.glide.email_client_template]	Template defines default content for the Email Client.	Active	false	
Email Digest [com.glide.email_digest]	Email Digest	Active	false	• Subscription Based Notifications • Outbound Email Notifications • com.glide.notification.preference.service
Email Filters [com.glide.email_filter]	Filters emails into different mailboxes or junk, depending on	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	headers and subject. Ignores any email that contains a VCAL invitation.			
Email Notification Preview Plugin [com.glide.email_notification_preview]	Allows you to easily preview a ServiceNow email notification without sending the notification. This allows you to preview notifications at design time.	Active	false	
Email Notification Script for Contextual Search Results [com.snc.adv_cxs_results_email_script]	Provides script for embedding contextual search results based on Predictive Intelligence additional resources and search resources in email notifications.	Inactive	false	
Email Retention [com.glide.email_retention]	Provides retention policy for email.	Active	false	• com.glide.mailbox • com.glide.auxdb
Email Service [com.glide.email.service]	Defines javascript and REST API for sending email.	Active	false	com.glide.mailbox
Email Unsubscribe [com.glide.email_unsubscribe]	Adds the ability to include an unsubscribe link in notifications.	Active	false	• com.glide.email_ordered_processing • com.glide.notification.subscription
Email/SMS Separation [com.glide.email_sms_separation]	Separation of the sending of SMS and email by adding a column to the email table. Prevents SMS messages from slowing down email message sending and vice versa. Activation of this plugin will cause email to stop sending during activation. On systems with large email tables this can take hours, and is not recommended.	Active	false	com.glide.notification
Embedded Help	Provides targeted help content to a	Active	false	com.glide.ui.hopscotch

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.embedded_help]	user in a UI page. Administrators can create customized embedded help to assist users with specific business processes within an organization.			
Embedded Help for ServiceNow Flow Designer [com.glide.hub.flow_designer_embedded_help]	This plugin is for the embedded help panel in Flow Designer. In Quebec, there is a help panel to help users easily access documentation on Flow Designer without having to navigate to the documentation site.	Active	false	
Employee Center [com.snc.employee_center]				
Employee Center - Core [com.snc.employee_center_core]				
Employee Center - Pro [com.snc.employee_center_pro]				
Employee Center - Pro [com.sn_ex_employee_center_pro]	Employee Center Pro	False	Inactive	com.sn_hr_service_portal
Employee Center integration with Zoom [com.snc.sn_ex_ec_zm] (Available in the ServiceNow Store)	Enables Employee Center integration with Zoom.	Active	true	sn_ex_sp

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Employee Document Management [com.sn_employee_document_management]	Enables you to manage large numbers of employee documents efficiently. Provides storage space and a filing system that allows you to easily retrieve documents, as well as define who can view sensitive documents, and when to purge documents. **Important:** To use Employee Document Management, the Human Resources Scoped App: Core plugin must be licensed and activated.	Inactive	true	• com.snc.documentviewer • com.glide.scope.access.restricted_caller
Employee Relations integration with NAVEX EthicsPoint [sn_hr_navex_ep] (Available in the ServiceNow Store)	Pulls employee relation cases from NAVEX EthicsPoint into ServiceNow Platform, enabling an HR Agent to work on employee relation cases from an ServiceNow instance.	Active	false	None
Employee Service Center [com.sn_hr_service_portal]	Activates a portal framework that allows administrators to build a mobile-friendly self service experience for users.	Active	true	• com.glide.connect.support • com.glide.connect.sp_widgets • com.sn_content_delivery • com.sn_content_automation • com.glide.va.sp_widgets • com.glideapp.user_criteria.scoped.api

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	Important: The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Center dashboards take over homepage functionality. Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards. For more information, see: • Dashboards in the Analytics Center. • Working with responsive dashboards.			
Hopscotch [com.glide.ui.hopscotch]	Hopscotch is a framework to make it easy for developers to add product	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	tours to their pages. Hopscotch accepts a tour JSON object as input and provides an API for the developer to control rendering the tour display and managing the tour progress. To learn more about Hopscotch and the API, check out http://linkedin.github.io/hopscotch.			
HR Service Delivery integration with Microsoft Teams [sn_now_teams_hr] (Available in the ServiceNow Store)	The integration provides a broad set of service-delivery capabilities within Microsoft Teams, to help resolve employees' HR requests. Quick Actions [com.glide.quickactions]	Enables slash commands in Agent Workspace chat.	Active	false	
Quiz Designer [com.glide.quiz_designer]	Provides the ability to send scored questionnaires quickly and easily to one or more users. A quiz may have categories of questions that are assigned only to some users.	Inactive	false	• com.glide.assessment_designer.common • com.snc.assessment_core
Random Watermark Support [com.glide.email.random_watermark]	Generate unpredictable watermarks, and enable matching on these watermarks in inbound emails.	Active	false	com.glide.mailbox
Rapid7 Vulnerability Integration [sn_vul_t7] (Available in the ServiceNow Store)	Provides the ability to integrate the ServiceNow Vulnerability Response application with the Rapid7 Nexpose and InsightVM products. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.			sn_vul
Rate Limit for REST API [com.glide.rest.rate_limit]	Rate Limit support for REST API	Active	true	
Read only roles for Agile - Scaled Agile Framework [com.snc.sdlc.safe_read_roles]	Provides read-only roles for Agile - Scaled Agile Framework.	Active	false	com.snc.agile_read_roles
Read only roles for Agile Development 2.0	Provides the sn_agile_read role that has read-only access for all Agile	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.snc.agile_read_roles]	Development 2.0 tables. The data from these tables can be used for generating reports.			
Read only roles for Application Portfolio Management [com.snc.apm_read_roles]	The plugin provides read only roles for Application Portfolio Management.	Active	false	
Read only roles for PPM Standard [com.snc.pmo_read_roles]	Read only roles for PPM Standard.	Active	false	
Read only roles for Release Management [com.snc.release_management_read_roles]	Provides the sn_release_read role that has read-only access for all Release Management tables. The data from these tables can be used for generating reports.	Active	false	
Read only roles for Test Management 1.0 [com.snc.tm1_read_roles]	Provides the sn_tm1_read role that has read-only access for all Test Management 1.0 tables.	Active	false	
Read only roles for Test Management 2.0 [com.snc.tm2_read_roles]	Provides the sn_tm2_read role that has read-only access for all Test Management 2.0 tables. The data from these tables can be used for generating reports.	Active	false	
Read-Only User Role [com.snc.read_only.role]	Enables Read-Only user role functionality.	Active	false	
Recommended Actions [sn_nb_action]	Recommends relevant actions, such as Guidances and Guided Decisions, for a given context.	Inactive	false	• sn_gd_guidance • com.snc.next_best_action • sn_nba_list

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
(Available in the ServiceNow Store)	Enables users to define contexts and strategies to recommend these actions.			
Recommended Actions Advanced [sn_nb_action_adv] (Available in the ServiceNow Store)	Enables customers to create recommendations based on AI/ML models created with Predictive Intelligence.	Inactive	false	com.snc.recommended_action
Recommended Actions for Customer Service [sn_cs_nb_action] (Available in the ServiceNow Store)	Installs the Recommended Actions capability, which recommends relevant actions for a given context. These actions appear on the Case form in the CSM Workspaces if users have defined strategies for the provided Case context.	Inactive	false	• com.sn_customerservice • com.snc.recommended_action
Redox Electronic Health Record Spoke [sn_redox_spoke] (Available in the ServiceNow Store)	An Integration Hub spoke that is used to facilitate Redox outbound calls.	Inactive	false	• com.glide.hub.integration.runtime • com.glide.hub.action_step.rest • com.glide.cobject
Redox Inbound Integration [sn_redox] (Available in the ServiceNow Store)	Improves inbound and proactive outbound service scalability and capabilities to integrate with healthcare systems that use the Redox platform.	Inactive	false	None
Relationship Layout	Enables scoped relationships to be associated to out-	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glide.ui.relationship_layout]	of-scope related list views.			
Release Management [com.snc.release_management_v2]	The Release Management v2 plugin is a rewrite of the original release management module. All products, releases, features, and release tasks are planned_task extensions, and much of the project management functionality (Gantt charts, timelines, time cards) is shared with release.	Active	true	• com.snc.release_management • com.snc.planned_task • com.snc.process_flow_formatter
Remote Tables [com.glide.script.vtable_demo]	Supports remote tables and associated script definitions that can be used to retrieve and optionally cache data from external sources.Tra			
Report - PDF Page Header Footer Templates [com.glideapp.report_page_hdrftr]	Allows the user to configure and store page headers and footers for PDF reports.	Active	false	• com.glideapp.report • com.glideapp.report2
Report Access Request [com.glideapp.report_access_request]	Provides the ability to request access to reports that have been restricted by report_view ACL.		false	
Report ACL Assessment [com.par_report_acl_assessment]				
Report Charting v2 [com.glideapp.report.charting_v2]	Installs V2 of ServiceNow charts with HighCharts.	Active	false	• com.glideapp.report • com.glideapp.report2
Report Engine - use summary table for reports	Causes the data from all reports, custom and standard, to be stored in the sys_report_summary	Active	false	com.glideapp.report2

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.glideapp.summary_report_engine]	table and separates the data from the rendering process for all reports. Report data is periodically purged from the sys_report_summary table (approximately every two hours).			
Report Security - enforce access control checks [com.glideapp.report_security]	Enforces ACL checks when reports are created, deleted or updated.	Active	false	• com.glideapp.report • com.glideapp.report2
Reporting Statistics Reports [com.glideapp.report_statreports]	Provides reports and dashboards on reporting statistics.	Inactive	false	com.glideapp.report
Required Form Fields [com.snc.required_form_fields]	Allows an administrator to specify required fields that cannot be removed from a form.	Inactive	false	
Resource Management [com.snc.resource_management]	Enables resource requesters and resource managers to plan, organize, and manage resources for both planned and unexpected work. Activating Resource Management automatically activates the Project Management plugin if it is not already active. Only upgrade is allowed for this plugin. Activation should be done through PPM Standard plugin.	Inactive	true	• com.snc.schedule_loader • com.snc.process_flow_formatter • com.snc.cost_management • com.snc.pps_portal_common
Resource Matching Engine [com.snc.matching_rule]	Provides a Resource Matching Engine.	Inactive	false	• com.snc.skills_management • com.snc.agent_schedule

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Responsive Canvas [com.glideapp.canvas]	Enables responsive canvas. For dashboards, the responsive canvas dynamically responds to dashboard resizing and enables dragging to place and resize widgets. Easily find and preview widgets that you want to add directly from the canvas.	Active	false	• com.glideapp.home • com.glide.text_search • com.glide.db_images • com.glide.ui.angular • com.glide.ui.ng
Responsive Dashboards [com.glideapp.dashboards]	Easily create, modify, and share dashboards using responsive and dynamic widget layouts.	Active	false	• com.glideapp.canvas • com.glideapp.home • com.glide.text_search • com.glide.db_images • com.glide.ui.angular • com.glide.ui.ng • com.snc.pa
REST API Builder Backend [com.glide.rest.api_builder.backend]	REST API Builder Framework data model and crud interfaces.		false	com.glide.api_runtime
REST API for global text search [com.glide.globalsearch]	REST API for global text search.	Active	false	com.glide.rest
REST API Trigger Flow Designer [com.glide.hub.flow_trigger.rest]	Adds ability for flow designers to create a REST endpoint that triggers a flow upon request.		false	• com.glide.hub.flow_trigger • com.glide.api_runtime • com.glide.rest.api_builder.backend
REST API Provider [com.glide.rest]	Provides a REST API framework to support RESTful services.	Active	false	• com.glide.ui.angular • com.glide.ui.heisenberg
Restore Deleted Records [com.snc.undelete]	Restores deleted records from audited tables and references to those records. Also restores any records that were deleted as	Inactive	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	a result of a cascade delete rule.			
Robotic Process Automation (RPA) Hub [com.sn_rpa_foundation] (Available in the ServiceNow Store)	Provides the capability to integrate the ServiceNow platform with applications that do not support APIs.	Active	true	sn_cmdb_ci_class (1.36.0)
RPA Sample Template [com.sn_rpa_template] (Available in the ServiceNow Store)	RPA templates are prebuilt automations that enable customers to kickstart their RPA initiatives. This template provides automating user password reset functionality for Oracle E-Business Suite (EBS) where APIs aren't available. It guides the ServiceNow developer to implement password reset functionality.	Active	false	com.sn_rpa_foundation (3.0.7)
Role Delegation [com.snc.role_delegation]	Allows an administrator to designate role delegators, who can delegate any role they have to members of their group.	Active	false	com.glideapp.workflow
S/MIME Email [com.glide.email.smime] (New in Tokyo)	Enables sending/ receiving signed and encrypted emails using S/MIME.	Active	false	• com.glide.certificates • com.glide.kmf
Sales Force Automation application template [com.snc.sfa2]	Provides tools to manage sales and marketing operations throughout the sales life cycle from lead generation through contract completion.	Inactive	true	com.snc.process_flow_formatter

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Scenario Planning for PPM [sn_pw_scenario] (Available in the ServiceNow Store)	Scenario Planning is a simple system to create and compare scenarios for a portfolio.	Active	true	com.snc.financial_planning_pmo
Schedule Optimization [com.snc_schedule_optimization] (New in Utah)	Agent schedules are automatically optimized daily to consolidate tasks and minimize travel time.	Inactive	false	• com.glide.platform_ml • com.snc.work_management • com.snc.app_fsm_sched_model
Schedule Optimization - Common [com.snc_schedule_optimization.common]				
Schedule Optimization - UI components [com.snc_schedule_optimization.ui]				
Schema Map v3 [com.glide.erd]	Displays the details of tables and their relationships in a visual manner, allowing administrators to view and easily access different parts of the database schema.	Active	false	com.glide.diagrammer
Scoped Analytics Framework [com.glide.scoped_analytics_framework]	Analytics Framework for Scoped Applications.	Active	false	
Scoped Application Restricted Caller Access [com.glide.scope.access.restricted_caller]	Allow scoped applications to restrict access to public tables and script includes.	Inactive	false	
Script Execution Context	Provides virtual closure mechanism.	Inactive	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
[com.snc.sn_context]				
Script stats [com.glide.stats.script]	Script stats.	Active	false	com.glide.stats.script
Script Templates [com.glide.script.templates]	Provides templates for some script fields.	Active	false	
Script Allowlist Manager [com.glide.script.whitelist]	Provides temporary support for continued direct invocation of Java Packages, Constructors, and Methods that are added to an allow list.	Active	false	
Scripted REST APIs [com.glide.scripted_rest_services]	Provides a framework for building Scripted REST APIs.	Active	false	• com.glide.rest • com.glide.scripted_rest_services.internal • com.glide.scripted_rest_services.errors
Scripted REST APIs - Error types [com.glide.scripted_rest_services.errors]	An internal plugin component to Scripted REST APIs.	Active	false	
Scripted REST APIs - Internal [com.glide.scripted_rest_services.internal]	An internal plugin component to Scripted REST APIs.	Active	false	
Scrum Program [com.snc.sdlc.scrum_program]	Plan and track the work across multiple Scrum teams that are working towards common objectives.	Inactive	true	• com.snc.program_common • com.snc.sdlc.agile.2.0
SCSS Bootstrap Theme [com.glide.ui.scss.bootstrap]	Theme assets for Bootstrap using SCSS.	Active	false	com.glide.ui.scss
SCSS Content Provider [com.glide.ui.scss]	SCSS Content Provider.	Active	false	
SDL Translation Management	It integrates Localization Framework with the	Active	false	com.glide.localization_framework

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
System Spoke for Localization Framework [com.glide.localization_framework.sdl_spoke]	SDL - Translation Management System. To activate this plugin, install the Localization Framework Installer plugin.			
SDLC - SCRUM [com.snc.sdlc.scrum]	Adds a release process specific to a Scrum development process. Sits on top of the SDLC application, adding additional agile notions like epics, stories, and sprints.	Inactive	true	com.snc.sdlc
Search Suggestions [com.glide.search.suggestions]	Provides suggestions when you enter text in a search field.	Active for new instances. Upgraded instances adopt the previous setting.		
Security Center [com.sn.vault_security_center]				
Security Dashboard [com.glide.security.dashboard]	Activates the Security Dashboard.	Inactive	false	com.snc.guided_setup
Security Incident Analytics [com.snc.security_incidentanalytics]	Provides an integration of Security Incident Response with Performance Analytics for trend based reporting. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.	Inactive	true	• com.snc.pa • com.snc.treemap • com.snc.security_incident

[com.sn_publications]	newsletter like articles to targeted internal/ external customers.			
Targeted Communications Demo Data [com.snc.publications_demo]	Targeted Communications application demo data.	Inactive	true	com.sn_publications
Task Activities [com.snc.task_activity]	Enables support for activities on task tables.	Inactive	false	
Task Intelligence for Customer Service [com.snc.csm_ml_task] (Available in the ServiceNow Store)	Offers several AI capabilities including language detection, multi-lingual email and case categorization, case sentiment analysis, and document intelligence. These features automate several routine tasks across the case lifecycle, enabling agents to focus on case resolution.	Active	false	• sn_ti_admin.com.sn_ti_admin • sn_docintel.com.snc.docintel • com.sn_customerservice • com.glide.platform_ml_task • com.glide.i18n • com.glide.dynamic_translation
Task-Outage Relationship [com.snc.task_outage]	Allows users to create an outage from an incident and a problem form. Incidents and problems have many to many relationship with outages. For new instances from Jakarta only, this feature is also available on the Change form.	Inactive	false	
Team Development [com.snc.apps_hub]	Supports parallel development on multiple, non-production ServiceNow instances by providing branching operations, the ability to compare a development instance to other development instances, and a central dashboard for	Active	false	• com.snc.apps • com.glide.ui.angular

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	all team development activities.			
Team Performance [com.sn_team_perf]	Team Performance module for Workforce Optimization	Active	false	com.snc.wfo
Template Management for Field Service [com.snc.fsm_template_management] (New in Tokyo)	Enables administrators to configure work order templates to process data dynamically rather than using the static information described in the work order templates. It fetches information from the source table to populate fields in the work order form and creates relevant tasks for a work order.	Active	false	com.snc.work_management
Templated Snippets [com.sn_templated_snip]	Activated with Human Resources Scoped App: Core [com.sn_hr_core]. Creates pre-defined and reusable responses that can be added to any table extending the task table including the HR Case table.	Inactive	true	com.glide.scope.access.restricted_caller
Test Management [com.snc.test_mgmt]	Provides a tool for manual software testing.	Inactive	true	com.snc.planned_task_v2
Test Management 2.0 [com.snc.test_management.2.0]	Enables you to manage testing processes and deliver software products more efficiently, with fewer errors.	Inactive	false	• com.snc.planned_task_v2 • com.snc.sdlc.agile.2.0.common
Test Migration 2.0 - Data Migration [com.snc.test_migration_v1_v2]	The Test Migration plugin provides functionality for migrating Test Case, Test and Test Suite to Test Management 2.0 Test version, Test Step and Test Set.	Active	false	• com.snc.test_mgmt • com.snc.test_management.2.0

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
Text Index Attachments [com.glide.text_index_attachments]	Text Index Attachments - natural language search using Lucene syntax.	Active	false	com.glide.text_index
Text Search [com.glide.text_search]	Text Searching across multiple tables.	Active	false	com.glide.text_index
Threat Core [com.snc.threat]	Integrates Threat Intelligence with other Security Operations applications. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.	Inactive	false	com.snc.secops.orchestration
Threat Intelligence [com.snc.threat.intelligence]	Provides a point of reference for your company's Structured Threat Information Expression (STIX) data. Included in Threat Intelligence is the Security Case Management application. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.	Inactive	true	com.snc.threat
Time card management [com.snc.time_card]	Works with the Task table to record time worked on projects, incidents, problems, and change requests. Task assignees can record time worked in the **Time worked** field on a task record or enter hours directly onto a time card.	Inactive	false	com.snc.time_card_portal
Time Recording for Customer Service [com.snc.csm_time_recording]	Enables customer service ages to record time on cases, case tasks, and other activities. Recording time automatically generates time cards	Inactive	false	• com.snc.wm_time_recording • com.sn_customerservice

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	and time sheets for approval by customer service managers.			
Time Recording for Field Service [com.snc.time_recording_fsm]	Extends the functionality of the Time Card Management and Cost Management applications to Field Service Management. Field service agents record time worked on tasks and other activities. These time worked entries automatically create time cards and weekly time sheets. Managers can review and approve time sheets as well as view and create labor rate cards.	Inactive	true	• com.snc.work_management • com.snc.wm_time_recording
Timeline Visualization [com.snc.timeline_visualization]	Enables graphical representation of activities over time to provide a high-level view of strategic and operational activities in your organization such as incidents, problems, changes, and projects. A base system visualization provided by this plugin is the CIO Roadmap. This roadmap shows projects grouped by portfolios. Organization leaders can use the CIO roadmap to monitor and evaluate the status of current and upcoming projects.	Inactive	true	com.snc.project_management_v3
Tiny URL Support [com.glide.tiny_url]	Enables support for generating shortened URLs to eliminate problems with very long URLs in Internet Explorer. New	Active	false	

Plugin [ID]	Description	State	Has Demo Data?	Dependencies
	properties will be added to the System properties page.			
TinyMCE HTML Field Editor [com.glide.editor.tinymce]	Enables users to edit HMTL fields with the TinyMCE editor instead of the legacy (htmlArea) editor.	Active	false	
Transaction Design Scope [com.glide.transaction_scope]	Handles transaction design scope management.	Active	false	
Transaction Quotas [com.glide.quota]	Allows definition of quota policies for different types of transactions. A transaction quota cancels any transaction in violation of the policy and notifies the user of the cancellation.	Active	false	
Transform Definitions [com.glide.transform.definitions]	Activates transform functions which enables flow designers to transform a data pill or field's data type without writing a script.	Active	false	com.glide.transform
Transform Service [com.glide.transform]	Supports use of Transform APIs associated with the Remote Tables functionality.			
Translated Email Retention [com.glide.email_retention.translation] (New in Tokyo)	Provides retention policy for Email translations.	Inactive	false	com.glide.notification.translation
Transaction stats [com.glide.stats.transaction]	Transaction stats.	Active	false	com.glide.stats
Tree map [com.snc.treemap]	Enables support for treemap view on any applications.	Inactive	false	com.snc.pa

Find components installed with an application

Activating a plugin installs an application on your instance. Each application consists of components such as tables, user roles, and scheduled jobs. To view all components that are installed with an application, see the Application Files table.

Before you begin

- The application plugin must be activated.
- Roles required: admin or the application admin role

Note:
The application admin role is only required for applications that use the Application administration feature. For example, Vulnerability Response.

About this task

In the Application Files table, look up the components that are installed with the plugin for the application. If the application comprises multiple plugins, look up each plugin individually.

Procedure

1. In the navigation filter, enter: `sys_metadata.list`
   The list of Application Files records is displayed.
2. Click the personalize list icon ( ), and add the **Package** column to the list.
3. Filter the list with these conditions to show only the components for the plugin:
   [Package] [is] [*<plugin name>***]**
4. In the **Class** column heading, click the menu icon ( ) and select **Group by Class**.
5. Select the class of information that you want to view.

Available system properties

Some properties are available on a system properties form, but some lesser-used properties are available only from the System Property [sys_properties] table. Sometimes, the property does not exist in a base instance, but can be added if you change the value.

Note:
The Instance Security Hardening Settings content contains detailed descriptions, and compliance values, for the security-related system properties and plugins in the ServiceNow AI Platform. To learn more about each of these properties, see Instance Security Hardening Settings.

cdu.record.watcher.timeout

Maximum waiting period for the Cloud Discovery schedule configuration wizard to stop watching the record watchers while validating account, member account Discovery, and logical database Discovery.

- Type: integer
- Default value: 120,000 milliseconds
- Location: System properties

com.cmdb.baseline.max_changes

Maximum number of changes and relationships for a CI that can appear in the baseline diff for the CI.

- Type: integer
- Default value: 100
- Location: **Configuration** > **CMDB Properties** > **Baseline Properties**

com.glide.attachment.max_size

Sets the maximum file attachment size in megabytes. An empty value in this field allows attachments up to a maximum of 1 KB.

- Type: integer
- Default value: 1024
- Location: **System Properties** > **Security**

com.glide.cs.collab.event_queue.enabled

Switch to enable the event queue for badge count calculation and publish.

Note:
If you set com.glide.cs.collab.event_queue.enabled to **true**, you must manually enable the Sidebar notification events process schedule record ("sys_trigger") by changing its *trigger_ type* value.

com.glide.cs.collab.event_queue.threshold

Calculates the unread count for each member of a chat. If the chat has too many members, this responder thread will be slow so offload this to the event queue. Default value: 50.

com.glide.cs.collab.notify_all_members

If Sidebar is unable to deliver messages to a Microsoft Teams user, this property determines who a "message not sent" notification is sent to. If this property is **true**, then a notification is sent to all Sidebar users in the discussion. If **false**, then the notification is sent only to the sender of the message.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.glide.cs.collab.teams_outage_timer

Length of time the "message not sent" notification (see com.glide.cs.collab.notify_all_members) displays.

- Type: integer
- Default value: 5
- Location: System Property [sys_properties] table

com.glide.cs.conversation_history_cross_channel.enabled

Enables (**true**) or disables (**false**) the display of cross-channel conversation history in the chat panel when an agent is having a conversation with a requester.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.cs.field.boolean.show.choice_picker

Enables (**false**) or disables (**true**) a Boolean option to requesters whenever a dynamic choice node only has a single value associated. When set to **true**, the dynamic choice node displays to requesters with only the single value selection option and no Boolean option.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

com.glide.cs.gen_ai.enable_mid_topic_ai_search

Enables or disables AI Search result in Mid Topic Discovery using this flag.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.glide.cs.genai.input_collector_mismatch_reprompts

Sets the number of times the user is asked to answer the original question before triggering topic discovery.

- Type: integer
- Default value: 2
- Location: System Property [sys_properties] table

com.glide.cs.instance_uri_override

Enables Virtual Agent to use this URL value to override the instance URL for link generation. The value entered must be a direct, full URL such as http://www.example.com to work correctly.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

com.glide.cs.notification.create_llm_actions_after_topic_migration

Enables (`true`) or disables (`false`) whether actions for Virtual Agent notifications and Proactive Triggers are created after LLM topics are published during the NLU to LLM topic migration workflow.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

com.glide.cs.proactive_trigger.create_llm_actions_after_topic_migration

Enables (true) or disables (false) whether actions for Proactive Triggers are created after LLM topics are published during the NLU to LLM topic migration workflow.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

com.glide.cs.unified.prompt_enabled_mid_skill_switch

Enable (true) or disable (false) the mid-topic switch confirmation message.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.glide.csv.loader.ignore_non_parseable_lines

Enables (**true**) or disables (**false**) ignoring one or more lines (rows) in an import set that contains bad data, such as a row that is missing a column of data.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.csv.loader.max_errors_allowed

Sets the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows ignored due to errors.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

com.glide.email.max_read

Specifies the maximum number of emails a POP3 reader should process concurrently.

- Type: integer
- Default value: 20
- Location: Add the property to the System Property [sys_properties] table.

com.glide.event_handler.CollabNotificationEventHandler

Specifies the event handler for the sidebar_notification queue.

com.glide.event_manager.sidebar_notification.claim_limit

Specifies the number of sidebar_notification events the job on each node polls each time.

com.glide.interaction.autocreate_relationships

Specifies whether auto-logging of records in the interaction_related_record table is turned on or off during active interactions.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.glide.loader.verify_target_field_size

Enables dynamic resizing of import set fields. With the default setting of **false**, up to 20 records of the source data are sampled to determine the import set field length. If the field is empty in all the sampled records, the default length of 40 is used. Any data loaded that exceeds the import set table field length is truncated. Set this property to **true** to allow any import set field to increase the column size by 100 to match the length of the data. For example, if the incoming source data has a length of 60, the system sets the length of the column to 160.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.scripting.module.use_module_sandbox

Separates the JavaScript module runtime environment from scripts. Setting this property to false may improve performance.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.soap.include_non_db_fields

Controls whether non-database fields, such as the sys_tags field, are included in WSDLs and SOAP responses (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.ssl.read.timeout

Sets the time-out value in seconds for SSL connections during read operations. Typically, this setting is used as part of LDAPS. If you enter timeout values for both this system property and the LDAP **Read timeout** field, the lowest timeout value takes precedence.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

com.glide.ui.virtual_host

Specifies Guided Tour Designer callout icons. When set, callout icons appear in the designer instead of letters.

- Type: String
- Value: pa,html,script,include scripts,glide,custprefix,_sn
- Location: System Property [sys_properties] table

com.glideapp.canvas

Enables (**true**) or disables (**false**) responsive canvas for dashboards. When enabled, all new dashboards use responsive canvas.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.apps.publish.include_inactive_choices

Specifies whether choice table selections marked as inactive (`sys_choice inactive attribute = true`) should be included when publishing an application (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.apps.publish.maxrows

Defines the maximum number of data records to include when publishing an application.

- Type: integer
- Default value: 1,000
- Location: System Property [sys_properties] table

com.snc.assessment.decision_matrix_filter_max_entries

Defines the maximum number of items to show for a decision matrix field filter.

- Type: integer
- Default value: 1,000
- Location: System Property [sys_properties] table

com.snc.assessment.signature_authentication

Requires authentication for a user signature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.dd.publish_to_app_repo_enabled

Enables (**true**) or disables (**false**) display of the **Publish To App Repo** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.dd.publish_to_app_store_enabled

Enables (**true**) or disables (**false**) display of the **Publish To App Store** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.dd.publish_to_update_set_enabled

Enables (**true**) or disables (**false**) display of the **Publish To Update Set** permission in Manage Developers.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

com.snc.dd.upgrade_app_enabled

Enables (**true**) or disables (**false**) display of the **Update App** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.hr.core.impersonateCheck

Allows a user to have identical permissions/access as the person they are impersonating. If **true**, access and restrictions apply when impersonating another user. If **false**, the user has identical permissions/access as the person they are impersonating.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.iam.log_level

Logging level for the business rule MapUpstreamImpactedCI. Debug is the most detailed option with full trace of how the Impacted CI List is calculated. Error is the minimal logging option with only severe errors being logged.

- Type: string
- Default value: info
- Possible values: debug, info, error
- Location: System Property [sys_properties] table

com.snc.on_call_rotation.reminders.showtz

Specifies whether to show the user time zone (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.activate_kpi_signals

Create this property and set to 'false' to deactivate the KPI Signals feature.

- Type: Boolean true | false
- Default value: Does not exist but is treated as 'true'
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.correlation.enable_insights

Enables the generation of key contributor insight cards.

- Type: true/false (Boolean)
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.dc.batch_score_insert

When true, Performance Analytics data collection jobs insert indicator scores to the database in batches. When false, indicator scores are inserted one by one. Even when true, batch score insertion is performed only as a fallback when nested data collection (com.snc.pa.dc.nested_collection) has been disabled.

- Type: Boolean true | false
- Default value: true
- Location: System Properties [sys_properties] table

com.snc.pa.dc.flush_snapshot_count

Maximum number of Performance Analytics snapshots to store in the memory during data collection. When this number is reached, the snapshots are offloaded to the database, freeing memory.

- Type: integer
- Default value: 1000
- Location: System Properties [sys_properties] table

com.snc.pa.dc.nested_collection

Activates a hierarchical approach to score collection, where Indicator > level 1 breakdown > level 2 breakdown. This approach is more resource efficient than a flat hierarchical approach, which creates redundant objects.

- Type: Boolean true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.dc.max_breakdown_elements_limit

Maximum number of breakdown elements retrieved by data collection for each breakdown source. This property is handled differently depending on whether nested collection is enabled. If nested collection is enabled, only those elements that have non-null scores count against this limit. If nested collection is disabled, such as under optimized data collection, all elements on the breakdown source count against the limit. When a breakdown source exceeds this limit, breakdown scores are not collected from that source.

- Type: integer
- Default value: 10000
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_error_count

Maximum errors that may occur before data collection is stopped.

- Type: integer
- Default value: 500
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_records

Maximum number of records that are stored during a data collection.

- Type: integer
- Default value: 5000
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_row_count_indicator_source

Maximum number of rows that are allowed to be fetched from an Indicator Source. This property only applies to jobs that do not use Optimized data collection.

- Type: integer
- Default value: 50000
- Location: System Property [sys_properties] table

com.snc.pa.dc.hsql.max_row_count_indicator_source

Maximum number of rows that are allowed to be fetched from an Indicator Source. This property only applies to jobs that use Optimized data collection.

- Type: integer
- Default value: 1 million
- Location: System Property [sys_properties] table

com.snc.pa.dc.script_timeout

Maximum time in seconds that a script is allowed to run during a data collection cycle.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

com.snc.pa.dc.use_hashcode_for_distinct

Sets whether Count Distinct aggregations are stored as separate values in memory or as a HashCode. When the value of this property is True, a HashCode is used, which consumes less memory than storing individual values.

- Type: Boolean true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.insight.max_days_in_past

By default, retrieve insights created within the number of days in the past that this property specifies.

- Type: Integer
- Default value: 14
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.insights.query_limit

Limit the number of rows when querying the par_computed_insight table in the GET response to the Insights API.

- Type: Integer
- Default value: 1000
- Location: The System Properties [sys_properties] table

com.snc.pa.target_batch_operation_limit

Applies only to KPI Details: The maximum number of targets that can be inserted or updated in one bulk action on the Targets Configuration page.

- Type: integer
- Default value: 100
- Location: System Property [sys_properties] table

com.snc.pa.dc.script.use.sandbox

Controls whether Performance Analytics data collection scripts use the sandbox. Only users with the security_admin role can modify this property.

Important:
Exercise caution when turning off this property. When set to false, unauthorized users may be able to execute malicious actions on your instance.

- Type: Boolean true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.pa.formula_indicator_valid_breakdown

Controls whether users can apply a breakdown to a formula indicator when not all contributing indicators in the formula use that breakdown. When true, all contributing indicators must use the formula. When false, a breakdown can be applied when at least one of the contributing indicators uses it.

- Type: Boolean true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.pa.xmr.processes.limit

The maximum number of KPI Signals Configurations (pa_xmr_processes) that can be evaluated by the KPI Signals Insight Job. After this number of processes have been evaluated, the remaining processes are ignored.

- Type: Integer
- Default: 1000
- Maximum: 10,000

com.snc.project.default_schedule

Stores the sys_id of the default schedule attached to projects.

- Type: string
- Location: System Property [sys_properties] table

com.snc.project.loglevel

Automatically resubmits timed-out Ajax requests.

- Type: choice list
- Default value: 0 (debugging disabled)
- Location: System Property [sys_properties] table

com.snc.project.wbs_gantt

Automatically resubmits timed-out Ajax requests.

- Type: true | false
- Default value: false
- Location: **Project** > **Administration** > **Properties**

com.snc.task.associate_ci

List of all task types where user wants to associate CIs using a List system.

- Type: string
- Default: incident,problem,change_request
- Location: System Property [sys_properties] table

com.snc.task.refresh_impacted_services

List of all task types where **Refresh Impacted Services** UI action is enabled.

- Type: string
- Default value: incident,change_request
- Location: System Property [sys_properties] table

com.snc.time_card.default_rate

(Cost Management plugin) Sets a default hourly rate to use if no labor rate cards apply to the user.

- Type: integer
- Default value: 50
- Location: System Property [sys_properties] table

com.snc.time_worked.update_task_timer

Enables (**true**) or disables (**false**) updating the task timer value based on changes to the task time worked records. Uses the Update task time business rule.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

csm_auto_account_domain_generation

When new account in Customer Service application is created, domain is created and placed under TOP domain. If parent field on account form is populated, and new record is inserted, it creates that account as a subdomain of the parent.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

css.assessment.caption.background.color

Sets the background color of the caption on assessment and survey questionnaires.

- Type: color
- Default value: #eee
- Location:
  - **Assessments** > **Admin** > **Assessment Properties**
  - **Survey Management** > **Administration** > **Properties**

css.assessment.caption.font.color

Sets the font color of the caption text on assessment and survey questionnaires.

- Type: color
- Default value: #ffffff
- Location:
  - **Assessments** > **Admin** > **Assessment Properties**
  - **Survey Management** > **Administration** > **Properties**

css.assessment.question.header.background.color

Sets the background color of question headers on assessment and survey questionnaires.

- Type: color
- Default value: #767676
- Location:
  - **Assessments** > **Admin** > **Assessment Properties**
  - **Survey Management** > **Administration** > **Properties**

css.$nav-highlight-main

Sets the color for the navigation expanded items highlight background.

- Type: color
- Default Value: #3D4853
- Location: System Property [sys_properties] table

css.$nav-hr-color

Sets the color for the navigation separator.

- Type: color
- Default Value: #303A46
- Location: System Property [sys_properties] table

css.$navpage-header-bg

Sets the color for the header background.

- Type: color
- Default Value: #303A46
- Location: System Property [sys_properties] table

css.$navpage-header-color

Sets the color for the banner text.

- Type: color
- Default Value: #FFFFFF
- Location: System Property [sys_properties] table

css.$navpage-nav-bg-sub

Sets the color for the background for navigator and sidebars.

- Type: color
- Default Value: #455464
- Location: System Property [sys_properties] table

css.$navpage-nav-border

Sets the color for the border for Core UI.

- Type: color
- Default Value: #DDD
- Location: System Property [sys_properties] table

css.$navpage-nav-color-sub

Sets the color for module text in Core UI.

- Type: color
- Default Value: #BEC1C6
- Location: System Property [sys_properties] table

css.$navpage-nav-selected-bg

Sets the color for navigator selected tab background.

- Type: color
- Default Value: #4B545F
- Location: System Property [sys_properties] table

css.$navpage-nav-selected-color

Sets the color for the currently selected navigation tab icon color for Core UI.

- Type: color
- Default Value: #FFFFFF
- Location: System Property [sys_properties] table

css.tablet.gradient.start

Start color of the gradient for the tablet UI header.

- Type: color
- Default value: #666
- Location: **System Properties** > **Tablet UI Properties**

css.tablet.gradient.end

End color of the gradient for the tablet UI header.

- Type: color
- Default value: #111
- Location: **System Properties** > **Tablet UI Properties**

css.tablet.headerfooter.text.color

Color of the text and icons in the tablet UI header and footer.

- Type: color
- Default value: #ffffff
- Location: **System Properties** > **Tablet UI Properties**

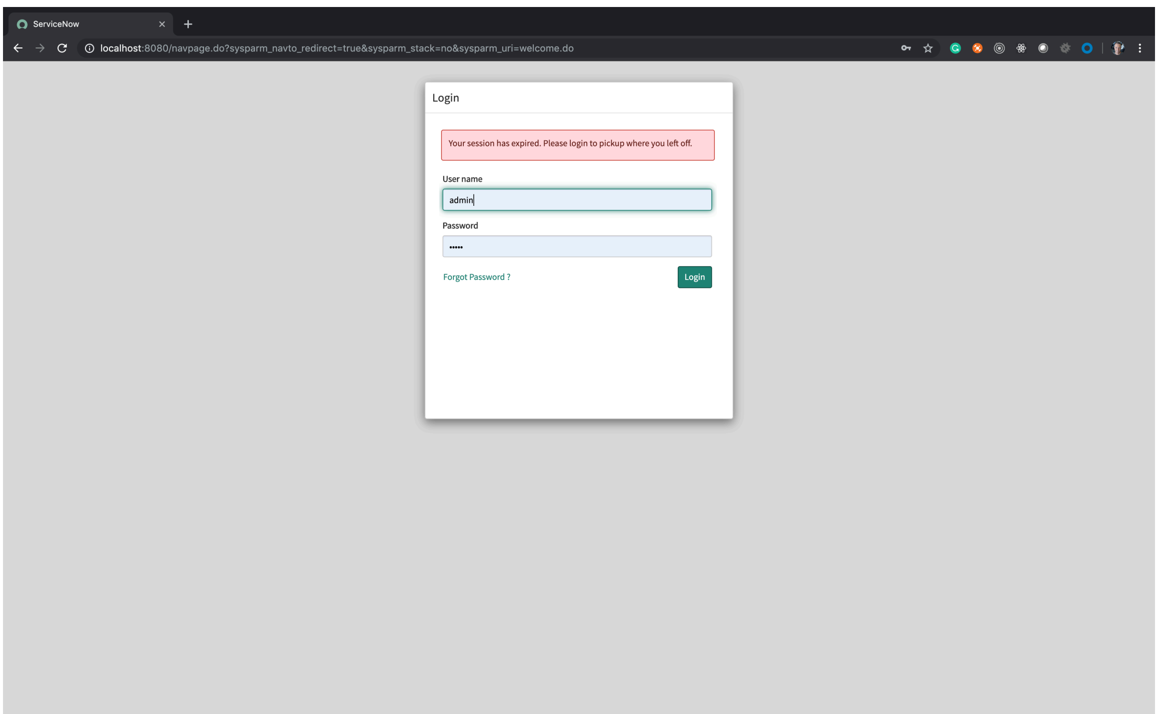
glide.allow.new.cert_follow_on_task

Allow Desired State audit to create a new follow-on task for the same failure at each audit run.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.amb.session.logout.overlay.style

Specifies a cascading style sheet (css) that defines an overlay. The overlay masks all onscreen data on timeout, and the login screen appears on top of the overlay.



Limited to core ServiceNow AI Platform functions, not applications.

- Type: string

  Example: `background-color: #000; opacity: 0.5`
- Default value: empty (no overlay)
- Location: System Property [sys_properties] table

glide.analytics.cache.enabled

When true, caching capability is turned on for data visualizations and Platform Analytics dashboards. Caching still needs to be turned on for individual dashboard and data visualizations in UI Builder and the in-line dashboard editor, respectively.

- Type: true | false (Boolean)
- Default value: false. Turned on automatically when the Data Visualizations 3.0 app from the ServiceNow Store is installed.
- Location: System property [sys_properties] table

glide.analytics.cache.expiration.age.in.seconds

Value in seconds of the expiration_time field in analytics cache records. Applies only when glide.analytics.cache.enabled is true.

- Type: integer
- Default value: 86400 (24 hours)
- Minimum value: 3600 (1 hour)
- Location: System property [sys_properties] table

glide.angular.legacy

When true, enables legacy AngularJS behavior. When false, integrates AngularJS sanitizeUri and $http security patches. If you set this property to false, existing JSONP requests with cross-domain endpoints will fail. You can address this issue in your scripts by doing one of the following:

1. Add the domains of any newly failing requests to the *`angular.jsonp.inclusion_list.urls`* system property.
2. Opt out of this behavior by changing *`angular.jsonp.inclusion_list.enabled`* to false.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.apps.hub.current

URL of the team development parent instance.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.attachment.extensions

Comma-separated list of file extensions that can be attached. No value means that there are no restrictions.

- Type: string
- Default value: none
- Location: **System Properties** > **Security**

glide.attachment.role

Comma-separated list of roles that can create attachments.

- Type: string
- Default value: public
- Location: **System Properties** > **Security**

glide.authenticate.multisso.login_locate.user_field

Identifies a common login identifier.

- Type: string
- Default value: user_name
- Location: Add the property to the System Property [sys_properties] table.

glide.authenticate.sso.saml2.require_signed_authnrequest

Enables the Identity Provider Single sign-on service to receive a signed AuthnRequest.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.banner.image.url

URL used when clicking the banner image.

- Type: string
- Default value: home.do
- Location: System Property [sys_properties] table

glide.banner.image.url_target

Target frame used when clicking the banner image. Use `gsft_main` for the main frame, `_top` to replace the current browser window,`_blank` for a new window or tab.

- Type: string
- Default value: gsft_main
- Location: System Property [sys_properties] table

glide.basicauth.update_last_login_time

Controls whether the Last login and Last login time fields in a user record [sys_user] are updated when an integration user sends a web request to an instance using basic authentication. If true, the Last login and Last login time fields in the user's record are updated with web requests.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.bsm.color.affect_neighbors

Color of an affected neighbor node. When a node has a service issue, all nodes that depend on that node are considered affected nodes. In the map, the affected nodes are parents or grandparents of the node with the service issue.

- Type: color
- Default value: Beige
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.font_family

Font family name used in the map text. If you designate a font that is not on the user system, the browser substitutes another font and the text may not render as you expect.

- Type: font name
- Default value: Arial
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.font_size

Font size of the text that appears with a CI node. The default size is magnified for nodes with more connections and reduced for downstream nodes.

- Type: integer
- Default value: 14
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.selection_background_color

Background color of a selected CI node. This color is also used with a node's Highlight Hierarchy option.

- Type: color
- Default value: RoyalBlue
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.selection_text_color

Color of the text that appears under a selected CI node.

- Type: color
- Default value: White
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.text_color

Color of the text that appears under an unselected CI node.

- Type: color
- Default value: Black
- Location: **BSM Map** > **Map Properties**

glide.bsm.max_levels

Maximum level depth from the root CI that can be initially displayed in business service maps. Level depth is the graph distance between the root CI and a node. This value must be an integer.

- Type: integer (1-10)
- Default value: 5
- Location: **BSM Map** > **Map Properties**

glide.bsm.new_node_color

Color for nodes that became viewable from the last expand operation.

- Type: color
- Default value: PaleGreen
- Location: **BSM Map** > **Map Properties**

glide.bsm.max_nodes

Maximum number of downstream nodes to retrieve from the database for a CI. If more nodes exist in the database, they are not displayed in the map.

- Type: integer
- Default value: 1000
- Location: **BSM Map** > **Map Properties**

glide.bsm.refresh_interval

Seconds between each automatic reloading of troubles and tasks.

- Type: integer
- Default value: 30
- Range of possible values: 1 to 3600
- Location: **BSM Map** > **Map Properties**

glide.bsm.task_threshold

Change the CI glyph color from orange to red when the number of tasks reaches this threshold.

- Type: integer
- Default value: 3
- Location: **BSM Map** > **Map Properties**

glide.bsm.too_many_children

Maximum number of child nodes to display. Nodes are collapsed for the map to meet this limit.

- Type: integer, valid values 1 or greater
- Default value: 10
- Location: **BSM Map** > **Map Properties**

glide.businessrule.async_condition_check

Specifies whether the instance checks the condition statement of async business rules (the **When** field is set to async) prior to running the business rule. If **true**, the instance evaluates the async business rule conditions a second time before running the rule. If **false** or missing, the instance does not evaluate the conditions a second time.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.businessrule.callstack

Specifies whether business rule executions are logged in the daily log when they start and finish (**true**) or are not logged (**false**). Logging is useful for troubleshooting

a problem where you must know which business rules are running and in which order.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.cache.size.service_cache

- Type: integer
- Default value: 20
- Location: Add the property to the System Property [sys_properties] table.

glide.canvas.grid.widget_render_concurrent_max

Defines the maximum number of widgets that can render simultaneously on a dashboard. With smaller values, individual widgets load more quickly. With larger values, fewer Ajax requests to the server are needed. Set the value of this property to half of the number of widgets that are visible when your most-used dashboard loads. For example, if six widgets are visible on the dashboard set the value to 3.

Note:
This system property applies to responsive dashboards only.

Two is the minimum value, and 1 is interpreted as 2. For values of zero or lower, all widgets load simultaneously.

- Type: integer
- Default value: none
- Location: System Property [sys_properties] table

glide.cmdb.query.batch_time_limit_in_sec

Time limit (in seconds) for running one batch to get one batch of query results (100 results).

- Type: integer
- Default value: 300
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.max_results_limit

Limits the number of results for a scheduled query and in the results section in the Query Builder when you click **Load All Results**.

- Type: integer
- Default value: 10,000
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.non_cmdb.black_listed_tables

Exclusion list of non-CMDB tables that appear in the CMDB Query Builder when creating a CMDB query.

- Type: string
- Default value: empty
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.query_time_limit_in_sec

Time limit (in seconds) for running an entire query to get all results.

- Type: integer
- Default value: 1,800
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.statemgmt.max_bulk_count

Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.

- Type: integer
- Default value: 1000
- Location: System Property [sys_properties] table

glide.cmdb.statemgmt.max_lease_expired_days

Maximum number of days that lease expiration can be set with for CI Actions.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.cms.dashboards.sharing_with_secure_search

When enabled, the list of users, user groups, and roles that are visible in the sharing panel is restricted. The restriction is based on the configuration of the sys_user, sys_user_group, and sys_user_role ACLs. For more information, see Access control list rules.

There is a performance penalty associated with enabling this property. Performance degradation may be based on the number and complexity of business rules and ACLs on your instance.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Dashboard Properties**

glide.cms.share_dashboards.role

When this property is empty, all users can share their own dashboards.

Note:
This property does not apply to users with the admin and dashboard_admin roles. Users with these roles can always share any dashboard.

- Type: string
- Default value: empty
- Location: **System Properties** > **Dashboard Properties**

glide.chart.decimal.precision

Controls the rounding precision of non-currency numeric values displayed on reports. A **Decimal Precision** value specified in a report's style options overrides this property. Currency values always have a precision of 2.

- Type: integer
- Default value: 2
- Maximum value: 4
- Location: Add the property to the System Property [sys_properties] table.

glide.chat.invite_fields

(Chat plugin) Comma-separated list of fields (glide_list or references to sys_user or sys_group) used to generate the invitations when creating a chat room from a task. Users can select a check box for each of the specified fields to invite to the chat room users that are referenced by the fields.

- Type: string
- Default value: none
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.chat_room.create_roles

(Chat plugin) Comma-separated list of roles that are allowed to create chat rooms.

- Type: string
- Default value: none
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.chat.show_emoticons

(Chat plugin) Enables (**true**) or disables (**false**) rendering text emoticons as images.

- Type: true | false
- Default value: true
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.class.downgrade.enabled

Flag for allowing class downgrade during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.class.switch.enabled

Flag for allowing class switching during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.class.upgrade.enabled

Flag for allowing class update during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.cmdb.health.metricProcessor.maxRunningTime

Max time in minutes for which individual metric processor runs in each scheduled cycle.

- Type: integer
- Default value: 120
- Location: Navigate to **All** > **Configuration** > **Health Preference**, and then click **System Properties** in the right hand-side navigator.

glide.cmdb.health.src.cmdb_health_audit_only

When set to **true**, disables health results from sources other than CMDB Health audit (such as cloud discovery). Only results generated by CMDB Health audit appear in the CMDB dashboard.

For example, by default, if a CI is determined to be stale by Discovery, then that CI appears as stale in the CMDB dashboard even though CMDB Health audit did not determine that CI to be stale. To disable these stale CI health results, set the property to **true**.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cmdb.health.staleness_exclude_dependent_cis

Exclude dependent CIs for the staleness CMDB Health metric.

When enabled, dependent CIs are not checked for staleness, regardless of any staleness or inclusion rules that are defined for the respective CI types.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cmdb.logger.source.identification_engine

Enable and configure what type of details the system logs when using IRE outside the scope of identification simulation. For example, when using an API, ECC queue or scheduled jobs.

- Type: string
- Default value: info, warn, error, debug, or debugVerbose
- Location: Add the property to the System Property [sys_properties] table.

Note:
Depending on the setting, the system can generate large amounts of data that might affect overall system performance. Set the value with caution, limiting the level of details and use time to the minimum necessary for testing or debugging.

glide.cmdb.logger.use_syslog.CMDBHealth

A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This logging helps debugging if there is a failure.

- Type: string
- Default value: error
- Location: System Property [sys_properties] table

glide.cmdb_model.display_name.shorten

If **true**, generates shorter display names for product models if the name of the product model contains the manufacturer name.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cookies.http_only

Enables (**true**) or disables (**false**) the generation of HTTP-only cookies. Set this property to **false** to use Approval with E-Signature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.cost_mgmt.calc_actual_cost

(Cost Management plugin) When an expense line is created for any task with a **Type** of **Planned task**, sums all task expense lines and adds the total to the **Work cost** field on the task record.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.cost_mgmt.debug

(Cost Management plugin) Enables debugging of cost management processing. All logging events are recorded in the Financial Management Log [fm_log] table.

Note:
This feature can generate a large number of log records. Enable the feature only during initial testing or when troubleshooting.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cost_mgmt.process_task_cis

(Cost Management plugin) Creates expense lines affected configuration items when creating a task expense line.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cost_mgmt.service_allocation.method

(Cost Management plugin) Defines whether business service to cost center allocation costs should be calculated based on total units or allocated units.

For example, if the service supports 100 units but only has 50 units allocated, and cost center ABC is allocated 25 units. Using the **All units** method results in an allocation cost of 25/100, or 25% of the total cost of the service. In this case, we track unallocated costs separately. Using **Allocation units** method results in an allocation cost of 25/50, or 50% of the total cost of the service. In this case, all costs are allocated (recovered).

- Type: choice list
- Default value: all_units
- Location: System Property [sys_properties] table

glide.csv.export.line_break

Enables the user to control how exported CSV data appears in Notepad. Valid values are LF for a line feed between records and CRLF for a carriage return followed by a line feed.

- Type: string
- Default value: LF
- Location: System Property [sys_properties] table

glide.csv.use_row_currency

If false, exports currency and price field values in the user's currency. If true, exports currency and price field values in the currency of the row.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.custom.ip.authenticate.allow

Comma-separated list or dash-separated range of IP addresses that are allowed access to view the stats.do, threads.do, and replication.do pages.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.
- Instance Security Hardening Settings: Performance monitoring IP restriction (instance security hardening)

glide.db.aggregates.trend.use_iso_week

If set to true, reports weekly trend by data according to ISO weeks. If false, data trended per week reports according to the first day of the week set by glide.ui.date_format.first_day_of_week.

- Type: true | false
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.audit.ignore.delete

Specifies the tables where the sys_audit_delete file is not updated when records are deleted.

- Type: string — comma-separated list of tables
- Location: System Property [sys_properties] table

glide.db.forced.chunk.threshold

Sets the threshold above which to forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. Use this property to set a force chunk threshold when using the GlideRecord – DeleteMultiple and GlideRecord – UpdateMultiple methods.

- Type: integer
- Default value: 100000000 (100 million)
- Location: Add the property to the System Property [sys_properties] table.

glide.db.clone.allow_clone_target

Enables (**true**) or disables (**false**) use of a non-production instance as the target for a system clone.

- Type: true | false
- Default value: **false** for production instances, **true** for non-production instances
- Location: System Property [sys_properties] table

glide.db.impex.XMLLoader.max.file.size.mb

Controls the maximum file size allowed when importing an XML file, in megabytes. Attempting to import an XML file larger than this limit results in an error.

> **Warning:**
> Use caution when modifying this property. Uploading a large XML file may impact performance and can cause an instance outage.

- Type: integer
- Default value: 100
- Location: **System Properties** > **Import Export**

glide.db.large.threshold

Sets the number of rows above which a table is considered large and uses a different method of querying for results. When this property is absent, the instance uses the default query method.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.loguser

Display (**true**) or suppress display (**false**) of database errors (such as `Unique Key violation detected by database (Duplicate entry 'ABC' for key 'name') to user.`) to logged-in user.

- Type: true | false
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.max.aggregate.size

Sets the maximum number of groups that a grouped report or list renders. Larger values may affect system performance.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.db.max_view_records

Sets the maximum number of records returned when running a GlideRecord query in a script. Do not use values larger than the default because they may cause queries to consume excessive memory on the application server and can, in extreme cases, cause a system outage. This property does not control the maximum number of records that appear in a list, report, or exported file.

- Type: integer
- Default value: 10000
- Location: Add the property to the System Property [sys_properties] table.

glide.db.table.update_inactive_choices_enabled

Specifies whether choice table selections marked as inactive (`sys_choice inactive attribute = true`) should be loaded into client databases when applications are installed (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.debug.log_point

Specifies whether the log points feature should be enabled or not.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.debugger.log.ui

Specifies whether logs should be displayed under forms and lists and in the Session Log tab, or only in the Session Log tab.

- Type: choice list
- Default value: Page
- Location: System Property [sys_properties] table

glide.discovery.application_mapping

Enables or disables the Application Dependency Mapping (ADM) feature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.discovery.log_debug_info

An optional property to populate debug information in Discovery log. If this property is set to **true**, the Discovery sensor extracts the debug information from ECC input message and writes this information to the Discovery log table, so that it is visible when inspecting discovery status.

- Type: true | false
- Default: false

glide.discovery.log_message_chars

When a log message is longer than this value, ServiceNow creates a preview of the message with an ellipsis at the end of the message to indicate that there is content that is not shown. The preview size prevents any one list row from taking up the entire screen.

- Type: integer
- Default value: 200 (characters)
- Location: **Discovery Definition** > **Properties**

glide.discovery.multi_page_serial_mode

This property controls the processing of multi-page pattern input records. **false** sets the pages to process in parallel and **true** sets the pages to process serially.

- Type: true | false
- Default value: false

glide.discovery.sam_batch_update_size

Enables batching the updates to table cmdb_sam_sw_install when only the field last_scanned in the table has changed. This optimizes the overall discovery execution as it reduces the multiple single update queries on the database. The default value is 100 which means 100 records at a time in the table are batched and updated. By setting this property to 1, this switches to sequential updates.

- Type: integer
- Default value: 100

glide.discovery.use_cmdb_identifiers

Controls whether Discovery uses the CMDB Identification and Reconciliation Framework (introduced with the Geneva release) or the legacy identifiers from previous releases.

- Type: true | false
- Default value: true
- Location: **Discovery Definition** > **Properties**

glide.domain.notify_change

Displays a notification message telling the user that the domain picker automatically changed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.domain.notify_record_change

Displays a notification message telling the user that the domain picker automatically changed because the record that the user is viewing changed the domain of the user.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.duplicate_ci_remediator.dry_run

Determines whether the Duplicate CI Remediator actually remediates CI duplication by updating records in the CMDB, or not.

- Type: true | false
- Default value: false
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

glide.duplicate_ci_remediator.max.cis

Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default).

- Type: integer
- Default value: 1000
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

Note:
This threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

glide.duplicate_ci_remediator.max.field_length

Attributes in which max_length exceeds this property value (4000 by default) are excluded from the **Select Main CI**, **Merge Attribute Values**, and **Determine Duplicate CI Actions** tabs in the Duplicate CI Remediator wizard.

- Type: integer
- Default value: 4000
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

Note:
This property impacts the performance of de-duplication tasks, therefore be cautious about setting this value.

glide.eccprobe.longrunner.class

Identifies the name of a script include that manages long running commands.

- Type: string
- Default value: LongRunner
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.retry_minutes

Allows bursts of polling errors up to specified minutes in duration.

- Type: integer
- Default value: 10
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.initial_seconds

Initial polling period for long running commands in seconds.

- Type: integer
- Default value: 20
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.backoff_percent

Percentage that polling period grows per poll.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.max_seconds

Maximum polling period. As the polling period decays, it gets longer until it reaches this maximum.

- Type: integer
- Default value: 300
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.debug

Allows LongRunner logs status on successful polls in addition to the usual messages on unsuccessful ones when set to **true**.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.max_poll_count

Maximum number of polls that is executed per 5- second polling period. This number is generally not relevant, but may be used to contain polling under extreme loading conditions.

- Type: integer
- Default value: unlimited
- Location: System Property [sys_properties] table

glide.ecmdb.all_relationship_role

An example value is: itil,asset,configuration.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

`glide.email_address_filter.max_domains`

Sets the maximum number of domains that can be associated with a single email address filter.

- Type: integer
- Default value: 100

`glide.email_address_filter.max_exceptions`

Sets the maximum number of exceptions that can be associated with a single email address filter.

- Type: integer
- Default value: 1000

glide.email.append.timezone

Specifies whether to append the time zone to all dates and times in outbound emails (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

`glide.email_client.quick_message.insert`

Controls how quick messages are inserted in the email client. If the property is set to **true**, quick message content is inserted at the place of the cursor. If **false**, quick message content replaces existing content in an email draft.

- Type: true | false
- Default value: true

glide.email.forward_subject_prefix

Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.

- Type: string
- Default value: fw:,fwd:
- Location: Add the property to the System Property [sys_properties] table.

glide.email.journal.lines

Specifies the number of entries from a journal field (such as Additional comments and Work notes) included in email notifications. A value of **-1** includes all journal entries.

- Type: integer
- Default value: 3
- Location: **System Properties** > **Email**

glide.email.mail_to

Specifies the email address to send notifications that use the *`${mailto:}`* variable.

- Type: string
- Default value: SMTP email address that is active by default
- Location: Add the property to the System Property [sys_properties] table.

glide.email.name_split

Delimiter between the first and last name in an email address to identify users from incoming emails. For example, a delimiter of "." in the email address john.smith@company.com tells the system to look for a user record for John Smith.

- Type: string
- Default value: period (.)
- Location: **System Properties** > **Email**

glide.email.notification.save_when_no_recipients

Controls whether (**true**) or not (**false**) a notification-generated sys_mail record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.email.override.url

Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is: https://servicenow.customerdomain.com/production/nav_to.do.

- Type: string
- Default value: Instance URL
- Location: Add the property to the System Property [sys_properties] table.

glide.email.read.active

Enables (**true**) or disables (**false**) the inbound mail server.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.email.reply_subject_prefix

Specifies the comma-separated list of prefixes in the subject line that identify an email reply.

- Type: string
- Default value: re:aw:,r:
- Location: System Property [sys_properties] table

glide.email.smtp.active

Specifies whether to enable (**true**) or disable (**false**) the outgoing mail server.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.email.smtp.max_recipients

Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.email.smtp.max_send

Specifies how many emails to send through each new SMTP connection. The instance establishes a new SMTP connection if there are more emails to send than the specified value.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

`glide.email_system_address_filter.max_address_filters`

Sets the maximum number of email filters that can be associated with a single system address filter.

- Type: integer
- Default value: 100

glide.email.test.user

Specifies the comma-separated list of email addresses to which the instance sends all email messages. Typically used in non-production instances for testing purposes.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.email.text_plain.strip_xhtml

Indicates whether both outbound and inbound emails that are shown in comments convert the XML to plain text (**true**) or preserve the XML (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.email.watermark.visible

Indicates whether the watermark in email notifications is visible (**true**) or is wrapped in a hidden div tag (**false**).

Note:
Email clients that use the plain text version of the email show the watermark.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.email_client.show_sms_option

Specifies whether a check box appears in the email client for sending the message to the user's SMS device (**true**) or not (**false**). If no SMS device exists, the email client sends the message to the primary email device.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.entry.loggedin.page_ess

Specifies the page that an ESS user, who by definition has no roles, is redirected to when the user logs in.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.excel.boolean.display_value

If true, translates columns of type boolean to the user's language when exporting records in Excel format. If false, exports the values in English, regardless of the user language.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.excel.max_cells

Sets the maximum number of cells in an Excel export.

- Type: integer
- Default value: 500000
- Location: Add the property to the System Property [sys_properties] table.

glide.excel.use_user_date_format

Specifies whether Excel exports use the date/time format specified in a user's profile (**true**) or not (**false**). If **false**, exports the instance date/time format defined by the `glide.sys.date_format` property.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.export.csv.charset

Specifies the character set used to export CSV files. See Supported Character Encodings for a list of supported character encoding options.

- Type: string
- Default value: windows-1252
- Location: Add the property to the System Property [sys_properties] table.

glide.export.csv.raw.value

When **true**, raw database values are exported instead of the display values when you export to CSV. When **false**, display values are exported.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Import Export**

glide.export.escape_formulas

When **true**, string values that start with the characters +, -, =, or @ are prepended with a single apostrophe when you export to CSV, XLS, or XLSX files.

- Type: true | false
- Default value: **true** for new instances starting with Istanbul
- Location: System Property [sys_properties] table for new instances starting with Istanbul. For upgraded instances, Add the property to the System Property [sys_properties] table.

glide.export.excel.general_formatting

When **true**, values in cells in exported Excel files have the general format. When **false**, the cells in exported Excel files have the text format.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.export.excel.wrap_cells

When **true**, values in cells in exported Excel files are wrapped automatically. When **false**, the width of exported Excel columns is resized to fit 256 characters and values are not wrapped.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.fdih.retry.max_count

Specifies the maximum number of retry attempts when no value is specified in **Count** for a retry policy.

- Type: Integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.glidesoap.proxy_host

Specifies the proxy server hostname or IP address for SOAP clients.

- Type: string
- Default value: value of `glide.http.proxy_host`
- Location: System Property [sys_properties] table

glide.glidesoap.proxy_port

Specifies the port number for the proxy server for SOAP clients.

- Type: string
- Default value: value of `glide.http.proxy_port`
- Location: System Property [sys_properties] table

glide.guest.active.session.life_span

Sets the maximum session time for a guest session regardless of user activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.guest.session_timeout

Sets the inactive session timeout for a guest session, in minutes.

Note:
This setting decouples a guest session timeout from the `glide.ui.session_timeout` property. Any changes to the `glide.ui.session_timeout` property do not affect a guest session timeout.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.hd.payload_multi_page.device_history.mutex_expires

Total time the thread waits to update the Discovery history before giving up.

- Type: integer
- Default value: 1 minutes
- Location: System Properties

glide.hd.payload_multi_page.device_history.mutex_spin_wait

The time between when we check if the Discovery history database is free.

- Type: integer
- Default value: 100 ms
- Location: System Properties

glide.hd.payload_multi_page.device_history.mutex_max_spins

The number of times the Discovery history is checked before giving up.

- Type: integer
- Default value: 600
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_expires

Total time the thread waits to update the Discovery log before giving up.

- Type: integer
- Default value: 1 minutes
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_spin_wait

The time between when we check if the Discovery log database is free.

- Type: integer
- Default value: 100 ms
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_max_spins

The number of times the Discovery log is checked before giving up.

- Type: integer
- Default value: 600
- Location: System Properties

glide.help.default.page

Sets the overall help URL for the system if you are using context-sensitive help. This URL is used when there is not any context-sensitive help available for the form, list, or record.

- Type: string
- Default value: http://wiki.servicenow.com/
- Location: System Property [sys_properties] table

glide.history.max_entries

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 250
- Location: System Property [sys_properties] table

glide.home.page

Specifies which page to load when a user selects a homepage from the banner.

- Type: string
- Default value: `home_splash.do?sysparm_direct=true`
- Location: System Property [sys_properties] table

glide.home.refresh_disabled

Enables (**true**) or disables (**false**) homepage refresh.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.home.refresh_intervals

Comma-separated list of refresh intervals available on homepages.

- Type: string
- Default value: 300,900,1800,3600
- Location: Add the property to the System Property [sys_properties] table.

Important:

The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Center dashboards take over homepage functionality.

Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards.

For more information, see:

- Dashboards in the Analytics Center.
- Working with responsive dashboards.

glide.html.enable_media_sites

Enables a URL option for media in the HTML Editor. The media attaches, but doesn't load in the HTML Editor.

- Type: string
- Default value: youtube.com,player.vimeo.com,vimeo.com
- Location: System Property [sys_properties] table

glide.html.escape_script

Enables (**true**) or disables (**false**) JavaScript tags in HTML fields.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.html.sanitize_all_fields

Specifies whether all HTML fields are sanitized to remove unwanted code (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: HTML sanitizer (instance security hardening)

glide.http.connection_timeout

Specifies the maximum number of milliseconds an outbound HTTP request (such as Web Services) waits to establish a connection.

- Type: integer
- Default value: 10000 (10 seconds)
- Location: System Property [sys_properties] table

glide.http.outbound.max_timeout

Specifies the number of seconds that RESTMessageV2 and SOAPMessageV2 APIs wait for a response from a synchronous call. The maximum value is 30 seconds.

To define a timeout longer than 30 seconds, set the `glide.http.outbound.max_timeout.enabled` system property to **false** and use the `waitForResponse()` method to set the timeout. For example, see Asynchronous SOAPMessageV2 example. If `glide.http.outbound.max_timeout.enabled` is set to true and a value is passed in the `waitForResponse()` method, the system uses the smallest value from either the `waitForResponse()` method or the `glide.http.outbound.max_timeout` system property.

- Type: integer
- Default value: 30
- Location: Add the property to the System Property [sys_properties] table.

glide.http.outbound.max_timeout.enabled

Enables setting a timeout in the `glide.http.outbound.max_timeout` system property.

To define a timeout longer than 30 seconds, set the *glide.http.outbound.max_timeout.enabled* system property to **false** and use the *waitForResponse()* method to set the timeout. For example, see Asynchronous SOAPMessageV2 example. If *glide.http.outbound.max_timeout.enabled* is set to true and a value is passed in the *waitForResponse()* method, the system uses the smallest value from either the *waitForResponse()* method or the *glide.http.outbound.max_timeout* system property.

- Type: boolean
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.http.proxy_bypass_list

Specifies the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk (*) as a wildcard character to specify all or part of an address.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_host

Specifies the proxy server hostname or IP address.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_ntdomain

Specifies the domain used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_nthost

Specifies the hostname used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_ntpassword

Specifies the password used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_ntusername

Specifies the user name used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_port

Specifies the port number for the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_password

Specifies the password used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_username

Specifies the username used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.timeout

(Web service Consumer Plugin) Specifies the maximum number of milliseconds to wait before an outbound transaction times out.

- Type: integer
- Default value: 175000 (175 seconds)
- Location: Add the property to the System Property [sys_properties] table.

glide.i18n.force_index

Enables (**true**) or disables (**false**) indexing all translated fields, regardless of the value of the table attribute text_index_translations.

- Type: true | false
- Default value: true

glide.identification_engine.batch_update_last_discovered

Controls batch update of last_discoveredfield in CIs that are being processed by the identification engine.

Set to **false** if there are business rules that apply to last_discovered field, and you want to trigger these rules when calling Identification and Reconciliation API.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.dependent_items_local_cache_count

For optimization, a custom number of locally cached query result entries of dependent CIs.

- Type: integer
- Default value: 10000
- Location: Add the property to the System Property [sys_properties] table.

Note:
If there is a memory issue due to optimization related to using local cache, set the *glide.identification_engine.related_items_local_cache_count* and the *glide.identification_engine.dependent_items_local_cache_count* properties to 0.

glide.identification_engine.granular_insert_locking

Determines whether to use multiple granular insert locks or single global insert lock.

Set to **false** if there are performance issues associated with the usage of multiple granular insert locks.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.independent_items_local_cache_count

For optimization, a custom number of locally cached query result entries of independent CIs.

- Type: integer
- Default value: 100000
- Location: Add the property to the System Property [sys_properties] table.

Note:
Setting the value to 0 avoids using local cache for independent CIs and might affect performance.

glide.identification_engine.related_items_local_cache_count

For optimization, a custom number of locally cached query result entries of related/lookup items.

- Type: integer
- Default value: 15000
- Location: Add the property to the System Property [sys_properties] table.

Note:
If there is a memory issue due to optimization related to using local cache, set the *glide.identification_engine.related_items_local_cache_count* and the *glide.identification_engine.dependent_items_local_cache_count* properties to 0.

glide.identification_engine.skip_duplicates

Controls how identification processes a small set of duplicate CIs.

- When **true**: If the number of duplicate CIs is less than the threshold specified by *glide.identification_engine.skip_duplicates.threshold*, then one of the duplicate CIs is picked as a match and gets updated. The rest of the duplicate CIs are tagged as duplicates.
- When **false**: Matching a CI fails, and an error is logged.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.skip_duplicates.threshold

Maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of *glide.identification_engine.skip_duplicates*.

If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if *glide.identification_engine.skip_duplicates* is set to **false**, regardless of the setting.

- Type: integer
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_logs.max_run_ids

Maximum number of log runs that can be displayed when navigating to **Configuration** > **Identification Logs**.

- Type: integer
- Default value: 1000
- Location: **Configuration** > **CMDB Properties** > **Identification/Reconciliation Properties**.

glide.image_provider.security_enabled

Controls the security settings for images. If **true**, images are visible only to authenticated and authorized users. If **false**, images are visible to anyone with a URL to the attachment.

- Type: true | false
- Default value: true

  - New/zbooted instances: property is present and set to **true**
  - Upgraded instances: **false** if property is not present, unchanged if property is present
- Location: System Property [sys_properties] table

glide.imap.secure

Enables (**true**) or disables (**false**) SSL encryption for connections to the IMAP server.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.imap.secure_port

Specifies the communications port for IMAP secure connections.

- Type: string
- Default value: 995
- Location: Add the property to the System Property [sys_properties] table.

glide.imap.tls

Enables (**true**) or disables (**false**) starting the IMAP server in Transport Layer Security (TLS) mode.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.debug

Enables (**true**) or disables (**false**) debug logging for all import processes.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.error_message.generic

Enables (**true**) or disables display (**false**), failed imports to display a generic error instead of a verbose SQL message. This property should be enabled.

- Type: true | false
- Default value:
  - New/zbooted instances: **true** for starting with Istanbul
  - Upgraded instances: false
- Location: System Property [sys_properties] table

glide.import_excel.use_only_user_session_date_format

If true, any Date or Date/Time value in an Excel spreadsheet is converted to a user session date format in the staging table upon Excel file import.

If false, any Date/Time explicit cell type in Excel is imported into a staging table with the user session date format, and any date value that is not explicitly in a Date/Time cell type in Excel is imported into a staging table using the system date format.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table if you want to change the value to false.

glide.import.sftp.debug

Enables (**true**) or disables (**false**) additional debug logging for SFTP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.scp.debug

Enables (**true**) or disables (**false**) additional debug logging for SCP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import_set.preserve.leading.spaces

Specifies whether the import process preserves leading spaces in Excel data cells (**true**) or not (**false**). When **false**, the import process removes leading spaces from Excel data cells.

Note:
The import process always removes trailing spaces from Excel data cells.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import_set_row.dynamically_add_fields

Specifies whether an import set can add new columns to the staging table (**true**) or not (**false**). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. Sometimes the database alter table action causes an outage. Setting this property to **false** prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ir.query_method

Sets the query method for global text search. Only the **Simple query** method is supported.

- Type: choice list
- Default value: simple
- Location: **System Properties** > **Global Text Search**

glide.active.session.timeout.invalidate.session

Specifies whether integration sessions can be invalidated by configuring a maximum active session time.

- Type: Boolean true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.integrations.active.session.life_span

Sets the maximum session time for a integration session regardless of activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.integration.session_timeout

Sets the inactive session timeout for integration sessions, in minutes.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.invalid_query.returns_no_rows

Controls how invalid GlideRecord queries are handled with respect to invalid or undefined field names. When this property is **true**, invalid queries containing invalid or undefined field names always return no rows. When this property is **false** (default), if a query is incorrect, and includes invalid or undefined field names, the invalid part of the query condition is ignored and results are based on the valid part of the query.

To override this logic at the session level, execute `gs.getSession().setStrictQuery(false)`. To restore strict query, execute `gs.getSession().setStrictQuery(true)`. To use this property, change the line `gr.addQuery('table', arguments.length == 1 ? record.getRecordClassName() : tableName);` in the Workflow script include to `gr.addQuery('table', (tableName) ? tableName : record.getRecordClassName() );`.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.itil.assign.number.on.insert

Controls whether (**true**) or not (**false**) a task number is generated and assigned on load (**Create New**) or when the task is submitted. This feature helps prevent unused task numbers.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.jdbcprobeloader.retry

Sets the number of times a JDBC probe attempts to connect to a JDBC data source.

- Type: integer
- Default value: 60
- Location: Add the property to the System Property [sys_properties] table.

glide.jdbcprobeloader.retry_millis

Sets the number of milliseconds a JDBC probe waits between retry attempts to a JDBC data source.

- Type: integer
- Default value: 5000
- Location: Add the property to the System Property [sys_properties] table.

glide.jquery.legacy

When true, enables legacy JQuery behavior. When false, integrates the JQuery 1.12.3 and 2.2.3 security patches. If you set this property to false, UI pages with incorrect HTML markup may render incorrectly. You can address this issue in your scripts by closing any html element tags that are self-closing and not in the valid list. For example, change `<div />` to `<div></div>`.

- Valid self-closing elements that do not need to be updated include:
  - `<area />`
  - `<base />`
  - `<br />`
  - `<col />`
  - `<embed />`
  - `<hr />`
  - `<img />`
  - `<input />`
  - `<link />`
  - `<meta />`
  - `<param />`
  - `<source />`
  - `<track />`
  - `<wbr />`
- Type: true | false

- Default value: true
- Location: System Property [sys_properties] table

glide.knowman.search.apply_role_based_security

If **true**, honors read access of knowledge bases or articles specified for roles. If **false**, enables specified user criteria to override read access specified for roles.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.search_character_limit

Minimum number of characters required for knowledge search. Search terms with fewer than this number of characters return no results.

- Type: integer
- Default value: 3
- Location: System Property [sys_properties] table

glide.knowman.search.default_language

(Knowledge Management Internationalization Plugin v2) Default language for knowledge articles. If empty, defaults to the language of the logged-in user.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

glide.knowman.serviceportal.seo_portals

Value contains a comma-separated list of service portal record sys_ids. The SEO indexing of knowledge articles is enabled on the portals mentioned in the list and is blocked by the noindex metatag for other portals. If at least one portal is listed, SEO suggestions display when users author or edit knowledge articles.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

Note:
If the property value is empty, the indexing is enabled for all portals.

glide.knowman.show_language_option

(Knowledge Management Internationalization Plugin v2) Specifies whether the **Language** box appears (**true**) or is hidden (**false**) on articles with multiple translations.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.show_language_option.roles

(Knowledge Management Internationalization Plugin v2) Comma-separated list of roles that can see the Language box on articles with multiple translations.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.show_links

Specifies whether the **Link** line appears (**true**) or is hidden (**false**) in a knowledge article.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ldap.allow_empty_group

Specifies whether all members can be removed from an Active Directory security group (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ldap.binary_attributes

Comma-separated list of LDAP attributes that should be converted from binary format to encoded64 strings. If you set this property, only the values listed are converted. The most common attributes are *objectSID* and *objectGUID*. These converted values are unique and can be used as the coalesce field on the LDAP import mapping. If this property is blank, ServiceNow tries to map these binary attributes without the conversion and they are not guaranteed to be unique since they are not properly converted to string values.

- Type: string
- Default value: objectsid,objectguid
- Location: System Property [sys_properties] table

glide.ldap.paging

Enables (**true**) or disables (**false**) LDAP paging query support. LDAP paging is a more efficient LDAP querying method for environments with more than 1000 users.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.legacy.excel.export

Enables (**true**) or disables (**false**) exporting to XLS format when exporting to an Excel file. By default, only XLSX export is enabled. This property does not affect the Excel web service. When **true**, this property also allows users to select XLS or XLSX as the Easy Import template format.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.list.filter_max_length

Sets a maximum character limit for the condition builder query.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.lists.live_list_enabled

Enables a list refresh prompt.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.live_feed.company_feed_exclude_groups

Controls whether messages posted to a public group appear (**true**) or are omitted (**false**) on the Company Feed.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.live_services

(Chat plugin) Enables (**true**) or disables (**false**) Live Services, such as chat support.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.login.no_blank_password

Prevents (**true**) or allows (**false**) logins from users with blank passwords. Often, importing lists of users creates many users with blank passwords. By default, this property is set to **true** on production instances.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.login.home

Sets the default homepage that users see after login. If blank, the last page visited is used. The format is *<page>.do*.

- Type: string
- Default value: home.do
- Location: System Property [sys_properties] table

glide.max_journal_list_size

Sets the maximum size, in megabytes, of journal input fields.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.messaging.reassign.enabled

Sets property that automatically reassigns messaging if the current agent is unavailable.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.notification.recipient.include_logging

Master switch to enable/disable logging all reasons a recipient was included. If **false**, no include logging is performed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.notification.recipient.exclude_logging

Master switch to enable/disable logging all reasons a recipient was excluded. If **false**, no exclude logging is performed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.notification.recipient.exclude_logging.device_inactive

Logs recipients who are excluded because their chosen notification device record is marked as inactive.

- Type: true | false
- Default value: true

The `glide.notification.recipient.exclude_logging` property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.device_schedule

Logs recipients who are excluded because the chosen notification device record's schedule field excludes it.

- Type: true | false
- Default value: true

  The `glide.notification.recipient.exclude_logging` property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.event_creator

Logs recipients who are excluded because they initiated the notification event, such as updating an incident record, and the **Send to Event Creator** check box is cleared on the notification record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.invalid_email

Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

To modify this property, you must enable the *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_calendar_integration_disabled

Logs recipients of calendar invitations who are excluded because the **Calendar Integration** field is set to **None** on the user record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.user_inactive

Logs recipients who are excluded because the **Active** check box is cleared on the user record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.user_notification_disabled

Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.

To modify this property, you must enable the *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging

Enables or disables logging all reasons that a recipient was included. This property is a main switch. If **true**, the subsequent properties dealing with the inclusion of

logging are enabled. If **false**, none of the subsequent properties relating to the inclusion of logging are enabled.

glide.notification.recipient.include_logging.delegate

Logs recipients who are included because they are delegates of another user.

- Type: true | false
- Default value: true

The `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.include_logging.event_parm

Logs recipients who are included because they are in the **parm1** or **parm2** fields of the event record.

To modify this property, you muse enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_fields

Logs recipients who are included via a notification target record, such as an incident record, specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, if the record that triggered the notification is an incident, and the **assigned_to** field for the incident is listed in recipient_fields, that user is included as a recipient.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.group_email

Logs recipients who are included in a group email for any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.manager

Logs recipients who are included because they manage any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.membership

Logs recipients who are included via membership in any group provided in the notification record recipient_groups or the event **parm1** or **parm2** field.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_users

Logs recipients who are included via notification record's **Users** field (recipient_users).

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.subscription

Logs recipients because they are subscribed via User Notification Preferences.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.oauth.update_last_login_time

Controls whether the Last login and Last login time fields in a user record [sys_user] are updated when an integration user sends a web request to an instance using OAuth authentication. If true, the Last login and Last login time fields in the user's record are updated with web requests.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.pdf_export_from_form_list.show_report_attrs

Enables or disables displaying the PDF page header for all PDFs generated from a list.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.pdf.max_rows

Sets the maximum number of rows in an exported PDF file.

- Type: integer
- Default value: 1000
- Location: Add the property to the System Property [sys_properties] table.

glide.pdf.font.size

Sets the font size for exported PDF files.

- Type: integer
- Default value: 8
- Location: Add the property to the System Property [sys_properties] table.

glide.pg.any_rejection_rejects

Controls the default process guide rejection handling. If **true**, the first rejection rejects the entity. If **false**, all users must reject the approval.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.phone_number_e164.allow_national_entry

When **true**, users can enter phone numbers in the local format listed in the territory selector. When **false**, users must enter phone numbers in the international format listed in the territory selector.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_national

When set to **true** or **form**, a Phone Number (E164) field displays phone numbers in a local format on forms but as an international format on lists. When set to **all**, a Phone Number (E164) field always displays phone numbers in a local format. When set to user, a Phone Number (E164) field only displays phone numbers in a local format when the phone number matches the locale setting of the current user.

- Type: string
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_territory_selector

Specifies whether to display (**true**) or hide (**false**) the territory selector. Hiding the territory selector restricts users to entering only local or national phone numbers.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_territory_text

When set to all, a Phone Number (E164) always displays the territory label. When set to national, a Phone Number (E164) displays the territory label only if the phone number is in local format. When set to read-only, a Phone Number (E164) displays the territory label in read-only mode regardless of whether the number is in local or global format. When set to read-only-national, a Phone Number (E164) displays the territory label in read-only mode only if the number is in local format. When set to list, a Phone Number (E164) displays the territory label in a list. When set to list-national, a Phone Number (E164) displays territory label in a list if the number is in national format. When set to none, a Phone Number (E164) does not display the territory label.

- Type: string
- Default value: read-only
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_users_idd

Specifies whether to display the international direct dialing prefix between the territory selector and the input box on forms (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.strict

Specifies whether all phone number fields must match the display format of the field's select territory. When **true**, the phone number input box displays a red line underneath phone numbers that do not match the territory format listed in the territory selector. Users cannot save an invalid phone number. When **false**, the phone number input box displays a green line underneath phone numbers that do not match the territory format listed in the territory selector. Users can save an invalid phone number, and the territory selector offers the option to select an **Other / Unknown** territory format.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.pop3.ignore_headers

Specifies the comma-separated list of email headers that cause the instance to ignore an email message. Use the format name:value to specify email header types and values. You can use a wildcard (*) for the subtype. For example, `Content-Type:multipart/*; report-type=delivery-status;` ignores emails containing a type of multipart and a parameter of *`report-type=delivery-status`*. For syntax specifications, see http://www.w3.org/Protocols/rfc1341/4_Content-Type.html.

- Type: string
- Default value: Auto-Submitted:auto-replied,X-FC-MachineGenerated:true,Content-Type:multipart/report; report-type=delivery-status;
- Location: **System Properties** > **Email**

glide.pop3.ignore_senders

Specifies the comma-separated list of senders that cause the instance to ignore an email message. Enter only the name before the at (@) sign.

- Type: string
- Default value: mailer-daemon, postmaster
- Location: **System Properties** > **Email**

glide.pop3.ignore_subjects

Specifies the comma-separated list of strings that cause the instance to ignore an email message if they are present at the start of a subject line. Values are case-insensitive.

- glide
- Type: string
- Default value: out of office autoreply, undeliverable:, delivery failure:,returned mail:,autoreply
- Location: **System Properties** > **Email**

glide.pop3.parse_end

[Legacy] Text indicating the end of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.pop3.parse_start

[Legacy] Text indicating the beginning of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.pop3.process_locked_out

Enables (**true**) or disables (**false**) the ability for locked out users to trigger inbound actions.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.pop3.reply_separators

Comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case-sensitive.

- Type: string
- Default value: \n\n-----Original Message-----,\n\n _____ \n\nFrom:
- Location: **System Properties** > **Email**

glide.pop3readerjob.create_caller

Controls the behavior when an instance receives an email from an email address not associated with a user record. If **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any created tickets. If **false**, the instance associates the new ticket to the **Guest** user record.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Email**

glide.processor.json.row_limit

Specifies the maximum number of rows a JSON query returns.

- Type: integer
- Default value: 250
- Location: Add the property to the System Property [sys_properties] table.

glide.product.description

The value of this property is displayed as text in the banner next to the company logo.

- Type: string
- Default value: Service Management
- Location: **System Properties** > **Basic Configuration UI16**

glide.product.help_url

Global setting for the URL that the help icon goes to. Value must be empty for context-sensitive help to work.

glide.product.help_show

Controls whether the help icon, help.gifx, appears in (**true**) or is omitted from (**false**) the welcome banner.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.product.image.light

The Banner image displayed for Core UI Interface.

- Type: uploaded image
- Default value: none
- Location: **System Properties** > **Basic Configuration UI16**

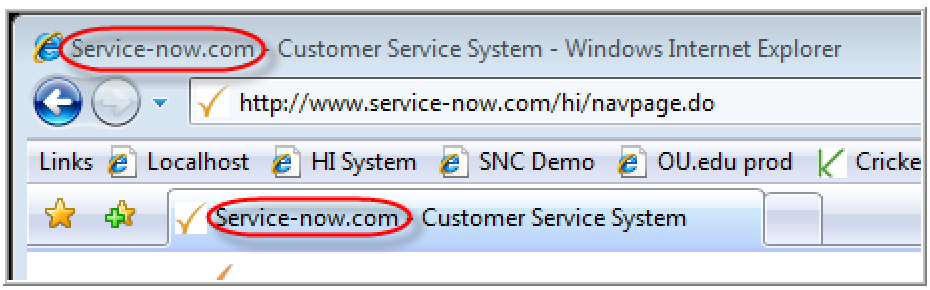
glide.product.icon

Stores the favicon image displayed in bookmarks, tabs, and the browser address bar.

- Type: image
- Default value: favicon.ico?v=4
- Location: **System Properties** > **System**

glide.product.name

Specifies text to use in place of Service-now.com in the browser top title bar (and in browser tabs). This text is duplicated in the banner to the right of the logo unless you add display: none; to the end of the value field within the `glide.product.name.style` property.



- Type: string
- Default value: ServiceNow
- Location: System Property [sys_properties] table

glide.product.name.style

Specifies the CSS properties used to display the `glide.product.name` text in the banner to the right of the logo. To not display the text, add `display: none;` to the end of the value field in this property.

- Type: string
- Default value: padding-bottom: 0px; padding-top: 0px;
- Location: System Property [sys_properties] table

glide.quota.manager.debug

Controls whether to display (**true**) or hide (**false**) additional information related to the Quota Manager, such as running transactions, canceled transactions, and which quotas are matched to transactions.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.heartbeat

Sets the number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions exceeding a quota and how often the Quota Manager writes status in the log file.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.minimum_transaction_time

Sets the minimum number of seconds that a transaction must run before the Quota Manager matches it to a transaction quota. You should set this value to at least 1 second because smaller values decrease performance, and because transactions shorter than 1 second are probably not worth canceling. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.reconciliation.override.null

Flag for allowing or disallowing the update of an empty field by a lower priority data source.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.remote_glide_record.max_count

Control the maximum number of records that the GlideRecord query method returns when using the SOAP web service. The instance primarily uses this property to control the records returned when using a Perl API GlideRecord query.

> **Warning:**
> If you set this property to a large value, such as 10000, socket timeout errors might occur with MID Servers. Keep the value of this property less than 1000.

- Type: integer
- Default value: 250
- Location: Add the property to the System Property [sys_properties] table.

glide.report.add_to_list_supported

Sets whether to support the add_to_list ACL for reporting on specified columns from the Available columns list when creating or sharing a list report.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.report.calendar.max_more_events_per_day

Specifies the maximum number of calendar events that can appear in the **+ <number>** pop-up for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

When this number is exceeded, a **+ many** link appears, which opens a list of events instead of a pop-up. For more information about the maximum number of events that can be displayed in a calendar day, see system property *glide.report.calendar.max_events_displayed_per_cell*.

- Type: integer
- Default value: 30
- Location: Add the property to the System Property [sys_properties] table.

glide.report.calendar.max_events_displayed_per_cell

Defines the maximum number of events that can appear in calendar report for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

Events that exceed this value are visible via a link in the calendar cell. See *glide.report.calendar.max_more_events_per_day* for more information.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

glide.report.new_calendar

Enables (**true**) or disables (**false**) new calendar reports. Internet Explorer 7 and 8 do not support new calendars. If you open a calendar report in one of these browsers, the old version of calendar reports is always used.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.report_home.group_report.show_usr_grp

Enables (**true**) or disables (**false**) the Reporting preferences link in the user profile.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.required.attribute.enabled

Flag for enforcing required attributes (cannot be null) during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table.

glide.rest.apis.disabled

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.enabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you disable specific APIs without explicitly enabling any APIs, all REST APIs except the disabled APIs are available.

- Type: string
- Default value: all REST APIs are enabled by default
- Location: System Property [sys_properties] table

glide.rest.apis.enabled

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.disabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you enable specific APIs, only those APIs are available.

- Type: string
- Default value: all REST APIs are enabled by default
- Location: Add the property to the System Property [sys_properties] table.

glide.rest.choice.allow_non_existing_value

Enables passing non-existing values to a choice field. Does not apply to Change REST API /api/sn_chg_rest/change.

- Type: true | false
- Default value: false

  If **true**, the choice field is set to a passed value, even if the passed value does not exist in the choice field.

- Location: Add the property to the System Property [sys_properties] table.

glide.rest.debug

Logs all stages of REST processing, including processing times.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.rest.replace_request_host_with_property

Ensures that generated links in an API payload, such as links to more pages and reference fields, are based off of the instance address not the request host address.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.rollback.version

Controls whether rollback behavior is used (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.rss.max_rows

Controls the maximum number of records returned by the RSS Feed Generator.

- Type: integer
- Default value: 1000
- Location: Add the property to the System Property [sys_properties] table.

glide.sc.reset_cascade

If **true**, forces variable cascading when navigating between pages in an order guide.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.schedules.repeat_nth

Controls how a schedule entry with **Repeats** set to **Monthly** and **Monthly Type** set to **Day of the Week** is defined. Choices are **Week** or **Day**. The **Week** option is defined as choosing a day of the month in the nth week selects the nth day of the month. The **Day** option is defined as choosing the nth day of the month selects the nth day of the month.

- Type: choice list
- Default value: day
- Location: System Property [sys_properties] table

glide.schedules.fifth

Controls how a schedule entry that selects the fifth occurrence of a day in month behaves in a month containing only four occurrences of the day. Choices are **Last**, **Next**, and **Strict**. The **Last** option selects the last (fourth) occurrence of the day. The **Next** option selects the first day of the next month. The **Strict** option skips the day completely. This property is valid only when the `glide.schedules.repeat_nth` property is set to **Day**.

- Type: choice list
- Default value: last
- Location: System Property [sys_properties] table

glide.script.ccsi.ispublic

Provides privacy control over client-callable script includes that are accessed by public pages. If **false**, all client-callable script includes are private.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.script.log_level

Controls the behavior of gs.log. Set this property to **none** to disable Glide script logging, or to **print** to save log data to the file system instead of the database. Use the default value **all** to save all Glide script logs to the database.

- Type: string
- Default value: all
- Location: Add the property to the System Property [sys_properties] table.

glide.script_processor.admin

Specifies the user role necessary to access the Scripts - Background module. To require administrators to elevate privileges to access the module, set the value to **security_admin**.

- Type: string
- Default value: admin
- Location: Add the property to the System Property [sys_properties] table.

glide.script.vtable.log.debug

Enables use of debug logs for remote table script definitions. Set this property to **true**. Prolonged use of this property can affect performance, so it is best to set its value to **false** when you finish a debugging session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.search.suggestions.enabled

Set it to **true** (default) to enable search suggestions, or set it to **false** to disable search suggestions everywhere. For more information about search suggestions, see Enable search suggestions.

glide.secondary.query.sysid

Controls whether a secondary sort using sys_id as a sort key is automatically applied when sorting requested database records on a list. This property is useful when sorting records that have multiple records found for a single value of the primary sort key. Use this property to ensure that the **Next / Previous** buttons on forms display the proper record. If **false**, there is no secondary sort, therefore records with the same primary sort value are returned as they are found in the database and may be inconsistent.

Note:
Setting this property to **true** may impact the load and sort processes. It is not supported by the Elasticsearch document store plugin.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.security.auto.resubmit.ajax

Automatically resubmits timed-out Ajax requests.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.checkacl.before.setvalue

Controls how the high security setting glide.security.strict.updates processes ACLs. When **true**, the instance checks ACL rules for all columns before applying any updates to a row. When **false**, the instance applies ACL rules as each column is processed in alphabetical order. This behavior may result in one update preventing another update from occurring. For example, suppose that you create a custom ACL rule to prevent updates after a record is closed. If you attempt to close an incident and also add information to a custom resolution code field in the same update, the close action is applied first because it is controlled by the [incident.state] column and the custom field by the [incident.u_resolution_code] column. After the instance applies the close action, the custom ACL rule prevents further write updates to the row.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.csrf.handle.ajax.timeout

Handles errors for timed out Ajax requests.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.csrf.strict.validation.mode

Enforces strict validation on CSRF tokens so that users cannot resubmit a request if the CSRF token does not match.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: CSRF strict validation (instance security hardening)

glide.security.diag_txns_acl

Controls who can view the stats.do, threads.do, and replication.do pages. If **true**, only administrators or users from a known IP address are allowed to view the pages. If **false**, all users have access to the pages.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.
- Instance Security Hardening Settings: Performance monitoring (ACL) (instance security hardening)

glide.security.disable_ui_pages_sysparm_client_script

The system does not evaluate client scripts that are passed in URL parameters in UI pages. If you use URL parameters to load client scripts, you can add and disable this system property. Use this property only while you change the implementation to no longer depend on clients being passed in by URL parameters. Do not keep the system property disabled.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.mime_type.aliasset

Creates customized mime type alias sets. For example, `image/png=image/x-png`.

- Type: string
- Location: Add the property to the System Property [sys_properties] table.

glide.security.granular.create

Requires users to have write access on all individual fields on a table before they can create a record in that table.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.security.file.mime_type.validation

Enables (**true**) or disables (**false**) MIME type validation for file attachments.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Upload MIME type restriction (instance security hardening)

glide.security.strict_elevate_privilege

Forces all elevated roles to be treated equally for users with the administrator role. When enabled, administrators must explicitly, manually elevate themselves to any roles that are marked as elevated.

When disabled, administrators need only to manually elevate to the security_admin role. Other roles are automatically granted to administrators.

- Type: true | false
- Default value: **true** for new instances, **false** for upgraded instances
- Location: For new instances, this property is available on the System Property [sys_properties] table. For upgrades, Add the property to the System Property [sys_properties] table.

glide.service_portal.search_as_you_type_behavior

Select search suggestions (Suggestions) or type-ahead functionality (Typeahead). For more information about search suggestions, see Enable search suggestions.

glide.set_x_frame_options

Enables (**true**) or disables (**false**) the X-Frame-Options response header to SAMEORIGIN for all UI pages. The X-Frame-Options HTTP response header can be used to indicate whether a browser should be allowed to render a page in a <frame> or <iframe>. Set this property to **true** to avoid clickjacking attacks, by ensuring that CMS content cannot be embedded into other sites.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: X-Frame-Options: SAMEORIGIN (instance security hardening)

glide.short_poll_delay

(Chat plugin) Sets the short polling delay, in milliseconds, for XMPP requests. Polling is the method by which the browser gets information from the server to send instant messages in chat.

- Type: integer
- Default value: 1000 (1 second)
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.shortened_journal_length

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 512000
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.dateformat

Specifies the date format to use for outgoing email notifications

- Type: string
- Default value: date format [sys_user.date_format] listed in the user record of the email sender.
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.default_retry

Enables (**true**) or disables (**false**) resending email when an unknown SMTP error code is encountered. The instance recognizes only the SMTP error codes defined in the *glide.smtp.defer_retry_ids* property.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.smtp.defer_retry_ids

Specifies the comma-separated list of SMTP error codes that force the instance to resend email.

- Type: string
- Default value: 421,450,451,452
- Location: **System Properties** > **Email**

glide.smtp.fail_message_ids

Specifies the comma-separated list of SMTP error codes that prevent the instance from resending email.

- Type: string
- Default value: 500,501,502,503,504,550,551,552,553,554
- Location: **System Properties** > **Email**

glide.smtp.timeformat

Specifies the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record [sys_user.time_format].
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.allow_null_numeric_output

When **true**, SOAP XML responses return an empty element for numeric fields with no value. When **false**, numeric fields with no value return a value of 0 in the SOAP response.

Note:
The property `glide.wsdl.show_nillable` must be **true** to allow null values in SOAP responses.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.default_security_policy

Specifies the name of SOAP security policy the instance uses when enforcing Web Services Security (WSS) for inbound requests.

- Type: string
- Default value: default security policy
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.import_set_insert_serialized

Controls the processing of web service inserts. If **true**, the instance processes multiple simultaneous inserts one at a time (serially across nodes) to ensure an accurate transform. Serialized processing slows the speed at which the instance processes inserts. If **false**, multiple simultaneous inserts into an import set table result in simultaneous transforms that may produce duplicate target records due to the coalesce value being created at the same time.

Note:
Set this value to **false** only to optimize performance when the related transform map does not have a coalesce value that may be present simultaneously.

servicenow

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.request_processing_timeout

Sets the maximum number of seconds that a SOAP request has to finish processing before the connection times out. This property computes a default value from the value of the property `glide.http.timeout` divided by 1000. There might be network infrastructure (such as proxy servers) in place that implements a shorter timeout. In this case, a socket timeout may occur unless this property is set to a shorter value. In general, you should set this property to a value several seconds less than the shortest socket inactivity timeout in effect anywhere in the network path between the client application and the ServiceNow instance.

- Type: integer
- Default value: 175 (value of `glide.http.timeout` divided by 1000)
- Location: System Property [sys_properties] table

glide.source_control.checksum_required

This property allows you to enable optional checksum validations and sanitizations. When set to **true**, continues to throw an error if the checksum validation of application files fails. This action prevents application developers on your instance from importing application files from source control that have been modified outside of an instance.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.source_control.checksum_quick_install

When set to **true**, bypasses the sanitization step(s) if the checksum matches. This action prevents an application developer from waiting for validation/sanitization steps to be processed if application files linked to a source control repository outside of your instance weren't modified.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.source_control.default_branch_name

Sets the default GIT repository branch to work in for application files linked to source control.

- Type: string
- Default value: sn_instances/<instance_name>
- Location: System Property [sys_properties] table

glide.spell.dictionary.en

Sets the spell checker dictionary used in the system for English users. Dictionaries are available for Brazilian Portuguese (pb.dic), Czech (cs.dic), Dutch (nl.dic), English US (en.dic), English UK (en_uk.dic), Estonian (et.dic), Finnish (fi.dic), French (fr.dic),

servicenow

German (de.dic), Hebrew (he.dic), Hungarian (hu.dic), Italian (it.dic), Polish (pl.dic), Portuguese (pt.dic), Russian (ru.dic), Spanish (es.dic), and Thai (th.dic).

- Type: choice list
- Default value: en.dic (English US)
- Location: System Property [sys_properties] table

glide.spell.dictionary.max_matches

Specifies the maximum number of spelling errors that the spell-check should detect. By default, spell-check finds only 10 spelling errors. The instance ignores any additional errors after reaching the maximum value.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.sys.activity_using_audit_direct

[Not Supported] Controls whether the record's history is generated using the Audit table (**true**) or not (**false**).

[Required] Set the value to **false** to generate history with History Sets.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.audit_inserts

Specifies whether the Audit table audits inserts (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.date_format

System date format for all users unless overridden in the user record.

- Type: date format
- Default value: yyyy-MM-dd
- Location: **System Properties** > **Basic Configuration U116**

glide.sys.default.tz

System timezone for all users unless overridden in the user's record.

- Type: timezone
- Default Value: none
- Location: **System Properties** > **Basic Configuration UI16**

glide.sys.domain.domain_change_notify

Domain legacy

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.sys.domain.no_change_roles

Domain legacy

- Type: string
- Default value: This field should be left empty.
- Location: System Property [sys_properties] table

glide.sys.domain.use_record_domain

Domain legacy

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.sys.domain.use_record_domain_for_client_scripts

Domain legacy

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.time_format

System time format for all users unless overridden in the user's record.

- Type: time format
- Default Value: HH:mm:ss
- Location: **System Properties** > **Basic Configuration UI16**

glide.sys_reference_row_check

Specifies whether the script conditions of Access Control Rules apply to a table's reference fields (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

Note:
If the `glide.sys_reference_row_check` system property is not present, or has been set to false, script conditions for Access Control Rules are not applied. This means an ACL containing scripted conditions will pass it's check as long as the other ACL criteria are met (such as role requirements).

glide.template.max_context

Specifies the maximum number of templates displayed in a form's context menu. If more than this number are available, users can click **Apply Template** on the context menu to open the reference list of templates.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.transform.reuse_coalesce_field_value

If **true**, avoid re-evaluation of coalesce scripts to get the values.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ts.index.attachment.debug

If **true**, enables log messages for exceptions that occur when indexing attachments. You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ts.index.attachment.list_terms.debug

If **true**, the system logs all indexed terms when an attachment is indexed.

For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ts.reindex.sys_metadata.after.upgrade

If **true**, the system automatically reindexes the sys_metadata table after an upgrade, without noticeable performance impact. To disable automatic reindexing, set the value to **false**.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.displayname

Specifies whether the activity formatter shows **name** values (true) or **user_name** values (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.email_roles

Specifies the list of roles (comma-separated) that can view email in the Activity Formatter.

- Type: string
- Default value: itil
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.email.use_display

Specifies whether to display the email address or the user IDs (display value of the User table) in email headers (**true**) or not (**false**). If **true**, the instance searches for a user record with a matching email address. If the instance cannot find a matching user record, it displays the email address.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.form_button

Removes the activity stream button from forms.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.list_button

Removes the activity stream button from lists.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.page_size

Size of pages for Core UI form activity stream. A value of `0` means no paging.

- Type: integer
- Default value: 0
- Location: Still appears in the System Properties [sys_properties] table, but is no longer available.

glide.ui.activity_stream.scale_animated_gifs

Creates a thumbnail of animated `.gif` files. The maximum dimensions are 525 px width and 350 px height. The animation is not preserved in the thumbnail, but previewing the image displays the animation at its original size.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.activity_stream.scale_images

Creates a thumbnail of large images to display in the activity stream. The maximum dimensions are 525 pixels wide and 350 pixels high. If the user clicks the image or attachment, the preview is at full size.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.comments

Changes the color of the left bar in activity stream comments in Core UI.

- Type: color entry, either a name, such as **blue** or a code, such as **#0000FF**.
- Default value: transparent
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.work_notes

Changes the color of the left bar in activity stream work notes in Core UI.

- Type: color entry, either a name, such as **blue** or a code, such as **#0000FF**.
- Default value: gold
- Location: System Property [sys_properties] table

glide.ui.activity.style.comments

Changes the background color of the activity stream comments in UI15.

- Type: string
- Default value: background-color: background-color: WhiteSmoke
- Location: System Property [sys_properties] table

glide.ui.activity.style.work_notes

Changes the background color of the activity stream work notes in UI15.

- Type: string
- Default value: background-color: LightGoldenRodYellow
- Location: System Property [sys_properties] table

glide.ui.allow.field.dependency.for.templates

Checks dependency for choice fields at the time of applying template, preventing invalid values to be set to the dependent field. For example, a subcategory field which depends on category field.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.allow_deep_html_validation

Allows administrators to prevent users from saving invalid HTML in a journal field.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.attachment.force_download_all_mime_types

Forces download of all MIME attachment files.

- Type: true | false
- Default value: true for new instances, false for upgraded instances
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Force Download MIME types (instance security hardening)

glide.ui.audit_deleted_tables

Comma-separated list of system tables for which the audit history tracks deletions.

- Type: string
- Default value: sys_user, sys_user_group, sys_user_role, sys_user_has_role, sys_user_grmember, sys_group_has_role, sys_security_acl_role
- Location: System Property [sys_properties] table

glide.ui.auto.recovery

Allows users to recover unsaved changes while working in the Studio.

- Type: true | false
- Default value: true
- Location: **Auto Recovery** > **Properties**

glide.ui.auto.recovery.exclude.field.types

Comma-separated list of field types to exclude from automatic recovery.

- Type: string
- Default value: none
- Location: **Auto Recovery** > **Properties**

glide.ui.auto.recovery.unsupported.field.types

Comma-separated list of field types no supported for automatic recovery.

- Type: string
- Default value: password,password2,glide_encrypted,video,user_image,image

glide.ui.auto.recovery.unsupported.tables

Comma-separated list of tables to exclude from automatic recovery.

- Type: string
- Default value: v_ws_editor
- Location: **Auto Recovery** > **Properties**

glide.ui.auto_req.extend.session

If **true**, enables the user to extend their user session by selecting a homepage refresh time. If **false**, it enforces session timeout. The session timeout value is ignored when the user specifies an automatic refresh value.

For example, if the user selects **5 minutes** for automatic homepage refresh, the session is renewed every five minutes. By adding this property and setting the value to **false**, administrators can force the user session to time out even if the user page refreshes every **x** number of minutes. The user session times out after the value specified in the session timeout, plus the selected refresh value. This property takes

effect when the **Remember me** check box is not selected for the user. Tablet and mobile devices do not support this feature.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.breadcrumb_max_entries

Specifies how many choices will be shown in the condition builder breadcrumb.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.buttons_bottom

Controls whether UI actions appear at both the bottom and top of the form (**true**) or only at the top (**false**). This property only works in a deprecated version of the UI.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.cert_task_activity.fields

Defines which journal field is the task activity field.

- Type: string
- Default value: work_notes
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.bar.horiz.max_col_slant_labels

Sets the maximum number of columns in a horizontal bar chart before slanting (angling) the labels.

- Type: integer
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.height

Specifies the height of a chart in pixels.

- Type: integer
- Default value: 300
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.pie.labels

Enables (**true**) or disables (**false**) labels on pie chart slices.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.pie.labels.max_items

Sets the maximum number of pie chart slice values that can be returned to display their labels.

- Type: integer
- Default value: 8
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.clickthrough.popup

- For reference fields, enables (**true**) or disables (**false**) display of the pop-up diamond icon for reference fields, and opening a new window when clicking the icon.
- For document ID fields, enables (**true**) or disables (**false**) displaying the information icon and opening a pop-up window with the document's form. To learn more Document ID field.

> **Note:**
> Related lists do not appear on forms opened in the pop-up window.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.clickthrough.replace

Enables (**true**) or disables (**false**) both the pop-up and click-through icons for reference fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.date_format.first_day_of_week

Specifies which day of the week that weeks start on for calendar reports (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

glide.ui.date_picker.first_day_of_week

Specifies the first (leftmost) day of the week for the date and date/time picker (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

glide.ui.default.applications

Comma-separated list of application names that open by default in the navigation pane when nothing is opened via user preferences. If the property is specified and

is blank, no applications are opened in the navigation pane when no applications are opened via user preferences. If the property is not specified, the first application that is authorized for the user opens if no applications are opened via user preferences.

- Type: string
- Default value: first authorized application for the user
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.dirty_form_support

Enables (**true**) or disables (**false**) display of a confirmation message when a form has unsaved changes and the user leaves the form through any means except a submit (such as using the green back arrow, any form button, or other). This property is not supported in Safari.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.encode_module_uri

Enables (**true**, the default) or disables (**false**) encoding of module URIs in the navigation pane. For information about how ServiceNow encodes module URIs, see Encoding module URIs.

glide.ui.escape_form_message

Specifies whether strings in `GlideForm` functions are sanitized to remove unwanted code (true) or not (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.escape_gwindow_message

Specifies whether strings in `GlideWindow` functions are sanitized to remove unwanted code (true) or not (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.export.choice_list_max_characters

Sets the maximum number of characters that will be included from a condition field type in an export to Microsoft Excel, as well as the maximum number of characters displayed in the list view condition builder in Core UI. (Note: This property has no effect on the length of condition field values in tables.)

- Type: integer
- Default value: 80
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.filter.first_day_of_week

Identifies the first day of the calendar week for the company. By default, the start of the week is Monday, meaning that the calendar week begins with

Monday and ends with Sunday. To change this behavior, add the property `glide.ui.filter.first_day_of_week` to the instance as an integer property. Set the value to the integer corresponding with the day of the week that the calendar begins on, where 1 is Sunday, 2 is Monday, and so on. The function impacts all charts and calculations where the day of the week is used as a parameter.

- Type: integer
- Default value: 2
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.first.field.reference

Enables (**true**) or disables (**false**) having the first column in a list always link to the underlying record, even if it is a reference field. For example, if the first column on an Incident list is **Assigned to**, that value links to the Incident if this property is set to **true**.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.form_annotations

Enables (**true**) or disables (**false**) form annotations, which allow you to add Custom, Section Separator, and Line Separator to a form.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.form_multiple_splits

Enables (**true**) or disables (**false**) multiple splits and end splits in the form layout configuration slushbucket.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.gauge.view

Defines which view you want to be the default for homepage gauges.

- Type: string
- Default value: portal
- Location: System Property [sys_properties] table

glide.ui.glide_list.start.locked

Controls whether a glide_list (like the watch list) starts out locked (**true**) or unlocked (**false**) on a form.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.goto_use_contains

Controls whether the **Go to** navigation performs a "contains" query (**true**) or a "greater than" query (**false**) by default.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.homepage.parallel

Enables (**true**) or disables (**false**) use of parallel rendering.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

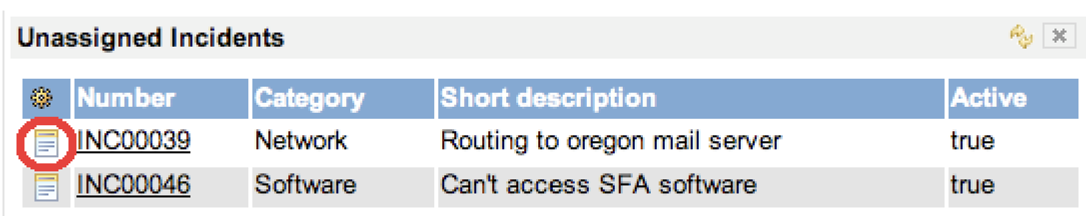
glide.ui.homepage.parallelism

Sets the maximum number of threads that should cooperate on rendering any given homepage.

- Type: integer
- Default value: 2
- Location: System Property [sys_properties] table

glide.ui.homepage.preview

Enables (**true**) or disables (**false**) displaying the preview icon for lists on the homepage.



- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.html.editor

Specifies which HTML field editor to use, TinyMCE or htmlArea (legacy).

- Type: string
- Default value: tinymce
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.default_target_link

Enables you to set a default target value for links in the TinyMCE.

- Type: string
- p

- Default value: ''
- Location: System Property [sys_properties] table

glide.ui.html.editor.extended_valid_elements

Defines which elements remain in the TinyMCE text when the editor saves. This functionality can be useful to add or override specific elements that should be kept.

- Type: string
- Default value: blank
- Location: System property [sys_properties] table

glide.ui.html.editor.toolbar.line1

Configures the editing toolbar (first line) for HTML fields when TinyMCE is enabled. The **spellchecker** tool is not supported in Core UI or UI15.

- Type: string
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.toolbar.line2

Configures the editing toolbar (second line) for HTML fields when TinyMCE is enabled. The **spellchecker** tool is not supported in Core UI or UI15.

- Type: string
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.v4.paste.html_import

Controls how content being pasted from sources other than Microsoft Word is filtered. This includes content copied from TinyMCE itself.

- Type: choice list
- Default value: clean
- Location: System Property [sys_properties] table

glide.ui.html.image.allow_url

Enables (**true**) or disables (**false**) uploading an image via URL from HTML Fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.html.editor.remove_trailing_brs

Specifies whether an empty line containing a `<br>` tag is converted to a `<div> </div>` tag for TinyMCE HTML fields. If **true**, the tag is converted. If **false**, the tag is left as `<br>`.

- Type: true | false
- Default value: true
- Location: **System Properties** > **UI Properties**

glide.ui.html.toolbar

Configures the editing toolbar for HTML fields.

- Type: string
- Default value: list of buttons
- Location: **System Properties** > **UI Properties**

glide.ui.incident_activity.fields

Defines what fields are visible in the activity formatter. If the activities are customized, the system updates this property automatically.

- Type: string
- Default value: list of fields
- Location: **System Properties** > **UI Properties**

glide.ui.incident_activity.max_addresses

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.incident_alert_activity.fields

Incident communication plan activity formatter fields — the list of fields tracked from the Incident Communication Plan form in the activity formatter.

- Type: string
- Default value: opened_by, work_notes, comments, severity, estd_distruption_time, actual_disruption_time
- Location: System Property [sys_properties] table

glide.ui.journal.use_html

Specifies whether TinyMCE is available for journal fields (**true**) or not (**false**).

- Type: true | false
- Default value: false

glide.ui.js_error_notify

Displays client script errors to users with the **client_script_admin** role. Also displays a generic error message to other users who encounter a client script error.

- Type: true | false
- Default value: true
- Location: **System Properties** > **All Properties**

glide.ui.label.enable

Enables (**true**) or disables (**false**) using labels, such as Most Active, Most Recent, or user-created.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.m.clear_pasteboard_when_backgrounded

Clears the copy/paste clipboard when the application enters the background.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table. In Categories, add the mobile_post_auth category.

glide.ui.max_calendar_duration

Maximum number of days that a single calendar report entry can display.

- Type: integer
- Default value: 90
- Range of possible values: 90 to 400
- Location: System Property [sys_properties] table

glide.ui.max_calendar_records

Maximum number of records saved in a calendar report.

- Type: integer
- Default value if the property is not configured: 10,000
- Location: System Property [sys_properties] table

glide.ui.m_agents

Comma-separated list of browser agents considered as mobile browsers for the Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

- Type: string
- Default value: iphone,android_phone,IEMobile,Windows Phone,iPod,Windows CE,BlackBerry,BB10
- Location: System Property [sys_properties] table

glide.ui.max_ref_dropdown

Maximum number of records for a reference field that is displayed as a choice list. If the number of available records is greater than this value, the field appears as a reference field, not as a choice list.

- Type: integer
- Default value: 25
- Location: System Property [sys_properties] table

glide.ui.mentions.default_limit

Number of users with same name displayed in Activity Stream Compose editor. When set to true, the default limit takes in a number which determines how many users with the same name are displayed.

- Type: string
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.mobile_agents

Comma-separated list of browser agents considered as mobile browsers for the Legacy Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

- Type: string
- Default value: iPod,Windows CE,BlackBerry,Android,Opera Mini,IEMobile,Windows Phone,iphone
- Location: System Property [sys_properties] table

glide.ui.nav.stripe.select.maxchars

Numerical character limit for list menu choices within the nav stripe. The nav stripe appears at the top of the page when using UI11.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.polaris.experience

Enables the Next Experience user interface, landing page, and Unified Navigation. For more information, see Next Experience UI.

This property does not affect anything in workspaces, such as Platform Analytics Components. Workspaces, UI Builder, and related features are always enabled.

- Type: true | false
- Default value: true on new instances, false on upgrades from Tokyo or earlier.
- Location: The System Property [sys_properties] table

glide.ui.polaris.global_search

Toggles the Next Experience search function.

- Type: true | false
- Default value: true when `glide.ui.polaris.experience` is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.history.url.param_blocklist

URL parameters that are excluded when the system identifies and clears duplicate URLs from the history. This property applies only to the Next Experience Unified Navigation, which is enabled when `glide.ui.polaris.experience` is true.

- Type: string
- Default value: ["tinyId"]
- Location: The System Property [sys_properties] table

glide.ui.polaris.list_style.enable_highlighted_value_style

Enables highlighted value style on list cells. This property applies only when `glide.ui.polaris.experience` is true.

- Type: true | false
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.login.show_illustrations

Enables display of illustrative graphics on the stylized login page. This property applies only when *glide.ui.polaris.experience* is true.

- Type: string
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.menus

Toggles the Unified Navigation menus in the header. This property applies only when *glide.ui.polaris.experience* is true, meaning that Next Experience Unified Navigation is enabled.

- Type: true | false
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.reference.readonly.clickthrough

Enables (**true**) or disables (**false**) reference pop-ups on read-only reference fields. Reference pop-ups and click-throughs are hidden by default if a client script, UI policy, or ACL makes the field read-only. Being able to see or click through to the target record is unrelated to the reference field being writable.

If **false**, the administrator can override the system setting for a specific field by adding the *readonly_clickthrough=true* attribute to the dictionary entry.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

glide.ui.remember_view

Enables (**true**) or disables (**false**) use of user preferences for the last view.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.remember.me.default

Controls whether the **Remember me** check box is selected (**true**) or cleared (**false**) by default.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.report.extend_calendar_choices

Controls which field styles are applied during calendar highlighting. If **false**, field styles in only the Task table are used. If **true**, the calendar first uses field styles from the table that the report is based on. If no applicable styles exist in that table, the calendar uses field styles from the Task table.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.report.old_report_builder

Enables (**true**) or disables (**false**) use of the old report builder UI.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.section508

Enables (**true**) or disables (**false**) rendering of alternate text in place of images.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

glide.ui.show_live_feed_activity

Enables (**true**) or disables (**false**) live feed for a record in the activity formatter.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

glide.ui.show_template_bar

Controls whether the template bar can be displayed on the specified table. For example: `glide.ui.show_template_bar.incident = false`.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.session_timeleft

Sets how much time, in minutes, users have to extend a session before it times out due to inactivity.

- Type: integer
- Default value: 2
- Location: System Property [sys_properties] table

glide.ui.active.session.life_span

Sets the maximum session time for sessions regardless of activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.ui.session_timeout

Sets the inactive session timeout, in minutes.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.ui.stream_icon

Toggles the displaying of the activity stream button on the specified table. For example: `glide.ui.stream_icon.hr_case = true`.

- Type: true | false
- Default value: false

glide.ui.syntax_editor.context_menu

Enables disables the context menu in script editor.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.syntax_editor.linter.eslint_config

Defines linting configurations using the ESLint utility.

- Type: string
- Default value: All recommended ESLint rules are enabled, except no-undef, no-unused-vars, no-empty, and semi.
- Location: System Property [sys_properties] table

glide.ui.table.labels

Controls whether the system uses verbose labels for table names (**true**) or literal table names (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.tablet_enabled

Enables (**true**) or disables (**false**) the tablet UI.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet_agents

Uses the tablet UI if one of the specified strings (comma-separated) appears in the browser user_agent header.

- Type: string
- Default value: ipad,android_tablet
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet.title

Displays the specified text as a brief page title for tablet UI.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet.title.ios_webapp

Displays the specified text as the default home screen icon label used in iOS version 6 and later.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.task.insert

Enables (**true**) or disables (**false**) the use of **Insert** and **Insert and Stay** options on tables derived from Task (such as Incident, Change, and Problem).

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.textarea.character_counter

When **true**, displays a count of available characters for journal and multi-line text fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.textarea_initial_rows

Sets the number of rows initially displayed for multiline form elements. When the element is selected for editing, it is expanded. Set this value to 0 or blank to ignore this property. This functionality is used to conserve space on a form when multiline elements take up too much space.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.ui.update_on_iterate

Controls whether updates are saved (**true**) or discarded (**false**) when a user clicks the blue arrows on a form.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.ui_policy_debug

Enables (**true**) or disables (**false**) logging of UI policy processing in the JavaScript debug window

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.user_cookie.life_span_in_days

Sets the expiration time period for the 'remember me' cookie.

> **Note:**
> When a user accesses an instance with 'remember me' enabled, the access resets the cookie expiration period until the maximum (glide.ui.user_cookie.max_life_span_in_days) life span limit is reached.

- Type: integer
- Default value: 15 (days)

  > **Note:**
  > Maximum value 30.

- Location: System Property [sys_properties] table

glide.ui.user_cookie.max_life_span_in_days

Sets a maximum cap for the `glide.ui.user_cookie.life_span_in_days` cookie to expire before forcing a user to re-authenticate into the instance.

- Type: integer
- Default value: 30 (days)

  > **Note:**
  > Maximum value 365 days.

- Location: System Property [sys_properties] table

glide.ui.welcome.profile_link

Enables (**true**) or disables (**false**) allowing users to click their name in the welcome message and see their user profile.

- Type: true | false
- Default value: In new instances **true**. In existing instances **false**.
- Location: System Property [sys_properties] table

glide.ui11.show_switch_link

This property only affects a deprecated version of the UI. It is no longer supported. Displays (**true**) or hides (**false**) a banner link for switching between the UI11 and legacy interfaces.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.update.suppress_update_version

Comma-separated list of tables for which updates are not tracked in the Versions [sys_update_version] table. You cannot compare and revert versions for tables in this list.

- Type: string
- Default value: sys_user,sys_import_set_row
- Location: Add the property to the System Property [sys_properties] table.

glide.user.default_password

Default password for new users created from incoming email. Users must reset the password at first login.

- Type: string
- Default value: password
- Location: **System Properties** > **Email**
- Instance Security Hardening Settings: Configure passwords for automatically created user accounts

glide.userauthgate.extauth.check

Enables (**true**) or disables (**false**) the *UserAuthenticationGate* checks for both external and internal authentication mechanisms.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.user.trusted_domain

Comma-separated list of trusted domains for which the instance automatically creates a guest user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a "guest user" but does not create a guest user in the instance.

- Type: string
- Default value: *
- Location: **System Properties** > **Email**

glide.workflow.model.cache.max

Maximum number of models held in the workflow cache. You must restart the instance after changing this property to apply the change.

- Type: integer
- Default value: 300
- Location: **Workflow** > **Properties**

glide.wsdl.definition.use_unique_namespace

Enables (**true**) or disables (**false**) use of a unique WSDL namespace value when publishing a ServiceNow table through web services. If **true**, the WSDL target namespace is www.service-now.com/<table name>.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.wsdl.maximum_hierarchy

Maximum number of hierarchical levels returned in a WSDL when hierarchical SOAP web service is enabled. This property has a maximum value of 3.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

glide.wsdl.show_nillable

Enables (**true**) or disables (**false**) allowing a WSDL element to be valid if it has no element content despite a {content type} which would otherwise require content.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ws.use_row_lock

If **true**, avoid using the current web service lock that applies before running the transform. Use the row lock that applies after the OnStart method.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.xmlhttp.excessive

Sets the number of items visible in the Available half of a many-to-many or one-to-many collection box.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.xmlprocessor.use_unload_format

Enables (true) or disables (false) unloading the XML using the display_value format. To unload using this format, add the parameter `useUnloadFormat=true` to the request URL.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

google.maps.auto_close

If **true**, automatically closes the current info window before opening a new one. Clear the check box to enable multiple pop-up windows to remain open at once.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Google Maps**

google.maps.client

Client ID for Google Maps API for Business. This client ID authorizes production use of Google Maps API for Business. By default, this ID is provided by ServiceNow. ServiceNow may require you to purchase a separate Client ID based on your usage.

- Type: string
- Default value: gme-servicenow
- Location: **System Properties** > **Google Maps**

google.maps.key

Map key from Google, tied to the URL of the server. This key is the private key authorizing development use of Google Maps.

- Type: string
- Default value: empty
- Location: **System Properties** > **Google Maps**

google.maps.latitude

Starting latitude of the map. This value determines the starting latitude displayed in Google Maps.

- Type: string
- Default value: 36.008522
- Location: **System Properties** > **Google Maps**

google.maps.longitude

Starting longitude of the map. This value determines the starting longitude displayed in Google Maps.

- Type: string
- Default value: -95.221764
- Location: **System Properties** > **Google Maps**

google.maps.max_items

Maximum number of items to display on the map. This setting determines how many icons can be displayed on a map.

- Type: integer
- Default value: 500
- Location: **System Properties** > **Google Maps**

google.maps.table

Table used by the map. This setting names the table containing the name, longitude, and latitude fields.

- Type: string
- Default value: cmn_location
- Location: **System Properties** > **Google Maps**

google.maps.zoom

Starting zoom level of the map (1 is the lowest).

- Type: integer
- Default value: 4
- Location: **System Properties** > **Google Maps**

help.base.default

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **false** and an absolute URL is not specified.

- Type: string
- Default value: http://servicenow.com/docs/?context=
- Location: System Property [sys_properties] table

help.base.servicenow

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **true**

- Type: string
- Default value: http://servicenow.com/docs/?context=
- Location: System Property [sys_properties] table

mid.server.rba_debug_powershell

Enables probe-level debugging for PowerShell probes. With this property enabled, PowerShell probes write detailed activity information to the MID Server log.

- Type: true | false
- Default value: false
- Location: **Orchestration** > **MID Server Properties**

mid.version.override

Sets an override condition for the current version for all MID Servers in your environment. For more information on version control, see MID Server version control properties.

- Type: string
- Default value: none (If this property is left empty, the MID Servers get their version information from the mid.buildstamp property.)
- Location: Add the property to the System Property [sys_properties] table.

par_vis_config.data_source.can_select_indicator

Specifies roles (comma-separated) which can select indicators as data sources from the Data Visualization configuration panel. If empty, all users can select the indicator sources that they have access to.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

par_vis_config.live_refresh_rate_min_value

Specifies the minimum interval in seconds for the **Live refresh rate** setting in the Data Visualization configuration. If set, a user can still set an empty or 0 value.

- Type: integer
- Default value: 30 (seconds)
- Location: System Property [sys_properties] table

par_viz.table_data_max_data_points

Maximum number of data points for data visualization charts based on table sources.

- Type: integer
- Default value: 10000
- Location: System Property [sys_properties] table

par_viz.table_data_max_groups

Maximum number of groups to be displayed for data visualization charts based on table sources.

- Type: integer
- Default value: 50
- Location: System Property [sys_properties] table

password_reset.activity_monitor.incident_threshold

Specifies the maximum number of lockouts before an alert is issued.

- Type: integer
- Default value: 10 (lockouts)
- Location: System Property [sys_properties] table

password_reset.activity_monitor.incident_window

Specifies the amount of time that is used for recording and counting the number of user lockouts.

- Type: integer
- Default value: 60 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.captcha.ignore

Enables and disables CAPTCHA functionality.

The password reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the `password_reset.captcha.google.enabled` system property to `false`.

- Type: true | false
- Default value: false
- Location: **Password Reset** > **Properties**

password_reset.qa.num_enroll

Specifies the number of questions a user must select and answer to be enrolled in the password reset program.

Note:
This security question property can be overridden by adding a value for the *num_enroll* parameter in a security question verification.

- Type: integer
- Default value: 5 (questions)
- Location: **Password Reset** > **Properties**

password_reset.qa.num_reset

Specifies the number of questions a user must answer to verify their identity during the password reset process.

Note:
This security question property can be overridden by adding a value for the *num_reset* parameter in a security question verification.

- Type: integer
- Default value: 3 (questions)
- Possible values: integers that are less than the number specified for the *num_enroll* property.
- Location: **Password Reset** > **Properties**

password_reset.request.max_attempt

Specifies the number of password reset attempts a user has before they are locked out for a period determined by the value in *max_attempt_window*.

- Type: integer
- Default value: 3 (attempts)
- Location: **Password Reset** > Properties

password_reset.request.max_attempt_window

Specifies how long a user is locked out or prevented from changing their password after trying the maximum number of times.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.request.retry_window

Specifies the length of time before the count for password reset attempts refreshes.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.request.success_window

Specifies how long a user is locked out after they have successfully reset their password.

- Type: integer
- Default value: 10 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.sms.default_complexity

Specifies the number of characters in the SMS code that are required for a user to reset their password.

Note:
This SMS code property can be overridden by adding a value for the complexity parameter in an SMS code verification.

- Type: integer
- Default value: 4 (digits)
- Location: **Password Reset** > **Properties**

password_reset.sms.expiry

Specifies the amount of time, in minutes, until the SMS code sent to the user expires.

Note:
This SMS code property can be overridden by adding a value for the expiry parameter in an SMS code verification.

- Type: integer
- Default value: 5 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.sms.max_per_day

Specifies the maximum number of SMS codes that are sent to a user within one 24-hour period. When a user clicks the **Send Verification Code** button, the 24-hour period begins.

Note:
This SMS code property can be overridden by adding a value for the `max_per_day` parameter in an SMS code verification.

- Type: integer
- Default value: 10 (per day)
- Location: **Password Reset** > **Properties**

password_reset.sms.pause_window

Specifies the amount of time to pass before another SMS code can be sent to a user.

> **Note:**
> This SMS code property can be overridden by adding a value for the *pause_window* parameter in an SMS code verification.

- Type: integer
- Default value: 2 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.wf.refresh_rate

Specifies how often to check the status of the workflow. Represented in the password reset process progress bar.

- Type: integer
- Default value: 90000 (milliseconds)
- Location: **Password Reset** > **Properties**

password_reset.wf.timeout

Specifies the maximum wait time, in milliseconds, for the workflow to execute. The workflow is triggered during the password reset request when the user clicks **Submit**.

- Type: integer
- Default value: 500 (milliseconds)
- Location: **Password Reset** > **Properties**

promin.show_records.limit

Specifies the maximum number of records that can be returned for an arc or node for the **Show Records** link to display. If more records are returned than the set limit, the link does not display.

- Type: integer
- Default value: 100,000 (records)
- Location: Add the property to the System Property [sys_properties] table.

remember_me.max_duration_in_days

Sets a maximum cap for the *remember_me_cookie.duration_in_days* cookie to expire before forcing a user to reauthenticate into the instance.

- Type: integer
- Default value: 30 (days)

  > **Note:**
  > Maximum value 365 days.

- Location: System Property [sys_properties] table

remember_me_cookie.duration_in_days

Sets the default expiration for the "remember me" cookie. When a user logs in with "remember me" enabled, each login within the expiration limit resets the expiration period.

- Type: integer
- Default value: 15 (days)

Note:
Maximum value 30 days.

- Location: System Property [sys_properties] table

sam.install_deletion_deadline

Defines the number of days after which a software install is deleted if not discovered with the configuration item. Use a value that is greater than the number of days between consecutive Discovery runs.

- Type: integer
- Default value: 7
- Location: System Property [sys_properties] table

security.list.internal.domains

Other domains (excluding the ones in the comma-separated list in this property) are classified as external email domains. The counts of incoming emails from these external domains display in the External Incoming Emails metric in the Instance Security Center.

- Type: choice string
- Default value: None
- Other possible values: Comma-separated list of all internal email domains in the organization.
- Location: System Property [sys_properties] table

sn_acc_vis_content.set_assigned_to

Determines if Assigned To attribute is overridden by ACC-V or not.

- Type: Boolean
- Default value: false

sn_acc_vis_content.assigned_to_user_order

Defines the source of Assigned To user and its priority for ACC-V. The order of the username sources defined is used to define the priority based on which the Assigned To user is set for a computer CI. For example, computer_system_username, logged_in_users. These two different sources decide which user name derived from which source takes preference in deciding the attribute Assigned To for a computer CI.

computer_system_username: The source is derived from the native command for Windows machine wmic computersystem get user username.

Logged_in_users: Source is OsQuery which gets logged in users from the OsQuery table.

- Type: choice string
- Default value: computer_system_username, logged_in_users

sn_acc_vis_content.persist_os_user_type

Persists the type of users that you are interested in for ACC-V.

- Type: Comma separated parameter
- Default value: local,system

sn_agent.disco_minimum_threshold_for_rediscovery_minutes

The minimum number of minutes since the last Enhanced Discovery on a given IP before a rediscovery can be triggered. This helps to prevent too frequent Enhanced Discovery in cases where a network intermittently has a break or a laptop is rebooted repeatedly.

- Type: Integer
- Default value: 60

sn_agent.disco_disable_ci_clobber_of_agentless_disco

If true, checks whether CI already exists discovered with matching criteria (discovery_source=ServiceNow) and instead of re-discovering, links the agent record to existing CI.

- Type: Boolean
- Default value: true

sn_agent.disco_ci_clobber_of_agentless_disco_threshold_days

The maximum number of days since an existing CI has been discovered using Agent-less Discovery where the existing CI links instead of re-discovering it using the Agent.#This takes effect when disco_disable_ci_clobber_of_agentless_disco is true and it has been an extended period of time (over 14 days, by default) since a non-ACC discovery_source (like ServiceNow) has discovered the CI. Once this threshold is exceeded, Enhanced Discovery is allowed to execute and clobber an existing CI regardless of whether a CI has been previously discovered by a non-ACC discovery_source. This enables the most recent discovered data to be present in the CMDB.

- Type: Integer
- Default value: 14

sn_agent.host_data_collection.disable_when_container

If true, when host data collection occurs and it is found that the Agent Client Collector is running in a container, the incoming data will not be processed and the host data collection status will be set to disabled.

- Type: Boolean
- Default value: true

sn_acc_vis_content.persist_sam_usage_metrics

Enable to leverage the SAM Basic metering functionality. If this flag is set to True, after fetching details about all the software installed, including the last accessed time via osquery, the information goes into the Software Usage [samp_sw_usage] table. The SAM plugin also needs to be enabled to persist the information.

- Type: Boolean
- Default value: true

sn_app_insights.minutes_between_triggers

How many minutes to wait before sending out a notification for an identical metric trigger.

- Type: Integer
- Default value: 30

sn_app_insights.p1_predict_factor.semaphores

The normalizing factor for data for the semaphores metric in the p1 prediction model.

- Type: Integer
- Default value: 21

sn_app_insights.p1_predict_factor.sys_load

The normalizing factor for data for the sys_load metric in the p1 prediction model.

- Type: Integer
- Default value: 923

sn_app_insights.p1_predict_max_cooldown

The number of consecutive "no p1 predicted" minutes required to exit the p1 alert state.

- Type: String
- Default value: 5

sn_app_insights.p1_predict_threshold

The minimum confidence required for the p1 predict model to predict a p1 alert state.

- Type: Integer
- Default value: 90

sn_bm_client.dashboard_display_unit

Time unit to use for KPI values on the Benchmarks dashboard. Options are **Hours** or **Days**.

- Type: choice list
- Default value: Days
- Location: System Property [sys_properties] table

sn_chg_soc.change_soc_initial_limit

Defines the number of change_request records to display on load of the Change Schedule.

- Type: Integer
- Default value: 40
- Location: System Property [sys_properties] table

sn_chg_soc.change_soc_scroll_load_limit

Defines the number of change_request records to display as the Change Schedule is scrolled.

- Type: Integer
- Default value: 20
- Location: System Property [sys_properties] table

sn_chg_soc.change_soc_total_limit

Defines the total number of change_request records that can be displayed on a Change Schedule.

- Type: Integer
- Default value: 1000
- Location: System Property [sys_properties] table

sn_chg_soc.landing_page.pinned_notification

Shows a message for pin or unpin a change schedule.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

sn_chg_soc.schedule_window_days

Specifies the number of days to be factored before and after the respective start/end of a change_request record when displaying blackout and maintenance window spans on the Change Schedule page.

- Type: Integer
- Default value: 30
- Location: System Property [sys_properties] table

sn_disco_cd.scheduled_job_time_out_in_mins

This property sets the value for the maximum run time of the scheduled job for Cloud Resources in minutes.

- Type: integer
- Default value: 120

sn_disco_certmgmt.cert_task_default_approval_group

This property is used to set default Approval Group name for Certificate Inventory and Management for manual approval processes for requesting new, renewing, or revoking certificates for automated workflows only. You can add more than one approval group, separated by commas. The task chooses the current domain group first and then the global domain group. If no group is found, the task will fail.

- Type: string
- Default value: none

sn_disco_certmgmt.default_cert_order_validity_period

This property is used to set the validity period of the certificate order being placed in Certificate Inventory and Management.

- Type: integer
- Default value: 1000 days

sn_disco_certmgmt.default_cert_task_priority

This property is used to configure New and Renew task priorities in Certificate Inventory and Management. Accepts values 1, 2, 3, 4, 5. If any invalid value (<1 || >5 || other strings) is provided, the value reverts to P3.

- Type: integer
- Default value: 3 (if property doesn't exist)

sn_disco_certmgmt.default_revoke_cert_task_priority

This property is used to configure Revoke task priorities in Certificate Inventory and Management. Accepts values 1, 2, 3, 4, 5. If any invalid value (<1 || >5 || other strings) is provided, the value reverts to P1.

- Type: integer
- Default value: 1 (if property doesn't exist)

sn_generative_ai.disable_dynamic_translation

Disables Dynamic Translation for large language model (LLM) conversations in Virtual Agent.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

sn_global_searchui.hide_results_count

Hides (**true**) or displays (**false**) the number of matching records for search groups and tables on the Global search page.

To modify this property, select **Enhanced Global Search UI** from the application picker before opening the System Properties table.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

sn_nowassist_va.com.glide.cs.gen_ai.enable_mid_topic_ai_search_conversational_catalogs

In Mid Topic Discovery AI Search results, change the value to true to show catalog results. By default, these Mid Topic AI Search results only show knowledge base results.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

sn_nowassist_va.synthesized_autostart_items

When synthesized response only returns a singular action, configure whether to automatically launch the action. By default, only Virtual Agent topics automatically

launch. You can configure this for whenever synthesized response returns a single conversational catalog item, a single Virtual Agent topic along with Knowledge Base information, or a single conversational catalog item along with Knowledge Base information.

- Type: string
- Default value: topic
- Location: System Property [sys_properties] table

subscription.custom_table.enforce_entitlement

You can enable guardrails around custom tables when using certain applications, such as Mobile Studio, in a production or non-production environment.

When set to **true**, the property limits the list of custom tables available in applications such as Mobile Studio to those you are entitled to use, based on the active subscriptions present on your instance. If you want to remove these guardrails, setting the property to **false** enables you to access to all custom tables, regardless of your active subscription entitlements.

- Type: Boolean
- Default value:
- Location: System Property [sys_properties] table

Note:
Setting this property to **false** enables you to use applications with custom tables that may not be entitled. See the service description for your active subscriptions to determine which custom tables (if any) you are entitled to use with selected applications.

sys_par_insights_enabled

Enables the Proactive Analytics feature.

- Type: true/false (Boolean)
- Default value: true
- Location: To change the value, create this property in the System Properties table.
- More information: Add a system property

tablet.footer.text

Text that appears on the footer of the tablet UI.

- Type: string
- Default value: Copyright ServiceNow 2012
- Location: **System Properties** > **Tablet UI Properties**

tablet.header.text

Text that appears on the right-hand side of the tablet UI header.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

Add a system property

Add or create a property to control system behavior.

Add a system property

Before you begin
Role required: admin

For more information on creating system properties for your own applications, take the training on the ServiceNow® Developer Site.

About this task
Some properties in the system aren't visible in an instance by default and must be added to the System Property [sys_properties] table. If a feature requires the addition of the property, you can add a system property.

Important:
System properties store configuration information that rarely or never changes. Each time you change or add a system property, the system flushes the cache to keep all nodes in the cluster in sync. This cache flush has a very high performance cost for one to 10 minutes, which can potentially cause an outage if done excessively. To prevent such outages, don't use a system property to store configuration information that changes more than once or twice a month. Instead, use a custom table to store regularly changing configuration information.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property doesn't exist by searching for the property name.
3. Select **New**.
4. Complete the System Property form using the database name of the property.

   Make sure to specify the correct data **Type** and add the new value that you want the property to use.

   Properties that you add already contain default values. You add properties to change this value.

Field	Description
Name	Name of the property you're creating.
Description	Type a brief, descriptive phrase describing the function of the property.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, `Blue=0000FF`, `Red=FF0000`, `Green=00FF00` displays **Blue**, **Red**, and **Green** in the list, and saves the corresponding hex value in the property value field.

servicenow

Field	Description
Type	Select the appropriate data type from the list (for example, **integer**, **string**, or **true|false)**.
Value	Set the desired value for the property. All property values are stored as strings. When retrieving properties via the `gs.getProperty()` method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Ignore cache	The system stores system property values in server-side caches to avoid querying the database for configuration settings. When you change a system property value, the system always flushes the cache for the sys_properties table. Use this field to determine whether to flush this property's value from all other server-side caches. The default cleared check box means that the system will flush all server-side caches and retrieve the current property value from the database. Leave the check box cleared when you want to ensure all caches have the current property value. Select the check box to ignore flushing some server-side caches, thus flushing only the cache for the sys_properties table and preserving the prior property value in all other caches. This option avoids the performance cost of flushing all caches and retrieving new property values. Typically, you should only select the check box and enable ignoring the cache when you have a system property that changes more frequently than once a month, and the property value is only stored in the sys_properties table.
Private	Set this property to true to exclude this property from being imported via update sets. Keeping system properties private prevents settings in one instance from overwriting values in another instance. For example, you may not want a system property in a development instance to use the same value as a production instance.
Read roles	Define the roles that have read access to this property.
Write roles	Defines the roles that have write access to this property.

5. Select **Submit**.
   Depending on the property name, an administrator might be able to change its value only through a new module. It may also appear in one of the Properties pages in System Properties.

   Note:
   If the **Ignore cache** check box is selected, the system flushes the server cache when the parameter is changed.

Create a system properties module

You can add a module in the application navigator to access the list of system properties. This module makes it easy to add properties to the System Properties table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Application Menus**.
2. Search for the application you want to add the properties table to, for example **System Properties**.
   Select an application that is restricted to the admin role so that non-admin users cannot access it.
3. From the Modules related list, click **New**.
4. Complete the form fields.

Field	Description
Title	Module name. For example, **All Properties**.
Application Menu	Specifies the name of the application menu the module appears under. This field should automatically be populated with the name of the application you accessed the Modules related list from.
Link type	Specifies the type of link this modules opens. For a list of system properties, select **List of Records**.
Table	Specifies the table used by the module. Select **System Properties [sys_properties]**.

5. Click **Submit**.
6. Verify that the module was created.
   For example, navigate to **System Properties** > **All Properties**.

What to do next

If you want to include additional parameters for the list of system properties module, see Create a module.

Query join and complexity size limits

The platform uses a relational database to store data. Retrieving data can involve multiple joins to create a single result set. While these joins are usually simple, in certain cases the system may issue very large joins to bring together large numbers (>20) of tables.

Database engines normally handle multiple joins quite well. The relational model assumes joins are cheap and efficient, and this is usually true. Rarely, however, exceedingly large joins may cause a database performance issue.

To mitigate this potential complexity, use the following property to limit join complexity and size.

Navigate to **System Properties > System** and find the property with this description:

Max number of database joins per query. Smaller values cause the system to issue a larger number of less complex queries. Larger values reduce the number of queries at the cost of additional complexity per query. In the absence of known database issues stemming from large join counts, this property should remain unchanged.

This property specifies the maximum number of joins the system prefers to do. In certain edge cases, more complex queries might need to be issued, but generally no more than this number of joins will be issued. e.g., a value of 10 will result in no more than 10 tables being joined together in any given query.

The system must compensate for the fewer joins by issuing more queries to retrieve necessary data, so tuning this number down will result in more queries being sent to the database. In most cases, tuning this parameter is counterproductive.

Note:
In the absence of known database issues stemming from large join counts, this parameter should remain unchanged.

Web proxy

Several properties support Web proxy configuration.

Note:
Set these properties in the System Properties `[sys_properties]` table.

Proxy setup properties

Property	Description	Examples
glide.http.proxy_host	Specify the proxy server hostname or IP address. • Type: string • Default value: none	proxy.company.com, 192.168.34.54
glide.http.proxy_port	Specify the port number for the proxy server. • Type: string • Default value: none	8080, 9100
glide.http.proxy_username	Specify the username used to authenticate the proxy server. • Type: string • Default value: none	proxyuser

Proxy setup properties (continued)

Property	Description	Examples
glide.http.proxy_password	Specify the password used to authenticate the proxy server. • Type: string • Default value: none	password
glide.email.override.url	Set the URL to use in emailed links in place of the instance URL. The URL should end with `nav_to.do`. • Type: string • Default value: instance URL	https://servicenow.customerdomain.com/production/nav_to.do

NTLM authentication

NTLM is the most complex of the authentication protocols supported by a basic web server.

NTLM is the most complex of the authentication protocols supported by a basic web server such as HttpClient. It is a proprietary protocol designed by Microsoft with no publicly available specification. Early versions of NTLM were less secure than Digest authentication due to faults in the design. However, these were fixed in a service pack for Windows NT 4 and the protocol is now considered more secure than Digest authentication.

NTLM authentication requires that an instance of NTCredentials be available for the domain name of the server or the default credentials. Since NTLM does not use the notion of realms, HttpClient uses the domain name of the server as the name of the realm. Also, the username provided to the NTCredentials should not be prefixed with the domain:

- Correct: adrian
- Incorrect: DOMAIN\adrian

There are some significant differences in the way NTLM works compared with basic and digest authentication. These differences are generally handled by HttpClient. However, having an understanding of these differences can help you avoid problems when using NTLM authentication.

- NTLM authentication works almost exactly the same as any other form of authentication in terms of the HttpClient API. The only difference is that you need to supply NTCredentials instead of UsernamePasswordCredentials (NTCredentials actually extends UsernamePasswordCredentials so you can use NTCredentials right throughout your application, if needed).
- The realm for NTLM authentication is the domain name of the computer being connected. This can be troublesome because servers often have multiple domain names. Only the domain name that HttpClient connects to, as specified by the HostConfiguration, is used to look up the credentials. While initially testing NTLM authentication, it is best to pass the realm in as null, which is used as the default.
- NTLM authenticates a connection and not a request. So you need to authenticate every time a new connection is made and keeping the connection open during authentication is vital. For

this reason, NTLM cannot be used to authenticate with both a proxy server and the web server, nor can NTLM be used with HTTP 1.0 connections or web servers that do not support HTTP keep-alives.

Note:
Set these properties from the System Properties `[sys_properties]` table.

NTLM authentication

Property	Description	Examples
glide.http.proxy_ntusername	Specify the username used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	username
glide.http.proxy_ntpassword	Specify the password used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	password
glide.http.proxy_nthost	Specify the hostname used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	nthost
glide.http.proxy_ntdomain	Specify the domain used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	DOMAIN

Proxy servers for SOAP clients

Administrators can specify separate proxy settings for SOAP clients, such as the MID Server or ODBC Driver.

To specify a proxy server for a MID Server, see MID Server configuration

To specify a proxy server for the ODBC driver, see Configure ODBC to use proxy servers

Bypass the proxy server

Administrators can configure the instance to bypass the proxy server for specific URLs or URL patterns.

Typically, internal addresses do not need a proxy server for SOAP communications.

Bypass the proxy server

Property	Description	Examples
glide.http.proxy_bypass_list	Specify the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk as a wildcard character to specify all or part of an address. • Type: string • Default value: none • Location: System Properties `[sys_properties]` table	127.0.0.1;*.internal.com;localhost

Admin Center

Admin Center provides a central hub for platform owners and admins to access platform capabilities, discover new applications, and get intelligent, actionable insights.

Use the Admin Center application to discover the capability of the available applications and how they can be implemented to work towards achieving your business goal.

Get started

Explore

Learn about Admin Center.

Discover

Discover Adoption Blueprints, recommended adoption journeys organized by business outcome.

Operate

Learn about the configurable Admin Home page features.

Configure

Learn more about how to configure applications with Configuration Hub

.

Admin Center overview

Admin Center gives a centralized control of the instance to the admins with easy access to the platform capabilities, applications, and configurable admin dashboards.

The first stop experience within Admin Center is the Admin Home page. It helps you manage and track all your administrative work within a single page experience. You can prioritize your work based on the instance data. See Admin Home for more information about Admin Home features.

Admin Center offers easy access to a number of key applications administrators need. You can access these applications directly from the **Admin** menu on the Admin Home page.

- Adoption Blueprints: Adoption Blueprints lists the available applications and features that are recommended to achieve business goals. You can target the strategic business improvements with a set of apps and features. See Adoption blueprints for more information.

  Note:
  Adoption Blueprints platform feature is available by default with instance upgrade to Tokyo and above.

- Now Assist Admin: The Now Assist Admin console provides you with quick and effortless access to the important information that you need to set up, configure, and monitor Now Assist features and skills. See Now Assist Admin console for more information.
- Application Manager: As an admin, you have the ability to install, update, and manage licensed applications and plugins on your instance using the Application Manager application. See Application Manager for more information.

  Note:
  Application Manager store application is available by default with the instance upgrade of Vancouver and above.

- Security Center: Use the Security Center application to help your organization maintain the security of your ServiceNow deployments. See Security Center for more information.

  Note:
  Security Center is available by default from the Vancouver release and above with the instance upgrade. For the previous releases, you can install it from the ServiceNow store.

- Subscription Management: Proactively manage your subscriptions and monitor subscription usage on your instances using the Subscription Management application. See Subscription Management for more information.

  Note:
  The legacy version Subscription Management is available by default with the Vancouver release. You can install the new version of Subscription Management on your Vancouver instance from the ServiceNow® Store. You can also have both the legacy and new version on your Vancouver instance.

- Configuration Hub: Access and zoom in all the relevant details related to the selected application(s) using the Configuration Hub application. You can also track and view delta changes, over-allocated licenses, and customizations on a single screen. See Configuration Hub for more details.

  Note:
  Configuration Hub store application is available by default with instance upgrade of Vancouver patch 2 and above.

You can also access the Admin Experience Product Hub on the ServiceNow Communityfor additional resources about Admin Center and the applications.

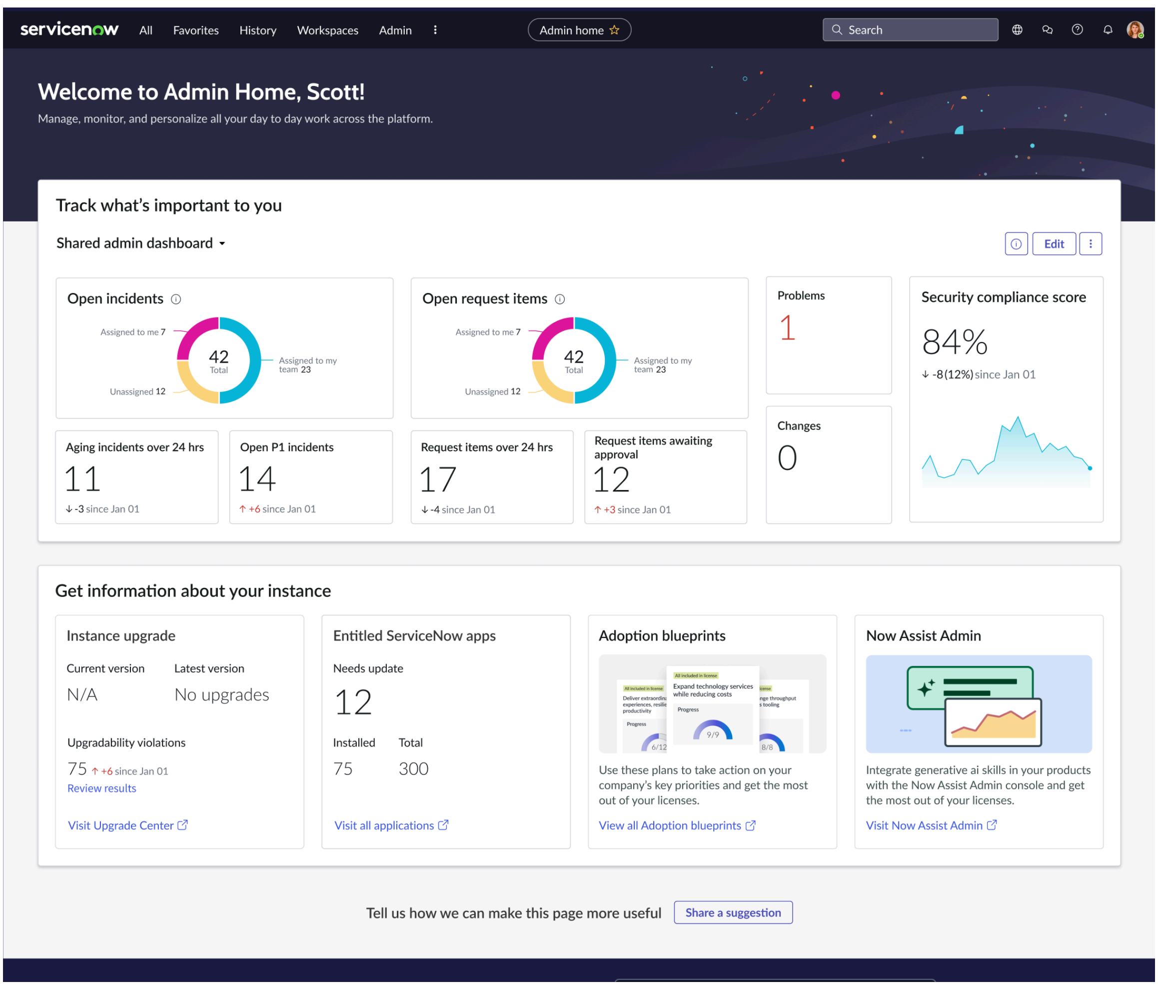
Admin Home

Manage and track your daily administrative work and tools on your instance by quickly accessing the cards on the dashboard. It helps you stay updated on any high priority incidents or problems on the instance that might need immediate attention.

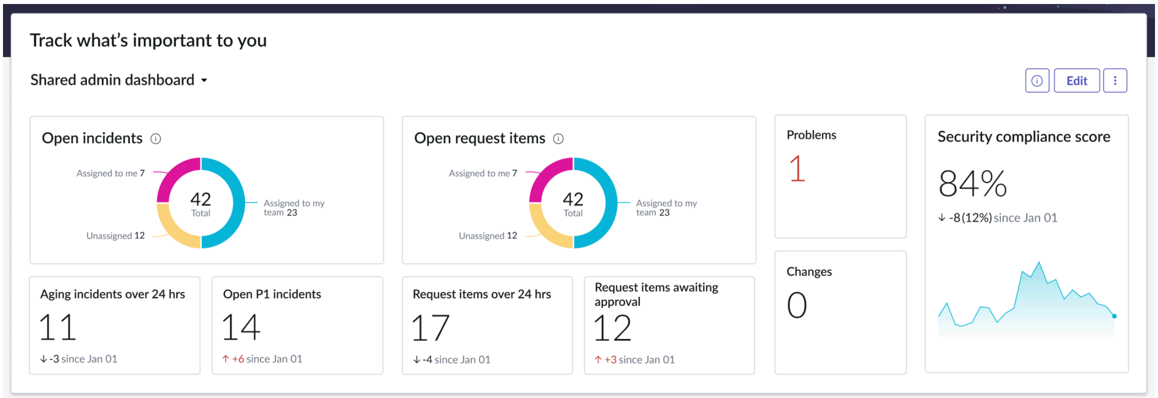
Watch the detailed video for more information.

Use the advanced Admin Home page to accomplish the following:

- Get notified of the critical and high priority incidents
- Stay updated about the problems and changes on the instance
- Create and switch to your personalized dashboard based on what is most important to you
- Stay updated on the current version, scheduled upgrade, and licensed applications status on your instance
- Get a comprehensive, single-page view of the delta changes on the instance

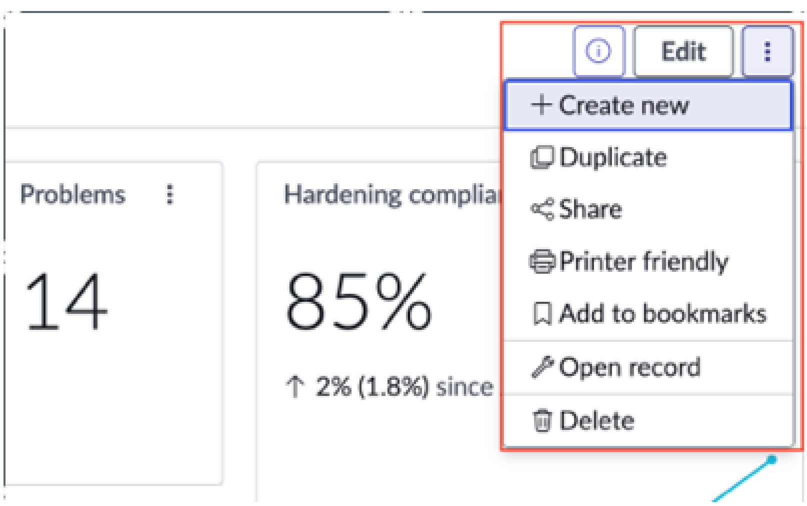


Track important information

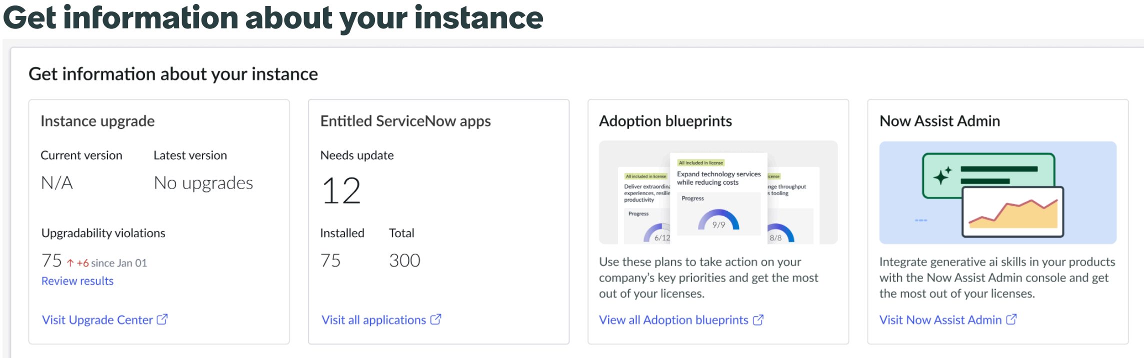


The **Track what's important to you** section of the Admin Home page provides insights into key information, such as open incidents, open requests, etc. This information is available on a default shared dashboard. You can click on each card to view more information.

Note:
You can't add or remove any cards from the Shared admin dashboard. Instead, to modify the cards, you must first create a new dashboard by selecting **Create new** dashboard. Then, modify the new dashboard as needed and share it with other administrators using the **Share** option.

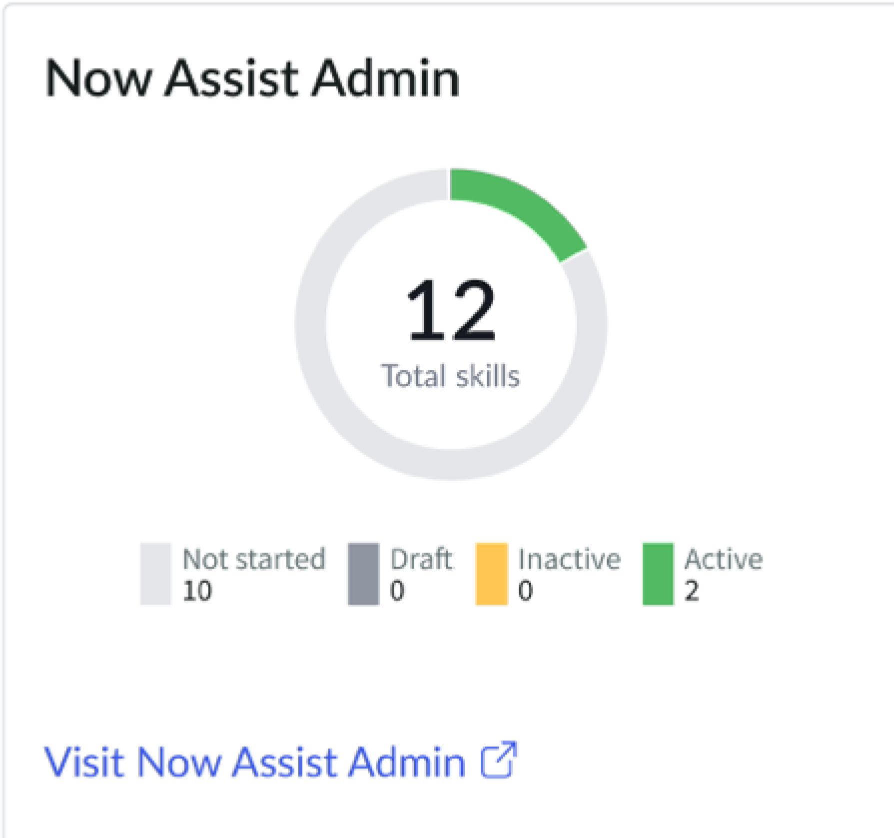


Get information about your instance



The **Get information about your instance** section of the Admin Home page shows information about your instance's current version, violations, and scheduled upgrade. It also shows the status of licensed applications as a list of installed applications on your instance and the applications that need to be updated, as well as a card with easy access to Adoption blueprints.

If your instance has one or more Now Assist plugins installed, a card displaying the status of your instance's Now Assist skills will be shown.



Adoption blueprints

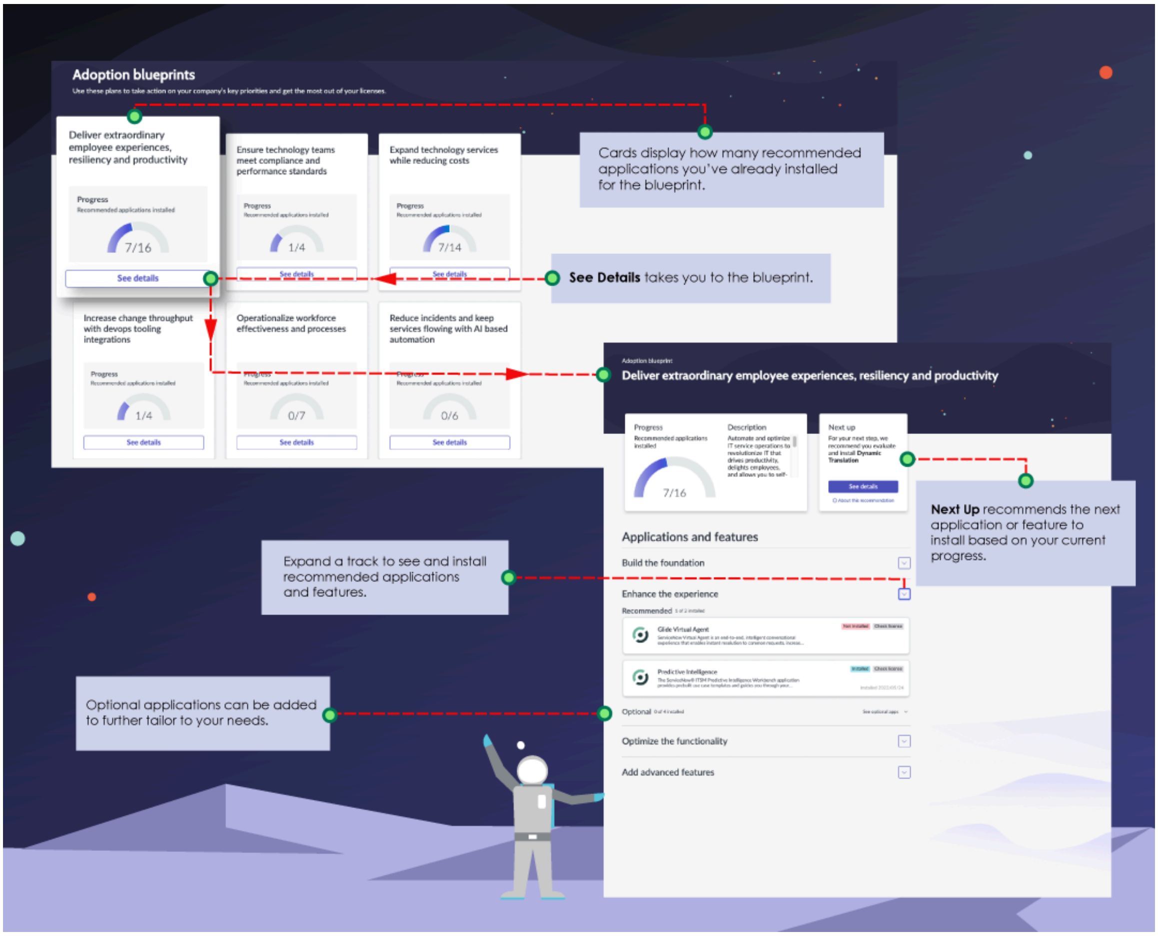
Adoption blueprints display the applications and features available to you and the recommended solutions to achieve business goals.

Adoption blueprints overview

Adoption blueprints are the specific and measurable results that an organization needs to accomplish their growth. You can target the strategic business improvements with a set of apps and features.

Some of the goals based on which adoption blueprints are recommended:

- Optimizing operation to efficiently meet the goals of your organization
  - Reduced service operations cost for premium quality services
  - Focused on simplifying and automating transactions
- Managing risk more efficiently by improving prioritization, efficiency, and operational reporting
- Delivering seamless employee experience to increase engagement and productivity with proper utilization of resources

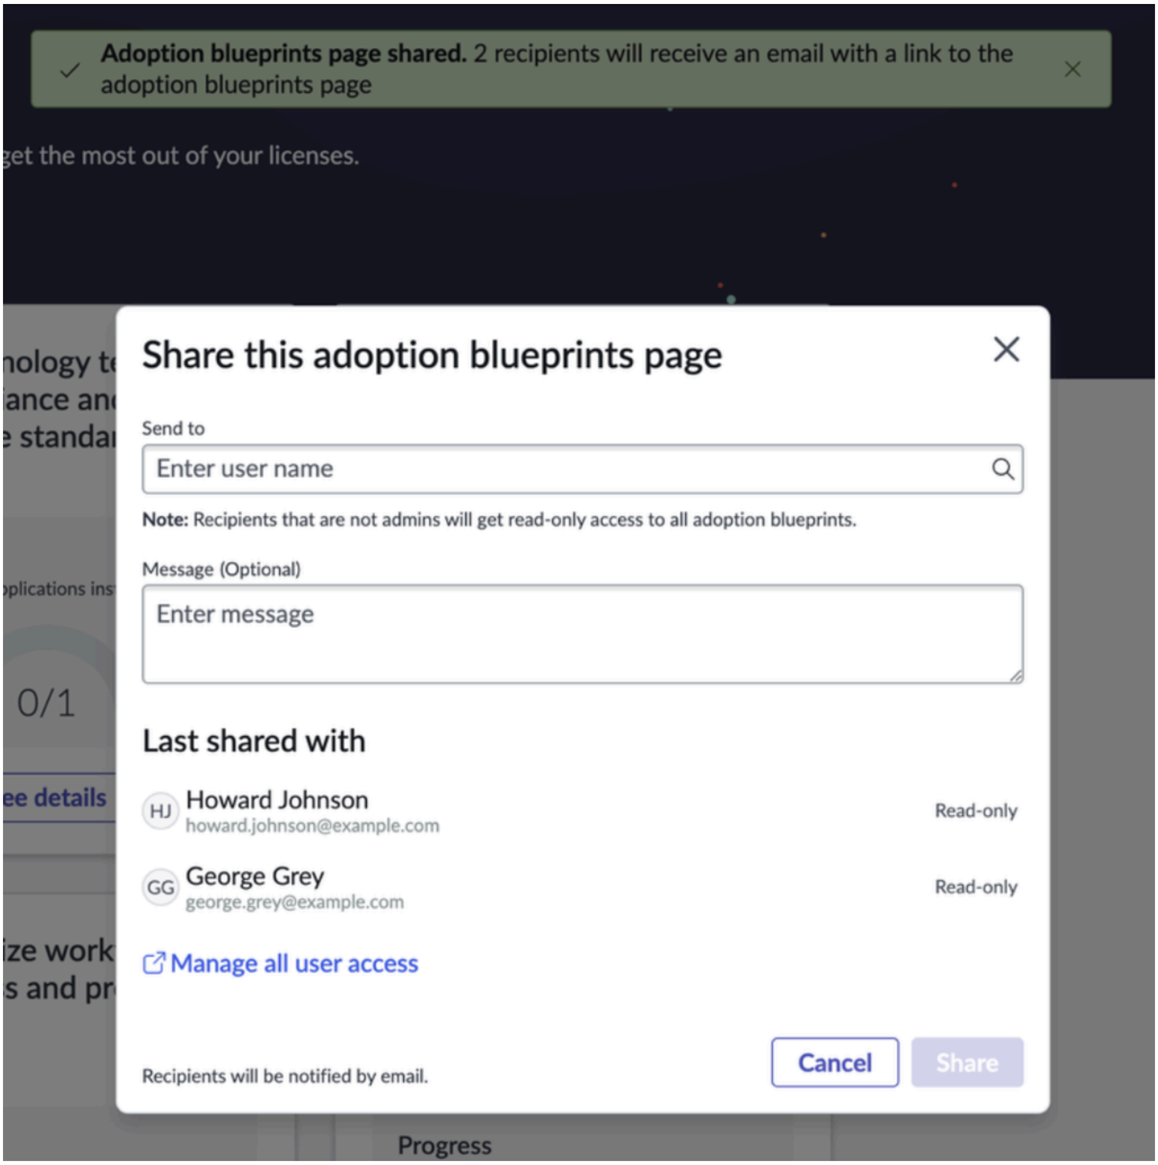


Each adoption blueprint displays the progress you have made in working towards your strategic goal. The number of applications that have been installed includes only the recommended applications.

See Select your adoption blueprint for more information.

Select **Share** if you want to share information about adoption blueprints, recommended applications and features. You can share the information with more than one recipient. The recipients are notified via email. You can also view the people with whom the details have been shared previously.

Note:
If the information is shared with a non-admin user, the share functionality provides a read-only access to the non-admin users.



When you select the adoption blueprint, the following tracks for the recommended applications and features within the selected adoption blueprint show up.

- Build a foundation
- Enhance the experience
- Optimize the functionality
- Add advanced features

The recommended applications and features have been arranged in the order of impact in the process of giving you a measurable result. They can also be referred as crawl, walk, run, and fly phases respectively.

Note:
The applications and features mentioned in different tracks are only recommended to be installed. Some of the recommended applications and features in each track may already be installed in your instance and not require any additional action.

In each of the tracks, the applications are mentioned in the following order:

1. Recommended applications which are not yet installed
2. Recommended applications which are already installed but need to be updated
3. Recommended applications which are already installed in your instance.

Note:
The recommended applications don't need to be installed at all or in the order listed.

Select your adoption blueprint

Select an adoption blueprint that matches one of the strategic goals of your organizations. It also gives you a list of recommended applications that can be installed in the right combination to realize your business goal.

Before you begin
Role required: admin

Procedure

1. Access Adoption blueprint in one of the following ways.
2. Select an adoption blueprint from the Adoption blueprint page.
3. Select **See Details** to view the details of the selected adoption blueprint.
   The adoption blueprint details page shows the progress of the installation of the recommended applications.
4. Scroll down to see all the tracks for the selected adoption blueprint.
   See Adoption blueprints for more information.
5. **Optional:** Expand the Optional list to view the optional list of applications and features that may be beneficial for you to install.
   The total number of recommended applications and features mentioned in the progress section doesn't include the optional applications.

   Note:
   The installation of each of the recommended and optional applications and features is not mandatory to achieve the business goal.
6. Review the Next Up card to view the application recommended to install next.

   Note:
   You can skip this step if you don't want to install the application mentioned in the Next Up card. You are also required to consider the current needs of your organization along with the suggested applications.

Expand technology services while reducing costs blueprint

Select this adoption blueprint to create actionable plans to achieve your organization's business goals for automating core service and operations processes.

Note:
The applications recommended within a blueprint may include, but aren’t limited to, the following applications. Factors like entitlements and other instance dependencies can cause the number of recommended applications to vary.

Track	Recommended applications	Description	Roles installed	Additional resources
Build the foundation	Configuration Management	CMDB is a centralized source that gives you full visibility into your IT environment. Install applications for an adoption blueprint

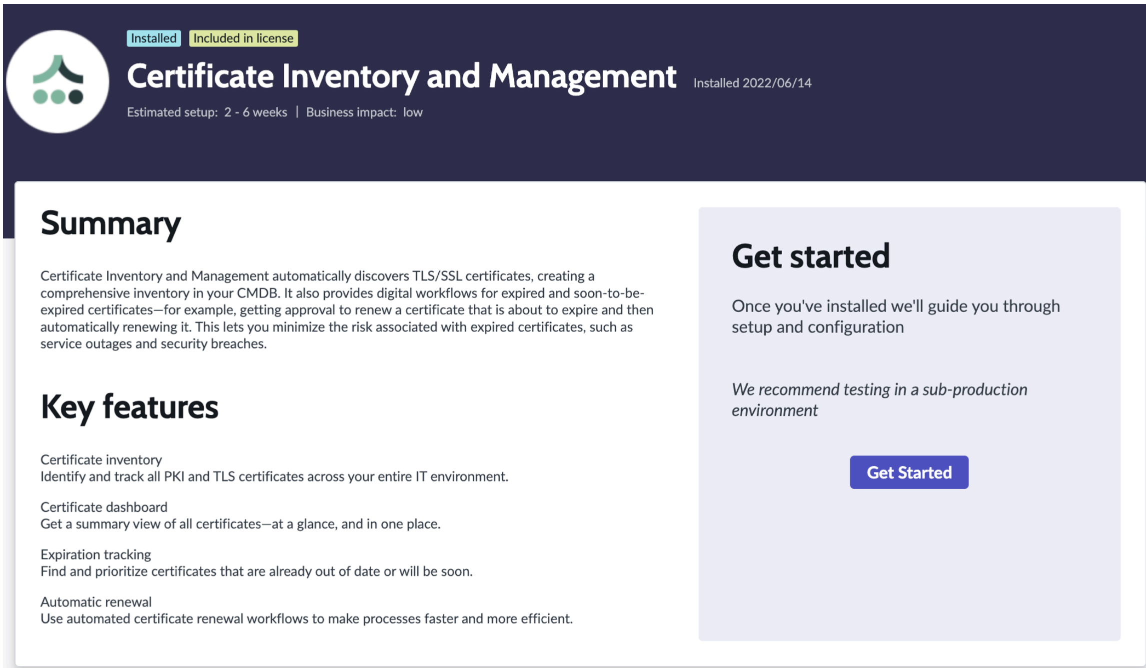
Install applications from the selected adoption blueprint to work towards achieving a certain business goal of your organization.

Before you begin

Role required: admin

Procedure

1. Select the application you want to install from the Adoption Blueprints details page.
   An application details page with the key features about the selected application appears.
2. Start the installation of the selected application.



The button to start the installation or activation may vary depending on the selected application.

- **Activate**: If you have selected a plugin
- **Install**: If you have selected an application
- **Update**: If the installed application needs to be updated
- **Get started**: If the application or the plugin is already installed

  Note:
  You can view the configuration page of the application by clicking **Get Started**.

Note:
Some applications and plugins show dependency applications and roles that need to be installed.

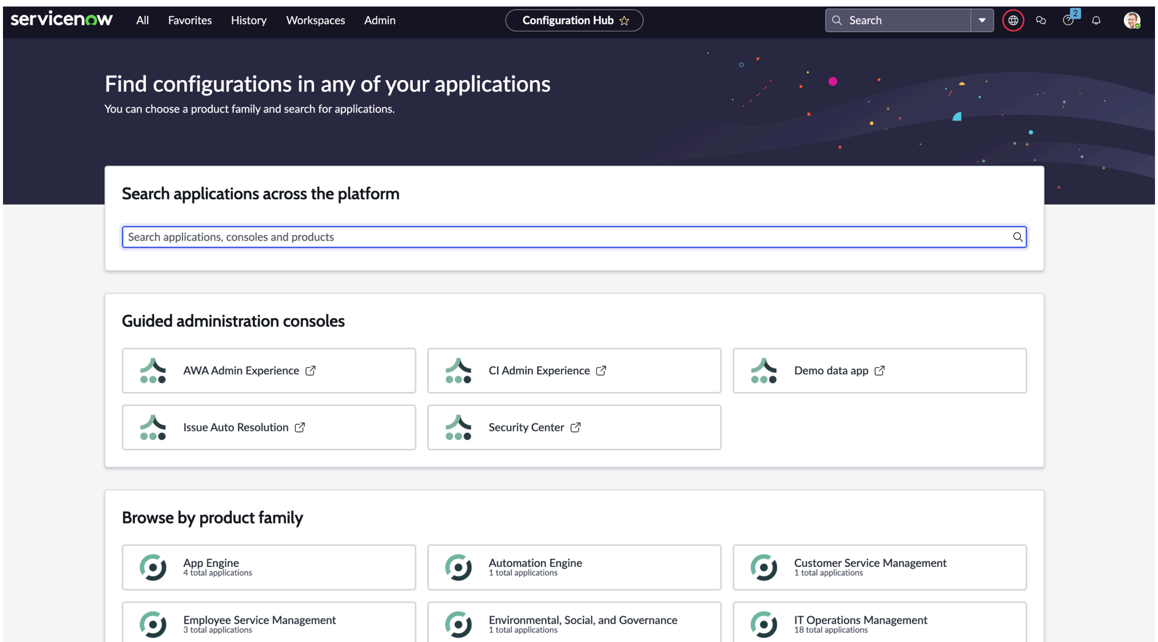
Configuration Hub

Experience the ability to zoom into an application or a group of applications and view all the relevant tables and records on a single page using the Configuration Hub. As an admin you can access all relevant details related to the selected application(s).

You can achieve the following by using Configuration Hub.

- One-stop experience to access all relevant information
- Enhanced ability to save your preferences for all tables and records
- Ability to track and view delta changes, over-allocated licenses, and customizations on a single screen
- Enhanced use of multiple filters simultaneously to drill down to a particular application
- Ability to open and edit a record within Configuration Hub. You don't need to navigate to the record using the conventional ways.

Note:
Configuration Hub store application is available by default with any instance upgrade of Vancouver patch 2 and above. You can navigate to Configuration Hub from the **Admin** menu.

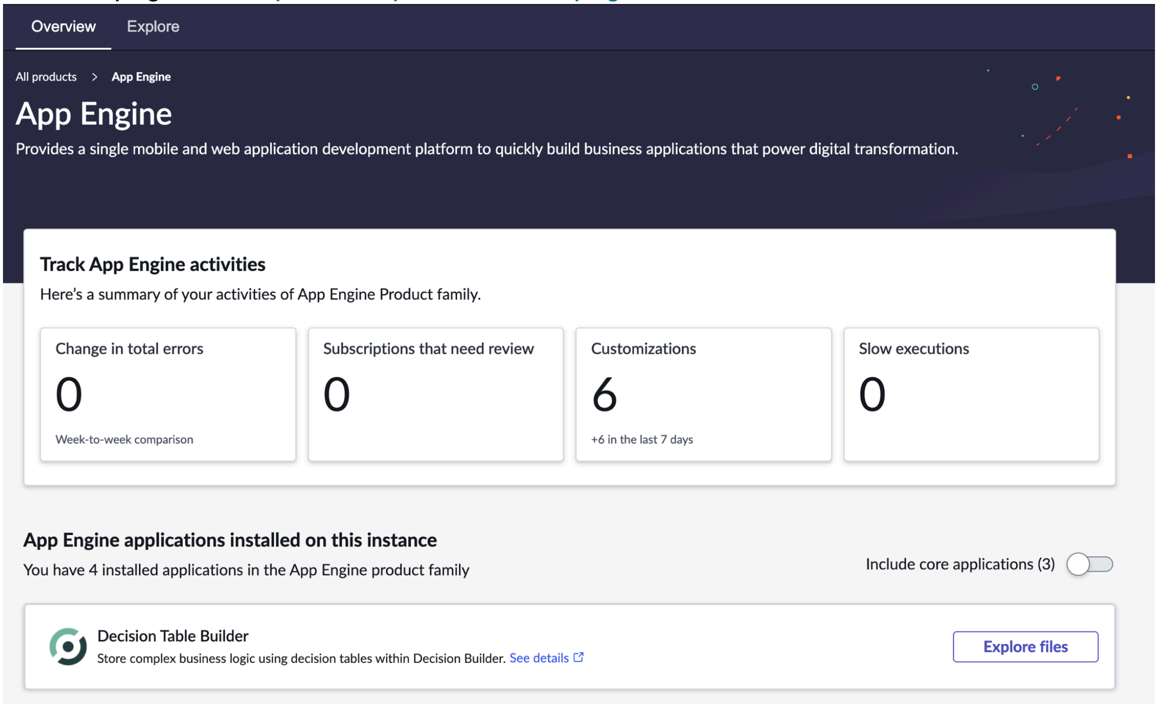


You can search through all the application, console or product names that have been installed on the instance within a certain scope.

Note:
The application name doesn’t populate in the search bar if it’s not yet installed on the instance. The number under the family name shows the number of applications in the selected family have been installed on the instance. If there is a product family that doesn’t have any app installed, it won’t show up on the list.

It can also help you search applications that have been grouped by SN store, taxonomy or product families. When you select a product family, it takes

to the product home page. See Explore the product home page for more information.



Explore the product home page

Track delta changes, over-allocated subscriptions, customizations, and slow execution on the product home page by selecting a product family

Before you begin

Role required: admin

Procedure

1. Access Configuration Hub in one of the following ways.

2. Select one of the product families as per your requirement.

The product home page shows 
up.

3. Track the following activities in the Overview tab.
   - Change in total errors: Weekly delta change in errors
   - Subscriptions that need review: Number of licenses that have been over-allocated
   - Customizations: Total modified files related to the installed applications within the selected product family.

     Note:
     The number mentioned under the total customizations is the number of files that have been modified recently within last 7 days.

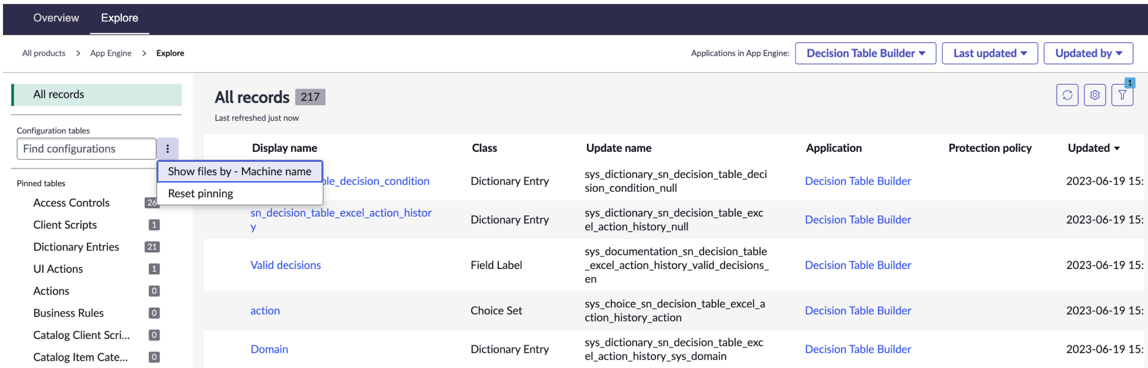
   - Slow execution: The number of slow transactions, events and scripts on the instance.

   By default, the core applications are hidden. Core applications are installed by default as you upgrade your instance. You can't uninstall the core applications. But you can use the toggle to show all the applications including the core apps.

   Note:
   It is recommended not to modify the core applications and its functionality so that during an upgrade you don't have too many skipped files.

   Select **See details** to read more about the store applications that have been installed. Select **Explore files** to list the records in the selected application of the product.
4. Drill down to a particular application by selecting the **Explore** tab.

   Note:
   The first time the **Explore** option is loaded, it takes in all the applications displayed in the **Overview** section.



You can do the following in the Explore tab:

- Search for table names, sys_id, or relevant records in the Configuration tables search bar.

  Note:
  You can also display the files as per machine names.

- Select a particular table from the left navigation bar and all the records in that table show up.

  Note:
  The number mentioned next to the table name is the number of records in that table. The records also satisfy the Applications in filter. You can also save your table preference by pinning the required tables.

- You can make edits in the records directly within Configuration Hub. You don't have to open the records in a conventional way to make edits in them.

Configure data synchronization for applications

As of Washington DC, certain ServiceNow applications have the ability to provide data visibility across instances within a customer's account.

Data visibility is protected by a trust configuration per instance, per application. You can configure the data sharing for production and non-production instances for the applicable applications by navigating to **All** > **Multi-Instance Management** > **Trust Configuration**.

Note:

By default, non-production instances allow application data sharing with production only. Production instances do not allow application data sharing with any other instance. However, these can be updated by the admin for each instance based on business needs.

If you demote a production instance to non-production, or promote a non-production instance to production, all previous customizations to data sharing settings are reset to the default configuration.

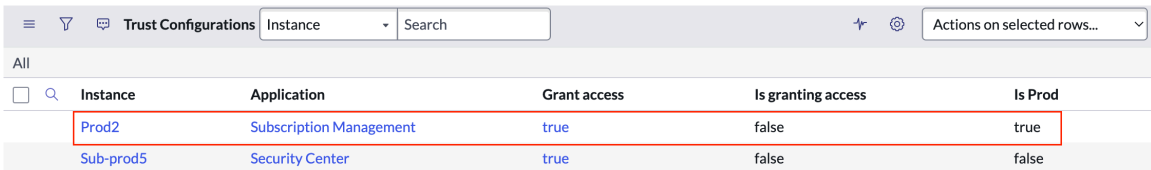
The **Grant access** column indicates the permission granted by the instance that you're currently logged in to for the instance named in the same row's instance column. The **Is granting access** column displays whether or not the instance mentioned in the Instance column has granted access to the instance you're currently logged in to; it can't be edited.

The following are some examples for data sharing restrictions between instances.

Example: Logged in to Prod1

In the following example, you're logged in to Prod1. Prod1 has granted access to the instance Prod2 for the application Subscription Management, as indicated by the `True` value in the **Grant access** column.

Prod2 hasn't granted access to Prod1, as indicated by the `False` value in the **Is granting access** column.



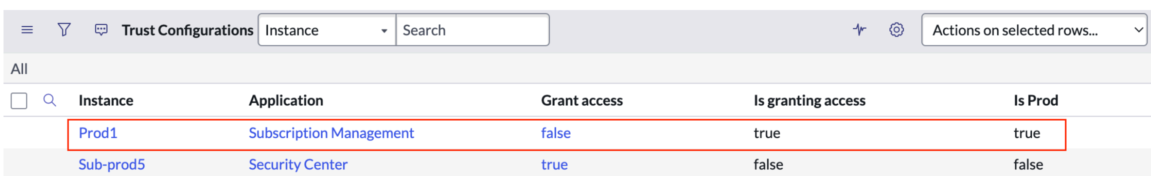
Instance	Application	Grant access	Is granting access	Is Prod
Prod2	Subscription Management	true	false	true
Sub-prod5	Security Center	true	false	false

To revoke access for the Subscription Management app from Prod1 to Prod2, update the value in the **Grant access** column to `False` while logged in to Prod1.

Example: Logged in to Prod2

In the following example, you're logged in to Prod2. Prod1 has granted access to the instance Prod2 for the application Subscription Management, as indicated by the `True` value in the **Is granting access** column.

Prod2 hasn't granted access to Prod1, as indicated by the `False` value in the **Grant access** column.



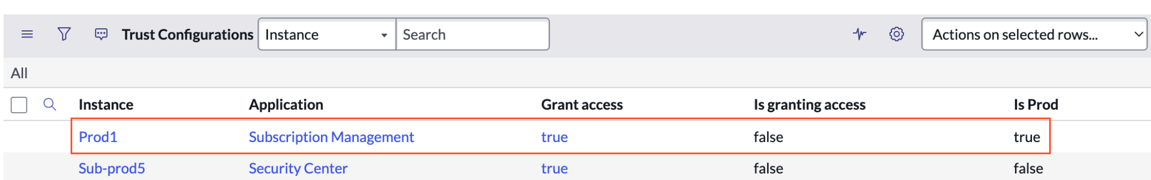
Instance	Application	Grant access	Is granting access	Is Prod
Prod1	Subscription Management	false	true	true
Sub-prod5	Security Center	true	false	false

To grant access from Prod2 to Prod1 for the Subscription Management application, update the value in the **Grant access** column to `True` while logged in to Prod2.

Example: Logged in to Sub-prod2

In the following example, you're logged in to Sub-prod2. Prod1 hasn't granted access to the instance Sub-prod2 for the application Subscription Management, as indicated by the `False` value in the **Is granting access** column.

Sub-prod2 has granted access to Prod1, as indicated by the `True` value in the **Grant access** column.

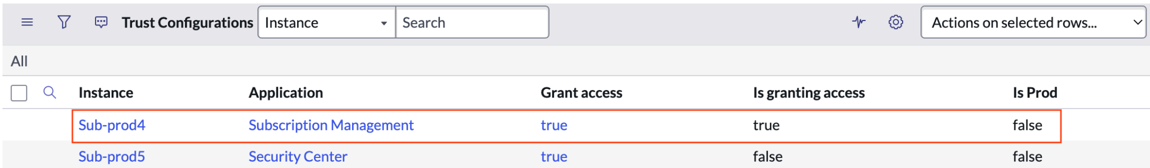


Instance	Application	Grant access	Is granting access	Is Prod
Prod1	Subscription Management	true	false	true
Sub-prod5	Security Center	true	false	false

To revoke access from Sub-prod2 to Prod1 for the Subscription Management application, update the value in the **Grant access** column to `True` while logged in to Sub-prod2.

Example: Logged in to Sub-prod3

In the following example, you're logged in to Sub-prod3. Sub-prod4 has granted access to the instance Sub-prod3 for the application Subscription Management, as indicated by the `True` value in the **Is granting access** column. Sub-prod3 has also granted access to Sub-prod4, as indicated by the `True` value in the **Grant access** column.



Instance	Application	Grant access	Is granting access	Is Prod
Sub-prod4	Subscription Management	true	true	false
Sub-prod5	Security Center	true	false	false

Admin Center roles

Admin Center is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

System Administrator [admin]

The admin role allows you to access admin home features, adoption blueprints and configuration hub. You can create your own personalized admin home page on your instance with the information that is most important to you.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevate to a privileged role.

No.

Special considerations

None.

Subscription Management

Subscription Management enables you to proactively manage your subscriptions and monitor subscription usage on your instances.

https://player.vimeo.com/video/1018055648?h=5c896ae137&badge=0&autopause=0&player_id=0&app_id=58479

Watch this short video to see an overview of Subscription Management.

Request apps on the Store

Exploring Subscription Management

Learn how Subscription Management helps you track and manage your product subscriptions and their applications.

Subscription Management Overview

Subscription Management gives you an accurate, consolidated view of your entitlements where you can proactively manage your subscriptions.

- Gain visibility and control of your product subscriptions and their applications.
- Access a real-time view of your entitlement data.
- Maximize subscription usage and make informed decisions about purchases by viewing insights.
- Stay in compliance and avoid unexpected costs by tracking subscription usage and allocations over time.

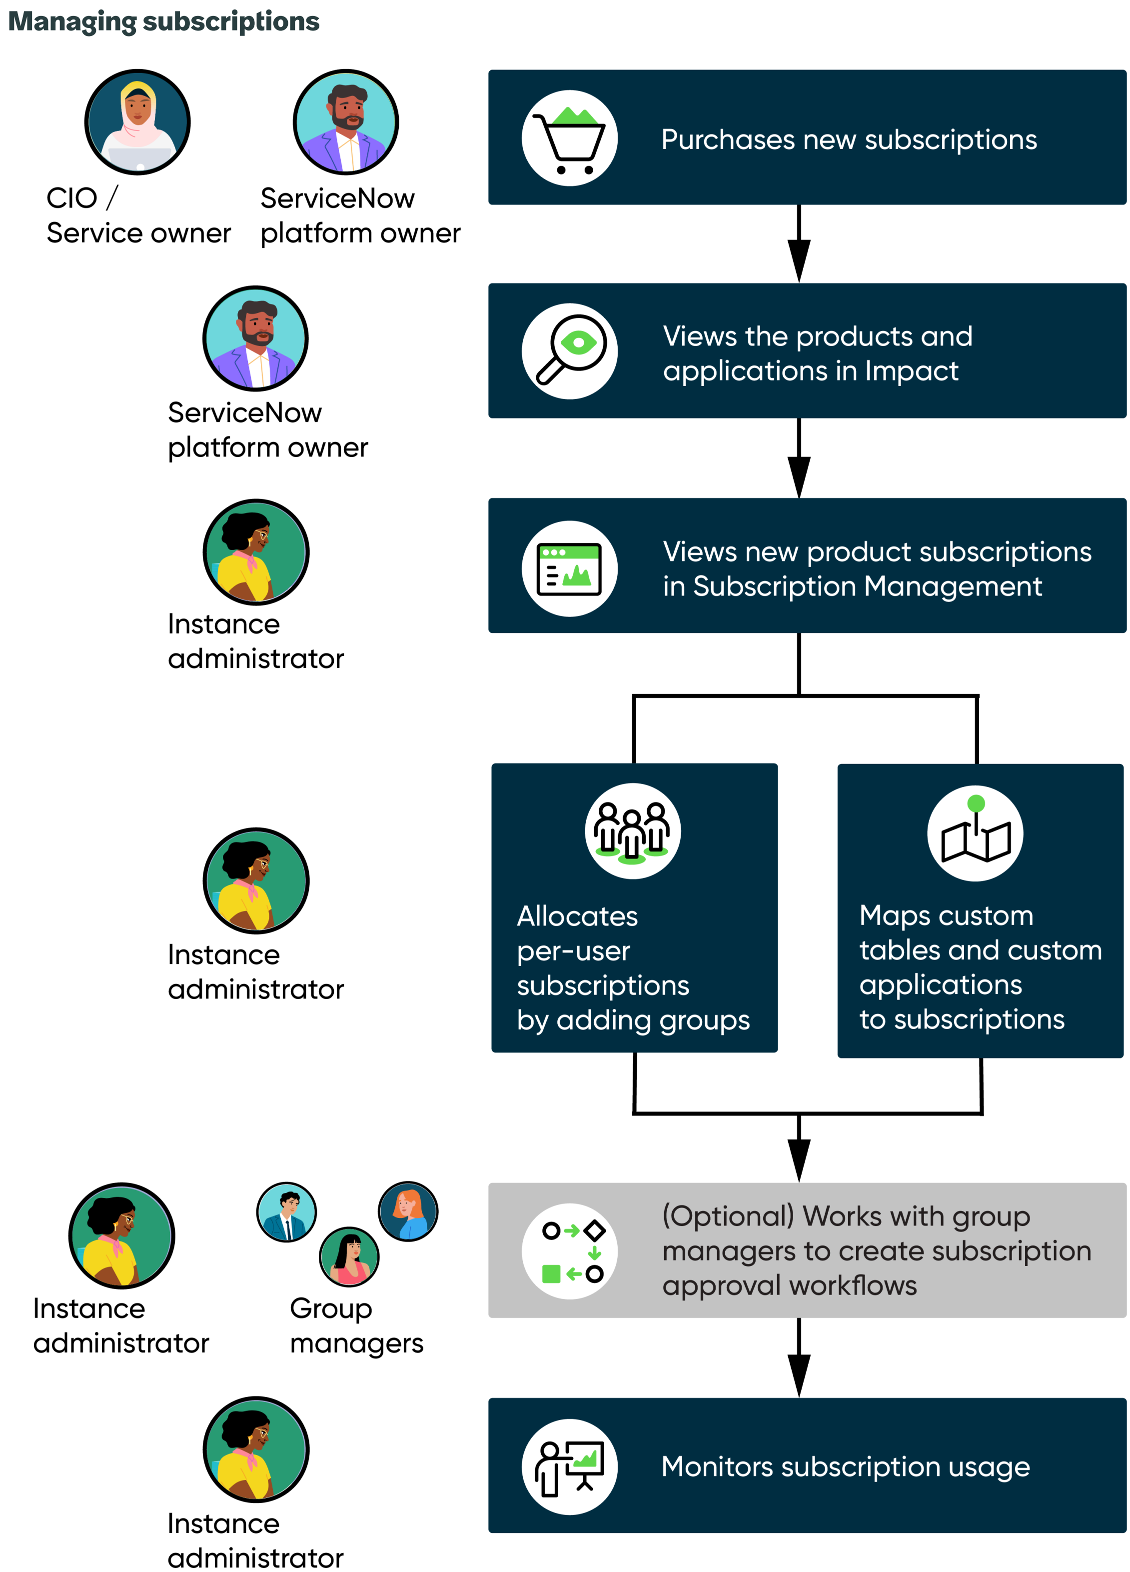
Subscription Management users

Users

User	Description
Instance admin	The instance admin allocates per-user subscriptions by adding groups to a product subscription. The instance admin maps custom tables and custom applications to subscriptions with available entitlements to maximize subscription usage and stay in compliance.

Subscription Management workflow

This infographic shows a sample end-to-end workflow of how different users in an organization work together to purchase, allocate, and manage subscriptions.



In this workflow:

1. The chief information officer or service owner works with the ServiceNow platform owner to purchase new subscriptions.
2. After the purchase is complete, the platform owner views the products and applications in Impact.
3. The instance admin views the new product subscriptions in Subscription Management on the production instance. For more information, see Product subscriptions overview.

4. The instance admin performs the following tasks in Subscription Management:
    - Allocates per-user subscriptions by adding groups to a product subscription, which grants entitlement to all group members. For more information, see Managing per-user subscriptions in Subscription Management.
    - Maps custom tables and custom applications to subscriptions with available entitlements to maximize subscription usage and stay in compliance. For more information, see Managing custom tables and applications in Subscription Management.
5. If the organization requires security approvals before adding users to groups or financial approvals before subscriptions are allocated to users, the instance admin works with group managers to create subscription approval workflows that determine who gets a subscription when new users are added to groups.
6. The instance admin monitors subscription usage to stay in compliance and make informed decisions on future purchases, consistently monitoring the following data:
    - Over-allocated subscriptions
    - Unmapped custom applications and tables
    - Usage patterns over time
    - Application popularity
    - Custom table usage

Subscription Management benefits

Benefit	Feature	User
Fix over-allocated subscriptions	Insights	Instance admin
View unallocated subscriptions	Insights	Instance admin
Allocate available subscriptions using recommended groups	Allocate subscriptions	Instance admin
Map global custom tables to a product subscription	Issues	Instance admin
Map custom applications to a product subscription	Issues	Instance admin
View a summary of subscription allocations	Subscription details	Instance admin
View subscription allocation details over time	Subscription details	Instance admin
View custom table usage over time	Subscription details	Instance admin

What to explore next

To learn more about configuring and using Subscription Management, see:

- Configuring Subscription Management
- Managing per-user subscriptions in Subscription Management
- Managing custom tables and applications in Subscription Management
- Monitoring capacity subscriptions
- Subscription Management reference

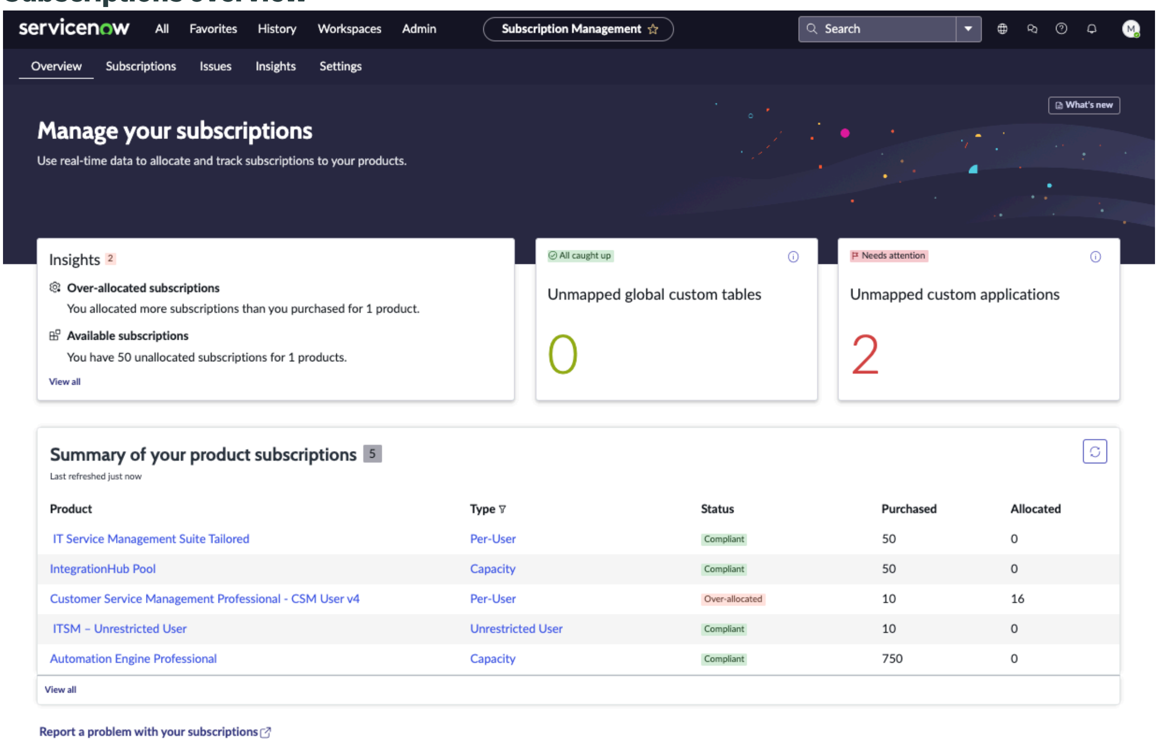
Product subscriptions overview

View a summary of your product subscriptions in Subscription Management.

Key benefits

- Determine whether you have any over-allocated subscriptions.
- Check for unallocated subscriptions that you can allocate to maximize usage and give users entitlement to ServiceNow products.
- Determine whether any custom tables in the global scope or any custom applications aren't mapped to subscriptions.
- Stay in compliance by monitoring the **Status** column in the list of product subscriptions.

Subscriptions overview



Required ServiceNow AI Platform roles

The usage_admin or admin roles are required to view and edit Subscription Management.

Accessing product subscription overview information

View subscription overview information on the **Overview** tab in Subscription Management by navigating to **Admin** > **Subscription Management** or **All** > **Subscription Management** > **Subscription Management**.

Use cases

View a summary of your instance-level entitlements in the **Instance entitlements** tab.

- Identify when subscriptions are over-allocated and view insights into actions you can take to maximize subscription usage.
- Determine whether any custom tables and custom applications on your instance aren't mapped to a valid product subscription. You must map custom tables and custom applications that you create to a product subscription.
- View product subscription details by selecting the product name.
- Identify which type of subscriptions you have by viewing the values in the **Type** column. The subscription type determines the properties and attributes of the product subscriptions that your company receives and whether to allocate subscriptions manually.
    - Product subscription types include per-user, capacity, unrestricted user, unlimited, and display only.
    - Per-user subscriptions require manual allocation by an administrator. Capacity, unrestricted user, and unlimited subscriptions are allocated on your instance automatically. Display-only subscriptions aren't measured on your instance.
    - Product subscriptions provide entitlements for different applications and can include different add-ons.

  For more information, see Types of subscriptions in Subscription Management.
- Determine whether your subscription allocations are in compliance by viewing the values in the **Status** column. Adjust allocations if subscriptions are over-allocated.

  Compliant

  The number of allocated subscriptions is below the number of purchased subscriptions.

  Near capacity

  The number of allocated subscriptions exceeds the threshold for your instance. You define the threshold on the **Settings** tab.

  Even

  The number of allocated subscriptions equals the number of purchased subscriptions.

  Over-allocated

  The number of allocated subscriptions exceeds the number of purchased subscriptions.

  Account-level only

  The subscription allocation status isn't calculated. Only applies to Creator Plus products.

  You can customize the near capacity threshold for your instance in the **Settings** tab. For more information, see Configure the subscription allocation status in Subscription Management.
- View a summary of the Creator Plus subscriptions on the instance that you're currently accessing.
    - View the total number of Creator Plus subscriptions that your company has purchased in the **Purchased** column.
    - Monitor the total number of Creator Plus allocations on your current instance in the **Allocated** column.

View a summary of your account-level entitlements in the **Account entitlements** tab.

- View an account-level summary of Now Assist usage.
  - View the aggregated total of Now Assist usage entitlements from all the subscriptions that your account has purchased in the **Purchased** column.
  - View the total number of Now Assist usage entitlements consumed across all your instances in the **Allocated** column.
  - View additional details about Now Assist usage by selecting the product name.
- View an account-level summary of Now Assist creators.
  - View the total number of Creator Plus subscriptions that your account has purchased in the **Purchased** column.
  - Monitor unique Creator Plus allocations across all your instances by checking the **Allocated** column.

    Note:
    Users allocated to a Creator Plus subscription on multiple instances are automatically de-duplicated in the count on the **Account entitlements** tab. When a user is allocated to a Creator Plus subscription on more than one instance, that user counts toward the allocation total only once.

  - View additional details about Now Assist creators by selecting the product name.

Reports

Title	Type	Source Table	Description
Insights	List	Subscription Insights definition [sn_sub_man_st_subscription_insights]	List of over-allocated subscriptions and available subscriptions
Unmapped global custom tables	Single Score	Custom Table Inventory [ua_custom_table_inventory]	Count of custom tables that aren't mapped to a subscription
Unmapped custom applications	Single Score	Custom Table Inventory [ua_custom_table_inventory]	Count of custom applications that aren't mapped to a subscription

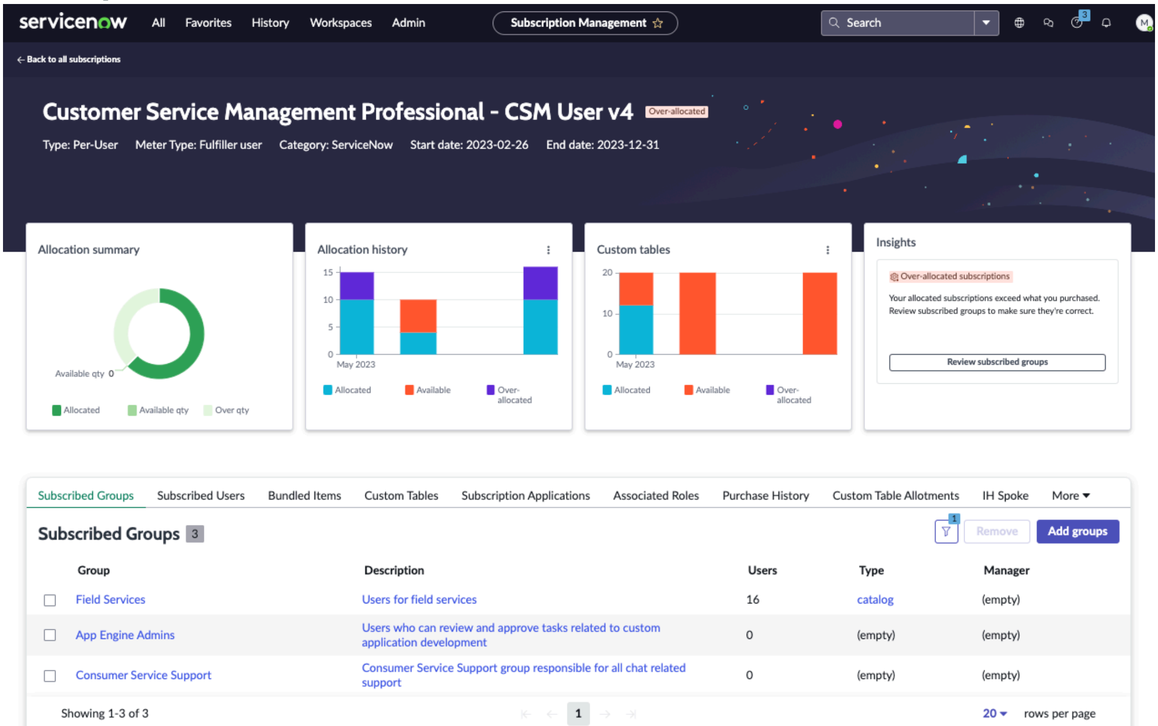
Viewing product subscription details in Subscription Management

View a summary of your subscription allocations, allocation totals over time, and track your custom table entitlements in Subscription Management.

Key benefits

- See how a product subscription is measured by viewing the subscription's meter type.
- Match a product subscription in Subscription Management to your purchase order.
- View the groups and users that you've added to a subscription.
- View your entitlements for custom tables, portal visits, or transactions.
- View the custom tables and applications that you've mapped to a product subscription.

Subscription details



Required ServiceNow AI Platform roles

The usage_admin role is required to view and edit Subscription Management.

Accessing subscription details

View subscription details on the details page by navigating to **Admin** > **Subscription Management** or **All** > **Subscription Management** > **Subscription Management**, and selecting a product or a subscription from the list.

Use cases

- See how a subscription is measured and the type of entitlement it provides by checking the **Meter Type** field.
  - Entitlements for users with fulfiller-type access are tracked through a per-user subscription with a Fulfiller User meter type.
  - Entitlements for users who have fewer access rights than fulfiller users are tracked through a per-user subscription with a Business Stakeholder User meter type.
  - Entitlements for users with the now.assist.creator role are tracked through a per-user subscription with a Creator User meter type.
  - The creation and retention of platform objects such as custom tables is tracked through a capacity subscription with a Capacity meter type.

  For more information, see Types of subscriptions in Subscription Management.
- See how a capacity subscription total is calculated by selecting the Capacity Definition record and viewing the definition details. For more information, see Monitor capacity subscription calculations in Subscription Management.

- Stay in compliance by monitoring your product subscription add-on usage on the **Bundled Items** tab. Product subscription add-ons can include bundled custom tables, portal visits, and transaction entitlements.
- Plan for future purchases and keep your subscriptions current by monitoring the start and end dates for each of your product subscriptions in the **Purchase History** tab. Note that multiple entries for the same product might appear if modifications are made to a product.
- View the applications that are included with a product subscription on the **Subscription applications** tab.
  - View application entitlement details, including the application's related plugins and associated roles by selecting an application.
  - Determine whether an application is available to install from the current product subscription by checking the **Installation status** column.
- Maximize subscription usage and grant entitlement to the right users by allocating per-user subscriptions. You allocate per-user subscriptions by adding one or more groups to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their assigned roles. For more information, see Allocate subscriptions in Subscription Management.

Consolidated subscriptions

When you purchase multiple qualifying subscriptions for certain types of products, such as Integration Hub, those individual subscriptions combine into a single subscription pool. Any usage against that subscription deducts from the common pool.

- Capacity subscriptions with a common capacity definition are consolidated into one capacity subscription. For example, if you purchased two different Integration Hub subscriptions that are measured using the same capacity definition, they're consolidated into one Integration Hub Pool capacity subscription. Other types of capacity subscriptions with matching definitions are consolidated as well, but aren't labeled as a pool. For any consolidated capacity subscription, you can view the combined products in the **Subscription line items** tab on the details page.
- Capacity subscriptions can also consolidate entitlements for secondary line items such as custom tables, transactions, or portal visits from other product subscriptions. For example, if you have two Integration Hub transaction subscriptions combined in a pool, transaction entitlements that are included as a secondary line item from another capacity subscription are added to the pool if the capacity definition matches. In this scenario, three separate entries appear on the **Subscription line items** tab, one for each product that contributes to the pool.
- Custom table entitlements that come with per-user subscriptions can also be consolidated under one product subscription. When custom table entitlements are consolidated under one subscription, the total number of custom tables appears in the **Purchased** column on the **Bundled Items** tab. The **Bundled Items** tab only appears on one of the product subscriptions that contributed to the pool of custom tables.
- Unrestricted User subscriptions aren't consolidated into a single product subscription.

Reports

Title	Type	Source table	Description

Title	Type	Source table	Description
			allocation is nearing capacity, consider reducing the number of allocated subscriptions or purchasing more subscriptions.
Account-level allocations	Donut	Account level entitlements [sn_sub_man_st_account_level_entitlement] table	View a summary of Creator Plus allocations across all of your instances. If the account-level allocation is nearing capacity, consider reducing the number of allocated subscriptions or purchasing more subscriptions.
Allocation history	Bar	Subscription license detail definition [sn_sub_man_st_subscription_license_detail_metric] table	View subscription allocation details over time. Prepare for future purchases or plan for changes according to the allocation trends.
Custom tables	Bar	Custom Table Inventory [ua_custom_table_inventory] table	View custom table usage over time in subscriptions that include bundled custom tables. Anticipate when to increase custom table entitlements by monitoring usage month-to-month.

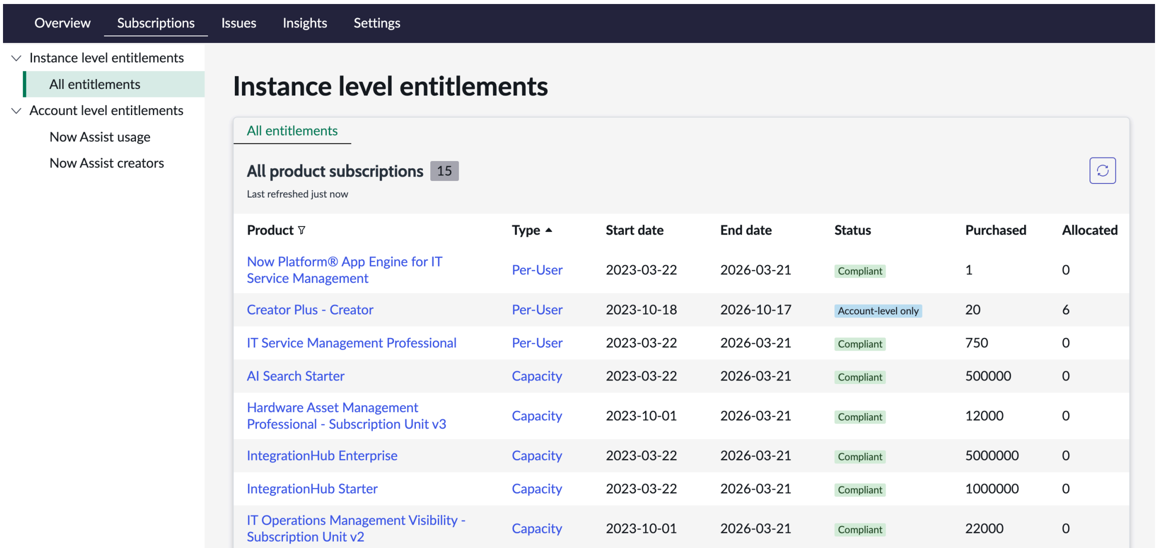
Viewing instance-level entitlements in Subscription Management

View a complete list of the product subscriptions purchased for your current instance.

Key benefits

- View details for product subscriptions, including purchase information and usage history by selecting the product name.
- Plan for future purchases and keep subscriptions current by monitoring the start and end dates for each of your product subscriptions.
- Stay in compliance by monitoring the subscription allocation values in the **Status** column.

Instance-level entitlements



Accessing your instance-level entitlements

Access your instance-level entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** or **All** > **Subscription Management** > **All Subscriptions**.

Subscription types

Identify which type of subscriptions you have and whether to allocate subscriptions manually by viewing the values in the **Type** column.

Per-User

Provides entitlements to users according to their assigned roles and associated access rights. You allocate per-user subscriptions manually by adding groups with metered roles or access rights to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their role assignments.

Unrestricted User

Provides entitlements for an organization's number of active users regardless of their role assignments. An active user is any user whose record in the Users [sys_user] table has a value in the **User ID** field and has the **Active** field set to true.

Capacity

Automatically tracks measured units, and counts of transactions, records created, or resources managed such as devices, software, or nodes.

Unlimited

Provides entitlements for active users, with no limit to the number of users that can be allocated. An active user is any user whose record in the Users [sys_user] table has a value in **User ID** field and has the **Active** field set to true.

Display Only

Displays information. This type of subscription doesn't support allocation.

Subscription status

Determine whether your subscription allocations are in compliance by viewing the values in the **Status** column.

Compliant

The number of allocated subscriptions is below the number of purchased subscriptions.

Near capacity

The number of allocated subscriptions exceeds the threshold for your instance. You define the threshold on the **Settings** tab.

Even

The number of allocated subscriptions equals the number of purchased subscriptions.

Over-allocated

The number of allocated subscriptions exceeds the number of purchased subscriptions.

Account-level only

The subscription allocation status isn't calculated. Only applies to Creator Plus products.

Missing subscriptions

Purchased subscriptions might not appear on the **Subscriptions** tab for one or more of the following reasons:

- Subscription data arrives on production instances only.
- Self-hosted instances don't receive subscription information. Contact your account manager for assistance.
- Subscription data might not yet have arrived. The data is downloaded daily.

Viewing account-level entitlements in Subscription Management

View an account-level summary of entitlements and consumption in Subscription Management.

Key benefits

- View and track Now Assist usage across all your instances.
- View and track Now Assist Creator allocations across all your instances.

Accessing your account-level entitlements

Access your account-level entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** or **All** > **Subscription Management** > **All Subscriptions** > **Account level entitlements**.

Viewing production and non-production instances

To view the entitlement data for all your instances, access your account-level entitlements on the **Subscriptions** tab in Subscription Management on a production instance. On a non-production instance, only entitlement data and usage for the instance that you're currently accessing is displayed.

Note:
On a production instance, you can view entitlement data for all the instances owned by your account. However, if data sharing is restricted on an instance, that instance's entitlement data is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.

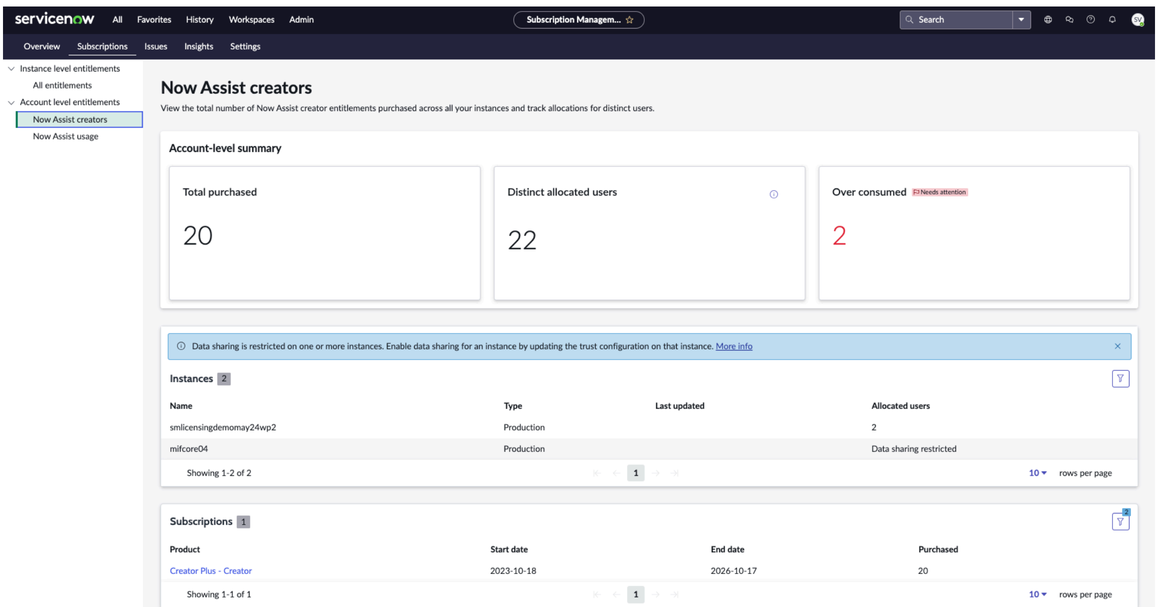
Monitoring Now Assist creators in Subscription Management

View a summary of your Creator Plus entitlements and track allocations for distinct users across all of your instances in Subscription Management.

Key benefits

- View the total number of Creator Plus entitlements that you purchased across all your instances.
- View the total number of Creator Plus entitlements allocated to unique users across all your instances.
- Track the availability of the remaining Creator Plus entitlements that you can allocate to users.

Now Assist Creator Plus entitlements



Required ServiceNow AI Platform roles

The usage_admin role is required to view and edit Subscription Management.

Accessing Creator Plus entitlements

Access details about Creator Plus entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Now Assist creators**.

Use cases

- Compare the total number of Creator Plus entitlements that your company has purchased to the total number of Creator Plus entitlements allocated across all your instances.
- Monitor the number of Creator Plus entitlements that are allocated to unique users across all your instances in the **Distinct allocated users** card.

Note:
Users allocated to a Creator Plus subscription on multiple instances are automatically de-duplicated in the total count. When a user is allocated to a Creator Plus subscription on more than one instance, that user counts toward the allocation total only once.

- View Creator Plus allocations by instance in the **Allocated users** column in the **Instances** list.

  In some scenarios, data isn't displayed in the **Instances** list.

  - Only instances on Washington DC Patch 2 and higher are listed in the **Instances** list.
  - If data sharing is restricted on an instance, usage data for that instance is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.
- View Creator Plus product subscription details by selecting a product in the **Subscriptions** list. On the details page, allocate available Creator Plus subscriptions by adding one or more groups with the Creator role.

Monitoring Now Assist usage in Subscription Management

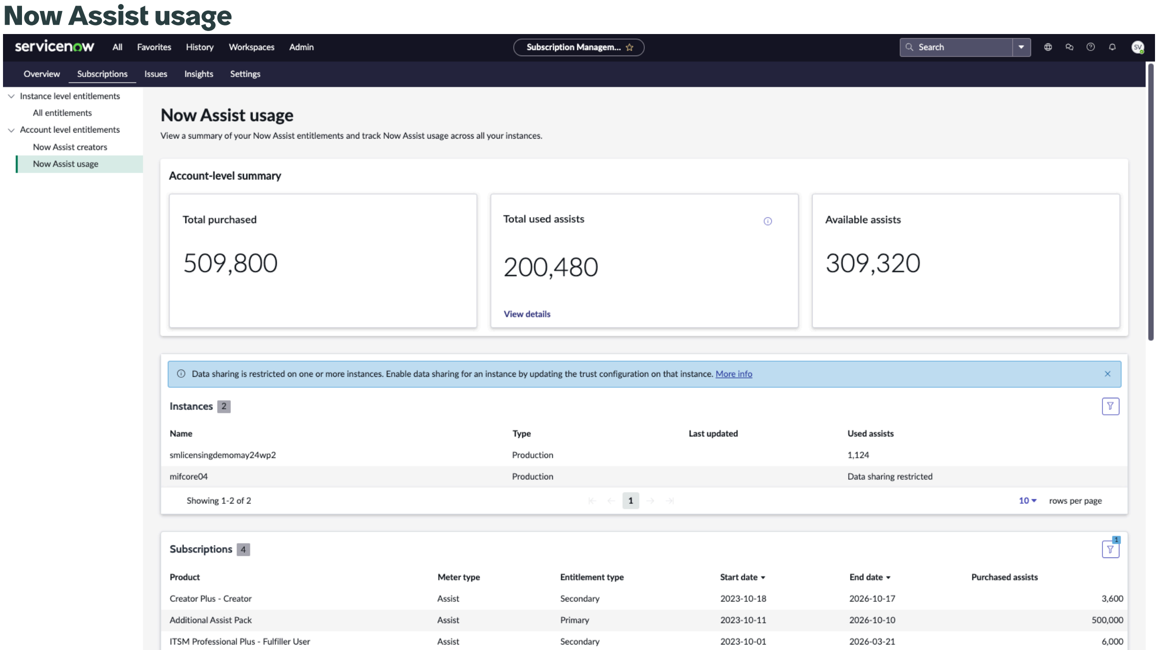
View a summary of your Now Assist entitlements and track Now Assist usage across all of your instances in Subscription Management.

Key benefits

- View an account-level summary of your Now Assist entitlements.
- Track Now Assist usage across your production and non-production instances.
- View a summary of Now Assist usage by skill.
- Plan for future purchases by analyzing Now Assist usage over time.

Note:
Now Assist usage data is refreshed daily in Subscription Management. The data reflects a 24-hour delay.

Now Assist usage



Required ServiceNow AI Platform roles

The usage_admin role is required to view and edit Subscription Management.

Accessing Now Assist usage details

Access details about Now Assist usage by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Now Assist usage**.

Use cases

- Compare the total number of Now Assist entitlements that your company has purchased to the total number of Now Assist entitlements consumed across all your instances. Monitor the remaining number of available number of Now Assist entitlements for your account.
- Visualize Now Assist consumption over time by selecting **View details** in the Total used assists card. Monitor compliance for your account over the last 365 days or determine when Now Assist usage exceeded the total purchased count.
- View the number of assists consumed by each of your instances in the **Used assists** column in the **Instances** list.

  In some scenarios, data isn't displayed in the **Instances** list.

  - Only instances on Washington DC Patch 2 and higher are listed in the **Instances** list.
  - If data sharing is restricted on an instance, usage data for that instance is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.
- View details for each of your products that include assists in the **Subscriptions** list.
  - Determine whether assists are the primary or secondary line item in a purchase according to the value in the **Entitlement type** column.
  - Verify the start date and end date for each product.
  - View the total number of entitlements provided by each product in the **Purchased assists** column.
- Determine cumulative Now Assist usage by skill on your current instance. Data in the table is updated nightly. If your current instance doesn’t have any active subscriptions with assists, the list of skills is empty.
  - View the number of times a skill has been used in the **Number of actions** column.
  - View the relative cost for each assist in the **Assist ratio** column.
  - Determine which skills are consuming the most Now Assist entitlements by checking the **Total assists** column. Total assists are calculated by multiplying values in the **Number of actions** column by values in the **Assist ratio** column.
  - Analyze Now Assist usage over time on your current instance by viewing the Utilization history chart. Monitor monthly or daily usage using the filter. Look for trends related to Now Assist skills. If usage continues to grow every month, consider purchasing more entitlements to stay in compliance.

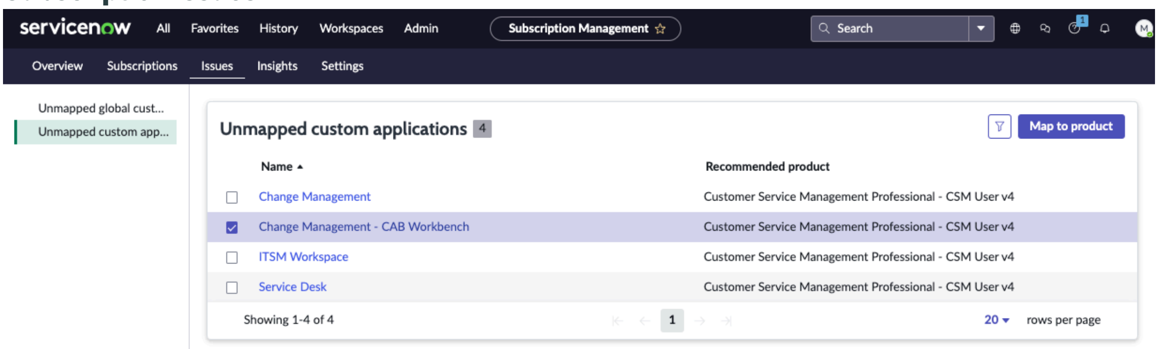
Addressing issues in Subscription Management

Stay in compliance by mapping custom tables and custom applications to subscriptions in Subscription Management.

Key benefits

- Identify custom tables and custom applications that aren't mapped to subscriptions.
- Maintain accurate entitlements by mapping custom tables and custom applications to a recommended product subscription or a product subscription of your choice.
- Plan for future subscription needs by assessing your custom table entitlements.

Subscription issues



Accessing subscription issues

Access information on subscription issues on the **Issues** tab by navigating to **Admin** > **Subscription Management** > **Issues** or **All** > **Subscription Management** > **Issues**.

Unmapped global custom tables

Determine whether you have custom tables in the global scope that aren't mapped to a valid product subscription by accessing the **Unmapped global custom tables** tab. Keep custom table entitlements current by mapping the tables to a product subscription. For more information, see Map custom tables to a product subscription in Subscription Management.

Custom tables that aren’t mapped to a subscription appear on the **Issues** tab the day after they’re created.

Unmapped custom applications

Determine whether you have custom tables in a scoped application that aren't currently mapped to a valid product subscription by accessing the **Unmapped custom applications** tab. Ensure that entitlements for these tables are current by mapping the application to a product subscription.

You map tables in a scoped application at the application-level, which eases administration because you don't need to map tables individually after the application is mapped. For more information, see Map a custom application to a product subscription in Subscription Management.

Custom applications that aren’t mapped to a subscription appear on the **Issues** tab the day after they’re created.

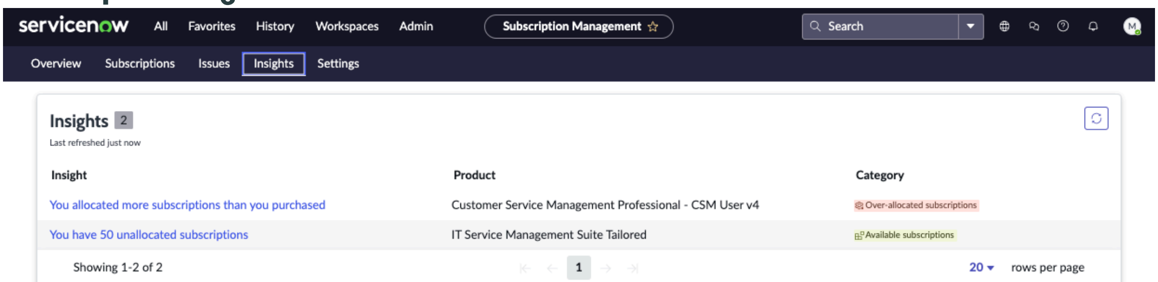
Discovering insights in Subscription Management

Identify when subscriptions are over-allocated and view actions you can take to maximize subscription usage in Subscription Management.

Key benefits

- View product subscriptions that are over-allocated and require adjustments or more entitlements.
- View product subscriptions with available subscriptions that you can allocate by adding groups.
- Maximize subscription usage by allocating your available subscriptions.

Subscription insights



Accessing subscription insights

Access subscription insight information on the **Insights** tab by navigating to **Admin** > **Subscription Management** > **Insights** or **All** > **Subscription Management** > **Insights**.

Over-allocated subscriptions

Identify over-allocated per-user subscriptions on your instance by accessing the **Insights** tab. Stay in compliance by performing one or more of the following actions:

- Remove a group from a subscription
- Remove a role from a group
- Remove users from a group
- Purchase more subscriptions

For more information, see Remove a group from a product subscription in Subscription Management.

Available subscriptions

Identify available subscriptions on your instance by accessing the **Insights** tab. Maximize subscription usage and grant entitlements to the right users by allocating available subscriptions.

You allocate per-user subscriptions by adding one or more groups to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their assigned roles. For more information, see Allocate subscriptions in Subscription Management.

Configuring Subscription Management

Set up and configure Subscription Management.

Configuration overview

Subscription Management is free and active by default for all production instances and non-production instances. You do not have to activate a plugin.

1. Create a Subscription Management administrator

   Assign the usage_admin role to at least one user who will manage subscriptions for your organization.

2. Share subscription data from another instance

   View subscription data from other production instances in areas of Subscription Management that provide account-level summaries of subscription usage.

3. Configure the subscription allocation status in Subscription Management

   Configure the allocation status threshold using a percentage value that represents what near capacity means for your instance.

Create a Subscription Management administrator

Create a Subscription Management administrator by assigning the usage_admin role to an administrator.

Before you begin

Role required: admin

About this task

Usage admins review and manage how purchased subscriptions are used on your production instance. They add groups to appropriate subscriptions, monitor usage of applications, and update subscriptions as needed.

Assign the usage_admin role to users that manage subscriptions for your organization. Assign the usage_admin role to at least one person in your organization. Only admins and usage_admins can use Subscription Management.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select an existing user.
3. Update the user's role assignment by selecting **Edit** in the Roles related list.
4. Add the usage_admin role.
5. Select **Update**.

Share subscription data from another instance

View subscription data from another instance by enabling data sharing on that instance.

Before you begin

Role required: admin

About this task

By default, data sharing is restricted between production instances, which means you can't see subscription data for other production instances in Subscription Management. To view subscription data from another production instance, modify the trust configuration settings on that instance.

For more information about modifying the trust configuration for an instance, see Configure data synchronization for applications.

Note:
Subscription data from a non-production instance is only viewable from a production instance.

In this scenario, the instance for viewing subscription data across all your instances is considered the primary production instance.

Procedure

1. Log in to the instance that has subscription data that you want to view on your primary production instance.
2. Navigate to **All** > **Multi-Instance Management** > **Trust Configuration**.
3. In the list of instances, find the primary production instance.
4. Share data from your current instance by changing the value in the **Grant access** column to true.

Result

Subscription data is shared with your primary production instance.

What to do next

Log in to your primary production instance to view the subscription data that is now shared with that instance. Repeat these steps for each additional production instance that has subscription data that you want to view from the primary production instance.

Configure the subscription allocation status in Subscription Management

Identify when you're close to allocating all of your subscriptions by configuring an allocation status threshold if you prefer a threshold other than the default value of 90 percent in Subscription Management.

Before you begin

Role required: usage_admin or admin

Procedure

1. Navigate to the **Settings** tab in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Settings**.
   - Navigate to **All** > **Subscription Management** > **Settings**.
2. In the **Allocation Status** tab, enter a percentage value that represents near capacity for your instance.
   If you want the **Status** column to display Near capacity before reaching the 90 percent threshold, enter a lower percentage value.
3. Select **Save**.

Result

When the number of allocated subscriptions exceeds the percentage you configured, the value Near capacity appears in the **Status** column throughout Subscription Management.

Managing per-user subscriptions in Subscription Management

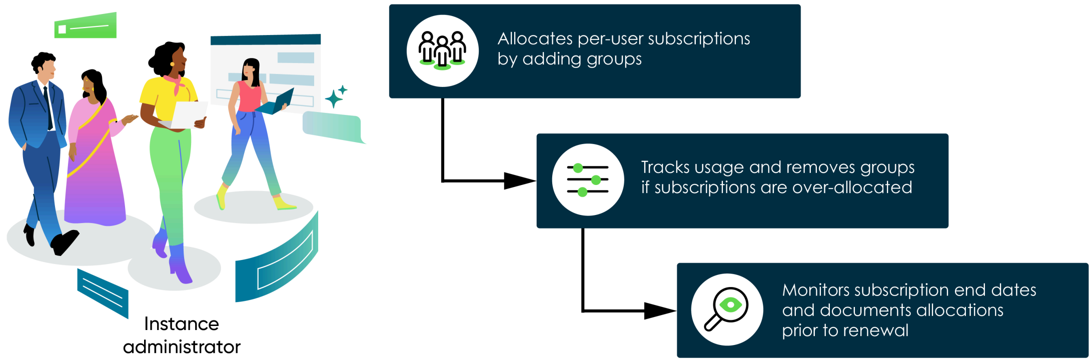
Manage your per-user subscription allocations using Subscription Management.

Overview of managing per-user subscriptions

To successfully manage your per-user subscriptions, follow the process in this infographic.

servicenow

Managing per-user subscriptions



- Allocate subscriptions in Subscription Management

  Subscriptions are managed in Subscription Management using groups. Subscriptions are measured and audited in Subscription Management using roles. You allocate subscriptions by adding one or more groups with measured roles to a product subscription.

- Remove a group from a product subscription in Subscription Management

  You can potentially over-allocate subscriptions, meaning more users possess an entitlement than the number of purchased subscriptions. Subscription Management flags over-allocated subscriptions for you. To stay in compliance, remove users or groups from the subscription or purchase more subscriptions.

- Maintain per-user subscription allocations in Subscription Management at renewal

  When a per-user subscription renews, a new product SKU might be added to your account. Maintain your current allocations during the renewal process by documenting your allocations before the renewal date.

Recommended groups

When allocating per-user subscriptions, you can add groups based on the roles they have or you can add groups recommended by Subscription Management based on their roles. For example:

- If the Service Desk group has a fulfiller-type role in the ITSM application, you can add the Service Desk group to the ITSM product subscription to allocate the fulfiller subscriptions included with ITSM to all of the users in the group.
- If you have available ITSM subscriptions, you can add groups that are recommended by Subscription Management based on the types of roles they have. If you don't want to add the recommended groups, Subscription Management identifies other groups with relevant roles that you can add instead.

Groups that you add to a product subscription are considered subscribed groups. Consider assigning a group manager who is responsible for managing group membership and role assignments.

Measured roles

Roles that require a subscription are considered measured roles. Measured roles grant users access to an application and are categorized by the level of access they provide.

When possible, simplify role administration by assigning measured roles to groups instead of assigning roles directly to individual users.

Allocate subscriptions in Subscription Management

Give users entitlement to ServiceNow products by allocating subscriptions in Subscription Management.

Before you begin

Role required: admin

Procedure

1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management**.
   - Navigate to **All** > **Subscription Management** > **Subscription Management**.
2. Select a product with subscriptions that you want to allocate.
3. Allocate subscriptions by either adding recommended groups based on role type or adding other groups with relevant roles.

Result

Subscriptions are allocated to all group members that grant each member entitlement to use the product.

Remove a group from a product subscription in Subscription Management

Fix an over-allocated subscription and free up entitlements by removing a group from a product subscription in Subscription Management.

Before you begin

Role required: usage_admin or admin

Procedure

1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management**.
   - Navigate to **All** > **Subscription Management** > **Subscription Management**.
2. Identify an over-allocated subscription by checking either the **Status** column on the **Overview** tab or the list of over-allocated subscriptions on the **Insights** tab.
3. Select the over-allocated product subscription.
4. On the subscription details page, select the **Subscribed Groups** tab.
5. Select the check box next to one or more groups that you want to remove.
6. Select **Remove**.
7. In the dialog box, confirm that you want to remove entitlements for all users in the selected groups by selecting **Remove**.
8. **Optional:** Verify that the subscription is no longer over-allocated by checking the value in the **Status** column on the **Subscriptions** tab.

What to do next

The group is removed from the subscription. If the group still has a measured-role that requires a subscription, add the group to a different subscription or remove the measured-role from the group.

Maintain per-user subscription allocations in Subscription Management at renewal

Ensure subscription allocations remain consistent throughout the renewal process.

Before you begin

Role required: admin

About this task

When a per-user subscription renews, a new product SKU might be added to your account. This SKU is treated as a new product subscription in Subscription Management, requiring you to re-allocate subscriptions by adding groups with measured roles to the subscription.

Procedure

1. Before the renewal date, monitor the subscription end dates on the details page and document the current group allocations.
   See Viewing product subscription details in Subscription Management.
2. After the renewal date, add the documented groups to the renewed subscription in Subscription Management.
   See Allocate subscriptions in Subscription Management.

What to do next

Continue to monitor subscription renewal dates to ensure that your allocations are accurate throughout each renewal.

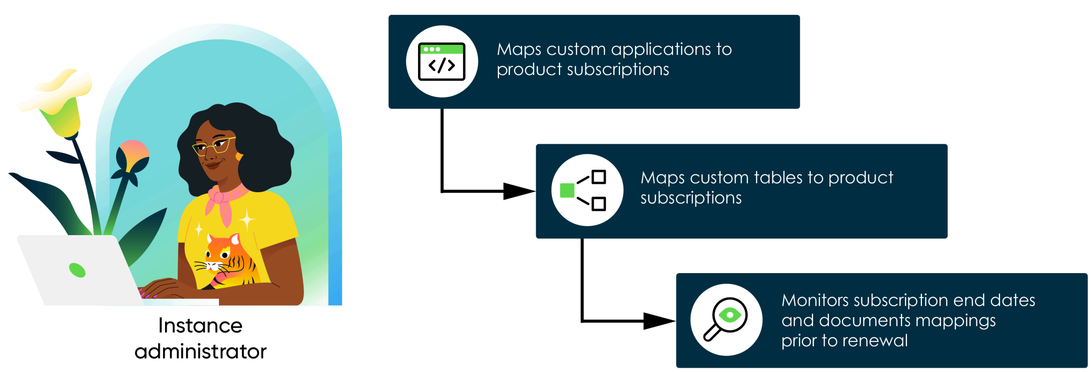
Managing custom tables and applications in Subscription Management

Keep your custom table entitlements updated by mapping all of your custom applications and tables to valid subscriptions in Subscription Management.

Overview of managing custom tables and applications

To successfully manage your custom tables and applications, follow the process in this infographic.

Managing custom tables and applications



- Map a custom application to a product subscription in Subscription Management

  Map a custom application to a product subscription so that when developers add more tables to the application, they're automatically mapped to the subscription. Track your custom table usage to ensure that your organization doesn't run out of custom table entitlements.

- Map custom tables to a product subscription in Subscription Management

Map custom applications and custom tables on your production instance to a valid subscription. On non-production instances, mapping is recommended but not required.

- Maintain custom table and application mappings at renewal in Subscription Management

  When a subscription renews, a new product SKU might be added to your account. Maintain your current custom table mappings during the renewal process by documenting your mappings before the renewal date.

Custom tables

A custom table is defined as a table that you create on the ServiceNow AI Platform that isn't provided by ServiceNow. Some tables are exempted from being classified as a custom table.

> **Note:**
> For more information on custom tables on the ServiceNow AI Platform, see Table administration. For a detailed description of custom table use rights and exempt tables, see the Custom Table Guide on http://www.servicenow.com/upgrade-schedules.html

Subscriptions come with custom table entitlements that dictate the number of custom tables that you can map to a subscription. The number of custom table entitlements depends on the subscription.

Custom applications

A custom application is defined as an application that you create on the ServiceNow AI Platform that isn't provided by ServiceNow. If your organization purchased App Engine, you can use Subscription Management to manage your custom application subscriptions.

Recommended subscriptions

When you map a custom table or a custom application to a subscription, Subscription Management provides a recommended subscription based on the following criteria:

The table belongs to an app scope or package

The custom table or tables in the application belong to an app scope or package associated with the recommended subscription.

The table extends another table

The custom table or tables in the application extend another table mapped to the recommended subscription.

The table has a relationship to another table

The custom table or tables in the application are related to a different custom table or a ServiceNow out-of-the-box table associated with the recommended subscription.

The table doesn't meet any of the above criteria

The custom table or tables in the application don't meet any of the above criteria. If you have an App Engine subscription, Subscription Management recommends mapping the table or application to an App Engine subscription.

If you don't want to map to the recommended subscription, you can map to a subscription of your choice. For details, see KB1644296.

In some cases, groups aren't recommended because the measured role is inherited and not directly assigned. To work around this problem, assign the measured role directly to the group.

Once the group is assigned the measured role, the group appears in the list of recommend groups in Subscription Management.

App Engine usage

App Engine subscriptions entitle you to develop applications and deploy custom tables in production instances. Based on your App Engine version, you monitor the subscription usage of your App Engine applications differently.

- You can view and manage App Engine V2 subscriptions in Subscription Management just like any other product subscription. You can map your applications and custom tables to an App Engine V2 subscription and allocate per-user subscriptions by adding groups with measured roles to an App Engine V2 subscription.
- For details on auditing App Engine V1 usage, see KB0999383.

Map a custom application to a product subscription in Subscription Management

Maintain accurate entitlement for custom tables in a scoped application by mapping the application to a product subscription in Subscription Management. To stay in compliance, you must map custom tables that belong to custom applications to a product subscription.

Before you begin

Role required: usage_admin or admin

About this task

As your developers create and deploy new custom applications and tables on your instances, use Subscription Management to map them to subscriptions. After you map a custom application to a product subscription, additional tables that developers add to the application are automatically mapped to the subscription.

Procedure

1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. In the **Unmapped custom applications** tab, look for custom applications that aren't mapped to a subscription.
3. Update your entitlements by mapping one or more custom applications to a recommended product or a product of your choice.
   Subscription Management recommends product subscriptions with available custom table entitlements in the **Recommended Product** column.

Result

One or more custom applications are mapped to a product subscription and your custom table entitlement count is updated.

Map custom tables to a product subscription in Subscription Management

Maintain accurate entitlement for custom tables in the global scope and stay in compliance by mapping the tables to a product subscription in Subscription Management. Mapping your custom tables keeps your custom table allotment updated and helps you avoid running out of custom table entitlements.

Before you begin

Role required: usage_admin or admin

Procedure

1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. In the **Unmapped global custom tables** tab, look for custom tables that aren't mapped to a subscription.
3. Update your entitlements by mapping one or more custom tables to a recommended product or a product of your choice.
   Subscription Management recommends product subscriptions with available custom table entitlements in the **Recommended Product** column.

Result

One or more custom tables are mapped to a product subscription and your custom table entitlement count is updated.

Maintain custom table and application mappings at renewal in Subscription Management

Ensure custom table and application mappings remain consistent throughout the renewal process.

Before you begin

Role required: admin

About this task

When a subscription renews, a new product SKU might be added to your account. This SKU is treated as a new product subscription in Subscription Management, requiring you to re-map custom applications and custom tables to the subscription to stay in compliance.

Procedure

1. Before the renewal date, monitor the subscription end dates and document the current list of custom application and custom table mappings.
   See Viewing product subscription details in Subscription Management.
2. After the renewal date, map the documented tables and applications to the renewed subscription in Subscription Management.
   See Map a custom application to a product subscription in Subscription Management and Map custom tables to a product subscription in Subscription Management.

What to do next

Continue to monitor subscription renewal dates to ensure that your mappings are accurate throughout each renewal.

Grandfathered and exempted tables

Grandfathered and exempted custom tables are treated differently than other custom tables on your instance. Please refer to your organization's ServiceNow® contract for additional information.

Grandfathered tables

Depending on your organization's legacy subscription entitlements and contractual migration, grandfathered tables may be allotted to your production instance. To preserve an organization's previous custom table entitlements through the license migration, a grandfathered table entitlement may be provided to the production instance. This one-time process ensures that

custom tables that currently exist in a production instance don't count against your new custom table entitlements.

Grandfathered custom tables may not be transferred, reused, or otherwise classified as another custom table type. If you delete a grandfathered custom table, you can't classify any other custom table as a grandfathered custom table to take its place. Once a custom table has been associated with a grandfathered table subscription, it remains in the Custom Table Inventory even if the table is deleted from the instance.

To view your grandfathered tables, enter `ua_custom_table_inventory.list` in the filter navigator, and then add a filter with the condition **[Allotment type] [is] [Grandfather]**.

If you have a combination of custom tables and grandfathered tables in one application, the grandfathered tables must be mapped to a grandfathered table subscription and the remaining custom tables to one other subscription. Open a case with Customer Service and Support for help with mapping a grandfathered table to a grandfather table subscription.

Example: Grandfathered tables on an instance

Scenario: Your organization purchases three new subscriptions with entitlements for a total of 55 App Engine Starter custom tables (formerly Bundled Custom Tables). To ensure your organization doesn't lose the previous custom table entitlements, a grandfather subscription with an entitlement for 25 grandfathered tables is allotted to your instance. This subscription requires the admin to identify and map the existing 25 tables. These subscriptions result in a total custom table entitlement of 80. Once a custom table has been assigned to the grandfather subscription there is no option to revert this.

Multiple subscriptions with grandfathered and custom table entitlements

Subscription	Number of custom table entitlements	Number of mappable tables
Grandfathered subscription	25	25
New Subscription 1	25	25
New Subscription 2	25	25
New Subscription 3	5	5

Exempted tables

Exempted tables are custom tables that do not count towards your subscription entitlements. These tables consist mostly of custom extensions of certain system-related tables, such as sys_portal_page and sys_user_preference, that you extend for operational improvements in your production instance.

To view a list of exempted tables, enter `ua_exempted_table_inventory.list` in the filter navigator.

The Custom Table Guide legal schedule provides the complete definition of which tables are considered exempt.

Note:
Legal schedules are enforced based on when the contract is executed.

To find past versions of the Custom Table Guide, see the Legal Schedules Custom Table Guide.

Monitoring capacity subscriptions

Manage and track capacity subscriptions using Subscription Management.

Overview of monitoring capacity subscriptions

Learn how capacity totals are calculated

Capacity subscription usage is calculated using a table query or scripted definition. You can view a Capacity Definition record to view the details of the table query or scripted definition. You can also execute the definition on demand to view the latest counts.

After you determine how a capacity total for a subscription is calculated, you can adjust the number of allocated resources or increase your capacity subscription to keep your subscription in compliance. For example, you can find out which tables are queried for active users or how usage is defined for devices or software when the system allocates CIs to a capacity subscription.

Monitor capacity subscription calculations in Subscription Management

View how a capacity total is calculated to keep your subscription in compliance.

Before you begin
Role required: admin or usage_admin

Procedure

1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Subscriptions**.
   - Navigate to **All** > **Subscription Management** > **All Subscriptions**.
2. In the list of all your product subscriptions, select a capacity subscription.
3. On the subscription details page, preview the Capacity Definition record by selecting the record ID next to the **Capacity Definition** field.
4. Depending on the definition type, review the following details to view how usage is calculated.
5. **Optional:** Select **Open Record** to view the full Capacity Definition record details.
6. **Optional:** Select **Execute** to run the query or script immediately and view the latest results.

   Note:
   Executing a script or table query in a Capacity Definition record does not count toward the execution total that is monitored by the system.

   The total time required to execute and the latest count are displayed. The count from prior executions is displayed in the Previous Executions related list.
7. If the capacity subscription is out of compliance, adjust the number of allocated resources or increase the capacity subscription.

Subscription Management reference

Reference topics provide information about subscription types, meters, and domain separation support.

Types of subscriptions in Subscription Management

Subscriptions to ServiceNow applications come in different types. The type of subscription determines the allocation of users, access to applications, and custom application and table entitlements.

Each type of product subscription is measured according to a meter. For details on the different types of meters and what they measure see KB0727967.

Subscription type	Associated meter types	Usage allocation method	Description
Capacity	• Devices • Subscription Units • Transactions	No manual steps are required. Usage is automatically calculated and shown in your instance.	Automatically tracks measured units, and counts of transactions, records created, or resources managed such as devices, software, or nodes.
Display Only	None	Allocation isn't measured	Displays information. This type of subscription doesn't support allocation.
Per-User	• Rights-based user: measure of Fulfiller Users and Business Stakeholder Users • Application user: measure of users with any level of access to a product; includes Creator Users	Manually allocated	Provides entitlements to users according to their assigned roles and associated access rights. You allocate per-user subscriptions manually by adding groups with measured roles or access rights to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their role assignments.
Unlimited	Unlimited: No measurement limit	Automatically allocated by your instance	Provides entitlements to users, with no limit to the number of users that can be allocated.
Unrestricted User	Unrestricted user: Instance-wide measure of all active users	Automatically allocated by your instance	Provides entitlements for an organization's number of active users regardless of their role assignments. An active user is any user whose record in the Users [sys_user] table has a value in the **User ID** field and has the **Active** field set to true.

Subscription form

The Subscription form contains important information about your subscription.

You can view the subscription form by entering `license_details.list` in the filter navigator to open the Subscriptions [license_details] table. Select a subscription name to open the Subscription form. Some fields do not appear for ServiceNow Store apps.

Subscription form

Field	Value
Name	Name of the subscription.
Category	Source of the purchased subscription: ServiceNow platform or ServiceNow Store.
Type	Type of subscription: • Per-User • Unrestricted User • Capacity • Unlimited • Display To learn more about subscription types, see Types of subscriptions in Subscription Management.
Start date/End date	Start and end of the subscription period as agreed in your service contract. This information appears in the General section of the service contract for the subscription.
Capacity Definition	The ID of the Capacity Definition. Learn how the total is calculated by selecting the Capacity Definition record ID on the product subscription details page. See Monitor capacity subscription calculations in Subscription Management.
Display only	Value of **true** indicates that user allocation or monitoring is not currently supported for the subscription.
Product Code	The product SKU shown on your subscription order form.

Related links

The related links on the subscription form may vary depending on the subscription.

Link	Description
Manage Your Tables	See custom tables mapped to the subscription.

Link	Description
View Subscription History	View subscription status, dates, and trend information.
View User Subscription History	Lists user allocation history for the subscription. The list shows a user's current subscription status and how they were allocated.

User sets and groups in Subscription Management

Subscription Management uses groups (previously user sets) to provide entitlement to sets of users.

User set and groups overview

Prior to Quebec, Subscription Management used user sets to group users together. Usage_admins grouped users by conditions, such as what city or department they are in. User sets could then be assigned to subscriptions to give every user in the user set a license to the subscription.

In Quebec and later releases, all user sets are converted to groups. A group is a set of users who share a common purpose. Similar to user sets, groups can be added to subscriptions. Adding a group to a subscription gives every user in the group entitlement.

User set conversion

On upgrade to Quebec or later releases, all current user sets convert to groups. The new groups contain the same users and properties as your user sets. The conversion is a one-time occurrence, and users are not automatically added or removed from the new group after the conversion.

Group management

Admins and user_admins create groups and add users in the **User Administration** application.

To learn more about creating and editing groups, see Creating groups.

Components installed with Subscription Management

Several components are installed with activation of the Subscription Management plugin (com.glide.subscription_management), including user roles and tables.

Roles installed

Role title [name]	Description	Contains roles
Usage administrator [usage_admin]	Administers Subscription Management. Allocates subscriptions, maps custom tables and custom applications to subscriptions.	sn_sub_man.admin

Tables installed

Table	Description
Subscribed Groups [sn_sub_man_st_subscribed_groups]	[Remote table] Groups that you add to a product subscription
Subscription Insights definition [sn_sub_man_st_subscription_insights]	[Remote table] Records for available subscriptions and over-allocated subscriptions
Subscription license detail definition [sn_sub_man_st_subscription_license_detail_metric]	[Remote table] Subscription allocation metrics and history
Unallocated Group Recommendations [sn_sub_man_st_unallocated_group_recommendation]	[Remote table] Product recommendations for unallocated groups

Subscription Management roles

Subscription Management is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Usage administrator [usage_admin]

Administers Subscription Management. Allocates subscriptions, maps custom tables and custom applications to subscriptions.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevate to a privileged role.

No

Special considerations

None

Usage administrator [usage_admin]

Administers Subscription Management. Allocates subscriptions, maps custom tables and custom applications to subscriptions.

Domain separation and Subscription Management

Domain separation is unsupported for Subscription Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Related topics

Domain separation for service providers

Now Support administration

The Now Support portal is where you can access self-help, get technical support, and manage your ServiceNow instances.

Who uses the Now Support portal

If you are responsible for managing, monitoring, or maintaining your company's ServiceNow instance(s), then you will likely use the Now Support portal. ServiceNow Customer Administrators are the gatekeepers and manage their companies' Now Support users. Administrators can then add or remove other users, such as developers, architects, and partners. What you can do within the portal will vary based on your role.

> **Note:**
> For information about the types of notifications different Now Support users may receive, see KB0547262: Company Key Contacts and Notification List Overview on Now Support.

View Now Support users

As a Now Support admin, you can view active and inactive users and their roles.

Before you begin

Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users** or search for a specific user.

Create a user in Now Support

You can create users in Now Support and assign them access roles.

Before you begin
Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users**.
5. Select **Add new user**.
6. Fill in the required fields.
7. Select the appropriate Now Support access roles.
8. Select **Submit**.

Manage user access in Now Support

You can manage users in Now Support and change their access roles.

Before you begin
Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users** or search for a specific user.
   You can also select **Locked users** or **Inactive users** to find the user you are looking for.
5. After you select the user you want to change access for, select **Edit Role(s)** from the **Actions** pull-down field.
6. Add or remove Now Support access roles.
7. Select **Confirm**.

Configure ServiceNow AI Platform Core Features

The ServiceNow AI Platform provides for a multitude of customization options to your applications. Customize your UI, handle user and data administration, and localize your instance for time zones, currencies, and more.

User administration

Set up users, groups, and roles.

ServiceNow AI Platform tables and data

Manage data with external sources, and configure data tables.

Forms, fields, and lists

Control the action and appearance of forms, fields, and lists.

Search administration

Enable users to find the information through Zing or AI search engines and specialized search experiences.

Notifications

Manage system email, notifications, and responses to inbound messages.

ServiceNow AI Platform translation and localization

Match languages and currency everywhere on the globe.

Time configuration

Create calendars, schedule events, and display time info to users around the world.

Currency administration

Manage the way financial data is displayed.

User administration

Create account access types and related roles to work within your instance. User records give you control over individual single account types and the records or actions that they can access. Group records expand control further, to assign access to teams or departments, as well as to subgroups or by skill associations. Customize instances even more with Roles, and assign access to various apps or modules. Troubleshoot and test it all with Tools that provide auditing, impersonation, and more.

See User administration.

ServiceNow AI Platform tables and data

Manage and use your business information effectively on the ServiceNow AI Platform. Take advantage of Data Management to store, transfer, import, and archive data. Work with multiple records at once using Table Administration, and connect with third-party or external instances to handle data with Financial Services Remote Tables.

See ServiceNow AI Platform tables and data.

ServiceNow AI Platform forms, fields, and lists

Take control of every aspect of data collection and usage in your instance. Forms on the ServiceNow AI Platform are fully customizable, with options for personalization, templates, attachments, UI, and more. Create and modify Fields, used in forms and displayed in lists or tables. Define user access to all your data with Lists, including custom controls and functions.

See ServiceNow AI Platform forms, fields, and lists.

Search administration

Help your users find information with ease using ServiceNow search administration products. AI Search and the Zing search engine provide intelligent search results and proper indexing. Focus your data requests with Table searches, and go wider with Global searches, all with configurable search systems across the ServiceNow AI Platform. Improve search assistance with search suggestions, Contextual Search based on intent, and search data analysis.

See Search administration.

Time configuration

Keep your business on-time with the ServiceNow AI Platform. Handle schedule and event info collection with Date/Time fields, and manage personnel, users, and data across Time Zones. Business and fiscal calendars and event system schedulers are all available and tailored to best help you and your users. Time displays, counts, and time-based data analysis all help you manage your work and track historical info.

See Time configuration.

Currency administration

Monitor currency values with ServiceNow currency administration systems. Configure Standard Currency fields for financial and non-financial records and applications, or use expanded Foreign Exchange (FX) Currency fields for added configuration options.

See Currency administration.

Service Level Management

Ensure your services to your customers are properly managed and documented. The full series of ServiceNow modules for Service Level Management lets you define service contracts and service level agreements (SLA) as needed. Repair, monitor, and validate SLA records for time and duration accuracy, get analyses and reports on service, and separate record domains for information display and control.

See Service Level Management.

ServiceNow AI Platform translation and localization

Communicate effectively with users and customers around the world. The Localization Framework provides info to users in a variety of languages and currencies across a multitude of apps—all within the same instance. Dynamic Translation helps accommodate users even more fully, by actively translating text in forms and other applications.

See ServiceNow AI Platform translation and localization.

ServiceNow AI Platform integrations

Bring ServiceNow and external applications together with integrations on the ServiceNow AI Platform. Make onboarding and service configuration easy by adding to your instance. Integrate other instances, third-party apps, and data sources, and make helpful features such as Single Sign-on available throughout your enterprise.

See ServiceNow AI Platform integrations.

Notifications

Use Notifications to automate status updates by email, system, or user (through individual providers). Set up Email administration and your instance email client to work with notifications, and proper sending and receiving of email. System notifications enable real-time updates through push notifications, SMS, chat messages, and more.

See Notifications.

State Management

Monitor workflow in your instance with State Management. Define state models and transitions to determine your business's service processes, as well as UI actions possible based on state.

See State Management.

User administration

Manage the individuals who can access your instance by defining them as users in the system. Create user groups and assign users to them. Use roles to specify what different users and user groups can see and do.

Get started

Explore	Create users, companies, and departments	Create groups
Learn about User administration.	Create records for users or enable self-registration. Optionally create companies and departments to further categorize users.	Create and manage groups that you can grant roles to and assign users to for efficiency.
Manage roles	**Monitor user activity**	**Monitor instance usage**
Manage roles that govern what users and groups with that role can do.	Monitor user activity and troubleshoot issues by impersonating users and managing sessions.	Track application usage on your instance.

Exploring user administration

Learn more about user administration for your instance.

Overview

Creating users, groups, and roles provide a flexible and scalable way to manage access to features on the ServiceNow AI Platform. By creating user accounts, assigning users to groups, and defining roles and permissions, administrators can ensure that users have the appropriate level of access to applications and data. This enables organizations to control access to sensitive data, maintain conformance with regulatory requirements, and improve overall security. Additionally, users, groups, and roles can be easily managed and modified over time as organizational needs change.

Work flow

Subscriptions, users, groups, and roles work together to help you define who can access features on your instance.

1. Subscription Management

   Understand your subscriptions. Subscription management enables you to manage your subscriptions proactively and monitor subscription usage on your instances.

   Subscriptions may include per-user subscriptions. For more information, see Managing per-user subscriptions in Subscription Management.

2. Creating users, companies, and departments

   Create an account record for the individuals who have access to your instance. Each user account has a unique login ID, password, and set of permissions (roles) that define what they can do and access within the platform.

3. Creating groups

   Define groups that have similar roles or permissions. Groups enable you to apply permissions (roles) to multiple users at the same time. When a user is a member of a group, that user has the same permissions that have been defined for the group.

   You can view group members by navigating to **All** > **User Administration** > **Groups**. Select a group name and view the members in the Group Members related list.

4. Managing roles

   Roles describe the types of activities that a user can perform on the instance. Each role has a set of permissions that can govern what the users and groups can do, such as read, write, create, or delete records. Roles can be assigned to users and groups. Users can have multiple roles.

   For a complete list of the roles included with the ServiceNow AI Platform, see Base system roles.

   Role records are stored in the Roles [sys_user_role] table.

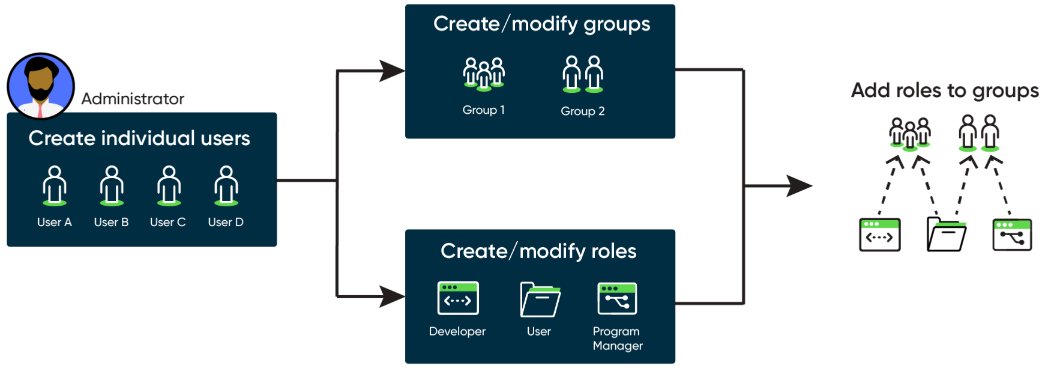
5. Monitoring instance usage

   Users with the admin or usage_admin role can view the **Application usage overview** and ServiceNow Store **usage overview** dashboards to track instance usage.

6. Monitoring user activity

   Users with the admin role can impersonate users, manage user sessions, and leverage non-interactive sessions.

User administration workflow



User preferences

Users can configure many UI features. Some examples include the number of rows per page in a list or whether the response time displays at the bottom of a list or form. Administrators can modify or delete these preferences as needed. For more information, see User preferences.

User groups

A group is a set of users who share a common purpose. Groups may perform tasks such as approving change requests, resolving incidents, receiving email notifications, or performing work order tasks. Any business rules, assignment rules, system roles, or attributes that refer to the group apply to all group members automatically. Users with the user_admin role can create and edit groups.

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Note:
You can view group members by navigating to **All** > **User Administration** > **Groups**. Select a group name and view the members in the **Group Members** related list.

Group records are stored in the Groups [sys_user_group] table.

User roles

Roles control access to features and capabilities in applications and modules. The admin role provides access to all features and capabilities.

After access has been granted to a role, all the groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

For a complete list of the roles included with the ServiceNow platform, see Base system roles.

Note:

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Role records are stored in the Roles [sys_user_role] table.

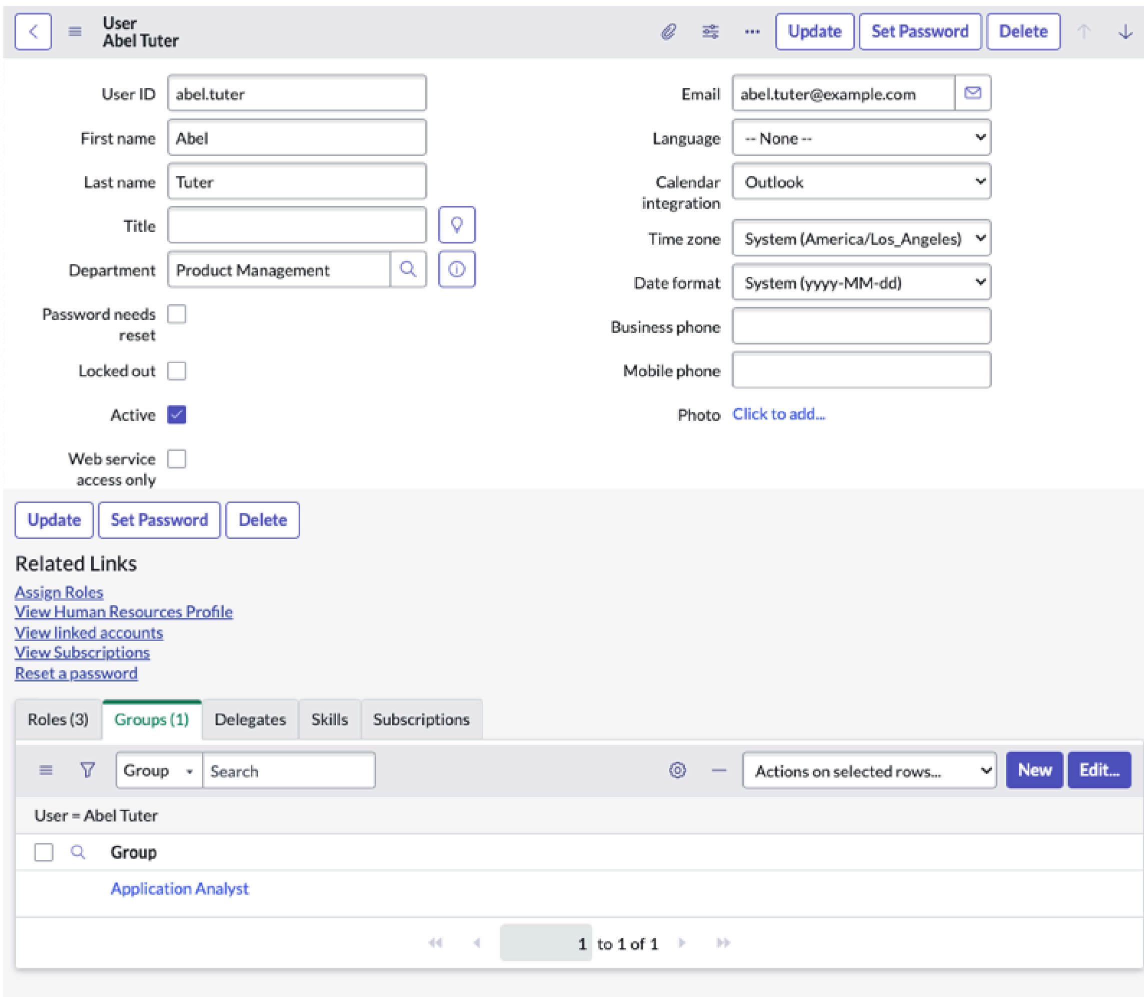
The User record

Learn about user records and their use within the ServiceNow AI Platform.

User account records

User records establish a relationship between an individual and your ServiceNow instance. User records consist of a user name, a password, and information relating to the individual, such as contact information, location, and job title.

User record



User records are stored in the Users [sys_user] table.

Related records

User records are associated with records on several other tables to control permissions, preferences, and other features.

Roles

Roles control access to features and capabilities in applications and modules. For more information on roles, see Managing roles.

Note:

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Groups

A group is a set of users who share a common purpose. Users assigned to groups are automatically assigned to all roles associated with that group. For more details, see Creating groups and Managing roles.

Delegates

In addition to role and group assignments, users can be assigned as delegates, giving them permission to act with the same permissions as a delegator user. See Delegating roles for more information on delegation.

Skills

Use skill management to associate users with their areas of training and expertise. For more information on skill management, see Skill Management.

Subscriptions

Administrators use subscriptions to control which users have access to purchased subscriptions on their instances. Details on subscription management can be found at Subscription Management.

User preferences

User accounts are also connected with user preferences. Users can save personalized preferences to configure many UI features, as well as preferences regarding the notifications they receive. Details on administering user preferences are found at User preferences.

System and guest users

Some automated processes use the system or guest user to apply and track changes to records. As a result, some records may show that they were last updated by system or guest.

For example, when a user logs in for the first time in a day, some fields on that user's record are updated by the system user, such as **Last login** and **Last login time**. If a user has a failed login attempt or is locked out, some fields on that user's record are updated by the guest user, such as **Failed Login Attempts** or **Locked Out**.

If a record was last updated by the system or by guest users, identify the fields that were updated by enabling auditing for the table and viewing the audit history set. For more information, see Configuring auditing for a table and Knowing about History sets.

Creating users, companies, and departments

Create user records for the individuals who access your instance. Users can be assigned to groups with defined roles to determine what records and actions they can access.

Creating users

Users are typically added through Lightweight Directory Access Protocol (LDAP) directory integrations. Admins can also manually add users to the instance, enable self-registration for new users, and impersonate users to ensure that they have the proper access privileges.

For more information on LDAP integrations, see LDAP integration.

Create a user

You can add a user to your instance to enable them to log in and use designated application features.

Before you begin

Role required: user_admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
User ID	Create a unique identifier for this user's ServiceNow login user name. Typical examples of user IDs are `cwitherspoon` and `charlie.witherspoon`. You can't create a user whose User ID duplicates an existing user. If you do import duplicates from an update set, the more recently created name takes the duplicate User ID.
Given name	Enter the user's given (often their first) name.
Family name	Enter the user's family name (often their last name). **Note:** You can clear the **First Name** field, or the **Last Name** field in an existing user record, but you can't clear both at the same time.
Title	Enter a title or job description, or select one from the list.
Department	Select the user's department from the list.
Password	Assign a password to the user. To set up the user's password, fill in the fields on the form and **save** the record. Then, select **Set Password**. This password can be permanent or temporary.
Password needs reset	Select this check box to require the user to change the password during the first login.
Locked out	Select this check box to lock the user out of the instance and terminate all their active sessions. The system helps prevent users with the admin role from locking themselves out.
Active	Select this check box to make this user active. Only the administrator sees an inactive user in: ◦ Lists of users ◦ The selection list on reference fields (magnifying glass icon) ◦ The auto-complete list that appears when you type into a reference field
Web service access only	Select this check box to designate this user as a non-interactive user. This field is available with Non-Interactive Sessions.
Internal Integration User	Select this check box to Mark service accounts as internal integration users.
Email	Enter the user's email address. To enter a non-standard email address that doesn't pass field validation, you must deactivate the validation script first:

Field	Description
	a. Navigate to **System Definition** > **Validation Scripts**. **b.** Select the **email** record. **c.** Clear the **Active** check box and save the change. **d.** Complete the user profile, including the email address, and update or submit the record. **e.** Reactivate the email validation script.
Language	Select your preferred language from the list.
Calendar integration	Select **Outlook** to have this user receive meeting notifications via email directly to the calendar. Otherwise, select **None**.
Time zone	Select the user's time zone.
Date format	Select the user's preferred format for dates.
Business phone	Enter the user's business phone number.
Mobile phone	Enter the user's mobile phone number.
Photo	Attach a photo of the user, if appropriate.

The minimum fields required to create a user record are: **User ID** and either **First name** or **Last name**.

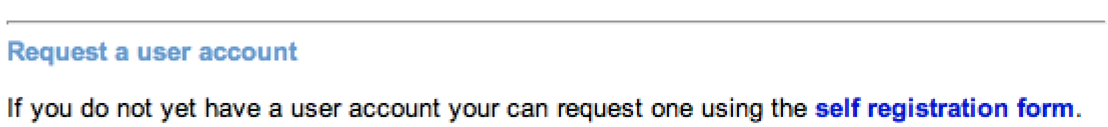
You can select the **Personalize Form** icon to remove fields.

4. **Optional:** Add **Roles**, **Groups**, **Delegates**, **Skills**, and **Subscriptions** to the user.
   For more information, see Managing roles, Creating groups, and Delegating roles.
5. Select **Submit**.
   The new user record appears in the list.

User self-registration

The User Registration Request [com.snc.user_registration] plugin provides the ability for unregistered users to request access to a ServiceNow instance. An administrator can activate the plugin.

A user can request an account by navigating to the instance. If the plugin is installed, the following section is added to the welcome screen.



The user can complete and submit the self-registration form, and see a confirmation that it was submitted. The user receives an email when the account is registered.

Note:
If the email address entered in the self-registration form is already in the system, the request is not submitted.

Approve a self-registered user account

When a user submits a self-registration form, an admin can review and approve it.

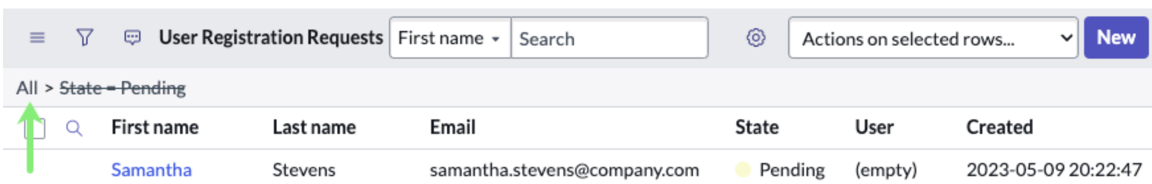
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Pending User Registrations** and open the request.
2. Use the **Create User** and **Reject** related links on the registration request form to approve or deny the request.
   - If **Create User** is selected, a new user is created using the email address as the **User ID**.
   - If **Reject** is selected, the request is marked **Rejected**.

   If the request was accepted, the user is sent an email notification with the login information. If it was denied, the user is sent an email with the rejection information.
3. **Optional:** To view past registration requests, remove the **[State] [is] [Pending]** condition from the filter in the list view.



Enable automatic self-registered user account approval

Admins can enable users to self-register. Enable automatic approval of such accounts to streamline user registration.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Properties** > **System**.
2. Select **Enable auto processing of user registration request**
3. Select **save**

   If enabled, registration requests do not require approval. Instead, the business rule *`Auto-Process User Registration`* creates the user record from the information provided.

What to do next

Request activation of the Explicit Roles (`com.glide.explicit_roles`) plugin. The Explicit Roles plugin creates two roles to differentiate between internal and external users.

Add a new company

You can add companies that represent vendors, manufacturers, or customers with whom you do business. These companies provide a way to categorize users, groups, and assets.

Before you begin

Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Companies**.
2. Click **New**.
3. Complete the form with the company details.

Company fields

Field	Description
Name	Name of the company.
Phone	Company phone number.
Fax phone	Company fax number.
Manufacturer	Whether the company is a manufacturer.
Vendor	Whether the company is a vendor.
Stock symbol	Three or four letter stock symbol for the company.
Stock price	Current price at which company stock is sold.
Street	Mailing street address of the company.
City	City in which the company is located.
State	State or province in which the company is located.
Zip/Postal code	Zip or postal code for the company.
Notes	Any information about the company that would be helpful for others to know.
Fields that can be added by Personalize a form:	
Latitude	The latitude of the company, if applicable. This field is populated by a business rule called `get_lat_long`. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Latitude is expressed as a floating point data type. Latitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called **Old Latitude**. The system attempts to convert all latitude values from previous versions to the floating point notation, where possible. **Note:** This field doesn't display by default. You can add it by personalizing the form.
Longitude	The longitude of the company, if applicable. This field is populated by a business rule called `get_lat_long`. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Longitude is expressed as a floating point data type. Longitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called **Old Longitude**. The system attempts to convert all longitude values from previous versions to the floating point notation, where possible.

Field	Description
	Note: This field doesn't display by default. You can add it by personalizing the form.

Note:
The IT Finance application adds a Finance view to the Company form. The Finance view adds a chart that shows expenses that were allocated to the company.

What to do next
Normalize company data to create consistency when referring to a company name, such as a vendor or manufacturer. For more information see, Normalization data services.

Normalization data services

The Normalization Data Services plugin helps maintain consistency for table fields that refer to a company name.

Tables related to configuration items and assets usually contain columns referring to a company name, such as a vendor or manufacturer. Often, these tables refer to the same company by several different names. This situation can happen for many reasons. For example, vendors sometimes use different company names depending on the device. This inconsistency creates problems, especially for reports that rely on these company names.

The Normalization Data Services plugin helps alleviate this problem.

When you enable and configure the Normalization Data Services plugin, the system downloads a list of standard company names that ServiceNow has compiled. It also downloads a list of common variants of that name. Anytime the plugin finds a company-name field with one of those variants, it substitutes the standard name in its place.

Note:
The Normalization Data Services plugin refers to a standard name as a normalized name and to a variant name as a discovered name.

While the Normalization Data Services plugin provides services similar to the field normalization feature, this plugin doesn't require you to manually set up the mappings from one name to another. If you like, you can add your own mappings to the set. However, you automatically start with extensive lists of common company names (normalized names) and their variants (discovered names).

The Normalization Data Services plugin stores data in two tables. The Normalized Company Names table contains the list of normalized company names. The Normalized Mappings table contains the mappings between each discovered name and its normalized name.

Important:
If you edit a field whose value is a normalized name, you change the normalized name for ALL discovered names that map to it. These types of updates occur regardless of the table in which you edit the field.

The Normalization Data Services plugin adds a unique index or hash on the [core_company] table. You can store only one company record for a company name. The unique hash is the same for two companies with the same name. The uniqueness is required for many features to work correctly. For example, **Discovery**, which creates customer management database (CMDB) models and CIs. On a domain separated instance, the unique index is expanded to

hash,sys_scope. This enables each domain to have its own version of a company with the same name.

Implementing normalization data services using guided setup

You can implement Normalization Data Services using a guided setup.

Normalization Data Services guided setup provides a sequence of tasks that help you configure the Normalization Data Services plugin on your instance. To open Normalization Data Services guided setup, navigate to **Normalization Data Services** > **Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Note:
Because the Normalization Data Services feature requires an internet connection to download mapping information, this feature isn't supported for on-premise instances.

Activating the plugin

In the first task of the guided setup, you activate the Normalization Data Services plugin (com.glide.data_services_canonicalization.client). Activating the plugin installs all the necessary schema to support normalizing references to Company records in the customer management database (CMDB) and Asset Management.

Downloading normalized data

In this task, you download the repository of all enterprise vendor names and the mappings to their normalized counterparts. After the download finishes, you can view the downloaded data in the Normalized Company Names [cds_client_name] table. You can verify mappings in the Normalized Mappings [cds_client_mapping] table. For example, you can verify that "Dell", "DELL", "Dell (UK)" are mapped to "Dell Inc.".

Updating reference qualifiers

This task modifies the reference qualifiers in reference fields linked to the Companies [core_company] table, helping to ensure that users can only select from a list of normalized company names. For example, when creating a Computer (cmdb_ci_computer) record, users can only select "Dell Inc." and not "Dell" or "Dell Incorporated".

Some reference qualifiers may not get updated. To normalize these reference qualifiers manually, see KB0784201.

Activating normalization properties

In this task, select the properties you want to activate. See Normalization properties.

Enable the **Normalize existing canonical core_company records** property if the Companies [core_company] table has two or more records that were both set to Normalized ("canonical=true") before any mapping. This option ensures only one [core_company] record is set to Normalized. When you normalize the CMDB tables later in guided setup, the normalization job reassigns the proper normalized value.

For example, prior to mapping, both "DELL Inc" and "Dell Inc." are set to Normalized ("canonical=true"). You define a new mapping for "DELL Inc" to "Dell Inc.". If this property is true, guided setup denormalizes "DELL Inc", and updates the manufacturer field in the CMDB records to "Dell Inc." when the CMDB tables are normalized.

Normalizing data

To finish the guided setup, complete the remaining tasks by normalizing data in the following tables:

- Configuration Items (CMDB)
- Configuration Items (CMDB) Model
- Software Asset Management tables

Normalized company names table

The Normalization Data Services plugin stores the normalized company names in the Normalized Company Names table.

Normalized company names fields

Field	Description
Name	The normalized name for this company.
Table	The table in which this name is stored.
Description	[optional] A description with further information about this company or record.
Field	The field in which this name is stored.
Customer override	**True**, if the customer has an override in place for this name. Otherwise, **false**.

Normalized company names related lists

List	Description
Normalized mappings	A list of all the discovered names that map to this normalized name.

See KB0819618 for more information.

Normalized Mappings table

The Normalized Mappings table lists all the discovered names and the normalized name to which each maps.

Normalized mappings fields

Field	Description
Discovered name	A variant of a normalized name in the database.
Normalized name	The normalized name to which the discovered name maps.
Table	The table in which this name is stored.
Field	The field in which this name is stored.

Normalized company names related lists

List	Description
Related mappings	A list of all the discovered names that map to the same normalized name as the selected record.

Actions

List	Description
Promote discovered name	Replaces the normalized name with the discovered name for the selected record and for all the records in its related mappings list.

Normalization properties

On the normalization properties form, you can see and change the configurable properties for the Normalization Data Services plugin.

Normalization Properties

Field	Description
Reference qualifiers on all tables that reference the company will be updated to use the Normalized field.	If **Yes**, any reference field for the company – for any table across the platform – uses the Normalized name. This service only works if you have run the Update Reference Qualifiers task in the Guided Setup.
Enable a business rule that automatically normalizes manufacturer names for configuration items.	If **Yes**, the system normalizes company names when you add or update configuration items by a mechanism other than Discovery (such as by manual import sets).
Enable Discovery to use the normalization service for the manufacturer name.	To have Discovery use the normalized company name for the manufacturer name, select **Yes**.
This property is to enable or disable the Normalization process.	To enable the Normalization Data Service process, select **Yes**. To disable, select **No**. For details, see Normalization data services.
Normalize existing canonical core_company records.	Select **Yes** to update an existing normalized (canonical=true) Companies record to not-normalized (canonical=false) if a mapping is present. For details, see KB0957144.

Changing normalized company names

You can change a normalized company name several different ways. In all cases, that change affects all normalized fields referring to that company.

You have several options for changing a normalized company name:

- Edit the Normalized Name field in the Normalized Mappings table. This method is preferred.
- Edit the Normalized Company name table.
- Edit the Company Name field on any table that refers to the Company [core_company] table.

> ⚠ **Warning:**
> If you edit a field whose value is a normalized name, you change the normalized name for ALL discovered names that map to it.

Change a normalized company name

You can change normalized company names by editing records in the Normalized Company Name table.

Before you begin
Role required: admin

About this task
You can add and edit records in the Normalized Company Names table.

Procedure

1. Navigate to **All** > **User Administration** > **Normalization Data Services** > **Normalized Mappings**.
2. Find the record with the name that you want to replace and edit the Normalized name field.
   The system changes the Normalized Company name for every discovered name that maps to that normalized name.

Add a department

Departments provide another way to categorize users, groups, and assets. You can add departments and assign them to users.

Before you begin
Role required: user_admin or admin

About this task
An administrator may need to configure the form to show all the fields listed in the steps. For more information see Personalize a form.

Procedure

1. Navigate to **All** > **User Administration** > **Departments** > **Create a new record**.
2. Enter or modify the department name, ID, and description.
3. Select the company that the department is associated with.
4. **Optional:** Add a department head, primary contact, or both from your list of users.
5. Select **Submit**.

Creating groups

Admins can add users to one or more groups.

Create a user group

Create groups and assign roles to them. Users assigned to the group inherit the roles.

Before you begin
Role required: user_admin

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select **New**.
3. On the form, fill in the fields.

   Some fields appear after personalizing the form. Personalize a form.

Field	Description
Name	Name of the group.
Manager	Group manager or lead.
Type	Category for this group. For example, a group designated as type **catalog** is a service catalog group and can also be accessed under the **Service Catalog** > **Catalog Policy** > **Fulfillment Groups** module. See Configure assignment group types for more information. You may need to Personalize a form to add the **Type** field. Activating the Work Management plugin adds the **Type** field automatically. **Note:** ITIL is added for groups with an empty group type. Also, the default reference qualifier for tasks enables these groups to assign tasks and other task types to the group.
Group email	Group email distribution list or the email address of the point of contact, such as the group manager.
Parent	Other group of which this group is a member. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group aren't members of the parent group. For example, if an incident is assigned to the parent group and you select the **Assigned to** lookup icon, only the members in the parent group are available. The members of the child group aren't available.
Active	Check box that indicates whether the group is active or inactive. Inactive groups still appear in any reference field that already references the group, but aren't visible by non-admin users in: ◦ lists of groups ◦ the reference lookup list for reference fields ◦ the auto-complete list of groups displayed when you type into a reference field
Exclude manager	Check box that controls whether the group manager receives email notifications.
Include members	Check box that controls whether the group members receive individual emails when someone sends an email to the **Group Email** address. The only exception to this functionality is for approval notifications, whereby all members of a group receive an approval notification, regardless of the **Include members** selection. See Receive notifications for more information.
Description	Helpful information about the group.

4. **Optional:** Remove or hide a group.

a. **Note:**
Only users in the hidden group are able to see the hidden group when selecting a group in a reference field.

Create a true/false field labeled `Hidden` on the Group form.
For more information on creating fields, see Add and customize a field in a table
The system creates a field called **u_hidden** on the **Users [sys_user_group]** table and enables use of the **Hidden** check box to designate a hidden group.

b. Create a new before query business rule on the [sys_user_group] (Group) table with the following script:

```
if (!gs.hasRole("admin") && !gs.hasRole("groups_admin") &&
 gs.getSession().isInteractive()) {
  var qc = current.addQuery("u_hidden", "!=",
 "true"); //cannot see hidden groups...
  qc.addOrCondition("sys_id",
 "javascript:getMyGroups()"); //...unless in the hidden group
}
```

Note:
For more information, see Before Query business rules.

Add a user to a group

Add a user to a group so that the user inherits all the roles assigned to the group.

Before you begin

Role required: user_admin

About this task

If you're a non-admin user, you can't add a user to a group that contains the admin role. Likewise, if you don't have a security_admin role, you can't add a user to a group that contains the security_admin role.

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select a group **Name**.
3. In the **Group Members** related list, select **Edit**.
4. Select one or more names in the **Collection** list.
5. Select **Add** and **Save**.
6. **Optional:** Remove a user from a group when they change roles.

   a. Navigate to **All** > **User Administration** > **Groups**.

   b. Select a group **Name**.

   c. In the **Group Members** related list, select the check box next to each group member name you want to remove.

d. From the **Actions on selected rows** menu, select **Delete**.

> **Note:**
> Before selecting **Delete**, first make sure you have properly selected the rows containing the users you want to remove from the group.

Configure assignment group types

Use the **Type** field to define categories of groups. Once defined, you can use these categories to filter assignment groups based on the group type using a reference qualifier.

For example, when selecting an assignment group from the Incident form, **Type** can be used to filter groups based on whether they're typically involved in the Incident management process. Groups such as Network or Help Desk are displayed as they're typically involved. Groups such as HR or New York are omitted.

The following items are provided in the base system.

- The types **catalog**, **itil**, and **survey**.
- The reference qualifier on [task.assignment_group] filters on **[Type] [equals] [itil]**.
- A reference qualifier named `GetGroupFilter` is available to filter for group types using Create a dynamic filter option.

> **Note:**
> Dictionary overrides enable administrators to filter a group type on an extended table using a simple reference qualifier override.

Add a group type

You can add additional group types to filter assignment groups for tasks.

Before you begin

Role required: admin

About this task

You may need to configure the form to display the **Type** field. For more information see: Personalize a form

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select a group record.
3. Select the lock icon beside **Type**.
4. Select the lookup icon beside the selection field.
   The Group Types dialog opens.
5. Complete the following steps.

   a. Select **New**.

   b. Enter the group type name and description.

Example
For example, to define a type for a group as **incident** and **problem**, enter: **incident,problem**.

Example
Select **Submit**.

The Group form reopens with the new type listed.

6. **Optional:** Add additional group types if needed.
7. Select **Update**.

Assign a group type

You can assign group types to filter assignment groups for tasks.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Groups** and select the desired group.
2. Select the lock icon beside **Type**.
3. Select the lookup icon beside the selection field and select one or more group types.

   Note:
   Because the default behavior of `task.assignment_group` is to filter out groups with group types defined, adding a type to a group filters it out of the **Assignment Group** field on tasks. To change the behavior, set up the reference qualifier.

4. Select **Update**.

Managing roles

Admins can create and configure roles that grant specific permissions, which govern what users and groups with that role can do.

All ServiceNow roles

Use this filterable table to review a complete list of roles used in ServiceNow instances. The table includes important details for all base system roles as well as any roles added by installed plugins.

Product

Product	Roles
AWA	AWA manager [awa_manager] AWA integration user [awa_integration_user] AWA agent [awa_agent] AWA administrator [awa_admin]
Document Intelligence	DocIntel Admin [sn_docintel.admin] DocIntel Extraction Agent [sn_docintel.extraction_agent]

Product (continued)

Product	Roles
	DocIntel Viewer [sn_docintel.viewer] DocIntel Manager [sn_docintel.manager] DocIntel Creation Agent [sn_docintel.creation_agent]
Document Services	Administrator [platform_document_management_admin]
Hermes Messaging Service	administrator [hermes_admin] Kafka namespace administrator [kafka_namespace_admin] Kafka administrator [kafka_admin]
IDR	administrator [idr_admin] rest [idr_rest] read [idr_read]
Knowledge Management	KCS contributor [kcs_contributor] Knowledge administrator [knowledge_admin] Knowledge manager [knowledge_manager] KCS publisher [kcs_publisher] KCS candidate [kcs_candidate] Knowledge domain expert [knowledge_domain_expert] Knowledge coach [knowledge_coach] Knowledge group member [knowledge_group_member] Knowledge group manager [knowledge_group_manager] Administrator [admin] Knowledge [knowledge]
MetricBase	administrator [clotho_admin] REST put [clotho_rest_put] REST accumulate [clotho_rest_accumulate] plus writer [mbplus_writer] plus reader [mbplus_reader]

Service Portal	administrator [sp_admin] Announcements administrator [announcement_admin] Portal analytics administrator [portal_analytics_admin] Portal analytics viewer [portal_analytics_viewer]
Task Intelligence	Task Intelligence Admin [tia_admin] Task Intelligence User [tia_user] Task Intelligence Analyst [tia_analyst]
Virtual Agent	Chat analytics administrator [chat_analytics_admin]

Product (continued)

Product	Roles
	UI builder administrator [ui_builder_admin] Virtual Agent administrator [virtual_agent_admin] Chat analytics viewer [chat_analytics_viewer] UI builder administrator [ui_builder_admin] Virtual Agent administrator [virtual_agent_admin] Chat analytics administrator [chat_analytics_admin] Chat analytics viewer [chat_analytics_viewer] Issue auto resolution administrator [iar_admin] Automated testing framework designer [atf_test_designer] Administrator [nlu_admin] admin [virtual_agent_admin] [action_designer] External application installation administrator [external_app_install_admin] Self-service manager [sn_ssa_core.self_service_manager] Localization editor [localization_editor] Localization fulfiller [localization_fulfiller] Image administrator [image_admin] Automated Customer Experiences (ACE) user [sn_ace.ace_user] Activity subscriptions administrator [actsub_admin] Conversational Interfaces guided setup administrator [sn_ci_gs_content.ci_guided_setup_admin] Virtual Agent branding [va_branding] Localization requestor [localization_requestor] Virtual Agent branding [va_branding]

Product (continued)

Product	Roles
	Search application administrator [search_application_admin] Chat analytics administrator [chat_analytics_admin] administrator [evam_admin] administrator [evam_admin] Localization requestor [localization_requestor] Activity subscriptions administrator [actsub_admin] [action_designer] Chat survey administrator [chat_survey_admin] Flow designer [flow_designer]

Base system roles

Administrators can assign one or more base system user roles to grant access to base system platform features and applications.

To learn more about managing per-user subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Important:
None.

Administrator [admin]

The administrator role. This role has access to all system features, functions, and data because administrators can override access control list (ACL) rules and pass all role checks. Avoid assigning this role to your users when more targeted roles are available.

Contains Roles

List of roles contained within the role.

- ais_admin
- announcement_admin
- catalog
- catalog_admin
- catalog_builder_editor
- catalog_lookup_admin
- catalog_template_editor
- chat_admin
- evam_admin

- image_admin

- user_criteria_admin

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

Grant this privilege carefully. If you have sensitive information, such as HR records, that you must protect, create a custom admin role for that area. Train any users authorized to see those records to act as the administrator. Also note the Special Administrative Roles.

Note:
Users with roles related to the Key Management Framework can only be modified by admins with the kmf_admin role. For details on KMF roles, see Roles installed with Key Management Framework.

Agent administrator [agent_admin]

Agent administrators can download and administer the built-in system agent. They can manage MID Server-related scripts.

Contains Roles

List of roles contained within the role.

- agent_security_admin
- view_changer

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

AI search administrator [ais_admin]

AI search administrators can query, create, update, and delete indexing and search settings and log messages through the AI Search application.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Application client company installer [app_client_company_installer]

Users assigned the app_client_company_installer role can install applications containing the same company as the currently logged in instance. Assigning this role enables first-time installation of applications for the company associated with the current instance. Users with this role can't install an application for another company.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Application client user [app_client_user]

Application client users can install applications containing the same company as the currently logged in instance.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Approval administrator [approval_admin]

Approval administrators can view or modify approval requests not directly assigned to them. Use the approver_user role to enable approvers to view or modify only requests directly assigned to them.

Fulfillers may approve within the product to which they are subscribed (ITSM Fulfiller approving within ITSM). This approval may be in the platform or via email. No additional entitlement is required.

Fulfillers may not approve beyond the product to which they are subscribed (ITSM Fulfiller approving within Procurement, GRC, etc.). This approval would need an additional approval entitlement for the user.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Approver users [approver_user]

Approver users can modify requests for approval routed to them. They also have all the capabilities of requesters.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

There's a fee associated with this role. Don't assign it to users without confirming your organization has the appropriate entitlement.

Asset user [asset]

Asset users can manage hardware and software assets.

Contains Roles

List of roles contained within the role.

- inventory_user
- cmdb_query_builder
- canvas_user
- financial_mgmt_user
- cmdb_read
- contract_manager
- category_manager

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Assignment rule administrator [assignment_rule_admin]

Assignment rule administrators can manage assignment rules.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Business process administrator [business_process_admin]

Business process admins can create, read, update, and delete all records and their relationships in the business process.

In the context of Governance, Risk, and Compliance (GRC), users with the sn_grc.admin role who manage GRC applications and their setup automatically gain access to this role. This access enables the GRC administrators to administer a business process and its records similar to other GRC tables.

Contains Roles

List of roles contained within the role: business_process_manager.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

This role is assigned to users who are administrators and have thorough information and training on business processes. None.

Business process manager [business_process_manager]

Business process managers can create, read, and update any business process and manage the relationship of business processes with other records. This role is assigned to business process managers who are usually specialists and manage multiple business processes in the organization. Assign this role to users who generally work with other employees and are experts around business processes.

In the context of GRC, users with the sn_grc.manager role automatically inherit this role that enables them to manage the business processes for the entire organization.

Contains Roles

List of roles contained within the role - business_process_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Business process user [business_process_user]

Business process users can update the business processes that a user owns and can also read any business process. This role must be assigned to the respective process owners. This role can also be provided to users who are required to view the business processes in the organization and understand them better.

In the context of GRC, users with the sn_risk.user role are automatically assigned this role. This role enables users to manage the business processes that they own as well as read all business processes.

Contains Roles

List of roles contained within the role- cmdb_read.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Catalog administrator [catalog_admin]

Catalog administrators can manage the Service Catalog application, including catalog categories and items.

Contains Roles

List of roles contained within the role.

- user_criteria_admin
- catalog_builder_editor
- catalog_template_editor
- catalog
- catalog_lookup_admin

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Catalog editor [catalog_editor]

Catalog editors can create, modify, and publish items within categories that they're assigned to.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Catalog item designer [catalog_item_designer]

Catalog item designers can view the status of their category requests. This role is granted automatically to users when they make a request for an item designer category.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Catalog manager [catalog_manager]

Catalog managers can view and assign catalog editors to their categories. They can also create, modify, and publish items within their categories.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Catalog user [catalog]

Catalog users have read and some write access to all Service Catalog Requests, Tasks, and Items.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

- Catalog Request Approvers > $1000
- Catalog Request Approvers for Sales
- Field Services

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Category manager [category_manager]

Category managers can create, edit, and delete model categories.

Contains Roles

List of roles contained within the role - model_manager.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CMDB administrator [sn_cmdb_admin]

The configuration management data base (CMDB) administrator is a key role required for interacting with the CMDB Workspace. CMDB administrators can access all CMDB data, tools, and UIs within the CMDB Workspace. Users with this role can set policies that an editor can't, such as class manager and app service requirements.

As you drill down in the CMDB Workspace, there are some dashboards and list views that require specific roles in addition to the CMDB Admin, CMDB Editor, or CMDB User roles.

Contains Roles

List of roles contained within the role.

- canvas_admin
- cmdb_ms_admin
- data_manager_admin
- sn_cmdb_editor

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

CMDB de-duplication administrator [cmdb_dedup_admin]

CMDB de-duplication admins can review and remediate CMDB de-duplication tasks.

Contains Roles

List of roles contained within the role - cmdb_read.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

CMDB editor [sn_cmdb_editor]

A key role required for interacting with CMDB Workspace. CMDB editors can create, edit, and delete CMDB records but can't change policies such as data manager, class manager within CMDB Workspace.

As you drill down in the CMDB Workspace, there are some dashboards and list views that require specific roles in addition to the key CMDB Admin, CMDB Editor, or CMDB User roles.

Contains Roles

List of roles contained within the role.

- cmdb_ms_editor
- sn_cmdb_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CMDB multi-source administrator [cmdb_ms_admin]

The CMDB multi-source administrator can create and run a query and can modify CMDB 360 properties. Contains the cmdb_ms_write role.

Contains Roles

List of roles contained within the role - cmdb_ms_editor.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

CMDB multi-source editor [cmdb_ms_editor]

CMDB multi-source editors can create and query, read, and write CMDB records, but can't perform recomputing actions.

Contains Roles

List of roles contained within the role - cmdb_ms_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CMDB multi-source user [cmdb_ms_user]

CMDB multi-source users have read and execute access to the multi-source queries.

Contains Roles

List of roles contained within the role - cmdb_read.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CMDB reader [cmdb_read]

CMDB reader users can read data from the CMDB hierarchy.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CMDB user [sn_cmdb_user]

A key role required for interacting with CMDB Workspace. CMDB users have read-only access to CMDB data and basic UI within CMDB Workspace.

As you drill down in the CMDB Workspace, there are some dashboards and list views that require specific roles in addition to the key CMDB Admin, CMDB Editor, or CMDB User roles.

Contains Roles

List of roles contained within the role.

- app_service_user
- canvas_user
- cmdb_ms_user
- cmdb_query_builder
- data_manager_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Contract manager [contract_manager]

Contract managers can create, edit, and delete contracts through the Contract Management application.

Contains Roles

List of roles contained within the role.

- canvas_user
- financial_mgmt_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

CreateNow unlimited [unlimited_createnow]

Role for CreateNow unlimited licensed users.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Data classification administrator [data_classification_admin]

Data classification administrators manage all aspects of the Data Classification application, data classification code setup, and assignment.

Contains Roles

List of roles contained within the role - data_classification_auditor.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Data classification auditor [data_classification_auditor]

Data classification auditors audit Data Classification code assignments.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Enterprise CMDB administrator [ecmdb_admin]

Enterprise CMDB administrators can perform administrative tasks and access tables and records in Enterprise CMDB.

Contains Roles

List of roles contained within the role - cmdb_read.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Filter administrator [filter_admin]

Filter administrators can create, edit, and delete filter [sys_filter] records.

Contains Roles

List of roles contained within the role.

- filter_global
- filter_group

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Filter group user [filter_group]

Filter group users can create filters that belong to groups of which the user is a member.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Gauge maker [gauge_maker]

Gauge makers can create gauges from reports. Starting with Helsinki, reports are no longer made into gauges.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Global filter user [filter_global]

Global filter users can create global filter [sys_filter] records.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Global template editor [template_editor_global]

Users with the template_editor_global role can create templates for global use.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Group template editor [template_editor_group]

Users with the template_editor_group role can create templates for groups. (Users must also be assigned the template_read_global role)

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Guided tour administrator [guided_tour_admin]

Guided tour administrators can create, modify, and delete guided tour [sys_embedded_tour_guide] records.

Contains Roles

List of roles contained within the role - sn_tourbuilder.tour_admin.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Image administrator [image_admin]

Image administrators can create, modify, and delete image [db_image] records.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Impersonator [impersonator]

Impersonators can impersonate users.

> **Warning:**
> This role doesn't enable the impersonation of admin users.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

For details on impersonation, see Base system roles.

Import administrator [import_admin]

Import administrators can manage all aspects of import set [sys_import_set] records and imports.

Contains Roles

List of roles contained within the role.

- import_set_loader
- import_transformer
- import_scheduler

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Import scheduler [import_scheduler]

Import schedulers can schedule imports.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

> **Warning:**
> Grant this role carefully. The import_scheduler can execute scripts with administrator level privileges.

Import set loader [import_set_loader]

Import set loader users can load import set [sys_import_set] records.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Import transformer [import_transformer]

Import transformer users can manage import set transform map [sys_transform_map] records and run transforms.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Inventory administrator [inventory_admin]

Inventory administrators administer stockrooms, stock models, stock rules.

Contains Roles

List of roles contained within the role.

- inventory_user
- canvas_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Inventory user [inventory_user]

Inventory users have access to stock information.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

ITIL

Information Technology Infrastructure Library (ITIL) users can open, update, close incidents, problems, changes, and configuration management items. This role is the base system technician role. Users with the ITIL role can have tasks assigned to them.

Contains Roles

List of roles contained within the role.

- agent_workspace_user
- app_service_user
- cmdb_query_builder
- cmdb_read
- dependency_views
- email_composer
- snc_platform_rest_api_access
- sn_change_write
- sn_cmdb_editor
- sn_comm_management.comm_plan_viewer
- sn_gd_guidance.guidance_user
- sn_incident_write
- sn_nb_action.next_best_action_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

Avoid granting admin roles when more specialized roles are available.

Knowledge [knowledge]

Knowledge users can write, edit, and review knowledge management articles.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Knowledge administrator [knowledge_admin]

Knowledge administrators can manage knowledge bases.

Contains Roles

List of roles contained within the role - knowledge.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

List updater [list_updater]

List updater users can select the **Update Entire List** and **Update Selected** menu options on a list.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Maintenance

This role is reserved for ServiceNow use.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

This role can't be assigned or impersonated, and is reserved for ServiceNow use.

MID server [mid_server]

MID server users can access to the tables that MID servers ordinarily use. This role should be granted to your MID servers.

Contains Roles

List of roles contained within the role - soap.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

This role should be assigned to user accounts created for MID servers to interact with your instance. For details, see Create the MID Server user and grant the role.

Model manager [model_manager]

Model managers can create, modify, and delete base model [cmdb_model] records.

Contains Roles

List of roles contained within the role - catalog_editor.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Personalize [personalize]

Users with the personalize role can personalize forms, lists, rules, controls, and scripts.

Contains Roles

List of roles contained within the role.

- personalize_control
- personalize_rules
- personalize_dictionary
- personalize_choices
- personalize_styles
- personalize_responses
- personalize_list
- personalize_form

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize choices [personalize_choices]

Users assigned to the personalize_choices role can personalize the choices for a list field.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize control [personalize_control]

Personalize control users can personalize controls on lists, such as filters, links, and buttons.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize dictionary [personalize_dictionary]

Users with the personalize_dictionary role can personalize dictionary entries and labels.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize form [personalize_form]

Users with the personalize_form role can personalize forms.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize list [personalize_list]

Users with the personalize_list role can personalize lists.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize responses [personalize_responses]

Users with the personalize_form role can personalize predefined responses for suggestion fields, such as the additional comments field.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize rules [personalize_rules]

Personalize rules users can personalize business rules and scripts. This role contains additional roles for granting selective, administrative access to rules and scripts.

Contains Roles

List of roles contained within the role.

- ui_action_admin
- business_rule_admin
- client_script_admin
- ui_policy_admin

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

Avoid granting this role to users who don't need access to all the roles contained in this role.

Personalize styles [personalize_styles]

Users with the personalize_styles role can personalize field styles.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Personalize UI [personalize_ui]

Users with the personalize_ui role can personalize forms and lists.

Contains Roles

List of roles contained within the role.

- personalize_form
- personalize_list

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Platform Rest API access [snc_platform_rest_api_access]

Allows access to Platform Rest APIs. This role is contained with in the ITIL [itil] role.

- Table API
- Import Set API
- Aggregate API
- Attachment API

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Public [public]

No login is required to access features or functions with the public role.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Release administrator [release_admin]

Release administrators can edit the release history for a release.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Report administrator [report_admin]

Report administrators can manage, share, publish, and schedule all reports. Users assigned this role can access the **Reports** > **Administration** module and manage all report-related objects. The report_admin role inherits all other report roles.

Contains Roles

List of roles contained within the role.

- gauge_maker
- report_alias_admin
- report_global
- report_group
- report_publisher
- report_scheduler
- viz_admin

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Report alias administrator [report_alias_admin]

Report alias administrators can maintain field and value aliases.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Report global [report_global]

Report global users can manage reports that are shared with everyone (listed in Global).

Contains Roles

List of roles contained within the role - report_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Report group [report_group]

Report group users can manage and share reports that are shared with them (listed in Group).

Contains Roles

List of roles contained within the role - report_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Report publisher [report_publisher]

Report publisher users can publish reports any that they can manage. Publishing a report creates a public link to that report. Users with this role must also have another role that grants permission to create, edit, and share reports.

Contains Roles

List of roles contained within the role - report_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Report scheduler [report_scheduler]

Report scheduler users can schedule emailing of all reports that they can see, including reports they can't manage. Users with this role must also have another role that grants permission to create, edit, and share reports.

Contains Roles

List of roles contained within the role - report_user.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Report user [report_user]

Report users can create and view reports that have been shared with them. Users with this role can't share, edit, or delete reports that have been shared with them.

Contains Roles

List of roles contained within the role - viz_creator.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Script fix administrator [script_fix_admin]

Script fix administrators can manage fix scripts.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Search application administrator [search_application_admin]

Search application administrators can insert, update, and delete search user experience-related configuration tables:

- sys_search_context_config
- sys_search_source
- m2m_search_context_config_search_source
- sys_search_facet
- sys_search_filter

Search application admin is granted the ais_admin role to enable AI search configuration.

Contains Roles

List of roles contained within the role.

- ais_admin
- personalize_dictionary

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren’t assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

SOAP [soap]

users with the soap role can query, create, update, and delete records on all tables, as well as execute scripts.

Contains Roles

List of roles contained within the role.

- soap_create
- soap_delete
- soap_ecc
- soap_query
- soap_script
- soap_update

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP create [soap_create]

Users with the soap_create role can create records in all tables and columns.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP delete [soap_delete]

Users with the soap_delete role can delete records in all tables and columns.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP ECC [soap_ecc]

Users with the soap_ecc role can query, create, and update on the external communication channel (ECC) Queue table only.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP query [soap_query]

Users with the soap_query role can query records on all tables and columns.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP query update [soap_query_update]

Users with the soap_query_update role can query and update all tables and columns.

Contains Roles

List of roles contained within the role.

- soap_query
- soap_update

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP script [soap_script]

Users with the soap_script role can execute business rule endpoint functions via **script.do**.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

SOAP update [soap_update]

Users with the soap_update role can update records on all tables and columns.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Survey administrator [survey_admin]

Survey administrators can see all surveys, definitions, questions, and instances created by them and others. Users with this role can use all modules in the **Survey** application menu.

Contains Roles

List of roles contained within the role.

- assessment_admin
- sn_bm_client.benchmark_data_viewer
- sn_publications_recipients_list_user

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Survey creator [survey_creator]

Survey creators can manage survey definitions, questions, and instances created by them.

Contains Roles

List of roles contained within the role.

- sn_bm_client.benchmark_data_viewer
- sn_publications_recipients_list_user

Groups

List of groups this role is assigned to by default - Survey Creators.

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Survey reader [survey_reader]

Survey readers can view surveys and related information, such as survey responses, survey groups, scorecards, and reports. Users with this role can't change or modify surveys or survey responses.

Contains Roles

List of roles contained within the role - sn_bm_client.benchmark_data_viewer.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Task editor [task_editor]

Task editors can edit protected task fields.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Template editor [template_editor]

Template editors can create templates for personal use, and modify or delete personal templates. This role is included in the itil role in the base system.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Template scheduler [template_scheduler]

Template schedulers can schedule template-based record creation.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None

Text search administrator [text_search_admin]

Text search administrators can customize Global Text Search groups and tables.

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

None.

Special administrative roles

Certain roles grant specific administrative rights without the full privileges of the admin role. For example, an administrator can grant a user the right to change UI policy but not client scripts.

To learn more about managing per-user subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

These roles don't change the behavior of the admin role, which grants full administrative privileges.

> **Important:**
> You can't rename roles of any kind in the ServiceNow AI Platform

Assignment rule administrator [assignment_rule_admin]

Create, modify, and delete assignment rules.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Business rule administrator [business_rule_admin]

Create, modify, and delete Classic Business rules.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Client script administrator [client_script_admin]

Create, modify, and delete Client scripts.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Form administrator [form_admin]

Create, modify, and delete forms, and form sections and section elements.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Report administrator [report_admin]

Manage, share, publish, and schedule all reports. Users assigned this role can access the **Reports** > **Administration** module and manage all report-related objects. The report_admin role inherits all other report roles.

Contains Roles

List of roles contained within the role.

- gauge_maker

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Script include administrator [script_include_admin]

Create, modify, and delete script includes.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

UI action administrator [ui_action_admin]

Create, modify, and delete UI actions.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

UI macro administrator [ui_macro_admin]

Create, modify, and delete UI macros.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

UI page administrator [ui_page_admin]

Create, modify, and delete UI pages.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

UI policy administrator [ui_policy_admin]

Create, modify, and delete UI policies.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

UI script administrator [ui_script_admin]

Create, modify, and delete UI scripts.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Read-only role

The read-only role (snc_read_only) restricts a user or a group of users to read-only access on the tables to which the user already has access.

This role is designed to complement other roles a user possesses. Its purpose is to restrict actions like the insert, update, or delete operations on the tables accessible through their existing roles.

After you assign this role to a user, they can no longer create, update, or delete records on ANY tables.

Note:
Assign this role only to users. Don't assign this role to other resources in the system, including applications, access control levels (ACLs), and so on.

The snc_read_only role can be assigned to any user to limit access to data without having to create ACLs for system tables, custom tables, and fields. This practice is useful for performing internal or external audits without enabling a user to have insert or update access to data.

Users with the snc_read_only role have the following restrictions regardless of other roles and privileges that they have.

- Can't insert, update, or delete records from the UI or when using the GlideRecord API.
- Can't activate or upgrade plugins.
- Can't directly run SQL.
- Can't upload XML files.
- Can only run background scripts when on an instance in the public sandbox environment.

Note:
These role restrictions are in place even if impersonating another user with write access such as an admin.

Activate the read-only role

If it isn't already active, an administrator can activate the Read-Only User Role (com.snc.read_only.role) plugin.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Read-Only User Role (com.snc.read_only.role) plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Read-only role properties

These system properties control the snc_read_only role. The following default values are used for the properties.

Name	Description
glide.security.snc_read_only_role.tables.exempt_create	Specifies which tables are exempt from the read-only role enforcement and enable the creation of new records. • Type: string • Default value: sys_user_session, sysevent, syslog, syslog_transaction, sys_user_preference, sys_ui_list, sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table
glide.security.snc_read_only_role.tables.exempt_write	Specifies which tables are exempt from the read-only role enforcement and enable the updating of existing records. • Type: string • Default value: sys_user_session, sysevent, syslog, syslog_transaction, sys_user_preference, sys_ui_list, sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table
glide.security.snc_read_only_role.tables.exempt_delete	Specifies which tables are exempt from the read-only role enforcement and enable the deletion of existing records.

(continued)

Name	Description
	• Type: string • Default value: sys_user_preference, sys_ui_list, sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table

After you configure these properties, assign the read-only role as needed. When you log in, you're restricted from creating, updating, or deleting records on ANY tables unless you modified these properties.

Note:
Test the read-only role by assigning it to a user and then impersonating that user.

Application specific roles

Applications you install on your instance may include additional roles. Follow the links in this section to see roles installed along with applications.

Strategic Portfolio Management	Teamspaces	Installed with teamspaces

System roles

Administrators can control access to features and capabilities on a ServiceNow instance by assigning roles to users.

Your ServiceNow includes roles to grant access to the platform features and applications included a base system instance. Applications you install on your instance may include additional roles to control access to those installed features. For more information about roles, see Exploring user administration.

Important:
Base system and roles installed with applications can be deactivated by administrators, but can't modify or rename these roles.

Base system roles

Base system roles are present in all ServiceNow instances and don't require the installation of additional plugins.

Role	Description
admin	The system administrator role. This role has access to all system features, functions, and data because administrators can override access control list (ACL) rules and pass all role checks. Avoid assigning this role to your users when more targeted roles are available. **Warning:** Grant this privilege carefully. If you have sensitive information, such as HR records, that you need to protect, you must create a custom admin role for that area. You must also train any users authorized to see those records to act as the administrator. Also note the Special Administrative Roles.
agent_admin	Agent administrators can download and administer the system's built-in agent. They can manage MID Server-related scripts.
ais_admin	AI search administrators can query, create, update, and delete indexing and search settings and log messages through the AI Search application.
approval_admin	Approval administrators can view or modify approval requests not directly assigned to them. Use the approver_user role to enable approvers to only view or modify requests directly assigned to them. Use of this role requires a Fulfiller license. Use of the approver_user role requires an Approver license.
approver_user	Approver users can modify requests for approval routed to them. They also have all capabilities of requesters. **Note:** There's a fee associated with this role. Don't assign it to users without confirming your organization has the appropriate entitlement.
assignment_rule_admin	Assignment rule administrators can manage assignment rules.
asset	Asset users can manage hardware and software assets.
business_process_admin	Business process admins can create, read, update, and delete all records and their relationships in the business process. In the context of Governance, Risk, and Compliance (GRC), users with the sn_grc.admin role who manage GRC applications and their setup automatically gain access to this role. This access enables the GRC administrators to administer a business process and its records similar to other GRC tables. **Important:** This role is assigned to users who are administrators and have thorough information and training on business processes.
business_process_manager	Business process managers can create, read, and update any business process and manage the relationship of business processes with other records. This role is assigned to business process managers

servicenow

Role	Description
	who are usually specialists and manage multiple business processes in the organization. These users generally work with other employees and are experts around business processes. In the context of GRC, users with the sn_grc.manager role automatically inherit this role that enables them to manage the business processes for the entire organization.
business_process_user	Business process users can update the business processes that a user owns and can also read any business process. This role must be assigned to the respective process owners who manage the business process that they own. This role can also be provided to users who are required to view the business processes in the organization and understand them better. In the context of GRC, users with the sn_risk.user role are automatically assigned this role as this role enables them to manage the business processes they own as well as read all business processes.
catalog	Catalog users can access service catalog requests.
catalog_admin	Catalog administrators can manage the Service Catalog application, including catalog categories and items.
catalog_editor	Catalog editors can create, modify, and publish items within categories that they’re assigned to.
catalog_item_designer	Catalog item designers can view the status of their category requests. This role is granted automatically to users when they make a request for an item designer category.
catalog_manager	Catalog managers can view and assign catalog editors to their categories. Can also create, modify, and publish items within their categories.
category_manager	Category managers can create, edit, and delete model categories.
cmdb_dedup_admin	CMDB de-duplication admins can review and remediate CMDB de-duplication tasks.
cmdb_ms_user	CMDB multiscource readers can access and run a multi-source CMDB query, but can't create a query. This role contains Contains cmdb_read role.
cmdb_ms_editor	Can create and run a query, has full read and write access, but can't do Recompute. Contains cmdb_ms_read role.
cmdb_ms_admin	Can create and run a query, and can modify CMDB 360 properties. Contains cmdb_ms_write role.
cmdb_read	Can read any CMDB table. Contained in admin and itil.
communication_manager	Manages communication for major incidents and is responsible for communicating with all stakeholders.
contract_manager	Can create, edit, and delete contracts through the Contract Management application.

servicenow

Role	Description
data_classification_admin	Administers all aspects of the Data Classification application, data classification code setup and assignment,
data_classification_auditor	Audits Data Classification code assignments.
ecmdb_admin	Can administer the CMDB.
filter_admin	Can manage filters.
filter_global	Can create global filters.
filter_group	Can create filters that belong to groups of which the user is a member.
gauge_maker	Can create gauges from reports. Starting with Helsinki, reports are no longer made into gauges.
guided_tour_admin	Can manage and administer Guided Tour functionality.
image_admin	Can manage image files on the Images [db_image] table.
impersonator	Can impersonate users. This role doesn't allow impersonation of admin users.
import_admin	Can manage all aspects of import sets and imports.
import_scheduler	Can schedule imports. **Warning:** Grant this role carefully. The import_scheduler role is equivalent to giving the user the admin role, because the import_scheduler has the ability to execute scripts with administrator level privileges.
import_set_loader	Can load import sets.
import_transformer	Can manage import set transform maps and run transforms.
incident_manager	Manages Incident properties and Major Incident trigger rules.
inventory_admin	Can create and delete stock information. Only users with the inventory_admin role can edit stock rules, stockrooms, and stockroom types.
inventory_user	Has access to stock information. Can create and manage transfer orders.
itil	Can perform standard actions for an ITIL helpdesk technician. Can open, update, close incidents, problems, changes, configuration management items. By default, only users with the itil role can have tasks assigned to them.
itil_admin	Possesses more privileges than the itil role and is intended for team leads. This role has the ability to delete incidents, problems, changes, and other related entities when both the itil and itil_admin roles are assigned. In addition, the itil_admin role grants full control of the CMDB. The itil_admin role includes all of the permissions granted to the sn_cmdb_admin role, which provides full access to CMDB data, tools, and UIs.
knowledge	Can create, edit, and review knowledge base articles.

Role	Description
knowledge_admin	Can manage the knowledge base.
list_updater	Can use Update Entire List and Update Selected menu options on lists.
maint	Reserved for ServiceNow use.
mid_server	Role that any MID server user should be granted. This role gives the MID server access to the tables it ordinarily uses.
model_manager	Can create CMDB models. Model manager can control the base models and any model extensions that aren't software or consumables. Consumable models are controlled by the asset manager role (asset). Software models are control by the software asset manager role (SAM).
major_incident_manager	Initiates the major incident process by assessing and approving major incident candidates or creating a major incident. Maintains the ownership and accountability for the life cycle of the incident. Identifies the users and groups to be involved in the resolution activities and sets up communication channels.
nobody	The nobody role means that no user has access - not even admin or maint. Use the nobody role carefully. The nobody role takes precedence over the admin override option on ACLs, so even admins can't have access. See Create an ACL rule. Don't assign it to specific users. You can use this role in ACLs that control access to resources, such as UI pages, processors, script includes, and records. **Warning:** Applying the nobody role may be irreversible if applied to some important system functions.
personalize	Can configure forms, lists, rules, controls, scripts.
personalize_choices	Can configure choices and predefined responses for non-journal fields designated as choice or suggestion fields.
personalize_control	Can configure controls on lists, such as filters, links, and buttons.
personalize_dictionary	Can configure dictionary entries and labels.
personalize_form	Can configure forms.
personalize_list	Can configure lists and list calculations.
personalize_responses	Can configure predefined responses for journal fields designated as suggestion fields.
personalize_rules	Can configure business rules and scripts. This role contains the following specialized roles for granting selective, administrative access to rules and scripts: • business_rule_admin • client_script_admin • ui_policy_admin • ui_action_admin

Role	Description
personalize_styles	Can configure field styles.
personalize_ui	Can configure forms and lists.
public	No login is required to access features or functions with the public role.
release_admin	Can edit Release history for a release.
report_admin	Can manage reports.
report_global	Can create global reports.
report_group	Can create reports and share reports with groups that the user is a member of. Users with this role can edit reports shared by other users in the group.
report_publisher	Can make reports available on a public page.
report_scheduler	Can schedule a report to be emailed.
script_fix_admin	Can create and manage fix scripts but can’t run fix scripts.
search_application_admin	Can query, create, update, and delete records on search UX-related tables. Contains the ais_admin role.
sn_appclient.app_client_company_installer	Can install applications containing the same company as the currently logged in instance. User role that enables first-time installation of applications for the company associated with the current instance. A user with this role can’t install an application for another company.
sn_appclient.app_client_user	Can install applications containing the same company as the currently logged in instance.
sn_cmdb_admin	Provides full access to CMDB data, tools, and UIs. A CMDB Admin, for example, sets policies in the CI Class Manager and application service requirements. CMDB Admin provides the highest level of access to the CMDB.
sn_cmdb_editor	Provides access to CMDB records. A CMDB Editor can't change policies such as in the CMDB Data Manager or in the CI Class Manager.
sn_cmdb_user	Provides read-only access to CMDB data and to basic UIs such as CMDB reports and dashboards.
soap	Can query, create, update, and delete records on all tables, as well as execute scripts.
soap_create	Can create records on all tables and columns.
soap_delete	Can delete records on all tables and columns.
soap_ecc	Can query, create, and update on the ECC Queue table only.
soap_query	Can query records on all tables and columns.
soap_query_update	Can query and update records on all tables and columns.
soap_script	Can execute business rule endpoint function via script.do.
soap_update	Can update records on all tables and columns.

Role	Description
survey_admin	Can see all Surveys, their definitions, questions, instances created by them and others. Survey administrators can use all modules in the Survey application menu.
survey_reader	Users with survey reader role can view surveys and related information, such as survey responses, survey groups, scorecards, and reports. Survey_reader can't change or modify a survey or survey responses.
task_editor	Can edit protected task fields.
template_editor	Can create templates for personal use, and modify or delete personal templates. Included in the itil role in the base system.
template_editor_global	Can create templates for global use.
template_editor_group	Can create templates for groups.
template_scheduler	Can schedule template-based record creation.
text_search_admin	Can customize Global Text Search groups and tables.
timecard_admin	Can approve, modify, and delete the time cards of other users.
ts_admin	Can administer Zing text indexing and search engine.
unlimited_createnow	Role for CreateNow unlimited licensed users.
upgrade_app	Can upgrade installed applications containing the same company as the currently logged in instance. Can't perform first-time installations of applications published to the Application Client page.
user	Available for customer use, has no function in the base system.
user_admin	Can administer users, groups, locations, and companies.
view_changer	Can switch active views.
workflow_admin	Can create, edit, publish, or delete graphical workflows.
workflow_creator	Can create new graphical workflows.
workflow_publisher	Can publish graphical workflows.

Application-specific roles

Applications you install on your instance may include additional roles. Follow the links in this section to see roles documentation on roles installed along with applications.

Product	Application
Platform Capabilities	Advanced Work Assignment

Create a role

Create a role to control access to features and capabilities in applications and modules. The new role doesn't have access to any application or module until you add other roles to it, or add it to the appropriate applications and modules.

Before you begin

Role required: admin

About this task

After access has been granted to a role, all groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

For a complete list of the roles included with the base instance, see Base system roles

Note:

You can't rename roles of any kind in the ServiceNow AI Platform. If you manually create a role, you can't rename it after you save it.

Move this action to the background so you aren't waiting when adding a number of group members by adding the system property `glide.ui.schedule_slushbucket_save_for_group_roles`. Set the system property to **true**. The system user is used to create records or update existing ones since the action is running in the background.

Procedure

1. Navigate to **All** > **User Administration** > **Roles** and create a record.
2. Complete the form.

Field	Description
Name	Enter a name for the role.
Requires Subscription	Indicates whether users with this role require a subscription to stay in compliance. **Yes** Measured-role that requires a subscription. You can allocate subscriptions to users with this role by adding one or more groups to a product subscription. To learn more, see Managing per-user subscriptions in Subscription Management. **No** Not a measured-role. **Unspecified** Neither
Application	Select the application that contains this record.
Elevated privilege	A role that requires elevated privilege can't be assigned to a user at login by the system. Instead, a user must manually elevate privileges to receive the elevated role. Select this option to mark this role as required to elevate it to high security. See Elevated privilege roles for more information.
Description	Select the roles to delegate to the group member.

Grant a role access to applications and modules

Roles control access to features and capabilities in applications and modules. You add a role to an application or module to enable the role to grant access to the application or module for all users with the role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Applications** or **System Definition** > **Modules**.
2. Select the appropriate application or module to open it in form view.
3. Select the lock to open the **Roles** field.
4. Add the desired roles to the application or module.
5. Select the lock to close the **Roles** field, and then save your changes.

Assign a role to a group

You can assign a role to a group to grant access to applications and modules to group members.

Before you begin

Role required: user_admin or admin

About this task

When you assign roles to groups rather than to individual users, members of the group inherit the role. When a user switches groups, the new group role is assigned automatically. For information about the Service Mapping roles, see Control user access to application services.

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select the group to assign a role.
3. In the **Roles** related list, select **Edit**.
4. Add the desired roles to the group.
5. Select **Save**.

Assign a role to a user

A user inherits roles from all groups to which they belong. You can also assign roles directly to a user. Whenever a user is assigned a new role, it only takes effect after logging in with a new session.

Before you begin

Role required: user_admin or admin
When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

About this task

To grant the admin role to a user, you must also have the admin role. To grant the security_admin role to a user, you must also have the security_admin role. You must elevate to the security_admin role before granting the security_admin role to other users. See Elevate to a privileged role.

> **Note:**
>
> The System administrator(admin) role provides access to all system features, functions, and data, regardless of security constraints. Avoid assigning this role to your users when more targeted roles are available.

You can't delete roles that are assigned to the group from the user record. You must remove the user from the group record.

Procedure

1. Navigate to **All** > **User Administration** > **Users** and then open a user record.
2. In the **Roles** related list, select **Edit**.
3. In the **Collection** list, select the desired roles, and then select **Add**.
4. Select **Save**.

What to do next

Note:
If the user is logged in when you update their roles and they're unable to access records enabled by the new role, they may need to log out and back in again.

Add a role to an existing role

When you add a new role to an existing role for a user, the user inherits the access that is granted by the new role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Roles** and open the existing role.
2. Click **Edit** in the Contains Roles related list.
3. Use the slushbucket to add one or more roles to the existing role.
4. Click **Save**.

   The users with the existing role inherit the access that is granted by the new role.

Create a group role

Create a group role to control access to features and capabilities in applications for all members in a group.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **User Administration** > **Group Roles**.
2. Select **New**.
3. Fill in the fields on the form and then select **Submit**.

Field	Description
Group	Select a group.
Role	Select the role to apply to the group.

Field	Description
Inherits	Select this option to have all members of the group inherit the role. This option is selected by default.

Note:
To move this action to the background so you aren't waiting when adding a number of group members, add the system property *`glide.ui.schedule_slushbucket_save_for_group_roles`* and set it to true.

Audit user roles

Changes to user roles are automatically tracked in the Audit Roles [sys_audit_role] table.

Before you begin

Role required: admin

Note:
If the Prevent duplicate entries with Contextual Security: Role Management V2 plugin is installed, you must Enable role auditing with Contextual Security: Role Management V2.

Procedure

Navigate to **All**, and then enter `sys_audit_role.list` in the filter.
The Audit Roles [sys_audit_role] table displays changes to user roles.

Field	Description
Changed by	The user who made the change.
Count after change	Direct role added as a result of the change (if any), plus the number of inherited roles added.
Granted by group	If the role was inherited, the group that the role was inherited from.
Operation	The type of change. Values include: • Added • Removed
Role	The affected role.
User	The affected user.

Delegating roles

Administrators can grant users the ability to assign roles within groups. However, these users can only assign roles that they already have.

Role delegators are users responsible for assigning roles to other users within a group. This role can be assigned manually by granting the role_delegator role to the user, or through the **Group Manager Change** business rule.

The **Group Manager Change** business rule, which is disabled by default, automatically grants the role_delegator role to a user who is designated manager of a group in the **Manager** field on the **Group** form. The role is removed when the user is no longer the manager of the group.

Activate the business rule to take advantage of it. For more information on **Business rules**, see Classic Business rules.

Reviewing Roles and Role Changes

To view roles and role changes:

- Individual users: Navigate to **User administration** > **Users** select a user, and review the **Roles** related list.
- Role delegators: Review who can give roles in which groups by navigating to **User administration** > **Role delegators**.
- For all role changes: To see a history of role changes, navigate to **System security** > **Reports** > **Role audit**. See Audit user roles for more information.

Designate role delegators

Designate role delegators to assign roles to users who are in a particular group.

Before you begin

Role required: admin

About this task

Delegators can assign roles that they inherit from a group. They can also assign roles that an administrator assigned to them.

Procedure

1. Navigate to **All** > **User Administration** > **Designate Role Delegator**.
2. Select the group that includes the user who you want to be the role delegator.
3. Select the user.
4. Select **Submit**.
   A change request for the role delegator request is created and automatically approved.

Assign roles as a role delegator

If you're a role delegator, you can delegate roles that are assigned to you for groups that you manage.

Before you begin

Role required: role_delegator

Procedure

1. Navigate to **User Administration** > **Delegate Roles in Group**.
2. Fill out the form.

Field	Description
Group	Select the group in which to delegate a role or roles to a member. Any group can be selected, including groups that the role_delegator doesn’t belong to or groups that the role_delegator doesn’t manage.
User	Select the group member to delegate a role or roles.
Roles to delegate	Select the roles to delegate to the group member. The roles available for delegating are only the roles that the role_delegator has.

(Optional) To remove a delegated role from a user, open the delegation record and remove the unwanted role or roles.

Prevent a role from being delegated

You can prevent roles from being delegated to users.

Before you begin

Role required: admin

About this task

By default, the following roles can’t be delegated.

- admin
- public
- role_delegator

Note:
A user with the role_delegator role can’t delegate this role to other group members.

Procedure

1. Navigate to **All** > **User Administration** > **Roles**.
2. Open the role.
3. Configure the form to add the **Grantable** or **Can delegate** fields.
4. Clear the check box for one or both of these fields.
5. Select **Update**.

Grant a time-limited user role

Learn how to assign a role to a user temporarily. Use this feature if you have a user who needs to perform a one-time action that is normally outside their roles.

Before you begin

Role required: admin

About this task

Warning:
Usage of Time-limited User Roles may consume access and use rights procured by customer and could result in additional subscription fees.

Procedure

1. Navigate to **All** > **User Administration** > **Time-Limited User Roles**.
2. Select **New**.
3. Fill in the fields on the form.

   All fields except Comments are mandatory.

Fields	Description
Active	Determines if the time limited role assignment is active.
Role	The role assigned to the user, only admin, impersonate and snc_readonly is allowed
User	The user to be assigned the time limited role
Start Time	The start time and date for the time limited role
End Time	The end time and date for the time limited role **Important:** The end date should not be more than 5 days after the start date.
Comments (Optional)	Additional comments or information for the limited role assignment

4. Select **Submit**.

Result

The specified user now has the role. They must complete their otherwise restricted task between the start time and the end time.

Note:
Time-limited roles are not displayed to the assigned users.

Monitoring instance usage

Track application usage on your instance through the Application Usage Overview and the ServiceNow Store Usage overview dashboards.

The usage analytics process collects data on all your instances and regularly updates the reports in the Usage Overview and ServiceNow Store Usage Overview dashboards. Application usage data is collected whenever an application is opened, and counts on tables are collected once a day. Data is collected on:

- The number of active users in the system
- The hardware CIs discovered (for instances that use Discovery)
- The number of cloud management service catalog items available to users in instances that use Cloud Management

Users with the admin or usage_admin role can view the Application Usage Overview and ServiceNow Store Usage Overview dashboards.

Application usage overview dashboard

The Application Usage Overview dashboard displays reports on the use of ServiceNow applications on your instance.

Navigate to **Self-Service** > **Dashboards**. From the Dashboards list, select **Usage Overview**.

To manage dashboards, create tabs, reset filters, or create a favorite, select the menu icon (). To see dashboards that you own or are shared with you, select the dashboards overview icon (). To add a widget, select the add widgets icon (). To change the dashboard layout or background color, select the configuration icon (). To share the dashboard with another admin, select the sharing icon ().

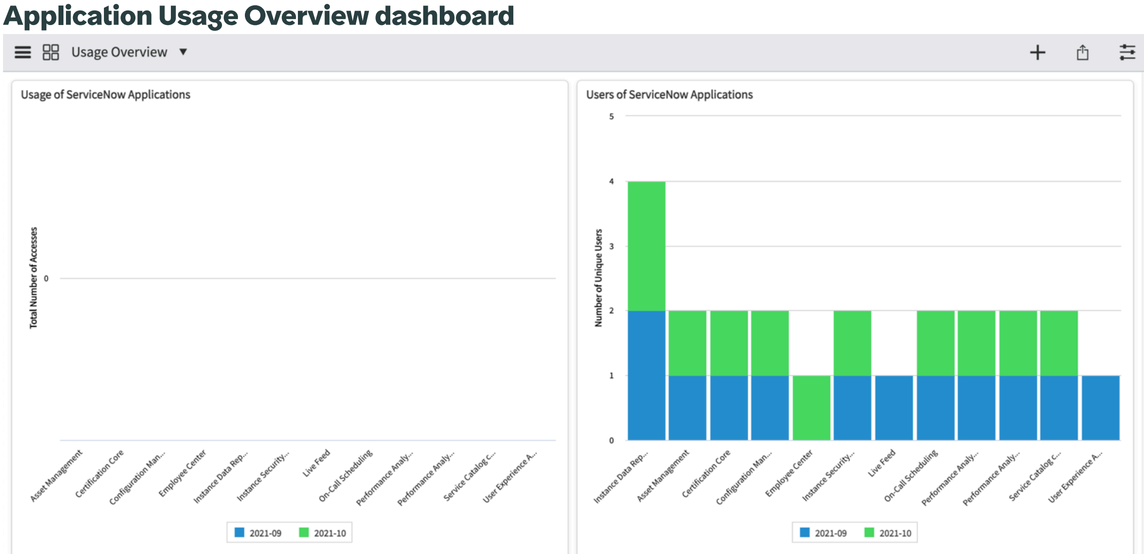
Application Usage Overview reports

Chart or report	Description
Usage of ServiceNow Applications	Shows the number of views or operations performed for each of the listed applications, grouped by month.
Users of ServiceNow Applications	Shows the number of active users who have used the instance, grouped by month. An active user is any user who could have accessed the applications, not only users who actually did access the applications.
Usage of Custom Applications	Shows the number of views or operations performed for each of the listed custom applications, grouped by month.
Users of Custom Applications	Shows the number of active users who have used custom applications, grouped by month. An active user is any user who could have accessed the custom applications, not only users who actually did access the applications.
`Google` **Maps Usage By Month**	Shows the number of views or operations performed for the Google maps application.
Additional Metrics	Shows any of the following items, depending on your licensing agreement: • Primary database size of this instance in megabytes • ServiceNow® Performance Analytics of all indices • NotifyNow conference calls • ServiceNow® Cloud Provisioning plugins active • ServiceNow® Discovery plugin active • ServiceNow® Password Reset plugin active • ServiceNow® Cloud Management — VMware instance • Vendor custom applications

Application Usage Overview reports (continued)

Chart or report	Description
	• Custom applications • ServiceNow® Event Management plugin active • Active benchmark indicators • Customer updated PA indicator • Active users • ServiceNow® Cloud Management — EC2 instances • ServiceNow® Orchestration core plugins active • Custom tables extending base system tables other than Task • Virtual node count • Active users for subscriptions • NotifyNow Messages • ServiceNow® Edge Encryption plugin active • Number of Google map page hits during the current month - as of yesterday • Physical node count

Application Usage Overview dashboard



ServiceNow Store Usage overview dashboard

The ServiceNow Store Usage Overview dashboard displays reports on the use of ServiceNow Store applications on your instance.

Navigate to **Self-Service** > **Dashboards**. From the Dashboards list, select **ServiceNow Store Usage Overview**.

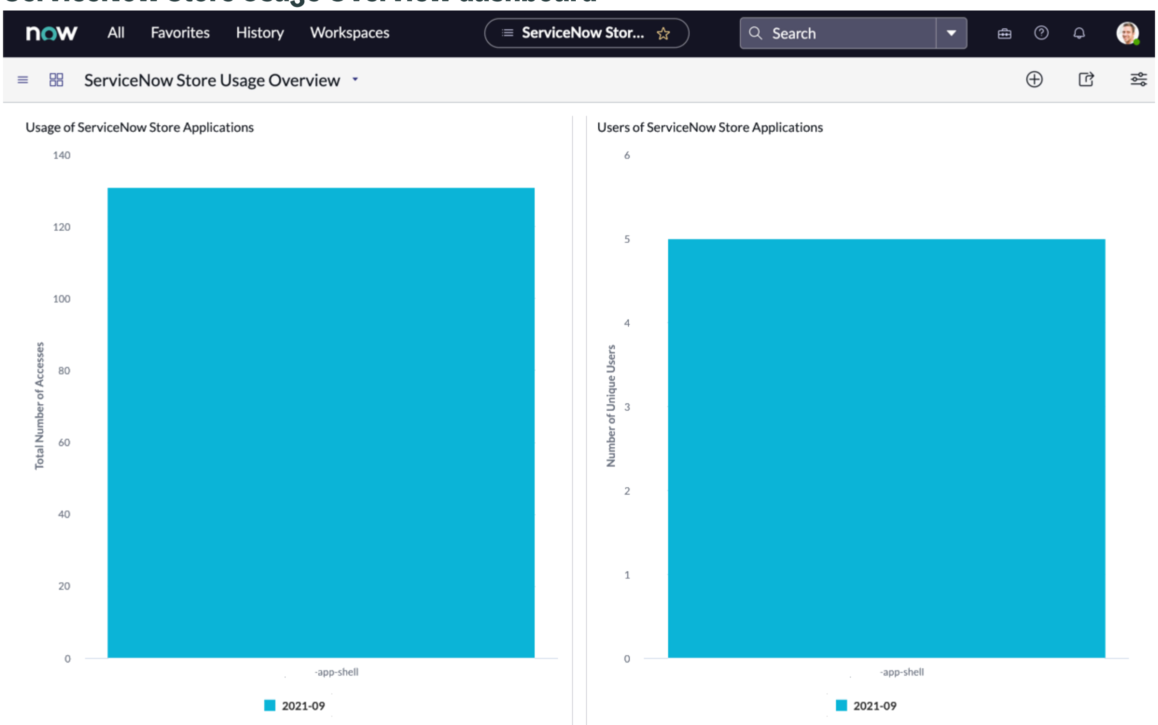
To manage dashboards, create tabs, reset filters, or create a favorite, select the menu icon ( ). To see dashboards that you own or are shared with you, select the dashboards overview icon ( ). To add a widget, select the add widgets icon ( ). To change the dashboard layout

or background color, select the configuration icon ( ). To share the dashboard with another admin, select the sharing icon ( ).

ServiceNow Store Usage Overview reports

Chart or report	Description
Usage of ServiceNow Store Applications	Shows the number of views or operations performed for each of the listed applications, grouped by month.
Users of ServiceNow Store Applications	Shows the number of active users who have used the instance, grouped by month. An active user is any user who could have accessed the applications, not only users who actually did access the applications.

ServiceNow Store Usage Overview dashboard



Monitoring user activity

Learn about the tools available to administrators for monitoring users on their instance.

User administration tools

In addition to storing information on a user, user accounts are also associated to groups and roles. Your instance uses groups and roles to determine which records and features an individual may access.

Impersonation

Administrators can select user records for impersonation. Use this feature to experience the instance as another user, with that user's preferences and permissions. User impersonation can be a valuable tool for testing and troubleshooting. For more information on impersonation, see Impersonating users.

Investigating user account activity

At any time there is a need to review specific user behavior, below are the recommended steps on how to review the transaction logs and event logs:

- Locate the IP address of successful/failed login for a particular ServiceNow user for their instance
- Modify the time frame of the search
- Limiting the scope of the search by user name
- View successful/failed login attempts

For more information about investigating user activity, see the How to investigate user account activity [KB0564981] article in the Now Support Knowledge Base.

User sessions

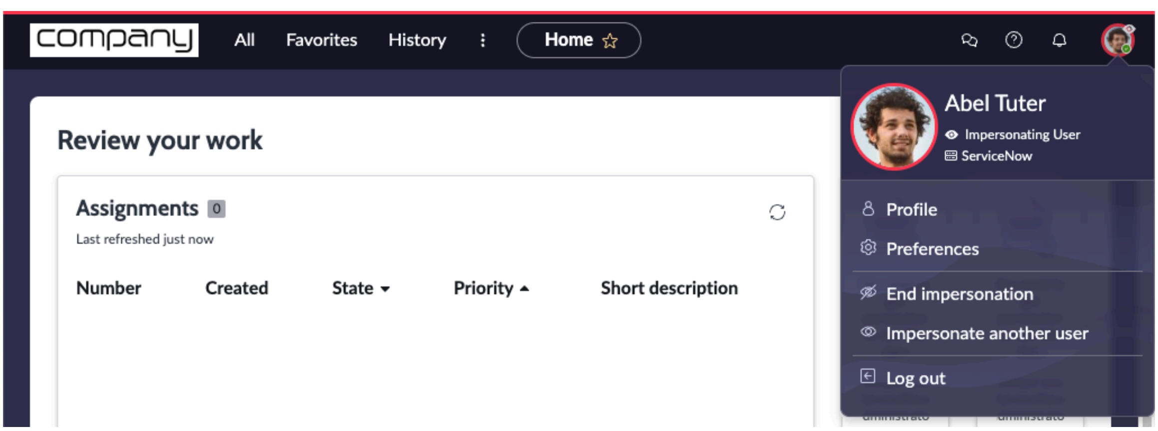
With user session management, and administrator can view and terminate individual user sessions, lock out users from the instance, and make users inactive. For details on managing user sessions, see Managing user sessions.

User records are also associated with transaction logs. Administrators can use these logs to track all browser activity for an instance.

Impersonating users

Administrators are able to impersonate other authenticated users, a feature primarily used for testing.

This function enables the administrator to access the system exactly as the impersonated user, including identical menus and modules. All actions performed by the administrator during impersonation are recorded as if they were executed by the impersonated user.



Impersonation limitations

When you impersonate a user, all scope-protected roles and encryption module roles are supported if the **Impersonation** option is configured in the module access policy. See Create a module access policy for details.

Impersonating a user enables access to scope-protected and encryption roles, as defined in the access policy. However, if impersonating a user with an admin role, access to certain features and modules is limited unless the impersonator already possesses those roles.

Impersonating a user with an application-specific admin role, like Human Resources admin or Security Incident Response, limits access to certain features such as security incidents and

profile information, unless these roles are already assigned to the impersonating admin. This restriction extends to certain modules and applications in the navigation bar, and admins can't change the password of users with application admin roles.

The following actions or conditions cause a user impersonation to end:

- The user impersonates a different user
- The user session ends, for example after a user logs out of their instance

Note:
When an administrator starts impersonating a user, the 'Impersonate Begin' event is logged in the system log. Similarly, the 'Impersonate End' event is recorded when impersonation concludes under one of the two conditions listed above.

Impersonation requirements

The user account to be impersonated must have a user ID. You can find this ID in the User [sys_user] record for the account. If this value is missing, the message `The user you selected could not be impersonated` appears.

You need several different accounts to test the system.

- An admin account to do work
- An information technology infrastructure library (ITIL), or similar, account to test as a technician
- An ESS account to test as an end user

More logins may be required to adequately test the system.

Note:
If you try to impersonate a user who is either locked out or inactive, the system will automatically log you out if you initiate an action or select a link. Remember that all changes made during impersonation only apply to that session. To help ensure accuracy, log out and then log back in after completing the impersonation.

Mobile impersonation

Mobile impersonation is available on ServiceNow mobile apps. For information on mobile impersonations, see Mobile impersonation.

Manage the visibility of the impersonation feature

Before users can impersonate another user, an administrator must make the feature visible.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System properties** > **UI properties**.
2. Select a check box under **Enable impersonation button in the banner line** to display or conceal the button.
3. Select **save** at the top of the page.
   Admins can still impersonate users via the **impersonate_dialog** UI page.

Impersonate a user

You can select a user or enter a different user name to perform an impersonation.

Before you begin

Role required: impersonator

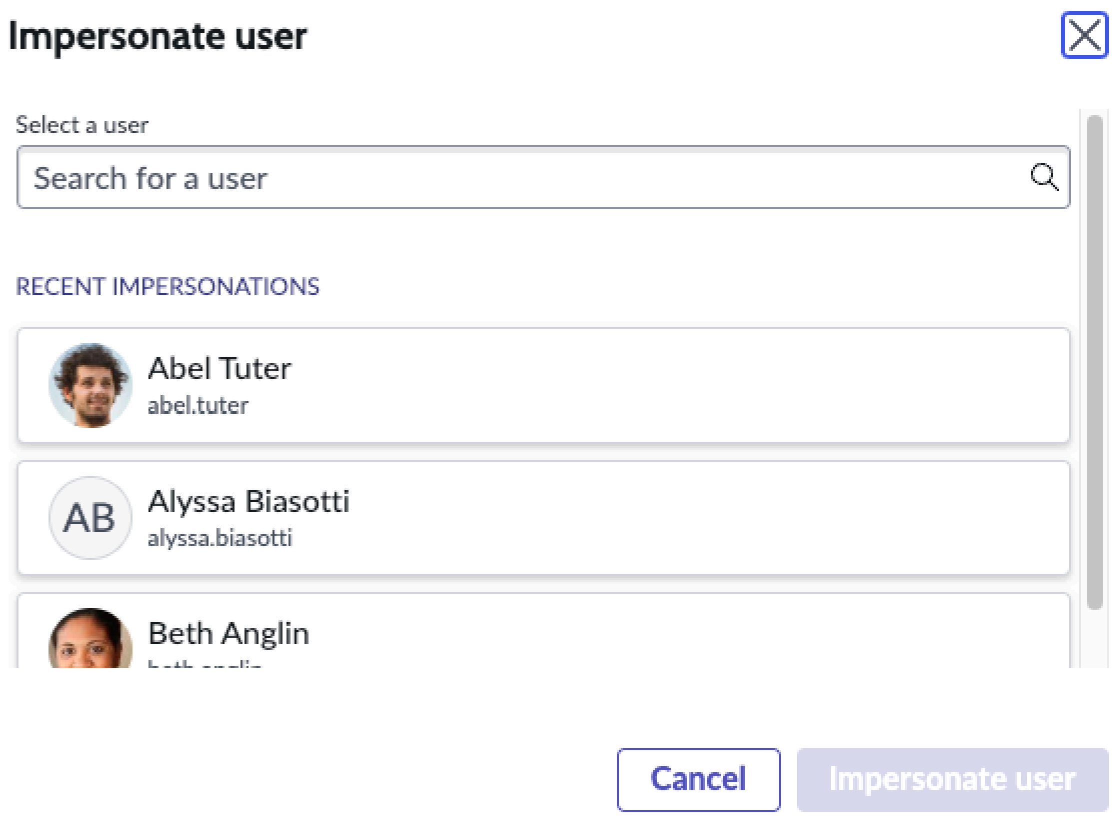
Procedure

1. In the banner frame, select your user profile picture to open the user menu.
2. Select **Impersonate User**.
    - In Next Experience:

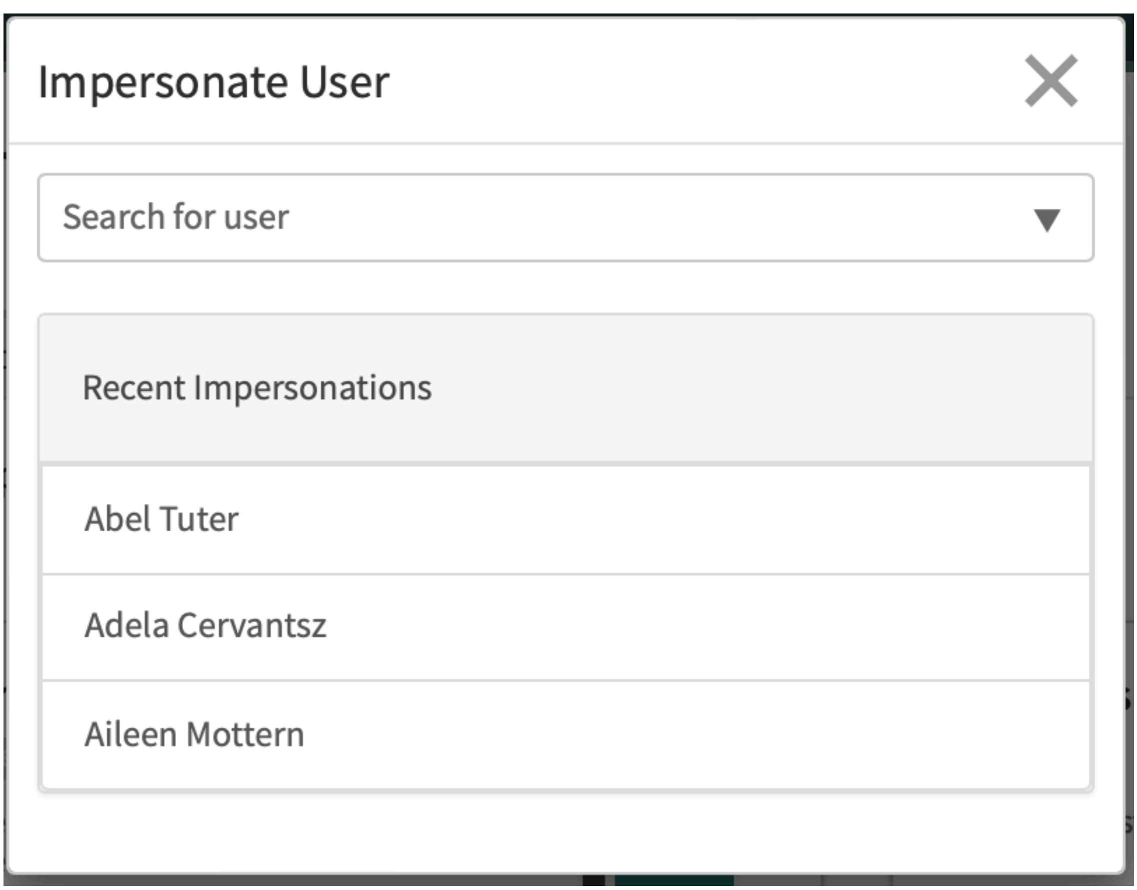
      
    - In Core UI:

      
   The Impersonate user dialog box displays.
3. Select a user from the **Recent Impersonations** list or enter a different user's name in the user selection field.

- In Next Experience:



- In Core UI:



4. Select **Impersonate User**.
5. **Optional:** To impersonate another user while impersonating a user, open the user menu and select **Impersonate another user**.
6. To return to your original login, open the user menu and select **End Impersonation**.

Note:
In some cases, impersonating a user might cause an issue that makes it difficult to switch back. If you're presented with a broken page while impersonating a user in a test environment, you may need to force a logout. To do so, navigate to http://<instance name>.service-now.com/logout.do and log back in.

Impersonation logs

Impersonations are logged in the system log.

Log impersonations for either interactive (UI) or non-interactive sessions.

Impersonation logging for interactive sessions

Interactive sessions are performed through the user interface (UI). Enable or disable impersonation logging for interactive sessions using the *glide.sys.log_impersonation* property.

If you enable impersonation logging for interactive sessions by setting *glide.sys.log_impersonation* to **true**, all interactive sessions are recorded in the log.

Property	Description
glide.sys.log_impersonation	Enables (**true**) or disables (**false**) impersonation logging for interactive sessions.

Impersonation logging for non-interactive sessions

Non-interactive sessions are performed by applications and scripts, not through the UI.

Impersonation logging of non-interactive sessions is turned off by default. If you enable impersonation logging by setting the *glide.sys.log_impersonation.non_interactive* property to **true**, impersonations of non-interactive sessions are recorded in the impersonate log.

Even with *glide.sys.log_impersonation.non_interactive* set to **true**, the system doesn't log certain common impersonation tasks performed on behalf of the default users (*system*, *soap.guest*, and *guest*) because the application impersonates those default users to perform a variety of tasks.

Use the *glide.sys.log_impersonation.non_interactive.exclusion* property to exclude impersonations by other users in addition to the default users.

Property	Description
glide.sys.log_impersonation.non_interactive	Enables (**true**) or disables (**false**) impersonation logging for

Property	Description
	non-interactive sessions.
glide.sys.log_impersonation.non_interactive.exclusion	Excludes impersonation logging of non-interactive sessions for specified users. Enter user names as a comma-separated list. Default users (**system**, **soap.guest**, and **guest**) don’t need to be included in the list.

Managing user sessions

The ServiceNow AI Platform provides the ability to view and terminate individual user sessions, lock out users from the system, and make users inactive.

Regardless of the number of windows you have open in a browser, it’s considered to be one session. However, if you have two separate browsers open (such as Google Chrome and Safari), it’s considered to be two separate sessions.

- Terminating a user session effectively logs that user out of the next transaction, which is usually the next browser select. Use the terminate sessions feature when you want to perform system maintenance.
- Locking a user out of the system means they can no longer log in or generate any actions from any email messages that they send to the instance. Locking users out also terminates their sessions.
- Making a user inactive means they don't show up in any fields that reference active users on the **User** table.

Configure a maximum active time for user sessions

Secure your instance by enforcing a maximum time for sessions regardless of user activity.

Before you begin

Role required: admin

About this task

By default, sessions expire only after a period of inactivity. Enforcing a maximum active session time ends sessions regardless of whether a user has been active recently, including whether they recently selected to extend a session. The active session timeout should be greater than the value configured for the inactive session timeout. For example, if sessions are configured to time out after 30 minutes of inactivity, the active session timeout should be greater than 30 minutes.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Filter the System Properties [sys_properties] list for the following properties and then select a property to open its record.
   - *`glide.ui.active.session.life_span`*: Sets the maximum session time for authenticated user sessions regardless of user activity. Authenticated users are logged out of the instance after the time specified and must enter their credentials again to access the instance.
   - *`glide.guest.active.session.life_span`*: Sets the maximum session time for guest user sessions regardless of user activity. This setting helps secure an instance using applications that involve guest user sessions, such as Agent Chat.
3. In the **Value** field, enter the number of minutes before the session times out regardless of user activity.
   The value should be greater than the value of the corresponding properties for an inactive session timeout: *`glide.ui.session_timeout`* for authenticated users or *`glide.guest.session_timeout`* for guest users. By default, the inactive session timeout for both authenticated and guest users is 30 minutes.
4. Select **Update**.

Related topics

Configure a maximum active time for integration sessions

Modify user session timeout after inactivity

Specify when to time out user sessions after a period of inactivity.

Before you begin

Role required: admin

About this task

By default, after 30 minutes of inactivity in the application, the platform logs the user out automatically, unless the **Remember Me** check box in the login screen is selected. Making the interval longer can lead to the unnecessary maintenance of inactive sessions in memory. Adjust this timeout setting to no more than a few hours, although up to 24 hours is workable.

Note:

- Ajax calls to the server keep the session alive (such as Labels and Refreshing dashboards).
- Polling keeps the session alive when the chat desktop is open (requires the Chat plugin).

Procedure

1. Clear the **Remember Me** check box in the login screen.
2. In the navigation filter, enter `sys_properties.list`.
3. From the System Property [sys_properties] list, search for *`glide.ui.session_timeout`*.
4. If *`glide.ui.session_timeout`* doesn't exist, select **New** to add a new property using the following values:
   - **Name**: *`glide.ui.session_timeout`*
   - **Description**: Type a brief description. In this case, enter something like `Override the default session timeout (30). This value is in minutes.`

- **Type**: Select the appropriate data type. In this case, select **Integer**.
- **Value**: Change the default value from 30 minutes to a value of your choice.

Note:
The session timeout can also be set through installation exit customizations.

What to do next

Administrators may also want to add the following properties to the System Properties table.

- `glide.security.csrf.handle.ajax.timeout`: Handles errors for timed out Ajax requests when set to **true**.
- `glide.security.auto.resubmit.ajax`: Automatically resubmits timed-out Ajax requests when set to **true** and the Log in to an instance check box is selected or Change the default value of the Remember me check box. A pop-up appears to users asking them to continue.
- `glide.ui.auto_req.extend.session`: When set to **true**, the system automatically extends a user's session by the value they select for the homepage refresh time. If there's no homepage refresh time, the standard timeout value applies. Tablet and mobile devices don't support this property. When set to **false**, user sessions time out when the **Remember me** check box is clear. The timeout is based on whether there's a homepage refresh time. When there's no homepage refresh time, the standard timeout value applies. When there's a homepage refresh time, the user session times out after the timeout value plus one interval of the homepage refresh time. For example, if a user selects a refresh interval of five minutes, then that session expires after the timeout value plus five minutes.

Note:
Users who select the **Remember me** check box are unaffected by session timeout properties.

Administrators can also add the following properties to configure additional timeout settings for user sessions. These additional settings help to conserve system resources:

- `glide.session.unauthorized.timeout.enabled`: Enables an alternate session timeout for unauthenticated, guest sessions. Guest sessions are created for HTTP requests to the instance that don't contain authentication information. By default this property is set to **true**.
- `glide.unauthorized.session_timeout`: Specifies the time, in minutes, after an authenticated user logs out of an instance before the session ends. Set the property to a value greater than **0** and less than the value in the `glide.ui.session_timeout` property.

Related topics

Modify integration session timeout after inactivity

Prompting users to extend a session

Configure how much time users have to extend a session before it times out due to inactivity.

Before you begin

Role required: admin

About this task

By default, users are prompted to extend their session two minutes before it expires with an "Extend your session" dialog box. This procedure explains how to adjust the timing of when users are presented with this prompt.

Procedure

1. Navigate to **All**, and then enter `sys_properties.list` in the navigation filter.
2. Open the *`glide.ui.session_timeleft`* property.
3. In the **Value** field, enter the number of minutes before the session timeout to prompt users to extend their session.
   Setting the value to zero turns off prompting users to extend their sessions.
4. Select **Update**.

Lock out a user

Lock out a user when you don't want the user to access the instance.

Before you begin

Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users** and select the user from the list.
2. Select the **Locked Out** check box, and update the record.

Mark a user inactive

You can mark a user inactive so the user doesn't show up in any fields that reference active users on the **User** table.

Before you begin

Role required: admin

About this task

Note:
By default, when you mark a user inactive, you lock out that user. The **Lock Out Inactive Users** business rule governs this behavior.

If you clear the **Active** checkbox, the user is locked out and cannot access the instance. This functionality is controlled through a Glide property *`glide.authenticate.only.allow.active.user.login`* which will only allow the active users to access the instance.

Procedure

1. Navigate to **All** > **User Administration** > **Users** and select the user from the list.
2. Clear the **Active** check box, and update the record.

Terminate a user session

You can terminate a user session, for example, if you're going to perform system maintenance and users are still logged in.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Logged in users**.
   You can only see users who are logged in to the same application node as you. If the Active field on a user record value is false, the user is logged in but not currently running a transaction. Most users appear as inactive at any given time.
2. Select the session that you want to end.
3. Select **Lock Out Session**.
   The session is terminated, and the user is redirected to the login page at the next attempted transaction. The user isn't locked out. Multiple user sessions may be associated with one user. Terminating a user session only affects the specific session.

   Note:
   Mobile user sessions can't be terminated using this process.

Non-interactive sessions

The Non-Interactive Sessions plugin creates a distinction between interactive and non-interactive users.

Interactive users

New users added to the instance automatically become interactive users. Interactive users can perform the following actions:

- Use their user name and password to log in to the UI or a service portal.
- Connect to an instance from a URL that calls a UI page, form, or list, for example, https://<instance name>.service-now.com/incident.do.
- Connect with single sign-on, for example, digest authentication or a Security assertion markup language (SAML).
- Use their credentials to authorize SOAP connections if allowed by strict security.
- Use their credentials for other API connections such as WSDL, JSON, XML, or XSD without restriction.

Non-interactive users

Non-interactive users can only use their credentials to authorize API connections such as JSON, SOAP, and WSDL. They can't log in to the ServiceNow UI. The strict security high security setting determines if non-interactive users are subject to Contextual Security Manager requirements.

Distinguishing between interactive and non-interactive users increases instance security by helping to ensure that users abide by the principle of least privilege.

Installed with Non-Interactive Sessions

Note:
Non-Interactive Sessions is enabled for all new instances since the Calgary release. If you don't see it in the list of plugins, request it using the Activate Plugin service catalog item in Now Support.

- Adds a column titled **Web Service Access Only** [web_service_access_only] to the **User** [sys_user] table.
- Changes all existing users to be interactive users (web_service_access_only=false).
- Updates the User form to display the **Web Service Access Only** [web_service_access_only] field by default.

Create a non-interactive user for web services

Non-interactive users can only connect to a ServiceNow instance from an API protocol. Use this feature to set up user accounts for web service authentication purposes.

Before you begin

Role required: user_admin or admin

About this task

Non-interactive users can't log in to an instance or a service portal or connect through single-sign-on. They can be used as a MID Server user if they're flagged as an Internal Integration User.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Search for the user to be updated.

   Example

   For example, SOAP user.
3. Select the **Web Service Access Only** check box.
4. Select **Update**.

   Note:

   The ServiceNow platform uses any user name and password credentials supplied with a request even if the High Security Settings don't require authorization for a given API protocol. For example, if a SOAP request supplies a user name and password, the instance verifies those credentials even if SOAP requests don't require authorization. To avoid verifying user credentials, the request must not include them.

Make a non-interactive user record interactive

Manually switch a non-interactive user to an interactive user.

Before you begin

Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Search for the user you want to update.
   For example, **System Administrator**.
3. Clear the **Web Service Access Only** check box.
4. Select **Update**.

Update web service user accounts for strict security

If your instance requires strict security, add the soap role to any user accounts used for web services.

Before you begin

Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select a web service user from the list.
3. From the **Roles** related list, select **Edit**.
4. Add soap to the **Roles List**.
5. Select **Save**.
6. Select **Update**.

Require authentication

You can specify whether non-interactive sessions require authentication from the **High Security Settings** module.

Before you begin

Role required: admin with elevated privileges

About this task

A non-interactive session bypasses the UI to connect to the instance at an API level. Typically, non-interactive sessions use set protocols such as JSON, SOAP, XSD, or WSDL. By default, all non-interactive sessions require authentication.

Procedure

1. Log in with an administrator user with the security_admin role.
2. Elevate your privileges to use security_admin.
3. Navigate to **All** > **System Security** > **High Security Settings**.
4. Select the matching **Requires authorization...** option for the protocol you want to set.
   For example, **Requires authorization for incoming SOAP requests**.
5. Select the check box to require authentication for the non-interactive session method.

   Clear the check box to enable the non-interactive session method to connect without providing any credentials.

   Note:

   Activating the Non-Interactive Sessions plugin might restrict existing users who manage SOAP and WSDL-based integrations from logging in, unless they already possess the SOAP role.

ServiceNow AI Platform tables and data

ServiceNow provides options for managing your data on the ServiceNow AI Platform.

Table administration	Data management	Export data	Roll back and delete recovery
Learn about working with complex, large amounts of data, by using tables and records on the ServiceNow AI Platform.	Explore options for storing and deleting data with ServiceNow.	Learn about exporting data from the ServiceNow AI Platform.	Learn how to roll back actions and recover deleted records.

Table administration

Handle data and process management for all your ServiceNow applications. Administrative roles on the ServiceNow AI Platform give you access to tables and records to manage incidents, problems, database changes, and more. Build graphical representations of tables and their relationships (such as parent or child tables) using Schema maps, and define elements in your database with Data Dictionary tables. Work with complex relationships between multiple sets of records using Many-to-Many Task Relations.

Data Management

Manage the growth of data on your instance with our set of Data Management tools. Keep performance smooth by archiving records, delete older records using table cleaner, and manage large tables with database rotations.

Exporting data

Export individual or multiple records from the ServiceNow AI Platform in a variety of formats.

Roll back and delete recovery

Roll back a software upgrade or plugin activation. Recover deleted records and related changes.

Table administration

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table.

This video covers the ServiceNow® infrastructure and introduces the concepts of tables, records and fields; table classes other table relationships; and schema maps.

Watch this short video to see an overview of table administration.

Exploring ServiceNow AI Platform® tables

Applications use tables and records to manage data and processes, such as Incident, Problem, and CMDB. Tables can extend other tables, creating parent tables and child tables.

Table administration overview

The ServiceNow AI Platform® uses a table-based data structure to store and organize information. Pre-built tables are included for common IT service management (ITSM) processes, with their data fully importable and exportable in CSV, XML, or other formats.

Table administration users

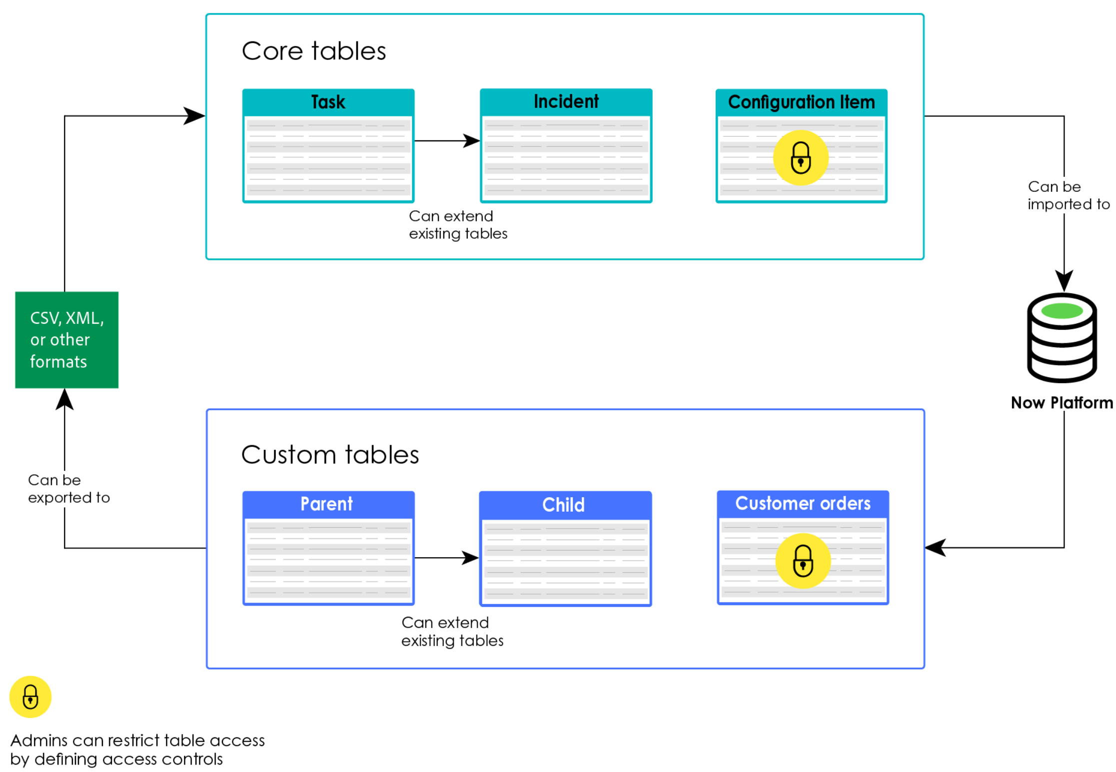
Users

User	Description
Administrator	Admins can create custom tables for specific business requirements, define field properties, create relationships between tables, and extend existing tables without modifying the originals. Administrators also define access controls to allow only approved user access to records, business rules for various tasks, and table cleanup policies for unused and outdated records.

Table administration workflow

This infographic depicts how an administrator can extend both core tables and custom tables.

Extending core tables and custom Tables



1. An administrator views table relationships and learns how table extension works on the ServiceNow AI Platform®.
2. The administrator creates a custom parent table and extends it by creating a custom child table.
3. The administrator defines access controls to restrict access to each table.
4. The administrator exports and imports data to core and custom tables as needed.

Table administration benefits

Benefit	Feature	Users
Define models and entity relationships across multiple tables.	Data dictionary tables	Admin
Access visual references for tables and their contents.	Viewing table references and extensions	Admin
Store records for your instance.	Create a custom table	Admin
Remove unneeded tables from your instance.	Deleting custom tables	Admin
Quickly find data stored in a table.	Create a table index	Admin
Connect a list to another list of multiple entries instead of a single field.	Create a many-to-many table relationship	Admin
Organize and store task-related data.	Working with the Task table	Admin
Connect tables for reporting purposes.	Creating database views for reporting	Admin

What to explore next

To learn more about using table administration features, see:

- Managing tables and indexes
- Working with the Task table
- Creating database views for reporting

Data dictionary tables

Access details related to tables, columns, and field labels in your instance.

Tables

All of the information on an instance is stored in tables, which consist of a series of records. The record in turn holds a series of fields that hold the individual bits of data and can be viewed either as a list or a form.

The Tables [sys_db_object] table contains a record for each table in the database.

Access the Tables [sys_db_object] table by navigating to **System Definition** > **Tables**. From the Tables list, an administrator can create a custom table, or select an existing table to view table details. In the table form, an administrator can access table administration options.

- View, add, or modify columns with a searchable and sortable embedded list, define the auto-number format, make the table extendable by other tables, and create modules for the table.
- Launch a schema map for a table by clicking the **Show Schema Map** related link.
- Open the dictionary entries for the table by right-clicking the form header and selecting **Show Dictionary Record**.

- Navigate directly to the default list or form view for the table by clicking the **Show List** or **Show Form** related link.
- Delete all records from a table by clicking the **Delete All Records**.

The following image shows a list of the tables that extend the Application File table.

Tables

Tables | Name | Search | Actions on selected rows... | New

All > Extends table = Application File

Label	Name	Extends table	Extensible	Updated
Agent Assist Recommendation	agent_assist_recommendation	Application File	false	2022-04-25 04:58:49
Record Producer Configuration	aisa_rp_config	Application File	false	2022-04-25 05:05:44

AI Search ACL Overrides	ais_acl_overrides	Application File	false	2022-04-25 03:48:21
AI Search Child Table	ais_child_table	Application File	false	2022-04-25 03:48:16

Dictionary Entries

The Dictionary Entries [sys_dictionary] table, also called the **System Dictionary**, defines every table and field in the system. It contains information about data type, character limit, default value, dependency, and other attributes of a field.

Access the system dictionary in one of these ways:

- To see the system dictionary list view, navigate to **System Definition** > **Dictionary**.
- To view particular dictionary definition, right-click the list header, form header, or field label, and select **Configure Dictionary**.

The following image shows a filtered list of dictionary entries for the Incident table and the Task table, which it extends.

Dictionary Inc Task

Dictionary Entries | Table | Search | Actions on selected rows... | New

All > Table = incident .or. Table = task

Table	Column name	Type	Reference	Default value	Display	Text index	Audit	Updated
incident	resolved_at	Date/Time	(empty)		false	false	false	2022-04-25 04:29:00
incident	resolved_by	Reference	User		false	false	false	2022-04-25 04:29:00
incident	rfc	Reference	Change Request		false	false	false	2022-04-25 04:16:53
incident	severity	Integer	(empty)	3	false	false	false	2022-04-25 04:16:53
incident	subcategory	String	(empty)		false	false	false	2022-04-25 04:16:53
incident	sys_id	Sys ID (GUID)	(empty)		false	false	false	2022-04-25 04:16:53
task		Collection	(empty)		false	true	false	2022-04-25 05:43:21
task	active	True/False	(empty)	true	false	false	false	2022-04-25 03:45:17

Field Labels

The Field Labels [sys_documentation] table, also called the **Language File**, contains information about the labels and hints for each table and column in the system.

Access the language file in one of these ways:

- To see the list view, navigate to **System Definition** > **Language File**.
- To see the field label for a particular field, right-click the field label on the form.

The following image shows the language file filtered to display only labels on the Incident table.

Field Labels

Field Labels | Table | Search | Actions on selected rows... | New

All > Table = incident

incident	reopened_by	en	Last reopened by	Last reopened by		2022-04-25 04:16:53

System dictionary

View a list of all tables in columns in your instance from the system dictionary.

Each row in the system dictionary represents either a table or a column in one of the tables. The system dictionary provides options for administrators to modify tables and fields, which in turn define lists and forms.

Use caution when changing system dictionary records because changes can have a high impact on functionality. In particular, changes to dictionary entries for system tables, which are tables that begin with sys_, can create system-wide issues such as the inability to use update sets.

Dictionary changes are difficult to reverse. Also, dictionary changes automatically apply to all extended tables unless a dictionary override is defined. Be sure that changes are well-tested before applying them to a production instance.

Creation options

When you create a field from the system dictionary, it is automatically added at the end of the first section of the default form view.

In most cases, use the following interfaces rather than creating entries directly on the system dictionary:

- To create tables and fields, use the Tables module.
- To create fields, configure the table form.

Table relationships

You can create relationships between tables by extending tables, referencing records in another table, creating many-to-many relationships, and joining tables in a database view.

Tables can be related to each other in several ways.

Extensions

A table can extend another table. The table doing the extending (child class) includes all of the fields of the other table (parent class) and adds its own fields. For instance, the Incident [incident] table has all of the Task [task] table fields (because an incident is a special form of task) and has its own incident-specific tasks. See Table extension and classes.

One-to-many

Within a table, a field can hold a reference to a record on another table. There are three types of one-to-many relationship fields.

Reference fields

Allow a user to select a record on a table defined by the reference field. For instance, the **Caller** field on the Incident table allows the user to select any record on the User table.

Glide lists

Allow a user to select multiple records on a table defined by the glide list. For instance, the **Watch list** field on the Incident [incident] table allows the user to select records on the User [sys_user] table.

Document ID fields

Allow a user to select a record on any table in the instance. These fields are much less common, but one example is the **Document** field on the Translated Text [sys_translated_text] table.

Many-to-many

Two tables can have a bi-directional relationship, so that the related records are visible from both tables in a related list.

Database views

Two tables can be joined virtually in a database view to enable reporting on data that might be stored over more than one table.

Table extension and classes

Enable one or more child tables to share fields and records with a parent table. Administrators and application developers can only extend tables during table creation.

Administrators and application developers typically extend tables to create a set of related records that share information. For example, in the base system, the Task and the Configuration Item tables have multiple extensions:

Sample extended tables in the base system

Original table	Related tables extended from original table
Task [task]	• Incident [incident] • Problem [problem] • Change Request [change_request]
Configuration Item [cmdb_ci]	• Application [cmdb_ci_appl] • Computer [cmdb_ci_computer] • Database [cmdb_ci_database]

A table that extends another table is called a child class, and the table it extends is the parent class. A table can be both a parent and child class both extending and providing extensions for other tables. A parent class that is not an extension of another table is called a base class.

Administrators can use these tools to see the relationships between classes.

- Schema map
- System dictionary
- Tables module

Extending a table:

- Links the new table to the extending table.
- Creates system fields in the new table.
- Creates one or more database tables to store the parent and child classes. The number of tables the system creates depends upon the extension model selected during table creation.

Extension models

The ServiceNow AI Platform offers these extension models.

- Table per class
- Table per hierarchy
- Table per partition

The extension model determines these attributes.

- The number of database tables created
- The derivation of fields from parent classes
- The replication of records from child classes

Table per class

Tables created

Creates a separate database table for the parent class and each child class.

Fields derived from parent class

Child classes derive fields from parent classes.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Contract [ast_contract] table has 59 Dictionary records, which define the table and its fields.

Dictionary records created for child classes

Each child class only has Dictionary entries for fields unique to the class.

Records replicated

The parent class replicates each record stored in its child classes. Each child class only stores records unique to the class. Replicated records have the same Sys ID value in each table. The system replicates any change you make to a child record to the matching record in the parent table. For example, Contract [ast_contract] table replicates records from the Lease [ast_lease] and Warranty [ast_warranty] tables.

Table per hierarchy

Tables created

Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables.

Fields derived from parent class

Child classes derive fields from parent classes. For example, the Incident table derives fields from the Task table.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Task table is a parent class that has 66 Dictionary records, which define the table and its fields.

The Dictionary entry for the parent class contains a sys_class_name column whose value indicates which child class each record belongs to. For example, Incident records have a sys_class_name value of incident, and change records have a sys_class_name value of change.

Dictionary records created for child classes

Each child class only has Dictionary entries for fields unique to the class. For example, the Incident table only has 22 Dictionary records, which are not already defined in the Task table.

Records replicated

Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Task table contains all records from its child classes such as the Change, Incident, and Problem tables.

Table per partition

Tables created

Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables. As the database table reaches a storage limit, the system dynamically adds storage tables (partitions) to store additional records.

Fields derived from parent class

Child classes do not derive fields from parent classes. Instead each child class has its own list of fields. For example, the Base Configuration Item [cmdb], Configuration Item [cmdb_ci], and Hardware [cmdb_ci_hardware] tables all have their own field definitions.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field relevant to it. For example, the Base Configuration Item [cmdb] table is a parent class that has 48 Dictionary records.

The system replicates changes made to parent class Dictionary entries to child class Dictionary entries. For example, when you change the name column in the parent class Base Configuration Item [cmdb] table, the system replicates it to child class Dictionary entries such as the Configuration Item [cmdb_ci] and Hardware [cmdb_ci_hardware] tables.

The Dictionary entry for the parent class contains columns for sys_class_name and sys_class_path whose values indicate which child class each record belongs to. For example, Hardware records have a sys_class_name value of cmdb_ci_hardware, and computer records have a sys_class_name value of cmdb_ci_computer.

When the database table reaches a storage limit, the system updates the Dictionary entry for the parent class to include columns for sys_storage_alias and storage_table_name. These storage column Dictionary entries allow administrators to manage the parent class and its storage tables as a single logical unit.

Dictionary records created for child classes

Each child class has a Dictionary record for the collection and for each field relevant to it. For example, the Hardware table has 73 Dictionary records with some records duplicating columns in the parent class.

Records replicated

Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Base Configuration Item [cmdb] table contains all records from its child classes such as the Application [cmdb_ci_appl], Computer [cmdb_ci_computer], and Hardware [cmdb_ci_hardware] tables.

Storage aliases

Learn about the role storage aliases play in data manipulation and field creation in the ServiceNow AI Platform.

Understanding storage aliases is important for effective data management and schema customization in the ServiceNow AI Platform, particularly when dealing with complex table hierarchies like those in the Task [task] table.

By default, administrators have access to the Storage Column Aliases [sys_storage_alias] table within an instance. However, transactional processes against this table can't be performed by an administrator from the user interface.

Table hierarchy and models

Understanding storage aliasing requires knowledge of table hierarchies within the Task [task] table, which involves two models: Table per hierarchy and Table per class.

Table per hierarchy

This model uses a single physical table, the Task [task] table, which features a flattened hierarchy where all columns within the task hierarchy exist only on the task table. For example, fields related to change requests aren't on a separate Change Request [change_request] table but are integrated into the Task [task] table. You can verify whether a table is Table per hierarchy by checking the extension model field in the Tables [sys_db_object] table. If the table's parent is a direct child of the Task [task] table, the table uses Table per hierarchy.

An extended table inherits the hierarchy of its parent. For example, the IMAC [change_request_imac] table is a child table of the Change Request [change_request] table, which extends the Task [task] table. Because the Change Request [change_request] table is Table per hierarchy, the IMAC [change_request_imac] table model is also Table per hierarchy. Legacy tables such as the Incident [incident] table, Change Request [change_request] table, and Problem [problem] table are all part of the flattened Task [task] table hierarchy.

Table per class

This model applies to tables that physically exist in the database. It's used for new tables directly extending from the Task [task] table when the task row count exceeds 1 million rows. Unlike Table per hierarchy, Table per class doesn't use glomming because it doesn't operate within a flattened hierarchy.

Storage alias definition

A storage alias is created for every field on a table within an instance. Familiarize yourself with the key fields on the Storage Column Aliases [sys_storage_alias] table.

Element Name

Indicates how the field appears to users, which is important for user interface interactions and scripting.

Storage Alias

Indicates the exact physical column where the data for a field is stored. The storage alias value is used in combination with the table_name value to identify what data to manipulate. The storage alias value is the actual physical column on the Task [task] table.

Storage Table Name

Specifies the physical table that houses the element. For Table per hierarchy tables, the value is always task. For Table per class tables, the value is the name of the physical table.

Table

Specifies the logical class that each element links to on the physical Task [task] table. The Table element holds the table_name value which is the class discriminator.

Storage column aliases

Storage Column Aliases | Element name | Search | Actions on selected rows... | New

All > Storage table name = task > Storage alias starts with a_ref_2

Element name ▲	Offrow storage	Storage alias	Storage table name	Table
Search	Search	a_ref_2	=task	Search
cab_delegate	false	a_ref_2	task	Change Request [change_request]
category	false	a_ref_2	task	Standard Change Proposal [std_change_proposal]
chat_channel	false	a_ref_2	task	Chat Queue Entry [chat_queue_entry]
feedback	false	a_ref_2	task	Knowledge Feedback Task [kb_feedback_task]
guidance_step	false	a_ref_2	task	Guidance Task [help_guidance_task]
policy_id	false	a_ref_2	task	CMDB Data Management Task [cmdb_data_management_task]
request	false	a_ref_2	task	Requested Item [sc_req_item]
requested_for	false	a_ref_2	task	Asset Task [asset_task]
request_item	false	a_ref_2	task	Catalog Task [sc_task]
rfc	false	a_ref_2	task	Incident [incident]

In this example, the storage alias for the cab_delegate element is a_ref_2 and the physical storage table where the data is stored is task. The example depicts 10 logical elements in different logical classes on the Task [table] that all link to the same alias a_ref_2 on the physical Task [task] table.

The sibling elements are glommed, which means they share one physical column on the Task [task] table. You can query data from the logical element cab_delegate using a query like:

```
SELECT a_ref_2 from task WHERE sys_class_name='change_request'
 AND a_ref_2 IS NOT NULL
```

The query specifies data in the physical column a_ref_2. The class discriminator change_request is used in combination with the storage alias a_ref_2 to query the logical element cab_delegate from the logical class change_request on the physical Task [task] table.

The naming convention for fields created in the actual physical tables can vary depending on the type of field. In this example, a_ref_2 is an alias on the Task [task] table that holds values for reference fields.

Functionality and usage

Storage aliases serve multiple purposes.

Mapping

Aliases map logical elements (Table per hierarchy) or physical elements (Table per class) to the actual physical columns in the backend database. The logical element can be glommed to a physical column that is larger than the logical element's max_length.

Glomming

Aliases allow multiple sibling elements to share a single physical column in a Table per hierarchy model.

Label mapping

Aliases associate sys_documentation (label) records with their respective elements, enhancing visibility in forms, reports, and list views.

Restrictions and rules

- Two logical elements within the same class can't share a physical column. For example, two string fields created on the Incident [incident] table can't map to the same physical column in the database.
- A parent element and its child can't share a physical column. For example, a field created on the Incident [incident] table can't be mapped to a physical column when that physical column is already mapped to a field on the Task [task] table.
- Only sibling elements can share a physical column. For example, a reference field on the Change Request [change_request] table and a reference field on the Incident [incident] table and can both map to the same physical column.
- Fields created directly on the Task [task] table (where sys_class_name is 'task') can't be glommed.

Managing tables and indexes

Administrators can modify the database structure using table administration tools.

Custom tables and fields

Administrators can add custom tables, define fields, and manage field labels. Administrators can also delete custom tables that aren't needed or delete all the records in a table without deleting the table itself.

Dictionary entries

The system dictionary is a table, called Dictionary Entry `[sys_dictionary]`, that contains details for each table and defines every column within each table in an instance. Administrators can modify tables and fields in the system dictionary, which subsequently define the lists and forms that users access throughout the instance.

Dictionary attributes

Dictionary attributes define global behavior for fields. An administrator applies attributes directly to the dictionary entry to control various aspects of how the table or field behaves across the entire system.

Dictionary overrides

Dictionary overrides enable administrators to override field settings on extended tables. Dictionary overrides enable administrators to customize the behavior of a field for a specific table that inherits from another table. Overrides are used to change the inherited dictionary attributes on child tables without affecting the parent table or other child tables.

Table flattening

With table flattening, the Task [task] table and Base Configuration Item [cmdb] table have a hierarchy of related tables where one or more child tables extend from a parent table.

The extension model does not affect how the tables appear or function in the instance. All table functionality, including database views, remains unchanged by the extension model.

Table indexes

An index puts unordered tables into order, and efficiently speeds up queries to columns in your tables, by creating pointers to where information is stored in your database. Administrators can add indexes to access table data more easily.

Many-to-many table relationships

Many-to-many (M2M) table relationships enable administrators to associate records between two tables in a bidirectional and flexible manner. This relationship type is used to create links between records where each record from one table can relate to multiple records in another table, and vice versa.

Create a custom table

Manage and store application data by creating a custom table, adding columns, and defining access controls.

Before you begin

Check your custom table entitlements before creating custom tables.

Role required: admin

About this task

Note:
To minimize the existence of unneeded and extraneous tables in an instance, don't overdo table creation. Create only those tables you need to minimize administration tasks and shorten upgrade times. If possible, create tables when building applications with tools. To learn more, see Building applications.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select **New**.
3. On the form, fill in the fields.

Control	Description
Label	Enter a unique label for the table (such as **Laptops** or **Thin Clients**). The label appears on list and form views for the table. Updating the **Label** field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables.
Name	Edit the table name, which is automatically populated based on the table label and a prefix as follows:

Control	Description
	◦ For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application. ◦ For a table in the global application, the name is prefixed with the string `u_`. ◦ For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it is remote and part of an application. ◦ For a remote table in the global application, the name is prefixed with the string `u_st_`. You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).
Extends Table	Select the table to extend. Extending a base table incorporates all the fields of the original table and creates system fields for the new table. If they are in the same scope or if they can be configured from other scopes, you can extend tables that are marked as extensible. **Important:** Don't extend the [sys_choice] table. Extending the [sys_choice] table is not supported. The Extends Table option is not available if you select the **Scriptable Table** check box to designate that this table is scriptable.
Application	[Read only] Displays the application associated with this table. If you are working on an application or are creating a table from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.
Remote Table	Option to designate this table as a remote table. A remote table is a table to which you can associate a script definition for retrieval of data from an external data source. Unlike a standard internal table, the data does not come from records in the current instance. If you select this check box, you cannot access the **Extends Table** option because scriptable tables cannot be extended from other tables. **Note:** To learn more about scriptable tables, see: ◦ Retrieving and caching external data using remote tables ◦ Create a remote table ◦ Create a script definition for a remote table
Create module	Select the check box and then complete the **Add module to menu** field to create a list module in the application menu. This option is available only when creating a table.

Control	Description
Add module to menu	Select an existing menu or select **Create new** and enter a new menu name. This option is available only when the **Create module** check box is selected.

4. Add columns to the table using the **Table Columns** embedded list in the **Columns** section.

Column	Description
Column label	Define a unique label for the column. The label appears on list headers and form fields for the column. When you update the **Column label** field, the system also updates the label in the language file for the current language.
Type	[Mandatory] Define the field type for the column. See Field administration and Field types. To preserve existing data, only change fields between the same basic type (for example, **Choice** and **String**). A warning appears if a change to a custom field results in data loss. You cannot change a base system field, that results in data loss.
Reference	Make the field into a Reference field type by entering the referenced table name. **Note:** Dynamic reference creation is enabled for this field. So, if you enter a table name that does not match an existing table, a new table is created when you save changes to the current table record. If the current table has a module in the application navigator, then a module for the newly created table is automatically created in the same application menu.
Max length	[String fields only] Limit the length of the field. A length of under 254 appears as a single-line text field. Anything 255 characters or over appears as a multi-line text box.

Column	Description
	Note: ◦ You can only change this value if the **Type** of the field is **String**. Changes for any other type of field are ignored. ◦ On an Oracle instance, you cannot increase the maximum length of a string field to greater than 4000 because it requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with ServiceNow Technical Support to request the change. ◦ To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss.
Default value	Specify the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field can use a default value of 2 but cannot use a default value of *two*. These values can be overridden with dictionary overrides.
Display	Indicate whether this field is the Display values (appears on records that reference this table). **Note:** This option does not control whether this field is displayed on lists or forms.

5. Define additional table options in the **Controls** section.

Control	Description
Extensible	Select the check box to enable other tables to extend this table. Clear the check box to prevent the creation of additional child tables; existing child tables remain unchanged.
Live feed	Select the check box to enable record feeds for the table. This option adds the **Show Live Feed** icon ( ) in the form header.

Control	Description
Auto-number	Select the check box, and then define the number format to add an auto-numbered field to the table. The check box is available only when a number format does not exist for the table. Otherwise, you can edit the existing number format.
Create access controls	Select the check box and then complete the **User role** field to create basic security rules for the table.
User role	Enter a new name or select an existing user role that is required to access this table. This option is available only when the **Create access controls** check box is selected.

6. Define the scope protection for the table in the **Application Access** section.
   For more information, see Application access settings.

Control	Description
Accessible from	Specify which application scopes can access the table: **All application scopes** Can be accessed from any application scope. **This application scope only** Can be accessed only from the current application scope.
Can read	Select the check box to enable script objects from other application scopes to read records stored in this table. This option offers runtime protection. For example, a script in another application can query data on this table. First select read access to grant any other API record operation.
Can create	Select the check box to enable script objects from other application scopes to create records in this table. This option offers runtime protection. For example, a script in another application can insert a new record in this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from creating records in this table.
Can update	Select the check box to enable script objects from other application scopes to modify

Control	Description
	records stored in this table. This option offers runtime protection. For example, a script in another application can modify a field value on this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from modifying data stored in this table.
Can delete	Select the check box to enable script objects from other application scopes to delete records from this table. This option offers runtime protection. For example, a script in another application can remove a record from this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from deleting records from this table.
Allow access to this table via web services	Select the check box to enable users to make inbound Web services web service queries to this table. This option offers both design-time and runtime protection. The user performing the query must have the correct permissions to access this table, even when this check box is selected. Clear the check box to prevent users from making web service queries to this table.
Allow configuration	Select the check box to enable applications from other application scopes to create configuration records for this table that change its functionality. For example, an application designer can select this table from the **Tables** list on business rules, client scripts, or UI actions. This option offers design-time protection. Clear the check box to prevent application designers from selecting this table when creating configuration records.

7. Click **Submit**.

What to do next

To change the field labels in your table or the label of the table itself, perform the following task:

1. Navigate to the Field Label [sys_documentation] table, and filter the table to show the table that has the fields you want to change. To find the label that represents the table itself, filter the records where **Element** is empty.
2. Open the field record that you want to change, and make your updates. For a description of each field, see Field Label table.

Global default fields

When you create a new custom table, several fields appear in the **Table Columns** embedded list. For all tables, required system fields are added automatically. You cannot delete or modify these fields.

For tables that extend another table, fields on the parent table also appear on the **Table Columns** embedded list for the current table. If you modify these fields, remember that all changes to fields on the parent table also affect all child tables, not just the current table.

These required system fields are added to all tables:

Required system fields

Field	Type	Description
Class [sys_class_name]	System Class Name	If the table is extensible, a string field that indicates which child table contains the record.
Created [sys_created_on]	Date/Time	A time-stamp field that indicates when a record was created.
Created by [sys_created_by]	String	A string field that indicates the user who created the record.
Sys_id [sys_id]	Sys ID	The Unique record identifier (sys_id) for the record.
Updates [sys_mod_count]	Integer	A numeric field that counts the number of updates for this record since record creation.
Updated by [sys_updated_by]	String	A string field that indicates the user who most recently updated the record.
Updated [sys_updated_on]	Date/Time	A time-stamp field that indicates the date and time of the most recent update.

Deleting custom tables

Administrators can delete custom tables that are no longer needed. For example, delete a table from an application that is under development because the business requirements change.

A table is custom if an administrator created it and it is not part of a system upgrade or plugin activation. Custom table names always begins with `u_`, or `x_` for scoped tables.

> **Warning:**
> You cannot delete base system tables. If you inadvertently delete such a table, it is automatically recreated when you upgrade an instance.
>
> You cannot delete a table that has associated tables that extend from it.
>
> You must first delete all records in the table before you delete the table itself. If you do not first delete the records, errors can result on the parent table if it references the records. Deleting the records removes any references from the parent table. To learn more, see delete the records in the table.

Delete a custom table

If you no longer need a custom table, you can delete it after you delete all the records in the table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Open the table to delete.
3. Select **Delete All Records**.

   Deleting all records before deleting the table ensures that the business logic is properly executed (for example, reference cascade rules or other delete business rules). If you do not delete all records from the table first, then you must manually fix any other records or tables that the table deletion impacts. Cascade deletions are also taken care of in this step.
4. Select **Delete**.
   The **Delete** button is only available for custom tables beginning with u_ (global) or x_ (scoped).
5. In the confirmation dialog box, enter `delete` and click **OK**.

   The table and all items that reference the table are deleted, including:

   - Choice list items
   - Forms, form sections, lists, and related lists
   - Reports and Performance Analytics widgets
   - Reference fields that reference the table
   - Access controls

Related topics

Deleting custom tables

Delete all records from a table

You may decide to delete all the records on a table without deleting the table itself. For example, the administrator may want to delete all incidents on a test instance without deleting the incident table itself.

Before you begin

Role required: admin

About this task

When you prepare to delete many records from a table, consider the following guidelines to minimize impact on performance.

- Limit the number of records to be deleted in a single delete action to prevent the table from being locked. Use the *`setLimit()`* method described at setLimit.
- Minimize triggering an excessive number of business rules as a result of this deletion. Use the *`setWorkflow(Boolean e)`* method described at setWorkflow.

Note:
Deleting all records for a table also deletes records from tables that extend the table.

There are several methods for deleting table records. Depending on the number of records to be deleted, choose the method that would be most efficient in your environment. Use these methods with caution. Before performing this procedure, be sure that you do not need any of the records.

Procedure

- From the **Tables and Columns** module, complete the following steps.

  1. Navigate to **System Definition** > **Tables & Columns**.

  2. Select the table for which to delete records.

     Note:
     If the table you want to delete records from belongs to a scoped application, select that application in the scope picker. Alternatively, configure scope-to-scope access. See Restricted caller access privilege settings.

     
     Note:
     Some system tables do not allow this method of deleting records, for example, you cannot delete all user records [sys_user]. The list of tables does not include system tables that you cannot delete records from.

  3. Click **Delete all records**.

  4. In the confirmation dialog box, enter `delete` and click **OK**.

- From a list view, complete the following steps.

  1. In List v2, navigate to the list view that displays the table records, click the context menu, and then navigate to **Show**.
  2. In List v3, click **<Number> rows per page** in the footer.
  3. Set the number of rows per page to display the max number.
  4. Select all the rows on the page.

5. Click **Actions on selected rows**, and then click **Delete**.
6. Continue deleting all rows on a page until all records are deleted.

Result

The selected table is empty of records. The table still exists, and any references to the table on other tables (such as business rules or reference fields) are preserved.

Modify dictionary entries

Modify dictionary entries by configuring a field on a form or from the Dictionary module.

Before you begin

Role required: admin

Procedure

1. Do one of the following steps:
   - Navigate to a field on a form, right-click the field, and select **Configure Dictionary** or **Show <field name>**. The system dictionary entry for the field opens.
   - Navigate to **System Definition** > **Dictionary**, and click an entry for a field or table. Entries for tables have **Type** set to **Collection**.
2. Update the dictionary entry fields.
3. Click **Update**.

Dictionary entry form

The Dictionary Entry form provides an Advanced view and additional fields. You might need to configure the form to see all fields.

Dictionary Entry form

Field	Description
Table	Defines the table in which the element is created. **Note:** This list shows only the tables that meet the scope protections for adding fields.
Type	Defines the field type of the column or, if the **Type** is **Collection**, indicates that the dictionary entry represents the table. For more information, see Field administration. You can change the type of a field. To preserve existing data, only change between logical types that map to the same physical type on the database. For example, Choice and String.
Active	Enables or disables the field. When this check box is cleared, the field is hidden in lists and forms in the Classic Environment. However, inactive fields are still available for queries. Additionally, disabling a field by clearing this option doesn't remove it from a configured list. Inactive fields display in admin-configured lists until an admin updates the list layout to remove them. See below for additional behavior notes.

Dictionary Entry form (continued)

Field	Description
	• Forms: Deactivated fields are removed from forms. • Lists: Inactive fields continue to display in admin-configured lists until an admin updates the list layout to remove them. If an inactive field is removed from an admin-configured default view, any personal lists will reset to follow the default view, thus removing the inactive field from the personal list. • Reports: Existing reports that include inactive fields will continue to work, because the data still exists in the records. However, deactivated fields are not available when creating new reports or list layouts if they are not present in admin-configured lists. • Condition Builder: Deactivated fields are not available in the Condition Builder, unless a you are using an existing URL with filters containing the inactive field. **Show Matching**, **Filter Out**, and **Group By** can also be used on an inactive field if the column is present in the list view. • ServiceNow API: The ServiceNow API does not check whether a column is active or inactive. The old values for the field remain in the records and cannot be undone. • Scripts: Inactive fields may still be referenced in scripts. (Server side scripts that use GlideRecord can read and write to inactive fields).
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Read only	Determines whether the users can change the field value in the user interface. When this checkbox is selected, users can't change the value. The system calculates and displays the data for the field. **Note:** You can override this option for extended tables.
Audit	Enables or disables auditing for a table. Turning on Auditing (History) for a Table. **Note:** This option only applies to tables.
Text index	Determines whether searches index the text in a table. **Note:** This option only applies to tables. To exclude fields from indexing, see Remove an index for a specific field.
Column label	Defines a unique label for the column. The label appears on list headers and form fields for the column.

Dictionary Entry form (continued)

Field	Description
	• Updating the **Column label** field also updates the label in the language file (for the current language). • When you create a new column, the column name is populated automatically based on the label, which is prefixed with u_ to indicate that it is custom. For example, if you enter **Activity Description** as the column label, the column name defaults to **u_activity_description**.
Column name	Defines the field name of the column. When you create a new field, this name is populated automatically based on the label and a prefix as follows: • For a field on a table in a different scope, the name is prefixed with the scope to indicate that it is custom and not part of that application. • For a field on a table in the same scoped application, the name does not have a prefix, which indicates that it is part of the application. • For a field in a global application, the name is prefixed with u_ to indicate that it is custom. You cannot modify the prefix; however, you can modify the rest of the name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). You cannot change the name of an existing dictionary record. **Note:** You cannot enter consecutive (double) underscores in a column name. For example if you enter `my__sample_name` as the column name, it is automatically changed to `my_sample_name` when you save the dictionary entry.]
Max length	Provides a logical limit for the size of string fields to determine how the system displays them in the user interface and how to map them to physical database data types. String fields with a length under 255 characters appear as a single-line text fields. String fields with a length over 254 characters appear as a multi-line text box. The system maps the field length to the closest physical data type available on the database. Sometimes, this results in more available length than originally specified. For example, entering a length of 50 maps to the closest physical data type of VARCHAR(100), which provides up to a 100 character limit or double the requested field length. Likewise, entering a length of 1000 maps to the closest physical data type of MEDIUMTEXT, which provides up to a 4000 character limit or four times the requested field length.

Dictionary Entry form (continued)

Field	Description
	Note: • You can only change this value for a **String** field. Changes for any other type of field are ignored. • Users on an Oracle instance cannot increase the maximum length of a string field to anything greater than 4000 through the application UI as this requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with technical support to request the change. • To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss.
Mandatory	Determines whether this field must contain a value to save a record. For more information, see Make a field mandatory. **Note:** You can override this option for extended tables.
Display	Indicates that this field is the Display values for reference fields. Set this to true for the one field whose value you want to use as the text displayed in links to this table on lists and forms. By default, the **Number** field is the display value for all task tables. **Note:** • This option does not control whether a list or form displays this field as part of the layout. Instead, see List configuration and Personalizing Forms. • The display value becomes part of the form title when viewing an individual record from a table. • You can set a different display value on an extended table than the display value on a parent table by using a dictionary override.
Function definition	Defines the function that the field performs. Starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. For example, the following function definition creates a field that shows the short description, followed by a space, followed by the caller name: `glidefunction:concat(short_description, ' ', caller_id.name)` **Note:** Function parameters support dot-walking. See Dot-walking to data in related tables.

Dictionary Entry form (continued)

Field	Description
Attributes [Advanced view]	Alters the behavior of a field or functionality that depends on the field. For more information, see Dictionary Attributes. Attributes can be overridden for extended tables with dictionary overrides. You can also configure attributes for this dictionary entry through the **Attributes** related list.
Default Value	
Use dynamic default [Advanced view]	Allows you to specify a default value that is generated dynamically based on a dynamic filter.
Dynamic filter value [Advanced view]	Specifies the Create a dynamic filter option that determines the default value if the **Use dynamic default** option is selected.
Default value	Specifies the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field uses a default value of 2 but cannot use a default value of two. These values can be overridden with dictionary overrides.
Reference Specification	
Reference	Makes the field into a Reference field type. If you enter a name that does not match an existing table, a new table is created when you save your changes to the dictionary record. If the current table has a module in the application navigator, a module for the new table is automatically created in the same application menu.
Use reference qualifier [Advanced view]	Specifies the type of qualifier to use: • Simple: A set of choice lists where you can specify a reference qualifier condition. • Dynamic: A Create a dynamic filter option that you can use to build the qualifier. • Advanced: A static encoded query string or JavaScript code that you can use to build the qualifier.
Reference qual condition	Specifies a condition when the reference qualifier runs if the **Simple** qualifier type is selected.
Dynamic ref qual [Advanced view]	Specifies the Create a dynamic filter option that determines the reference qualifier when the **Dynamic** qualifier type is selected.
Reference qual [Advanced view]	Filters the records available for a reference field if the **Advanced** qualifier type is selected. Reference qualifiers can be overridden with dictionary overrides.

Dictionary Entry form (continued)

Field	Description
Reference key [Advanced view]	Identifies a field other than sys_id to use as the unique identifier for reference fields.
Reference cascade rule [Advanced view]	Defines what happens to a record if the record it references is deleted. Select one of the following options: • Clear: Clears the references (default). • Delete: Deletes all referencing records. • Restrict: Prevents record deletion if there is a referencing record. • None: Does not change referencing records.
Reference floats [Advanced view]	Enables the **Edit** button on related lists for one-to-many relationships.
Dynamic creation [Advanced view]	For reference fields, determines whether entering a value that does not match an existing record creates a record on the referenced table. If selected, use the **Dynamic creation script** field to define how to create the record.
Dynamic creation script [Advanced view]	When the **Dynamic creation field** is selected, allows you to enter a script for creating a record on the referenced table.
Dependent Field	
Dependent on field [Advanced view]	Specifies a field on which the current field depends. For more information, see Make a field dependent **Note:** You can override this value for extended tables. .
Choice List Specification	
Choice	Allows users to see a list of suggested values in one of the following ways: • List menu without -- None -- • List menu with -- None -- • Suggestion field type If a choice is used, either define a Choice list field type or use the fields **Choice** table and **Choice** field to copy choices from another field elsewhere in the dictionary.
Choice table	Populates the field choices with the same values as another choice field. If the **Choice** field is set to anything besides **None**, select a table to draw choice values from. The field **Choice field** must also be populated.

Dictionary Entry form (continued)

Field	Description
[Advanced view]	For example, if **Choice table** is set to the Incident [incident] table, this field has the same choice list as one of the choice fields on Incident. **Choice field** (see below) determines which field.
Choice field [Advanced view]	Populates the field choices with the same values as another choice field. If the **Choice** field is set to anything besides **None**, select a field from the table you selected for **Choice table**. For example, if the **Choice table** field is set to the Incident [incident] table, and **Choice Field** is set to **Priority**, this field has the same choices as the **Priority** field on Incident, even if those choices change. **Note:** This field must be a choice field.
Calculated Value	
Calculated [Advanced view]	Determines whether the value of the field is calculated from other values. If selected, use the **Calculation** field to define how the calculation is performed. The **Calculation Type** field allows you to select script or formula based calculation for the column value. When filtering, sorting or grouping by a calculated field, the sort order is based on the stored field value from the last time the field was updated, not the last time the field appeared. **Note:** In relation to business rules, calculated fields are populated first before any business rule, even a before business rule, is run. Calculated fields are then populated again if necessary after any before business rules run.
Calculation Type [Advanced view]	Allows you to select script based calculation or formula based calculation for a column. For more information about predefined functions and example formulas, see Formulas for column values in Table Builder.
Calculation [Advanced view]	Allows you to enter a script or formula based on the selected Calculation Type. When the **Calculation Type** is **Formula**, you can enter a predefined function or formula for calculating the value of the field. You can use a predefined formula or combine other formulas to create a formula according to your requirements. When the **Calculation Type** is **Script**, you can enter a script for calculating the value of the field. These can be overridden for extended tables with dictionary overrides. You can use the current object in this script. As with access control rules, the script can: • Evaluate to true or false. • Return an answer variable set to true or false. • Set a field value directly, such as: `current.display_name="name"`. **Note:** Fields display as read-only when calculated scripts are applied. For example, by adding a script to the calculated field on a dictionary record that is set to Active, the Active field is made read-only on the form. Inline editing of the Active field from the list view is also disabled.

Dictionary Entry form (continued)

Field	Description
Additional fields	
Class	Identifies the table that the current table extends. Tables that do not extend other tables specify their own name in this field. For more information, see .
Defaultsort	Obsolete.
Size class	Determines whether the platform handles this table as a large table by reducing the amount of memory stored for each row during queries. There is a scheduled job which runs and sets the value of this field.
Spell check	Enables or disables spell check on the field.
Unique	Requires the field value to be unique. **Warning:** Making a field unique when the corresponding table already has different values for that field causes data loss. Before you enforce uniqueness on a field, verify that no records in the table for the field have values, or that they all have the same value.
UI action	
Default view or Advanced view	Changes the form view to the default or advanced view. The fields change based on the view. If you are using the default view, you must write a script to accomplish the same tasks that advanced view fields provided.
Related Lists	
Access Controls	Provides access to the access controls that permit or limit access to the data in the table.
Choices	Provides access to the options in the choice list field you are editing.
Dictionary overrides	Provides access to the dictionary overrides for this field.
Attributes	Provides access to the dictionary attributes for this entry.
Labels	Provides access to the labels used for the table or field you are editing.

Altering tables and fields using dictionary attributes

Dictionary attributes alter the behavior of the table or field that the dictionary record describes. Administrators can add or modify dictionary attributes.

Adding an attribute

To add or remove an attribute to a table or field, open a dictionary record, select the **Advanced** link, and modify the **Attributes** field. Alternatively, in a dictionary record, select **New** in the Attributes related list. For details on modifying dictionary entries, see Modify dictionary entries.

Attributes are comma-separated. If attributes exist on a dictionary record, add a comma with no spaces before adding an attribute.

For an attribute that accepts true/false values:

- To specify a value of true, you can either enter `attribute` or `attribute=true`.
- To specify a value of false, you can either ensure that the attribute does not appear or enter `attribute=false`. To maintain the values during upgrades, do not remove an attribute that is on a table by default.

Maintaining attribute values for upgrades

If you remove an attribute that is part of the base system, it is automatically restored during an upgrade. To prevent upgrades from changing the behavior of your system, leave the attribute on the table or field, but set its value as desired.

For example, if a field has the attribute `knowledge_search=true` by default, do not remove the attribute to set it to false; rather set it to `knowledge_search=false`.

Available dictionary attributes

Name	Value	Target Element	Description
allow_null	true/false	field_name field	If present or true, enables you to enter `None` as the field
allow_public	true/false	table_name field	If true, the table name field displays tables from all scopes instead of only the current scope.
allow_references	true/false	field_name field	If true, a tree is displayed to select from that includes reference fields so you can dot-walk.
allowHugeAlter	true/false	any table	If true, enables you to add a column to a table with more than 100 million rows.
approval_user	name of field containing the users for the approval type this field represents	integer field	Specifies the table fields that are used to perform lookups using a matcher. You specify approvals as table fields that have an attribute of *`approval_user=<field_name>`*, where <field_name> indicates the field in the table that contains the users for this approval type. • Fields with this attribute contain an integer value that indicates the sequence for the approvals. • All approval fields with the same sequence number indicate that multiple approvals are required before continuing. • Approvals are requested in the order of the sequence numbers. For example, all approvals with sequence number 100 must

Name	Value	Target Element	Description
			be approved before approvals with sequence number 200 are requested.
attachment_index	true/false	any table	If true, attachments on the table are indexed for search purposes. To learn more, see Index attachments on a table.
barcode	true/false	string field	Enables a string field to access a camera on a mobile device to scan and process a bar code.
base_table	name of base table type	table_name field	Specifies the table_name field that enables you to select any table that is derived from the table specified by this attribute. By default, the base table itself is also included in the list (but see `skip_root` to turn off this behavior).
calendar_elements	list of field names, separated by semicolons (";")	any calendar event table	Specifies the list of fields used when constructing the description of a calendar event. If not specified, the display name plus short description are used. The `calendar_elements` attribute does not support derived (dot-walked) fields.
collection_interval	interval specified as "HH:MM:SS" (like "01:02:30" for one hour, two minutes, and 30 seconds)	collection field	Specifies the interval of metrics collection.
close_states	inactive state integer values	task state field	Used by the `TaskStateUtil` API to identify the list of inactive state values delimited by semicolons (;)
critical	true/false	any field in the apm_application table	Defines fields that have critical information about an application, which enables tracking the entry of critical information.
current_location	true/false	string field	Enables a string field to access the GPS location of a mobile device.
disable_execute_now	true/false	any table derived from sys_auto	If present or true, disables the usual **Execute Now** button. The ServiceNow AI Platform applications that use schedules, such as Discovery, use this attribute to substitute their own more appropriate action.

Name	Value	Target Element	Description
default_rows	integer value	multitext fields	Sets the default number of rows in a multitext field.
default_close_state	state integer value	task state field	Used by the `TaskStateUtil` API to identify the default close state value for a task table.
default_work_state	state integer value	task state field	Used by the `TaskStateUtil` API to identify the default working state value for a task table.
detail_row	name of field to display in detail row	any table	Displays the value of the specified field as a Lists for each record in the list view. UI15 is required to use this attribute. **Note:** If different `detail_row` attributes are defined for a parent table and a child table, the system uses the child table attribute.
display_image	true/false	table with fields of the user_image type	If present or true, displays records of the user_image type in an image form. If the record is in the [sys_user] table, and the image is not available, the user initials are displayed.
document_viewer_audit	view, download, or all	any table	When the Document Viewer is enabled, this attribute keeps a record of the user actions that are performed on attachments. The values are as follows: • **view**: Enables an audit when users view an attachment • **download**: Supplies audit information for only downloaded attachments • **all**: Shows audit information when attachments are viewed and downloaded
email_client	true/false	any table	If present or true, causes an icon (an envelope) to appear in the more options menu in the form header. If you click it, a pop-up email client appears.
exclude_auto_recovery	true/false	any table	Disables automatic recovery of draft records for this table and its extensions.
exclude_from_rollback	true/false	any table	Excludes this table (and any of its descendant tables) from being

Name	Value	Target Element	Description
			recorded for rollback. For example, use this attribute to preserve records that are created from an automated test. For tables excluded by default, see Tables excluded from rollback after running an automated test.
extensions_only	true/false	any table	Specifies that the table should only have records in tables that extend it. For example, the Task table has this attribute because you would create incident, problem, change records, and not task records.
field_list_selector	true/false	any glide_list	Enables the user to select a field from the dependent table (or current if the dependent is not specified). Some workflow activities use this attribute.
field_decorations	UI Macro name list, separated by semicolons (";")	most fields (except list and multiline text fields)	Similar to `ref_contributions`, causes the named UI macro to be invoked when the field is rendered on a form.
format	format name	any numeric field	Specifies a named format to use instead of the standard numeric formatting. Options are as follows: • **glide_duration**: Formats a time specified in milliseconds as **ddd hh:mm:ss**. • **none**: Disables automatic number formatting (for example, changes 2,500–2500). **Note:** This attribute applies only to display values and not user input values.
glide.db.oracle.ps.query	true/false	any table	If present and false, prevents the use of Oracle prepared queries on the table.
global_visibility	true/false	any table with a sys_domain column	If present or true, makes this table visible globally even if there are domain restrictions (that is, the sys_domain field has a value).
hasLabels	true/false	any table	If present or true, marks this table as being the target of a label at some point. You can manually set this attribute, but it is normally set automatically whenever a label is generated. When true, the label engine runs on any change to the

Name	Value	Target Element	Description
			table, and updates the labels as needed.
hasListeners	true/false	any table	If present or true, marks this table as available for listeners to get events (insert, update, delete).
hasWorkflow	true/false	any table	Instructs the workflow engine to listen for changes to the table and fires events to a workflow when a record associated with a particular workflow has changed.
html_sanitize	true/false	any HTML or translated HTML field	If present or true, enables HTML sanitization for the selected HTML or Translated HTML field. By default, performs HTML Sanitization on all HTML and Translated HTML fields. Set this attribute to false to disable sanitization.
html_sanitize_config	name of custom sanitizer configuration file	any HTML or translated HTML field	If present, performs sanitization using the specified configuration file instead of the default platform sanitizer. For example, the Embedded Help [sys_embedded_help_content] table uses a specified file (EmbeddedHelpSanitizerConfig) for the help **Content** field.
icons	name of JavaScript class	any workflow field	Specifies a JavaScript class that produces workflow icons.
ignore_filter_on_new	true/false	any field	If true, prevents the fields on a form from populating with values from a filtered list.
image	relative path of image file	any table	Specifies an image file to use when a module or BSM map uses this table. This specification overrides the icons that would otherwise be used for the table.
include_container_types	true/false	any internal_type field	Causes the field to render with container (split) types as well other types.
ip_data_control	• none • canonical • expanded • canonicalize_when_possible (default value)	field type on any table	Checks whether the data should be normalized through the `ip_data_control` attribute. • If the attribute is none, no conversion happens and data is inserted as-is. • If the attribute is canonical, values are inserted in their smaller canonical form.

Name	Value	Target Element	Description
			• If the attribute is expanded, values are inserted in the larger expanded form to facilitate comparisons. • If the attribute is canonicalize_when_possible, values are inserted in canonical form when it is a valid IP or as-is when it is not.
isOrder	true/false	any field	Sets the field as the default field that is used for the sort order in lists. Overridden by the **ORDERBY** URL parameter, or the user's sort preferences.
iterativeDelete	true/false	any table	If present or true, forces all row deletes to execute iteratively. Otherwise, you can perform some deletes using a more efficient bulk method.
json_view	true/false	any table	if a JSON object is associated with the field, places an icon next to a field that, when you click it, displays the data interchange information.
knowledge_custom	name of JavaScript function	any field	Specifies a JavaScript function to implement a custom knowledge search (see *knowledge_search*).
knowledge_search	true/false	string fields	If present or true, causes a knowledge search icon (a small book) to appear next to the field. Clicking this icon launches a pop-up window for searching the knowledge base, unless a custom knowledge search function has been specified. To learn more, see *knowledge_custom*.
largeTable	true/false	any table	If present or true, marks this table as "large" to preventing table locking with specific MySQL database operations (adding/removing a column/index, compacting a table). Without this attribute (or the *smallTable* attribute), the *glide.db.large.threshold* property, or the default value of **5,000**, determines whether a table is large.
listen	true/false	any field	If present or true, calls a JavaScript function named *<tableName>_<fieldName>Listen*,

Name	Value	Target Element	Description
			or *globalListen* if that function does not exist. It calls the function with arguments (*tableName*, *fieldName*, *oldValue*, *newValue*).
live_feed	true/false	any field	If present or true, creates a toggle option on the activity formatter header for incidents, tasks, and problems. The toggle provides a choice between the **Live Feed** for that record (also known as a document feed) or the activity formatter fields already in use. To learn more, see Activity formatter for more details.
long_label	true/false	any reference field	Long or short labels refer to the label that appears for reference fields on a form. For example, if the reference field contains the caller's email address, the long label would be Caller Email, while the short label would be Email. • Usually the placement of the reference field on the form makes it clear what the field represents. • It uses the global property (*glide.short.labels*) to specify the type of labels that appear for all reference fields on any form. • You can override the global property for any reference field by setting the *short_label=true* or *long_label=true* attribute in the dictionary for the reference field.
maintain_order	true/false	any glide_list	If present or true, the up/down arrow order buttons appear to the right of the list of selected items. **Note:** You need to use the **Add multiple** button to see the order buttons.
mode_toggler	true/false	any composite_name field	If present or true, causes a name mode toggle icon (a small right-pointing triangle) to appear to the right of the label. Clicking this icon causes the field's rendering to change from a text field that accepts

Name	Value	Target Element	Description
			<tablename>.<fieldname> to a pair of reference choice boxes (one for the table, the other for the field). The latter is the default.
model_class	binary Java class name	any field of type glide_var	Specifies a model variable within the Java code. The model must have a class that implements the IVariablesModel interface.
model_field	see description	any field of type glide_var	Identifies a reference field in the record that has the model defined for it. For example, a workflow activity is associated with an activity definition. The activity definition has a related list of questions that make up the model for that activity definition. By using the activity_definition as the model_field for the activity, it builds the workflow activity model by reading the questions that are defined for the referenced activity definition.
nibble_size	positive integer	any table affected by the table cleaner.	Specifies the maximum number of records that the table cleaner can delete in a single operation. The default value for this attribute is **250**.
nibble_sleep	true/false	any table affected by the table cleaner.	If false, causes the table cleaner to perform cleanup operations without a pause between each operation.
no_add_me	true/false	any table	If present or true, hides the display of the Add Me icon that appears next to certain fields, such as the **Watch List** field.
no_attachment	true/false	any table	If present or true, prevents the attachment icon (a paperclip) from appearing on the form header.
no_attachments	true/false	any table	If present or true, attachments are not checked for and deleted when a record from this table is deleted. Meant for high-activity tables that never have attachments.
no_audit	true/false	any table	If present, this field is not audited, even if the table is being audited. The true or false value is ignored.
no_audit_delete	true/false	any table	If present or true, a sys_audit_delete record is never created when you delete a record from this table. Meant for high-activity tables

Name	Value	Target Element	Description
			that never need sys_audit_delete information.
no_auto_map	true/false	any table	If true, this field is not mapped during an import set. Primarily used for LDAP imports.
no_email	true/false	any glide_list field referencing sys_user	If present or true, the email box is removed from the glide_list field like the **Watch list** field.
no_multiple	true/false	any glide_list field	Hides the select multiple icons.
no_optimize	true/false	any table affected by the table cleaner.	If present or true, prevents the MySQL table compaction operation from running on the specified table. The table compaction operation typically runs after the table cleaner deletes at least 50 percent of the data in the specified table.
no_separation	true/false	any table	If present or true, marks this table as not participating in domain separation. To learn more, see Domain separation for service providers.
no_text_index	true/false	any field on a text indexed table, or any child table of a text indexed table	If a table is text indexed, the `no_text_index` field attribute prevents this field or child table from being included in the text index.
no_truncate	true/false	any string field	In a list view, shows the entire text value of the multitext value in a list, without truncating it. Without this attribute, the string is truncated based on the UI property **Number of characters displayed in list cells** which is **40** by default.
no_update	true/false	table	True for tables in which records are inserted or deleted but not updated. Prevents the system from creating sys_mod_count, sys_updated_by, sys_updated_on fields in the table when created. Does not stop updates of the table. This attribute setting is used to save space on high volume system tables, such as syslog and sys_audit.
no_view	true/false	any glide_list field	Hides the view-selected item icon.
omit_sys_original	true/false	price and currency type fields	When true, avoids retrieving the original value of a field during calculations. Omitting the

Name	Value	Target Element	Description
			sys_original value from being referenced during calculations can reduce performance issues when dealing with currencies or prices.
onlineAlter	true/false	any table	Tables with the `onlineAlter` attribute perform MySQL database operations using online schema changes. • Online schema changes provide a lock-free table upgrade when adding, modifying, or removing columns and when adding or dropping indexes. Without online schema changes, these changes to the database lock write access during execution. • Online schema changes use additional system resources. Oracle databases do not lock tables by default and do not use online schema changes.
order	numeric value	model variable fields	Used internally only (for model variables).
pop-up_processor	binary Java class name	any field or table	Specifies a custom pop-up processor for processing the field (or all fields in a table).
readable	true/false	any conditions field	When true, causes rendering of the conditions field in any list view as a human-readable condition (instead of the encoded query that is stored in the database).
ref_ac_columns	list of field names separated by semi-colons	any reference field with an auto completer (see ref_auto_completer)	Specifies the columns whose display values should appear in an auto completion list, in addition to the name. To learn more, see the cmdb_ci field (**Configuration Item**) on the Incident form for a working example.
ref_ac_columns_search	true/false	any reference field with an auto completer (see ref_auto_completer)	Causes auto-complete to work with all fields that are specified in the `ref_ac_columns` attribute. This attribute overrides the default behavior, which searches only the display value column. To learn more, see Configure auto-complete to match text from any reference field.
ref_ac_display_value	true/false	any reference field with an auto	Causes the reference field to hide the display value column so that the auto-complete function

Name	Value	Target Element	Description
		completer (see ref_auto_completer)	only matches the text from the columns that are listed in the `ref_ac_columns` attribute. This feature requires the use of the `AJAXTableCompleter` class and the `ref_ac_columns`, `ref_ac_columns_search`, and `ref_ac_display_value` attributes. To learn more, see Remove the display value column. **Note:** The ref_ac_display_value function does not work with Catalog Item variables.
ref_ac_order_by	field name	any reference field with an auto completer (see ref_auto_completer)	Specifies the column that is used to order the auto completion list.
ref_auto_completer	JavaScript class name	any reference field (can be applied to a table to affect all reference fields on the table.)	Specifies the name of a JavaScript class (client side) that creates the list auto completion choices. Valid class values include: • `AJAXReferenceCompleter`: Matching auto-complete choices appear as a list. Only the Display values column of the reference table appears. If there is no other auto-completion class specified, reference fields automatically use this class. • `AJAXTableCompleter`: Matching auto-complete choices appear as rows in a table. The display value column of the reference table appears, with any columns listed in the `ref_ac_columns` attribute. • `AJAXReferenceChoice`: Displays matching auto-complete choices as a list. Only the display value column of the reference table, and up to 25 matching choices, appear. If there are more than 25 auto-complete choices, the choices for the `AJAXTableCompleter` class appear for the reference field instead.

Name	Value	Target Element	Description
			For more information, see Auto-complete for reference fields.
ref_contributions	UI Macro name list, separated by semicolons (";")	any reference field	When the field renders on a form, it invokes the named UI macro.
ref_decoration_disabled	true/false	any reference field	When set to `true`, disables the display of the reference icon on a selected field.
ref_list_label	label text	any table	Specifies the title to use in a list banner.
ref_qual_elements	field name list, separated by semicolons (";")	any reference field with a reference_qual field	Specifies a list of fields to send back to the server to get an updated reference.
ref_sequence	list of fields in referenced table, separated by top hats ("^")	any reference field	Specifies the fields in the referenced table that are used to order the list. This attribute works like an ORDER BY clause in SQL, with each element in ascending order.
reference_types	list of valid reference types that are clickable separated by semicolons (";")	field_name field	Limits the reference fields that appear in the tree to the specified types.
remoteDependent	name of database and table (like "model.matcher")	any script field	Defines the remote (such as in another database) table that the script depends on.
repeat_type_field	field name	a repeat count field for schedule rotation	Specifies the field that contains the repeat type (daily, weekly, monthly, or yearly).
ro_collapsible	true/false	any multiline field	If present or true, causes an icon (either a "+" or a "-") to appear next to the field label, allowing the field itself to be expanded or collapsed.
saver_exempt	• exempt_always= field will be skipped from writing to xml for all install contexts. • exempt_never= field will not be skipped from writing to xml (Default). • exempt_vcs_only= field will be	Fields of metadata records	When present, determines if the field is written to the xml representation of the record. An absence of the attribute is equivalent to exempt_never. When exempt_always, the field is skipped from writing to xml when exporting (publish, commit to source control, update set). When exempt_vcs_only, the field is skipped from writing to xml only in the source control context.

Name	Value	Target Element	Description
	skipped from writing to xml only in source control context.		
scale	integer	decimal field	Sets the number of decimal places to use on a Decimal field type. The default is 2. This attribute is applied to the max length attribute setting for the field. The decimal places for a field are a combination of the max length attribute setting and the scale attribute. For example, if you want four decimal places for the field, you need a max length attribute setting of 4, plus the default of 15 or 19. You would set the scale attribute to 4 to indicate the number of decimal places. Six decimal places require a max length setting of 21, a scale attribute setting of 6, and so on. **Note:** Increase the max length attribute to a value greater than 15 to increase this attribute.
script	a function that returns the contents of the field	any slushbucket field	Enables you to write a script to define what is loaded into the slush bucket field.
short_label	true/false	any reference field	Long or short labels refer to the label that appears for reference fields on a form. For example, if the reference field contains the caller's email address, the long label would be Caller Email, while the short label would be Email. • Usually the placement of the reference field on the form makes it clear what the field represents. • The global property (*glide.short.labels*) specifies the type of labels that appear for all reference fields on any form. • You can override the global property for any reference field by setting the *short_label=true*

Name	Value	Target Element	Description
			or *long_label=true* attribute for the reference field in the dictionary
show_all_tables	true/false	document ID fields	Enables users to select documents from system tables. For example, sys_script or sys_user. By default, users cannot select records from system tables.
show_condition_count	true/false	condition fields	Enables or disables the condition count widget to preview how many records are a set of conditions. To learn more, see Add the condition count to a condition field.
skip_root	true/false	table_name field	If present or true, removes the base table from the list. To learn more, see base_table.
sla_basis	list of table names separated by semicolons (";")	any field of date type (glide_date_time, glide_date, due_date, date, or datetime)	Defines the tables for which this field determines the start (open) time of an SLA.
sla_closure	list of table names separated by semicolons (";")	any field of date type (glide_date_time, glide_date, due_date, date, or datetime)	Defines the tables for which this field determines the ending (close) time of an SLA.
slushbucket_ref_no_expand	true/false	any reference field	If present or true, prevents users from expanding the field from a form or list slush bucket.
smallTable	true/false	any table	If present or true, marks this table as Small (that is, not large) for querying purposes. Without this attribute (or the *largeTable* attribute), the *glide.db.large.threshold* property, or a default value of **5,000** determines whether the table is large.
start_locked	true/false	any glide_list field	Determines whether the field is locked or unlocked by default. Set the value to false to unlock the field by default.
staticDependent	name of table	any script field	Specifies the table that the script depends on.
strip_html_in_pdf	true/false	any field	Attempts to remove HTML tags from a field when that field is exported to a PDF. This attribute is most useful on HTML fields.

Name	Value	Target Element	Description
synch_attachments	true/false	any table	Similar to *update_synch* but writes the file attachments of the record to update sets. To learn more, see Index attachments on a table.
table	name of table	field_name field	Displays the specified table fields.
tableChoicesScript	name of script include	table_name field	Specifies the name of a script include whose `process()` method returns an array of table names from which to select.
target_field	percent_complete_target decimal field name	any percent complete field any decimal field	Works in combination with the target_threshold_colors attribute to define thresholds for percent complete fields. See the description for target_threshold colors. Example: `target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen` Specify an additional target_field attribute to compare the actual completion percentage of a task with a target percentage in a different decimal field that specifies where the task should be at this point. Use the column name of the decimal field. Example: `target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen,target_field=u_expected_completion` If you do not specify an additional target_field, a target value of 100 is used, allowing you to use the color thresholds with a single field value. See Target threshold colors attribute.
target_form	name of form	any table	Specifies the alternative form to be used when this table is referenced through a pop-up window on a reference field.
target_threshold_colors	threshold limit:color	any percent complete field with the	Works in combination with the target_field attribute to define thresholds for percent complete

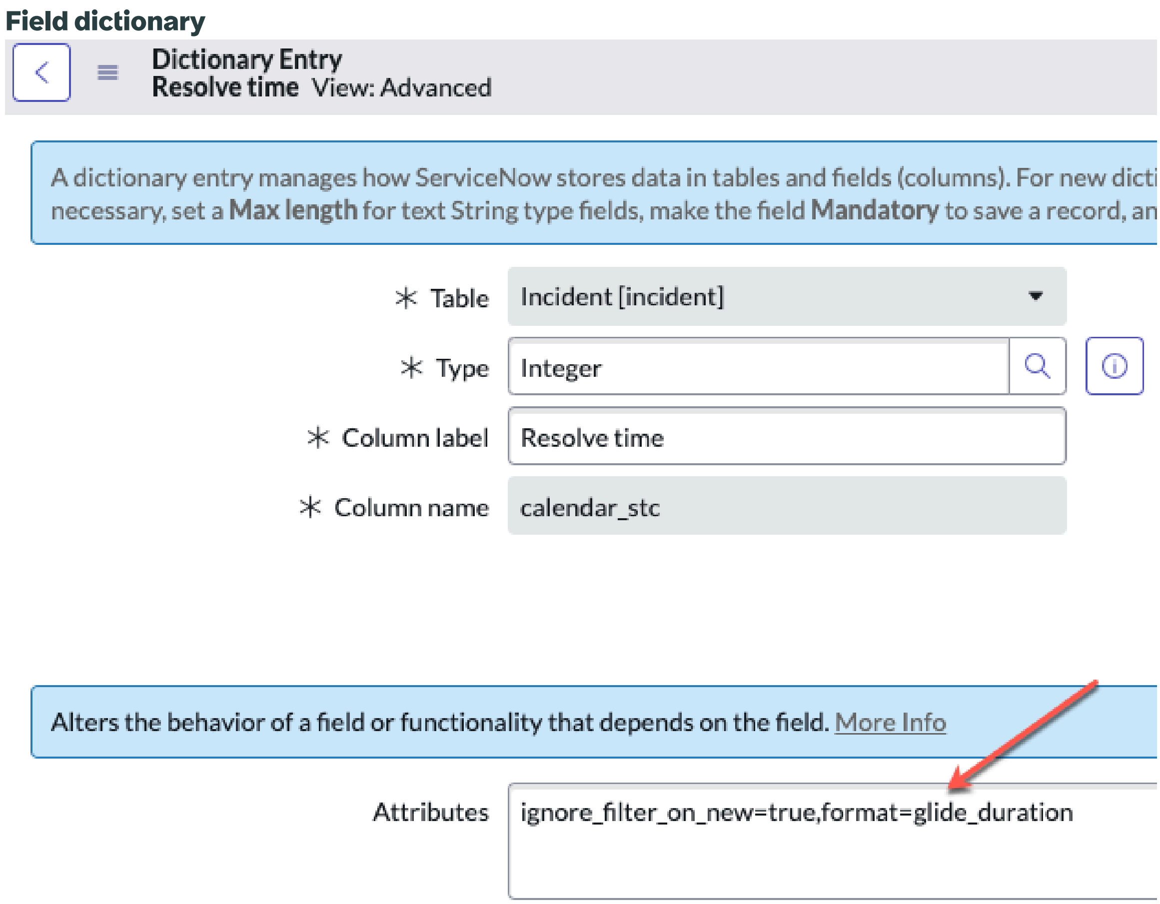
Name	Value	Target Element	Description
		target_field attribute	fields. See the description for target_field.
text_index_filter_junk	true/false	any table	Sets the value to false to Enable or disable the Zing junk filter for the table. • By default, Zing does not index or search for two-digit numbers and single character words (unless they are Chinese or Japanese characters). • Regenerate the index after disabling the junk filter. This attribute results in a larger table index. • For optimal performance, do not apply it unless it is required.
text_search_only	true/false	table_name field	Limits the tables listed to those tables that are searchable by text.
text_index_translations	true/false	any table	If present or true, forces indexes to be recalculated when translated strings are added. You must have a sys-admin role to modify this attribute. This one is automatically set for indexed fields that are translated, and to fields that have a translation and are being indexed. The `glide.i18n.force_index` `system` property, which defaults to true, overrides this attribute.
time_zone_field	name of field containing the time zone	any schedule date/time field	Specifies the field in the parent record that contains the reference time zone for this field.
timeDimension	true/false	any field of date type (glide_date_time, glide_date, due_date, date, or datetime) in a table subclassed from the task table	If present or true, enables the production of time dimension data for use by OLAP (to produce reports based on quarters, weeks, or other time periods). **Note:** OLAP functionality has been deprecated.
tree_picker	true/false	reference field to a hierarchical table	Displays the hierarchy of reference values in a tree display (such as locations).

Name	Value	Target Element	Description
			Note: The tree display hierarchy does not appear in reference fields when you are using mobile applications.
ts_weight	integer value	any field	Controls the relative importance of a match in the field for a text search. To learn more, see Set the relative weight of a field.
types	list of valid element types separated by semicolons (";")	field_name field	Limits the display of fields to the specified types.
update_exempt	true/false	any field from a table that has update_synch set to true	If present or true, you can change this field without skipping updates to the rest of the record. During software upgrades, the value of this field is preserved, while the rest of the record receives upgrades. By default, the Active field on a tracked table is treated as update_exempt even if the attribute is not present.
update_synch	true/false	any table	Indicates that changes in the table are tracked in update sets. Administrators cannot modify this attribute. To migrate data, use an Importing from another ServiceNow instance.
use_document_viewer	true/false	any table	If present or true, enables users to open supported attachments in a document viewer within the platform, rather than downloading the files directly to their own file system.
use_workflow	true/false	any table that has delivery plans or uses workflow	If present or true, causes a workflow to be used instead of delivery plans.
user_preference	true/false	any field	If present or true, causes any user preferences to be used instead of the normal default value.

Modify the Glide durations format

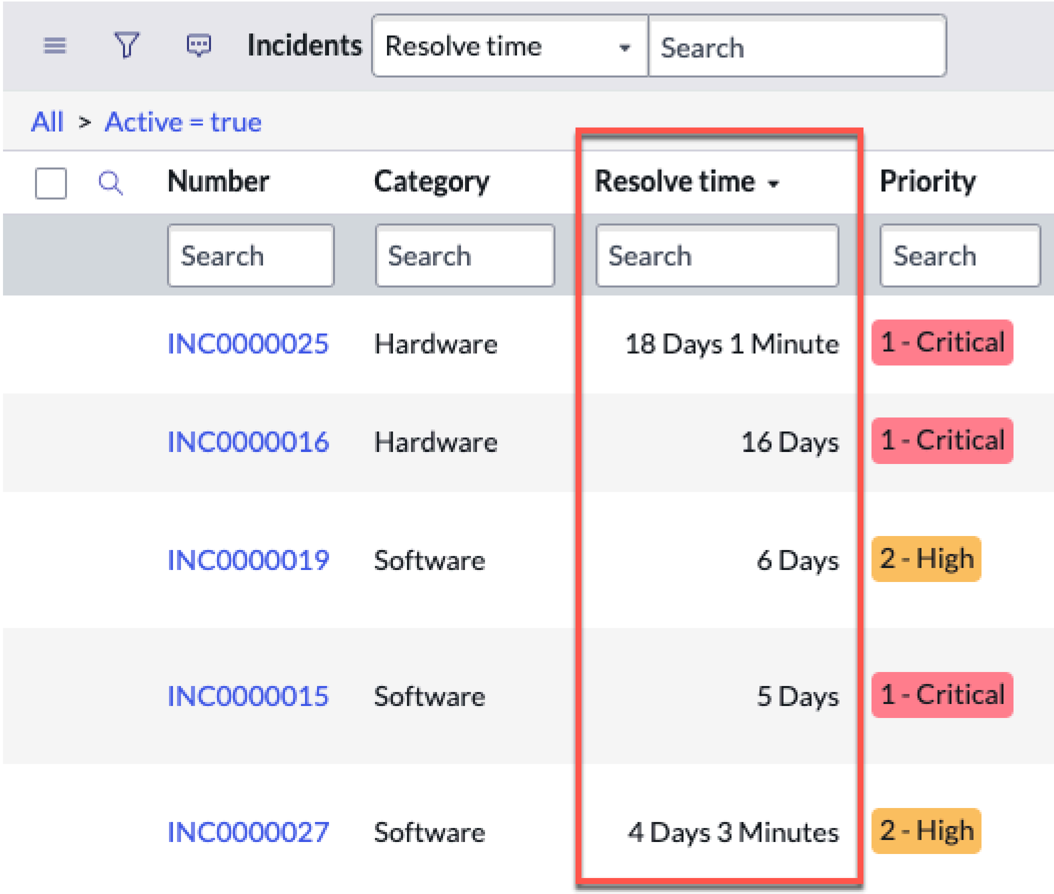
To convert fields that are displayed in milliseconds (such as 'Resolution Time' on the Incident table) to a duration format (Months/Days/Hours/Seconds), populate the attribute field on the dictionary with: `format=glide_duration`.

Now the value is displayed as a duration in lists and can be utilized in the Configure Calculations functions. This may be useful to illustrate ITIL KPIs such as Mean Time To Repair.



Results in list:

Results in list



Dictionary overrides

Dictionary overrides provide the ability to define a field on an extended table differently from the field on the parent table.

For example, for a field on the Task [task] table, a dictionary override can change the default value on the Incident [incident] table without affecting the default value on Task [task] or on Change [change].

Administrators can override these aspects of a field:

- Reference qualifiers
- Dictionary attributes
- Default values
- Calculations
- Field dependencies
- Default column display values
- Mandatory and read-only status

Define a dictionary override

Use a dictionary override to allow a field in a child table to have a different value or behavior than the same field in a parent table. For example, a dictionary override changes the default value of the priority field from 4 in the parent table to 5 in the Incident table.

Before you begin

Role required: admin.

About this task

Dictionary overrides are only available for tables that support table extension.

Dictionary overrides are inherited by extended tables, so it may be necessary to define additional overrides to change the value of fields on extended tables. For example, if you define the default value of cmdb_ci.install_status to be 3, and create an override for the same field on cmdb_ci_hardware to be 5, all tables extended from the Hardware table will also default to 5. So if you want the default cmdb_ci_computer.install_status to be 3, you will need another override.

You can add a dictionary override in a scoped app, but you must add the override while working in the scoped app context and you can only select child tables from within that scope. Open the scoped app, edit the field's dictionary entry, add a new dictionary override, select the child table, and then provide the override details.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the record for the field.
3. In the **Dictionary Overrides** related list, click **New**.
4. Fill in the fields on the form, as appropriate (see table).

Field	Description
Application	The application scope to which the record belongs.
Base table	The parent table containing the field to override.
Table	Select the extended table to which the dictionary override applies. **Note:** The list shows only tables and database views that are in the same scope as the dictionary override.
Override reference qualifier	Select the check box to display the **Reference qualifier** field, which overrides the Reference qualifiers for the field on the extended table.
Override dependent	Select the check box to display the **Dependent** field, which overrides the field on which the current field depends.
Override attributes	Select the check box to display the **Attributes** field, which overrides the dictionary attributes for the field on the extended table.

Field	Description
	Note: Any attributes defined on the base table are ignored. If there are attributes on the base table that should still apply to the extended table, make sure to include them in this field.
Override default value	Select the check box to display the **Default Value** field, which overrides the default value for the field on the extended table.
Override calculation	Select the check box to display the **Calculation** field, which overrides the calculation of the value for the field on the extended table.
Override mandatory	Select the check box to display the **Mandatory** field, which overrides whether the field on the extended table must contain a value to save a record.
Override read only	Select the check box to display the **Read only** field, which overrides whether a user can change the field value on the extended table.
Override display value	Select the check box to use this field as the display value on the extended table. For example, the Story [`rm_story`] table uses the short description as the display value in reference fields instead of the number, as defined in the Task [`task`] table. **Note:** Only fields that exist at the task table can be used as display value overrides.

5. Click **Submit**.

Table flattening

Table flattening stores a hierarchy of related tables as one table in a relational database.

Extension models

The system offers these extension models to store a table hierarchy on a relational database.

Available extension models

Extension model	Flattens tables?
Table per class	No
Table per hierarchy	Yes
Table per partition	Yes

Table per class

The Table per class extension model stores each table of the hierarchy in its own physical table on the relational database. Each physical table uses the table prefix of the source table each stores a different class of records. An example of the Table per class extension model is the Asset [alm_asset] table, and its child tables: Hardware [alm_hardware], Consumable [alm_consumable], Facility [alm_facility], and Software License [alm_license]. The parent table of the hierarchy, Asset, stores a copy of every record in its descendant tables.

To find records in the Table per class extension model, the system queries records from multiple tables and joins the results. For example, when searching for hardware in a related facility, the system must join results from the Hardware, Facility, and Asset tables.

Table joins cause a performance bottleneck on relational databases. The more classes a query includes, the worse the query performance. Therefore any query for records from the top of the table hierarchy has the worst performance because it requires joining all descendant tables.

The system uses the Table per class extension model by default when creating tables. Most system tables also use the Table per class extension model as there is no performance benefit from flattening them.

Table per hierarchy

The Table per hierarchy extension model stores an entire table hierarchy in a single flat physical table on the relational database. The physical table is named after the parent table of the hierarchy, such as Task. The physical table contains all records of the table hierarchy and assigns a class name column value to each descendant table of the hierarchy. The system uses the name of the source table as the class name value. For example, Task records can have class names such as Change, Incident, or Problem.

To find records in a table hierarchy, the system queries the physical table and uses the class name column to constrain the results. Since such queries do not require joining results from multiple tables, the system provides better search performance.

The system uses the Table per hierarchy extension model for the Task table hierarchy on MySQL databases. Other tables use the Table per class extension model because there is no performance benefit to flattening them. To use Table per hierarchy on an Oracle database, contact Technical Support.

Table per partition

The Table per partition extension model stores an entire table hierarchy in a single flat logical table on the relational database. Each logical table can have multiple physical storage tables called partitions supporting it. Each partition optimizes the database resources available to a physical table such as the column count, index count, and row size. The system adds a partition whenever the logical table needs additional relational database resources.

Each logical table is named after the parent table of the hierarchy, and each supporting physical partition consists of the logical name plus a partition name. For example, the Base Configuration Item [cmdb] table starts as a logical table with no partitions. Suppose your hardware configuration items consume enough database resources that the system creates a partition called **cmdb$par1** to store them. Later, computer configuration items could consume enough database resources to warrant the system creating a second partition called **cmdb$par2** to store these records.

Within each logical table, the system assigns a class name column value to each descendant table of the hierarchy. For example, within the Base Configuration Item logical table there are records with class names for Application, Computer, and IP Router. The system also assigns a two-digit class path value to each descendant table of the hierarchy. The class path is based on the table location in the hierarchy. For example, the parent class Hardware might have a class path such as **/!!/!D** and the child class Computer might have a class path such as **/!!/!D/!!**.

To find records in the Table per partition extension model, the system queries the logical table and its partitions and uses the class path column to constrain the results. Since these queries do not require joining results from multiple tables, the system provides better search performance. In addition, the class path reduces the total number of records to search, which further improves search performance.

The system uses the Table per partition extension model for the Base Configuration Item [cmdb] table hierarchy on MySQL databases. To use Table per partition on an Oracle database, contact Technical Support.

View a table hierarchy and the extension model

The extension model used by a table is not immediately apparent. While a hierarchy can use a single physical table, the platform displays tables as if each logical table has a unique physical table. For example, when specifying a table for a workflow, you can select Change [change_request] or Incident [incident] even though the parent table, Task [task], uses a single physical table.

Before you begin

Role required: admin

About this task

Administrators can view the status of flattened table hierarchies, but cannot flatten additional hierarchies. You can configure the form to add the **Extension model** field if necessary.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select a table record.
3. Review the **Extension model** field value, which indicates whether the table hierarchy uses multiple unique tables or a single flat table.
   - **None**: Indicates that the table uses the table per class model. Defines a unique physical table per logical table in a hierarchy. For example, there are separate physical tables for the Asset [alm_asset] table, and its child tables: Hardware [alm_hardware], Consumable [alm_consumable], Facility [alm_facility], and Software License [alm_license].

Note:
If a table has an empty Extension Model field, it is not necessarily a Table Per Class table. If the table extends another table, it actually inherits the model from any parent tables it is extending, and only when none of the parents have a defined extension model is the table's extension model Table Per Class. This can be seen on many tables that extend the Task table. Incident is a logical table that extends Task and is physically located on Task, but by default has a blank Extension Model value.

When a table doesn't extend anything at all, and has a blank Extension Model field, it is a Table Per Class table.

- **Table per hierarchy**: Defines a single physical table per logical table hierarchy. For example, there is a single Task [task] table on the MySQL database that contains all the Task, Incident, Problem and Change records. This single physical table is represented as separate logical tables.

Viewing table references and extensions

View table relationships in a visual manner using the schema map.

The schema map displays the details of tables and their relationships visually, allowing administrators to view and easily access different parts of the database schema.

The schema map can also be printed directly from a browser.

Table relationships depicted in the schema map

Relationship type	Color used
Referenced by	Red
Referencing	Orange
Extended by	Green
Extending	Blue

By default, each type of relationship is displayed. However, you can view or hide each type as needed.

Generate a schema map

Generate a schema map to view different parts of the database schema.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables & Columns**.
2. In the **Table Names** pane, select a table.
3. Click **Schema map**.

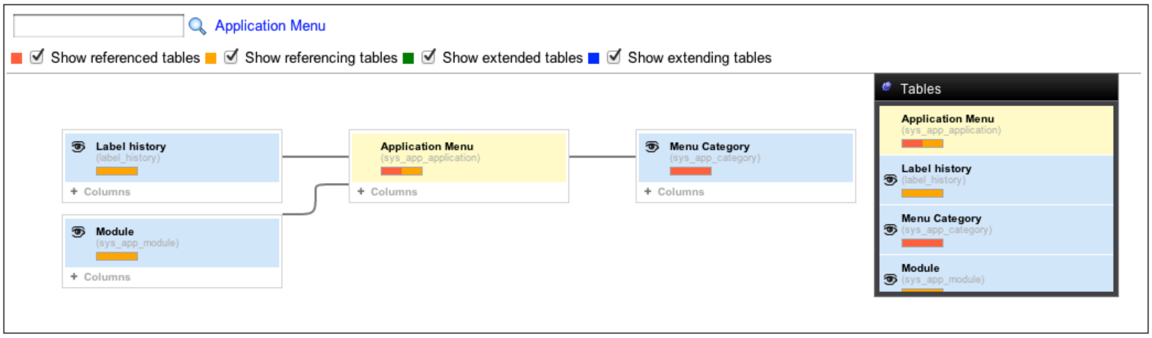
   The schema map for the selected table opens in a separate tab or window.

   If required, you can print this map from the browser.

Analyzing table relationships

The schema map shows the selected table in yellow, typically centered, and all tables related to that table, typically shown at the sides.

Example schema map



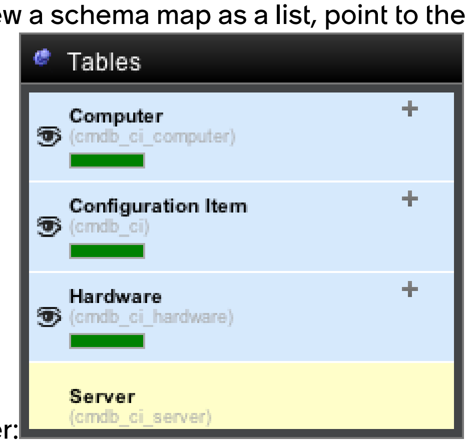
From this map:

- The check boxes at the top allow you to control which relationships to display. Select or clear a relationship type to display or hide tables with that relationship to the selected table.
- Each related table has a colored bar indicating the relationship to the selected table.
- You can point to the connector lines to display the details of a relationship between the two tables.

Note:
Since relationships are shown as single lines for simplicity, the diagrams rendered are not entity relationship diagrams.

Using the Table Selector:

To view a schema map as a list, point to the table selector in the right



corner:

You can:

- Click a table in the list to scroll the schema map to that table.
- Click the eye icon beside a listed table to hide or show that table in the schema map.
- Click the pin icon in the selector to keep the list open.

Using Related Tables:

Right-click a table node header to display a context menu with these functions:

- **Focus on this table**: Make the selected table the new focus table and redraw the schema map based on the new selection.

  The new focus table is added as a breadcrumb at the top, allowing you to return to the previous table at any time.
- **Go to list**: Display the list of records for the table.
- **Go to dictionary**: Display the system dictionary, filtered for the selected table.

To hide a related table from view, click the eye icon in the node header (the node can be made visible again with the table selector).

For tables that are part of their own derivation hierarchy, click the expand button (**+**) in the node header to add their derivation hierarchy to the schema map.

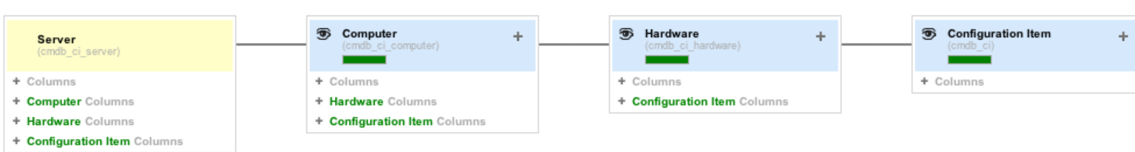
Viewing More Information

Click the expand button (**+**) beside **Columns** to expand the table fields.

Columns -	
Business resolve time:	integer
Caller:	reference to User
Category:	string
Caused by Change:	reference to Change Request
Change Request:	reference to Change Request
Child Incidents:	integer
Close code:	string
Incident state:	integer
Notify:	integer
Parent Incident:	reference to Incident
Problem:	reference to Problem
Reopen count:	integer
Resolve time:	integer
Severity:	integer
Subcategory:	string

The reference fields show a red notation of the table they refer to.

If any tables extend from a table, their columns are displayed in reverse derivation order. For example:



Here, the Server `[cmdb_ci_server]` table extends from Computer `[cmdb_ci_computer]`, Hardware `[cmdb_ci_hardware]`, and Configuration Item `[cmdb_ci]`, and displays the columns from those tables.

Similarly, the Computer table displays the columns from the Hardware and Configuration Item tables.

Create a table index

Build indexes to access the data held in your tables more easily.

Before you begin

Role required: admin

About this task

Note:
Constructing an effective index requires specialized knowledge in database architecture. If you don't have this expertise, consult with a database administrator.

Creating an index on a large table can significantly affect system performance. A large table in this case is generally considered to be any table around 1 TB in size. Therefore, consider creating indexes on larger tables only during off-peak hours. For example, avoid adding an index to a CMDB table while a discovery job is running, as this can lead to increased load and potential delays.

Procedure

1. Access the Index creator in one of the following ways.
2. Select the fields you want included in the index.
   The order in which you select the fields affects how the index works. If you do not have expertise in database design, you should consult someone who does.
3. To create a unique index, select the **Unique Index** check box.
4. Select **Create Index**.
   The **Table Name** field is there for your reference only. Overriding the default has no effect.

Drop a custom index

Remove a custom index by dropping it from a table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the table that contains the custom index you want to drop.
3. On the **Table** form, select the Database Indexes related list.
4. In the list, select the custom index that you want to drop.
5. On the Database Indexes form, select **Drop**.

Result

The custom index is dropped from the table.

Create a many-to-many table relationship

Create a bi-directional relationship between two tables, so that the related records are visible from both tables in a related list.

Before you begin

Role required: admin.

About this task

Many-to-many relationships allow a list to point to a list of entries, rather than to single field.

If a knowledge base article points to a list of related configuration items, it uses a related list. Not all lists can be used as related lists, however. For a list to be related to another list, a many-to-many relationship that refers to both tables must exist.

The Many to Many Definitions `[sys_m2m]` table allows administrators to create custom many-to-many relationships.

Many-to-Many tables aren't considered custom tables and don't count toward your custom table allotment.

Procedure

1. In the navigation filter, enter `sys_m2m.list`.
2. Click **New**.
3. In the **From table** field, specify a parent table.
4. In the **To table** field, specify a child table.
   The Many-to-Many form automatically populates the other fields with suggested values.
5. **Optional:** Edit other field values, if appropriate.

   > **Note:**
   > Many-to-Many table names cannot exceed 30 characters.

Related topics

Reference default many-to-many relationships

Reference default many-to-many relationships

Some many-to-many relationships are defined by default.

To reference many-to-many relationships that are available in the base system, administrators can enter `sys_collection.list` in the navigation filter.

> **Note:**
> Only use this table to view many-to-many relationships in the base system. To create a new relationship, always use the Many-to-Many Definitions table.

Working with the Task table

The Tasks [task] table is one of the core tables provided with the base system.

The Tasks [task] table provides a series of standard fields used on each of the tables that extend it, such as the Incident [incident] and Problem [problem] tables. In addition, any table that extends the Tasks [task] table can take advantage of task-specific functionality for driving tasks.

The Planned Task plugin provides the Planned Task [planned_task] table, which extends the Tasks [task] table to provide more fields for tasks to measure duration and effort.

Creating tasks

The Tasks [task] table provides means for creating and completing tasks, as well as tracking their workflow in your instance.

Tasks aren't created directly on the Tasks [task] table. Instead, tasks are created on task child tables. To create a record in a task child table, access the Tasks [task] table by entering `task.list` in the navigation filter, and then select **New**. In the Task Interceptor, select the desired task child table.

Tools for completing tasks

These tools can be run on any table which extends Task.

- Approvals

  Approvals can be generated to a list of Approvers, either manually or automatically, according to Approval Rules. Approvals can be incorporated into workflows or can stand alone. For more information, see Process approvals.

  Approvals can be used on tables that do not extend Task.

- Assignments

  Assignment rules can automatically assign tasks to users or groups, ensuring that the most appropriate team members handle the tasks. For more information, see Defining Assignment Rules.

- Service levels

  Service level agreements can track the amount of time that a task has been open, to ensure that tasks are completed within an allotted time.

- Inactivity monitors

  Inactivity monitors ensure that tasks do not fall by the wayside by notifying users when tasks have been untouched for a predefined period of time. For more information, see Set an inactivity monitor.

- Flow Designer

  A process owner can design a flow for tasks that meet certain conditions. After a task is created that meets the conditions, the flow applies an automated process to the task. The process is defined in Flow Designer. For more information, see Flow Designer.

Modifying the Task table

Modifications made to the Tasks [task} table are applied to all child tables.

Be sure that changes are appropriate for all the child tables. Adding fields is a low-impact change, because you can hide fields on tables that don't need them. However, if the fields are being used across tables, deleting fields may cause unwanted data loss.

Note:
When adding choice list entries to a choice list on the Tasks [task] table, make sure that the entry value is unique.

You can use dictionary overrides to change some parts of a field definition in a way that does not to not apply to all child tables.

Tasks workflow

An administrator can specify a specific workflow process to apply to tasks that meet certain conditions.

Once a task is created that meets the conditions, the workflow applies the process to the task, asking for approvals, notifying users, generating other tasks, running scripts, and so on.

Task table structure

The Task table structure provides a framework to organize and store task-related data, and includes extensive customization options.

Important Task table fields

The Task table is a base class that provides fields for the core ITSM applications such as Incident, Problem, and Change Management. All applications that extend the Task table share these fields in common.

Label	Name	Type	Description
Active	active	boolean	Specifies whether work is still being done on a task or whether the work for the task is complete. By default, only application-specific business rules set the value of this field. For example, the `incident autoclose` business rule closes resolved incidents that have not been updated for one day.
Additional comments	comments	journal_input	Displays and allows the entry of comments about the task record. Each comment is inserted into the **Activity** field. For more information, see Journal field type.
Approval History	approval_history	journal	Displays the history of approvals for the record. For more information, see Tools for completing tasks.
Assigned To	assigned_to	reference	Specifies the user assigned to complete the task. By default, this field uses a Reference qualifiers to only display users with the itil role. Some applications override the parent reference qualifier to display relevant users. For example, the Service Order and Project Task tables filter users based on their skills.
Created	sys_created_on	glide_date_time	Displays the date and time when the task record was created.
Description	description	string	Displays and allows the entry of a multi-line description of the work to be done.
Escalation	escalation	integer	Indicates how long the task has been open. Escalations are dynamically populated using service level agreements, which specify how long a task remains in each escalation state. Escalation states go from **Normal** to **Moderate** to **High**, and finally to **Overdue**. Record lists color code each task by escalation state.
Number	number	string	Displays an identifying number for each task record. This field is the display value for

Label	Name	Type	Description
			the Task table. The system generates this number when the task is created. To manage number generation, see Record numbering.
Opened	opened_at	glide_date_time	Displays the date and time when a human opened the task record for the first time.
Priority	priority	integer	Specifies how high a priority the task should be for the assignee. By default, the *calculatePriority*business rule calculates this value based on the **Impact** and **Urgency** values. Record lists color code each task by degree of priority.
Short Description	short_description	String	Displays and allows the entry of a short description of the task, which is a human-readable title for the record.
State	state	Integer	Displays a choice list for status of the task: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped Applications typically use Dictionary overrides to display application-specific states.
Sys ID	sys_id	GUID	Displays the Unique record identifier (sys_id).
Task Type	sys_class_name	sys_class_name	Specifies the type of task, which corresponds to the child class. The system populates this value when a record is created on a child table.
Time Worked	time_worked	timer	Display a timer which measures how long a record is open in the form view.
Watch list	watch_list	glide_list	Specifies users who receive Email and SMS notifications when the record is updated. By default, only the Incident, Change, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.
Work notes	work_notes	journal_input	Displays and allows the entry of comments viewable only by ITIL users. Each comment

Label	Name	Type	Description
			is inserted into the **Activity** field. For more information, see Journal field type.
Work notes list	work_notes_list	glide_list	Specifies users who receive Email and SMS notifications when work notes are added to the record. By default, only the Change, Problem, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.

Journal fields

Journal fields work together to create a log of changes and comments as tasks are worked on.

Note:
Journal fields work on audited tables only.

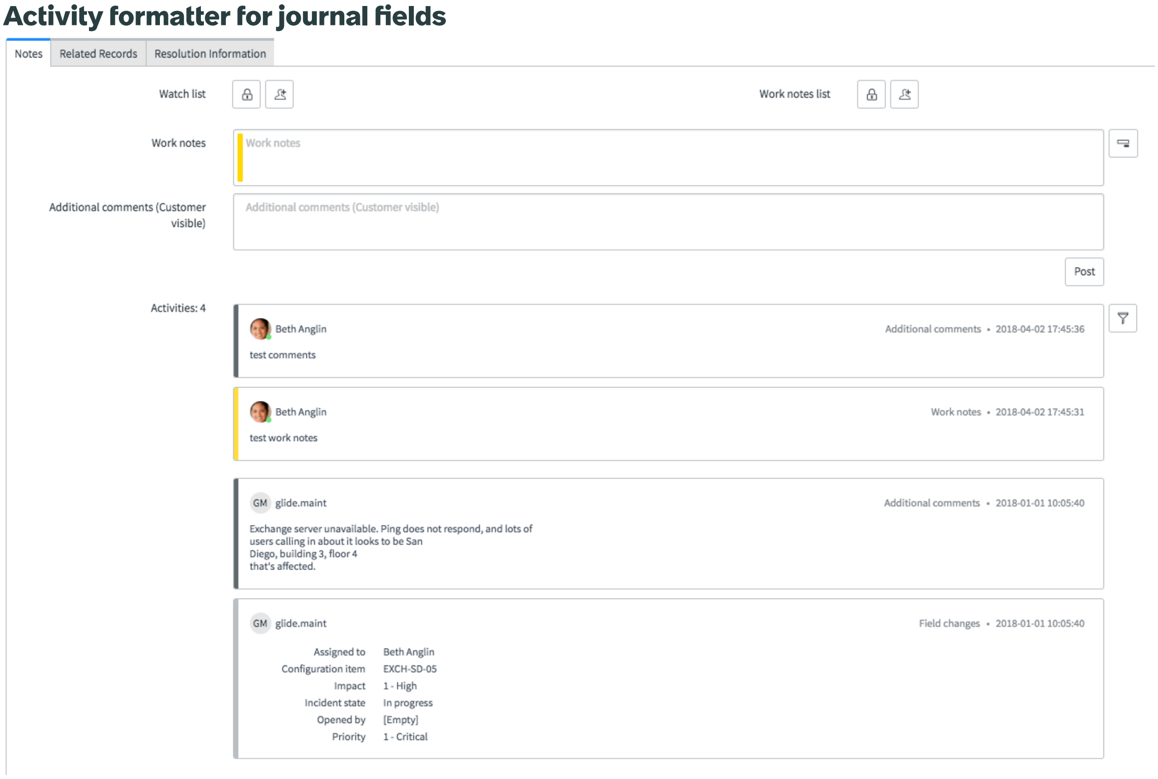
Fields of the journal_input type are multi-line text boxes which, upon save, add the comments into the Activity field with a notation.

Fields that accept input into the journal

Field	Description
Additional comments	Any user can update.
Work notes	ITIL users can update.

These comments, as well as any changes to the record or email notifications sent out because of the record, are displayed in the activity formatter, which can be added to the form like a field.

Activity formatter for journal fields



Reminder table

The Reminder [reminder] table provides a way to auto-generate reminders for a task.

Any table that extends the Task table, such as the Incident [incident] table, can use the Reminder [reminder] table.

You can add Reminders as a related list to the Incident form by opening the form context menu, navigating to **Configure** > **Related Lists**, and then adding **Reminders->Task**.

By default, only an administrator can create or modify a Reminder record. To enable non-administrators to create reminders, you must add create and read ACL rules to the Reminder [reminder] table and specify the user's role.

Note:
You can only create reminders for active task records.

To access the Reminder table, type `reminder.do` in the filter navigator.

Reminder table

Field	Description
Task	Refers to the parent task record.
User	Specifies the user who has logged in to the system.
Remind me	Specifies the time before which the reminder must be sent. Available values are: **15 minutes**, **30 minutes**, **1 hour**, and **2 hours**. You can add values to this field as required. **Note:** Internally in the system, the value is always converted to minutes and then stored in the **Remind me** field.
Before	Refers to a date field on the parent task record. **Note:** The **Activity due** and **SLA due** fields are legacy fields with an **UNKNOWN** value that you can't use. You can only use the **Due date** and **Follow up** fields. Note the following details about using the **Before** field. • The parent task record must have a value in the field you specify. For example, if you select **Due date**, the parent task record must have a value in **Due date** before you can save the reminder. • You can use a date field other than **Due date** or **Follow up** by performing the following steps: 1. Select either **Due date** or **Follow up**in the **Before** field. 2. Save the reminder. 3. Find the reminder in a list view using one of the following methods:

Reminder table (continued)

Field	Description
	▪ In the parent task record, configure the form, and then add Reminders as a related list. ▪ Navigate to `reminder.do` and search for the reminder. **4.** In the list view, change the **Before** field value to a different date field from the parent task. Use the field name and make sure the field has a value. For example, enter `work_start` to use the **Actual start** field instead. Note that you can't make additional changes on the reminder form without changing the **Before** field value back to either **Due date** or **Follow up**.
Using	Specifies the method by which the reminder must be sent. Available options are: **Send an Email** and **Outlook Calendar**.
Subject	Specifies the subject or the reason of the reminder. Maximum number of characters allowed on this field is 100.
Notes	Provides a space where you can enter your comments regarding the reminder. Maximum number of characters allowed on this field is 8000.

Defining assignment rules

The instance can automatically assign a task to a user or group based on pre-defined conditions by using data lookup rules and assignment rules.

Assignment rules module

The Assignment rules module allows you to automatically set a value in the assigned_to and assignment_group fields when a set of conditions occurs.

An assignment rule must also meet these additional criteria to run:

- The task record has been created or updated. Assignment rules do not apply to unsaved changes on a form.
- The task record must be unassigned. The record cannot have an existing value for either the *assigned_to* or *assignment_group* fields. Assignment rules cannot overwrite existing assignments (including assignments set by a default value or a previously run assignment rule).
- The assignment rule is the first rule that matches the table and conditions. If more than one assignment rule matches the conditions, only the rule with the lowest order value runs.

Data lookup rules

Data lookup rules offer a generic way to change any field value, not just assignment fields.

Data lookup and record matching support offer the following improvements over the *Assignment* module:

- Ability to change any field value not just an assignment field
- More options to define when a rule runs:

    - On form change (Allows assignment rules to apply to unsaved changes on a form)
    - On record insert
    - On record update
- Option to replace existing values (including default values)

Note:
You can define data lookup and *Assignment* rules at the same time. The system ignores any duplicate rules after an incident has been assigned unless you are using a data lookup definition option to replace existing values.

Related topics

Precedence between data lookup, assignment, and business rules

Precedence between data lookup, assignment, and business rules

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

Note:
Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. Before business rules: Scripts configured to execute before the database operation with an order less than 1000.
2. Before engines. The following are not executed in any specific order:
    - Approval engine (for task and sys_approval_approver tables)
    - Assignment rules engine (for task tables)
    - Escalation engine
    - Data policy engine
    - Field normalization engine
    - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
    - Execution plan engine (for task tables)
    - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
    - Data lookup engine inserts or updates
    - Workflow engine (for default workflows)
3. Before business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The data base operation (insert, update, delete).
5. After business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. After engines. The following are not executed in any specific order:
    - Label engine
    - Listener engine

- Table notifications engine
- Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
- Text indexing engine
- Update sync engine
- Workflow engine (for deferred workflows)
- Trigger engine (for all Flow Designer flows)

7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. After business rules (Only active records). Scripts configured to execute after the database operation with an order greater than or equal to 1000.

Note:
Like After business rules, Async business rules execute their logic after a database operation occurs. Unlike After business rules, Async business rules execute asynchronously, running in the background simultaneously with other processes. Async business rules run after the user submits the form and after the scheduler runs the scheduled job created from the business rule. The system creates a scheduled job from the business rule after the user submits the form but before any action is taken on the record in the database.

Business rules

Workflow assignments

An alternative to creating data lookup or assignment rules is to create one or more workflow tasks that assign a task record as part of a workflow.

Consider using Task workflow activities for assignment if your process includes multiple steps or conditions such as requiring a particular group approve a request.

When using a workflow to manage task assignments, add a brief Timer workflow activity to the start of the workflow. Without this timer activity, the workflow runs before the parent record, the current record, is inserted into the database. After the timer activity completes, the workflow resumes using the parent record information from the database instead of the original current. Pausing a workflow in this way does not change a default workflow to a deferred workflow. For more information on how the workflow engine interacts with the database, see Workflow engine operation order.

Baseline assignment rules example

A baseline instance contains certain assignment rules.

Baseline instance rules

Name	Table	Conditions	Assigned to user, Assigned to group, or Script
Networking	incident	Category is Network	User: System Administrator

Baseline instance rules (continued)

Name	Table	Conditions	Assigned to user, Assigned to group, or Script
			Group: Network
Database or Software	incident	Category is one of Request, Inquiry / Help, Software, Hardware	User: System Administrator Group: Software
SC Item fulfillment - Field Services	Ticket	Parent.Task type is Request item	Group: Field Services
Release Planning	release_phase	Name is Plan	Script: `current.release.product.service.assigned_to;`
IT Hardware	sc_req_item	Approval is Approved and Item.Category is Request Computers and Hardware	User: System Administrator Group: Hardware
Service Desk	incident	Active is true	Group: Service Desk

Create an assignment rule

Automatically assign a record according to one or more conditions in an assignment rule. Assignment rules are designed to run at the time you open a record.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment**.
2. Select **New**.
3. On the form, fill in the fields.

Assignment rule form

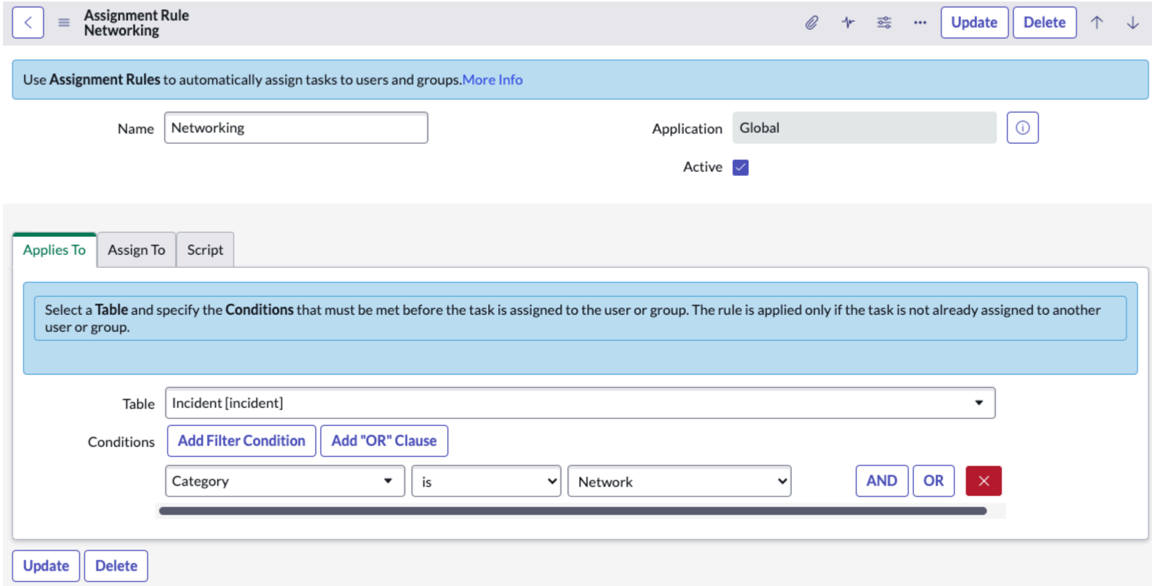
Field	Description
Name	The descriptive name for the assignment rule.
Active	Option to activate the assignment rule.
Applies to	
Table	The table with the records that the assignment rule applies to. The list shows only tables and database views that are in the same scope as the assignment rule. If you select a custom table that extends the task table, and for the assignment rule to work properly, you must clear the instance cache by navigating to https://<instance_name>.service-now.com/cache.do.

Field	Description
	Important: Clearing the system cache can affect overall performance, and degrade system response times. Do not run cache flushes during business hours, and do not trigger cache flushes automatically.
Conditions	The conditions under which the assignment rule applies.
Assign to	
User	The user the event is assigned to.
Group	The group the event is assigned to.
Script	
Script	A script to specify advanced assignment rule functionality. The current.variable_pool set of variables is available. **Note:** Make sure the input in the script is correct, and that the input type matches the field type in the Assignment Rule script. For example, if the assignment rule script sets the value of an Integer field, and the value in the script is set to String, the assignment rule may yield unexpected results.
Optional fields	
Match conditions	**Any** If any of the conditions are met, assignment rule applies. **All** If all the conditions are met, assignment rule applies.
Execution Order	The order in which the assignment rule is processed. If assignment rules conflict, a rule with a lower-order value takes precedence over a rule with a higher value. If the order values are set to the same number, the assignment rule with the first matching condition takes precedence over the others. Only the first assignment rule with a matching condition runs against a record.

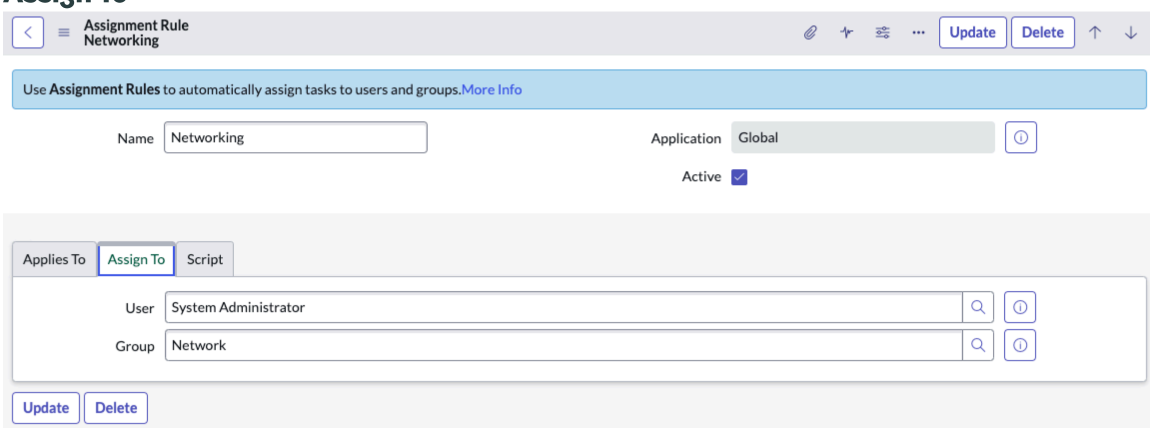
Example: Condition editor

In this example, the condition statement automatically assigns any incident opened in the Network category to the system administrator in the Network assignment group.

Applies To



Assign To



Create an assignment data lookup rule

Automatically assign a record using Data Lookup and Record Matching.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment Lookup Rules**.
2. Select **New**.
3. On the form, fill in the fields.

Assignment Data Lookup fields

Field	Description
Category	The category the data lookup matches against.
Subcategory	The subcategory the data lookup matches against.
Configuration item	The configuration item the data lookup matches against.

Field	Description
Location	The location the data lookup matches against.
Assignment group	The assignment group to assign the incident to.
Assigned to	The user to assign the incident to.
Active	Option to run the rule or deactivate the rule.
Order	Order in which the rule runs compared to other rules on the same table. The Data Lookup Plugin runs the rule with the lowest order and matching values.

4. Select **Submit**.

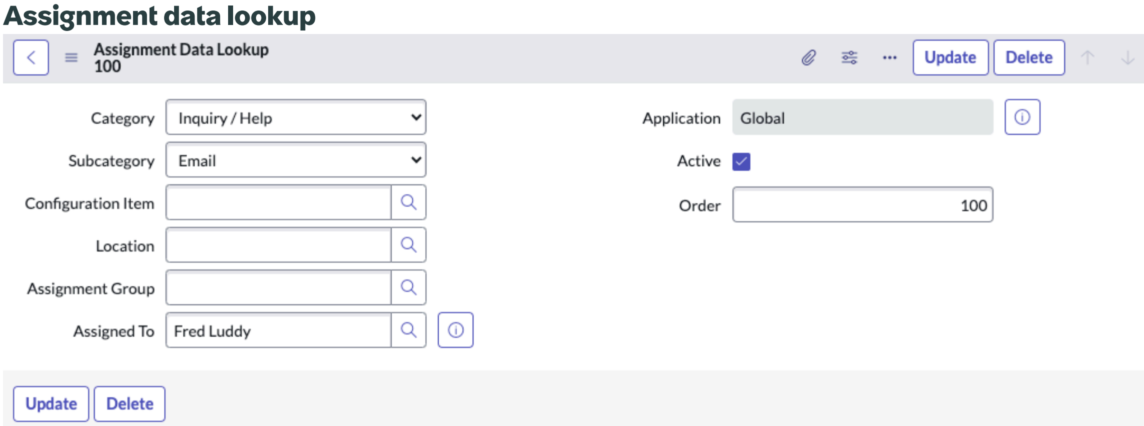
Result

The rule assigns incidents to the values in the *Assignment Group* and *Assigned To* fields based on the values selected in the **Category**, **Subcategory**, **Configuration Item**, or **Location** fields. A valid assignment lookup rule requires at least one matcher field and one setter field.

Example: Assignment Data Lookup

In this example, the Assignment Data Lookup rule automatically assigns any incident with the Category of Inquiry/Help and Subcategory of Email to Fred Luddy.

Assignment data lookup



Extending the Task table with Planned tasks

The Planned Task plugin provides a Planned Task `[planned_task]` table that extends the Task `[task]` table.

The Planned Task plugin cannot be activated independently. It gets activated when activating the Project Management plugin (through PPM Standard plugin).

Planned tasks provide additional fields for tasks pertaining to time and effort as part of a planned, multi-stage process.

Note:
If the Planned Task_v2 (`com.snc.planned_taskv2`) plugin is active when you upgrade to the Geneva or later releases, the system adds the Task column to the Planned Task [planned_task] table. The Task column is of type Composite Field, and stores the Short Description and Number of the task. During the upgrade, the system updates all records in the Planned Task table.

Create a planned task

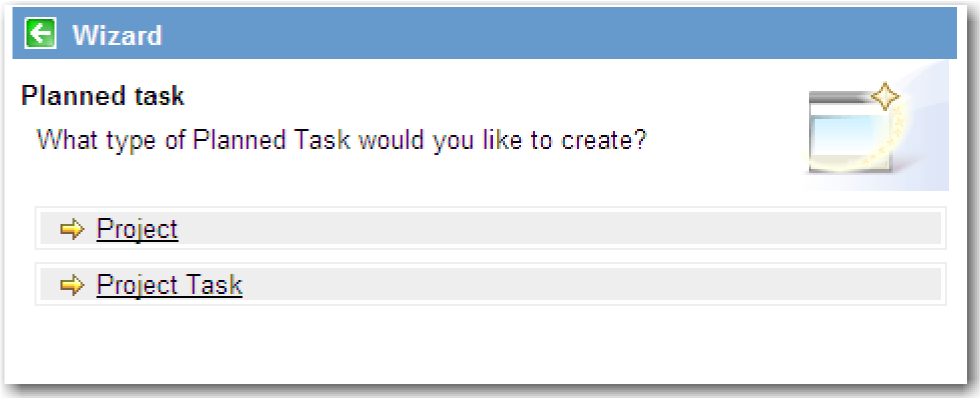
Planned Tasks are created on planned task child tables.

Before you begin

Role required:

About this task

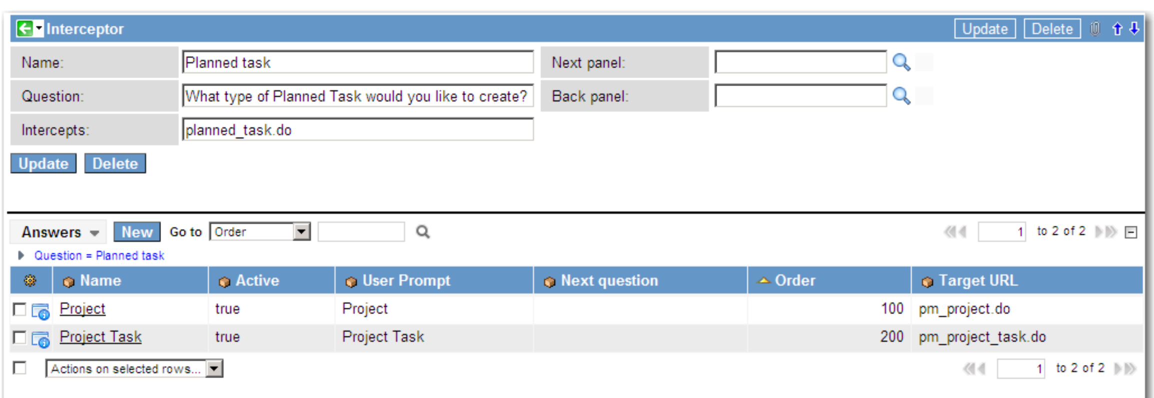
Selecting the **New** button on the Planned Task record list launches the Planned Task Interceptor, which prompts the user to select a child table to create the planned task on:



To modify the planned task interceptor:

Procedure

1. Navigate to **All** > **System Definition** > **Interceptors**.
   This module may need to be activated.
2. Select the **Planned Task** Interceptor.
3. Modify the **Answers** related list as desired.
   This related list specifies what choices are presented, and where the user is redirected to once they select the choice.

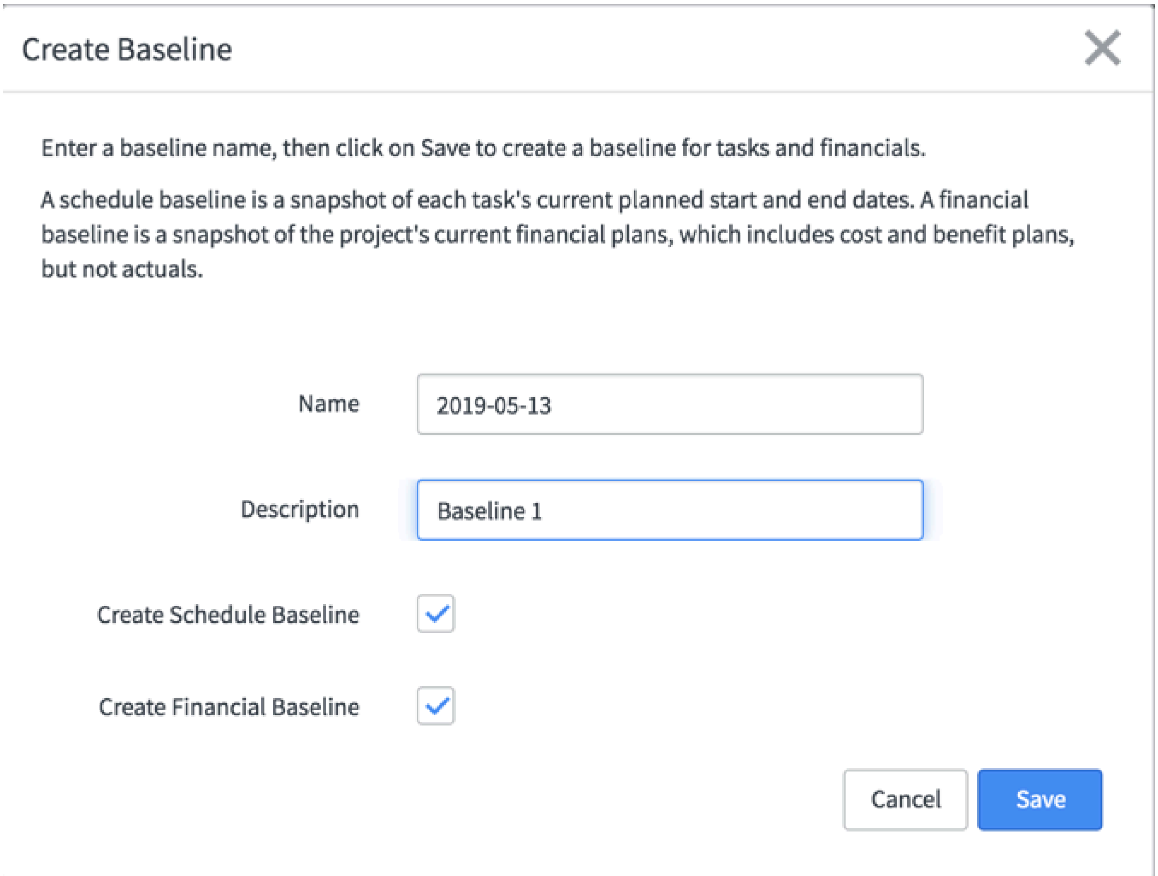


Create a baseline

A Planned Task Baseline is a record of the start and end times of the planned task at a particular moment in time.

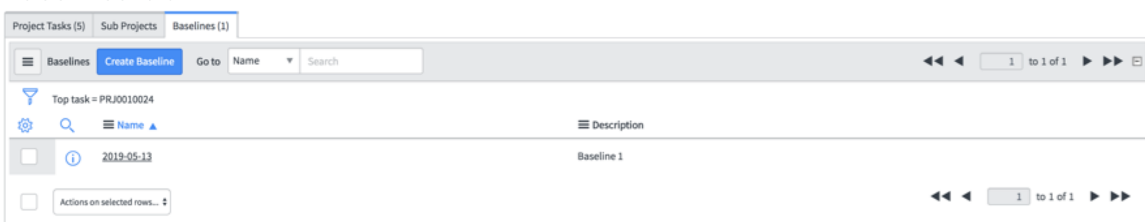
To create a baseline, navigate to the form of the top planned task and select the **Create a Baseline** related link:

Create baseline



To view the baseline, configure the related lists to add a related list of baselines:

Baselines tab



The baseline can be viewed on a Gantt Chart using the related link.

Measure time and effort

The Planned Task [planned_task] table provides standard fields for tracking duration and effort.

Duration measures the time from start to end date. Effort measures the hours of work exerted on the project.

Duration

- Planned duration: The projected length of time for the planned task.
- Actual duration: The actual length of time so far for the planned task.
- Remaining duration: The Planned duration minus the Actual duration, which represents the projected length of time left.

Effort

- Planned effort: The projected amount of time that will be spent on the planned task.
- Actual effort: The actual amount of time that has already been spent on the planned task.
- Remaining effort: The Planned effort minus the Actual effort, which represents the amount of project work left.
- Percent complete: For the parent task, the percent complete field is not editable and is rolled up from the percent completion of child tasks using the following formula:

  Percent complete of parent task = sum (planned duration of child tasks * percent complete of child tasks) / sum (planned duration of child tasks)

  For a child task, the percent complete is entered manually.

Date Calculation: All planned dates and actual dates of the child tasks are rolled up to the parent task automatically. Planned end date for a child task is calculated based on the planned start date and planned duration. If actual start is present, then planned end date is calculated from actual start date and planned duration.

Dependencies: All type of task dependencies, excluding external dependencies, are supported by the planned tasks. For more information about various dependency types, see Project task relationships and dependencies.

Important planned task table fields

The Planned Task table has these fields.

Important Planned Task Table Fields

Label	Name	Type	Description
Actual cost	`work_cost`	currency	The actual cost of the planned task, to be compared with the Estimated cost.
Actual duration	`work_duration`	glide_duration	The actual length of time (from start time to end time) of work on the planned task, to be compared with the Planned duration.
Actual effort	`work_effort`	glide_duration	The actual time spent working, to be compared to the Planned effort.
Critical Path	`critical_path`	boolean	
Estimated cost	cost	currency	An estimation of the cost of the planned task, to be compared with the actual cost.
HTML Description	`html_description`	html	A description field that accepts HTML mark-up.
Percent Complete	`percent_complete`	decimal	A percentage of the completed effort. Generated using the Planned effort and Actual effort fields.
Planned duration	duration	glide_duration	The estimated length of time (from start time to end time) of the planned task.

Important Planned Task Table Fields (continued)

Label	Name	Type	Description
Planned effort	effort	glide_duration	The estimated amount of time spent working on the planned task.
Planned end date	`end_date`	glide_date_time	The estimated date and time for the planned task to end.
Planned start date	`start_date`	glide_date_time	The estimated date and time for the planned task to start.
Remaining duration	`remaining_duration`	glide_duration	The difference in planned and actual duration, representing the time left for the planned task.
Remaining effort	`remaining_effort`	glide_duration	The difference in planned and actual effort, representing the amount of work time left for the planned task.
Rollup	rollup	boolean	Read-only field managed by the system that identifies the task as having child tasks. A rollup task has several its fields calculated from the children so those fields are read-only.
Time constraint	`time_constraint`	string	A description of time constraints that apply to the planned task.
Top Task	`top_task`	reference (planned_task)	When different planned tasks are stacked in a hierarchy, this field populates with the highest-level parent task. For example, if Project A has a child Project B, and Project B has a child Project C, then the Top Task for Project C is Project A. The Top Task field for Project A is blank.
Actual start date	`work_start`	glide_date_time	The actual date when the work starts on the planned task.
Actual end date	`work_end`	glide_date_time	The actual date when the work ends on the planned task.

Planned task scripts

Several business rules and one script include determines the dynamic calculation of crucial Planned Task fields.

Planned Task Scripts

Business Rule	Description
Set actual work start value	Sets the Actual Start Date of the planned task when State is set to the default work state.
Set close data on inactive	Sets the close data of the planned task when task becomes inactive.

Planned Task Scripts (continued)

Business Rule	Description
Recalculate	Recalculates the planned task schedule fields when one of the schedule fields changes.
Planned task global events	Raises global event for every insert or update of planned task record. For more information, see Global events.
Update parent actual effort	Rolls up actual effort from child task to parent task.
Update parent effort	Rolls up planned effort from child task to parent task.
Update parent percent complete	Rolls up percent complete from child task to parent task.
Validate duration	Validates the value in the planned duration field is not 0 or negative.
Validate percent complete	Validates the value in the percent complete field is between 0 and 100.
Validate work end before work start	Validates that the actual end date is not earlier than the actual start date.
Set top task	Sets top tasks to maintain hierarchy of tasks.
Set top task on children	Sets top tasks on child tasks to maintain hierarchy of tasks.

Planned task hierarchy

The **Task Hierarchy** tool available for Planned Task displays the relationship between parent and child planned tasks.

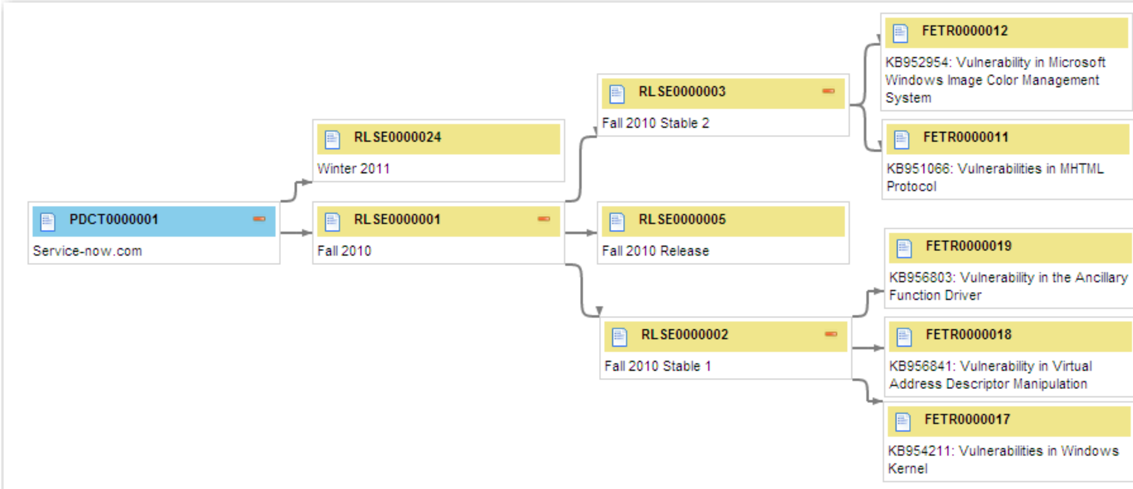
About this task

Out-of-box, the **Task Hierarchy** tool is available in both Project and Release Management.

Different **Planned Task** tables have different UI actions to launch the task hierarchy:

- To view the hierarchy of a Project, navigate to the use the **Task hierarchy** context menu action.
- To view the hierarchy of a Product in Release v2, navigate to the product and click the **Product hierarchy** related link.
- To view the hierarchy of a Release in Release v2, navigate to the release and click the **Release hierarchy** related link.

Rm2 Hierarchy



The Task Hierarchy can be added to any planned task table by:

Procedure

1. Navigating to **System UI** > **UI Actions**.
2. Selecting one of the existing Task Hierarchy UI Actions (for example, **Task hierarchy** if Project Management is activated).
3. Change the table to the desired table and rename the UI Action if appropriate, and insert.

   The hierarchy should now be available as a UI Action on the form of the new table.

Configure rollup for planned task fields

You can configure the planned task fields to roll up the field values in the parent entity.

About this task

By default the following fields are configured to roll up for any planned task and planned task derivatives:

Cost, **Budget**, **Effort**, **Actual date**, **Planned date**, **Duration**, **Percent Complete**

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Open the **Planned task rollup** table.
3. In the Related links, click **Show List**.
4. Click **New**.
5. Fill out the Planned task rollup form (see table).
6. Click **Submit**.

Planned task rollup form fields

Field	Description
Child	Select the table you want to include or exclude.
Field	Select the column name you want to include or exclude.

Field	Description
Navigator	The reference column of the parent to which the value must be rolled up.
Parent	Select the parent table.
Application	Auto-generated value.
Rollup	Select the check box to allow roll up. Leave the field unchecked to exclude the field from rollup.

Creating many-to-many task relations

By default, tasks can be related to each other using a parent/child relationship, such as a Problem with a group of child Incidents or a Catalog Request with a group of child Catalog Tasks.

However, it may prove useful to record exactly the nature of the relationship between the task records. When activated, the Many-to-Many Task Relations plugin allows administrators to define relationships between different tasks.

Request many to many task relations

The Many to Many Task Relations plugin (com.snc.task_relations) is included with several plugins. You can request activation of the plugin by itself.

Before you begin

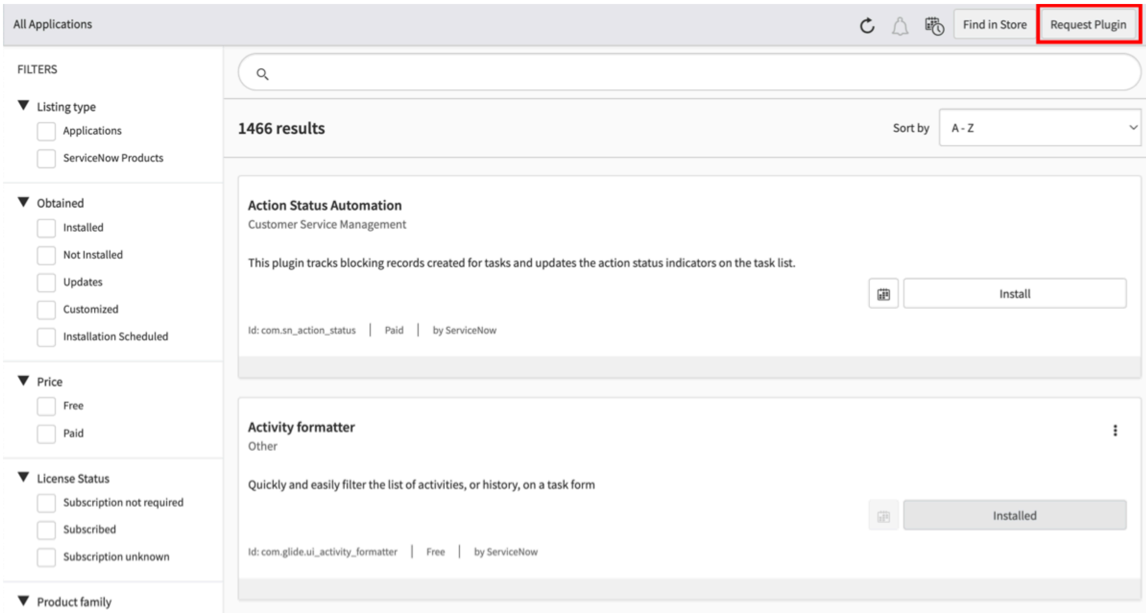
Role required: admin

About this task

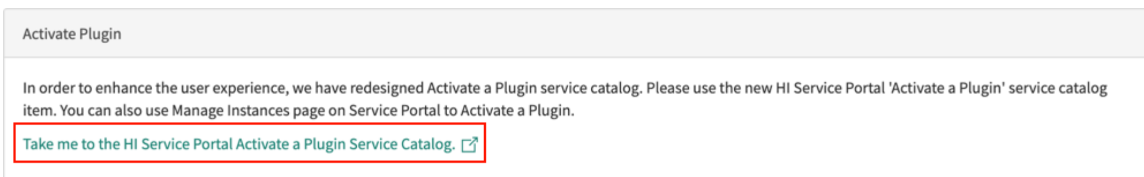
- Planned Task
- Field Service Management
- Project Management
- Governance, Risk, and Compliance

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

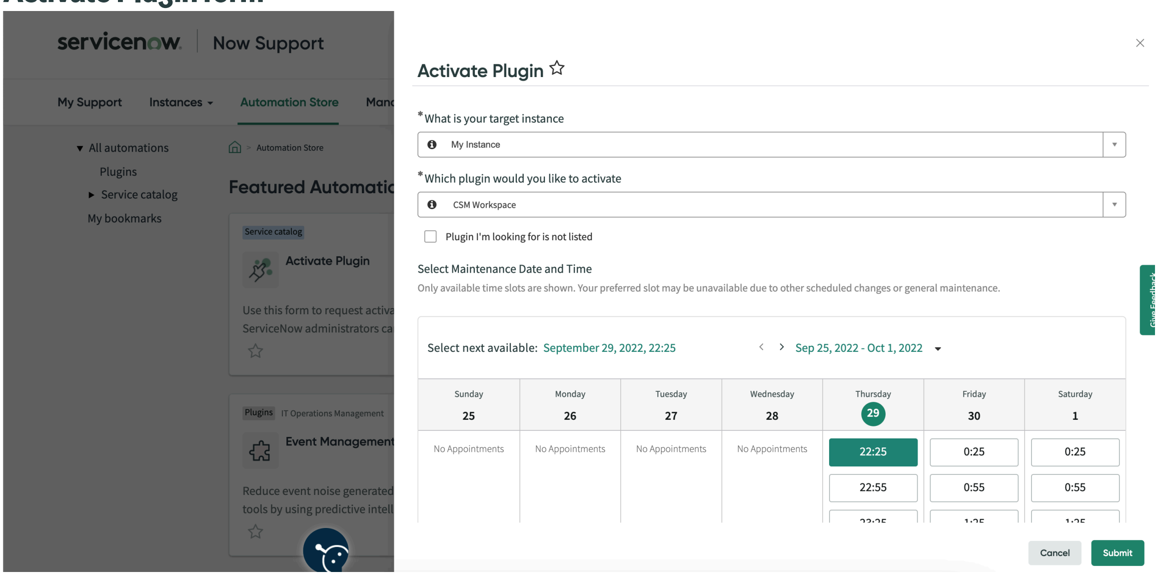
Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin.

Field	Description
	Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Plugin manifest

When the plugin is activated, the Task Relationships application is available with certain modules.

Task relationships

Module	Description
Knowledge Relation Types	Contains the definitions for the possible types of relationships between knowledge articles and tasks.
Knowledge Relationships	Displays all the defined relationships between existing tasks and knowledge articles.
Relationship Types	Contains the definitions for the possible types of relationships between tasks.

Task relationships (continued)

Module	Description
Relationships	Contains all the defined relationships between existing tasks.

The following Relation Types are available by default:

- Solution is documented in::Documenting solution for
- Caused by::Causes
- Contains::Task of
- Documenting Solution for::Solution is documented in
- Investigated by::Investigates
- Permanent correction for::Permanently corrected by
- Related to::Related to
- Requesting::Requested by
- Solved by::Solves

Define a relationship type

Create type codes that define the relationship between parent and child tasks.

Before you begin

Activate the Many to Many Task Relations plugin (com.snc.task_relations) first. See Request many to many task relations.

Role required: admin

Procedure

1. Navigate to **All** > **Task Relationships** > **Relation Types** and select **New**.
2. Populate the *Parent Descriptor* and *Child Descriptor* fields with a short description of the relationship between the two tasks, such as a parent descriptor of *Caused By* and a child descriptor of *Causes*.
3. Select and hold (or right-click) the form header bar and select **Save**.
   The *Name* field automatically populates with the Parent and Child descriptors.

Define a task relationship allowed from the task relationship type record

Define the Task Relationships Allowed from the Task Relationship Type record.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Task Relationships** > **Relationship Types**.
2. Select a Task Relationship Type record.
3. In the Task Relationship Allowed related list, select **New**.
4. Populate the parent and child tables to define which tables are able to accept the relationship.
5. **Optional:** Define scripts to run in the *Parent* and *Child* script fields.

(Optional) These scripts are run when a parent or child record is run to automatically generate the other task (child or parent). These scripts use the current value of the new record, as opposed to the source record which triggered the script.

6. Select **Submit**.

Modify the displayed field

The list view of the Reference Lookup defines the fields displayed in the Task Relations field and editing interface.

Before you begin

Role required: admin

Procedure

1. Navigate to a form that has a reference to the table whose display values you would like to modify within Task Relations field.
2. Click the magnifying glass to display the Reference Lookup list view.
3. Right-click the list header and select **Configure** > **List Layout**.

   The selected List layout is used as the display value for records within the Task Relations field.

Mark as Solution button

The **Mark as Solution** button is added to the KB popup view and displayed when you search the knowledge base from a task record.

Selecting **Mark as Solution** creates a record in the Task / KB Relationships `[task_rel_kb]` table to associate the KB article with a task. You can disable this button by marking the active field false on the 'solution_button' UI macro.

Task relationships with UI actions

After defining task relationships, you can use UI Actions to define the task relationship when a new task is being created from an old task.

Below are a few examples.

> **Warning:**
> These examples may not work on all instances. They are provided as illustrative examples.

UI Actions examples

Cause an incident

This UI Action allows the change management team to log an incident directly from the change request and records that the change caused the incident.

Create a UI Action on the Change Request [change_request] table and place the following into the script:

```
var inccaus =new GlideRecord("incident");
inccaus.short_description= current.short_description;
inccaus.comments= current.comments.getHTMLValue();
// inccaus.parent = current.sys_id;
inccaus.insert();
CauIncident();
```

```
gs.addInfoMessage("Incident "+ inccaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(inccaus);

function CauIncident(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= inccaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

Cause a problem

This UI Action allows the change management team to record a problem from a change request and record that the change caused the problem.

Create a UI Action on the Change Request [change_request] table and paste the following script:

```
var probcaus =new GlideRecord("problem");
probcaus.short_description= current.short_description;
probcaus.comments= current.comments.getHTMLValue();
// probcaus.parent = current.sys_id;
probcaus.insert();
CauProblem();

gs.addInfoMessage("Problem "+ probcaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(probcaus);

function CauProblem(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= probcaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

Fix a problem

This UI Action allows a change request to be generated from a problem, recording that the change fixes the problem.

Create a UI Action on the Problem [problem] table, and paste the following code:

```
var fixchg =new GlideRecord("change_request");
fixchg.short_description= current.short_description;
fixchg.comments= current.comments.getHTMLValue();
// fixchg.parent = current.sys_id;
fixchg.insert();
FixChange();

gs.addInfoMessage("Change "+ fixchg.number+" created");
action.setRedirectURL(current);
action.setReturnURL(fixchg);
```

```
function FixChange(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= fixchg.sys_id;
m2m.type.setDisplayValue("Fixes::Fixed by");
m2m.insert();}
```

Time Card Management

The Time Card Management feature enables time card users such as task assignees to report and track their time for the assigned tasks.

Video explaining how to set up the time tracking feature for projects, enter time, and approve time cards. Watch this five-minute video to learn about setup of the time tracking feature, entering time and approvals.

Time Card Management works with the Task table to record time worked on various task types, such as projects, incidents, problems, and change requests.

With the Time Card Management feature:

- The time card users can record the time worked on a task using time cards and time sheets. They can submit their time cards and time sheets for approval.
- Time cards and time sheets are routed for approval based on the **Non-project time approver** and **Project time approver** fields in the user time sheet policy. User managers with time card approver role can also log time and submit the time sheet of their resources
- The time card approvers can perform the following tasks:
  - Review and approve or reject the time cards in a submitted time sheet.
  - Recall the approved time sheets or time cards to return them to the users for corrections.
  - Use dashboards to view reports of time card and time sheet exceptions, and categorize time reported by the users.
  - Delegate another time card approver to process time sheets from your resources when you might not have time or will be unavailable. Note the following points for delegation:
    - You cannot delegate approval only for an individual resource.
    - The delegated time card approver cannot further delegate your time sheet approvals.

  The project_manager and the resource_manager roles contain the timecard_approver role in the base system. However, the timecard_approver role can also be used independently without these roles.
- The time card admin can create and manage time sheet policies, and can also approve or reject by exception and process the time sheets. Time card admin can also create or edit time cards of any users if the time cards are in Pending or Rejected state.

Note:
The Time Card Management plugin is required to use time cards. Some of the procedures require the project management feature, which activates time cards automatically. For more information, see Project Management (com.snc.financial_planning_pmo).

Domain separation in Time Card Management

Domain separation provides complete data isolation for domain-specific users. Time card Management is domain separation compliant at the **Data only** level.

Activate Time Card Management

Administrators can activate the Time Card Management plugin (com.snc.time_card). The plugin also activates the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards plugin (com.snc.pa.time_card). However, you need a Performance Analytics license to use the dashboards.

Before you begin

Role required: admin

About this task

> **Note:**
> The Time Card Management plugin also gets activated as part of PPM Standard plugin (com.snc.financial_planning_pmo).

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   > **Note:**
   > When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Time sheet policies

Time sheet policies contain the policies to which a time sheet, or a time card must adhere.

By default, the Default time sheet policy is available with the system. As a Time card admin, you can create multiple time sheet policies based on different requirements and workflows in your organization. For example, specify a time sheet policy for each department or team and assign appropriate users to them.

Time sheet policies also provide an ability to specify appropriate approval workflow for project and non-project tasks.

A time sheet policy can be set as a default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as a default policy.

Navigate to **Time Sheets** > **Administration** > **Time Sheet Policies** to view the list of timesheet policies.

Create a time sheet policy

As a time card administrator, you can create a time sheet policy to define the requirements for time card users to record their time worked. The time card approvers must review and process time sheets under the applicable time sheet policy.

Before you begin

Role required: timecard_admin

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Click **New**.
3. On the form, fill in the fields.

Time Sheet Policy form

Field	Description
Name	Unique name of the policy.
Allow blank time cards	Option to enable submission of blank time cards for approval. By default, this option is not selected.
Auto create time card on planned task update	Option to create a time card automatically when you update a planned task, if the following conditions are true: ◦ You are a time card user ◦ You are assigned to the task through **Assigned to** or **Additional assignee list** field ◦ The task is not in a pending state. By default, this option is not selected.
Auto fill time card with time worked entries	Option to fill in time cards automatically when you enter time in the **Time worked** field on the Task form. If a time card does not exist for the task, one is created when the time worked is updated if the following conditions are true: ◦ You are a time card user. ◦ You are assigned to the task through the **Assigned to** or **Additional assignee list** field. By default, this option is not selected.
Auto create time cards every week	Option to generate time cards automatically every week through a scheduled job for all users assigned to the time sheet policy. The time cards are generated based on the planned task assignments and hard-allocated resource plans of the users.

Field	Description
	By default, this option is selected.
Update actual hours and cost in resource plan/reports	Option to update actual hours and actual cost of the associated resource plan based on the hours entered in the approved time card. When selected, you can associate a resource plan related to the selected task with the time card in the following ways: ◦ If the task has multiple resource plans, you can select the appropriate plan. ◦ If the task has one resource plan, that plan is selected by default. The hours from the time card entry and the hourly resource rate are used to update the **Actual hours** and **Actual cost** values of the associated resource plan. **Note:** If the task has no resource plan, the associated records update the corresponding project. By default, this option is not selected.
Allow recall	Option to enable the recall action on a time sheet or time card after it is approved and processed. By default, this option is selected.
Recall period allowed (days)	Number of days within which you can recall a time sheet or time card. This field appears when the **Allow recall** option is selected. The default value is 30.
Week starts on	Start day of the week for the time sheet. The default value is Sunday. **Note:** For more information on filtering Time Sheets using this field, see KB0852458 article in Now Support Knowledge Base.
Maximum hours per day	Maximum number of hours that can be entered each day in a time sheet. The default value is 24. Setting this field to -1 enables the resource to enter: ◦ A value from 0 through 24 for the hours worked each day ◦ A negative value, to correct the previously entered timecards.
Maximum hours per week	Maximum number of hours allowed in a week in a time sheet.

Field	Description
	The value for total hours for a week in a time sheet is the sum of hours entered per day of that week. If set to -1, the total hours per week allowed is up to 168 (24 x 7) hours. The default value is 40.
Non-project time approver	Type of approval required when you submit a time card that has a non-project task assigned. ◦ **Auto**: Time card is auto-approved when submitted. ◦ **User Manager**: Time card is routed to the user manager for approval when submitted. The user manager has the time card approver role and is also selected as the manager of the time card user on the User form. ◦ **None**: A user with the timecard_admin role can approve time cards when submitted.
Project time approver	Type of approval required when you submit a time card that has the project task. ◦ **Auto**: Time card is auto-approved when submitted. ◦ **Project Manager**: Time cards for a project task are routed to the respective project manager for approval when submitted. The project manager is picked from the task against which you are submitting time. ◦ **User Manager**: Time cards are routed to the user manager for approval when submitted. ◦ **Both**: Time cards are routed to both the user manager and project manager for approval when submitted. A time card remains in the Submitted state when only one of the approvers approves the time card. ◦ **None**: A user with the time_card admin role can approve time cards. **Note:** ◦ The project manager and the user manager can view only those time cards that are routed to them for approval. ◦ If the user manager or the project manager changes while the time card is still not approved, the system automatically updates the approver of the time card. ◦ If the name of the project manager or the user manager is not populated on the respective form, a user with the time_card admin role can approve time cards.
Allow multiple rate types	Option to provide a rate type in a time card to be used during expense line generation. When this option is selected, the **Rate type** field displays on the Time Card form to enable the selection of a rate type.

Field	Description
	For more information, see Rate type in labor rate card.
Default rate type	Rate type used by default for the time card. If you select none, the Standard rate type option is used. This field appears when the **Allow multiple rate types** check box is selected.
Default Policy	Option to set the time sheet policy as the default. The default policy is a global time sheet policy that applies to all users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as the default. A time sheet policy set as the default policy cannot be deleted. You must first set another policy as the default policy.

4. Click **Submit**.

What to do next

- Set the time sheet policy as the default policy, if required.
- Assign the time sheet policy to users.

Set a time sheet policy as default policy

As a time card administrator, you can set a time sheet policy as the default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy.

Before you begin

Role required: timecard_admin

About this task

Only one time sheet policy can be set as a default policy.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Open the time sheet policy record.
3. Click the **Set as default** related link.

   Note:
   The related link appears only for a time sheet policy which is not already set as the default policy.

Result

The **Default Policy** option on the record form is selected to indicate that the current time sheet policy is set as the default policy. The **Default Policy** option on the earlier default time sheet policy is cleared.

You cannot delete a default time sheet policy. You must first mark another policy as the default policy to delete the current default policy.

Assign a time sheet policy to a user

As a time card administrator, you can assign a time sheet policy to a user.

Before you begin

Role required: timecard_admin

About this task

You can assign only one time sheet policy to a user.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Open the time sheet policy record.
3. In the **Users** related list, click **Edit**.
4. On the Edit Members form, move the users to the **User List**.
5. Click **Save**.

Result

The selected users appear on the **Users** related list. The time sheet policy is assigned to the selected users.

Create a rate type

You can create rate types using the Rate Types feature.

Before you begin

Role required: timecard_admin

About this task

The rate type functionality is used to categorize different types of work. For example, Standard versus Overtime. It can also instruct down-stream, third-party product about the nature of the work performed.

For example:

- A user works extra time during the day and must differentiate standard time from overtime.
- A technician may be paid at a higher rate based on different types of work involved in the execution of a task.
- An appliance repair task may be billed at one rate for the first hour and a different rate for the remaining hours.
- A service call may last four hours during which specialized equipment is used for one hour. The company must capture the use of the specialized equipment for purposes ranging from additional billing to legal compliance or warranty tracking.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Rate Types**.
2. Click **New** and fill the form.
3. Click **Submit**.

Result

- The rate type is displayed in the **Rate Types** list.
- The rate type if active is also displayed in the **Rate Type** field in the Labor Rate Cards form, Time Worked form, Time Card form, and Time Sheet Portal.

Time Sheet Portal

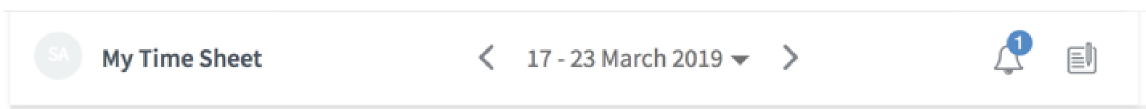
Time Sheet Portal categorizes and displays all your assigned tasks in a single view for a given week. The portal enables you to record time spent on tasks on a day-to-day basis and submit the time sheet in a single action.

Time Sheet Portal works with the Task table to record the time that you spend on various task types, such as projects, incidents, problems, and change requests. It provides a complete breakdown of the time you enter for the task, task categories, and days in a week. It enables you to:

- Generate time cards for assigned projects or project tasks.
- Copy time cards from a previous time sheet.
- Search and create a time card for a task that is not displayed in the assigned tasks list.
- Edit, delete, or add notes to a time card.
- Submit, approve, reject, and recall a time sheet.
- View notifications for the submitted, rejected, and recalled time sheets or time cards.

Time Sheet Portal comprises of the following sections:

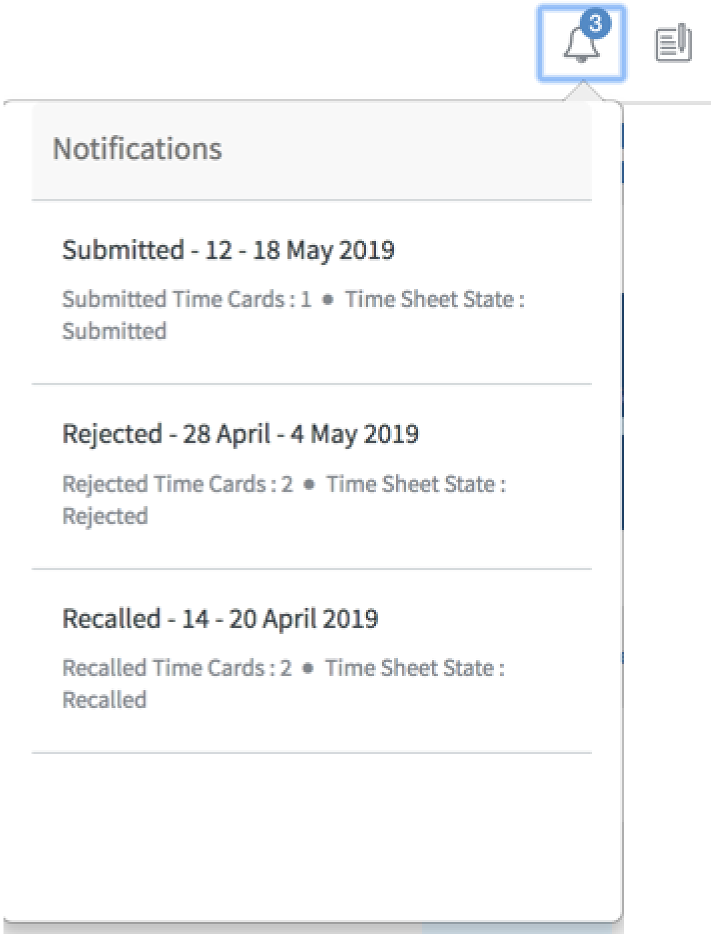
Header



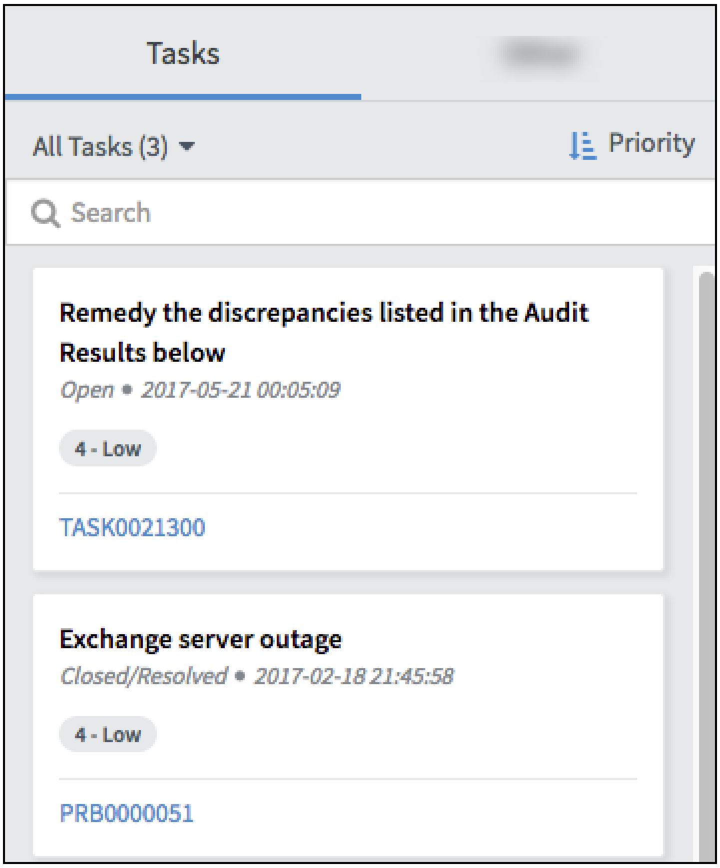
The Time Sheet Portal header:

- Displays a date range of the time sheet for the selected week and provides options to navigate to the time sheet of previous or next week.
- Provides a calendar along with the date range. Clicking a date in the calendar displays the time sheet for the week of the selected date.
- Provides a link to navigate to the time sheet for the current week when a different time sheet is being viewed.
- Provides an option under **My Time Sheet** that enables you to open and edit the time sheets of your resources. The option is available only for a user manager.
- Provides an option to view the time sheet in the Form view using time sheet form view icon ().

- Displays the notifications for the submitted, rejected, and recalled time sheets under the show notifications icon ( ). Each entry displays the number of time cards and their state. Click on a notification item to open the time sheet.



Tasks



The **Tasks** tab displays your assigned tasks as cards. Each card provides information about a task, such as short description, state, last updated date and time, and priority. Tasks are derived from the following filter conditions:

- All your assigned incidents, problems, or change requests that are active.
- All your assigned incidents, problems, or change requests that are closed in the selected week.
- All tasks for which you are hard-allocated during the selected week.
- All your assigned projects or project tasks that are active during the selected week. Project or project tasks are derived from the following conditions:
  - A project or project task that has started and its actual start date is before the end of the selected week.
  - A project or project task has closed and its actual end date is after the week has begun.
  - When there are no actual dates for a project, planned dates of the project must occur within the selected week.
- All active stories assigned to you.
- All active scrum tasks assigned to you or closed in the selected week.
- All active test plans assigned to you.
- All active defect and enhancements assigned to you or closed in the selected week.

Note:
If the Customer Service Management plugin (com.sn_customerservice) is activated, your assigned tasks that are active and closed in the selected week are also derived from the following tables:

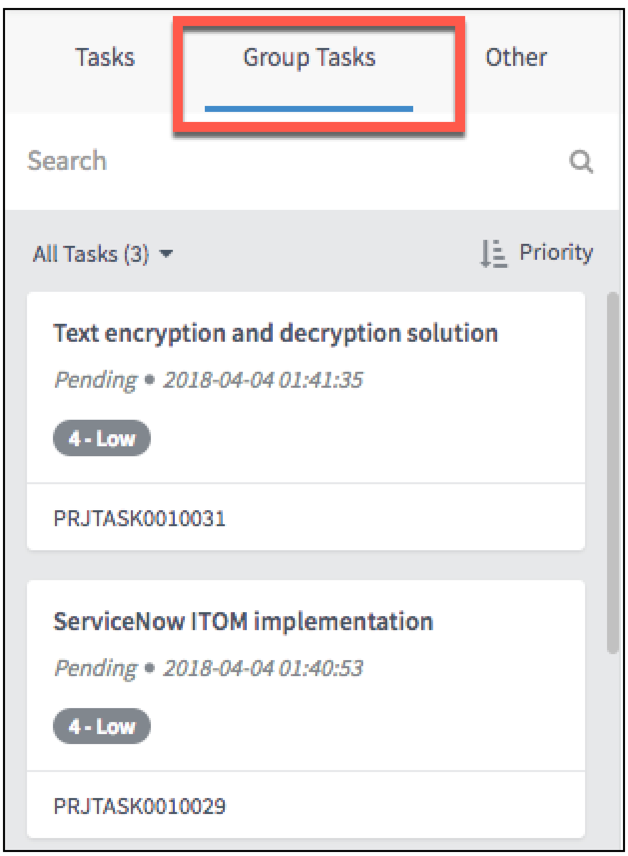
- Case [sn_customerservice_case]
- Work Order [wm_order]
- Work Order Task [wm_task]

On the **Tasks** tab, you can perform the following operations:

- Type a keyword in the search field to view only cards with details that match the keyword.
- Sort cards in ascending or descending order based on priority, irrespective of the task type.
- View cards based on a category, such as projects, project tasks, incident, problem, change, defect, enhancement, test plans, and scrum tasks.
- Create time cards for assigned tasks. See Create time cards and log time through Time Sheet Portal.

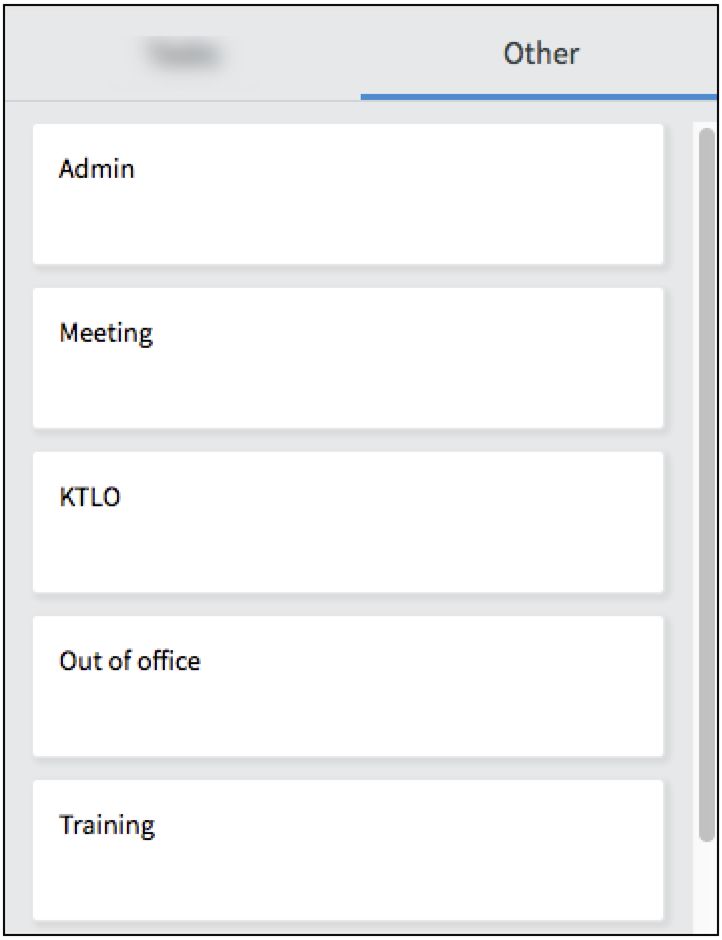
  Note:
  Time sheet policies apply when you create or edit a time card.

Group Tasks



The **Group Tasks** tab displays the tasks assigned to your **Assignment group**. The group tasks are displayed as cards in the tab. A card provides information about the task, such as short description, state, last updated date and time, and priority.

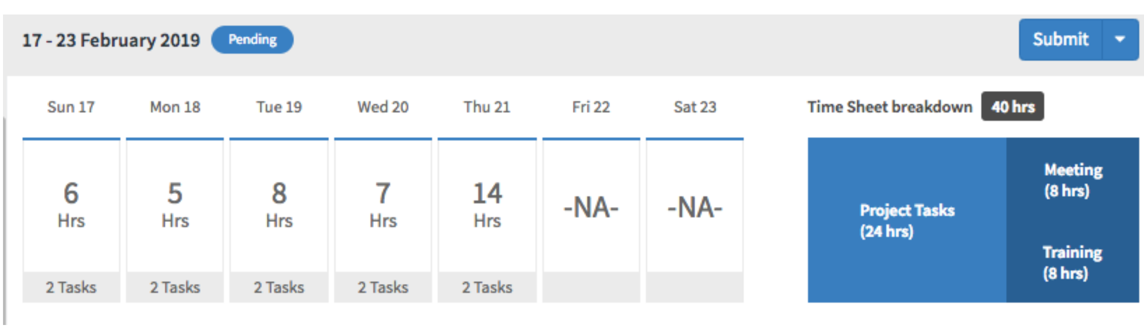
Other



The **Other** tab displays cards used to log time for operational work, such as administration, meeting, and KTLO.

Note:
The list of categories in the time card controls the list of cards displayed on the **Other** tab. If an administrator marks any of the categories as inactive in the time cards, those categories are not displayed on the **Other** tab.

Time Sheet

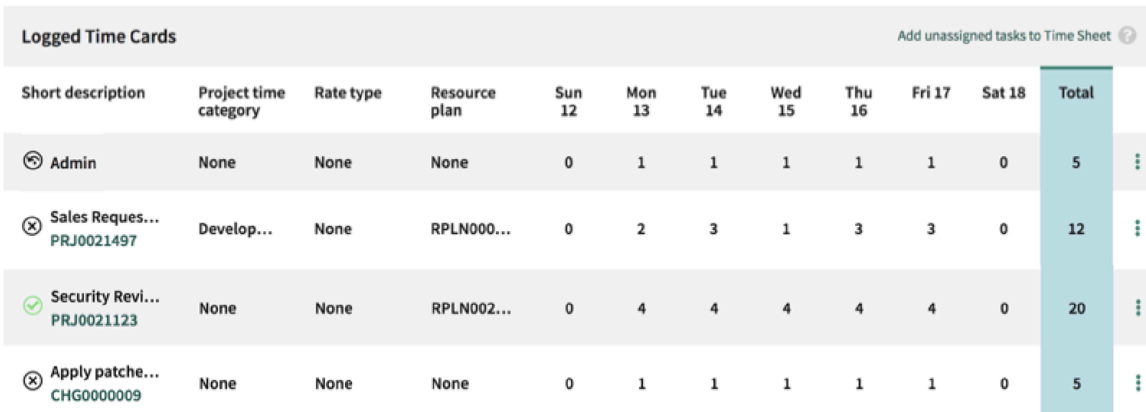


The Time Sheet section:

- Displays the date range of the time sheet for the selected week.
- Indicates the state of the time sheet being viewed.

- Displays the total number of tasks and hours that you have entered for each day in a week. When you click a day in the time sheet, the column for that day is highlighted in both the **Time Sheet** and **Logged Time Cards** sections. The first day displayed in the Time Sheet section is based on the value specified in the **Week starts on** field in the users Time Sheet Policy. For example, if the **Week starts on** field is set to Friday, the Time Sheet section starts with Friday.
- Indicates the total number of hours that you entered in the time sheet. Time Sheet breakdown also displays a breakdown of user-entered hours in different work categories, such as project tasks, admin, meeting, follow on tasks, or change requests.
- Provides options that enable you to submit a time sheet and copy time cards from a previous time sheet. For an approver, options to approve or reject a submitted time sheet and recall a processed time sheet are available.

Logged Time Cards



Logged Time Cards — Add unassigned tasks to Time Sheet

Short description	Project time category	Rate type	Resource plan	Sun 12	Mon 13	Tue 14	Wed 15	Thu 16	Fri 17	Sat 18	Total
Admin	None	None	None	0	1	1	1	1	1	0	5
Sales Reques... PRJ0021497	Develop...	None	RPLN000...	0	2	3	1	3	3	0	12
Security Revi... PRJ0021123	None	None	RPLN002...	0	4	4	4	4	4	0	20
Apply patche... CHG0000009	None	None	None	0	1	1	1	1	1	0	5

Each row in the Logged Time Cards section represents a time card entry for a given week. It has details such as icon for state of the time card, short description of the task, project time category, rate type, resource plan, and logged time. Each row of the time card contains options that enable you to edit, delete, or add notes to a time card. For more information, see Create time cards and log time through Time Sheet Portal.

Note:

- The **Rate type** column is visible only when the **Allow multiple rate types** option in the time sheet policy of the user is selected.
- The **Resource plan** column is visible only when the **Update actual hours and cost in resource plan/reports** option in the time sheet policy of the user is selected.

The icon beside the short description of a row indicates a time card state. The merge icon () in a time card row indicates that a duplicate time card for the same task exists in the time sheet and provides option to merge them into a single time card.

When there are no time cards, the Logged Time Cards section displays the **Generate Time Cards** and **Copy from previous time sheet** buttons to create time cards.

Note:
Time Sheet Portal is not designed for use on mobile devices, and may not appear as shown in this document.

Create time cards and log time through Time Sheet Portal

After you create time cards in Time Sheet Portal, log time in the time cards.

Before you begin

Role required: timecard_ user

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Create time cards in the **Logged Time Cards** section using any of the following options.

   Based on the **Allow time card reporting on** field settings in the **Preferences** tab of a project, the **Add to Time Sheet** and **Add selected to Time Sheet** options are displayed in Time Sheet Portal.

   If a duplicate time card exists for a time card, you can merge both time cards to become a single one, except for time cards in the processed, approved, or recalled state. A duplicate time card is identified by comparing the values in the **Short description**, **State**, **Task**, **Category**, **Rate Type**, **Resource Plan**, or **Project Time Category** fields in the time card.
3. In the **Logged Time Cards** section, log time in a time card.

Submit time sheet through Time Sheet Portal

Once you update the time sheet with time worked for a given week, submit it for approval.

Before you begin

Role required: timecard_ user

About this task

When you submit a time sheet, time cards are verified against the assigned time sheet policy. If there is no time sheet policy assigned, time cards are verified against the default time sheet policy. Business rules prevent you from submitting a time sheet in case any violation is found.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Click **Submit**.
   The time sheet moves to the Submitted state.

Log time and submit time sheets of your resources

As a user manager, you can log time and submit the time sheet of your resources.

Before you begin

A user manager must have time card approver role to create and edit time cards, and submit the time sheet of other time card users. The user manager has either of the required roles and is the one listed as the manager of the time card users.

Role required: timecard_approver

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Click **My Time Sheet** choice list and select the user for whom you want to approve or reject time sheet for under **My Resources**.

The **My Resources** section lists the time card users reporting to you.

> **Note:**
> The choice list with **My Time Sheet** is available only for a user manager.

3. Create time cards and log time through Time Sheet Portal as required.
4. Click **Submit**.

Result

- The time sheet of the selected user moves to the Submitted state. The time sheet policy assigned to the time card user is used for validation when you submit the time sheet.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.
- The **Approve** and **Reject** buttons appear in the Time Sheet section. The two buttons appear only for a user manager.

What to do next

Once you have submitted the time sheet for your resource, you can click **Approve** or **Reject** to approve or reject it. Only the time cards that are routed to the user manager, are approved or rejected. The routing for approval happens based on the **Non-project time approver** and **Project time approver** fields in the time sheet policy of the time card user.

Time Sheets

A time sheet groups all the time cards for a user for the given week.

With time sheets:

- Time card users can submit all the time for their work week in a single step by using a time sheet.
- Time card approvers can approve all the time cards in a time sheet for a user in a single step by approving the time sheet. They do not need to approve multiple time cards for a given user individually.
- Track the activities of a time sheet, such as who submitted or approved a time sheet, in the Activities section on the Time Sheet form. This time sheet activity audit is useful for tracking when you delegate responsibility for your time card processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it is not already enabled. For more information, see Include a table field in auditing.

A time sheet can have any of the following states:

Pending

A time sheet has been created, but the user is still making changes before submitting it.

Submitted

A time sheet has been submitted for approval. The approver can approve or reject it.

Approved

A time sheet has been approved. If the time sheet isn't automatically updated to Processed, this means there was no task associated with the time sheet.

Processed

A time sheet has been processed by the system. After a time sheet is approved, the after business rule Create expense from approved time card is triggered. This business rule creates an expense line for the associated task, and then updates the state to Processed.

Rejected

A time sheet has been sent back to the submitter for changes.

Recalled

A time sheet has been recalled by the submitter for modification.

Create a time sheet

As a time card user, you can create a time sheet to group all your time cards for the given week and submit them in a single step.

Before you begin

Role required: timecard_user

About this task

A user can create only one time sheet per week.

Note:
When a user creates a time card for a week, a time sheet is also automatically created for that week.

Procedure

1. Create the time sheet with one of these options.

2. On the form, fill in the fields.

Time Sheet form

Field	Description
Week starts on	Starting date of the week for which the time sheet is created. **Note:** The time sheet policy **Week starts on** controls the start day of the week.
Total Hours	Number of hours the user has worked in that week. This field is automatically populated from the hours recorded for the associated time cards.
User	Name of the user for which time sheet is created.
State	Current state of the time sheet. All new time sheets begin as Pending. Default states: Pending, Submitted, Approved, Processed, and Rejected, Recalled.
Comments	Comments related to the time sheet.
Notes	Any additional information.

3. Click **Submit**.

What to do next

Add time cards to the time sheet. You can use the related links and related list to add time cards. You can also add time cards using the Time Sheet Portal.

Time sheet form related links

Field	Description
Generate Time Cards	Link to generate time cards for the assigned project tasks.
Copy from previous time sheet	Link to open the **Copy Time Sheet** window for you to copy the time cards from previous time sheets.
Time Sheet Portal	Link to open the Time Sheet Portal to view and manage the time sheet.

Time sheet form related lists

Field	Description
Time Cards	List of the time cards that are part of the time sheet. To create a time card, click **New**.

Submit a time sheet

Once the time sheet is updated with time worked, you can submit the time sheet for the week to submit all the time cards for the week together.

Before you begin

Role required: timecard_user

About this task

When a user submits a time sheet, the time sheet policy assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time sheet in case any violation is found.

Note:
You can also perform this task from the Time Sheet Portal.

Procedure

1. Navigate to the time sheet using one of the following options:
   - To submit a time sheet in the Pending state, navigate to**Time Sheets** > **My Time Sheets** > **Pending**.
   - To submit the time sheet for the current week, navigate to **Time Sheets** > **My Time Sheets** > **Current Time Sheet**.
   - To submit a time sheet in the Rejected state, **Time Sheets** > **My Time Sheets** > **Rejected**. You can make required changes as suggested in the rejection comments to resubmit a rejected time sheet.
2. To submit in the Time Sheets list, open the time sheet.
3. Add comments, if required.
4. Click **Submit Time Sheet**.

Result

- The time sheet moves to the Submitted state.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.

Approve or reject a time sheet

View, approve, or reject time sheet or time cards for your user, for the given week, in a single step.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

A user manager is the one who has either of the required roles and is selected in the **Manager** field on User form of the time card user.

During out-of-office time, the user manager can Delegate time sheet approvals to another user with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by the time card users to process.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheets** > **Pending Approval**.
2. In the Time Sheets list, open the time sheet to approve or reject.
3. If required, add comments.
4. Click **Approve** or **Reject**.

Result

- The time sheet moves to the Approved or Rejected state.

  Note:
  If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under the show notifications icon ( ) on Time Sheet Portal.

- All the time cards associated with the time sheet are also approved or rejected automatically.
- If any time cards in the time sheet are pending approval by one of the approvers as defined by the time sheet policy, the time sheet remains in the Submitted state.

Note:

- You can also approve or reject the time cards within a time sheet selectively by selecting one or more time cards and approving or rejecting them.
- If a time sheet is rejected, all the associated time cards in the Submitted state are also rejected automatically. The time cards in the Approved and Processed state for the time sheet remain unaffected.
- If all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.
- If a time card in a time sheet is in the Rejected state, then irrespective of the state of other time cards in the time sheet, the time sheet also moves to the Rejected state.

Time cards

Time cards are used to record the time worked on a task by a task assignee.

The time card management feature works with the Task table to record time worked on Projects, Incidents, Problems, and Change Requests.

Task assignees can record time worked in the *Time worked* field on a task record or enter hours directly into their time card. Some tables support automatic time card creation based on start and end date fields.

Track the activities of a time card, such as who submitted or approved a time card, in the Activities section on the Time Card form. This time card activity audit is useful for tracking when you delegate responsibility for your time sheet processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it isn't already enabled. For more information, see Include a table field in auditing.

You can associate time cards for the project tasks and other task categories, such as meeting and training, with relevant resource plans.

When you approve a time card, the time logged in the time card is saved day-wise in the Time Card Daily [time_card_daily] table. Using daily time logged data, you can generate time card reports by days for any period irrespective of the time sheet period to which the time cards belong. For example, you can create a monthly time card report that includes time cards from the first day to the last day of the month.

Time cards also have an optional approval mechanism for project managers to approve the time cards. Administrators and time card approvers can see all the time cards for the week. All users who are in a role that is responsible for working on tasks also can access their personal time cards. A time card can have any of the following states:

Time Card states

State	Description
Pending	A Time card that isn't submitted for approval.
Submitted	A time card submitted for approvals.
Approved	An approved time card.
Processed	An approved time card with an expense line for the associated task.
Rejected	A rejected time card.
Recalled	An approved time card recalled for any required adjustments.

Create a time card

You can create time cards to log time against the work you have done.

Before you begin

Role required: timecard_user

About this task

The **Allow time card reporting on** field on the project form determines the level at which the time cards for the project tasks can be created.

Note:
Time Cards created from Project form do not populate Resource plans automatically to avoid random allocations. For more information, see KB0814884 article in the Now Support Knowledge Base.

Time cards can be created automatically or manually.

- *Automatic*: Use the following options to automatically generate the time cards:
  - *By updating task*:

    Auto create time card on task update

    Configure time cards to be created when a user updates a task record. The **Auto create time card on task update** setting in the assigned time sheet policy controls this behavior and is set to false by default.

    Auto fill time card with time worked entries

    Configure time cards to be created when a user records **Time worked**. A time card is created if a time card does not exist for the task. The time sheet policy **Auto fill time card with time worked entries** controls this behavior and is set to false by default.

    In **Project Task**, **Incident**, **Problem**, and **Change** records, the **Time worked** field does not appear by default and must be configured on the form.
  - *By scheduled job*: Configure time cards for the project tasks to be generated automatically for users through a scheduled job. Only the admin can configure a scheduled job.

  Note:
  Time cards cannot be created automatically when you use the mobile interface. Use the desktop interface if you want to use the automatic time card feature.
- *Manual*: Create a time card for each task and enter the time manually.

Procedure

1. Create the time card using one of the following options.

2. On the form, fill in the fields.

Time card form

Field	Description
Week starts on	Starting date of the week of the time sheet. **Note:** The time sheet policy **Week starts on** controls the start day of the week. A message is displayed when you try to associate a resource plan with a time card when the week on which the time card starts is outside the resource plan dates.
State	Current state of the time card. All new time cards begin in the Pending state. Different states of a time card are Pending, Submitted, Approved, Processed, Rejected, and Recalled.
Category	Type of task for which the time card is created.
Task	Task that is associated to the time card.
Project time category	Type of activity in the project that time is reported for.

Field	Description
	This field appears when you select **Project/Project Task** or **Task work** in the **Category** field.
User	Name of the user that the time card is created for.
Rate type	Rate type that is considered during the expense line generation. For more information, see Rate type in labor rate card. **Note:** This field appears when the **Allow multiple rate types** option is selected in the assigned time sheet policy of the user.
Resource Plan	Resource plan of the task associated with the time card. When the time card is approved, the hours from the time card entry and the hourly resource rate are used to update the **Actual hours** and **Actual cost** values of the associated resource plan. A resource plan is associated with the time card in the following ways: ◦ If the task has multiple resource plans, you can select the appropriate plan. ◦ If the task has one resource plan, that plan is selected by default. **Note:** ◦ If the task has no resource plan, the associated record updates the corresponding project. ◦ A message is displayed on the time card when the resource plan dates are outside the dates of the time submission week. ◦ This field appears when the **Update actual hours and cost in resource plan/reports** option is selected in the assigned time sheet policy of the user.
Remaining effort	Amount of work time left for the planned task. Remaining effort is the remaining effort in the planned task table and is calculated as: `Remaining effort = Planned effort - Actual effort` **Note:** The field is not available on the Time Card form by default. Configure the form to add this field if required.

3. Click **Submit**.

Result

- The time card is created for the selected time card period.
- If the time sheet for the week does not exist, a time sheet is created for the time card week.

What to do next

After the time card is created, the hours for that task can be incremented automatically from the **Time worked** field in the task record. The time sheet policy **Auto fill time card with time worked entries** controls the way the time is updated in time cards. The policy is set to *false* by default. If

automatic updates for time worked are not configured, the user must manually update the time card.

Related topics

Map a time card category with operational work types

Copy time cards from a previous time sheet

Another option for creating time cards is to copy them from an existing timesheet, which copies all the time cards (for project as well as non-project tasks) from a selected time sheet.

Before you begin

Role required: timecard_user

About this task

You can also perform this task from the Time Sheet Portal.

Procedure

1. Open the time sheet record that you want to create the time cards for.
2. Click the **Copy from previous time sheet** related link.
3. In the **Select Time Sheet** field, select a previous time sheet that you want to copy the time cards from.
4. **Optional:** You can copy the time logged for the tasks in the previous time sheet, select the **Copy time logged** check box.
5. Click **OK**.

Result

Time cards for project tasks

Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not created during copying.

Time cards for non-task category

Time cards for all non-task category such as meetings and trainings are copied from the selected time sheet. If a time card for a non-task category exists, a duplicate time card is created during copying.

Note:

- If the previous time sheet has rate types and the time sheet policy of the user allows rate types, then rate types are also copied into the current time sheet.
- If the previous time sheet has rate types, but the time sheet policy of the user no longer allows rate types, then rate types are not copied to the current time sheet.
- If the previous time sheet has a rate type that is inactive, that rate type is not copied. If necessary, the user can enter a different rate type before saving the individual time cards.

Auto-generate time cards

As an admin, you can configure a scheduled job to generate time cards automatically for project tasks assigned to time card users.

Before you begin

Role required: admin

About this task

In addition to the manual option **Generate Time Cards**, a scheduled job can be run to automatically generate the time cards for project tasks. A job can be scheduled to run every week, for example, on every Sunday to generate time sheets for all users for the next week. You can configure when to run the scheduled job based on the business process of the organization. By default, the scheduled job is turned off. For more information, see Schedule a script execution .

Note:
The scheduled job auto-generates time cards only for those users who have the **Auto create time cards every week** option set to true in their assigned time sheet policy.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. In the Scheduled Jobs list, select **Auto Generate Time Cards**.
3. Configure the following parameters in the script as per the business requirements:
   - run for (CURRENT_WEEK, NEXT_WEEK, LAST_WEEK)
   - Group Name (includeGroups, excludeGroups)

   Note:
   - If a time card exists for a project task for the time card week, a duplicate time card is not created.
   - Time cards are generated only for those project tasks that are in progress or planned in that week.
   - The **Allow time card reporting on** field on the project form determines the level that the time cards for the project tasks are created at.

Example:
The following example script is executed when a scheduled job is run to generate time cards for the `Current week` for the `Database` and `Hardware` groups:

```
// Clone this schedule job to run separately for different
 groups at different times
// One of the following values
// TimeCardConstants.CURRENT_WEEK
// TimeCardConstants.NEXT_WEEK
// TimeCardConstants.LAST_WEEK
var runFor = TimeCardConstants.CURRENT_WEEK;

// Comma separated group sys ids or group names.
 TimeSheet/TimeCards will be auto generated for time card users
 in the given groups.
var includeGroups = [Database,Hardware];
var excludeGroups = [];

var generator = new TimeCardGenerator();
generator.generateFromConfig(runFor, includeGroups,
 excludeGroups);
```

Submit a time card

As a time card user, once a time card for the week is updated with the time worked, you can submit the time card individually.

Before you begin

A time card in the Pending or Rejected state can be submitted.

Role required: timecard_user

About this task

When a user submits a time card, the time sheet policy assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time card in case any violation is found.

Procedure

1. Navigate to:
   - **Time Sheets** > **My Time Cards** > **All**
   - The **Time cards** related list in a time sheet.

   Note:
   You can select multiple time cards to submit.

2. In the Time Card list, open the time card to submit.
3. Click **Submit Time Card**.

Result

- The time card moves to the Submitted state.
- The time card is submitted to an approver based on the values set in the **Project time approver** and **Non-project time approver** fields in the time sheet policy assigned to the user.

  Note:
  If the project or user manager is changed after submitting the time card, the time card is automatically redirected to the new project or user manager for approval.

Approve or reject a time card

As a time card approver, you can view and approve or reject a submitted time card.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

You can view only those time cards that are submitted to you for approval or you have been delegated as the time card approver by one of the other user managers. The time sheet policy assigned to the user governs the approval process.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Cards** > **Pending Approval**.
2. Select the time card to approve or reject.
3. Click **Approve** or **Reject**.

Result

- The time card moves to the Approved or Rejected state.
- Expense line is created for an approved time card.
- For an approved time card, a Time Card Daily record is created.

Note:

- A user manager can also approve the time cards within a time sheet by selecting one or more time cards and approving them. When all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.

  A user manager is one who is selected in the **Manager** field on User form of the time card user.

- If a time card is in the Rejected state, the associated time sheet also moves to the Rejected state irrespective of the state of other time cards in the time sheet.

  Note:
  If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under notifications icon on Time Sheet Portal.

- If **Project time approver** is set to **Both** in the assigned time sheet policy, the time card is in the Submitted state only if both approvers approve it. If one of the approver rejects, the time card state is set to Rejected and the **Approved by** field is cleared, requiring approval of both approvers on resubmission.

Record time worked

The time card retrieves time accrued on a project or spent working on any record in the Task table from the **Time worked** field.

This field does not appear by default on the Project Task, Incident, Problem, and Change forms and must be added by personalizing the form. Time recorded in this field is used to populate an existing time card or to create a new time card if one does not exist. A time sheet policy controls this behavior.

Note:

When time worked is updated, a time card is created only if:

- the user is a time card user, AND
- the user is assigned to the task through **Assigned to** or **Additional assignee list** field.

The *Time worked* field has a counter that acts like a stopwatch for the duration of the time spent in the record. A button in the field can stop and start the counter. By default, the *Time worked* counter is enabled and begins recording the elapsed time when the record is opened. Stop the counter with the stop button and restart it with the play button.

If you are creating time cards from time worked entries, you can ask your admin to add the **Time Worked** related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records overrides values in the time card. This is displayed using a Create a formatter and add it to a form, which can be added or removed by configuring the form.

Manage costs

When the cost management feature is enabled, time cards can be used to manage the cost of labor in the Cost Management application.

When a time card for a project task is approved, an expense line is generated for the corresponding labor cost associated with the project. If the project has a Rate Models associated, then the hourly rate for calculating labor cost for the expense lines is derived from the rate model. If no rate model is associated to the project, the rate listed in

the *Labor Rate Card* is considered. If no Labor Rate Cards is applicable, the property `com.snc.time_card.default_rate` defines the default hourly rate.

Roles

The timecard_admin role enables users to approve, modify, and delete the time cards of other users.

Domain separation and Time Card

Domain separation is supported in Time Card. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

For more information about using domain separation with Time Card, see https://community.servicenow.com/community?id=community_article&sys_id=616d706edbb318d066f1d9d9689619c1.

Domain separation for service providers

Creating database views for reporting

A database view defines table joins for reporting purposes.

For example, a database view can join the Incident table to the Metric Definition and Metric Instance tables. This view can be used to report on incident metrics and may include fields from any of these three tables.

Several useful database views are installed with the Database View plugin and the Database Views for Service Management plugin. These database views cover most metric reporting needs and greatly reduce the need to define new ones.

Any user who can create a report can use database views as the report source, but ACLs on the underlying tables are honored.

Note:

- The accumulated impact on performance grows as the number of tables that are included in the view and the number of records that those tables contain increases. To maximize the performance of the database view, ensure that the 'where' clauses that are defined in the database view are based on indexed fields.
- A database view is not treated like a custom table, so there is no licensing impact.
- Database view tables are not included in FTP exports.

Limitations

- Database views cannot be created on tables that participate in table rotation.
- It is not possible to edit data in the database view output.
- Database view tables cannot be added as a data preserver in clone requests.
- You can reference a table or database view from a different application scope in a Table Name field. However, if the field belongs to a table that extends sys_metadata, the table or database view must belong to the same application scope as that table.

ACLs and database views

You do not need to create ACLs on fields in the view. The system honors contextual ACLs (ACLs with a condition or script) that exist on the underlying table. Non-contextual ACLs (ACLs with only role checks) are still honored just as with previous releases.

To require explicit read ACLs be added to the database views, set the `glide.security.expander.view.legacy` property to **true**. On upgraded instances, add this system property and set it to **true**.

You can still create additional ACLs on the database views. These ACLs are evaluated last and are always honored.

Database view reserved words

Using the terms may cause unintended or undesirable performance. For more information, see the MySQL reserved words document.

Database view creation

Create a database view to join tables. You can then create a report based on the database view.

Use the **Database Views** module to create a database view that joins tables to create a pseudo-table that combines data from each table in the view. You can create a report on this data by adding the database view as a table in a report. Accessing the database view does not require database access.

Create a database view

Create the database view.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select **New**.

3. Name the view as you would name a new table.
   The application converts capital letters to lower case and spaces to underscores.
4. Provide a label and a plural.

   The **Label** and **Plural** fields define how the database view is labeled in lists and forms. For example, give a database view with the label Duplicate installation the plural `Duplicate installations`.
5. **Optional:** Provide a description of the database view so that other users know its purpose.
6. Select **Submit**.

Result

The database view is created and accessible from the **Database Views** module.

What to do next

Add a table to the database view

Add a table to the database view

Specify the table to join to the database view.

Before you begin

Role required: admin.

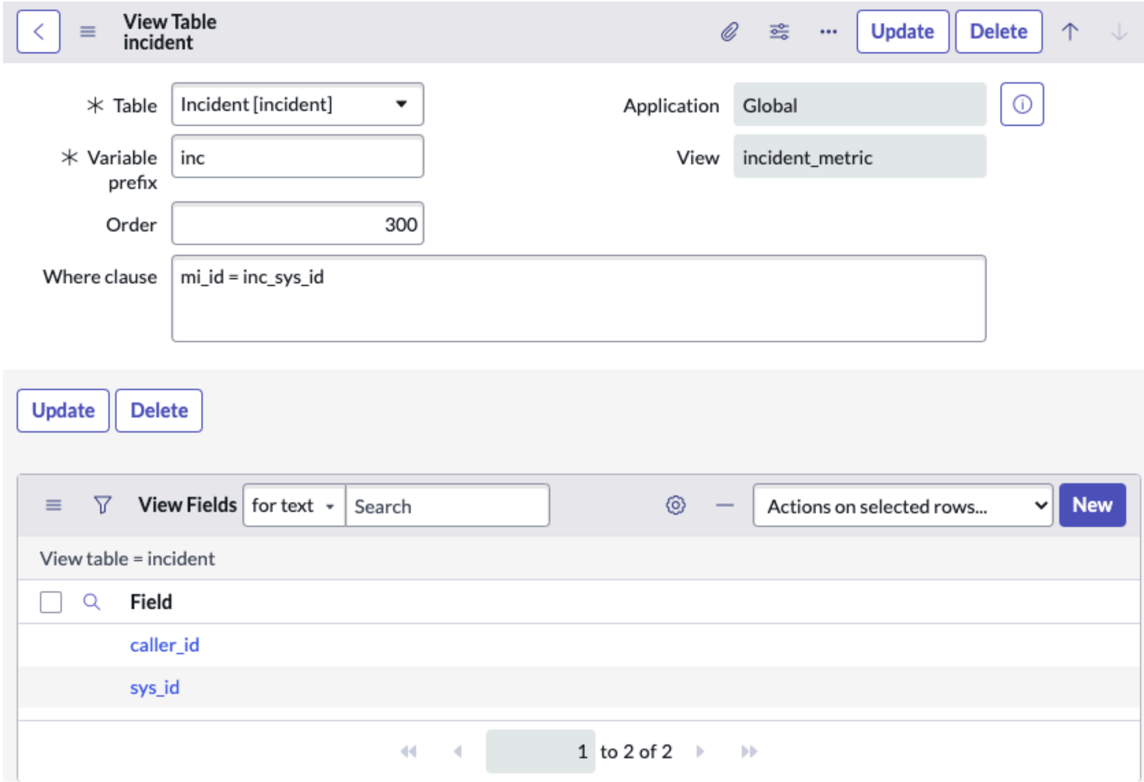
About this task

The **Table** field in the View Table form specifies the table to join to the database view. The **Variable prefix** is used by the **Where clause** to define the conditions for the join. These conditions can refer to any field, but typically define the join by matching a field in the table to a field in another table in the database view.

> **Note:**
> The Variable prefix field is mandatory.

When you write the **Where clause**, add the field name to the **Variable prefix** of its table with an underscore. In the following example, **mi_id** refers to the **id** field in the Metric Instance [metric_instance] table (mi) and **inc_sys_id** refers to the **sys_id** field in the Incident [incident] table (inc).

Database View Table form



Note:

- Database views cannot be created on tables that participate in table rotation.
- Use only lowercase characters in the **Variable prefix**. Using uppercase characters may prevent you from viewing the database view in a list.

To see an example of using left joins to create a view, see Example left join in creating a database view.

The **Where clause** supports these JavaScript conditional operators:

- =
- !=
- <
- <=
- >
- >=
- &&
- ||

There is no support for LIKE or CONTAINS conditions in the **Where clause** clause of a database view. Link tables based on the sys_id using the = operator to work with the full dataset when filtering lists, running glide queries, or running reports.

Procedure

1. From the Database View form, select **New** on the View Tables related list.
2. Configure the form and add the **Left join** field (a check box) to the form.

3. Select **Save**.
4. Complete the form and select the **Left join** check box.

    - Selecting **Left join** causes the left-hand table in the database view to display all records, even if the join condition does not find a matching record on the right-hand table. Select this check box to view tables that specify a **Where clause**. Selecting **Left join** for view tables without a **Where clause** does not affect the query.
    - Joined tables are ordered left to right from lowest to highest **Order** values.
5. Select **Submit**.
6. Personalize the **View Tables** related list to show the **Left join** column.
   The **Left join** field is **true**.
7. Select a record to view a table.
8. To add an OR to your Where clause, use ||.

   For example, to query all incidents related to RFCs OR all incidents that are the parent of a change request, use the syntax: `inc_rfc = chg_sys_id || chg_parent = inc_sys_id`.

Example left join in creating a database view

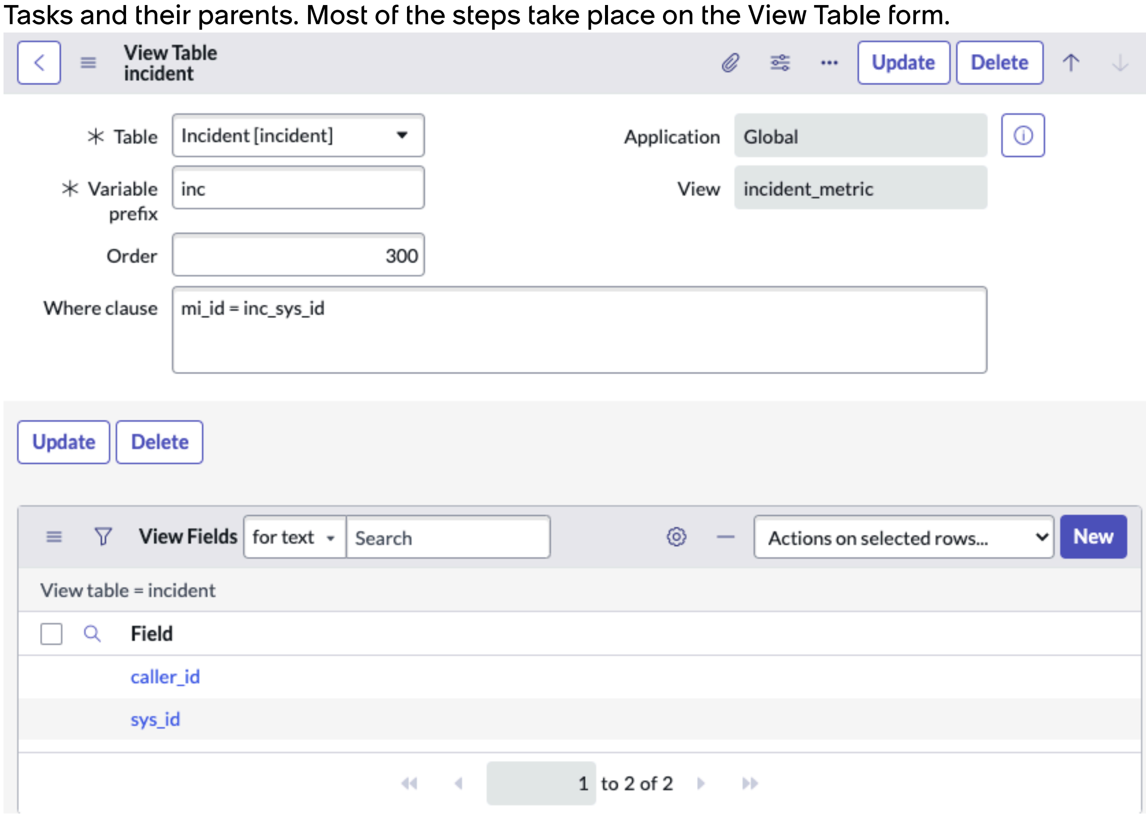
This example shows the proper settings when using left-joins to add tables to a database view.

Before you begin

Role required: admin

About this task

The following procedure shows how to create a database view that includes a list of Catalog Tasks and their parents. Most of the steps take place on the View Table form.



Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the view you want to edit.
   The Database View page appears. In the View Tables related list, specify the tables you want in the database view.
3. In the **View Tables** related list, select **New**.
4. Add a **Left join** check box to the form by Configuring the form layout.
5. Add the Catalog Task [sc_task] table to the database view by filling in the form with the following data and then select **Submit**. Joined tables are ordered left to right from lowest to highest **Order** values.

Field	Value
Table	Catalog Task [sc_task]
Variable prefix	cat
Order	100
Where clause	Leave blank

   The Database View page appears with the Catalog Task table in the View Tables table.
6. In the **View Tables** table, select **New** and add the Requested Item [sc_req_item] table to the database view by filling in the form with the following data and then selecting **Submit**. Joined tables are ordered left to right from lowest to highest **Order** values.

Field	Value
Table	Requested Item [sc_req_item]
Variable prefix	item
Order	200
Where clause	cat_parent=item_sys_id
Left join check box	True

   The Database View page appears with the Requested Item table in the View Tables table.
7. In the **View Tables** table, select **New** and add the Request [sc_request] table to the database view by filling in the form with the following data and then selecting **Submit**.

Field	Value
Table	Request [sc_request]
Variable prefix	req
Order	300
Where clause	cat_parent=req_sys_id
Left join check box	True

   The Database View page appears with the Request table in the View Tables table.

8. In the **View Tables** table, select **New** and add the User [sys_user] table to the database view by filling in the form with the following data and then selecting **Submit**.

Field	Value
Table	User [sys_user]
Variable prefix	user
Order	400
Where clause	cat_opened_by=user_sys_id
Left join check box	False

   - The Database View page appears with the User table in the View Tables table.
   - If the parent record of Catalog Task is a Requested Item, all the fields in the Request table will be blank.
   - If the parent record is a Request, all the fields in Requested Item will be blank.
   - Because of the two left joins, the Catalog Task record returns even if the parent is empty or is not a Requested Item or Request.
   - Because User is not a left join, there must be a matching user in sys_user for the row's Opened By field for the Catalog Task row to return.
9. **Optional:** Perform the following steps to experiment and learn more about how left joins impact database views.
   If you make the left join in:
   - User true, rows that have an empty **Created By** return.
   - Requested Item false, only Catalog Tasks that have a Requested Item as a parent return.
   - Request false, only Catalog Tasks that have a Request as a parent return.
   - Requested Item and Request false, no rows return because nothing can have a Requested Item and a Request as parents.

Specify a field to return

Restrict or specify a field that you want returned by the joined table.

Before you begin

Role required: admin

About this task

You can restrict the fields displayed in the database view output by adding fields to the View Tables related list.

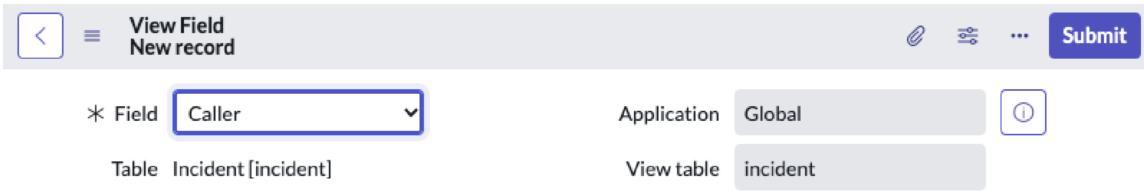
When you restrict fields, you must create a View Field record for the join field from the *Where clause* in the parent record. If you omit a record for this field, it cannot be returned, and the join fails.

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the database view you want to add a field to return to.
3. In the database view record, select a view table, and then select **New** in the View Fields related list.

4. In the View Field form, select the field you want to display in the database view output.
If no fields are defined in the View Fields related list, all fields are returned. If any fields are defined, then only those fields are returned. For example, you can restrict the display if there are fields that should not be viewable to all users.

View Field form



In this example, the *Where clause* uses the *sys_id* field from the Incident table to establish the join. For the join to succeed with a restricted field list, you must include a record for the *sys_id* field in the View Fields related list.

What to do next

Verify your changes using the **Try It** related link in the database view record. See Test the database view.

Relabel a column

Sometimes, two different tables may have fields of the same name that are both important (such as two tables with a sys_updated_on field). For clarity, relabel one of the fields.

Before you begin

Role required: admin.

About this task

To create clear reports, relabel the fields on the Database View [sys_db_view] table without changing the names of the fields.

Procedure

1. Navigate to **All** > **System Definition** > **Language File**.
2. Select **New**.
3. Fill in the form as follows:

New language file fields

Name	Description
Table	Name of the database view
Label	Display label
Plural	Plural form of the display label
Element	Name of the field on the database view in the format variable prefix_fieldname. For example, you may enter inc_name to indicate the Name field on the Incident table. **Variable prefix** is a required field when you define the tables in a database view.

4. Select **Submit**.

Specify the number of records to return

Specify the number of records to return for a database view when the view is used in a script.

A property called *glide.db.max_view_records* controls the maximum number of rows returned when running a GlideRecord query in a script. The default value for this property is 10000. To change this value, add the property to the System Property [sys_properties] table and edit the property's **Value** field, which determines the number of rows to return.

This property only applies when querying a database view table in a script. When the database view table is used in a list or report, this property doesn't apply. Reports or lists based on the database view use all rows in the view.

Test the database view

Verify that the database view works correctly.

Before you begin

Role required: admin.

About this task

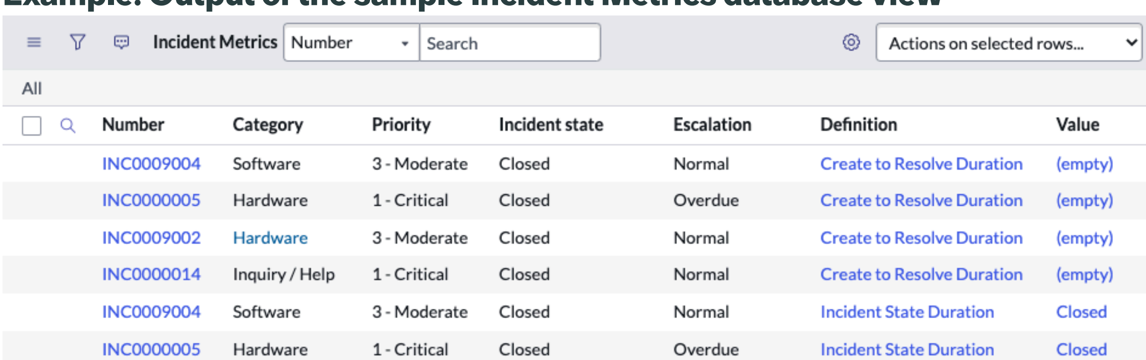
Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the database view that you want to test.
3. Test the view by clicking the **Try It** related link.

   Note:
   If you do not see the *Try It* link, the tables necessary for the view do not exist. If this problem occurs, it is possible that you did not activate the necessary plugins to create the supporting tables.

   The database view runs and a list of items is displayed. If you have specified fields in the **View Fields** related list for each table, the output is limited to those fields. If you specified view fields and the view does not display correctly, review the **View Fields** related list for each table and ensure that you include fields from the **Where clause**.

Example: Output of the sample Incident Metrics database view



Number	Category	Priority	Incident state	Escalation	Definition	Value
INC0009004	Software	3 - Moderate	Closed	Normal	Create to Resolve Duration	(empty)
INC0000005	Hardware	1 - Critical	Closed	Overdue	Create to Resolve Duration	(empty)
INC0009002	Hardware	3 - Moderate	Closed	Normal	Create to Resolve Duration	(empty)
INC0000014	Inquiry / Help	1 - Critical	Closed	Normal	Create to Resolve Duration	(empty)
INC0009004	Software	3 - Moderate	Closed	Normal	Incident State Duration	Closed
INC0000005	Hardware	1 - Critical	Closed	Overdue	Incident State Duration	Closed

What to do next

To use the database view in a data visualization, select it from the data sources. Database views are listed under tables.

You can create any visualization type using the database view. This example shows the database view visualized as vertical bar.

Displaying function results in a database view

Enhance the display of a database view by adding a function field to the output to display function results.

Function fields perform common database transformations and calculations on fields in the system. Function fields do not store any data, but rather display the results of a database query when the function is executed.

For example, you could identify incidents with ineffective descriptions of fewer than 10 characters by adding a function field that calculates the length of the **Short description** field.

Create a function field to perform a database function

Create a function field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation.

Before you begin

Role required: admin

You can either select a function field from a physical table or create a function field directly on the database view.

If you create a function field directly on the database view, you must use the variable prefixes from the database view in the function definition to identify the columns. Before you create the function field, take note of the variable prefixes in your database view.

For example, if the variable prefix for the Incidents table is `inc2` and you want to return the length of the description field, the function definition would be `glidefunction:length(inc2_description)`. If the variable prefix for the Metric Instance table is `mi` and you want to concatenate the Definition and Value fields, the function definition would be `glidefunction:concat(mi_definition.name,' ',mi_value)`.

For information on supported functions, see Report on function fields.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Select **New**.
3. Select **Function field**.
4. On the form, fill in the fields.

Function fields form

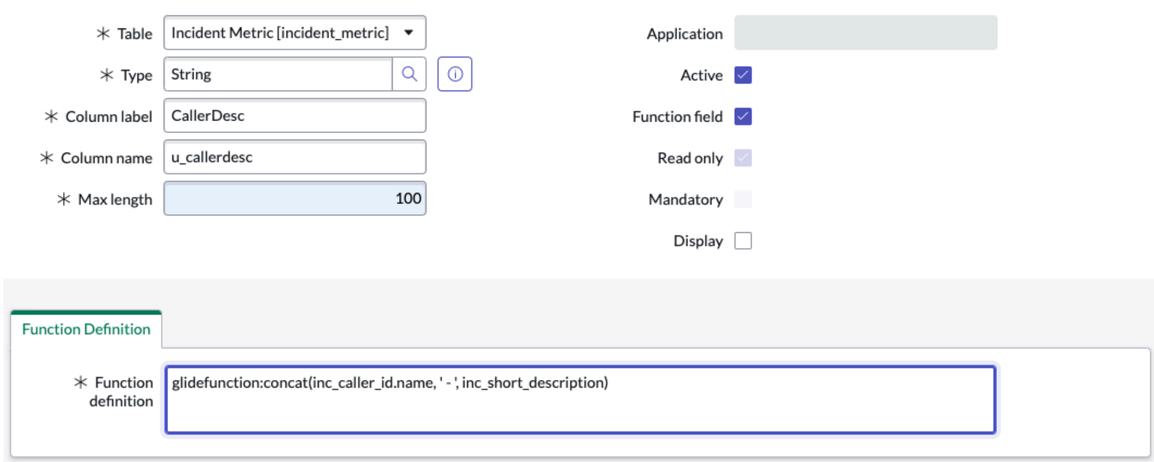
Field	Description
Table	The table or database view to which the function field is added. If you select a database view, you must include the database view's variable prefixes in the **Function definition** field.
Type	The type of field: string, number, date, and so on.
Column label	The label for the column.
Column name	The name of the column. This field is automatically set to the value of the **Column label** field.
Max length	The maximum length of the return value.

Field	Description
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Function definition	The function that the field performs. The format for functions starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. **Important:** If you create the function field on a database view and not a physical table, you must include the database view's variable prefixes in the **Function definition** field.

5. Select **Submit**.

Example: Create a Function field on the Incident Metric database view

In this example, a new Function field, CallerDesc, is added to the Incident Metric database view. The field concatenates the caller name, a hyphen, and the short description.



The variable prefix `inc` is included because the function field is defined on the Incident Metric database view and not on a physical table. The prefix is necessary to distinguish which short_description and caller_id columns to use from the tables that are part of the database view.

What to do next

Display function results in a database view

Display function results in a database view

Add a function field to the output of a database view to see function results.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select a database view.
3. Select the **Try it** related link.
4. Add the function field to the database view output.
   See Configure items on forms or in lists using a list collector.
5. Review the function definition if the expected value is not returned or a returned value indicates the function definition is invalid.
   - If the message **Invalid function** is returned, the function definition is invalid for string field types.
   - If an empty value is returned, the function definition is invalid for other field types.
   - If an unexpected value is returned, review the field definition in the function definition.

Result

The function field operation is executed and the results appear in the database view output.

Use disjunctions in complex queries

ServiceNow performs conjunction statements before disjunction statements in a query.

When you create a complex query, you must use parenthesis around disjunctions where appropriate to ensure proper grouping of query elements. For example, you must use parenthesis in the query `(md_table = 'incident' || md_table = 'task') && mi_definition = md_sys_id && mi_id = inc_sys_id`. Removing the parenthesis from this query returns all records where the md_table value is *incident*.

Database views in the base system

Certain views are included in the base system with the Database Views and Database Views for Service Management plugins.

Database views

Name	Description	Label
change_request_metric	Join change to metric definition to metric instance, creating a view that can be reported on for things like: Changes that were closed by category.	Change Metric
change_request_sla	Join change_request to sla(task_sla), creating a view that can be reported on for things like change request resolved by sla per change category.	Change Request SLA
change_task_metric	Join change task to metric definition to metric instance, creating a view that can be reported on for things like: Change tasks that were closed by change state	Change Task Metric

Database views (continued)

Name	Description	Label
change_task_sla	Join change_task to sla(task_sla), creating a view that can be reported on for things like change tasks resolved by sla.	Change Task SLA
change_task_time_worked	Join change task to task time worked to pull time worked entries associated with incidents.	Change Task Time Worked
incident_metric	Join incident to metric definition to metric instance creating a view that can be reported on for things like: Incidents that were resolved on the first call by category	Incident Metric
incident_sla	Join incident to sla(task_sla) to report on things like incidents resolved by sla per incident category.	Incident SLA
incident_time_worked	Join incident to task time worked to pull time worked entries associated with incidents.	Incident Time Worked
pm_project_metric	Join pm_project to metric definition to metric instance creating a view that can be reported on for things like: Projects that were closed by name or date	Project Metric
pm_project_sla	Join pm_project to sla(task_sla) to report on things like project names by sla.	Project SLA
pm_project_task_metric	Join pm_project_task to metric definition to metric instance creating a view that can be reported on for things like: Project tasks that were closed by name or date	Project Task Metric
pm_project_task_sla	Join pm_project to sla(task_sla) to report on things like release tasks by sla.	Project Task SLA
pm_project_task_time_worked	Join pm_project_task to task time worked to pull time worked entries associated with project tasks.	Project Task Time Worked
problem_metric	Join problem to metric definition to metric instance creating a view that can be reported on for things like: Problems that were resolved on the first call by category	Problem Metric
problem_sla	Join problem to sla(task_sla) to report on things like problems resolved by sla per problem state.	Problem SLA
release_feature_metric	Join release_feature to metric definition to metric instance creating a view that can be reported on for things like: Release Features that were closed by product	Release Feature Metric

Database views (continued)

Name	Description	Label
release_project_metric	Join release_project to metric definition to metric instance creating a view that can be reported on for things like: Releases that were closed by category	Release Metric
release_task_metric	Join release_task to metric definition to metric instance creating a view that can be reported on for things like: Release Features that were closed by feature	Release Task Metric
release_task_sla	Join release_task to sla(task_sla) to report on things like release tasks by sla.	Release Task SLA
sc_request_metric	Join sc_request to metric definition to metric instance creating a view that can be reported on for things like: Requests that were closed by category	Catalog Request Metric
sc_request_sla	Join sc_request to sla(task_sla) to report on things like requests by sla.	Catalog Request SLA
sc_req_item_metric	Join sc_request_item to metric definition to metric instance creating a view that can be reported on for things like: Request Items that were closed by item	Catalog Request Item Metric
sc_req_item_sla	Join sc_req_item to sla(task_sla) to report on things like request items by sla.	Catalog Request Item SLA
sc_task_metric	Join sc_task to metric definition to metric instance creating a view that can be reported on for things like: Catalog tasks that were closed by item	Catalog Task Metric
sc_task_sla	Join sc_task to sla(task_sla) to report on things like tasks by sla.	Catalog Task SLA

Data management

Data is stored and managed in your instance according to a principled structure that administrators can view and configure. Data management functions include importing, exporting, and archiving database data and configuring fields and tables.

Database structure

All of the information in the instances is stored in tables, which consist of a series of records. The record in turn holds a series of fields that hold the individual bits of data and can be viewed either as a list or a form.

Tables can be related to each other in the following ways:

Extensions

A table can extend another table. The table doing the extending (child class) includes all of the fields of the other table (parent class) and adds its own fields. For

instance, the Incident [incident] table has all of the Task [task] table fields (because an incident is a special form of task) and has its own incident-specific tasks.

One-to-Many

Within a table, a field can hold a reference to a record on another table. There are three types of one-to-many relationship fields:

- Reference Field: allow a user to select a record on a table defined by the reference field. For instance, the **Caller** field on the Incident table allows the user to select any record on the User table.
- Glide List: allows a user to select multiple records on a table defined by the glide list. For instance, the **Watch list** field on the Incident table allows the user to select records on the User table.
- Document ID Field: allows a user to select a record on any table in the instance. These fields are much less common, but one example is the **Document** field on the Translated Text [sys_translated_text] table.

Many-to-Many

Two tables can have a bi-directional relationship, so that the related records are visible from both tables in a related list.

Database Views

Two tables can be joined virtually with Database Views to enable reporting on data that might be stored over more than one table.

Data management tools

There are a number of tools that can help manage data within the instance.

Schema map

The Schema Map displays the relationships between tables visually, helping to navigate through the database structure.

The Schema Map provides an interface for viewing the relationships between tables. The inter-table relationships it captures include many-to-many relationships, tables that extend other tables, and tables that reference other tables through reference fields.

Data dictionary tables

Data dictionary tables holds information that defines the database and can be accessed for information on the database schema.

These tables hold important information on the database and its structure:

- `Tables [sys_db_object]`: contains a record for each table.
- `Dictionary Entries [sys_dictionary]`: contains additional details for each table and the definition for every column on each table. Each row represents either a column on a table or a table.
- `Field Labels [sys_documentation]`: contains the human-readable labels and language information.

Data management plugins

Plugin	Description
Data Archiving	Provides the ability to archive records to minimize performance issues.
Database Rotations	Provides tools for managing large tables to minimize performance issues.
Many to Many task relations	Provides the ability to define many-to-many relationships between task tables.

Unique record identifier (sys_id)

A unique 32-character GUID (Globally Unique ID), called a Sys ID (sys_id) identifies each record in an instance. There are various ways a record is assigned a sys_id.

When created within the application, sys_id values are unique. The ServiceNow AI Platform and database should manage all operations on sys_id values. The same sys_id value is never generated twice, which ensures that every record created in every table in every instance in the world has a unique identifier. If two records have the same sys_id value, it occurs as a result of the following situations:

- If a record with the sys_id was copied to the other at the database level outside of the ServiceNow AI Platform.
- If a record with the sys_id was copied using an Update Set or via XML, its sys_id is the same.

Note:
A new record has a sys_id of -1, and once inserted, it is assigned a new sys_id. The sys_id is not meant to show as a field on a form or as a column in a list. To learn more, see the Users are unable to add the sys_id field to a form or list view [KB0690876] article in the Now Support Knowledge Base.

Get the sys_id from the header bar

Users can locate the sys_id of a record using the header bar.

Procedure

1. Navigate to the record.
2. Right click the header bar and select **Copy URL**.

   The sys_id is inside of the URL, after the parameter sys_id=. For example, the following is a URL for an Incident:

   ```
   https://<instance
    name>.service-now.com/nav_to.do?uri=incident.do?sys_id=9d38501
   7c611228701d22104cc95c371
   ```

   Therefore the sys_id is 9d385017c611228701d22104cc95c371.

Get the sys_id from a script

Users can locate the sys_id of a record using a script.

Procedure

- The sys_id value of a record can be found in a business rule (or any other server-side JavaScript) by dot-walking from the GlideRecord.

```
var id = current.sys_id;
```

- The sys_id of a record can be found in client-side JavaScript using g_form.getUniqueValue() as shown in the following example.

```
function onLoad() {
    var incSysid = g_form.getUniqueValue();
    alert(incSysid);
}
```

Get the sys_id from the URL

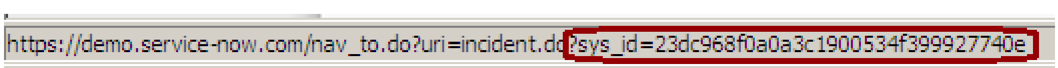
Users can locate the sys_id of a record by viewing the URL.

About this task

Since the sys_id of a record is always part of the URL for a link to that record, it is possible to retrieve the sys_id by viewing the URL.

Procedure

View the sys_id in the information bar of the browser by hovering over a link to the record. For example, an Incident with the following URL: https://<instance name>.service-now.com/nav_to.do?uri=incident.do?sys_id=23dc968f0a0a3c1900534f399927740e, has this sys_id: *23dc968f0a0a3c1900534f399927740e*.



Data archiving

Data archiving involves managing table size growth and archiving old data. It moves data that is no longer needed every day from primary tables to a set of archive tables.

The longer an instance runs, the more likely it is to accumulate data that is no longer relevant. For example, task records from two years ago are typically less relevant than currently active tasks. Old data may eventually cause performance issues by consuming system resources and slowing down queries and reports.

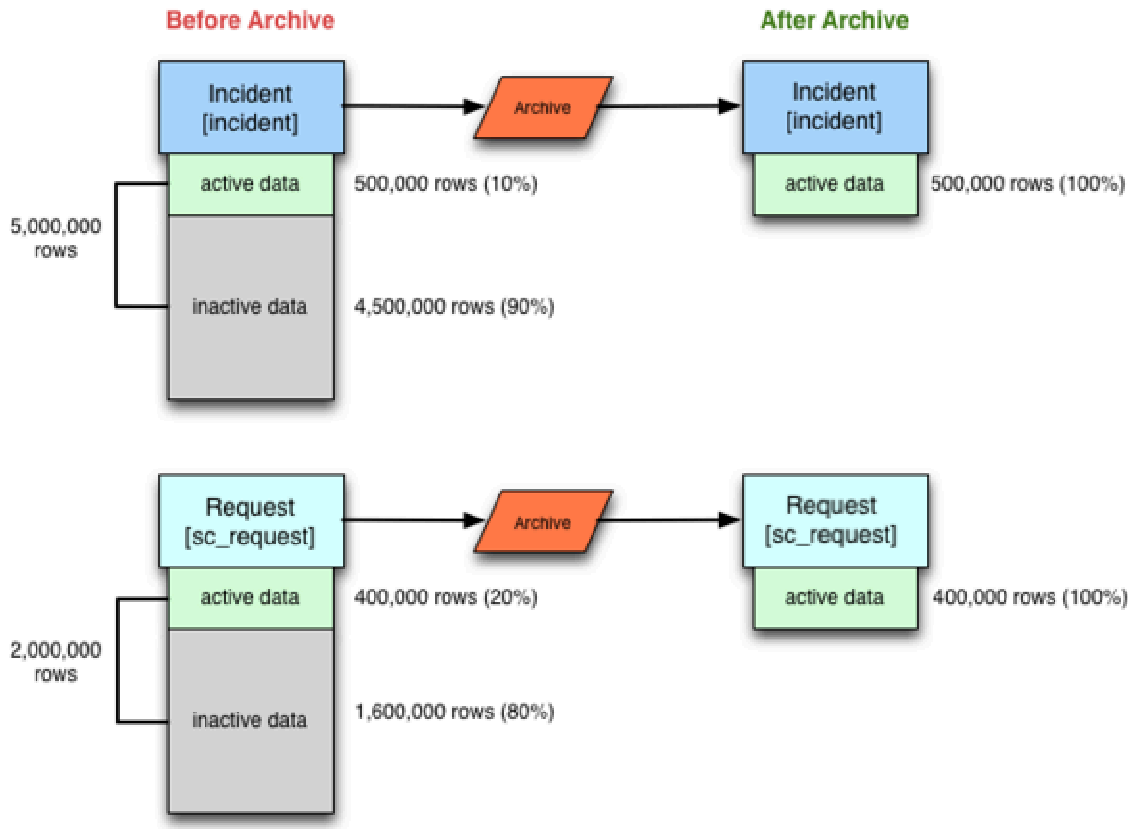
If you cannot delete this data because you need it for auditing or for historical purposes:

1. Create an archive rule that archives the data and removes it from immediate access to free up system resources.
2. Create a destroy rule to delete the data after a specified period.
3. Configure archive and destroy rule properties that control batch processing of the archive and destroy rules.

You can archive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform.

To archive Configuration Management Database (CMDB) CI records, use the Working with CMDB Data Manager.

Sample Benefits of Archiving Data



Data archiving supports Domain separation for service providers. For example, incidents that belong to a domain keep their domain designation even after they are archived.

Note:
If you want to archive emails, activate the Email retention plugin and use the archive and destruction rules that come with the plugin. Do not use the archive feature to create your own archiving rules on the email table.

Tables and modules created by an archive rule

The first time you activate an archive rule, it performs the following actions:

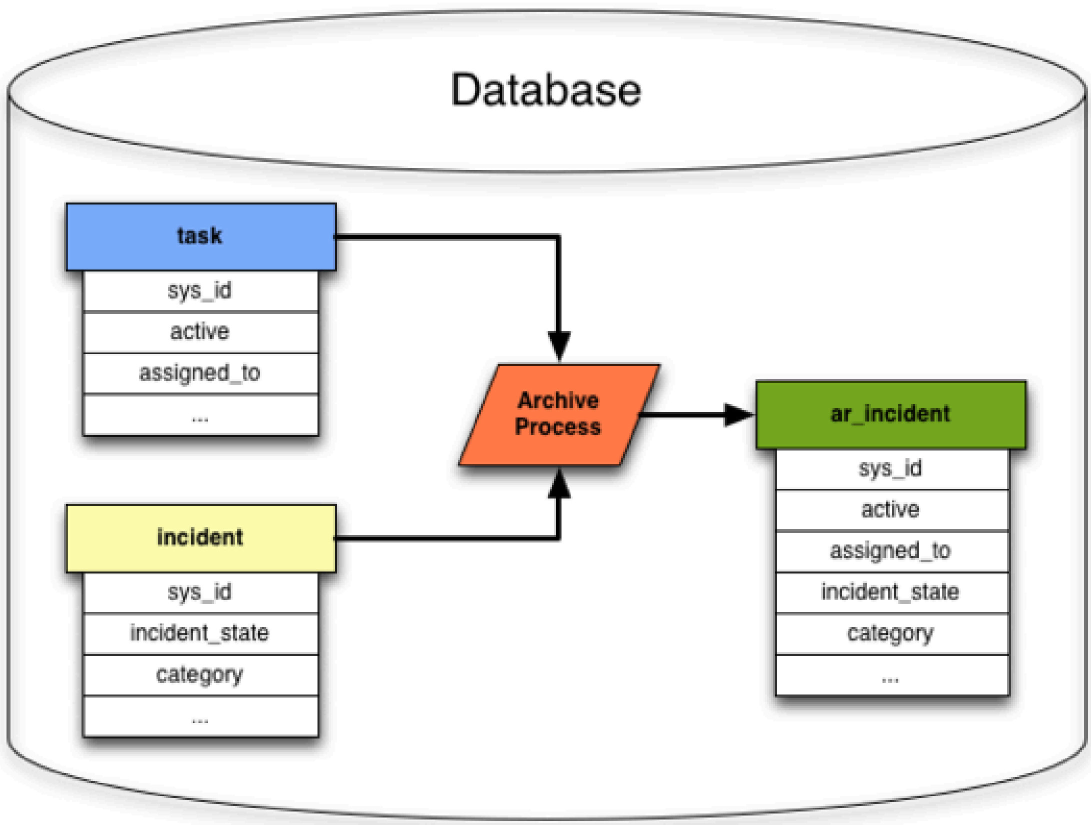
- Creates the archive table in the database. The archive table has the same name as the primary table with an "ar_" prefix. For example, if you archive the Incident `[incident]` table, then the archive table is `[ar_incident]`.
- Stores an XML version of each archived record in the sys_archive_log table. This archive log is the same table for all archive rules, and you cannot alter this behavior. It is also the only place where the sys_id is stored together with the display value for reference fields.

For example, for ar_incident `<assigned_to>Fred Luddy</assigned_to>`, the sys_archive_log record is as follows:

```
<assigned_to display_value="Fred
 Luddy">5137153cc611227c000bbd1bd8cd2005</assigned_to>
```

- Converts multiple joined tables into a single flat-file archive table. The archive table no longer consists of a base and extended tables.
- Converts reference field values (values set by references to records in other tables) into string values. The archive record contains the display value of the reference field at the time of the archive.
- Adds a module to the **Archive Tables** list in the **System Archiving** application. The module name is a combination of the word "Archive" plus the display name for the archived table. For example, the archive module for the Attachment `[sys_attachments]` table is **Archive Attachment**. Click the module name to view records in the archive table.
- Creates a list of the archive table using the default list view.
- Creates a form for the archive table using the default form view. The form excludes any dot-walking fields such as **Caller ID.Email**.

Conversion of Multiple Joined Tables into a Flat Archive Table



Reference values converted to strings

Archived data is stored as a flat file with no reference fields to other tables. The archive process converts any references to other tables to string values.

In the case of a reference field, the string uses the display value such as the caller's user name. For example, the **Caller** reference field in an incident would display the string *ITIL User*. If the reference was a document ID and the archive rule included the option to archive related document IDs, then the string is the document ID of the related record.

It is important to note that archive records do not receive any future changes to referenced values. For example, if you change the user name for "John Smith" to "John A Smith", all active incident records automatically show the caller as "John A Smith" because of the reference

between the Incident and User tables. However, all archived incident records display the user name that existed at the time of the archive. Any incident for "John Smith" continues referencing this user. Likewise, if you delete a user from the system, current incidents no longer display the deleted user as a caller. However, there can be archived incidents that still display the string "John Smith" as the user because the user existed at the time of the archive.

Query archived data

Archived tables are not optimized for ad hoc queries. They only contain index entries for the display value, creation date, and the primary key of sys_id.

For this reason, do not make on-demand queries against an archived table, such as searching for all priority 1 archived incidents. Instead, only search against the indexed fields. For example, search for incident INC100001 or incidents created on a specific date.

Archive tables and ACLs

By default, archive tables use the ACLs for the unarchived table of the same name. For example, the archived Incident `[ar_incident]` table uses the ACLs defined for the unarchived Incident `[incident]` table.

You can manage access to archive tables explicitly by creating ACLs for specific archive tables and setting the *glide.security.enable_archive_table_acls* property to **true**. The system then follows one of two paths:

1. If one or more active ACLs are defined for an archive table, those ACLs control access to the archive table.
2. If no ACLs are defined for an archive table, the system reverts to default behavior and uses the ACLs for the unarchived version of the table.

> **Note:**
> The two paths are mutually exclusive: If archive table ACLs deny access, the system doesn't attempt to revert to the default behavior.

The read operation read is the only operation evaluated, and other operations are prevented.

The Execution Plan UI is aware of this logic and presents information accordingly. For example, adding the first ACL to an archive table shows that the archive table ACL is "masking" ACLs on the unarchived (original data) table.

If you have existing ACLs on archived tables, they are ignored unless you set the *glide.security.enable_archive_table_acls* property to **true**. Those newly activated ACLs may possibly cause access issues. To prevent this occurrence, the system sets the *glide.security.enable_archive_table_acls* property as follows:

- Instances without the *glide.security.enable_archive_table_acls* property use the default value of **false**.
- Upgraded instances don't install the property. The property must be added manually and set to **true** to enable the archive table ACL behavior.
- Zbooted instances install the property and set it to **true**.

Create an archive rule

The System Archiving application includes several sample archive rules that illustrate the archive features. Related records can be added to an archive rule, and you can view an estimate of the number of records the rule affects.

Before you begin

Role required: admin

About this task

The sample archive rules are inactive by default.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Select **New**.
3. Fill in the fields as appropriate.

Archive Rule form

Field	Description
Name	Required. Enter a unique name that identifies the rule. Since this name is the display field for archive rules, references to archive rules display the name you enter here.
Table	Required. Select the table containing records to archive. ◦ There can only be one archive rule per table (even if the rule is inactive). If there is an existing archive rule for a table, the table no longer appears as an option on the archive rule table list. ◦ You can't change the table in an existing archive rule. To archive records in a different table, create a new archive rule. ◦ You can't select a table in a different application scope. ◦ You can't create an archive rule for a table where `update_synch` is set to true in the dictionary entry for the table. ◦ You can't create archive rules for some internal system tables or peripheral tables. For example: ▪ Sys Audit [sys_audit] ▪ Audit Deleted Record [sys_audit_delete] ▪ Audit Relationship Change [sys_audit_relation] ▪ Attachment [sys_attachment] ▪ Journal Entry [sys_journal_field]
Active	Select this check box to enable the archive rule. Clear the check box to disable the rule. Leave your archive rules inactive until you calculate an estimate of the number of records the rule affects and verify that rule behaves as expected.
Retain references	Select this check box to keep the sys_id for a reference field instead of storing the display name as a string in the archive table. **Important:** The **Retain references** check box becomes read-only after you select it and save the archive rule. If you select this option an existing archive rule, newly-archived records store the sys_ids of the referenced records but existing records will still have string values. See Migrating non-reference fields to reference fields.
Description	Enter a description of the archive rule.

Field	Description
Conditions	Select the fields and values that must be true in order for the archive rule to run. Typically, you would archive inactive records older than a certain date. Ensure the correct records are selected by testing the conditions in a list view before you activate the archive rule. For example, the condition **[Closed] [before] [Last 2 years]** archives records for the current year and the prior year, and not two years ago from today's date. To archive records closed more than two years ago from today, use the relative operator in a condition like **[Closed] [relative] [before] [2] [Years] [ago]**.
Auto Rearchive	If a record is restored, this enables the record to be automatically rearchived after a set period of time.
Auto Rearchive Duration	If you set the Auto Rearchive option, you must set a time interval before the restored record is automatically archived.

4. Select **Submit**.
5. Calculate the estimated number of records to archive by selecting the **Recalculate Estimate** related link.
   The updated count appears in the **Record estimate** field.

What to do next

After verifying that the archive rule is selecting records as expected, activate the archive rule.
If you do not want to wait for the scheduled job to run the archive rule, you can manually start the archive rule by clicking **Run Archive Now**.

Archive related records

Use the **Archive Related Records** related list to add related records to the archive rule.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Select the appropriate archive rule.
3. From the **Archive Related Records** related list, click **New**.
4. Fill in the Archive Related Records form.

Archive Related Records form

Field	Description
Archive map	Displays the archive rule to which the related records apply.
Action	Select the action you want the archive rule to take on related records. Choices include:

Field	Description
	◦ **Archive**: archive records that reference the archived record. ◦ **Clear**: remove the reference to the archived record. The record no longer references the archived record and does not appear as a related record in future archives. ◦ **Delete**: delete records that reference the archived record.
Reference	Select the relationship of the records you want to apply an action to. The **Reference** field lists all relations that currently exist for the table being referenced. There are two types of possible relations. Another table has a reference field calling the archived table. For example, if you are archiving problem records, there is a **Problem ID** field in the Incident table that references the related problem records. ◦ The **Archive** action archives the related record in addition to the primary record. For example, if you select the **Problem in Incident** reference, the related record rule also archives any incident record that references an archived problem. ◦ The **Clear** action removes the reference to the primary record. For example, if you select the **Problem in Incident** reference, the related record rule updates any incident record with a reference to the archived problem record by clearing the reference. If the reference is a many-to-many relationship, the related record rule deletes the reference instead of clearing the reference. ◦ The **Delete** action deletes any record that references the primary record. For example, if you select the **Problem in Incident** reference, the related record rule deletes any incident record that references the archived problem record. Another table has a **Document ID** field which might point to the archived table. For example, if you are archiving problem records, there is a **sys ID** field in the Attachments table that may reference the problem record. The list indicates document ID relationships by displaying an asterisk (*) character at the end of the selection name. ◦ The **Archive** action updates the **Document ID** of the related record to point to the archived table. For example, if you select the **Table sys ID Attachment(sys_attachment)*** reference, the related record rule updates the attachment record to change the **Document ID** to refer to the archived table record. ◦ The **Clear** action removes the **Document ID** reference to the archived record. The record no longer references the archived record and does not appear as a related record in future archives. ◦ The **Delete** action deletes any record that references the primary record. For example, if you select the **Table sys ID Attachment(sys_attachment)*** reference, the related record rule deletes any attachment record that references the archived primary record.

Field	Description
	Note: You can't select references from some internal system tables or from peripheral tables. For example: ◦ Sys Audit [sys_audit] ◦ Audit Deleted Record [sys_audit_delete] ◦ Audit Relationship Change [sys_audit_relation] ◦ Attachment [sys_attachment] ◦ Journal Entry [sys_journal_field]
Reference table	Displays the table where the rule looks for related records.
Reference element	Displays the reference field or **Document ID** the rule queries for.
Reference table rule	Select an existing archive rule that applies to the related records you are archiving. For example, if you already have an archive rule for the Incident table, select the existing Incident table rule when archiving records related to incidents records. **Note:** You control the cascade depth by specifying the archive rule for an archive related record. Related records without a specified archive rule aren't cascaded. ◦ Prior to the Washington DC release, if an archive rule was defined for the table matching a related record's table, the system would automatically cascade and process that archive rule and the related records associated with it. ◦ Beginning in the Washington DC release, even if an archive rule exists for a related record's table, you must declare that rule in the **Reference table rule** field to achieve that cascading behavior. If you have multiple related records on multiple tables, you can decide which of those records you want to include in the cascade by defining the reference table rule.

5. Click **Submit**.

Verify the number of records affected

Each archive rule provides an estimate of the number of records the rule affects.

Before you begin

Role required: admin

About this task

This estimate only includes primary records and excludes any related records added to the archive rule. The estimate helps you determine if the archive rule affects the number of records you expect it to. If the estimate is too high or low, change the archive rule conditions and then click the Recalculate Estimate related link.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Select the archive rule you want to estimate records for.
3. Click the **Recalculate Estimate** related link.

Setting the language of archived strings

On internationalized instances, the archive process uses the language of the SYSTEM user to select the display value strings.

If there is no SYSTEM user, the instance uses the default language setting to select the display value strings. You can either create a SYSTEM user with a specific language setting or set the system default language to select the language of archived strings.

Create a destroy rule

Create a destroy rule to delete archived records and related records after a specified amount of time.

Before you begin

Role required: admin

About this task

If you need to amend the destroy rule properties running against your archived data, see Archive rule and destroy rule properties.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Destroy Rules**.
2. Click **New**.
3. Fill out the form fields.

Field	Description
Name	Provide a descriptive name.
Table	Select the archive table that the system created when you archived records.
Archive	Improve archive performance by linking this destroy rule to an existing archive rule for the archive table that you selected.
Description	Provide a description.
Destroy Related Records	Automatically destroy related records associated with the archived records. **Note:** Peripheral records, which include records in the Journal Entry [sys_journal_field], Attachment [sys_attachment], and Sys Audit [sys_audit] tables are deleted automatically, even if you decide to preserve related records.
Archive Duration	Specify the amount of time that records stay in the archive table before the system deletes them.

4. Click **Submit**.
5. You can check the archive destroy log at any time

Archive rule and destroy rule properties

Rules to prevent the archive process from consuming too many system resources have been automated. You can manually change the system behavior.

The archive process uses a producer and consumer model. Records are queued for archiving in the Archive Job Execution Chunks [sys_archive_run_chunk] table in batches.

- The ArchiveProducerJob creates chunks of sys_ids records that need to be archived. Each chunk contains records pertaining to a single archive rule. The maximum number of records in a chunk is specified by the property *`glide.db.archive.chunk_size`*. The maximum number of records for a single rule across all chunks is specified by *`glide.db.archive.max.rule.records`*.
- The producer starts up 4 (default) ArchiverJob consumers. The exact number of consumers is specified by *`glide.db.archiving.max_consumer_workers`*.
- Consumers read and process chunks of sys_ids. The number of chunks each consumer processes is specified by *`glide.db.archive.max.batches`*. The chunks processed by each consumer may be from different archive rules.
- Consumers repeat reading chunks of sys_ids until none remain or the limit of chunks a consumer can process (specified by *`glide.db.archive.max.batches`*) is reached, after which it shuts down and schedules another consumer.
- If a chunk remains in the running state longer than what's specified in *`glide.db.archive.chunk.max.process.time`*, the system assumes that the consumer abruptly terminated, and it changes the chunk's status to error. This doesn't stop or end any running consumers.

Note:
The archive and destroy properties listed in the table are not used if the Archive Job Execution Chunks [sys_archive_run_chunk] table is deleted.

To manually control how many records the archive rule and destroy processes at one interval, you can change these default settings by adding the following system properties.

Archive System Properties

Name	Description	Type	Default Value
glide.db.archive.chunk_size	Number of unique identifiers added to each record in the Archive Job Execution Chunks [sys_archive_run_chunk] table. The record is formatted as CSV values in the keys field of the Archive Job Execution Chunk (sys_archive_run_chunk.do) form.	Integer	1000
glide.db.archive.chunk.max.process.time	Number of milliseconds a record can remain in the Active state	Integer	600000

Archive System Properties (continued)

Name	Description	Type	Default Value
	in the Archive Job Execution Chunks [sys_archive_run_chunk] table. The time is the difference between the system time and the value of the **Start** field in the Archive Job Execution Chunks [sys_archive_run_chunk] table.		
glide.db.archive.max.rule.records	Maximum number of records to batch per consumer, per rule.	Integer	10000
glide.db.archive.debug	Option that enables verbose logging when copying the column definitions from the original table to the archive table.	true | false	false
glide.db.archive.max.batches	Number of chunks, which are records from the Archive Job Execution Chunks [sys_archive_run_chunk] table, processed by a consumer before it shuts down and schedules another consumer.	Integer	10
glide.db.archiving.max_consumer_workers	The maximum number of concurrent consumers cluster-wide.	Integer	4

Manage archived data

View archived data, change an archive schedule, and restore archived data.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Tables**.
2. Select the module name for the archived table you want to view, for example, **Archive Incidents**.
3. Select a record from the archived table to see the archived record.

Change an archive schedule

All active archive rules are executed by a system-scheduled job set to run every 60 minutes. You can modify the job if you need to change the interval.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. Open the **Archive** record.
3. Modify the **repeat** value.

Restore archived records and related records

When you restore a record, the instance inserts it back into the primary table and flags the record as having been restored in the log. You can also restore the record along with related records.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Log**.
2. Select the archived record to restore.
3. Click the applicable related link:
    - **Restore Record**
    - **Restore Record and Related Records**

    Warning:
    Do not delete archive record log entries. Deleting an archive log entry prevents you from restoring the data for the archived records.

Result

The record is restored to the primary table. The archive record is deleted from the archive table.

What to do next

View the restore date and time in the **Restored** column in the Archive Log related list.

Stop an active archive rule

Stop archiving by deactivating, deleting, or cancelling an archive rule.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Select the archive rule that you want to stop.
3. Stop the archive rule from running.
   - Deactivate the archive rule by clearing the **Active** check box. The `Archive - Handle archive chunks` business rule updates the state of the corresponding record in the Archive Job Execution Chunks [sys_archive_run_chunk] table from **waiting** to **not-needed**.
   - Contact Customer Service and Support to delete the archive rule.
   - Cancel the archive rule by calling `GlideArchiver().cancel()` from **System Maintenance** > **Scripts - Background**. This automatically changes the chunks in the Archive Job Execution Chunks [sys_archive_run_chunk] table from **running** to **cancelled**.

Result

No additional chunks are processed.

Data archive table size limits

There are constraints to the size of the table you use to archive your instance data.

Limits on data archive tables

There is a limit on the size of an archive table you can create to store data. The limit is based on the size of the data, not the record count. If you receive an error that an archive table could not be created, it might be related to this size limitation.

Archive table size limits

Table Attribute	Size
Static row size limit	65535 bytes
Row size limit	8126 bytes
Columns	1000 for Oracle 1011 for others

Review the custom columns on the table being archived. Also review the custom fields on the tables the table extends from. Determine if those columns are no longer needed and are not being used by current customizations. If you identify unused columns, you can remove them. Doing this might reduce the row size of the table being archived. If that is unsuccessful, contact ServiceNow® Customer Service and Support to see what other alternatives are available.

Migrating non-reference fields to reference fields

Manually preserve sys_ids in reference fields instead of storing the display name as a string.

Determining tables to migrate

To begin the data migration process, run the following background script. This script creates migration records for both direct table extensions and related archived records in the Archive Rule Reference Migration [sys_archive_ref_migration] table, ensuring that only valid tables are processed.

```
var tables =
 GlideDBObjectManager.get().getAllExtensions(current.table);
    for (i = 0; i < tables.size(); i++) {
        var gr = new GlideRecord('sys_archive_ref_migration');
```

```
        gr.addQuery('table', 'ar_' + tables.get(i));
        gr.query();
        if (!gr.next()) {
            if (GlideTableDescriptor.isValid('ar_' +
tables.get(i))) {
                var gr2 = new GlideRecord("sys_archive_ref_migration");
                gr2.initialize();
                gr2.setValue('rule', current.sys_id);
                gr2.setValue('table', 'ar_' + tables.get(i));
                gr2.setValue('reference_migration_progress', 'waiting');
                gr2.insert();
            }
        }
    }
    //Also get insert related records tables as well
    var map = new GlideRecord('sys_archive');
    map.addQuery('table', current.table);
    map.query();
    if (map.next()) {
        var id = map.getValue('sys_id');
        if (!(id === undefined)) {
            var related = new GlideRecord('sys_archive_related');
            related.addQuery('archive_map', id);
            related.addQuery('action', 'archive');
            related.query();
            while (related.next()) {
                if (!GlideTableDescriptor.isValid('ar_' +
related.getValue('table'))) {
                    gs.log('Related Record table: ' +
related.getValue('table') + ' not created yet');
                    continue;
                }

                var gr3 = new GlideRecord("sys_archive_ref_migration");
                gr3.initialize();
                gr3.setValue('rule', current.sys_id);
                gr3.setValue('table', 'ar_' +
related.getValue('table'));
                gr3.setValue('reference_migration_progress', 'waiting');
                gr3.insert();
            }
        }
    }
```

Copying archive references

For each table that goes through the migration process, the Archive Reference Copy (RefCopyJob) job identifies the sys_id of the reference fields and updates the display value to be the correct sys_id. The job configures 10k records at a time unless there are more than 10k records with the same timestamp. The migration progress relies on the archived timestamp.

Changing field types from string to reference

After the tables associated with an archive rule completely migrate, the ArchiveRefJob job executes. This job changes the sys_dictionary types of the archive table from string to reference.

Fixing node failures for RefCopyJob and ArchiveRefJob

If node failure occurs while these jobs are running, it leaves the status of the data migration in an improper state. If the *RefCopyJob* fails, it can leave a table in a migrating status. You can verify this condition by checking if rows in the sys_archive_ref_migration are stuck in **migrating** status for an extraordinary amount of time. Update the specific row status from **migrating** to **waiting** and the *RefCopyJob* continues the data migration on the table when the job runs again.

The node can also fail when the *ArchiveRefJob* terminates prematurely. Check if tables have fields that are reference fields and some that are still string type fields. The job might have stopped in the middle of changing the field types. You can resolve this condition by setting up a trigger job to execute in a background script, which starts the process over again:

```
GlideRecord trigger = new GlideRecord('sys_trigger');
trigger.initialize();
trigger.setValue('state', 0);
trigger.setValue('trigger_type', 0);
trigger.setValue('next_action', new GlideDateTime());
trigger.setValue('job_context', 'fcRuleId=' + ruleId);
trigger.setValue('name', 'Job Reference Migration' + ' Node - ' + new
 GlideClusterSynchronizer().getSystemID());
trigger.setValue('trigger_class', 'com.glide.db.auxiliary.job.ArchiveRefJob');
trigger.insert();
```

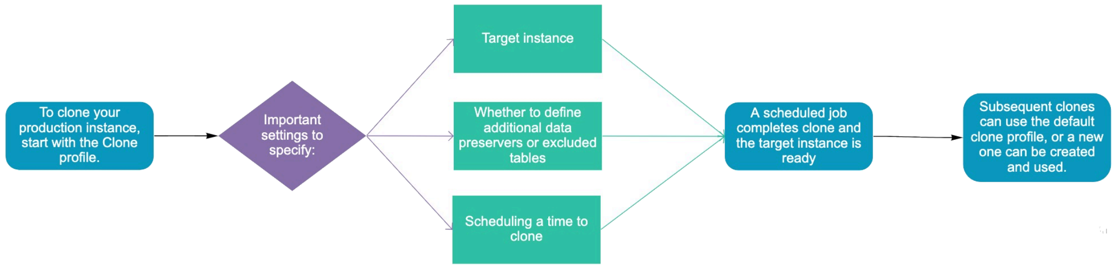
System clone

Use the System Clone application to copy everything in a database from one instance to another.

Cloning is typically used to copy a production instance to a pre-production instance to test changes. Cloning data comes from the most recent nightly backup.

Note:
A new, unified admin experience based on the existing clone engine is now available in the Clone Admin Console. The Clone Admin Console provides enhanced visibility for cloning data between instances, one of our most-used automations, as well as a number of other enhancements.

Clone process



In response to a clone request, the ServiceNow platform performs the following tasks:

1. Generates a file to preserve operational data on the target server.

   Note:
   This file contains the data preserved by data preservers.

2. Copies the database schema from the source instance to the target instance.
3. Creates tables in the target instance database using the source instance table definitions.
4. Copies data from the most recent nightly backup of the source instance to the target instance database.

   Note:
   Certain exclusions are automatic, large tables are normally excluded. These include audit, log, and email tables. MetricBase tables aren't excluded by default.

5. Briefly disables UI traffic and requests to the target instance server.
6. Displays the message **Clone in progress...** to any user accessing the target instance.
7. Restores operational data preserved from the target instance.
8. Runs any post-clone cleanup scripts on the target instance.
9. Briefly suspends all email functions on the target instance.
10. Queues an event to regenerate text indexes.
11. Enables UI traffic and requests to the target instance server.

During a clone, the target instance may be intermittently unavailable. After clone completion, you have up to 24 hours to contact Customer Service and Support and request a rollback of the target instance to its pre-clone state. You're notified when the rollback is complete.

Note:
If the source instance has a clone depth level of >=5 then the clone isn't allowed.

If the source instance purpose is DART (Data Access for Responsible Training) then the clone isn't allowed and an error message will be displayed.

Clone to an instance on a different version

The System Clone application can target an instance running a different instance version from the source.

A central web service controls the clone processing and automatically modifies the target instance version to match the source instance version. This matching process starts up to eight hours before the time specified in the **Date and time** field on the System Clone form. This web service also confirms that there's enough disk space on the target instance for the clone to proceed.

When cloning from a backup, the target instance doesn't need additional time to upgrade or downgrade. The ServiceNow platform performs any version changes during a brief window where the target instance is unavailable, after it copies data from the source instance backup.

Clone from a backup

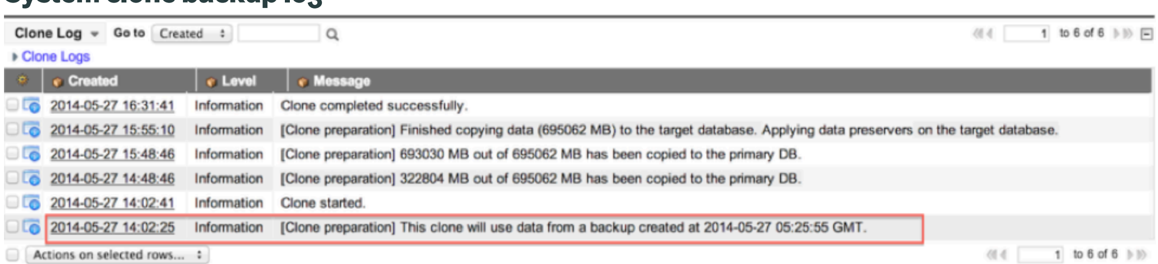
The clone uses data from the most recent, nightly backup of the source instance when cloning. Backups that are used for cloning are a maximum of 36 hours old. System Clone begins the initial preparation, including selecting the latest backup to use, only at the date and time processing is scheduled to start.

If cloning from a source backup fails, the system uses the legacy clone engine instead. The legacy clone engine can't preserve data from extended tables, relationships, hierarchies between tables, and dot-walked queries. You may want to restore the target instance from a backup and then reschedule the clone in such cases.

After cloning from a backup, the target instance is unavailable for several minutes before the clone is marked as complete in the source instance. If the source and target instances are on different versions of the ServiceNow AI Platform, the target instance is modified to match the source instance version during this time.

When starting a clone from a backup, the date and time the backup was taken, as well as periodic progress messages, appear in the **Clone Log** related list.

System clone backup log



Created	Level	Message
2014-05-27 16:31:41	Information	Clone completed successfully.
2014-05-27 15:55:10	Information	[Clone preparation] Finished copying data (695062 MB) to the target database. Applying data preservers on the target database.
2014-05-27 15:48:46	Information	[Clone preparation] 693030 MB out of 695062 MB has been copied to the primary DB.
2014-05-27 14:48:46	Information	[Clone preparation] 322804 MB out of 695062 MB has been copied to the primary DB.
2014-05-27 14:02:41	Information	Clone started.
2014-05-27 14:02:25	Information	[Clone preparation] This clone will use data from a backup created at 2014-05-27 05:25:55 GMT.

Clone over production instances

As long as the system property `glide.db.clone.allow_clone_target` is TRUE, an instance can serve as a clone. Modifying data on the source instance during a clone can cause a data mismatch between records or duplicate record entries.

Deprecated Clone Options

The clone option check box **Preserve users and related tables** has been removed from Clone Options in the Utah release. In some cases, past customizations to the clone request page or related to clone, may cause this field to remain on your form.

> **Important:**
> Checking this deprecated field won't have any effect on the user, role, or related tables during your clone.

.

Request a clone

Request a clone to copy data from a production instance to a non-production instance or to copy data between non-production instances.

Before you begin

Role required: admin

About this task

https://player.vimeo.com/video/1006365658?h=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479

The ServiceNow AI Platform uses data from the most recent, daily backup of the source instance when cloning. Backups that are used for cloning are a maximum of 36 hours old. System Clone begins the initial preparation, including selecting the latest backup to use, only at the date and time processing is scheduled to start.

If cloning from a source backup fails, the system uses the legacy clone engine instead. The legacy clone engine cannot preserve data from extended tables, relationships, hierarchies between tables, and dot-walked queries. You may want to restore the target instance from a backup and then reschedule the clone in such cases.

Note:

- For instances that use an Oracle database, see KB0538884 - System Clone Support for Oracle Customers.
- You can automate cloning by scheduling it in the Options pane.
- You cannot initiate a clone request when the source instance is in debug mode. If the source instance is in debug mode, contact Customer Service and Support to turn off debug mode before you submit a clone request.

Procedure

1. Log in to the instance that you want to clone.
   This instance becomes the source instance of the clone request.
2. Clone Target Registration and Authentication record for each target instance that you want to receive clone data.
3. Verify the list of tables that are excluded from cloning and add or remove tables to exclude from the target instance.
4. Verify the list of tables and system properties that you want saved on the target instance with the following.

   You can use data preservers. You can also create or modify data preservers, as needed.

   The legacy clone engine does not support data preservers for these records:

   - Tables that extend the Task table
   - Relationships

- Hierarchies
- Dot-walked queries

If you are preserving any data that the legacy clone engine does not support, verify that there is a recent backup of the target instance available. If the clone-from-backup-process fails for any reason, you can restore the target instance from the backup.

5. Preserve any unpublished applications on the target instance.
6. Navigate to **System Clone** > **Request Clone**.
7. **Optional:** Specify a predefined clone profile.
   A clone profile stores target and clone options. The clone profile automatically populates your clone request with your selected profile settings. See clone profiles for clone requests.
8. In the **Target instance** field, select the target instance that you want to receive the cloned data. Create a separate clone request for each target instance that you want to receive clone data.
9. In the **Clone Scheduled Start Time** field, select the time that you want the cloning to start.
   You can schedule multiple clone requests for the same source instance. For example, create one clone request to copy data to non-production instance A and another clone request to copy data to non-production instance B. The scheduling engine determines whether multiple clone requests against the same source instance can occur simultaneously or whether they must occur sequentially.
   The system verifies the scheduled start time and either accepts the date-time value that you selected or suggests an available date-time value. The validation process prevents scheduling conflicts with other automations using the same target instance.
10. In the **Email upon completion** field, enter your email address so that you can receive alerts after the cloning finishes, is canceled, or has an error.
11. Click the **Options** arrowhead so that it turns downward and use the following table to make appropriate selections in the Options pane.

Clone options

Field	Description
Exclude tables specified in Exclusion List	Prevents cloning records from tables on the source instance which are listed under#**System Clone** > **Exclude Tables**. If a table is on the Exclusion List, clone will exclude the records on the table as well as records on the child tables. When excluding tables, their table schema and hierarchy will still be cloned to your target instance. As a result, your target instance will have empty but usable tables after the clone. **Note:** ServiceNow out-of-the-box table exclusions will still be excluded and are not affected by this setting. These include tables containing auditing, license usage, logging, and notifications. You can choose to disable this setting if you need the data from your excluded tables. This is called a Full Clone and is recommended for upgrade or deployment testing. The legacy clone engine does not support this option. The default setting is that tables specified in the Exclusion List are excluded from a clone.

Field	Description
Exclude audit and log data	Prevents the cloning of audit and log records from the source instance. This creates empty but usable audit and log tables on the target instance. **Note:** If you exclude audit and log data from your clone, the Activity Stream for records won't match the source instance. This is because the Activity Stream relies on the audit table to generate the history. The default setting is that audit and log data are excluded from a clone.
Exclude attachment data	Prevents the cloning of certain files like ◦ Video files ◦ Image files ◦ Other large binary files from the sys_attachment table. **Note:** ServiceNow out-of-the-box attachments and other system-relevant files (e.g. catalog item images, theme images, and icons) are not affected by this setting. The following ServiceNow out-of-the-box attachments and other system-relevant files are not affected by this setting and are not excluded from a clone: ◦ Table name values that start with ZZ_. ◦ Table names: sys_certificate, sc_cat_item,sys_upgrade_manifest, ecc_agent_jar, ecc_agent_mib, sys_store_app, or invisible.sys_store_app. The default setting is to exclude attachment data.
Preserve theme	Preserves the theme and CSS elements on the target instance. As a result, your target instance will keep its theme, its look and feel after a clone. The default setting is to preserve the theme on the target instance.
Lock settings for this clone request	If you use a clone profile, this option locks the settings and options at the time of the clone request. Any subsequent changes to the clone profile, regardless of when the clone runs, do not affect the clone request. This option is not selected by default.
Amount of data copied from specific tables	Limits the number of days of historical data for the task table and its child tables (e.g. Incident, problem, and change tables) to 90 days. To reduce clone time, consider excluding large tables altogether. When excluding tables, your target instance will have the same table schema and hierarchy (i.e. empty usable tables) as the source instance. The default setting is to clone all data from the task table and its child tables to the target instance.
Preserve In Progress Update Sets	Preserves the last 90 days of in-progress update sets in the global application scope. This option allows you to keep in-progress, global update sets created within the last 90 days on your target instance.

Field	Description
	Note: This option does not preserve your in-progress scoped update sets. Update sets that are older than 90 days will not be saved. It is recommended to review and commit your update sets before cloning. The default is to not preserve update sets.
Clone frequency	This option allows you to schedule recurring clones from your source to your target instance. It allows you to define the clone frequency and the maximum number of occurrences. By default, the clone frequency is set to None. For more information about scheduling cloning, see Schedule cloning.

12. Click **Submit**.
    If there are no issues with the clone request, the system displays the Authenticate Target modal.

    Trouble?

    If your clone request preserves large tables, a warning message displays the large tables from your preserver list. You can cancel your clone request and remove the tables from your preserver list, or you can specify a reason and continue the clone request.
13. In the **Username** and **Password** fields, enter the username and password for an administrator account on the target instance and then click **Authenticate**.
14. Review the clone settings and click **OK**.
    An email is sent to the supplied address after the clone finishes, is canceled, or has an error.

What to do next

You can:

- Schedule automatic clonings.
- Cancel your clone request.
- View the cloning history of completed clonings.

Clone Target Registration and Authentication

A clone target record specifies the instance URL and credentials used for cloning.

Before you begin

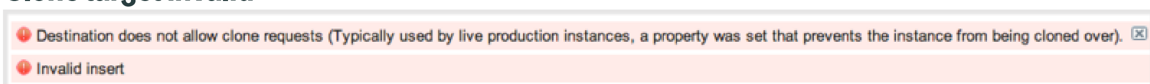
- Provide credentials for the target instance for a user with the admin role. Use a local, user account, not an LDAP or SSO user account. The target instance credentials must exist in the User [sys_user] table as a user record or as part of an LDAP integration. Clone requests cannot redirect authentication requests to a single sign-on identity provider.
- Verify the system property *glide.db.clone.allow_clone_target* is set to **True**. By default, this property is enabled on instances whose name ends in Dev, Test, Stage, UAT, or QA.
- If the target instance uses IP range based authentication, it must allow the IP range 10.0.0.0/10.255.255.255 to communicate on a local network.
- Role required: clone_admin or admin.

Procedure

1. Navigate to **All** > **System Clone** > **Clone Targets**.
2. Click **New**.
3. Enter the URL for the receiving instance (target).

   The system validates the instance allows clone targets and that High Availability Cloning is active. Production and demonstration instances fail these validation checks.

   #### Clone target invalid

4. Enter the basic authentication credentials for a user account with the admin role on the target instance.

   Note:
   You cannot request cloning multiple targets from the same source. Instead, make a separate request for each target.

   The system validates the user credentials have admin access to the target instance.

5. Click **Submit**.
   The system checks connectivity and validates the user credentials against the target instance.

Exclude a table from cloning

Exclude a table to create an empty but usable table on the target instance.

Before you begin

Role required: clone_admin or admin

About this task

Note:
When using Exclusions (Exclude Tables) the data is removed during our exclusion substage prior to the node repoint. The data is removed before the instance becomes available to users.

The **System Clone** > **Exclude Tables** module lists the tables that aren't copied during a system clone. On the clone request form, the option "Exclude tables specified in Exclusion List" is on by default. It verifies that the exclusions are processed during a clone. By default, the system excludes certain required tables such as logging, auditing, notifications, workflow contexts, and license usage.

Note:
Excluded workflow context data includes records stored in the wf_context table, and in related tables with names starting with a prefix of wf_. This also includes the workflow scheduler table. This helps to prevent the occurrence of workflow timer syncing issues that might take place due to the length of the cloning process if workflow contexts were included.

`sys_db_object` and `sys_db_object.*` can't be added to the exclusions.

When excluding child tables of the Task table, which use the table per hierarchy extension model, child tables are excluded. You don't need to exclude the parent Task table together with the child table.

You can use wildcards to exclude several tables from cloning with one entry. For example, `sys_script.*` excludes all tables starting with sys_script.

Note:
The wildcard has to include the dot '.' before the asterisk.

To preserve the existing data on the target instance, see Create a data preserver. Data on tables that reference the table, such as business rules, isn't excluded. To avoid unexpected results, we (strongly) advice against altering out-of-box preservers.

To preserve or exclude related tables, you must preserve and exclude all of the following tables. If any of the tables are missed, the customer may not be able to log in to the instance after a clone.

- sys_user
- sys_user_role
- sys_user_group
- sys_user_grmember
- sys_group_has_role
- sys_user_role_contains
- customer_contact (if the Customer Service Management plugin is active)

Procedure

1. On the source instance, navigate to **System Clone** > **Exclude Tables**.
2. Select **New**.
3. Enter the table **Name**.
   Entering a parent table results in the clone process also excluding its child tables. For example, excluding the Task table would also exclude the Change, Incident, and Problem tables.
4. Select **Submit**.

Data preservation on cloning target instances

You can use data preservers to protect data on the target instance from being overwritten. If you have custom applications, you must also manually preserve unpublished application content.

Data preservers

Sometimes, it is necessary to preserve some data on an instance targeted for cloning. For example, if the target is a MID Server, you must not overwrite the MID Server [ecc_agent] table. Preserved data is stored on the target instance before cloning begins and is restored on the target instance after cloning.

> **Warning:**
> You must define data preservers on the source instance. Defining them on the target instance does not preserve the data.

Data preservers typically preserve system settings and themes, such as:

- Instance-specific authentication settings
- Bookmark [sys_ui_bookmark]
- Recent Selection [sys_ui_recent_selection]
- User Preference [sys_user_preference]

> **Note:**
> A clone does not support preserving data from a database view.

Do not use data preservers to transfer large sets of data, such as user groups. If you must preserve table data, such as users, groups, and roles, consider exporting the records to a file and importing them after cloning.

Data preservers for Multi-SSO

The system automatically creates the necessary data preservers for cloning when you activate Multiple Provider Single Sign-On integration.

Name	Table	Conditions
Certificate	X.509 Certificates [sys_certificate]	None
Core Instance Properties	System Property [sys_properties]	• [OR] [Name] [is one of] [glide.authenticate.external, glide.authenticate.external.logout_redirect] • [OR] [Name] [starts with] [com.snc.integration.saml_esig] • [OR] [Name] [is one of] [glide.smtp.port, glide.smtp.auth, glide.smtp.encryption] • [OR] [Name] [starts with] [glide.authenticate.multisso] • [OR] [Name] [is] [glide.authenticate.sso.redirect.idp] **Note:** The properties `glide.smtp.port`, `glide.smtp.auth`, and `glide.smtp.encryption` are deprecated.
Digest Properties	Digest Properties [digest_properties]	None
Identity Providers	Identity Providers [sso_properties]	None
SAML2 Update1 Properties	SAML2 Update1 Properties [saml2_update1_properties]	None

Note:
Although you can modify these data preservers, it is good practice not to. The Digest Properties [digest_properties], Identity Providers [sso_properties], and SAML2 Update1 Properties [saml2_update1_properties] tables are required for multiple source, single sign-on (SSO) to function properly. If multiple source, single sign-on is disabled on the target instance, you can safely remove all three data preservers. Remove them at the same time, as the system terminates the clone with an error message when you attempt to clone with one or two of these tables being preserved.

Data preservers for SAML

Preserving SAML SSO-related settings can prevent the target instance from using the wrong issuer and audience parameters when making authentication requests to your IdP. To preserve SAML settings, create data preservers for the following tables:

- System Property [sys_properties]: to preserve SAML properties.
- X.509 Certificates [sys_certificate]: to preserve SAML certificates.
- User [sys_user]: to preserve SAML users.

You also need to preserve properties and users that are involved in SAML.

Preservation of unpublished applications

You cannot use data preservers to save unpublished applications. Instead, application developers must choose how they want to preserve unpublished applications.

The cloning process does not preserve version differences for applications in development. Instead, the system clone only copies the application version installed on the source instance onto the target instance. If the target instance had a development version of the same application, the application will be editable after the clone, but it will be at whatever version was installed on the source instance. If the application was missing from the source instance, the cloning process deletes the application from the target instance.

Create a data preserver

Data preservers maintain specified data on a target instance.

Before you begin

Role required: clone_admin or admin

About this task

Sometimes, preserving certain data on a target instance is desirable. For example, when using a MID Server, you can avoid overwriting the MID Server [ecc_agent] table. Preserved data is stored in a dynamically generated list on the target instance before the clone and restored on the target instance after the clone is complete. You define data preservers on the source instance.

Data preservers are primarily intended to preserve system settings and themes, such as instance-specific authentication settings. Do not use data preservers to transfer large sets of data, such as user groups. If you must preserve table data such as users, groups, and roles, consider exporting the records to a file and importing it after the clone is complete.

Consider whether to preserve the data in the following tables.

- Bookmark [sys_ui_bookmark]
- Recent Selection [sys_ui_recent_selection]
- User Preference [sys_user_preference]

If you set a data preserver on a table where the source instance has more records than the target instance, the data preserved on the target instance also includes the additional records from the source instance.

For example, assume that the data preserver is already in place.

- In the source instance, the sys_temp table contains 100 records.
- In the target instance, the sys_temp table contains 20 records.

After the clone, the sys_temp table in the target instance contains 100 records.

- The 20 records in the target sys_temp table are preserved successfully (per the data preserver specification). These records were part of the 100 records in the source sys_temp table.
- The source sys_temp table brings over the remaining 80 records to the target sys_temp table.

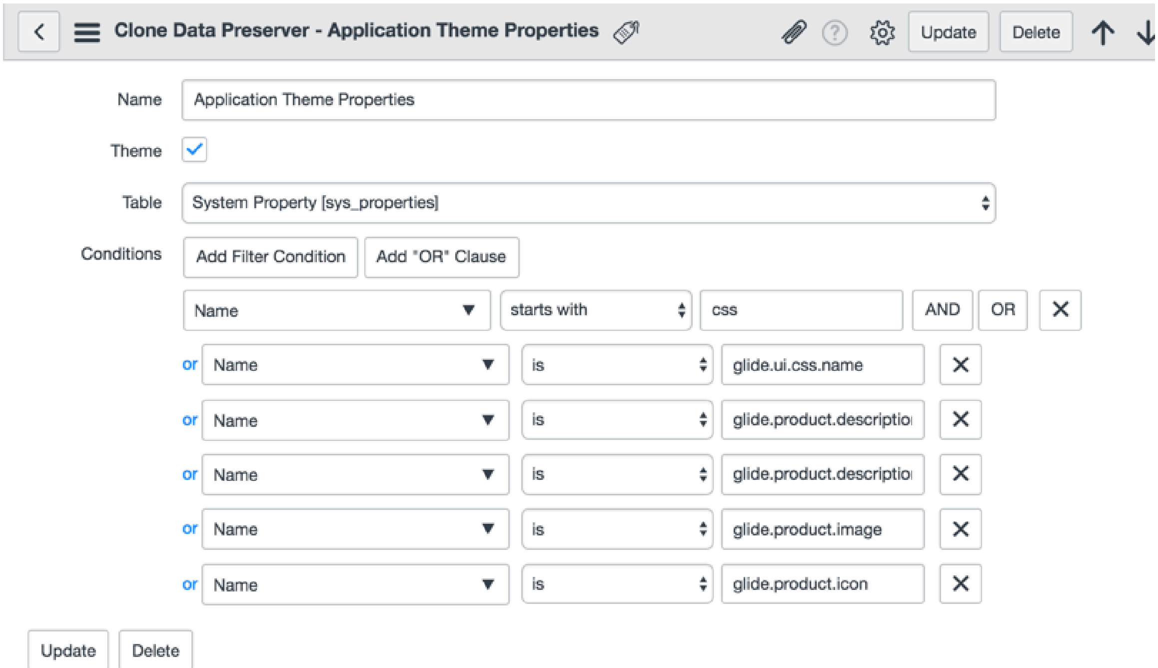
To resolve this issue and to preserve only the records in the target table, create an exclude table record for the target table, in addition to setting the data preserver on the source table.

Important:
Configure preservers on the source instance.

Procedure

1. On the source instance, navigate to **System Clone** > **Preserve Data**.
2. Click **New**.
3. Enter the table label as the **Name**, for example, User Preference for the [sys_user_preference] table.
   The data preserver must have a table name or it cannot be submitted.
4. Select the **Table** to be preserved.
   The data preserver must have a table selected or it cannot be submitted.
5. Select the **Theme** check box if the data being preserved is a UI property.
6. Define the data to be preserved using the Condition Builder .
   You can use conditions to define particular records you want to preserve during a clone. For example, to only preserve particular system properties, you can add conditions for each property name you want to preserve.

   Note:
   The condition to match regular expressions [match regex] is no longer supported.



Warning:
If the clone from backup fails for some reason, the clone process fails over to the legacy clone engine. The legacy clone engine cannot preserve data from extended tables, relationships, hierarchies between tables, and dot-walked queries. You may want to reschedule a system clone or manually transfer data in such cases.

7. Click **Submit**.

   If you want to delete the data preserver later, make sure not to modify or delete the following data preserver records:

   - Core Instance Properties
   - Semaphores
   - Email Accounts

   Note:
   DB views cannot be preserved.

   Preservers cannot be empty, and users will not be able to submit the clone if preservers are empty.

Preserve SAML properties

If you want a clone target instance to keep its existing SAML integration, you must edit the **Core Instance Properties** data preserver to include the SAML properties.

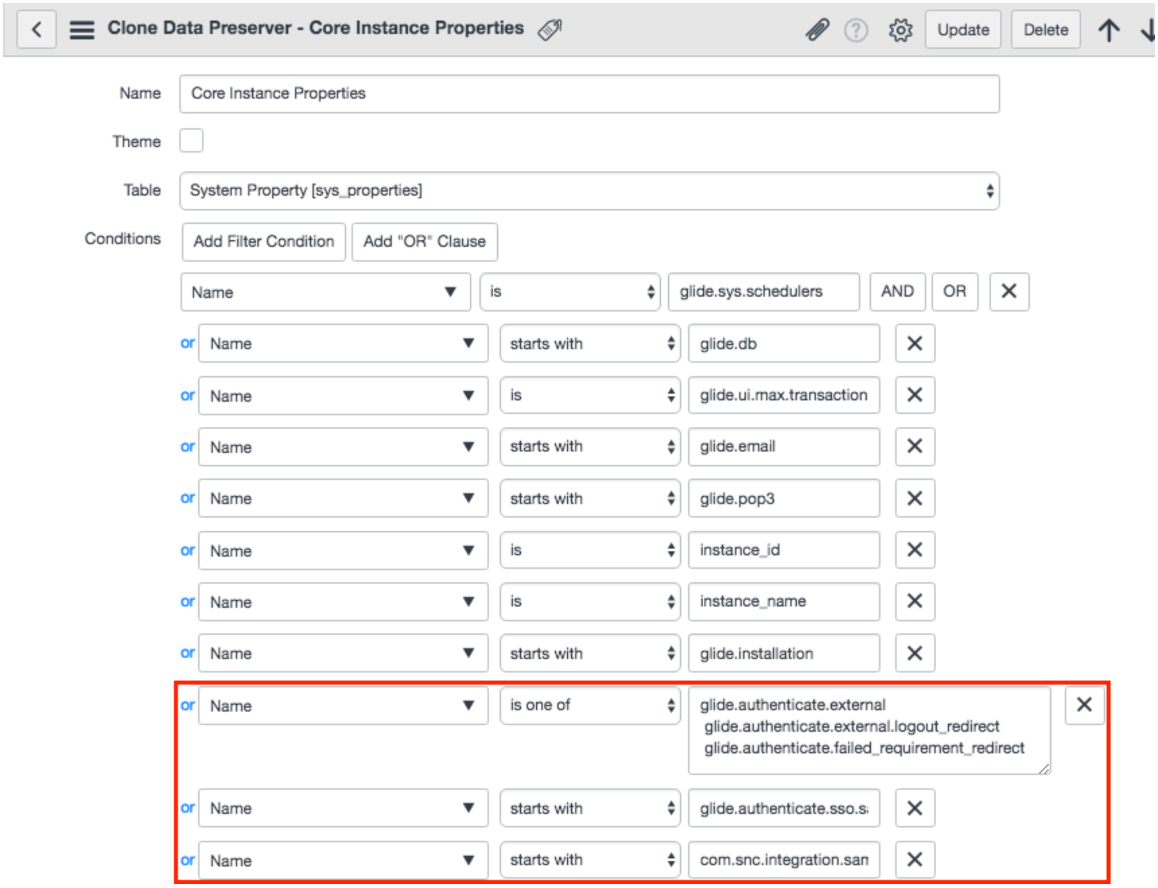
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Clone** > **Preserve Data**.
2. Select **Core Instance Properties**.
3. Add the following **Conditions**.

- [OR] [Name] [is one of] [glide.authenticate.external, glide.authenticate.external.logout_redirect, glide.authenticate.failed_requirement_redirect]
- [OR] [Name] [starts with] [glide.authenticate.sso.saml2]
- [OR] [Name] [starts with] [com.snc.integration.saml_esig]



Note:
Ensure the **Theme** check box is cleared so these properties are preserved regardless of whether you preserve the instance theme.

4. Click **Update**.

Preserve applications and customizations in development during a system clone

Manually preserve a copy of each application and customization that you currently have in development before you can clone the application version to the target (development) instance.

Before you begin

Ensure that you have write access to the application record.

Ensure that you have access to a source control repository.

Role required: admin

About this task

The cloning process does not preserve version differences for applications and app customizations in development. Instead, the system clones only the copies of the application and app customization versions that are installed on the source instance onto the target instance. If the target instance had a development version of the same application, the

application is editable after the clone, but is at the version that was installed on the source instance. If the application was missing from the source instance, the cloning process deletes the application from the target instance.

Procedure

1. To preserve the application on the clone target instance, do one of these actions:

   Version differences between instances

<table>
<tr><th>Application version state</th><th>Action to take</th></tr>
<tr><td>The application version on the clone target instance is different than the source instance version.</td><td rowspan="2">Export each application from the clone target instance. The choices include:
◦ Link each application to a source control repository.
Note:
If the application is already linked to a source control repository, commit the latest version to it.
◦ Publish each application to an update set.</td></tr>
<tr><td>The application is available only on the clone target instance.</td></tr>
<tr><td>The application version on the clone target instance is the same as the source instance.</td><td>None. The system clone process copies this application version onto the target instance during the clone.</td></tr>
</table>

2. Request a system clone of the source instance to the target instance.

   Example
   For example, clone your production instance over your development instance.

3. After the clone process finishes, log in to the clone target instance.

4. **Note:**
   If source control is linked, then post clone, the platform will automatically retrieve applications and customized applications. If this is disabled via `glide.source_control.post_clone_import_enabled` you will need to manually retrieve by doing the following.

   If you saved each application to a source control repository, use one of these actions to retrieve them from the source control repository:

   Note:
   For what to expect after application customization post clone, see Results post cloning for application customizations.

   Retrieve applications from a source control repository

Application installation state	Action to take on clone target
The application and customization were previously installed on the source instance.	Apply remote changes from the source control repository.

Application installation state	Action to take on clone target
The application was never installed on the source instance.	Delete the repository configuration (sys_repo_config) and import the customization from the source control repository.

Remote changes after clone

Field	Description
glide.source_control.post_clone_import_enabled	To disable the apply remote changes automation, set to **False**. The default is **True**.
glide.source_control.post_clone_import_delay_time_sec	To provide a delay time, which will delay processing of the queue, provide a value. The default is zero.
glide.source_control.post_clone_import_pause_refresh_time_sec	To provide a time interval in which the refresh repository job will not run, provide a value. The default is three hours (10800).

5. If you saved each application to an update set, do one of these actions to retrieve them from the update set:

Retrieve applications from an update set

Application installation state	Action to take on clone target
The application was previously installed on the source instance.	**a.** Delete the application version that was cloned from the source instance. **b.** Load the update set that contains the current application version.
The application was never installed on the source instance.	Load the update set that contains the current application version.

Result

The applications previously in development are available for further development on the clone target instance.

Example: Preserve the Marketing Events application

Let's say that your company previously created version 1.0 of a custom application called Marketing Events. You have already published version 1.0 of the Marketing Events application to the application repository and installed it on your production instance.

Over time, users have submitted enhancement requests for the application, and you decide to develop version 2.0 of the Marketing Events application on a non-production instance to address these requests. As development nears completion, you want to update your non-production instance to the latest copy of production for some comprehensive testing.

Because you previously used a source control integration to develop version 1.0 of the Marketing Events application, you have already linked the Marketing Events application to a source control repository. You commit version 2.0 of the Marketing Events application to the source control repository.

You schedule a clone of the production instance over the development instance. After completion, you log in to the development instance and see that it has version 1.0 of the Marketing Events application, because that was the version installed on the source instance.

Because the application was already installed on the source instance, you apply the remote changes from the source control repository to receive the latest application version. The development instance now has version 2.0 of the Marketing Events application and is available for further development and testing.

Clone profiles for clone requests

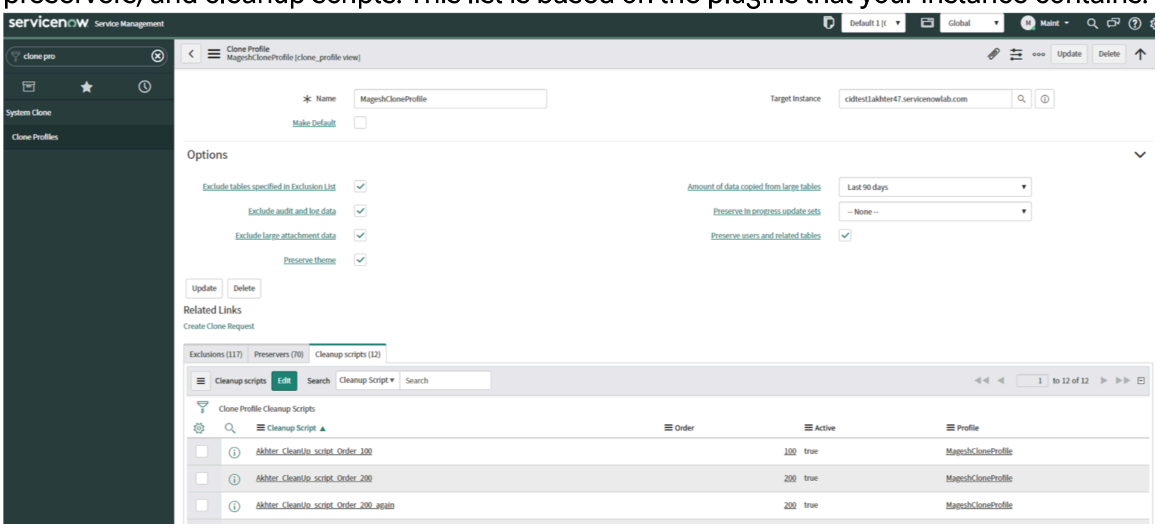
A clone profile enables you to store predefined target and clone options. The clone profile automatically populates your clone request with your selected profile settings.

Clone profiles

Navigate to **System Clone** > **Clone Profiles** to view your clone profiles. With a clone profile, you can:

- Create a profile with specific target instance and option settings, tables to exclude, data to preserve, and cleanup scripts to run
- Create a clone request directly from the clone profile
- Apply the clone profile to a clone request

You can create, edit, and delete clone profiles from the **Clone Profile** view. The system profile is a read-only clone profile that you can't delete. It shows a predefined list of table exclusions, data preservers, and cleanup scripts. This list is based on the plugins that your instance contains.



To set a new clone profile as the default profile used when you request a clone, select the **Make Default** option. Verify that this is the correct clone profile you want to use for the clone scenario you are requesting.

If you create a new data preserver, exclusion, or cleanup script, it is not automatically added to your clone profiles. To add a preserver, exclusion, or cleanup script, open the clone profile, select **Additional actions** > **Configure** > **Form Layout**, and move the new preserver to the selected list.

You are not required to use clone profiles. If you leave the clone profile field empty when scheduling a clone, the system uses the exclude tables, data preservers, and cleanup scripts configured under **System Clone** > **Clone Definition**.

Cancel a clone

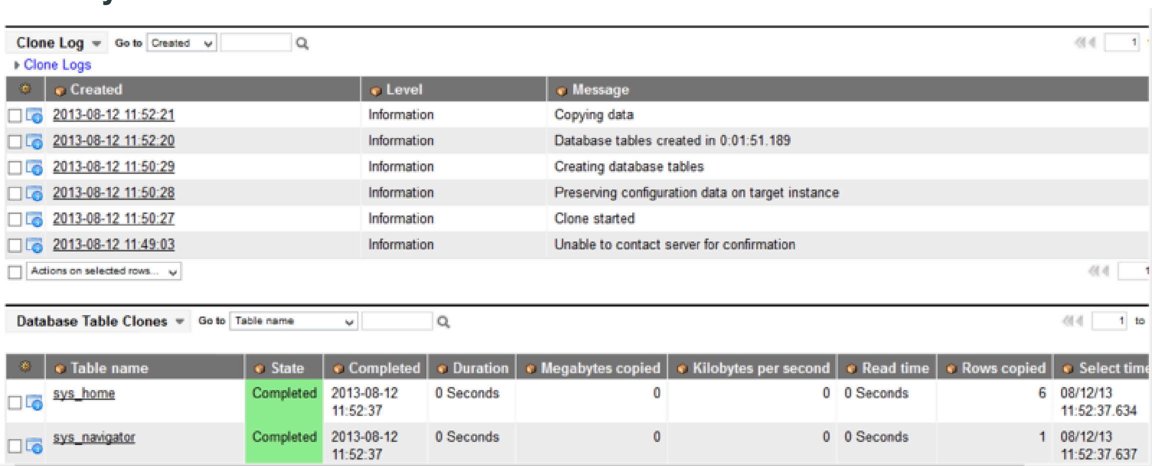
You can cancel requested, scheduled, and active clones without negatively impacting system stability or usability. Canceling a clone restores the target instance to the pre-clone state, retaining all original data.

Before you begin

Role required: admin

About this task

Active system clone



Clone Log — Go to Created

Clone Logs

Created	Level	Message
2013-08-12 11:52:21	Information	Copying data

Database Table Clones — Go to Table name

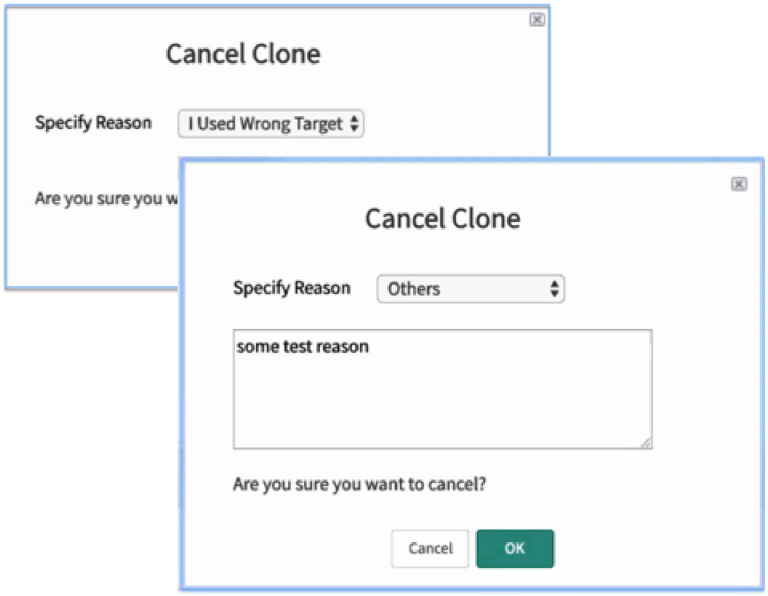
Table name	State	Completed	Duration	Megabytes copied	Kilobytes per second	Read time	Rows copied	Select time
sys_home	Completed	2013-08-12 11:52:37	0 Seconds	0	0	0 Seconds	6	08/12/13 11:52:37.634
sys_navigator	Completed	2013-08-12 11:52:37	0 Seconds	0	0	0 Seconds	1	08/12/13 11:52:37.637

After starting a clone, the **Clone Log** and **Database Table Clones** related lists appear on the form. These related lists show general log messages, and the details of individual tables respectively.

The duration a clone remains active varies upon the amount of data being cloned, and whether the source and target instance are in the same physical location. If a clone takes longer than anticipated, ServiceNow Technical Support can identify additional details about the clone progress.

Procedure

1. Navigate to **All** > **System Clone** > **Live Clones** > **Active Clones**.
   The system displays the list of currently active clones.
2. Select the clone you want to cancel.
   The system displays the System Clone record.
3. From **Related Links**, click **Cancel Clone**.
   The **Cancel Clone** modal displays.



4. In **Specify Reason**, select a reason for the cancellation and click **OK**, or select **Others**, enter a reason in the text box and click **OK**.
   The system stops any current clone activities and sets the **State** to **Canceled**.

What to do next

If you want to restart a canceled clone, you must create a new clone request.

Schedule cloning

You can use System Clone to schedule automatic cloning, which is the easiest way to keep your cloned instances up to date.

Before you begin

Role required: admin

About this task

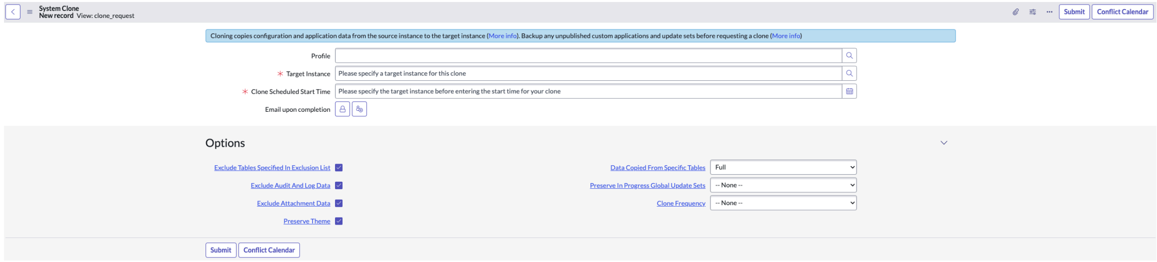
Instead of manually cloning instances, you can schedule cloning that happens automatically. You create a cloning schedule in the same interface you use to create a clone. This topic assumes that you created a clone but not a cloning schedule for it.

Procedure

1. Click **System Clone** > **Active Clones** > **<one-of-your-clones>**.

2. **Note:**
   (Optional) if the **Options** panel is not already displayed.

   Click the **Options** arrowhead so it turns downward.
   The **Options** panel appears.



3. **Note:**
   A target instance must be selected or an error message appears.

   Select the **Conflict calendar** to view a calendar with their current clone time and potential conflicts if you want to schedule for a different time.
   The conflict calendar appears in a new 

   tab.
4. Enter values in the following fields to schedule automatic clonings.

5. Click **Submit**.
   The system displays the **Authenticate Target** modal.
6. Enter the **Username** and **Password** for an administrator account on the target instance and click **Authenticate**.
   The System Clone form displays for the target clone.
7. To see the cloning schedule for this target, click the **Recurring Clones** tab.
   Each line in the list shows a separate, scheduled cloning session.
8. To see log messages for past clonings on this target, click the **Clone Log** tab.
9. To see cloning schedules for all the clones in the system, click **System Clone** > **Live Clones** > **Clone History**.
   The **System Clones** page lists all the cloning instances in the system along with their scheduled clonings.

Modify cloning schedules

You can cancel scheduled clonings but not modify them.

Before you begin

Role required: admin

About this task

This topic assumes that you have a cloning schedule that you want to modify. Cloning schedules cannot be modified. Instead, you have to cancel scheduled clonings and create a new cloning schedule.

Procedure

1. Click **System Clone** > **Active Clones** > **<one-of-your-clones>**.
   The **System Clone**record opens for your cloning instance.

2. To delete one or more scheduled clonings, on the **Recurring Clones**tab, select the check box next to the row(s) you want to cancel and on **Actions on selected rows**, click **Delete**.
3. If you deleted all future clonings, you can create a new cloning schedule.
   You cannot create more than one cloning schedule for a target instance.
4. To stop a cloning that is already in progress, under **Related Links**, click **Cancel Clone**.
   The system stops any current cloning activities and sets the **State** to **Canceled**. Future, scheduled clonings are not deleted.

View clone status

You can view the status of a clone to make sure the cloning process isn't stuck.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Clone** > **Live Clones** > **Active Clones**.
   The system displays the list of currently active clones.
2. Select the clone you want the status of.
   The system displays the System Clone record of that clone.
3. Under **Related Links**, click **Check Clone Status**.
   The system updates the **State** field and produces a log entry in the **Clone Log** that shows the status of the clone.

   If a cloning status is failed, you might roll back the cloning and schedule a new cloning.

View clone history

You can view the status and history of any system clone request.

Before you begin

Role required: clone_admin or admin

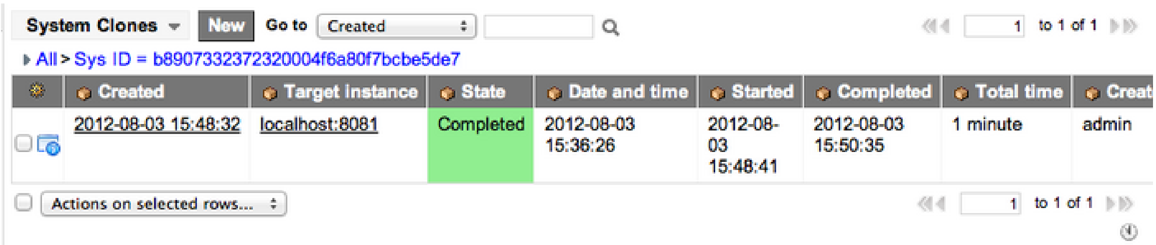
About this task

The System Clone [clone_instance] table stores records for all previously and currently scheduled clones.

servicenow

Procedure

1. Navigate to **All** > **System Clone** > **Live Clones** > **Clone History**.
   Clone history also displays the **State** for current and past clones. Clones in the **Draft** state do not appear on the Clone History table.



Clone states

Clone state	Description
Requested	The clone was requested and is awaiting approval.
Scheduled	The clone is ready to begin at the scheduled time and date.
Active	The clone is currently running.
Completed	The clone completed successfully.
Canceled	A user canceled the request.
Hold	The server rejected the clone request. This can happen either because the clone was not ready to proceed by the scheduled time or because additional clone requests were submitted before the first one completed.
Error	The clone encountered an error while running. Contact technical support for help resolving this issue.
Draft	The clone is scheduled to be created. This state never appears in the Clone History table.

2. Select a System Clone record to view its history.

Roll back a clone

Return a clone target to its state before the latest cloning. Roll back cloning if something went wrong in the cloning process.

Before you begin

Role required: admin

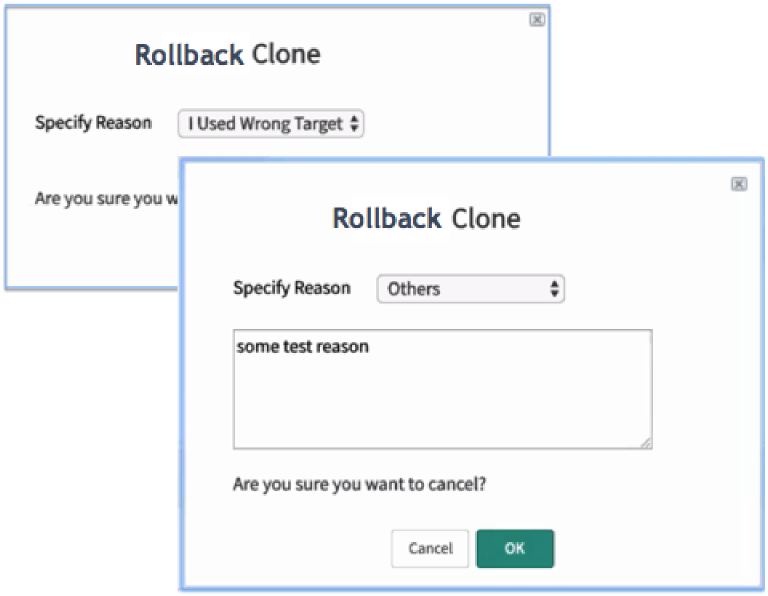
Rollbacks remove the latest cloning updates on a cloning target. You can only roll back the latest cloning updates. Rollbacks must occur no more than seven days after the cloning.

Note:
Rollbacks must occur no more than two days after the cloning for users with sharded instances.

Procedure

1. Navigate to **All** > **System Clone** > **Live Clones** > **Clone History**.
2. Select the clone to roll back.
3. Under **Related Links**, click **Rollback**.

The **Rollback Clone** modal displays.



4. In **Specify Reason**, select a reason for the rollback and click **OK**, or select **Others**, enter a reason in the text box and click **OK**.
   The system rolls back the clone and sets the **State** to **Rollback Requested**, and, if successful, to **Rolled Back**, or, if unsuccessful, to **Rollback Failure**.

   You can retry a rollback but if you get repeated failures, contact ServiceNow Customer Support.

Result
The instance contains the same data it had before the clone was applied.

Post-clone cleanup scripts

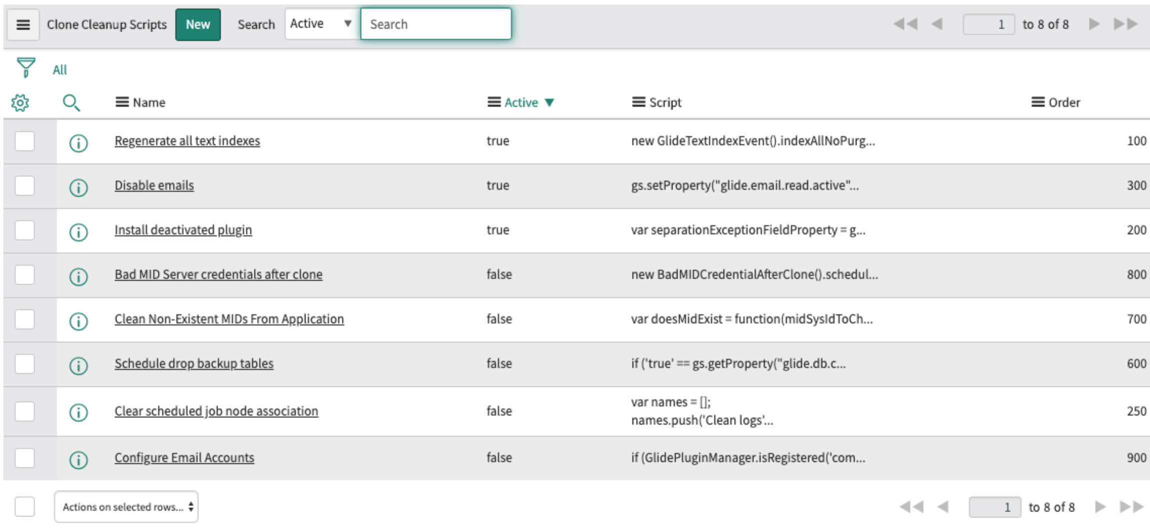
Cleanup scripts automatically run on the target instance after the cloning process finishes.

Use cleanup scripts to modify or remove bad data. Cleanup scripts run after data preservers and the clone are complete.

You can add new post-cloning scripts on the source instance to perform any action that can normally be accomplished through script includes or business rules. To add a script, navigate to **System Clone** > **Clone Definition** > **Cleanup Scripts** and click **New**.

Note:
Cleanup scripts will always run on clones created using a Clone profile, this is necessary as they're available OOB and ensure a healthy state post clone. After the clone completes, all cleanup scripts are combined together as a scheduled job named **Execute Clone Cleanup Script: Execute Cleanup Scripts Sequentially** and run till completion in the global scope. The cleanup scripts are ordered based on the order field. Cleanup scripts must be defined on the **Source** instance.

You can make post-clone scripts active or inactive to control whether these scripts run or do not run. You can also set an order number on each script, which enables you to set the order that the active scripts run, with lower numbers having a higher priority.



Note:
All cleanup scripts run in the global scope irrespective of the scope in which you have configured the cleanup script. An example of how to run a scoped script is to

- Create a script include in the desired scope with the cleanup logic in it.
- Have a Restricted Caller Access configuration in place to allow access to your scoped script, be sure you are in the scope of the script include used to create the RCA.

Field	Description
Source Scope	Global
Source Type	Scope
Status	Allowed
Target Scope	The scope of the script include.
Target Type	Script Include
Target	The script.
Operation	Execute API

- Call the script include from the clone cleanup script.

The following post-clone cleanup scripts perform various actions on the target instance.

Post-clone cleanup scripts

Script	Description
Bad MID Server credentials after clone	Runs a script include called `BadMIDCredentialAfterClone` on a cloned instance to detect bad MID Server user credentials. This script include creates scheduled jobs that log MID Servers in the **Down** state to the MID Server Issue [ecc_agent_issue] table after an instance clone.
Clear scheduled job node association	Resets any scheduled jobs that were active on the source instance to the **Ready** state. This script also clears the value of the **System ID** and **Claimed by** fields on all scheduled jobs.

Post-clone cleanup scripts (continued)

Script	Description
Configure Email Accounts	Migrates email accounts that existed on the source instance to the target instance if they are not enabled there. This script also migrates the email properties to the target instance.
Disable emails	Disables email on the target instance. A default data preserver maintains other email settings from the target instance.
Install deactivated plugin	Enables the Domain Separation plugin for instances that use this feature.
Regenerate all text indexes	Rebuilds text indexes on the target instance after a clone. Text indexes are not cloned from the source to the target instance.
Schedule drop backup tables	Schedules the deletion of the data that is contained in the target instance database prior to the clone. This original data is preserved for 24 hours following a clone to enable you to roll back an instance to the pre-clone state. If the target instance is downgraded as part of the clone, backup data is not available.

Clone Admin Console

The Clone Admin Console provides a streamlined experience and enhanced visibility for cloning data between instances. You'll find your existing clone profiles, exclusions, preservers, and scripts within the new console. It has added guidance on the clone request page, an on-demand backup option, and provides more visibility into clone progress.

https://player.vimeo.com/video/1006365658?h=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479

Cloning

Clone copies data and metadata from one ServiceNow instance (source instance) to another ServiceNow instance (target instance). Cloning is typically used to copy the data and metadata from a production instance to a non-production instance to test changes. Cloning data comes from the most recent, daily backup. To learn more about clone, see System clone.

Notes regarding the Clone Admin Console

1. Legacy clones and new clones are stored separately. Clones requested via the Clone Admin Console are stored on a new table and displayed within the new console.#Legacy clones aren't shown in the console. Clones initiated via the legacy Request Clone page are stored on the legacy Clone History table.
2. Since requests submitted from the clone admin console are stored in a separate table, request numbers in this new table may coincide with request numbers in the legacy table (clone history).
3. Your existing clone settings and configurations remain the same. You can find your existing clone instances, clone profiles, exclusions, preservers, cleanup scripts within both the new Clone Admin Console, and within their original lists and forms.

4. Access and clone-related permissions: The Clone Admin Console requires the clone admin or the admin role on the source and the admin role on the target instance to place a clone request.
5. The new experience uses the same clone engine as the legacy clone.#Known (backend) clone behavior is the same between the legacy and the new user interface.

Overview of the Clone Admin Console

The following sections reflect the different parts of the Clone Admin Console.

Home

The home page displays all current clones in your instance. You can search for your clones by using the **search bar** and entering in the number for your clone.

Note:
The dashboard shows any clones requested through the app. You can't view clones requested through the Now Platform in the dashboard.

Filter options are available to identify the clones you want to view with the filter drop-down button. You can apply the following conditions to be displayed on your dashboard:

- Canceled
- Completed
- Error
- Requested
- Rollback failure
- Rollback requested
- Rolled back
- Rolling back
- Running

You can choose to view your clones in either a grid or list view by selecting the appropriate button option.

Configurations

The **Overview** tab displays the current number of **Clone instances** and **Clone profiles** in your instance.

On the **Clone instances** tab, you can view all currently available clone instances. Once you add an instance to this list, you can use it as a clone source or clone target for your clones. To add your non-production instance to your clone instances list, select **New**.

The **Clone profiles** tab displays all of your available **Clone profiles**. You can think of clone profiles as templates for clone, which you can customize, save and reuse to achieve consistent outcomes with each of your clones. To learn more about Clone Profiles see Clone profiles for clone requests.

Note:
The profile **System Profile** is available out-of-the-box and can't be modified.

Custom profiles you create use the default Exclusions, Preservers, and Scripts from the System Profile as a basis.

Note:
When you're creating a custom profile, all existing custom exclusions and preservers are automatically added to it.

You can create as many custom clone profiles as you'd like and edit them as needed. To change the definitions of a clone profile, such as exclusions, preservers or cleanup scripts, select the number under the definition and select the **Edit** button on the page.

Note:
Certain out-of-the-box system items can't be removed from the exclusions, preservers, or scripts list.

Definitions

The **Definitions** page displays an overview for the following clone definitions.

- **Exclusions**
- **Preservers**
- **Cleanup Scripts**

The **Exclusions** tab lists the tables that aren't copied during a system clone. By default, the system excludes tables for logging, auditing, notifications, workflow contexts, and license usage. You can add **Exclusions** by selecting New and adding the table you want to exclude.

The **Preservers** tab displays a list of all of your available data preservers. **Preservers** protect data on the target instance from being overwritten. Preserving data in a table only preserves the specified table and parent tables.

Note:
Child tables must be individually preserved.

To create a preserver see Create new clone preserver.

Importance of saving your in-flight dev work. During a clone, in-progress development work is over-written (for example work-in-progress update sets, scoped apps which only exist on the target instance but not on the source instance). If you have in-progress update sets, you must export them prior to the clone and reimport them after the clone is finished. If you have custom applications which are not yet deployed to production, you must install the respective plugins or apps after the clone is completed. To learn more about clone and app development best practices, see Whitepaper here.

Tip for dealing with large quantities of in-progress updates sets:

1. On your target instance, which has the work in progress (WIP) update sets, filter to obtain a list view with all your WIP update sets.
2. In a separate window/tab, create a new update set.
3. Batch all incomplete update sets from step 1 - i.e. set the parent field on your list of WIP update sets to the new batch update set
    - How to mass-update: You can mass-update the list by holding down the shift key + holding a left click of your mouse while you're selecting the whole column with your mouse.
    - Double click on any one of the fields in the selected column – type the desired value and update all of them to that value.)

4. Set the parent update set to "Completed" and name it "CLNREQ_DATE" (naming suggestion to make it easier to identify).
5. Export the parent update set.
6. Back on your source instance, retrieve the update set (Important: Don't commit!) The parent update set is now added to the retrieved update sets on your source instance.
7. Verify you wait 24 h until your updates set is captured by the daily backup (alternatively, you can select an on-demand backup on the clone admin console.)
8. Perform the clone as usual from your source instance > target instance.
9. Because your parent update set has been retrieved in the backup, your target instance will have your parent update set along with your dev work which is in flight after the clone.
10. Back on your target instance, you can set the parent update set back to work in progress, and unparent it.
11. On the source instance: Retrieved parent update set can now be cleaned up (i.e. deleted).

The **Cleanup scripts** tab displays a list of all of your available scripts. You can write cleanup scripts to automate post-clone steps. To create a cleanup script see Create cleanup scripts.

Request clone

The app features a clone request page, with guidance and explanations for how the various clone settings affect your clone. The new request page also features a new scheduling calendar to help to prevent timing conflicts with ServiceNow maintenance windows.

To learn more about how to request a clone see Request a clone in Clone Admin Console.

Request a clone in Clone Admin Console

Request a clone to copy data from a production instance to a non-production instance or to copy data between non-production instances.

Before you begin
Role required: admin

Configure your target instance before requesting your clone. Do the following

- Navigate to the **Configurations** > **Clone instances**.
- Select **New**.
- Fill in the new clone instance form.

Note:
You can create multiple clone profiles, utilize a reusable clone template, and clone profiles allow you to select the correct exclusions and preservers for your clone.

Configure a clone profile. Do the following

- Navigate to **Configurations** > **Clone profiles**.
- Fill in the new clone profile form.

Note:

Please note that requests initiated via the classic page `clone_instance.do` will not show up on the new clone console dashboard. However, they can still be found on the classic clone history page `clone_instance_list.do`.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Dashboard**.
2. Select **Request Clone**.
3. On the form, fill in the fields.

Clone request form

Field	Description
Source Instance	The instance you want to clone.
Target Instance	The instance you want to clone the source instance to. **Note:** You can add an instance or select an existing instance without leaving the page.
Clone Profile	The clone profile to be used for your clone.
Clone Scheduled Start Time	The start time to begin cloning your instance.
Email upon completion	The email to be notified of clone completion.

4. **Note:**
   Additional settings can be configured for your clone request, however, these options may significantly increase your clone completion time.

   Select the following options you want to configure for your clone.

   - The amount of data copied from large tables

     Note:
     By excluding this data, this can extend the time of your clone as the data is copied over from the source, and all data older than 90 days is removed.

   - Apply On-demand Backup
   - Clone frequency
   - Exclude tables specified in the Exclusion list

     Note:
     When a table is excluded, this also excludes all of its child tables. For example, excluding the task table, also excludes its child tables such as Incidents, problems, and change tables.

   - Exclude audit and log data

     Note:
     When **sys_audit** is excluded it will break the activity stream for records. The activity stream is built from the **sys_audit** table, so if it's empty all of the updates will show as the username who created the record and display the created time.

   - Exclude attachment data

- Preserve theme
- Number of days of in-progress Global Update Sets to be preserved

5. Select **Continue**.
6. Review your clone request summary and select **Confirm and Submit Clone Request**.

Create cleanup scripts

Use cleanup scripts to modify or remove data that is not appropriate for your clone.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Dashboard**.
2. Select **Definitions** from the secondary navigation.
3. Select the **Cleanup scripts** tab.
4. Select **New**.
5. Enter a name for your script.
6. Select the order number for your script.
7. Check **Active** when your script is ready.
8. Enter your script in the **Script** field, and select **Save**.

Create new clone preserver

Create clone preservers to protect data on the target instance from being overwritten.

Before you begin

Role required: admin

Preserving large amounts of data can significantly increase your clone duration. Only preserve tables if necessary.

The **Preservers** tab displays a list of all of your available data preservers. **Preservers** protect data on the target instance from being overwritten. If you have custom applications, you must also manually preserve your unpublished application content. To create a preserver, do the following.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Dashboard**.
2. Select **Definitions** from the secondary navigation bar.
3. Select the **Preservers** tab.
4. On the **Preservers** task page, select **New**.
5. Enter the table label as the **Name** for your preserver.

   Note:
   The data preserver must have a table selected or it can't be submitted.

6. Select the **Table** to be preserved.
7. Select the **Theme** check box if the data being preserved is a UI property.

8. Define the data to be preserved using the **Condition builder**, and select **Save**.
   The success message displays.

Database rotation

Database rotation involves managing table size growth and archiving old data.

Data within an instance grows quickly, and as these tables grow in size they require management. Database Rotation preserves instance performance and averts risk associated with querying growing data sets utilizing three techniques. These techniques are based on the concept of managing large quantities of data by separating whole sets into individual tables. After this task is performed, each technique handles data in a different manner:

- Table Rotation works by rotating among a small set of tables, and deleting and reusing the old tables for new data.
- Table Extension works by periodically starting a new table and allowing old tables to be easily archived and removed from the system.
- Table Sharding works by enabling records to be grouped in a single table by document ID.

Table rotation plugins

- **Database Rotations Plugin** activates Table Rotation and Extension without any tables automatically included (com.snc.db.rotation)
- **Database Rotations Default Tables Plugin** applies Table Rotation and Extension to specific tables (com.snc.db.rotation_default_tables)

Database Rotation

Functionality	Tables applied to
Table Rotation	`syslog` `sys_querystat` `ecc_queue` `ecc_event` `cmdb_metric` `sysevent`
Table Extension	`sys_email`

Table rotation and extension

The System Definition Table Rotation module allows you to define a new table rotation, a new table extension, a new table shard, or modify an existing one.

Table rotation groups

Name	Base cleaned	Clean base rotation	Duration	Initialized	Rotations	Shard by	Shards	Type
cmdb_ire_incomplete_payloads	false	2019-10-19 12:18:33	1 Day	true	7			Rotation
ecc_agent_command_audit_log	true	(empty)	1 Day	true	7			Rotation
ecc_agent_host_service	true	(empty)	60 Days	true	3			Rotation
ecc_event	true	(empty)	1 Day	true	7			Rotation
ecc_queue	true	(empty)	1 Day	true	7			Rotation

- **Name**: auto-generated from table name
- **Duration**: overall time parameter for function
- **Initialized**: sets function as active (true) or inactive (false)
- **Rotations**: number of tables to be created within Duration
- **Type**: indicates Extension (archiving), Rotation (deletion), or Shard (doc ID) functionality

When you define a new rotation, a schedule is created and new data is subsequently written to one of the tables in the rotation group. You will notice the that the group includes the original table plus a number of additional tables. Be aware that deleting a rotation will delete the additional tables and all the data, therefore the rotation should not be deleted if the data is needed.

See these topics for more information on managing tables:

- Table Rotation
- Table Extension

Activate database rotation

For new instances, database rotation is active by default. If you are upgrading from a previous version, you can activate the Database Rotations plugin if it is not already active.

About this task

Note:
Deployment of this plugin should be executed in partnership with a ServiceNow representative.

If it is not already active, you can activate the **Database Rotations** plugin if you have the admin role.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
Do not activate the **Database Rotations Default Tables** plugin. Instead, specify the tables manually, after consulting a ServiceNow representative.

Table cleaner

Table cleaner deletes older records automatically and prevents data from growing exponentially.

Table cleaner is a scheduled job that runs once per hour (by default) to delete older, expired, or unwanted records from tables. Table cleaner prevents tables from growing to an unmanageable size and improves query performance.

You can view a list of table cleaner rules in the Auto Flush [sys_auto_flush] table by typing `sys_auto_flush.list` in the filter navigator. The Auto Flush table displays rules for base system tables and their corresponding record ages. Multiple rules can appear for a single table if each rule has a unique condition defined.

Which records are deleted

Each table cleaner rule specifies the following:

- The target table (to delete records from).
- A **Matchfield** value that corresponds to a Date/Time column in the target table. Ideally, the **Matchfield** is a date field that represents how long the record has been active (for example, sys_created_on) or how long since the last update (sys_updated_on).
- An **Age in seconds** value that determines when the delete is triggered.
- Options for cleaning related records in peripheral or audit tables.
- One or more optional conditions to filter which records are deleted. For example, you might specify that only records where 'active = false AND state =closed' are deleted.

When the **Matchfield** date is farther in the past than the **Age in seconds** value, the table cleaner job deletes the record.

Slow rule handling

When the table cleaner job runs, each table cleaner rule runs several queries as part of the process. If there's no index on a rule's match field or on significant portions of its condition, rule processing can be slow because its queries are running inefficiently on large amounts of data.

If a table cleaner rule has a query that takes longer than 30 seconds to complete, the entire table cleaner job is stopped. By default, table cleaner waits two days before including that rule in the table cleaner job again, which enables the table cleaner job to run without disruption in the meantime. You can configure the duration of the waiting period by adding a system property. See Table cleaner properties.

Disabling table cleaner

You can prevent an administrator from creating a table cleaner rule or running the table cleaner on a specific table by adding the Disable Table Cleaner attribute to the table's dictionary record. Some internal system tables have the Disable Table Cleaner attribute added by default.

Table cleaner limitations

Note the following limitations.

- Table cleaner rules aren't supported for tables configured with table rotation or table extension. Some tables in your instance might have legacy table cleaner rules that were established before table rotation or table extension were enabled. These legacy rules can be safely ignored.
- Performance depends on the size of the table and the conditions you specify. For example, if you use a custom column without an index in a large table, performance is severely degraded. Performance also depends on the number of rows to be deleted.
- Table cleaner spends a maximum of 20 minutes to delete records from a single table. If queries are slow, the volume of records deleted in the 20-minute period may be small.
- Table cleaner does not call `DBDelete.setWorkflow()`. This means `DBDelete` objects run with `workflow=false` (false is the default value for a Java Boolean), hence Delete business rules and workflows are not triggered.

Activate table cleanup

Activate table cleanup for tables with older, expired, or unwanted records.

Before you begin
Role required: admin

Procedure

1. Open the Auto Flush [sys_auto_flush] table by typing `sys_auto_flush.list` in the filter navigator and select **New**.
2. Fill in the fields on the form.

Auto Flush form

Field	Description`
Tablename	The name of the target table.
Matchfield	The Date/Time field in the target table that is used to monitor duration. Defaults to sys_created_on, which deletes records based on the amount of time since their creation date.
Age in seconds	The amount of time the system waits before deleting records. When the **Matchfield** value becomes older than the **Age in seconds**, the record is deleted.
Active	Option to activate or deactivate table cleaning for this table.
Application	The application scope to which this table cleaner job applies.

Field	Description`
Clean peripheral	If selected, related records in the Journal Entry [sys_journal_field] table are also deleted. If cleared, the system deletes records from the target table, but not any related journal records in this tables.
Clean audit	If selected, related records in these audit tables are also deleted: ◦ Sys Audit [sys_audit] table ◦ Audit Relationship Change [sys_audit_relation] table Note that the audit records that are created by table cleaner in the Audit Deleted Record [sys_audit_delete] table are preserved. If cleared, the system deletes records from the target table, but not any related audit records in these tables.
Cascade delete	If selected, this option deletes all matching records plus any records referring to them. If cleared, the system deletes matching records, but not records referring to them.
Conditions	Condition builder for specifying filter conditions that define the records to be removed.

3. Select **Submit**.

Result

Table cleaner runs automatically and deletes records when they meet the specified record age and any conditions that you set for them.

Table cleaner properties

These system properties control table cleaner behavior.

To set table cleaner system properties, navigate to the System Properties [sys_properties] table and add the property.

System properties

Property	Description
Configure the number of days table cleaner must wait before attempting to reprocess a slow rule. `glide.db.tablecleaner.days_before_slow_rule_reattempt`	When a table cleaner rule has a query that takes longer than 30 seconds to complete, the entire table cleaner job is stopped. By default, table cleaner waits two days before including that rule in the table cleaner job again. You can change the default waiting period by adding this property.

System properties (continued)

Property	Description
	• Type: integer • Default value: 2
Configure a time limit for a table cleaner rule. `glide.db.tablecleaner.chunk_delete_max_time_spent`	Limits how long the cleaner spends trying to batch-delete records per rule during a single run. The value is given in seconds and defaults to 1200 (20 minutes), which means the table cleaner runs hourly for a maximum of 20 minutes. You can change the default time limit by adding this property. • Type: integer • Default value: 1200

Deleting records safely

You can safely delete records from a table without using scripts and without deleting the table by creating and executing delete jobs. For example, you might want to delete incident records on a test instance without deleting the incident table itself.

After creating a delete job, you can preview the number of affected records before you schedule or execute the job.

If you want to restore deleted records after the job has run, use the rollback option in the delete job.

If you must delete a large number of records from a table rather than a selection of records, use the table cleaner option. For details, see Table cleaner.

Mark records for deletion

Mark records for deletion according to one or more criteria by creating a delete job.

Before you begin

Role required: admin

Procedure

1. Either choose to mark specific records for deletion or mark all records in a list for deletion.
   - To mark only specific records for deletion, navigate to **All** > **System Data Management** > **Delete Jobs**.
   - To mark all records in a list for deletion, in any list of records, right-click a column heading, and then select **Data Management** > **Delete All with preview**.
2. Select the table that contains the records you want to delete.
3. **Optional:** Limit the number of records in the delete job by adding one or more conditions that records must meet.

a. Select a field, operator, and field value.

Example
For example, **[Category] [is] [Software]**.

b. **Optional:** Use the OR and AND operators to add conditions.

c. **Optional:** Select **New Criteria** to add another set of conditions.

Note:
Limiting the number of records that are added to the delete job can help prevent the table from being locked when the job is executed.

4. **Optional:** View the records that match the conditions.
   a. Select **Preview**.
   b. Select the link with the number of matching records.
   The list of records appears in a new browser tab.
5. Return to the Delete Job tab.
6. Select **Continue** to save the current job information.

Result
The job is saved and the form displays options to schedule the job or execute it now.

What to do next
Preview affected records for deletion.

Preview affected records for deletion

Before you run a delete job, preview the count of affected records to see the impact of executing the delete job.

Before you begin
Role required: admin

About this task
Deleting records in a table also deletes records from tables that extend or reference the source table. Preview the affected records before you execute a delete job and learn about other tables that are impacted.

Up to three levels of cascaded records are deleted when the job is executed. For example, if the preview identifies incidents that match the conditions, it will also delete any problems that reference those incidents, defects that reference those problems, and test records that reference the defects. If sys_attachment and sys_attachment_docs table records are associated with the incidents, those records might not appear in the preview but they are deleted as well.

Procedure
1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job record.
3. Select the **Preview Cascade** related link to view the count of records from the source table that match the conditions in the delete job.

The record count appears in the **Preview record count** column. Counts for records in other tables that reference those source records are listed as well, although those counts are only close estimates.

4. Review the count of affected records by table to ensure that the records are safe to delete.

What to do next

Schedule or execute a job to delete records

Schedule or execute a job to delete records

Schedule a date and time to execute a delete job or execute the job immediately.

Before you begin

Role required: admin

About this task

Consider scheduling the delete job to run during non-business hours to minimize the potential performance impact on your users. Deleting all records in a table temporarily locks the table, which prevents inserts and updates. If you want to delete all records from a table, use the table cleaner option instead. For more information, see Table cleaner.

Procedure

1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job record.
3. Determine whether to schedule the delete job for a later time or run it right away.

Result

The records are scheduled for deletion or deleted immediately. If you want to restore the deleted records, see Rollback a delete job.

Rollback a delete job

Rollback a completed delete job to restore the deleted records.

Before you begin

Role required: admin

About this task

If you want to restore records deleted through a delete job, execute a rollback operation.

Procedure

1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job that has been executed.
3. Select the **Rollback** related link to restore the deleted records.
4. When prompted, confirm that you want to rollback the delete job.

Result

The rollback job is executed immediately and the deleted records are restored. If you want to delete the restored records, create a delete job using the same conditions, and then schedule the delete job or execute it immediately.

Updating records safely

Update several records simultaneously without using scripts by creating and executing a batch update job. For example, you might want to update the Assigned to value for multiple incidents on a test instance without running a script.

To update multiple records safely, create an update job, and then preview the number of affected records before you schedule or execute the job. For more information, see Mark records for updating.

If you must restore the updated records to their previous state, use the rollback option in the update job. For more information, see Rollback a delete job.

Mark records for updating

Mark records for updating according to one or more criteria by creating an update job.

Before you begin

Role required: admin

Procedure

1. Either choose to mark specific records for updating or mark all records in a list for updating.
   - To mark only specific records for updating, navigate to **All** > **System Data Management** > **Update Jobs**.
   - To mark all records in a list for updating, in any list of records, right-click a column heading, and then select **Data Management** > **Update All with preview**.
2. Select the table that contains the records you want to update.
3. **Optional:** Limit the number of records in the update job by adding a condition or conditions that records must meet.

   a. Select a field, operator, and field value.

      Example
      For example, **[Category] [is] [Software]**.

   b. **Optional:** Use the OR and AND operators to add conditions.

   c. **Optional:** Select **New Criteria** to add another set of conditions.

   Note:
   Limiting the number of records that are added to the update job can help prevent the table from being locked when the job is executed.

4. **Optional:** View the number of records that match the conditions.

   a. Select **Preview**.

   b. Select the link with the number of matching records.
5. In the Fields & values lists, select the field that you want to update and a new value.
6. **Optional:** Select additional fields and values to update more fields.
7. Select **Continue**.

Result

The job is saved and the form provides options to schedule the job or execute it now.

What to do next

[Schedule or execute a job to update records](#)

Schedule or execute a job to update records

Schedule a date and time to execute an update job or execute the job immediately.

Before you begin

Role required: admin

About this task

Consider scheduling the update job to run during non-business hours to minimize the potential performance impact on your users. Updating all records in a table temporarily locks the table, which prevents inserts and updates.

Procedure

1. Navigate to **All** > **System Data Management** > **Update jobs**.
2. Select an update job record.
3. Determine whether to schedule the update job for a later time or run it right away.

Result

The records are scheduled for update or updated immediately. If you want to revert the updates to the records, see Rollback an update job.

Rollback an update job

Rollback a completed update job to revert the updates to the records.

Before you begin

Role required: admin

About this task

If you want to revert the updates to records made through an update job, execute a rollback operation.

Procedure

1. Navigate to **All** > **System Data Management** > **Update jobs**.
2. Select an update job that has been executed.
3. Select the **Rollback** related link to revert the updated records.
4. When prompted, confirm that you want to rollback the delete job.

Result

The rollback job is executed immediately and the updated records are reverted to their prior versions. If you want to update the records again, create an update job using the same conditions, and then schedule the update job or execute it immediately.

Domain separation and Data Management

Domain separation is supported in Data Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- There is business logic to ensure data goes into the proper domain for the application's service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer's message, the client must be able to see my response.

Related topics

Domain separation for service providers

Data export

Export data from the ServiceNow AI Platform in a variety of formats.

Key benefits

- Export an individual record to a PDF or XML file directly from a form. See Export data from a record.
- Export multiple records to a CSV, Excel, PDF, XML, or Google Sheets file directly from a list. See Export data from a list.
- Export multiple records from a table using the CSV, Excel, PDF, or XML processor in a URL with optional parameters. See Export directly from a URL.

You can also export data from your instance using the following options:

- Export multiple records from a table via a web services request. For example, you can create an external application or process to automate the retrieval of data from an instance via web services such as REST or SOAP. For more information, see Web services .
- Push all the data that you want to export to an external file by creating an export set. For more information, see Export sets .

Associated roles

You can export form data to PDF or XML, depending on your role.

- The PDF options are available to all users.
- The XML option is only available to users with the admin role.

You can export records in a list to Excel, CSV, XML, JSON, PDF, or an Export Set depending on your role.

- The Excel, CSV, JSON, and PDF options are available to all users.
- The XML option is only available to users with the admin role.
- The Export Set option is only available to users with the export_set_admin or admin role.

Export formats

Available export formats

Export format	Description
CSV	Export table records as a comma-separated value text file. Use this option to export the currently displayed fields in the list or form as a text file. Configure the list or form to add or remove fields from the export. When exported to CSV, dot-walked fields appear using their full field name, such as u_assignment_group.parent. **Note:** By default, ServiceNow exports all CSV files in Windows-1252 encoding. If you need to export translated data, set the *glide.export.csv.charset* system property to UTF-8.
Excel	Export table records as a Microsoft Excel spreadsheet. Use this option to export the currently displayed fields in the list or form as an Excel spreadsheet. Configure the list or form to add or remove fields from the export.
XML	Export table records as an XML document. Use this option to export all data from a table or all data for a particular record. The XML file has an XML element for each column in the table. See Exporting and importing data via XML. **Note:** Image field data is not preserved when exporting to XML.
PDF	Export table records as a Portable Document Format file. Use this option to export the currently displayed fields in the list or form as a PDF file. Configure the list or form to add or remove fields from the export. **Note:** The PDF export processor prints data from left-to-right, which can produce rendering errors when displaying right-to-left language data.
JSON	Export the table records as a JSON string. The JSON file has an element for each column in the table.

Column headers

The file type you export to, such as CSV or PDF, determines how column headers are exported. In general, formats meant for human consumption such as PDF display the column label, whereas formats meant for machine use, such as CSV, use the database field_name.

Header format by file type

File type	Column header format
Excel	Label
PDF	Label
CSV	field_name
XML	field_name

Header format by file type (continued)

File type	Column header format
JSON	field_name

Export data from a record

Export a record to PDF or XML.

Before you begin

Role required: none for exporting to PDF. Exporting to XML requires the admin role.

About this task

When exporting to PDF, any field hidden by UI scripts (UI policies, UI actions, client scripts) and any fields visible from the current view are exported. When exporting to XML, all fields are exported, regardless of the view.

A PDF is generated only if the form has been submitted. An unsubmitted form generates an empty page.

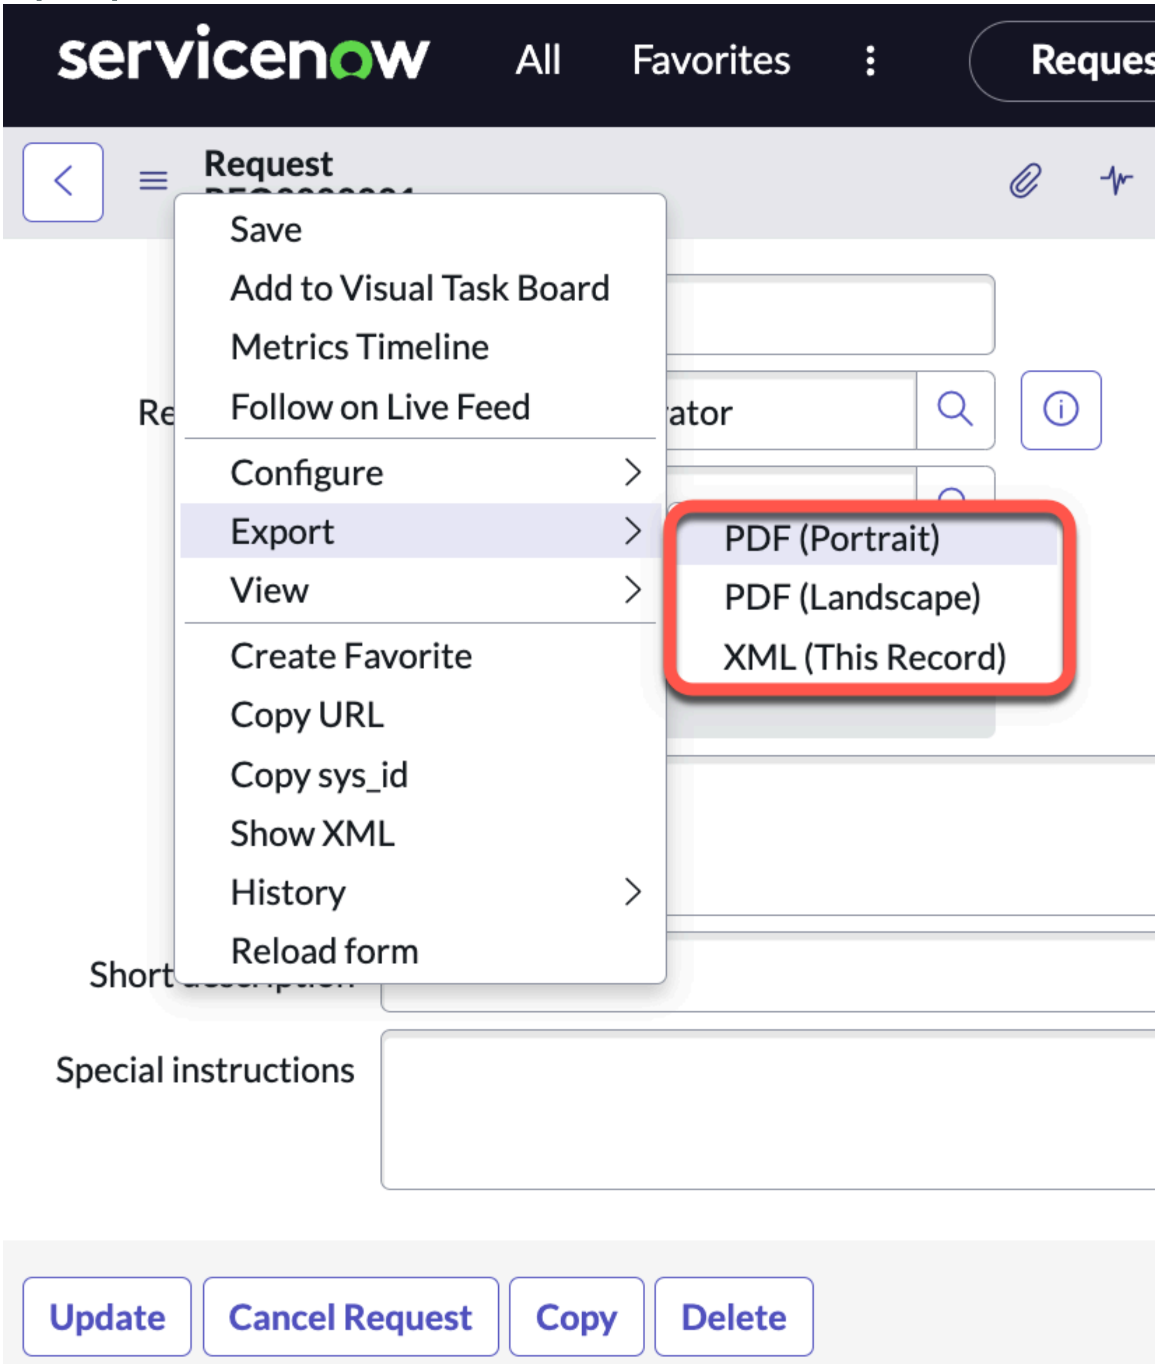
Procedure

1. Navigate to the record that you want to export.
2. Select the Additional actions menu ().
3. Select an export option.
   - To export the form data to PDF in portrait mode, select **Export** > **PDF (Portrait)**.
   - To export the form data to PDF in landscape mode, select **Export** > **PDF (Landscape)**.
   - To export all fields in the record to XML, select **Export** > **XML (This Record)**.

   When exporting to XML, the system prompts you to save the file, or the browser automatically saves the file to the downloads folder specified in the browser preferences.

Example:

Export options



Export data from a list

Export a list of records to a variety of file formats.

Before you begin

Role required: none. Exporting to XML requires the admin role.

About this task

The **Export** option is available in the column heading context menu in List v2. In List v3, it's available in the list title menu.

Note the following important details:

- Data exported from a list may be different from what a user sees in the list view. This generally happens when a table has ACLs that are dependent on the user's current session. To avoid blocking user activity on the browser, list export is executed from a background thread and doesn't have access to user session data.
- To export records in an embedded list, export the record containing the list. See Export data from a record.
- To control how line breaks appear in exported CSV data, use the glide.csv.export.line_break system property. See glide.csv.export.line_break.
- To remove unwanted HTML tags from list data, see the blog Rendering HTML in Exported Lists by a ServiceNow employee in the ServiceNow Community.
- The platform provides a default upper limit for data exports. See Export limits.

Procedure

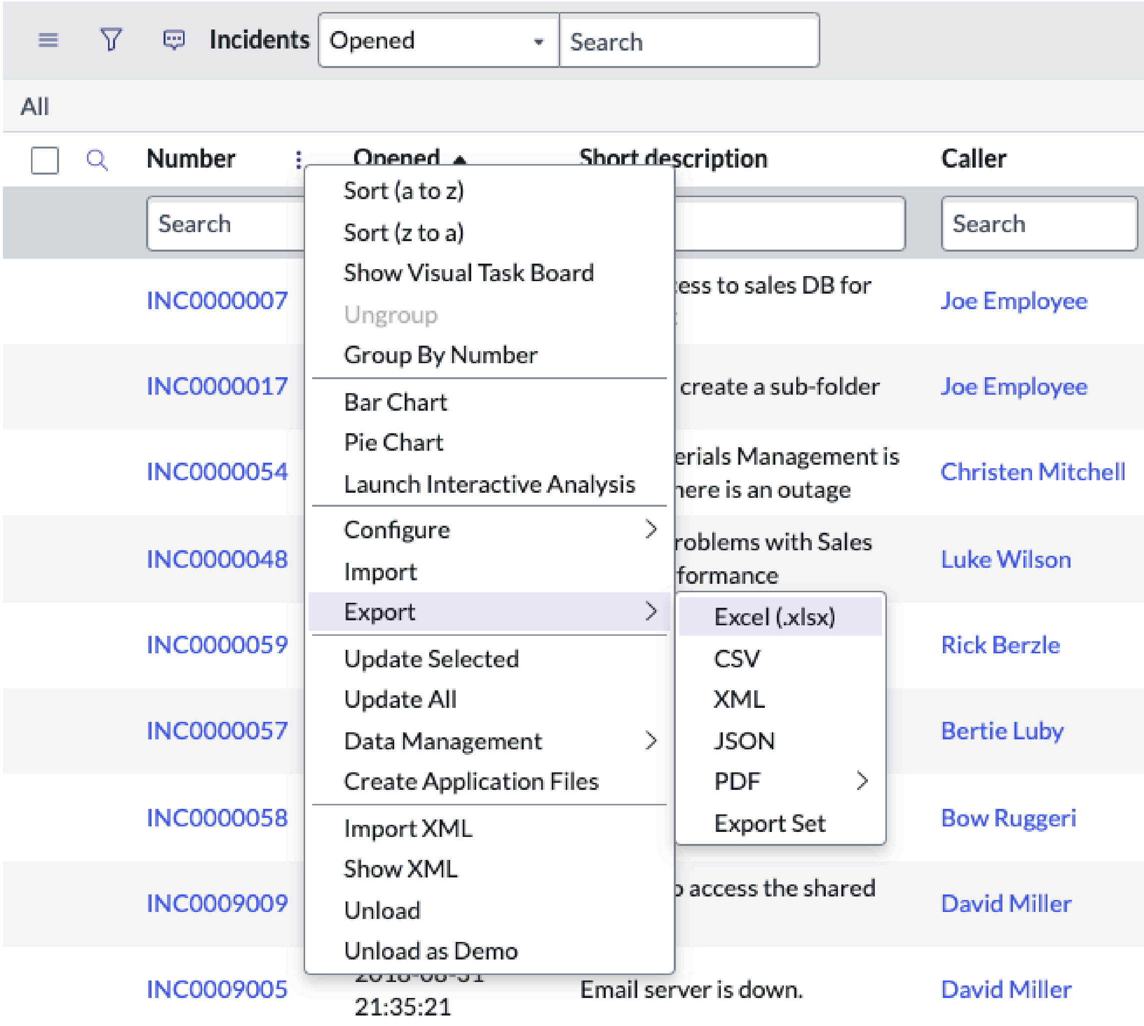
1. Navigate to the list of records that you want to export.
2. Select and hold (or right-click) any column header in the list.
3. Select an export option.
    - To export the list to Excel, select **Export** > **Excel (.xlsx)**.
    - To export the list to CSV, select **Export** > **CSV**.
    - To export the list to XML, select **Export** > **XML**
    - To export the list to JSON, select **Export** > **JSON**.
    - To export the list to PDF in portrait mode, select **Export** > **PDF** > **PDF Portrait**
    - To export the list to PDF in landscape mode, select **Export** > **PDF** > **PDF Landscape**
    - To export the list and the associated form for each record in portrait mode, select **Export** > **PDF** > **PDF Detailed Portrait**.
    - To export the list and the associated form for each record in landscape mode, select **Export** > **PDF** > **PDF Details Landscape**.
    - To export the list to a file using an export set, select **Export** > **Export Set**.

    For details on using export sets, see Export sets.
4. When the export completes, select **Download**.

servicenow

Example:

Export options



Export directly from a URL

Dynamically export data from a script or web service by building a URL query.

Before you begin

Role required: None

Note:
ServiceNow enforces basic authentication for direct URL access. The data extracted from the URL contains only the fields to which the currently authenticated user has read access.

About this task

You can use URL queries to generate filtered lists of records programmatically before exporting them. URL queries are useful for scripts that generate a list of records or when no user can manually add the filter from the UI.

You must be familiar with the ServiceNow table and column names to export data directly from the URL. See Navigate to a record or a module using a URL.

You can control whether to export the display value or raw value of fields and the field label or field name for headers using query parameters or system properties.

- For details on using query parameters, see Query parameters for display value and header.
- For details on using system properties, see System properties for display value and header.

Query parameters, if present, override system properties.

Procedure

1. Specify the instance URL.
   For example:

   ```
   https://<instance name>.service-now.com/
   ```

2. Specify the table form or list to export.
   For example:

   ```
   incident_list.do
   ```

3. Specify the export format processor to use for the export.
   You can specify CSV, XLS, JSON, XLSX, or XML. For example:

   ```
   ?CSV
   ```

   Note:
   The XML processor in a URL export doesn't export attachments or journal fields. To export attachments and journal fields like the **Work Notes** or **Additional Comments** fields, export the records from a list by using the **Export** > **XML** option in the context menu.

4. **Optional:** Query for specific records by adding the *sysparm_query* parameter.
   The required syntax is `sysparm_query=[column name][operator][value]`. For example:

   ```
   https://<instance
    name>.service-now.com/incident_list.do?XML&sysparm_query=prior
   ity=1
   ```

   Note:
   All queries use a column name, an operator, and a value. See Condition Builder for a list of available operators.

5. **Optional:** Sort the records by column name using the *sysparm_orderby* parameter.
   The required syntax is `sysparm_orderby=[column name]`. For example:

   ```
   https://<instance
    name>.service-now.com/incident_list.do?XML&sysparm_query=prior
   ity=1&sysparm_orderby=assigned_to
   ```

   Note:
   You can sort by only one column using *sysparm_orderby*. To sort by multiple columns, use multiple orderby entries. For example:

   ```
   sysparm_query=ORDERBYassigned_to^ORDERBYpriority
   ```

6. **Optional:** Export fields from a specific view using the *sysparm_view* parameter.
   The required syntax is `sysparm_view=[view name]`. For example:

   ```
   https://<instance
    name>.service-now.com/incident.do?CSV&sysparm_view=ess
   ```

   This URL exports incident fields visible from the Self Service (ess) view.

- By default, exporting data from a list exports only the fields that are visible from the current view. If you want to export fields from another list view, you can switch views from the UI. See View management.
- If you're exporting CSV or Excel data and don't specify a view, the export uses the default list view.
- If you're exporting XML data, all fields are exported by default unless you specify a particular view.

7. **Optional:** Export specific fields from the table using the *sysparm_fields* parameter.
   The required syntax is `sysparm_fields=[field1],[field2]`. For example:

   ```
   https://<instance
    name>.service-now.com/incident_list.do?CSV&sysparm_fields=sys_
   id,number
   ```

8. **Optional:** Export all fields from the table, including the sys_id, using the *sysparm_default_export_fields* parameter.
   The required syntax is `sysparm_default_export_fields=all`. For example:

   ```
   https://<instance
    name>.service-now.com/incident_list.do?CSV&sysparm_default_exp
   ort_fields=all
   ```

   The *sysparm_default_export_fields* parameter has no effect on XML exports unless you include the *sysparm_view* parameter to specify a non-default view.

Example: Sample URLs

URL	Description
https://<instance name>.service-now.com/incident_list.do?CSV	Export all incidents to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_query=sys_id%3E%3Db4aedb520a0a0b1001af10e278657d27	Export a particular incident to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_orderby=sys_id	Export all incidents to a comma-separated value text file and sort the list by sys_id.
https://<instance name>.service-now.com/incident_list.do?XML&sysparm_query=priority=1&sysparm_orderby=assigned_to	Export a list of all priority 1 incidents to an XML file and sort the list by **Assigned to** field.

Call URL export programmatically

Dynamically export data from a script or web service by calling a URL export from any programming language.

Before you begin

Role required: none

About this task

The following procedure includes code samples that demonstrate calling a URL export in C# for a .Net framework call:

Procedure

1. Add the following Imports:

```
using System.Net;
using System.IO;
```

2. Call the Download method:

```
static void Main(string[] args)

     {
        // Call to DownloadFile method supplying the URL and
 location to save CSV file locally
        int read =
 DownloadFile("https://
<instance>.service-now.com/incident_list.do?CSV&sysparm_query=p
riority=1&sysparm_orderby=assigned_to",
                     "c:\\test\\incident.csv");
    }
```

3. Create a Download method as follows:

```
public static int DownloadFile(String url,
                                       String localFilename)
    {
        // Function will return the number of bytes processed
        // to the caller. Initialize to 0 here.
        int bytesProcessed = 0;
        // Assign values to these objects here so that they can
        // be referenced in the finally block
        Stream remoteStream = null;
        Stream localStream = null;
        WebResponse response = null;
        // Use a try/catch/finally block as both the WebRequest
 and Stream
        // classes throw exceptions upon error
        try
        {
            // Create a request for the specified remote file
 name
            WebRequest request = WebRequest.Create(url);
            // Create the credentials required for Basic
 Authentication
            System.Net.ICredentials cred = new
 System.Net.NetworkCredential("user_name", "password");
            // Add the credentials to the request
            request.Credentials = cred;
            if (request != null)
            {
                // Send the request to the server and retrieve
 the
                // WebResponse object
                response = request.GetResponse();
                if (response != null)
                {
```

```
                   // Once the WebResponse object has been
retrieved,
                   // get the stream object associated with
the response's data
                   remoteStream =
response.GetResponseStream();
                   // Create the local file
                   localStream = File.Create(localFilename);
                   // Allocate a 1k buffer
                   byte[] buffer = new byte[1024];
                   int bytesRead;
                   // Simple do/while loop to read from stream
until
                   // no bytes are returned
                   do
                   {
                       // Read data (up to 1k) from the stream
                       bytesRead = remoteStream.Read(buffer,
0, buffer.Length);
                       // Write the data to the local file
                       localStream.Write(buffer, 0,
bytesRead);
                       // Increment total bytes processed
                       bytesProcessed += bytesRead;
                   } while (bytesRead > 0);
               }
           }
       }
       catch (Exception e)
       {
           Console.WriteLine(e.Message);
       }
       finally
       {
           // Close the response and streams objects here
           // to make sure they're closed even if an exception
           // is thrown at some point
           if (response != null) response.Close();
           if (remoteStream != null) remoteStream.Close();
           if (localStream != null) localStream.Close();
       }
       // Return total bytes processed to caller.
       return bytesProcessed;
   }
```

Break up a large export

If the number of records to be exported exceeds the actual export limit, you may want to break the export into smaller increments that do not place a significant performance load on the platform.

Before you begin

Role required: none

servicenow

Procedure

1. Create a filtered list of records that you want to export by following the steps in Export directly from a URL.
2. Write down the number of records returned.
3. If the record number is higher than the defined threshold, issue a `sysparm` query for the first 10,000 records using the following syntax:

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_orderby=sys_i
   d&sysparm_record_count=10000
   ```

   This exports the first 10,000 records in order, sorted by the *sys_id* number.

4. Find the next record in order, such as 10,001.
   You can find the next Sys ID value by creating a database view on the table and adding the sys_id column to the view. You don't need to specify a where clause. After you create the database view, view the records and their Sys ID values by selecting **Try it**. You can sort by the sys_id column and enter 10,001 to skip to that row.
5. Right-click the row and copy the sys_id of the next record you want to export.
6. Access the next series of records with a *greater than or equal to* query run against the *sys_id* of record 10,001.

   The following example shows a query that uses a sys_id of b4aedb520a0a0b1001af10e278657d27. Use the syntax shown in this query to export the next set of records.

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_query=sys
   _id%3E
   %3Db4aedb520a0a0b1001af10e278657d27&sysparm_orderby=sys_id&sysp
   arm_record_count=10000
   ```

   Note:
   URL queries use typical percent encoding. In this example, the greater than sign (>) is encoded as %3E and the equal sign (=) is encoded as %3D.

7. **Optional:** Continue issuing this query, using the starting sys_id for the next set of records until you have exported all the necessary records.

Exporting and importing data via XML

Migrate data from one instance to another by exporting and importing XML files.

Key benefits

- Directly export records as XML from any list or form.
- Transfer all fields and values exactly from one instance to another.
- Perform unscheduled data imports as needed.
- Save time by not building import sets or transform maps.

Use cases

- Export smaller batches of records on an infrequent basis by exporting and importing data via XML.
- Export and import data using XML files for records created in a development instance that must be migrated with an update set as part of a migration procedure. Examples of these records include lookup tables, unit test records, and other information required to support production. Typically, this information is only migrated once and the overhead of an import set is not justified.

Important considerations

- The XML export preserves all record field values including system generated field values such as:
  - Sys ID
  - Creation date
  - Update date
- Image field data is not preserved when exporting to XML.
- The XML import directly inserts records into the target table. During the import the system:
  - Ignores any business rules that normally apply to the table.
  - Does not provide any opportunity to transform incoming data.
  - Automatically matches a reference field's display value to the local Sys ID for some tables.
- Data export and import via XML is helpful for copying records from one system to another but does not remove the need to know the relationships between tables. If you need validate or transform data or reconcile the sys ID values of reference fields, use an XML import set instead. See Export sets.

Export data to XML

Export data from a source instance to an XML file.

Before you begin

Role required: admin

Procedure

1. Log in to the source instance (the instance that should send the data).
2. Export a record or a list of records to XML.

What to do next

Import data from XML

Import data from XML

After you have successfully exported data from the source instance to XML, import the XML file directly to the target instance.

Before you begin

Role required: admin

About this task

Importing XML doesn't trigger business rules or update the instance cache.

Procedure

1. Log in to the target instance (the instance that should receive the data).
2. Navigate to any list in the system.
   Any list can be used because the XML file contains the destination table name for the records.
3. Select and hold (or right-click) any column title and select **Import XML**.
4. In the Import XML form, select **Choose File** and select the previously exported XML file.
5. Select **Upload**.

Result

Data is imported into the target instance.

Trouble?

If the data doesn't import, navigate to **System Definition** > **Tables & Columns** and verify that the table from which the data was exported also exists in the target instance. If the table doesn't exist, you can move it using an update set. For details on using update sets, see Get started with update sets.

Automatic matching of display values

During the import of XML records, the system attempts to match some reference field display values to a local sys_id value.

If the system finds an existing record with a matching display value on the local instance, the import uses the sys_id of the existing record rather than the sys_id of the imported record.

For example, suppose you export an incident record that is assigned to the user John Smith. In the exported XML file there is an entry such as:

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">7712173d2ba80200c5244f74b4da159a</assigned_to>
 ...
</incident>
```

This user already exists on the target instance but has a different sys_id value such as:

```
<sys_user><name>John Smith</name>
 ...
 <sys_id>18cab8de2be80200c5244f74b4da15f7</sys_id>
 ...
</sys_user>
```

Since the display value matches an existing record, the system uses the local instance's existing sys_id value for the reference field such as:

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">18cab8de2be80200c5244f74b4da15f7</assigned_to>
 ...
</incident>
```

The system can match display values for the following tables.

- User [sys_user]
- Group [sys_user_group]
- Role [sys_user_role]
- Group Roles [sys_group_has_role]

Exporting currency fields to Excel

Exporting currency fields to Excel applies Account formatting and can be configured to convert all values to US dollars or to export values in the user's session currency.

When exporting currency fields to Microsoft Excel, the cells containing currency data use Accounting formatting. This formatting allows you to perform numeric operations on those values as well as view the currency symbol, such as $ or €.

When exporting currency fields the type of currency, such as $ or €, is preserved by default. The conversion rates for non-USD currencies are stored on the Exchange Rates [fx_rate] table.

You can choose to export all currency values either in US dollars or in the user's session currency.

- To export all currency values in US dollars, set the property *glide.excel.fixed_currency_usd* to **true**.
- To export all currency values in the user's session currency, set the property *glide.excel.convert_to_user_currency* to **true**.

If both *glide.excel.fixed_currency_usd* and *glide.excel.convert_to_user_currency* are set to **true**, *glide.excel.fixed_currency_usd* overrides *glide.excel.convert_to_user_currency*.

Currency export behavior and symbols

The behavior of the currency field in Excel depends on the **Symbol** of the currency.

- When the currency symbol is $, the Excel cell type is set as **Currency**.
- When the currency symbol is 1 character (such as ¥ or ¢) or more than 1 character (such as KR), the Excel cell type is set to **Custom**.

Enable export debug logging

When the property `glide.export.debug` is true, the instance logs export processing including database query time and the time taken to write data to the file.

When the property `glide.export.debug` is *true*, the instance logs export processing including database query time and the time taken to write data to the file. Debug logs are indicated by the text *Export API*. Prolonged use of this property can affect performance, so it is best to use it while debugging export processing, and then set the property back to *false*.

Data export reference

Reference topics provide details on exporting data.

Default values for column headers and column values

Default values are used for column headers and column values, unless overridden by query parameters, Export Set fields, or system properties.

The following table describes the default values used if you do not use query parameters, Export Set fields, or system properties to control output format.

Output format	Column headers	Column values
CSV	**Use field name**	**Use raw value** if *glide.export.csv.raw.value* set, otherwise **Use display value**.
Excel	**Use field label**	**Use display label**
JSON	N/A	**Use raw value**
XLSX	**Use field label**	**Use display value**
XML	N/A	**Use raw value**

Field types affected by export controls

Different field types are affected differently by export controls.

The following table describes how different field types are affected by export controls.

Field type	Display value	Raw value
Date/Time	CSV: User timezone date/time with user format.	CSV: UTC timezone date/time with system format.
	Excel/XLSX: User timezone date/time with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: UTC timezone date/time with user format if *glide.excel.use_user_date_format* set, otherwise system format.
Date	Date with user format.	Date with system format.
	Excel/XLSX: Date with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: Date with user format if *glide.excel.use_user_date_format* set, otherwise system format.
Time	CSV: Time with user format.	CSV: UTC time, assuming 1970-01-01 as the date with system format.
	Excel/XLSX: User timezone time with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: UTC time, assuming 1970-01-01 as the date with user format if *glide.excel.use_user_date_format* set, otherwise system format.
References	Display value of the referenced record.	Sys_id of the referenced record.
Choice	Label of the selected choice.	Value of the selected choice.
Currency	Value with the currency symbol.	USD value without the currency symbol.
Price (calculated)	Value with the currency symbol.	USD value without the currency symbol.
Price (fixed)	Value with the currency symbol.	USD value without the currency symbol.

System properties for display value and header

Use system properties to export the display value or raw value of fields and the field label or field name for headers.

System properties control the output for the CSV, Excel, JSON, and XLSX file formats. System properties define default behavior if overrides such as query parameters are not specified. System properties apply to exported files downloaded with URL parameters, exported from list view, or generated by export sets.

The following table describes each of the system properties that control display values and headers.

Format	Property	Default Value
CSV	*glide.export.csv.raw.value*	**false** **Note:** Setting the property as false also crops the value's string to 32000 characters.

Format	Property	Default Value
	`glide.export.csv.column_header_label`	**false**
Excel	`glide.export.excel.display_value`	**true**
	`glide.export.excel.column_header_label`	**true**
JSON	`glide.json.return_displayValue`	**false**
XLSX	`glide.export.xlsx.display_value`	**true**
	`glide.export.xlsx.column_header_label`	**true**

Example: CSV

Example:

glide.export.csv.raw.value = **false** (default)

glide.export.csv.column_header_label = **false** (default)

Query parameters for display value and header

Use query parameters to export the display value or raw value of fields and the field label or field name for headers.

Query parameters control the output for CSV, XLS, JSON, XLSX, and XML file formats. Query parameters, if present, override system properties.

The following table describes each of the query parameters that control display values and headers.

Query parameter	Description
sysparm_display_value	Exports the display value (**true**) or raw value (**false**) for the CSV, XLS, XLSX, and XML file formats.

Query parameter	Description
	See Field types affected by export controls for more information.
displayvalue	Exports the display value (**true**), raw value (**false**), or both (**All**) for the JSON file format. See Field types affected by export controls for more information.
sysparm_export_column_header_label	Exports the CSV, XLS, and XLSX file formats with the field label (**true**) or field name (**false**).

Example: sysparm_display_value

Example: *sysparm_display_value* **= true**

Export limits

The platform provides a default upper limit for data exports.

The purpose of the upper limit is to avoid creating performance issues when a table is excessively large. If you must export more records than the threshold permits, Break up a large export into separate manageable chunks.

servicenow

Export limit properties

You can set the number of records to return during an export using the `sysparm_record_count` URL parameter.

However, the system analyzes the following settings to determine whether an export limit should be applied.

1. First, the platform checks the property that defines the format-specific export limit. Each format can have a different limit. Although this property can be set to any value, exceeding the default export limit can impact system performance. You may want to set the property at or below the default limit and have users Break up a large export to export large amounts of data.
2. If the format-specific property is not set, the system checks the property for the general export limit. This property can also be set to any value, but exceeding the default export limit can impact system performance.
3. If both the format-specific export limit and the general export limit property aren't set, the system enforces the default export limit.

Important:
To set these properties, navigate to **System Properties** > **Import Export**.

Default export limit

Format	Format-specific export limit	General export limit	Default export limit
XML	glide.xml.export.limit	glide.ui.export.limit	10,000
CSV	glide.csv.export.limit	glide.ui.export.limit	10,000
EXCEL (XLSX)	glide.xlsx.export.limit	glide.ui.export.limit	10,000
EXCEL (XLS)	glide.excel.export.limit	glide.ui.export.limit	10,000
EXCEL (XLSX)	glide.xlsx.max_cells	N/A	500,000
EXCEL (XLS)	glide.excel.max_cells	N/A	500,000
PDF	glide.pdf.max_detail_pages **Note:** The number of rows can be set from 0 to 250. If no value is specified, the default is 250. If a value greater than 250 is specified, the default value of 250 is used.	250	250
PDF	glide.pdf.max_rows	N/A	1,000

Default export limit (continued)

Format	Format-specific export limit	General export limit	Default export limit
	Note: The number of rows can be set from 0 to 5,000. If no value is specified, the default is 1,000. If a value greater than 5,000 is specified, the default value of 1,000 is used.		
PDF	glide.pdf.max_columns **Note:** Only 25 header labels fit on a page.	N/A	25
JSON	glide.json.export.limit	glide.ui.export.limit	10,000

A warning threshold property called `glide.ui.export.warn.threshold` controls how the records are exported. When you export enough records from a list to exceed the threshold, a choice dialog appears. You can choose to wait for the export to complete or email the exported records as an attachment. The warning threshold can be changed in the system property. The email attachment must not exceed the maximum Email size limits.

Export limit examples

Example	Property	Breaking export limits
Exporting to CSV	• glide.csv.export.limit = 20,000 • glide.ui.export.limit = 10,000 • com.glide.processors.XMLProcessor.max_record_count = 20,000 • Default export limit for CSV = 10,000	If you export 30,000 records, the number of records returned from the database is 20,000. The number of records specified for export exceeds the value set in the `glide.csv.export.limit` property.
Exporting to Excel (XLSX)	• glide.xlsx.export.limit = no entry • glide.ui.export.limit = no entry • Default export limit for Excel (XLSX) = 10,000	If you export 30,000 records, the number of records returned from the database is 10,000. The number of records specified for export exceeds the default export limit for Excel.
Exporting to PDF	• glide.pdf.max_rows = 1,000 • Default export limit for PDF = 1,000 • Maximum export limit for PDF = 5,000	If you export 5,000 records, the number of records returned from the database is 1,000. The number of records returned is limited because the number of records specified for export exceeds the default value in the `glide.pdf.max_rows` property.

Excel export threshold

Excel exports are intended for relatively small exports with fewer than 500,000 cells. CSV can handle larger exports.

If an exported spreadsheet has more than 500,000 cells, the export process stops. You receive the Excel file at that point. The following message displays in the bottom row: `Export stopped due to excessive size. Use CSV for a complete export.`

The Excel export cell threshold is customizable using the *`glide.xlsx.max_cells`* integer property (or *`glide.excel.max_cells`* if using XLS).

Note:
Increasing this threshold may cause a memory issue in your instance. The threshold is set at an appropriate level to prevent resource issues.

The export puts the information into the Excel document with 32,000 rows per spreadsheet.

Roll back and delete recovery

With rollback contexts, you can roll back certain actions such as a patch upgrade, plugin activation, and background script executions, and you can recover record deletions and all related changes.

The roll back and delete recovery features are available on instances that use MySQL and MariaDB databases. Instances that use Oracle databases only support roll back. Instances that use SQL Server do not support roll back or delete recovery.

Roll back and delete recovery database support

Database type	Roll back	Delete recovery
MySQL	yes	yes
MariaDB	yes	yes
Oracle	yes	no

Deleted Records module

This module works on records in audited tables. Recovery of cascaded deleted records must be done within seven days of the record deletion. After seven days, only data records and references on tables that audit deletions can be recovered, which is the same functionality as prior releases.

To find this module, navigate to **System Definition** > **Deleted Records**.

Delete Recovery module

This module works for any deleted record. This recovery must be done within seven days of the record deletion.

To find this module, navigate to **Rollback & Recovery** > **Delete Recovery**.

Script Execution History module

This module works on scripts executed using the **Scripts - Background** module. This history only includes seven days of script executions.

To find this module, navigate to **Rollback & Recovery** > **Script Execution History**.

Rollback contexts

Rollback contexts contain everything necessary to roll back a software upgrade or plugin activation. They include deleted records, patch updates, Scripts-Background script executions, database actions, and plugin activations. A rollback context is created for each patch upgrade within a family, and each plugin activation, provided that the plugin supports rollback contexts.

To use rollback contexts, activate the Restore Deleted Records (com.snc.undelete) and Delete Recovery (com.glide.delete_recovery) plugins.

Rollbacks are typically performed on pre-production instances where functionality must be restored before you can find the root cause of a problem in the upgrade. Rolling back deletes data, which can often make it hard if not impossible to discover the problem that made the rollback necessary.

A rollback context is created when:

- *`GlideRecord.delete()`* or *`GlideRecord.deleteMultiple()`* delete records.
- There is a patch upgrade.
- You activate a plugin that supports rollback contexts.
- A script executes using the **Scripts-Background** module, and rollback was enabled by selecting the **Record for Rollback?** check box.

Rollbacks do not impact other database activities. If a database activity modifies a record that is part of a rollback context, the rollback does not affect that record.

Because rollback contexts contain a significant amount of data, rollback contexts are deleted after 10 days. Therefore, rollbacks must occur within 10 days of the latest upgrade or plugin activation. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property. See Rollback context properties.

> **Note:**
> Do not roll back a rollback context until checking with Customer Service and Support. A roll back deletes data and may remove evidence of the upgrade or activation issue preventing debugging of the problem.

To find this module, navigate to **Rollback & Recovery** > **Rollback Contexts**.

If any of the following operations occur during a rollback, a rollback context is not created:

- Tables or columns are dropped from the schema.

  > **Note:**
  > Index drops are okay.

- A table is truncated.
- A table or column is renamed.
- A column is re-parented or promoted.
- A column type changes.
- A column width is decreased.

The rollback process on Now Support does the following:

- Updates the reported WAR to the rolled-back version and the assigned WAR remains set to the version before the rollback.
- Sets the property `glide.war.no_upgrade` on the instance is set to the version before the rollback.
- Displays the message, "Desired war matches reverted war specified by property [`glide.war.no_upgrade`]. Upgrade script will NOT run".
- Changes the state to **Expired** and the rollback purges all stored data.

Roll back patch upgrades or plugin activations

Use the **Rollback Contexts** module to roll back patch upgrades and plugin activations.

Before you begin

Role required: admin

Review this information and requirements before performing rollback:

- Rolling back is possible only between patches in the same software release. For example, Rolling back is possible from Orlando patch 2 to patch 1, but not from Orlando to New York.
- The rollback must be done within 10 days of the most recent upgrade or plugin activation. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property. See Rollback context properties.
- You can only roll back to the previous version.

  For example, rolling back from patch 3 to patch 1 requires two rollbacks.
- You must have the Restore Deleted Records (com.snc.undelete) and Delete Recovery (com.glide.delete_recovery) plugins activated.
- You can only roll back one active instance at a time.

  Rolling back contexts on multiple nodes is not supported.
- A rollback deletes data and may remove evidence of an upgrade or activation record, which makes it difficult to debug the problem that made the rollback necessary.
- To roll back to a patch version before the Assigned WAR, submit a request for Customer Service and Support to do the rollback.

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Rollback Contexts**.
2. Select the context you want to rollback.
3. Roll back by selecting the **Rollback** related link.

   Note:
   The rollback link only works if the app was the last to be updated on the instance. If another app has been updated on the instance, the rollback won't work.

4. Confirm the rollback.
   An indicator appears showing the progress of the rollback. `glide.war` updates to the rolled-back version. The log shows the stages of the rollback process.
5. After the rollback is complete, log out of your instance and log back in again.

6. Open a new tab and see if the context state changed to **Rolled back**.
   If not, contact Customer Service and Support.

Use the Deleted Records module to restore a deleted record

You can recover deleted records that are in audited tables.

Before you begin

Role required: admin

About this task

The instance can track deletions on any table, and references on audited tables, with a few exceptions. Record deletions are not tracked in these circumstances:

- Record deletions are not tracked on tables with the `no_audit_delete=true` dictionary attribute.
- Not all tables with a sys prefix track deletions by default. You can Enable auditing for a system table.
- References are restored only if the reference field is on an audited table and the Restore Deleted Record plugin is activated.
- References that use an **Image** field type are not restored.

Procedure

1. Navigate to **All** > **System Definition** > **Deleted Records**.
2. Open the deleted record that you want to restore.

   Note:
   You can only restore one deleted record and its associated references at a time.

3. Do one of the following to restore the record.

Option	Description
Undelete With Related	Recovers the record and all cascaded deletes and other database actions that re sulted from the delete. This option appears when a rollback context is available for the delete.
Recover entire operation	If this record was deleted as part of another delete, all records from the parent delete are recovered including all cascaded deletes and other database actions that resulted from the parent delete. If this is the top level delete, then this is the same as **Undelete with Relat ed**. This option appears when a rollback context is available for the delete.
Undelete Record	Recovers only this record.

Option	Description
	Important: The undelete operation performs an in sert, which can trigger business rules. This might lead to additional inserts and updates on related records in other ta bles, potentially resulting in unexpect ed outcomes. For guidance on avoiding this behavior, contact Customer Service and Support.

An instructions page appears, explaining the process and its limitations.

4. Click **Restore deleted record**.
   A Progress page shows the progress of the restore process, and shows a count of the references restored.

Result

When the process completes, a Restore Summary itemizes the changes and provides links for viewing the restored record or returning to the deleted records list.

Use the Delete Recovery module to restore a deleted record

You can recover a deleted record and all related changes. The recovery must be done within seven days of the record being deleted.

Before you begin

Role required: admin

About this task

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Delete Recovery**.
2. Click the item from the **Delete Recoveries** list to be recovered.
   The **Delete Recovery** form is shown.
3. Under Related Links, click **Rollback...**.
4. In the **Rollback entire operation** form, enter `yes`, and click **OK**.
   A Progress page shows the progress of the restore process, and shows a count of the references restored.

Result

When the process completes, a **Restore Summary** itemizes the changes and provides links for viewing the restored record or returning to the **Delete Recoveries** list.

Use the Script Execution History module to roll back a Scripts-Background execution

You can roll back the database actions of a script executed using the Scripts-Background module.

Before you begin

Role required: admin

About this task

When you executed the script using the Scripts-Background module, the **Record for Rollback?** item must have been checked.

If you are still in the **Scripts-Background** module after executing a script, you can use the **Script execution history and recovery available here** link to get to the **Script Execution History** form.

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Script Execution History**.
2. Click the script execution to be rolled back.
3. In the **Related Links**, click **Rollback Script Execution**.

Rollback context properties

Change the default expiration period for different types of rollback context records.

Because rollback contexts contain a significant amount of data, they're deleted after 10 days by default. The Clean Expired Rollback Contexts scheduled job runs daily to delete expired records in the Rollback Context [sys_rollback_context] table. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property.

To add a system property, navigate to the System Properties [sys_properties] table and add a property for the type of rollback context record that you want to preserve. You can determine which property to add for a given rollback context by matching the property name to the Type column on the Rollback Context [sys_rollback_context] table.

Rollback context properties

Property	Description
The number of days to retain the rollback context for an app install `glide.rollback.expiration_days_app_install`	By default, you have 15 days to roll back an application installed from the ServiceNow® Store before the rollback context expires. You can extend the expiration period by updating this property. • Type: integer • Default value: 15
The number of days to retain the rollback context for a batch app install `glide.rollback.expiration_days_batch_app_install`	By default, you have 10 days to roll back apps installed using the Batch Installation feature before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for demo data `glide.rollback.expiration_clean_demo_data`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value.

Rollback context properties (continued)

Property	Description
	• Type: integer • Default value: 10
The number of days to retain the rollback context for recorded delete operations `glide.rollback.expiration_days_delete`	By default, you have 10 days after a delete operation completes to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context created for validating Flow Designer flow execution before and after an upgrade `glide.rollback.expiration_days_flow`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for IRE changes recorded from CMDB Integration Studio. `glide.rollback.expiration_days_inst_preview`	By default, you have 10 days after IRE changes are recorded from CMDB Integration Studio to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain rollback contexts in which the Type is set to Other. `glide.rollback.expiration_days_other`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for a plugin activation `glide.rollback.expiration_days_plugin`	By default, you have 15 days to roll back plugins activated in Application Manager before the rollback context expires. You can extend the expiration period by updating this property. • Type: integer • Default value: 15
The number of days to retain the rollback context for an anonymization job.	By default, you have 10 days after data is redacted by a Data anonymization job to roll

Rollback context properties (continued)

Property	Description
`glide.rollback.expiration_days_reboot`	back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for a background script execution `glide.rollback.expiration_days_scripts_bg`	By default, you have 10 days to roll back script execution before the rollback context expires. The rollback context tracks all INSERT, DELETE, and UPDATE statements executed by the script and recovers the data by undoing the SQL statements. You can extend the expiration period by updating this property. • Type: integer • Default value: 10
The number of days to retain the rollback context for changes recorded during test executions `glide.rollback.expiration_days_test_execution`	By default, you have 10 days after test execution to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for an upgrade `glide.rollback.expiration_days_upgrade`	By default, you have 10 days after the latest upgrade to roll back the upgrade before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10

ServiceNow AI Platform forms, fields, and lists

Data collection is easy with the ServiceNow AI Platform. Customize your forms with personalization, templates, tailored UI, file attachments, and more.

Form administration	Field administration	List administration
Configure forms and customize their functions to best suit your enterprise demands.	Create and maintain individual data items in your records on the ServiceNow AI Platform.	Control who views and uses data in your instance, and how they use it, with ServiceNow administrative options.

Form administration

Create and modify forms with a wide variety of tools on the ServiceNow AI Platform. Give users roles to configure forms with Form Personalization. Include supplemental info with Annotations, Attachments, and Formatters. Populate forms automatically with Form Templates, to add data based on configurable settings. Form UIs are fully customizable, with desired UI actions, UI policies, and more advanced form configuration options.

Field administration

Fine-tune every detail of your data collection. Field administration includes the ability to create individual pieces of data, modify them as needed. Parent-to-child field relationships and vice-versa are automatically maintained and updated as you make changes in your tables. Multiple Field types are available on the ServiceNow AI Platform, to tailor records on your instance as needed.

List administration

Give users controlled access to data with List administrative tools by ServiceNow. Delegate read-only or read-and-write privileges to users, and set up or modify UI controls for data in your lists.

For more information about how users interact with the ServiceNow user interface, lists, forms, and filters, see the ServiceNow User Interface Overview on ServiceNow University.

Form configuration

Form configuration involves changing the form layout and the related list layout. The form layout changes what appears on the form and the related list layout changes which related lists appear at the bottom of the form.

Important:
Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.

Understanding form views; configuring layout; designing forms;configuring related lists

You change aspects of a form such as showing or hiding fields, embedding lists, and adding sections and annotations. This video highlights form layout and design.

Using the form designer

Administrators or users with the personalize_form role can use the form design feature to quickly create new or change existing form views.

Important:
Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.

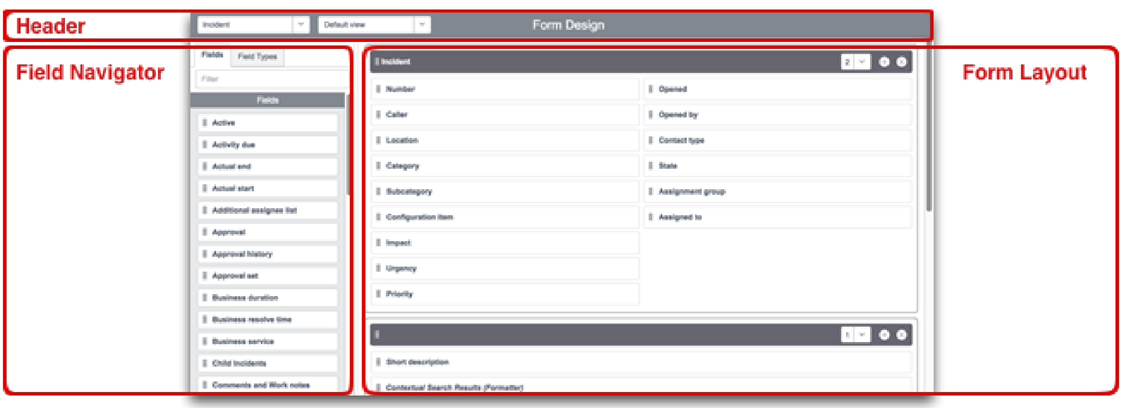
With form design, you can accomplish the same tasks that you can with form layout in a graphical tool called the form designer. You can also access field properties and add information from macros or previously scripted UI elements.

Form design is an alternative to configuring forms that combines several configuration options into one tool. It is available by default for new instances and requires Core UI . Administrators who upgrade from a previous version must activate the Form Designer (com.glide.ui.ng.fd) plugin to use the feature.

Access Form Designer by opening an existing form, selecting the Additional actions icon ( ), and then navigating to **Configure** > **Form Design**.

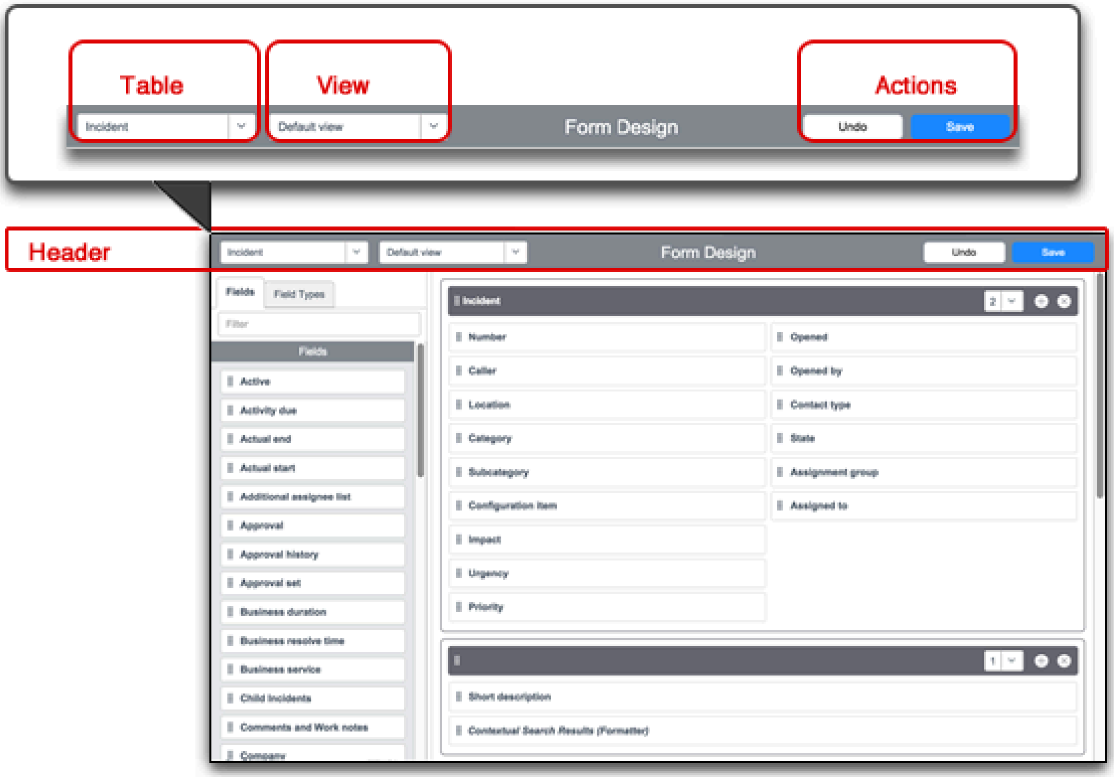
Accessing Form Designer from an existing form

Parts of the UI form design interface



The page header

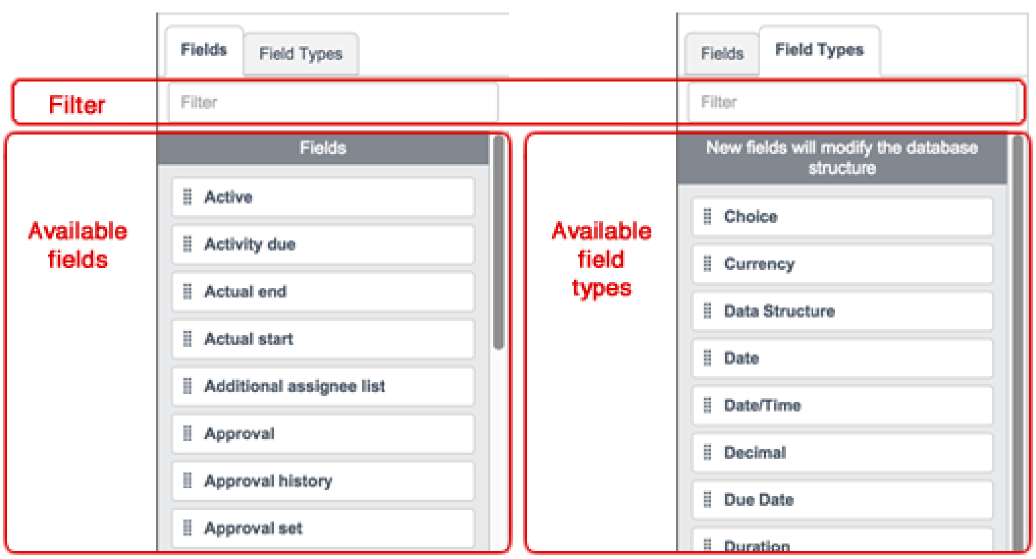
The page header displays the current table and view being designed. Each form is tied to a unique table and view combination. For example, there can only be one form for the incident table default view. Select a different view to modify different form layouts for a table.



The field navigator

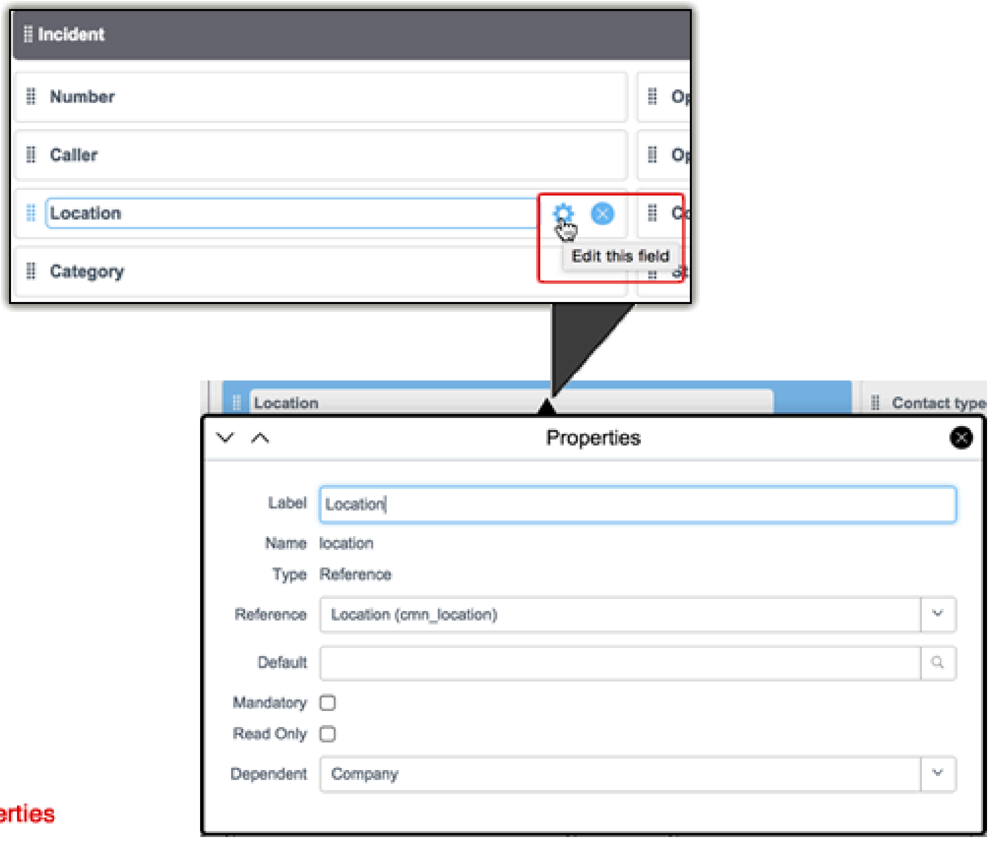
The field navigator allows you to manage fields on the form. It contains the following elements:

- **Filter**: Allows text search on the currently selected tab.
- **Fields**: Displays a list of existing fields you can add to the current form.
- **Field Types**: Displays a list of field types you can add to the current form. Adding a field type to the form layout creates fields in the selected table when the form layout is saved.



Field Navigator

Field properties are accessed by clicking the gear icon that appears when you point to a field in the form layout.

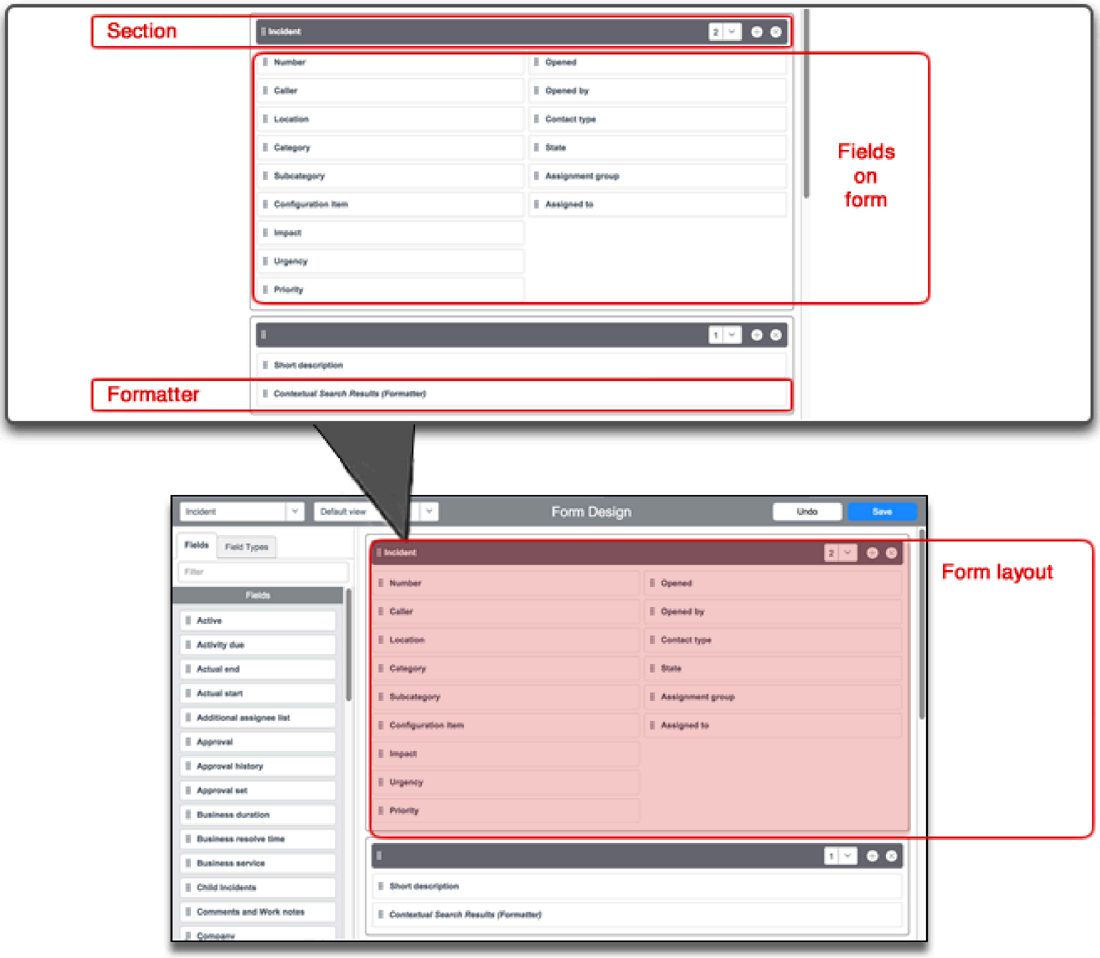


Field properties

Form layout

The form layout displays a separate cell for each field, section, annotation, UI element, and related list that is on the form. Each cell has an identifying label and a handle icon to aid in selecting and moving it. The location of the cell in the form layout represents its relative position on the form. Only fields visible on the form layout are displayed on a form.

Form layout



Show or hide fields with the form designer

You can move fields to and from the form workspace to display the fields on the form.

Before you begin

Role required: personalize_form

About this task

Use the filter to quickly find fields in the field navigator.

Procedure

1. Navigate to the form designer.
2. From the list of fields in the **Field Navigator**, select the field you want to display from the list of available fields.
3. Drag the field to the form layout.
4. Drag the field to the location you want it to be on the form.
5. To remove a field from the form layout, select the field and click the **Remove this field** (X) button beside the field label.
6. Click **Save**.

Add a form annotation with the form designer

Use annotations to provide instructions or additional information about fields on a form.

Before you begin

Role required: personalize_form

Procedure

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the **Annotations** field type.
4. Drag the annotation to the appropriate location on the form.
5. Point to the **Annotations** field and click the gear icon to open Properties dialog box.
6. In the Properties dialog box, enter a value for **Annotation Text**.
   You can use HTML tags to format the annotation text.
7. Click **Save**.

Add a new section with the form designer

Move sections to and from the form layout to display or remove the sections on the form.

Before you begin

Role required: personalize_form

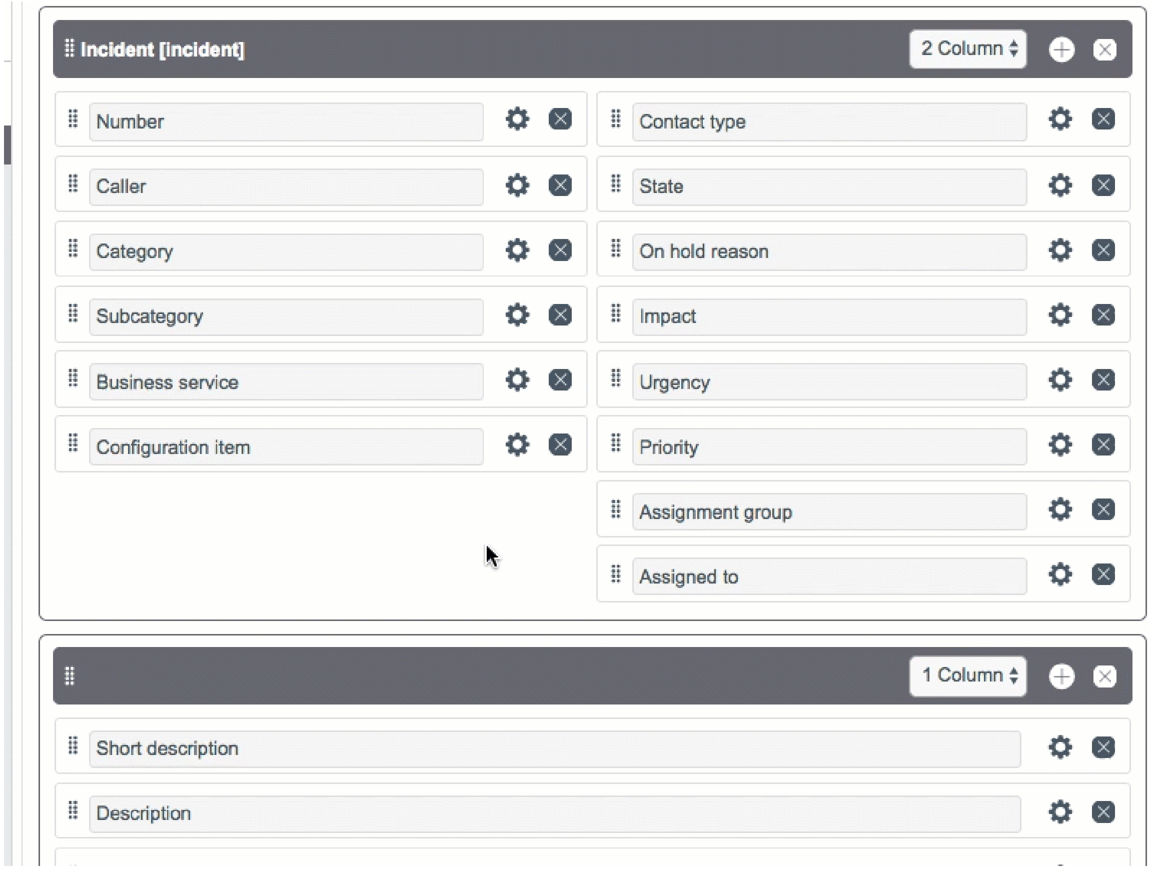
About this task

Sections can have a one- or two-column layout.
By default, the first section on a form is always a read-only section displaying the label of the table. You cannot remove this section.

Procedure

1. Navigate to the form designer.
2. Select an existing section.
3. Click the (+) button beside the section label to add a section.
4. Enter a label for the section.
5. Drag sections to reorder them.
   The label for the first section on the form designer is displayed as the form title.
6. To delete a section, click the (x) button beside the section label.
7. Click **Save**.

The following GIF shows how you would use form designer to add and then delete a form section.



Add a formatter with the form designer

Use formatters to add information from macros or previously scripted UI elements to a form.

About this task

Formatters are used to add information from macros or previously scripted UI elements to a form.

Procedure

1. Navigate to the form designer.
2. Click the **Fields** tab.
3. In the filter, enter the string `Format`.
4. Select the formatter you want to add to the form.
5. Drag the formatter to the location you want it to be on the form.
6. Click **Save**.

Add a new field with the form designer

You can add a field to a form and the associated table.

Before you begin

Role required: personalize_form

About this task

Adding a field creates a dictionary entry for the new column in the current table. You can create a custom table and then use the form designer to add fields to the form.

Use the filter to quickly find field types in the field navigator.

Procedure

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the cell for the field type to create.
4. Drag the field type to the location you want it to be on the form.
5. Enter a label for the field.
6. **Optional:** Point to a field in the form design area and click the gear icon to access properties.
7. Click **Save**.

Configuring the form layout

Administrators or users with the personalize_form role can configure the form and related list layout.

> **Important:**
> Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.

Show or hide fields on a form

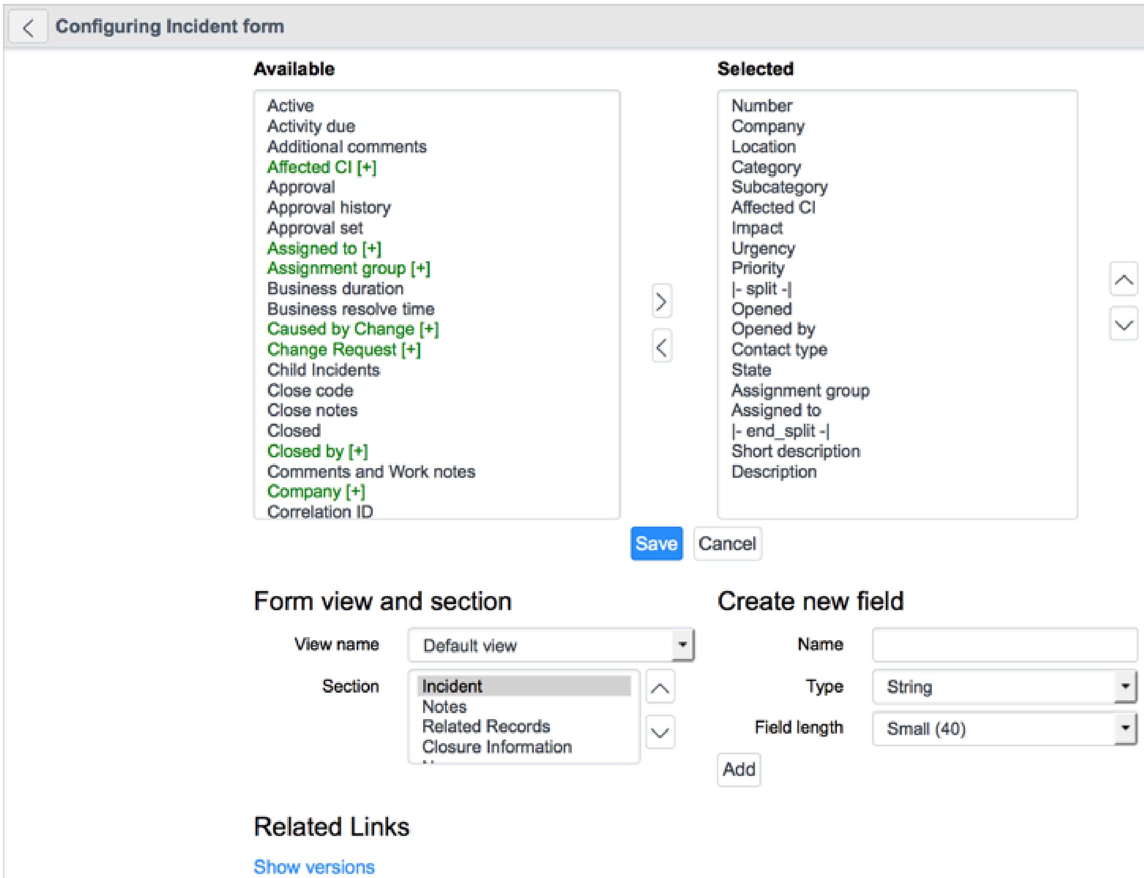
Configure form layout to change what appears on the form. You can perform tasks like changing what fields are visible, embedding lists, and adding sections and annotations.

Before you begin

Role required: personalize_form

Procedure

1. Navigate to a form.
2. Click the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Using the slushbucket, select the fields and the order in which you want them to appear. Available items that appear in green followed by a plus (+) sign represent related tables. To access fields on these tables, use dot-walking.



In Core UI, Form Layout is not responsible for the order of the Additional Comments and Work Notes fields. For more information on how to determine the order of these fields, see Customize activities.

4. Click **Save**.

> **Warning:**
> Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

What to do next

Through form configuration, you can also add new fields to the form, which creates columns to the table that underlies the form. See Add and customize a field in a table for more information.

Add a related list to a form

You can configure related lists to appear on forms and in hierarchical lists.

Before you begin

Role required: personalize_form

About this task

Related lists display records in another table that have a relationship with the current record.

Procedure

1. Open the form.
2. Click the form context menu icon and select **Configure** > **Related Lists**.

3. Using the slushbucket, select the related list to display on the form.
4. Click **Save**.
   Related lists appear at the bottom of the form.

Add an annotation to a form

Highlight form elements by displaying blocks of colored text or separators between form elements.

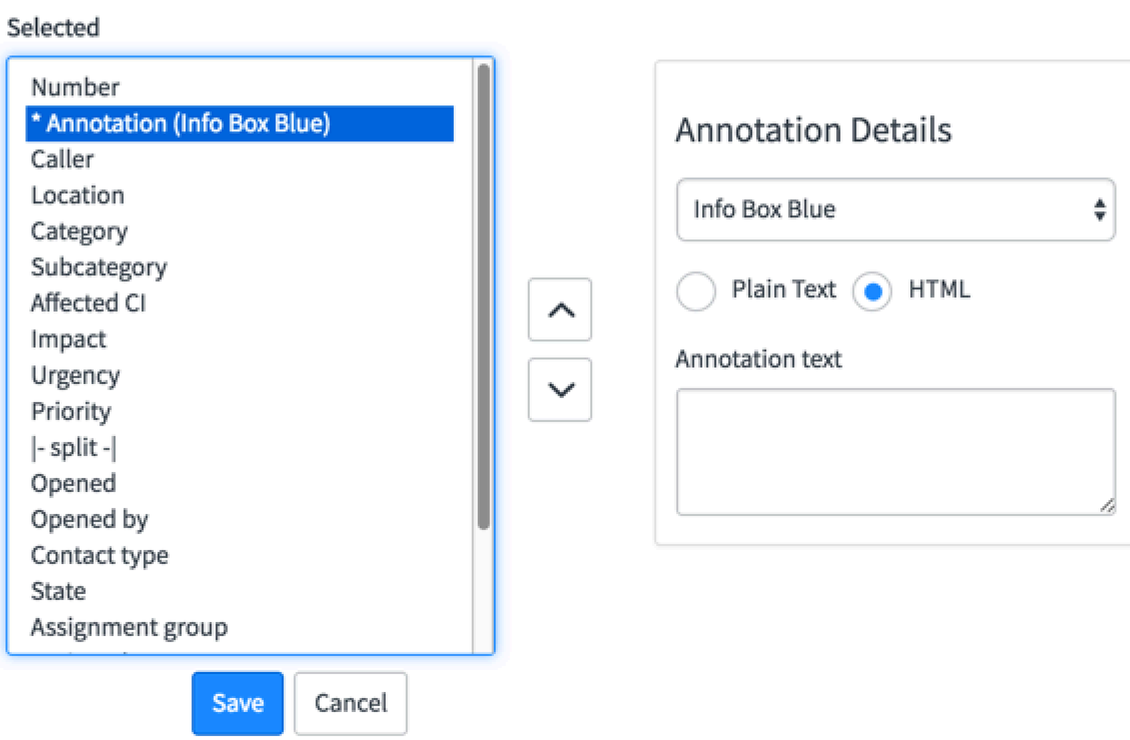
Before you begin

Role required: personalize_form

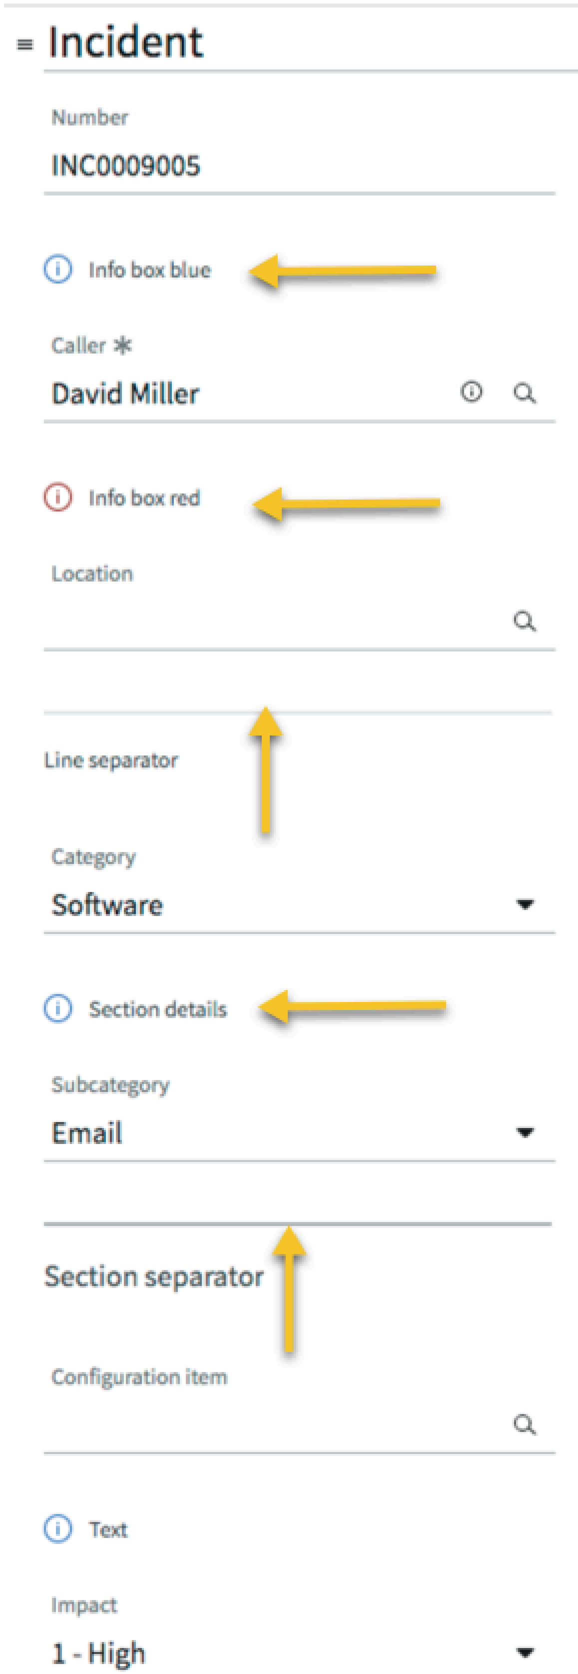
Procedure

1. Navigate to a form.
2. Click the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Under **Form view and section**, select a section.
4. In the Available list, double-click *** Annotation** to move it to the **Selected** list.

   The Annotation Details section appears.



5. Place it above the field to annotate.
6. In Annotation Details, select the type of annotation.
   The available types of annotations include **Info Box Blue**, **Info Box Red**, **Line Separator** (any text you add appears beneath the line), **Section Details**, **Section Separator**, and **Text**.



7. Select either **Plain Text** or **HTML** for the data type and enter the annotation in the text box.

   All valid HTML tags are supported.

For example, select the **Text** annotation type, the **HTML** data type, and enter Select the primary location:. The text appears red on the form.

8. Click **Save**.

Toggle annotations

Users can toggle annotations on a form in Core UI . The *glide.ui.show_annotations* user preference controls the visibility of annotations for each user.

Before you begin

Role required: none

Procedure

1. Navigate to a form.
2. Select the more options icon () to see the annotations icon.
   The icon is light gray and cannot be toggled when no annotations are available.

Create a form section

Create sections on forms to help group related fields together.

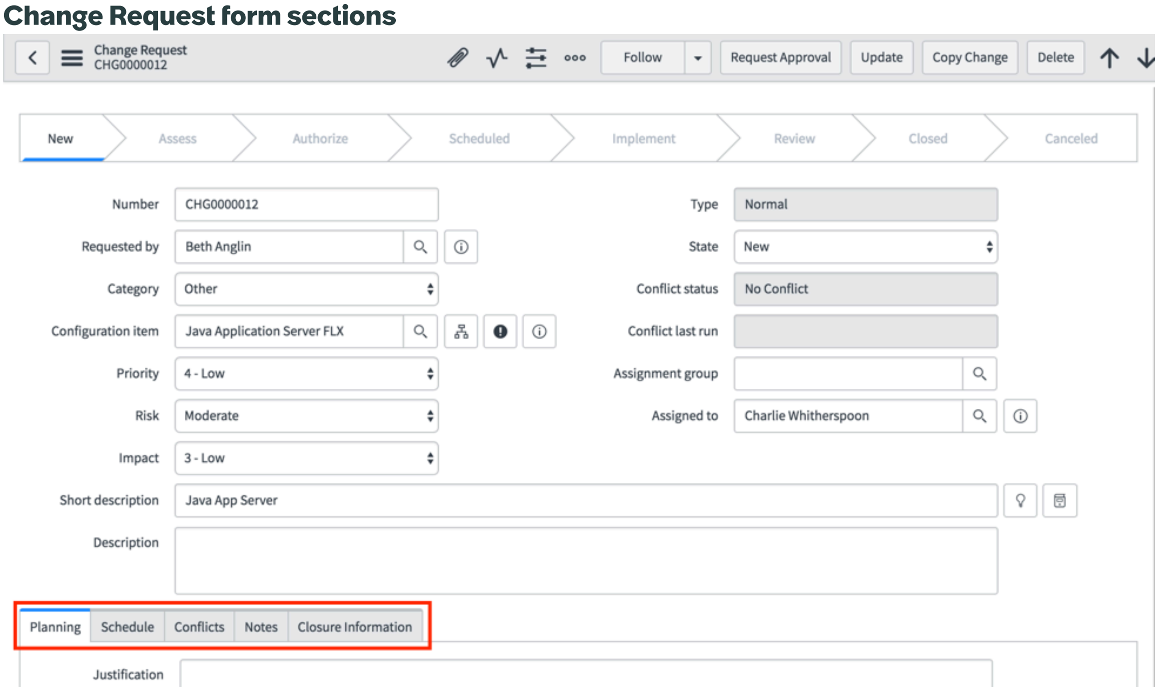
Before you begin

Role required: form_admin

About this task

Users can expand or collapse form sections to show or hide the fields they need. If you have tabs enabled, each form section appears on a separate tab. The default Change Request form is an example of a form with multiple sections as shown in the following image.

Change Request form sections



Procedure

1. Right-click the form header and select **Configure** > **Form Layout**.
2. In the **Form view and section** area below the slushbucket, click **New** in the **Section** list.
3. In the **Section caption** field, give the new section a title, then click **OK**.
4. Select a form section name and click the up or down arrow to change the section order.

   > **Note:**
   > The caption for the first section on the form becomes the form title.

5. Add fields to the new section using the slushbucket.
6. Click **Save** when you are finished.
   The new section appears on the form with the fields you selected. If you do not add any fields to a section, the section stays empty.

   If you want to delete the form section later, do the following:

   a. Navigate to **System UI** > **Form Sections**.
   b. Filter for the table that contains the section you want to delete. For example, the Incident table. The name of the form section to be deleted is displayed in the **Caption** field.
   c. Select the check box beside the form section to delete, and then select **Delete** from the **Actions on selected rows** menu.
   d. Click **OK** to confirm the deletion.

Move form splits

Change the place where fields split on a form by moving the split section indicators in a slushbucket.

Before you begin

Role required: admin

Procedure

1. Navigate to a form.
2. Click the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Move any of the following split section indicators:
   - |- begin_split -|
   - |- split -|
   - |- end_split -|
4. Click **Save**.

Display tabbed forms

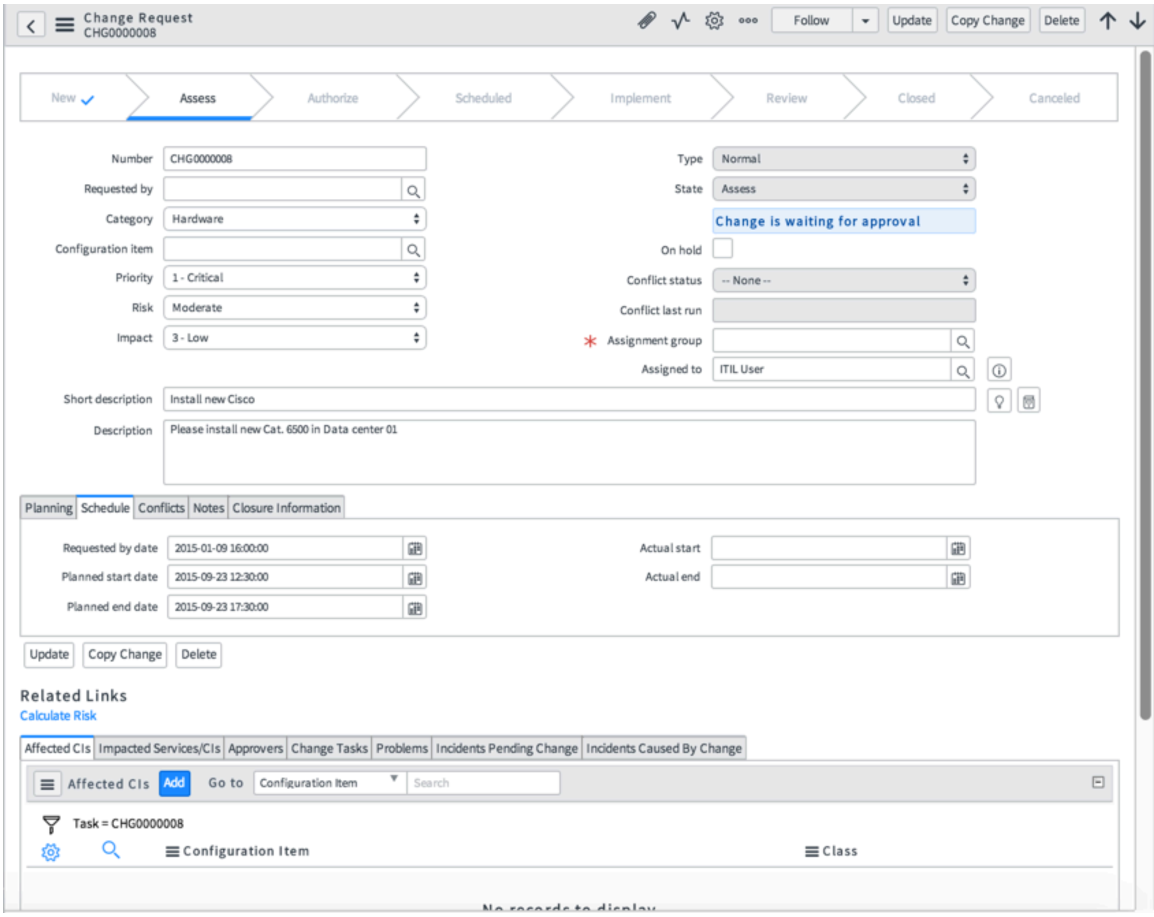
Tabbed forms offer a useful way to make forms and related lists take up less space by reducing the scrolling that must be done to navigate the form.

Before you begin

Role required: personalize_form

About this task

Tabbed forms



Form sections and related lists are tabbed separately, each with their own tab line. A user always sees the first form section. All sections after that can be tabbed. Tabs are enabled by default for new instances.

Tabbed forms are enabled by default for new instances. A system user preference with the name **tabbed.forms** specifies whether the tabbed UI is used by default for all users. Users can change this preference as described in this procedure.

Procedure

1. Click the gear icon in the banner frame.
2. Enable **Tabbed forms**.

Embed a list within a form

You can embed lists within a form. When a list is embedded in a form, any changes made to the contents of the list are saved when the form is saved.

Before you begin

Role required: personalize_form

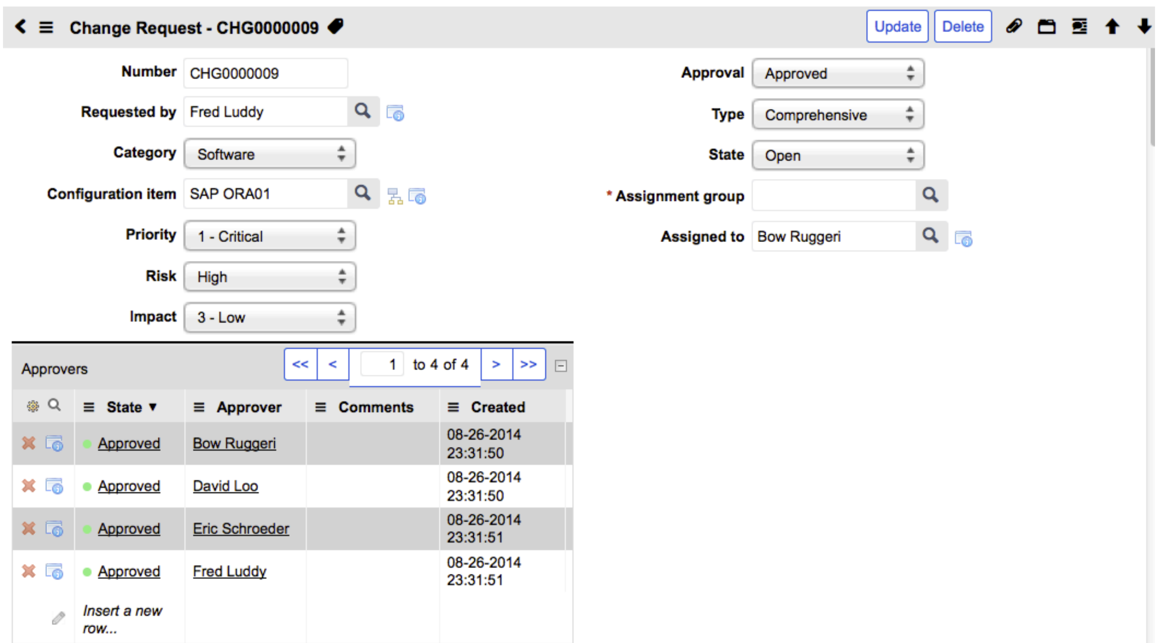
About this task

This allows the embedded list to be treated just like another element on the form. In addition, users can create records in the list view. After a row is added to the list, double-click any cell in the list to edit its value. You can add the same lists to a form as embedded lists or as related lists, depending on the path selected in the form context menu.

You can also modify embedded list controls, such as the name of the related list and the roles required to create records in the embedded list.

Procedure

1. Select a record from the list.
2. Right-click the form header and select **Configure** > **Form Layout**.
   The slushbucket shows the available fields and the lists that can be embedded in the form. Lists appear in red at the bottom of the **Available** list.
3. Select a list and move it to the **Selected** column.
4. Use the up and down arrow buttons to position the list in the form.
5. Click **Save**.
   Lists adjust to fit the frames of the adjacent fields.



Configure customer updates indicator

You can configure the indicator for customer updates, which are changes that update sets, scripts, service catalog items, and other configuration tables track.

Before you begin

Role required: admin

About this task

The customer updates indicator icon ( ) may appear on the header of forms that have customer updates. Clicking the customer updates indicator opens the update set records for the item.

You can configure this indicator to appear for all or for specific administrators using the `owned_by_indicator.form` user preference.

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Perform one of the following actions.

Option	Description
Enable the indicator for all administrators	Set the *owned_by_indicator.form* preference to **true**.
Enable the indicator for an individual admin istrator	**a.** Make sure the *owned_by_indicator.form* system user preference is set to **false**. **b.** Create a user preference with the following values: ▪ **Name:** `owned_by_indicator.form` ▪ **User:** Select the administrator for which to enable the preference. ▪ **Value:** `true`

Add a chart to a form

Add a chart to a form to show your users graphical data related to the form. For example, you could show an incident SLA-related chart on the Incident form so your users can see how well service level agreements are being met.

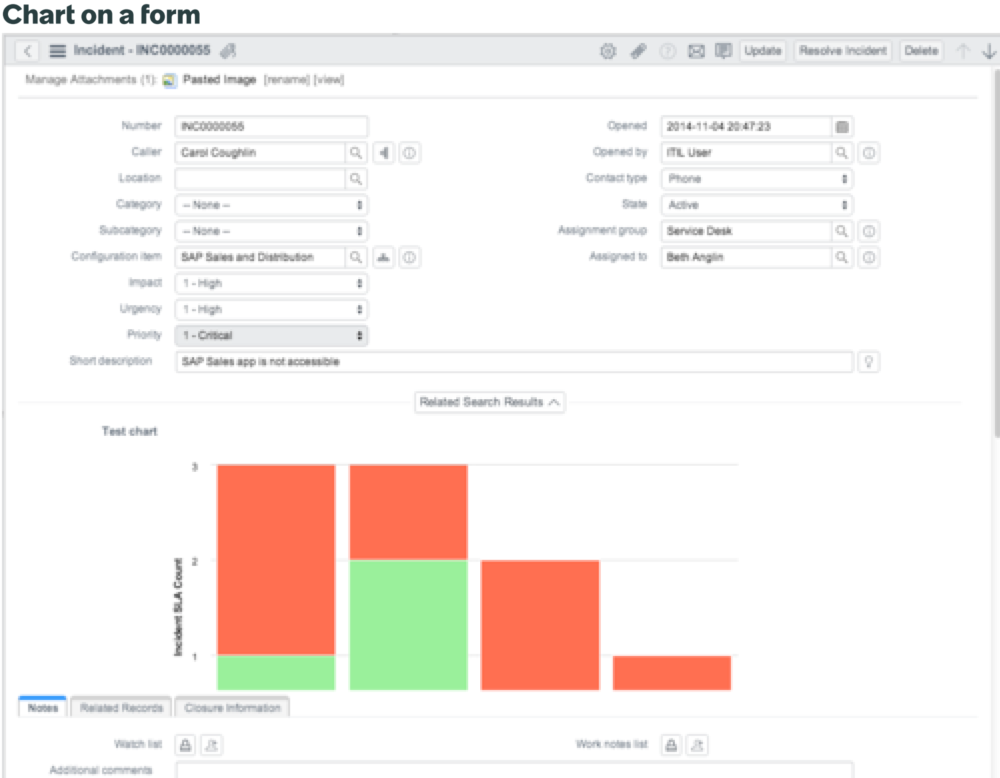
Before you begin

Role required: personalize_form

About this task

Note:
The following report types are not supported on forms: List, Pivot, Multilevel Pivot, Calendar, and Single Score.

Chart on a form



Procedure

1. Navigate to **All** > **System UI** > **Forms**.
2. Select the form you want to configure.
3. Click the form context menu icon ( ) and select **Configure** > **Form Layout**.
4. Using the slushbucket, select *** Chart**.
5. Enter a **Label** in the chart details.
6. Click **Save** to return to the form.
7. Click **Configure chart**.
8. Select a chart in the **Report** field and configure other options as desired.
9. Click **Update**.

Form administration

Administrators can configure several settings that control form functionality.

Form personalization

Control how users configure forms. You can also change the role that is necessary to configure a form and disable the form configurations that specific users already made.

See Administering form personalization for instructions.

Form annotations

Choose the types of annotations that are available on forms and save localized versions of form annotations.

See Administering form annotations for instructions.

Attachments

Control several aspects of form attachments, such as attachment size, allowed file extensions, and the roles that are allowed to attach files.

See Administering attachments for instructions.

Formatters

Create and edit formatters, such as the activity formatter, which displays information on the form that is not a field in the record. You can also configure formatter settings such as the maximum number of formatter entries.

See Formatters for more information.

Form templates

Create templates that automatically populate form fields based on settings you configure.

See Form templates for more information.

UI actions

Add buttons, links, and context menu items on forms to the UI more interactive, customizable, and specific to user activities.

See UI actions for more information.

UI policies

Configure the policies that dynamically change information on a form.

See Create a UI policy for more information.

Other advanced options

Configure advanced form features, such as form focus, form splits, and derived fields.

See Advanced form configuration for instructions.

Administering form personalization

Administrators can configure several aspects of form personalization, which allows users to customize the layout for any form view.

Administrators can manage this function using the following options.

- Activate or deactivate form personalization globally.
- Control user access to form personalization based on roles.
- Manage the personalized forms of users.

Note:
Personalizing a form in this way modifies the form for you only. To make changes to a form that are visible to all users, you must configure the form.

Activate form personalization

Form personalization is activated for new instances. To activate form personalization for upgraded instances, an administrator must activate the Form Personalization (com.glide.ui.personalize_form) plugin.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Form Personalization (com.glide.ui.personalize_form) plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Change form personalization role requirements

By default, the itil role is required to personalize forms, but you can change this requirement with a system property.

Before you begin

Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the *glide.ui.personalize_ form.role* property in the System Properties list.
3. In the **Value** field, specify the roles that can access form personalization.

Manage personalized forms

When a user personalizes a form, the system stores the customizations as a user preference record. You can view and manage the user preferences.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Filter the list by **[Name] [contains] [personalize]**.
   There is a user preference for each form view each user personalizes. The name format combines the word personalize with the name of the table and the name of the view. For example, if a user personalizes the default view of the Asset [alm_asset] form, the user preference is called *personalize_alm_asset_default*.
3. Delete a user preference to remove the customizations for the user.

Disable form personalization

If you do not want your users to customize forms, you can disable form personalization.

Before you begin

Role required: admin

About this task

Activating the Personalize Forms plugin sets the *glide.ui.personalize_ form* property to true. You can disable form personalization.

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the *glide.ui.personalize_ form* property in the System Properties list.
3. Set the **Value** field to `false`.

Administering form annotations

Form annotations are additional pieces of information on a form, such as a line or paragraph of text. Use form annotations to provide on-screen instructions to your users.

Form annotations are enabled by default in the base system. To disable them, set the `glide.ui.form_annotations` system property to false.

Support multiple languages for a form annotation

You can store multiple translations of form annotation text.

Before you begin
Role required: admin

About this task
To support multiple languages, use message records to translate annotation text.

Procedure

1. Navigate to **All** > **System UI** > **Messages**.
2. Create a message record for each language you support.
3. On the Message form, set the **Key** field to a unique identifier for the annotation text.
   The annotation text is a good key. The key must be the same for each translation message for the annotation.
4. Select the appropriate **Language**.
5. In the **Message** field, enter the translated annotation text.
6. Edit the form annotation and reference the message key with a *`gs.getMessage`* call.
   For example, if the message key is **Message key text**, enter `${gs.getMessage("Message key text")}` in the form annotation.

Administer form annotation types

You can define the form annotation types to control their appearance.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Form Annotation Types**.
2. Set the **Active** field to **false** for any types you do not want to use.
3. Click **New** to add a type.

Administering attachments

Administrators can configure system properties for how files are uploaded and attached to records. Uploading, viewing, and deleting file attachments triggers a single event that can be used for notifications or in scripts.

Attachment tables

When you store an attachment to any table, a record is created in the Attachment [sys_attachment] table that contains attachment metadata. The file data is stored in the Attachment Document [sys_attachment_doc] table, in 4k chunks. For example, if you attach a 12k file called **My_attachment.pdf**, then there is an Attachment entry with three related Attachment Document entries.

To learn how to upload attachments to records, see Add and manage attachments.

Activity stream thumbnail scaling

The *`glide.ui.activity_stream.scale_images`* property scales large images down and creates thumbnails for the activity stream view of the images. This property is active by default. It applies to images retroactively, so any attachments included in an activity stream in the past also see the effects.

- Maximum dimensions for thumbnails using this property are 525 pixels width by 350 pixels height. The system favors the pixel height first, so you can end up with images that are wider than 525 pixels.
- Attaching image files over 5 MB can create an out of memory error and cause the instance to restart. An out of memory error and restart occur when the system generates the thumbnail when you attach a new image. The error and restart can also occur the first time you load existing images on a record.
- The administrator can add the *com.glide.attachment.max_get_size* system property to control the maximum image scaling dimensions.

Enter the following information into the [sys_properties.list] table:

Field	Description
Name	com.glide.attachment.max_get_size
Type	integer
Value	5242880

The value field represents the size in bytes.

- The base system value is 5242880 bytes (5 MB). You can change the value as necessary.
- With this property set, images that are larger than 5 MB are not scaled and the system creates a link instead. Images smaller than 5 MB are scaled down.

Configure the max image size property for Activity Streams

When attaching an image in an Activity Stream, the system controls the maximum size of the image. Use the *com.glide.attachment.max_get_size* property to control the maximum image scaling dimensions.

Attachment events and logging

A script action or notification can process attachment events. Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

Attachment events

Event	Description
attachment.read	An attachment has been read or downloaded.
attachment.uploaded	An attachment has been uploaded. If multiple attachments are uploaded to a record at one time, only one event is created.
attachment.deleted	An attachment has been deleted. This event is also triggered when the record containing the attachment is deleted. If a record is deleted that contains multiple attachments, a separate event is triggered for each attachment in the deleted record.
attachment.renamed	An attachment has been renamed.

Attachment logging

When an attachment is downloaded, the `attachment.read` event record is written, and you can do something with this event. For example, you can record when and by whom certain attachments are downloaded. For this functionality, **current** is a sys_attachment record, and the event record uses the following parameters:

- **parm1:** File name
- **parm2:** Table name

Debug attachment indexing

To change debugging options for attachment indexing, add these system properties.

- `glide.ts.index.attachment.debug`: When the value is set to **true**, enables log messages for exceptions that occur when indexing attachments (default is **false**).

  You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

- `glide.ts.index.attachment.list_terms.debug`: When the value is set to **true**, logs all indexed terms when an attachment is indexed (default is **false**).

  [Recommended] For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.

> **Note:**
> To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

Configure attachment system properties

You can disable the drag-and-drop feature. (Users can still upload attachments by browsing to the file.) You can also limit the attachment file size, restrict who can upload attachments, and restrict what file extensions can be uploaded.

Before you begin

Role required: admin

> **Note:**
> To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

Procedure

1. To disable the drag-and-drop features, navigate to **System Properties** > **UI Properties**.
2. Clear the check box for the **Allow attachment drag and drop in supported HTML5 browsers** property.
3. Click **Save**.

Limit attachment file size

You can specify the maximum size allowable for attachments to avoid issues with the user's active session on the instance. The maximum attachment size for email attachments is configured separately.

Before you begin

Role required: Admin.

About this task

Note:
The maximum attachment size for email attachments is configured separately.

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. Enter a value in the **Maximum file attachment size in megabytes** property.
   The system only allows attachment sizes up to 1 GB. By default, this field is blank. If you leave this field blank, the system uses the default maximum limit of 1 GB.
3. Click **Save**.

Require a role to attach files

You can restrict who can upload attachments.

Before you begin

Role required: Admin.

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. In the **Attachment limits and behavior** section, locate the **List of roles (comma-separated) that can create attachments** property (*`glide.attachment.role`*).
3. Enter one or more roles separated by commas.
   Only roles listed in this property are able to upload attachments to a record. If no roles are entered, then all roles can upload attachments.
4. Click **Save**.

Restrict attachment file extensions

The *`glide.attachment.extensions`* property restricts the file extensions that users can upload as attachments.

Before you begin

Role required: Admin.

About this task

Restrict attachment file extensions to prevent users from uploading invalid file types and file types that may be more likely than others to contain viruses or malware.

Note:
This property does not restrict attachments based on the actual file type, only based on the extension. To enable MIME type validation, which validates that the MIME type of a file matches the file extension and can block attachments that do not pass this validation, see Upload MIME type restriction (instance security hardening).

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. In the **Attachment limits and behavior** section, locate the **List of file extensions (comma-separated) that can be attached to documents via the attachment dialog** property.

3. Enter the file extensions and click **Save**.
If no extensions are specified, then all extensions are allowed. However, if any extensions are specified, all unlisted extensions are restricted. Listed extensions should not include the dot (.) prefix or spaces after commas. For example, enter `xls,xlsx,doc,docx`.

Disable attachments on a table

You can prevent users from adding attachments to records on a specific table.

Before you begin
Role required: admin

Procedure

1. Open a record in the table.
2. Right-click the form header and select **Configure** > **Dictionary**.
3. In the list of dictionary entries, select the first record in the list (the record with no **Column name** entry).
4. Add `no_attachment` to the **Attributes** field, separated by commas from any existing attributes.
See Altering tables and fields using dictionary attributes for more information.

Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

Before you begin
Role required: admin

About this task
By default, attachment indexing is enabled for the Knowledge Base. You can enable attachment indexing for other tables. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

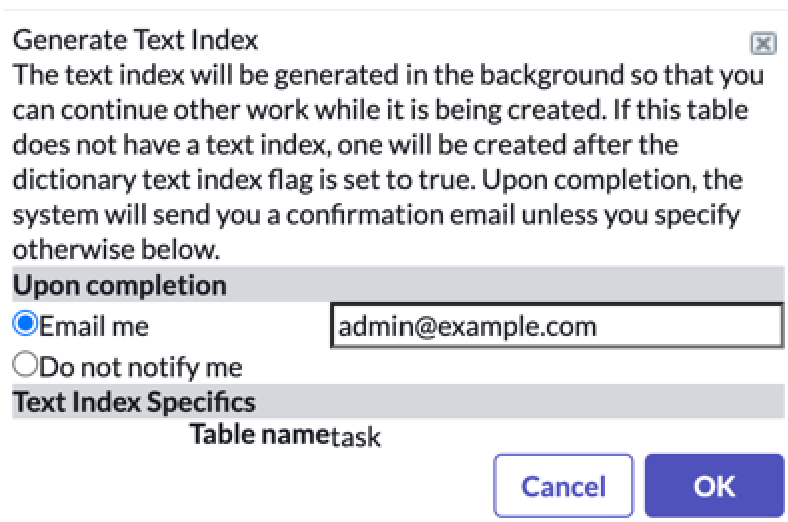
Procedure

1. Navigate to **All** > **System Definition** > **Text Index Configurations**.
2. Edit the record for the table that you want to enable attachment indexing for.
3. In the Text Index Table Attribute Maps related list, select **New**.
4. On the Text Index Table Attribute Map form, fill in the fields.

Field	Value
Table	<table name>
Attribute name	Attachment index
Value	true

> **Note:**
> The attachment index attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, enabling indexing of attachments on the Task table does not enable indexing of attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

5. Select **Submit**.
   A message appears indicating that the attachment index attribute change will not take effect until you reindex the selected table.
6. Dismiss the reindexing message by selecting **OK**.
7. On the Text Index Configuration form, select the **Generate Text Index** related link.
8. In the confirmation window, perform one of these two steps:
   - To receive an email notification from the system when text indexing for the table is complete, enter your email address and select **OK**.
   - If you do not want to receive an email notification, select **Do not notify me**, then select **OK**.



9. Dismiss the confirmation message by selecting **OK**.

Result

The system begins text indexing for the table. When it is complete, attachments can be searched on that table.

Hide the attachment [view] link

Users can open an attachment by clicking either the file name or the **[view]** link. The **[view]** link opens the file from within the browser, which executes JavaScript code as part of the attachment. You can hide the **[view]** link. Users can still view attachments by clicking the file name.

Before you begin

Role required: Admin.

Procedure

1. Add the `glide.ui.disable_attachment_view` and `glide.ui.attachment_popup` properties.
   For instructions on adding properties to the platform, see Add a system property.

2. For the *glide.ui.disable_attachment_view* property, set the **Type** to **true/false** and set the **Value** to **true**.
3. For the *glide.ui.attachment_popup* property, set the **Type** to **true/false** and set the **Value** to **false**.
4. To return to the default behavior (enable the link), set the *glide.ui.attachment_popup* property **Value** to **true**.

Configure attachment icons

Configure the icon that appears beside an attachment of a particular file type.

Before you begin

Role required: admin

Procedure

1. Determine the path of the image file or upload a new image.
2. Navigate to **System UI** > **Attachment Icon Rules**.
3. Open an existing rule or click **New** to create a new rule.
4. Enter the rule details.
5. Click **Submit** or **Update**.

Formatters

A formatter is a form element used to display information that is not a field in the record. Add formatters to a form by configuring the form.

Examples of formatters in the base platform

Formatter	Description
Activity formatter	Displays the list of activities, or history, on a task form. For an example of an activity formatter, see Activity formatter.
Process flow formatter	Displays the different stages in a linear process flow across the top of a record. For an example of a process flow formatter, see Process flow formatter.
Parent breadcrumbs formatter	Provides breadcrumbs to show the parent or parents of the current task. For an example of a parent breadcrumbs formatter, see Parent breadcrumbs formatter.
Approval summarizer formatter	Displays dynamic summary information about the request being approved. For an example of an approval summarizer formatter, see Approval summarizer formatter.

Examples of formatters in the base platform (continued)

Formatter	Description
CI relations formatter	Displays on the CI form a toolbar for viewing the relationships between the current CI and related CIs. For an example of CI relations formatter icons, see CI relations formatter.

Note:
Formatter elements cannot be exported to PDF. When exporting PDF data from a form, any formatter elements added to the form are not displayed in the PDF output.

To create a custom formatter, create a UI macro to define content for the formatter, then create a formatter that refers to the UI macro. You can then add the formatter to a form.

Create a UI macro for a formatter

Create a UI macro to define the content that the formatter displays.

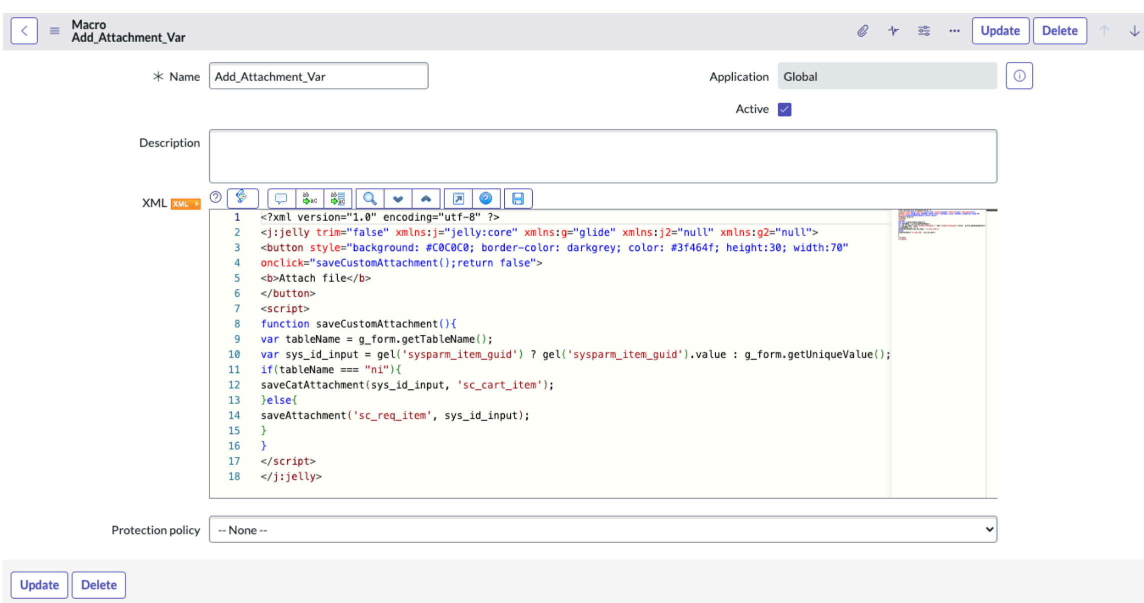
Before you begin

This functionality requires knowledge of Jelly script.
Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Click **New**.
3. Complete the form.
4. In the **XML** script field, enter Jelly script to define the content to be displayed by the formatter.

   Note:
   The UI Macro for the formatter represents a row in the UI. It must begin and end with `<TR></TR>` tags.



This Jelly script is reproduced below in plain text that you can copy into the Macro form as a basis for your macro script.

```
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide"
 xmlns:j2="null" xmlns:g2="null">
<button style="background: #C0C0C0; border-color: darkgrey;
 color: #3f464f; height:30; width:70"
onclick="saveCustomAttachment();return false">
<b>Attach file</b>
</button>
<script>
function saveCustomAttachment(){
var tableName = g_form.getTableName();
var sys_id_input = gel('sysparm_item_guid') ?
 gel('sysparm_item_guid').value : g_form.getUniqueValue();
if(tableName === "ni"){
saveCatAttachment(sys_id_input, 'sc_cart_item');
}else{
saveAttachment('sc_req_item', sys_id_input);
}
}
</script>
</j:jelly>
```

5. Click **Submit**.

Create a formatter and add it to a form

Create the formatter after creating the UI macro that defines the content.

Before you begin

Role required: admin

About this task

With the UI macro in place, create the formatter that references it, and add it to the form.

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Click **New**.
3. In the **Name** field, enter a descriptive name for the formatter.
4. In the **Formatter** field, enter the name of the UI macro with `.xml` appended to it.
5. In the **Table** field, select the table in which the formatter will be used.
6. In the **Type** field, select **Formatter**.
7. Click **Submit**.
8. To add the formatter to a form, configure the form design and add the formatter.
   The formatter appears on the form according to your selections.

Activity formatter

The activity formatter provides an easy way to track items not saved with a field in the record, for example, journal fields like comments and work notes.

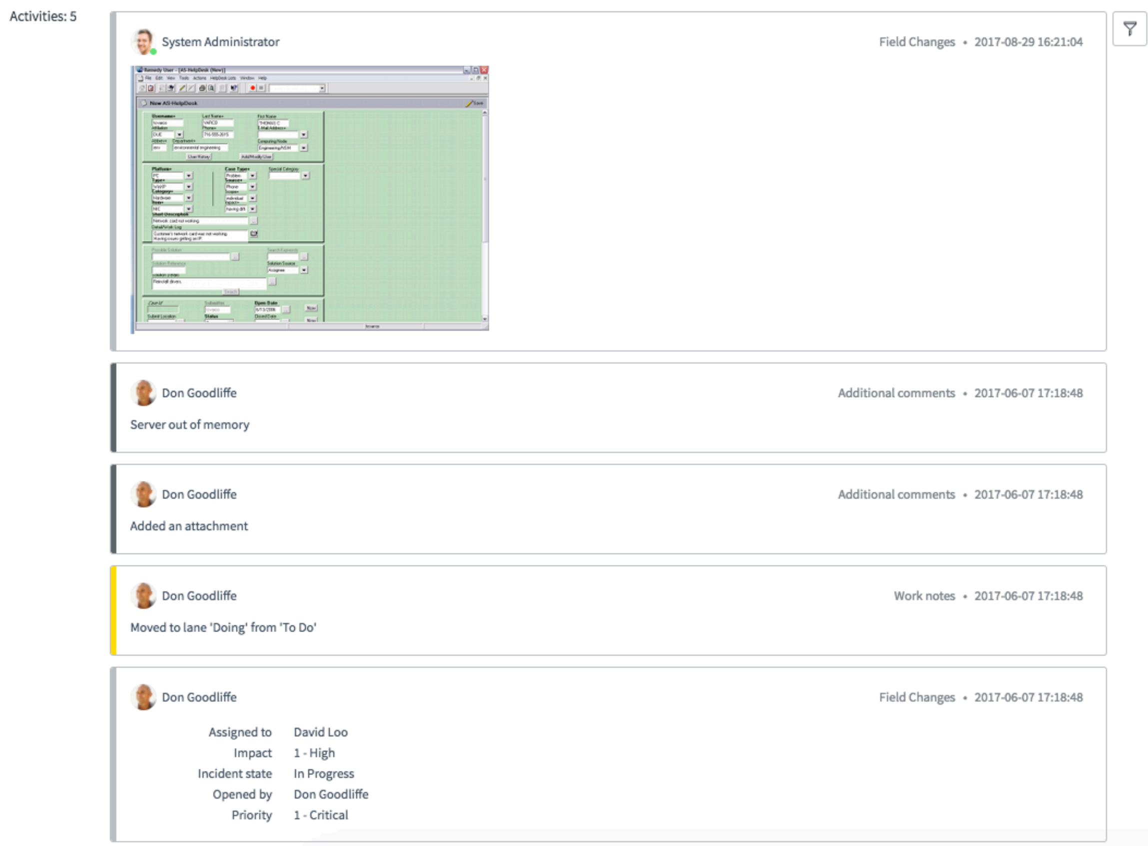
The activity formatter is enabled by default on the Task [task] table and other tables that extend the Task table, such as the Incident [incident] table. It is also enabled on the Approvals [sysapproval_approver] table.

You can filter the content that appears on the activity formatter and participate in the record feeds on the record. You can create an activity formatter for any form and configure properties that control what fields appear in the formatter. The number next to activities indicates the number of entries in the record feed. The number updates when users use the filter.

Activity type and a time stamp display in the top of each entry.

In Core UI, the activity formatter shows updates in real time so you can see the latest information without refreshing the form. User presence enables you to see when other users are entering comments.

Core UI activity formatter



Create an activity formatter

You can create an activity formatter for any audited table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Click **New**.
3. Enter a name for the formatter, such as `Activities (task)`.
4. Select a **Table**.
5. Enter `activity.xml` in the **Formatter** field.

6. Leave the **Type** as **Formatter**.
7. Click **Submit**.

Result

Note:
You can create more than one activity formatter for a table, however, the system does not allow you to add more than one activity formatter to a form.

What to do next

Add the new activity formatter to forms as needed.

Add the activity formatter to a form

Add an activity formatter to any form to track journal fields on the form.

Before you begin

Role required: personalize_form

Procedure

1. Verify that the table associated with the form is audited.
2. Configure the form layout to add **Activities (filtered)**.

   Note:
   In Core UI, you cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.

   Note:
   Field styles are not applied to comments and work notes fields used with the activity formatter. Styles for these fields can be set using the `glide.ui.activity_stream.style.comments` and `glide.ui.activity_stream.style.work_notes` system properties located on the sys_properties table.

Enable the Live Feed-Activity toggle

Enable the Live Feed-Activity toggle, which allows users to switch between the activity feed and the document feed for a record.

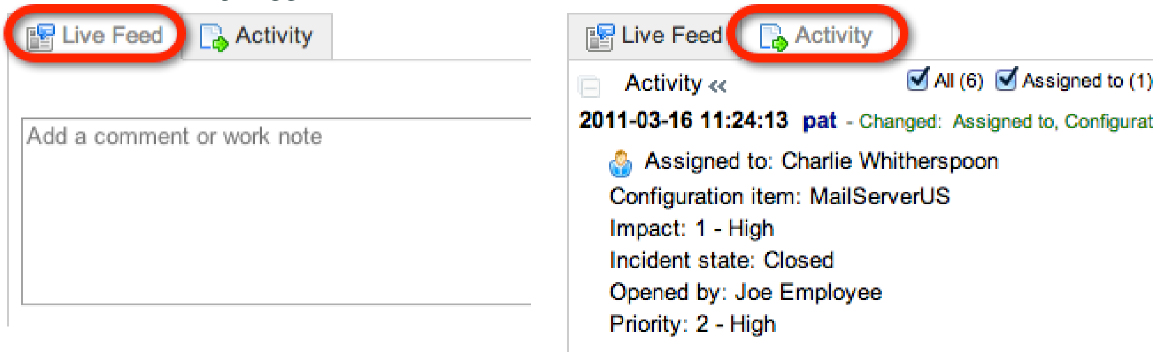
Before you begin

Role required: admin.

About this task

Use live feed to interact with other users on a record by posting messages and adding attachments to the feed. Use the activity formatter to see an overall summary of activity for the record.

Live Feed/Activity toggle



The *glide.ui.show_live_feed_activity property* is enabled. Navigate to **Collaborate** > **Feed Administration** > **Properties** and enable the **Toggle the display of the live feed tab in the activity formatter** option.

Procedure

1. Verify that the live feed and record feed plugins are active.
2. If the activity formatter is not visible, configure the form to add it.
3. Set the *live_ feed* dictionary attribute to true on the form.
   This action adds live feed to the activity formatter.
4. Enable the system property.
   a. Navigate to **Collaborate** > **Feed Administration** > **Properties**.
   b. Enable the **Toggle the display of the live feed tab in the activity formatter** option (*glide.ui.show_live_feed_activity property*).

Customize activities

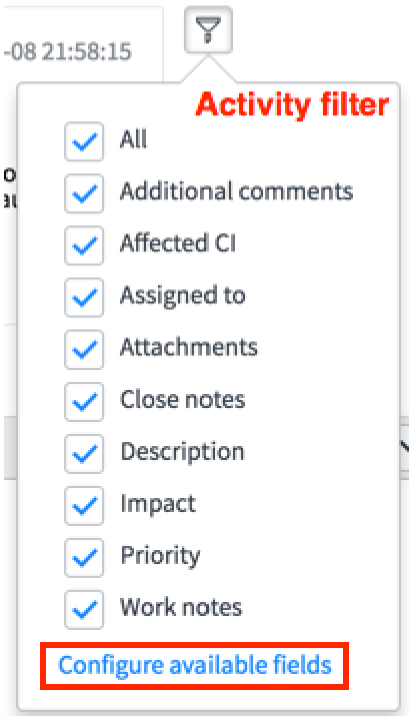
You can customize which fields appear in the activity formatter. You can add or remove fields from the list of activities that users can select when they open the activity filter.

Before you begin

Role required: personalize_form and personalize_list

About this task

Customize the fields that appear in the activity filter



Procedure

1. Select the activity filter icon ( ).
2. At the bottom of the list, select **Configure available fields**.
3. In the slushbucket, select the desired fields in the **Available** column and move them to the **Selected** column.
   The activities appear in alphabetical order, regardless of the order in the **Selected** column.

   > **Note:**
   > In Core UI, **Configure available fields** is responsible for the order of the Additional Comments and Work Notes fields.

4. Select **Save** to add them to the activity formatter and the filter.

What to do next

Administrators can also modify the system property **Incident activity formatter fields**(*`glide.ui.incident_activity.fields`*). Access this property through **System Properties** > **UI Properties**. The system automatically synchronizes the values in the system property and the selections you made.

Configure roles for viewing emails in the activity formatter

The system property *`glide.ui.activity.email_roles`* enables you to control which roles can see emails in the activity formatter.

Before you begin

Role required: admin

About this task

In the activity formatter, users see activity only for fields they have permission to read. For example, self-service users might see the activity formatter on the self-service view of the Incident form, but they do not see work notes, unless security rules have been customized to allow this.

If the **Emails-autogenerated** or **Emails-correspondence**field is included in the activities list, all users see all emails. No determination is made whether an end user, for example, should see an email containing work notes. Configure this property to restrict this capability to specified roles.

> **Note:**
> Email does not appear as an activity until it is sent. If email properties are not configured for outbound delivery, the message can be found by navigating to **System Mailboxes** > **Outbox**.

Procedure

1. Navigate to **System Properties** > **UI Properties**.
2. Locate the property labeled **List of roles (comma separated) that can view emails in the Activity Formatter when "Emails-autogenerated" or "Emails-correspondence" are included.**
3. Add roles to the property, separated by commas.
   These are the only roles that can see email in the activity formatter. All other roles are prevented from seeing email. If no roles are listed, all users can see email. The itil role is on the list by default.
4. Click **Save**.

Configure the max activity size property

Use the glide.max_activity_size property to increase the amount of content that can be visible in the Activity Formatter.

Before you begin

Role required: admin

About this task

The default size for an activity is 100 * 1024, which causes large amounts of content to be hidden in the Activity Formatter. You can change the default value by adding the glide.max_activity_size property.

Procedure

1. Type `sys_properties.list` in the Application Navigator.
2. Select **New** and enter the following values.

Field	Description
Name	glide.max_activity_size
Type	integer
Value	102400 Use this field to increase the number of content allowed in the Activity Formatter. This value should be in bytes, for example 100 * 1024, or 102400.

Configure email reply for the activity formatter in Core UI

The *glide.ui16.emailStreamResponseActions* system property determines whether a user can reply to email using the email reply button in the activity stream in Core UI.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, type `sys_properties.list`.
2. Add the following system property.
   For more information on adding a system property, see Add a system property.
3. Select **Submit**.

Configure activity formatter colors

Use the glide.ui.activity_stream.style.comments and glide.ui.activity_stream.style.work_notes properties to change the color-coding in the Activity Formatter.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Add a system property for the **Additional comments** field.
   a. Select **New**.
   b. Enter the following values.

Field	Description
Name	`glide.ui.activity_stream.style.comments`
Type	string

   c. Select **Submit**.
3. Change the color of the **Additional comments** field.
   a. In the System Properties list, select the glide.ui.activity_stream.style.comments record.
   b. Enter the color that you want to use.
      For example, enter `LightGreen`. The default value is transparent.
   c. Select **Update**.
4. Add a system property for the **Work notes** field.

a. Select **New**.

b. Enter the following values.

Field	Description
Name	`glide.ui.activity_stream.style.work_notes`
Type	string

5. Change the color of the **Work notes** field.

   a. In the System Properties list, select the glide.ui.activity_stream.style.work_notes record.

   b. Enter the color that you want to use.
   For example, enter `Blue`. The default value is gold.

   c. Select **Update**.

Process flow formatter

The process flow formatter provides a graphical summary of the stages in a process. The formatter is typically shown at the top of forms that are part of a process.

Each record on the Flow Formatter [sys_process_flow] table represents a process stage and can have a different condition applied to it. When specified conditions are fulfilled, the formatter highlights the current stage and places a check mark next to all previous stages.

These examples show a workflow in Core UI interface.

Core UI process flow for a change request

When any formatter stages are defined for a table, they appear on the form associated with that table in the order specified, assuming the formatter has been added to the form.

Activate the process flow formatter

You can activate the Process Flow Formatter plugin.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a process flow formatter

You can create a process flow formatter stage.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Process Flow**.
2. Click **New**.
3. Complete the form, as appropriate.

Field	Description
Table	Select a table for this process flow formatter.
Name	Enter a name to identify the formatter.
Label	Enter the name to be displayed in the form configuration slushbucket.
Active	Select the check box to ensure that the formatter stage is active. When the check box is cleared, the formatter stage does not appear in the flow display.
Order	Enter a number to indicate where in the process flow the formatter will be displayed. Formatters are arranged with the lowest number on the left and the highest number on the right.
Condition	Use the condition builder to set the conditions under which the formatter is highlighted as current. Any field available in the condition builder, such as SLA or Impact, can be used to trigger a process flow stage.
Description	Describe the process flow formatter. This description does not appear on the actual formatter.

4. Repeat as necessary for each stage.

Parent breadcrumbs formatter

The parent breadcrumbs formatter on the Task table provides breadcrumbs that show the parent or parents of the current task. This formatter can be used also on any table that extends Task.

Before you begin

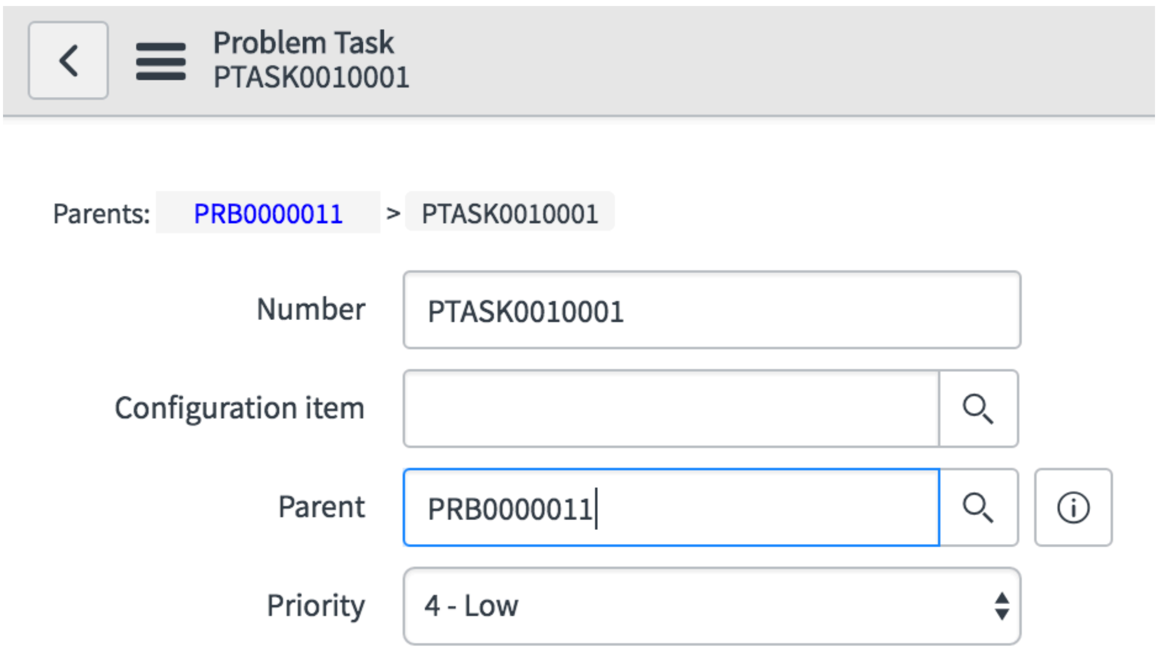
Role required: personalize_form

About this task

To add the parent breadcrumbs formatter to a form, configure the form and add **Parent Breadcrumbs** to the desired location. The breadcrumbs show only six levels of parents. If more levels exist, the breadcrumbs display an ellipsis ("...").

The **Parent** reference field also has to contain a value for the breadcrumbs to appear. You may need to configure the form to contain the **Parent** field as well.

Breadcrumbs



Customize the parent breadcrumbs formatter

You can customize the parent breadcrumbs formatter to control what breadcrumbs appear.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Select **Parent Breadcrumbs**.
3. Click **View UI Macro for this Formatter** to view or modify the underlying formatter.
   By default, the breadcrumb uses the default display field, **gr.getDisplayValue(),** as the link in the breadcrumb. To customize this, add the following line, replacing the **fieldName** parameter with the desired field name (not the field label):

   ```
   pc.setLabelField("fieldName")
   ```

   If a user points to a breadcrumb, the short description for that record appears as a hint by default. To display alternate hints for the breadcrumb, add the following line, replacing the **fieldName** parameter with the desired field name (not the field label):

   ```
   pc.setTitleField("fieldName")
   ```

   Be sure to add these lines in the proper location, as shown in the following example:

```
//parent crumb functions - script include
var pc = new ParentCrumbs(now_GR);
pc.setLabelField("short_description");

//override the default display field to be used for label
pc.setTitleField("number");

//override default short_description hover text
var crumbs = pc.getCrumbs();
```

Use the parent breadcrumbs formatter on non-Task tables

The parent breadcrumbs formatter can be used on non-Task tables as long as the table has a reference to itself through a field called **parent**.

Before you begin

Role required: admin

About this task

To make the formatter available for a different table, duplicate the formatter used by the Task table:

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Select **Parent Breadcrumbs**.
3. Set the **Table** field to the appropriate table.
4. Right-click the form header and choose **Insert**.
5. Add the new formatter to the appropriate form.

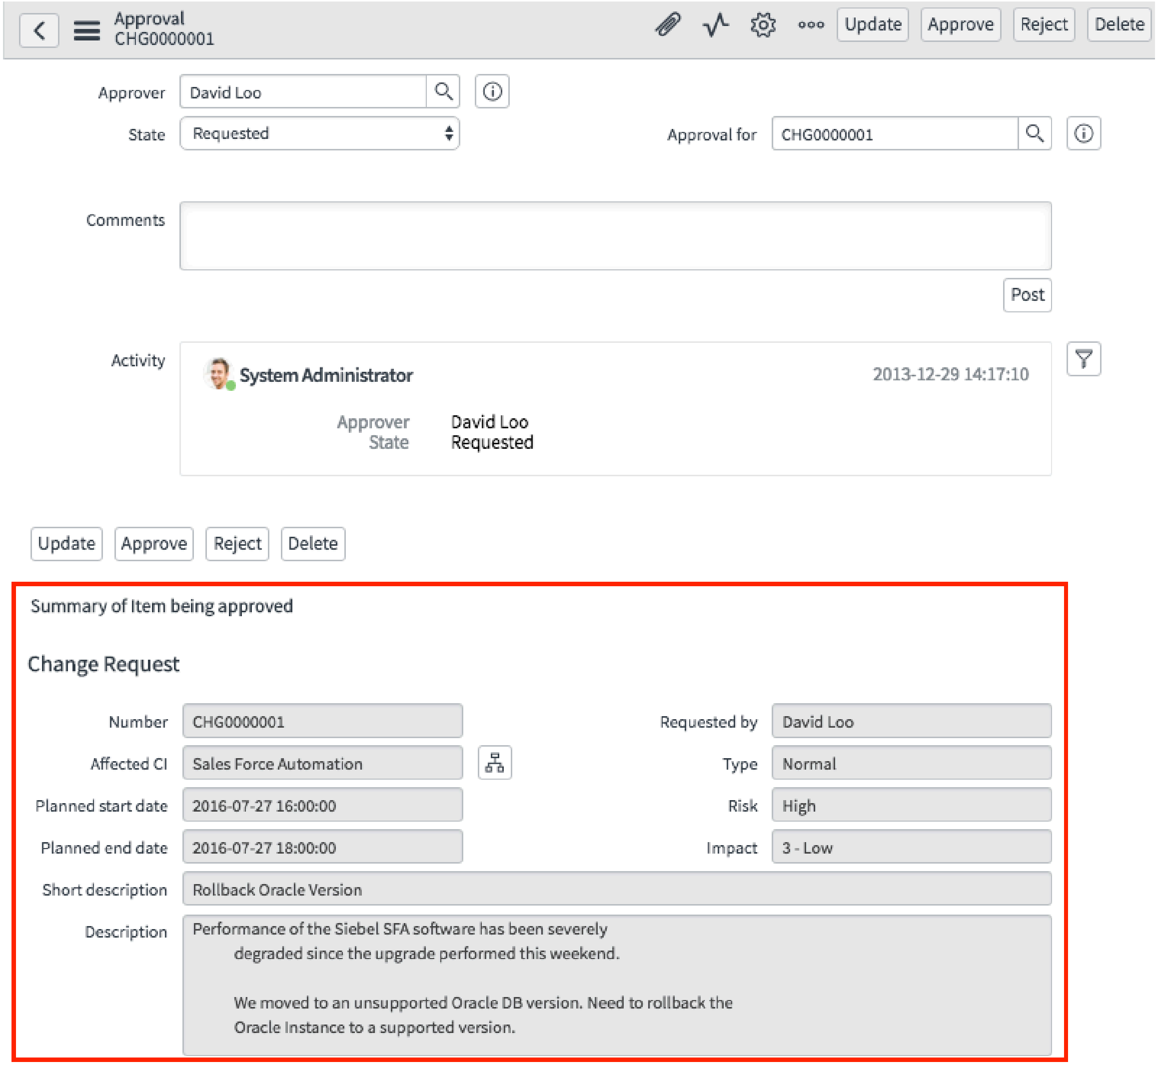
Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.

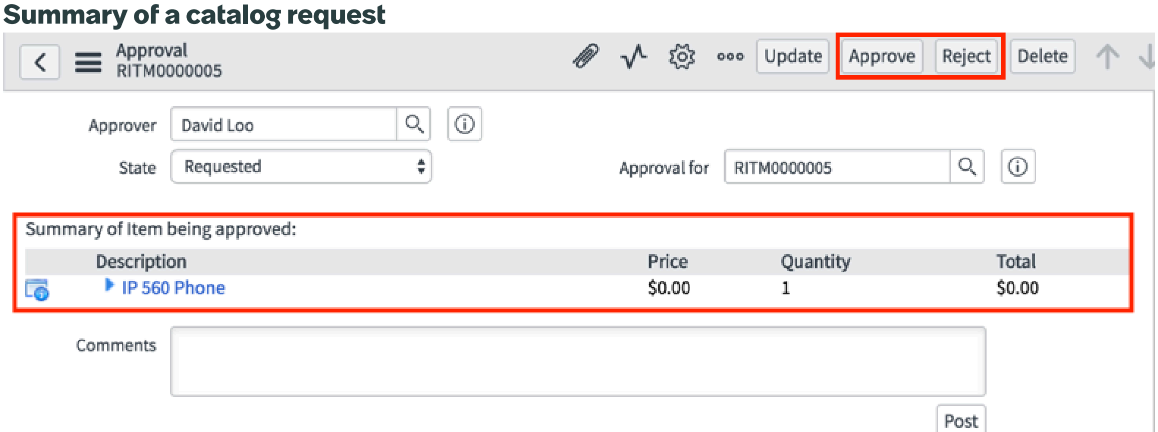
The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.

servicenow.

Summary of a change request



Summary of a catalog request



The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

Note:
When the overall request is approved, you must ensure this **Reject** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

Override a formatter with macros

The system uses formatters to handle complex rendering of specific form elements.

Before you begin

Role required: ui_macro_admin

About this task

Examples of form elements rendered by formatters in the base platform are:

- Activity formatter: Displays the list of activities, or history, on a task form.
- Process flow formatter: Displays the different stages in a linear process flow across the top of a record.
- Task parent breadcrumbs formatter: Provides breadcrumbs to show the parent or parents of the current task.
- Approval summarizer formatter: Displays dynamic summary information about the element being approved.

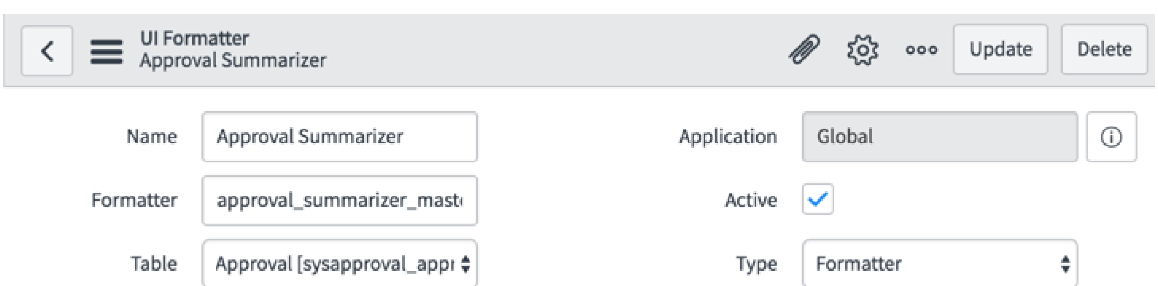
A UI macro can override formatters provided in the base system.

Procedure

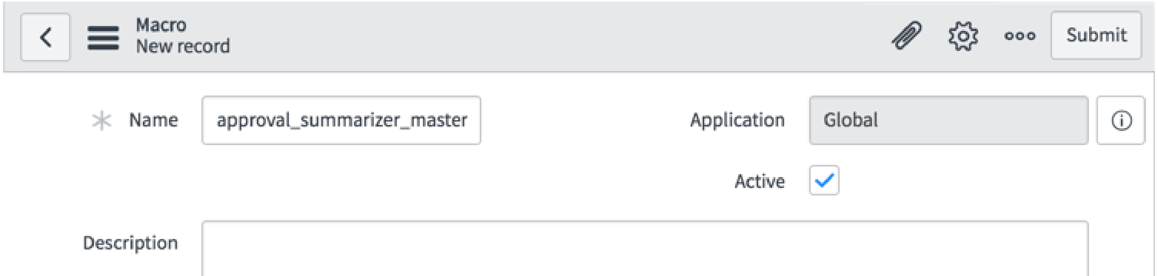
1. Navigate to **All** > **System UI** > **UI Macros**.
2. Click **New**.
3. In the **Name** field, enter the same name as the formatter you want to override, but omit the .xml extension.
4. Complete the remaining fields on the form.
5. Click **Submit**.

Example:

This example shows the form that defines the existing approval summarizer formatter:



Here is the form for the UI macro that overrides the approval summarizer formatter:



Limit the number of activity stream entries

You can set a system property to limit the number of entries allowed in an activity stream.

Before you begin

Role required: admin

Procedure

1. Enter `sys_properties.list` in the Navigation filter.
2. Search for the property *glide.history.max_entries*.
3. Edit the **Value** property to set the maximum number of entries that users can view in an activity stream.

   Note:
   New entries do not count towards the max number until the form is refreshed.

Option	Description
Name	glide.history.max_entries
Description	Maximum number of entries allowed to display in an activity stream. The default number is 250. New entries do not count towards the max number until the form is refreshed.
Type	integer
Default value	250

Form templates

Templates simplify the process of submitting new records by populating fields automatically.

To use a template, populate the most-used fields for a specific table, save it as a template, and then make the template accessible to your users. Users can manually apply a template when creating records, or an administrator can define scripts to apply templates automatically.

Create templates for the forms that you use frequently, such as incident, problem, and change. There is no limit to the number of templates that you can create or access, but having many templates for each form makes the templates more complex to manage.

You can create table-level access controls to restrict template creation. When applied, a user creating a new record from a template must satisfy the save_as_template access control for every field modified by the template.

Automatically applied templates

You can make a template that automatically applies to new, user-created records on a specific table. To create this kind of template, set the template name to match the name of the table to which the template applies.

For example, imagine you want to apply a template automatically when a user creates a record on the Windows Server [cmdb_ci_win_server] table. Set the **Name** field to **cmdb_ci_win_server** and the **Table** field to **Windows Server [cmdb_ci_win_server]** on the Template form.

Automatic templates are always global. They do not honor the **User** and **Groups** fields on the Template form. Automatic templates do not apply to records created by the system, such as those records generated by business rules, UI actions, or workflows.

Related topics

Hide the template bar for a table

Create a template using the Template form

Create a template record for any table to populate certain fields automatically.

Before you begin

Role required: template_editor_global or admin

About this task

Create a template using the Template form.

Templates allow users to more quickly and uniformly complete records.

The video above shows you how to complete the procedure below to create a template using the Template form.

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Template form

Field	Description
Name	Name of this template. **Note:** The template name can't match an existing table name.
Table	Table that this template applies to. Select **Global** to make the template available for use with all tables. **Note:** The table list shows only the tables and database views that are in the same scope as the template.
Active	Option for making the template available for use. A template must be active to be used.

Field	Description
User	User who can configure and apply the template. If you define a user, no other users can see the template unless you select the **Global** option.
Groups	Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the **Global** option.
Global	Option to enable any user who can access the templates to view and apply this template.
Short description	Description of the template. **Note:** Adding content to this field doesn't add that content to the **Short description** field of the forms that use this template.
Template	Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to populate automatically in the right column. **Note:** Even though you can select dot-walked fields in the template, they don't apply to fields that are on the form.
Link element	Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table. **Note:** This field doesn't appear by default. Configure the template form to add the field.

4. Select **Submit**.

What to do next

See Application scope.

Create templates for related task records

Administrators can create a template for a Task table record that also creates one or more related records in the child Task table.

Before you begin

Role required: admin

About this task

Administrators must understand the parent-child relationships between Task tables. For example, the Change Task table is a child of the Change table and the Incident Task table is a child of the Incident table.

Note:
Child templates can only be applied automatically if you first apply the parent template from a module.

Procedure

1. From the parent Task table template, configure the form layout to add these fields.
   - **Next Related Child Template**
   - **Next Related Template**
   - **Link element**
2. Create a template for the parent Task table.
   For example, create this template for the Change table.

Sample Change template

Field	Value
Name	Add server to network
Table	Change [change_request]
Short description	Set up a server on the network
Template	◦ [Short description][Set up server on the network] ◦ [Category][Hardware] ◦ [Assignment group][Hardware]

3. Create a template for the first related task.
   For example, create this template for the Change Task table.

First sample Change Task template

Field	Value
Name	Order server
Table	Change Task [change_task]
Short description	Order server hardware
Template	◦ [Short description][Order server hardware] ◦ [Assignment group][Hardware]
Link element	Change request

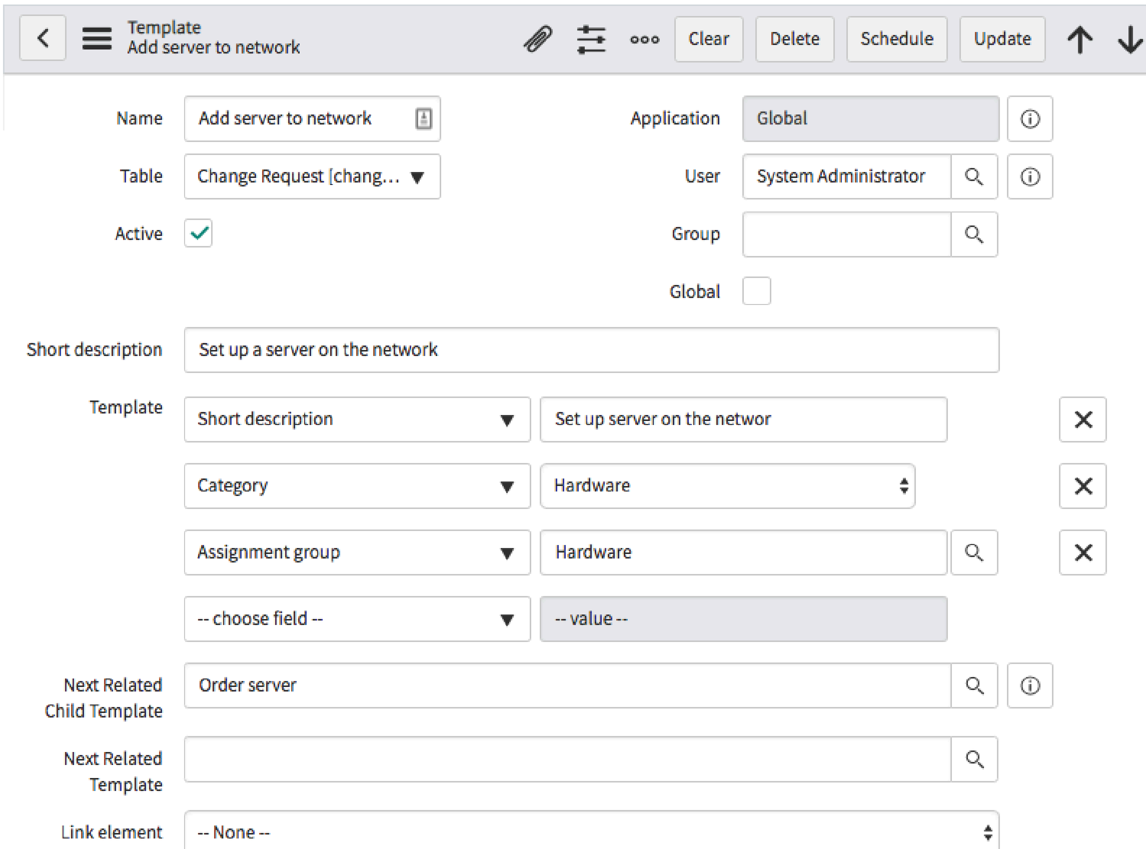
4. Create a template for each additional related task.
   For example, create one additional template for the Change Task table.

Second sample Change Task template

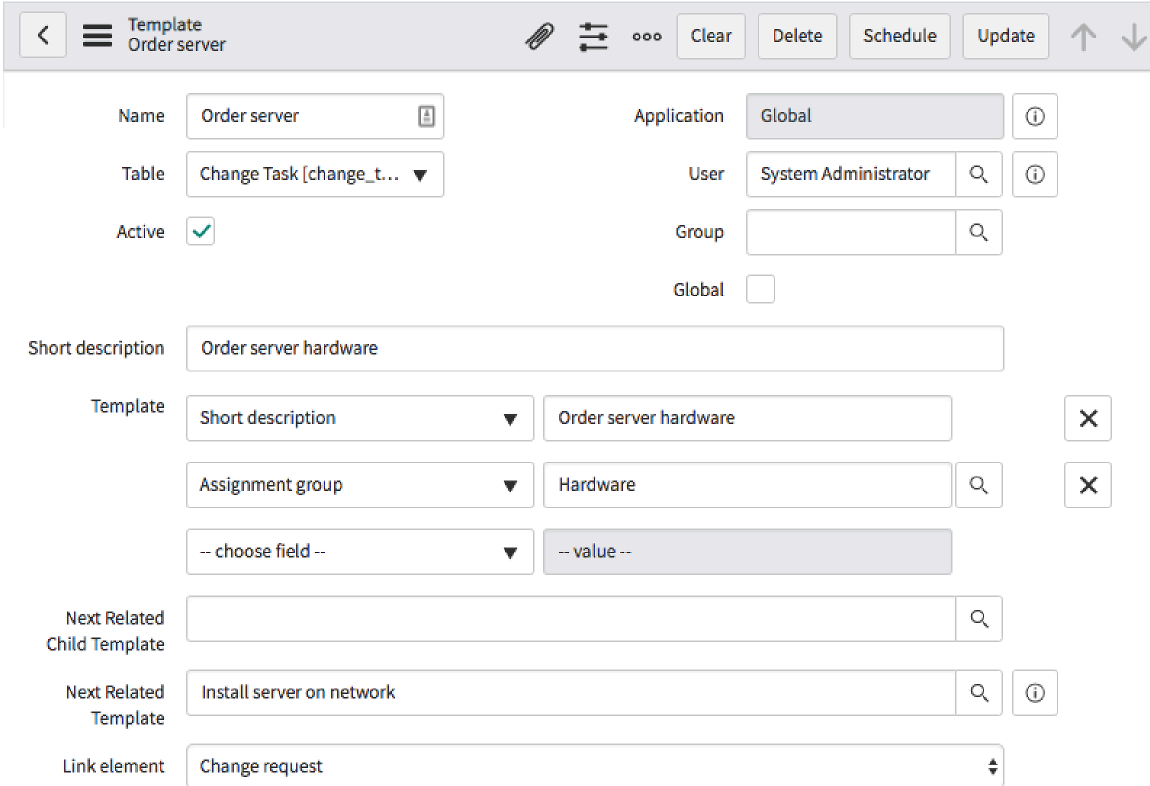
Field	Value
Name	Install server on network
Table	Change Task [change_task]
Short description	Install server on network
Template	◦ [Short description][Install server on network] ◦ [Assignment group][Hardware]

Field	Value
Link element	Change request

5. From the parent Task table template, set **Next Related Child Template** to the first related child task.
   For example, in the Add server to network template, select `Order server` in the **Next Related Child Template** field.



6. For each child related task, set **Next Related Template** to the next related task template.
   For example, in the Order server template, select `Install server on network` in the **Next Related Template** field.



Note:
The last related task template does not have a value for **Next Related Template**. For example, the **Install server on network** template does not have a value in **Next Related Template**.

What to do next

Create a module for the parent Task table template so that child templates can be applied to related task records. For example, create a module for **Add server to network**.

Create a template by saving a form

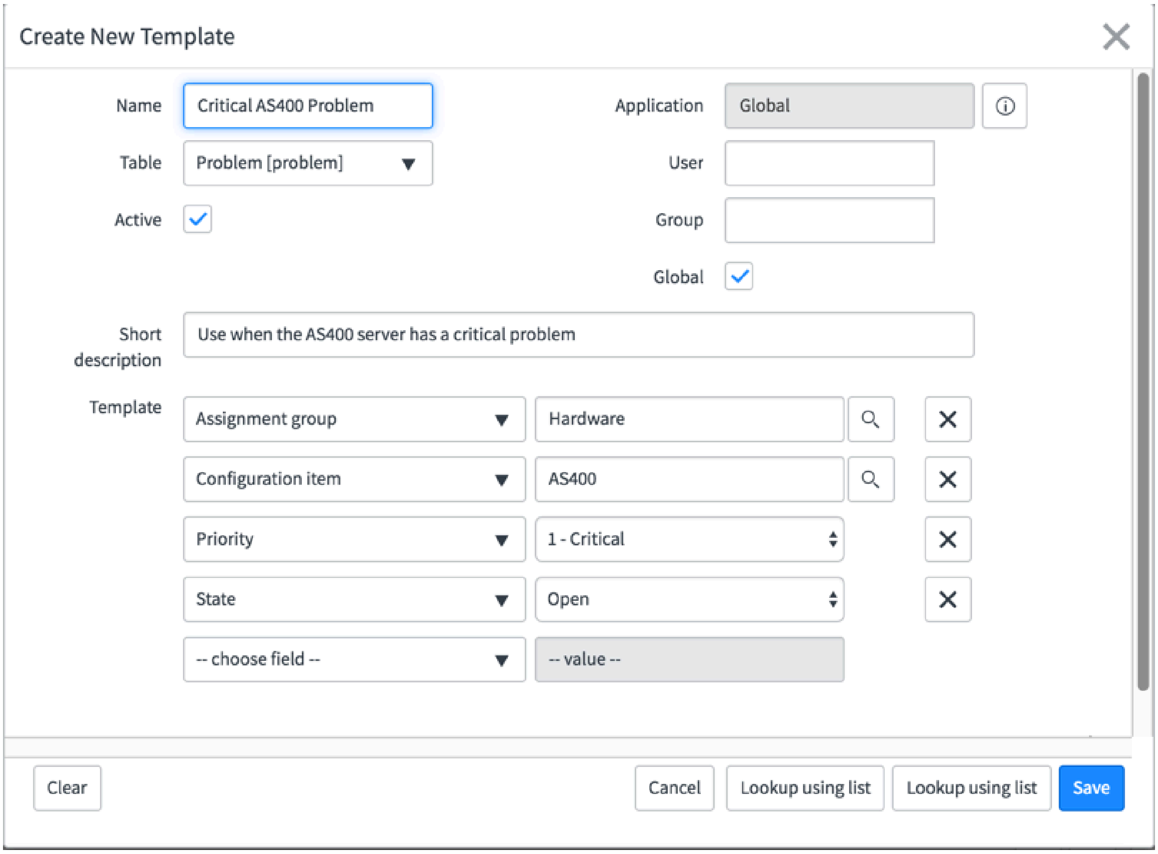
Save a populated form as a template.

Before you begin

Toggle the template bar so it is visible on forms.
Role required: admin

Procedure

1. Navigate to a form.
2. Complete the form as it should appear when a user applies the template.
3. In the template bar, click the plus icon (+).



4. Enter a descriptive name to make it easy for a user to select the correct template.
5. Make any additional changes as needed.
6. Click **Save**.

ACL rule types

Create records based on a template

You can create and schedule a scheduled job to create records based on a template. For example, you can regularly create a populated task record to perform a weekly backup.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
2. Select a template record.
3. Click **Schedule**.
   The Scheduled Entity Generation form appears.
4. In the **Run** choice list, select how frequently to create a record.
5. Complete the schedule information.
6. Click **Submit**.

Create a module for a template

You can create a module to open a form with pre-populated template data.

Before you begin

Role required: admin

About this task

Child templates are only applied if the parent template is applied from a module. Child templates are not applied by applying a template to a new form.

Procedure

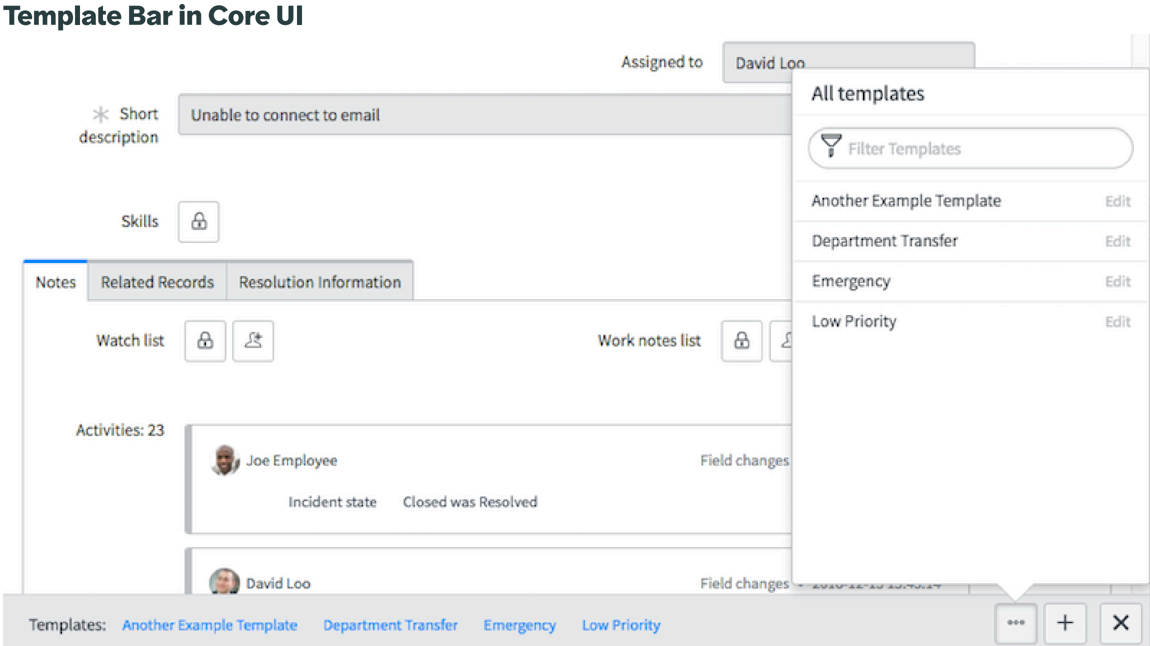
1. Point to the application menu, such as **Self-Service**, and click the edit application (pencil) icon.
2. In the **Modules** related list, click **New**.
3. Fill in the **Title** and **Order** fields as appropriate.
4. In the Link Type form section, in the table field, select the table you want to create the form in.
5. In the **Link Type** field, select **URL (from Arguments)**.
6. In the **Arguments** field, enter `<table>.do?sys_id=-1&sysparm_template=<templatename>`
   The `<table>` is the name of the table you selected for the table field, for example `incident`. The `<templatename>` is the name of the template you want to use to pre-populate the form, for example `Incident call type`.
7. Click **Submit**.
8. Refresh the application navigator to view the new module.

Template bar

Use the template bar to apply, edit, and create templates.

When toggled, the template bar appears at the bottom of the form. Select a template title to apply the template to the form. Use the buttons at the bottom-right to add, edit, and access the complete list of templates.

Template Bar in Core UI



Template Bar Elements

Element	Description
Templates	Available templates appear in blue text on the template bar. Click a template to apply it to the form.
All Templates button ( )	Toggles the All Templates window.
Create New Template button ( )	Displays the Create New Template window.
All Templates popup	This window displays when the **All Templates** button is selected. The window displays a filterable list of all available templates. Click the **Edit** button to the left of any template to edit that template.
Disable Template Bar button ( )	Disables the template bar. To display the bar, see Toggle the template bar

For non-admins, see KB0711956 for more information on enabling the Edit button.

Toggle the template bar

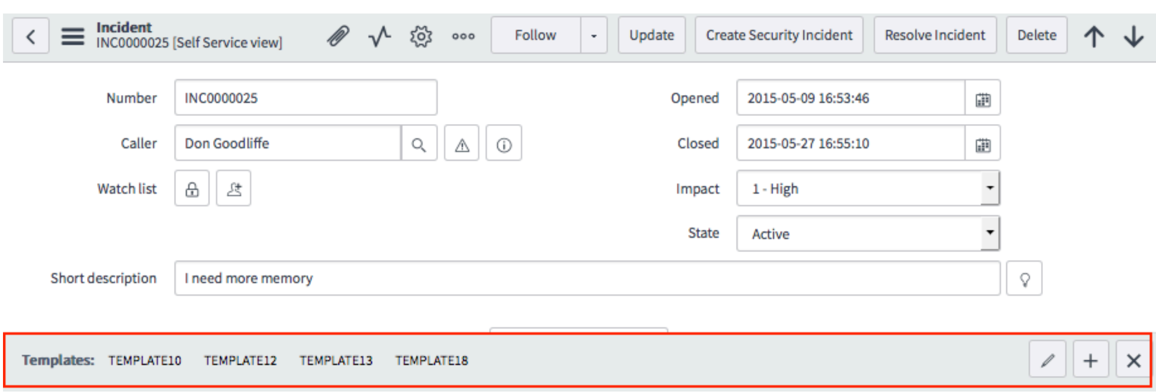
The template bar appears at the bottom of forms. It provides shortcuts to apply, edit, and create templates.

Before you begin

Role required: none

About this task

You can toggle the template bar, which hides or shows it for all forms. The template bar is shown by default.



Procedure

1. Navigate to a form.
2. Click the more options icon ( ) in the form header.
3. Select **Toggle Template Bar**.

Scripted templates

You can apply an active template to a record using JavaScript.

Apply a template to current

To apply a template, use the *applyTemplate* method.

```
current.applyTemplate("<templatename>");
```

Apply a template to a GlideRecord

To apply the template to a record other than current, change current to a GlideRecord variable. When using a GlideRecord variable, you may need to initialize it after declaring the variable.

```
var rec1 = new GlideRecord("incident");
rec1.initialize();
rec1.applyTemplate("my_incident_template");
```

Apply a template from a UI action

The following script demonstrates a possible customization to the *Create Change* UI action on the Problem form. After you add this script to the UI action, a user can select the UI action to create a change record with information from both the problem record and the change template.

```
var change = new GlideRecord("change_request");
change.initialize();
change.short_description = current.short_description;
change.description = current.u_details;
change.cmdb_ci = current.u_service;
change.priority = current.priority;
change.requested_by = current.caller_id;
change.assignment_group.setDisplayValue('Change & Release');
change.u_status = 'New';
change.parent = current.number;
if(0 == change.applyTemplate("standard_rfc")) {
    current.rfc = change.insert();
    current.comments = 'Change ' + change.number + ' created.';
}

var mySysID = current.update();

gs.addInfoMessage("Change " + change.number + " created");
action.setRedirectURL(change);
action.setReturnURL(current);
```

Script a template with child templates

When using *applyTemplate* with a template that has one or more child templates, the system creates the parent record before applying the child templates. This behavior ensures that any references or dot-walked fields from the child record to the parent have a valid target.

For example, if a template for the Change Request table has a child template for the Change Task table, applying the Change Request template inserts a Change Request record into the database. It assigns this record as the Change request for the Change Task record, then applies the child template to the Change Task record.

Apply a template using a sys_id instead of a name

To apply a template using a sys_id, use the following method.

```
GlideTemplate.get(template.sys_id).apply(GlideRecord)
```

UI actions

UI actions include the buttons, links, and context menu items on forms and lists. Configure UI actions to make the UI more interactive, customized, and specific to user activities.

Administrators and users with the ui_action_admin role can define UI actions.

UI action controls

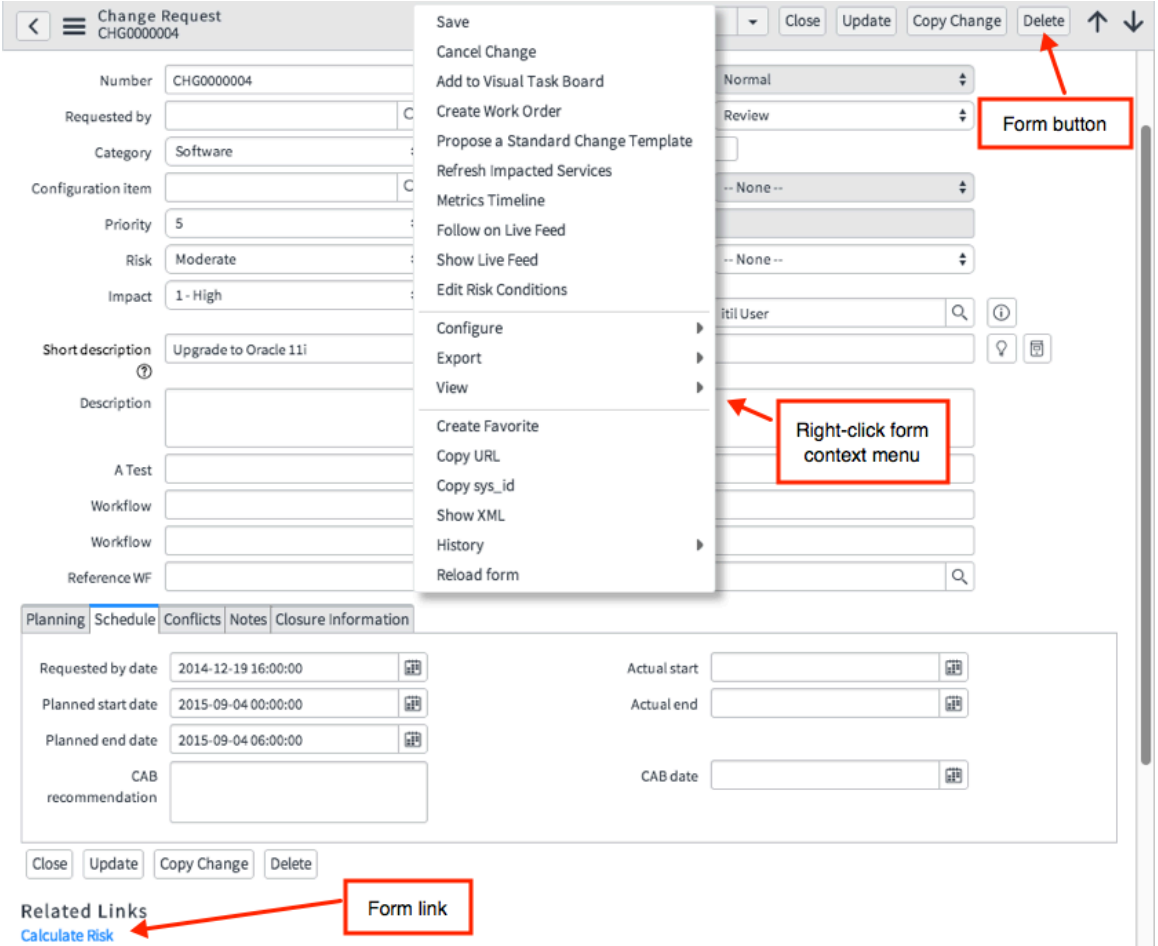
You can create a UI action to provide any of these controls:

- A button on a form.
- A context menu item on a form that appears when you open the form context menu or right-click the form header.
- A related link in a form.
- A button in the banner on top of a list.
- A button at the bottom of a list.
- A context menu item on a list that appears when you open the list context menu or right-click the list header.
- A menu item for the action choice list at the bottom of a list.
- A related link at the bottom of a list.

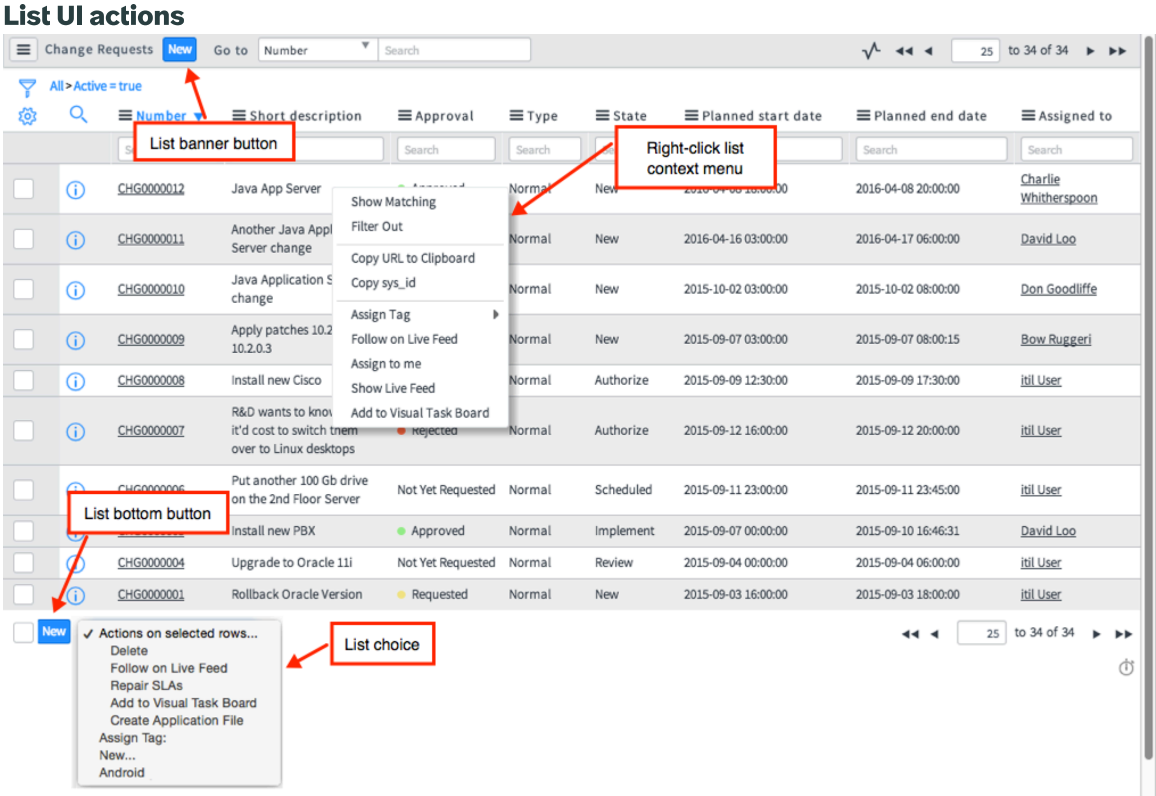
Note:
To hide or restrict the **New** or **Edit** UI action on related list, use list control.

servicenow

Form UI actions



List UI actions



Create a UI action

You can create a new UI action or edit an existing one.

Before you begin

Role required: ui_action_admin or admin

About this task

You can add UI actions to tables and database views that are in the same scope as the UI action and tables that allow UI actions from another application scope to run on them.

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Click **New** or open an existing record.
3. Define the UI action by completing the fields.
   You may need to configure the form to see all the fields.

UI action fields

Field	Description
Name	The text that appears on the button, link, or context menu item.
Table	The table on which the UI action is available. By default, the UI action also appears on tables that extend the selected table (for example, Task actions appear on the Incident table). Select **Global** to make the action available on all tables.
Order	The order in which the UI action appears. The order applies to buttons from left to right and to menu actions from top to bottom.
Action name	A unique name to use when referencing the UI action in scripts.
Active	An option to enable the UI action when selected. To disable a UI action, clear the check box.
Show insert	An option to show a button on new records that have not been inserted.
Show update	An option to show a button on existing records.
Client	An option for the UI action to execute its script in the user's browser, not on the server. When enabled, the **Onclick** field appears above the Condition field.
Form button	An option to put a button on a form.
Form context menu	An option to put an item in a form context menu (right-click the form header).
Form link	An option to put a link in the Related Links section of a form.
Form style	○ Primary—Colors the UI Action blue. ○ Destructive—Colors the UI Action red. ○ Unstyled—Does not color the UI Action.
List banner button	An option to put a button in the banner of a list.

Field	Description
	Note: List banner buttons are not intended to support record-specific conditions, so only the first row is considered when the condition is evaluated to determine whether the button will show for the list. Do not use record-specific conditions (e.g., current.getValue('state') === 'closed') in list banner button UI Actions.
List bottom button	An option to put a button at the bottom of a list. **Note:** List bottom buttons show regardless of condition and are evaluated per record on execution.
List context menu	An option to put an item in a list field context menu (right-click a cell in a list).
List choice	An option to put an item in the action choice list at the bottom of a list. **Note:** List bottom buttons, like list choice actions, show regardless of condition and are evaluated per record on execution.
List link	An option to put a link in the Related Links section at the bottom of a list.
List style	◦ Primary—Colors the UI Action blue. ◦ Destructive—Colors the UI Action red. ◦ Unstyled—Does not color the UI Action.
Overrides	A UI action that this UI action overrides.
Messages	Text strings that the UI action can use as a key to look up a localized message alternative from the Message [sys_ui_message] table. Each message key is on a separate line in the Messages field. The instance looks for a localized message string anytime the UI action makes a getMessage(msg) call where the msg string matches a key in the Messages field.
Comments	Descriptive content regarding this UI action.
Hint	The text that appears when a user points to the UI action control.
Onclick	The name of the JavaScript function to run when the UI action is executed. The function is defined in the **Script** field.
Condition	A JavaScript conditional statement that restricts when a UI action appears. Conditions always run on the server.

Field	Description
	Note: ◦ The current object is not available for conditions on a list context menu. If the **List context menu** option is selected, any use of `current` on these actions is ignored. ◦ You can reference the parent record for the UI action conditions on a related list button. For example, to disable the **New** and **Edit** buttons on the Affected CIs related list for closed changes, copy the global m2m UI actions to the task_ci table and add a condition of `parent.active`. ◦ If you leave one of the fields empty that you specify in your condition statement, that condition defaults to **true**.
Script	The script to run when the UI action is executed. Function names must be unique.
Workspace	
Workspace Form Button	An option to make the UI action appear on the list of UI actions in a workspace.
Workspace Form Menu	An option to make the UI action appear as a list item in the menu associated with UI actions in a workspace.
Format for Configurable Workspace	An option to use the UI action in a Configurable Workspace. If cleared, the UI action applies in Legacy Workspaces.
Workspace Client Script	A script to run when the UI action is executed in workspaces.
Requires role	
Role	The roles required for the UI action to apply. Users must have at least one of the roles for the UI action to apply.
Related lists on the form view	
UI Action Visibility	The views of the form that the UI action applies to. Use this option to restrict the UI action to form views that you specify. A UI action is available for the specified view according to the following rules: **a.** If there are no visibility rules, the action appears on all views. **b.** Any exclude rule on a given view means that the action does not appear on that view. **c.** If there is at least one include rule, then the action appears only on views that are specifically included.
Versions	All versions of the UI action. Use this list to compare versions or to revert to a previous version.

4. Click **Submit** or **Update**.

Note:
If the UI action is enabled to run on the client side, wrap it in a function. Otherwise, the contents of the **Script** field runs when the page loads.

Example:
As part of a UI action script, you can redirect a user to a URL. For example, you might add links to a form or open a new record after it is created from a UI action. To redirect a user to a URL from a UI action, use this syntax in the **Script** field to define the redirect link:

```
action.setRedirectURL ( '');
```

To direct a user to a record, use this syntax, where *new_record* is the variable name for the GlideRecord:

```
action.setRedirectURL (new_record );
```

Override a UI action for an extended table

You can override or remove a UI action for a table that is extended from another table.

Before you begin

This is not applicable to domain separated instances.

About this task

When a UI action is defined for the Task table, it applies to all tasks, including incidents, changes, problems, and any other tables that extend the Task table. Similarly, a global UI action applies to every table. However, you can override a UI action for a specific table. This example demonstrates how to override or remove a UI action on the Task [task] table for only the Incident [incident] table.

Procedure

1. Complete the following steps to override a UI action on the Task table for just the Incident table.

   a. Create a UI action on the Incident table with the same **Action name**.
   If the **Action name** is not defined, update both the new UI action and the UI action to be overridden with the same **Action name**.

   b. Enter a script that is specific to the Incident table.

2. Complete the following steps to remove a UI action on the Task table for the Incident table.

   a. Navigate to the UI action definition for the Task table.

   b. Add the condition *current.getRecordClassName() !='incident'*.

UI policies

UI policies dynamically change the behavior of information on a form and control custom process flows for tasks.

For example, you can use UI policies to make the number field on a form read-only, make the short description field mandatory, and hide other fields. Basic UI policies do not require any scripting, however for more advanced actions, use the **Run scripts** option.

You can also use client scripts to perform all of these actions, but for faster load times use UI policies when possible.

Create a UI policy

Create a UI policy to define custom process flows for tasks.

Adding a UI Policy

Before you begin
Role required: ui_policy_admin

About this task
A UI policy condition evaluates all fields even if they are not visible on the form. This function removes the requirement that a field must be on a form for it to be evaluated.

Note:

- Policies carried over from versions prior to Fuji are evaluated differently. Fields that previously were not evaluated are evaluated.
- UI policies are not supported on search screens.
- UI Policies also apply to forms and lists displayed within Content Management System application.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Click **New**.
   The UI Policy [Advanced view] form opens
3. To change the view, in **Related Links** click **Default view**.
4. Complete the form, as appropriate.
   You may need to configure the form to see all the fields.

UI policy fields

Field	Description
Table	The table for the form to be modified.
Active	The active status of the UI policy. Only active UI policies are applied.
Short description	Short summary of the UI policy.
Order [Advanced view]	The processing sequence, from the lowest to highest number. If two policies conflict, the UI policy with the higher number executes. For inherited UI policies, the extended (child) table's UI policies are executed first. Then the base table UI policies are executed; both from lowest to highest specified value.
When to Apply	
Conditions	The conditions which, if fulfilled, cause the UI policy to be applied. Conditions are built with the condition builder. To set conditions using a script, use a client script instead. Conditions are only rechecked if a user manually changes a field on a form. If the change is made by a UI action, context menu action, or through the list editor, it is not evaluated.
Global [Advanced view]	Option for specifying whether the UI policy applies to all form views. If this check box is cleared, the UI policy is view-specific. By default, the Global UI policy applies to all form views. However, a UI policy can be specific to a view. For example, you can define a UI policy for only the itil view of a form. Use the **View** field to accomplish this.

Field	Description
View [Advanced view]	Option for indicating which form view the UI policy applies to. This field is visible only if **Global** is not selected. If Global is not selected and the View field is left blank, the script applies the default view. For more information on form views, see View management.
Reverse if false [Advanced view]	Option for specifying that the UI policy action is undone when the conditions of its UI policy evaluate to false. In other words, when the conditions are true, the specified actions are taken and when they are false, the actions are undone.
On load [Advanced view]	Option for specifying that the UI policy behavior should be performed OnLoad as well as when the form changes. You can check or clear the **On load** check box in a UI policy to control whether it runs every time a form is loaded when the conditions are satisfied. In this example, an administrator does not want an incident to enter the **Awaiting user info** state unless the user provides an explanation to the customer. The administrator creates a UI policy with the following settings. ◦ In the When to Apply section, adds the condition **[State] [is] [Awaiting user info]** and clears the **On load** check box. This condition means that the UI policy applies only when the state is changed to **Awaiting user info**. ◦ In the **UI Policy Actions** related list, creates a record that makes the **Additional comments** field mandatory when the condition is met.
Inherit [Advanced view]	Option for specifying whether extended tables inherit this UI policy. When a child table has an inherited UI policy from its parent table, the UI policy on the child table always runs first. This event is true regardless of the **Order** of the UI policies. Consider the following example: ◦ A child table has a UI policy with **Order** value **500** that shows the **Urgency** field when its conditions are met. ◦ Its parent table has a UI policy with the same conditions that hides the **Urgency** field. The parent table UI policy has **Order** value **100**. ◦ Although the parent table **Order** field has a lower value, the child UI policy runs first and then the parent UI policy runs. When the conditions are met, the **Urgency** field is hidden.
Script	
Run scripts [Advanced view]	Option for specifying whether advanced behavior can be scripted for both true and false conditions.
Execute if true [Advanced view]	A script that executes when the conditions of the UI policy are fulfilled. ◦ This field is available only if **Run scripts** is selected. ◦ This feature is not available outside the scope or in global scope.
Execute if false [Advanced view]	A script that executes if the conditions of the UI policy are not fulfilled and the **Reverse if false** option is selected.

Field	Description
	○ This field is available only if **Run scripts** is selected. ○ This feature is not available outside the scope or in global scope.
Other fields	
Run scripts in UI type	The UI type for this UI policy: Desktop, Mobile / Service Portal, or Both.
Related List: UI Policy Actions	
Table	[read-only] Field the UI policy action applies to.
Field name	Field on the selected table to which the UI policy performs an action if true. **Note:** If the specified field is not found on the form, the UI policy performs the action on the variable with the same name.
Mandatory	Choice list for specifying how the UI policy affects the mandatory state of the field. Choices are: ○ Leave alone ○ True ○ False
Visible	Choice list for specifying how the UI policy affects the visible state of the field. Choices are: ○ Leave alone ○ True ○ False
Read only	Choice list for specifying how the UI policy affects the read-only state of the field. Choices are: ○ Leave alone ○ True ○ False
Related Links	
Default view or Advanced view	Changes the form view to the default or advanced view. The fields change based on the view.

5. Click **Submit**.

Example: creating a UI policy

Create a UI policy to implement controls in the Incident form when the state changes to **Resolved**.

Before you begin

Role required: ui_policy_admin

About this task

This example demonstrates how to implement the following controls.

- Make a **Close Notes** field mandatory.
- Hide the **Opened by** field.
- Make the **Priority**, **Severity**, and **Urgency** fields read-only.
- Run a client script that displays an alert message.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Click **New**.
3. Supply the following information.

New UI policy

Name	Input
Table	Incident
Conditions	[Incident state] [is] [Resolved]
Reverse if false	Select this check box. If the incident state is not **Resolved**, the UI policy is reversed.
On load	Select this check box to perform the actions when the form is loaded or when the condition changes.

4. Right-click the form header and select **Save** from the context menu.
   The **UI Policy Actions** related list appears.
5. In the related list, click **New**.
6. Provide the following information.

New UI policy actions

Name	Input
Field name	Close notes. This UI action makes the Close notes field mandatory.
Mandatory	True
Visible	Leave alone
Read Only	Leave alone

7. Click **Submit**.
8. Repeat the process to create UI policy actions to hide the **Opened by** field, and to make the **Priority**, **Severity**, and **Urgency** fields read-only.

Client scripts for UI policies

Any scripts you create for UI policies run on the client side.

You can use different options in the UI Policy form to control when and how the UI policy is applied. These options include client scripts, OnLoad execution, and view-specific UI policies. Administrators can use the UI Policy form to create client scripts that run `onChange` when the UI

policy conditions are met (**Execute if true**) or not met (**Execute if false**).To display these scripting fields in the UI Policy form, in the Script section, select the **Run scripts** check box.

For example, to display an alert to the user when the incident **State** field changes to **Resolved**, create the following script in the **Execute if true** field.

```
function onCondition(){
alert('You changed the "Incident state" to Resolved. Please
 enter your comments in the "Close notes" field.');
}
```

Service catalog UI policies control the behavior of catalog item forms. Service catalog UI policies can be applied to a catalog item or a variable set. For more information about using UI policies for service catalog items, see Service catalog UI policy

Advanced form configuration

Administrators can configure advanced form features, such as form focus, form splits, and derived fields.

Allow insert options on task records

The **Insert** and **Insert and Stay** options are disabled by default for task records such as incidents and change requests. You can set a system property to show these options for task records.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property **Allow the use of the "Insert" and "Insert and Stay" options on task derived tables** (`glide.ui.task.insert`).
3. Select the check box to enable or clear the check box to disable (default) the options for tasks.
4. Click **Save**.

Turn off focusing on the first writable field of a form

Switch the focus on a form to the first element on the page instead of the first writable field to make the form more accessible to users who use screen readers.

Before you begin

Role required: admin

About this task

By default, forms set focus on the first writable field on the form. With first-field focus turned off, the form focuses on the first element on the page instead. Focusing on the first element, instead of the first writable element, helps orient users who use screen readers so they can find all the elements on a form.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Set the property `glide.ui.focus_first_element` to **false**.

Hide the template bar for a table

Administrators can hide the template bar for a table by creating a system property.

Before you begin

Role required: admin

About this task

Creating a table-specific property and setting it to false prevents users from displaying the template bar on a record for the specified table.

Procedure

1. Navigate to `sys_properties.list`.
2. Add a system property with the following settings.

Property	Value
Name	glide.ui.show_template_bar.<TABLENAME>
Type	true | false
Value	false

3. Click **Submit**.

Deactivate form submission with the Enter key

By default, when you press the `Enter` key in a simple one-line text field, a choice list, or a Boolean field, the form is submitted.

Before you begin

Role required: admin

About this task

You can use a system preference to deactivate this feature if you do not want the `Enter` key to submit the form.

Procedure

1. From the left navigation pane, select **User Administration** > **User Preferences**.
2. Select the **enter_submits_form** preference.
3. Set the value to **false**.
4. Click **Update**.
   The change does not take effect until user preferences are reloaded either at login or when a session is created.

Enable multiple form splits

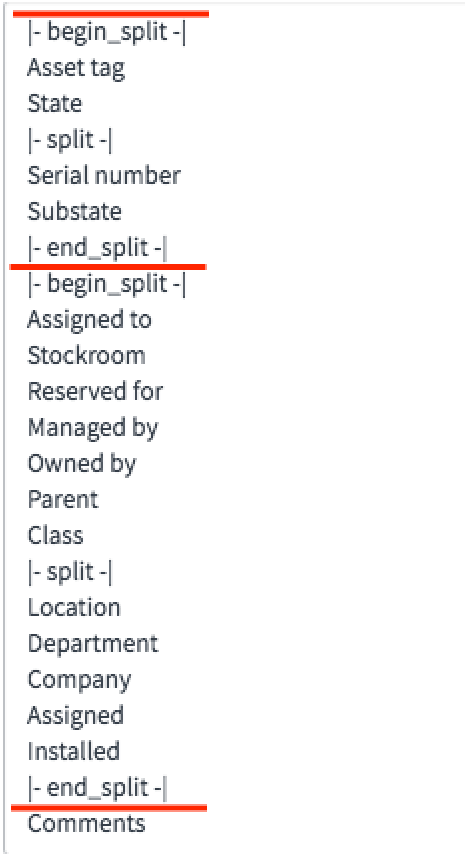
Form splits enable you to organize fields on a form into columns. Administrators must add a property to enable form splits.

Before you begin

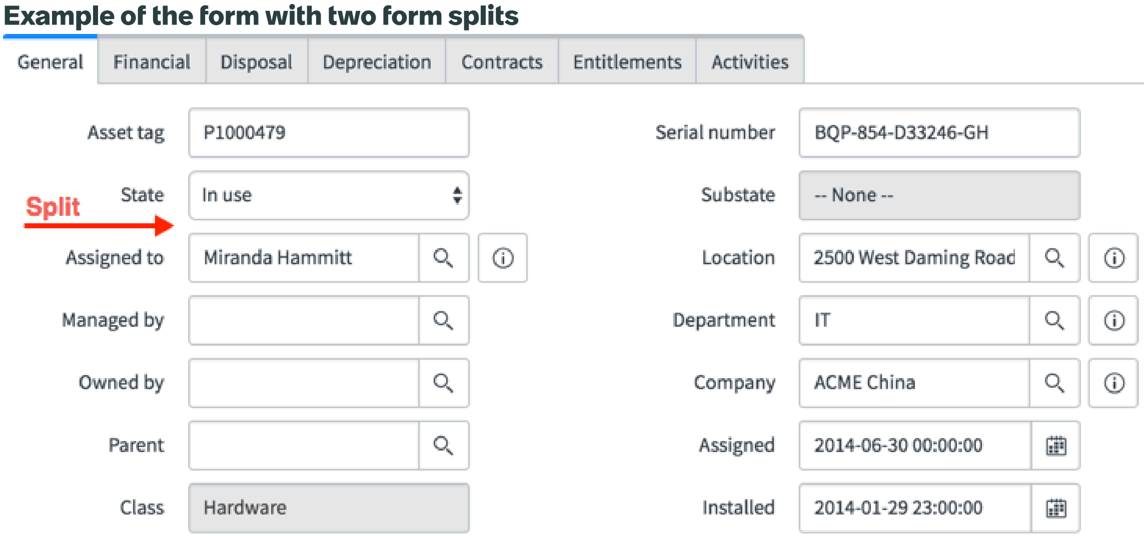
Role required: admin

About this task

Configuration of two form splits



Example of the form with two form splits



When you organize fields in this manner and the user is viewing the form on a small mobile device, the fields within the first split are listed before the fields in the second split. In this example, the **Asset tag**, **State**, **Serial number**, and **Substate** field are listed before any of the fields below them. You can also create elements that span the form at the top of the form.

Procedure

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.

2. If the property does not exist, click **New**.
3. Enter the following information.

Option	Description
Name	glide.ui.form_multiple_splits
Description	Enable multiple form splits
Type	true | false
Value	true

4. Click the form context menu icon and select **Save**.
   The **Categories** related list appears.
5. Click **Edit** and move **UI** to the **Categories List**.
6. Click **Save**.
   The System Property form reopens and the new property appears in the UI Properties page.

Define required fields

You can specify which form fields are required in forms. This action prevents users with the personalize_form role from removing the field by configuring the form layout.

Before you begin

Role required: admin
The Required Form Fields plugin must be active.

About this task

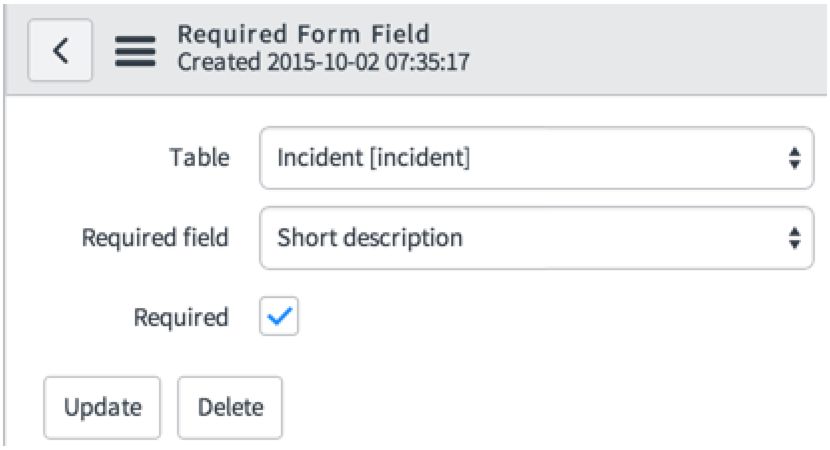
If present on a form, only an administrator can remove required fields. When you configure a form, required fields appear in a gray color and have a tooltip indicating they are required. Required fields are defined in the Required Form Fields [sys_ui_element_required] table.

The expected (although not the only) use case for this feature is as part of a delegated administration scheme. For example, you can grant branch offices the rights to modify forms by granting the personalize_form role, but not allow them to remove certain fields which are critical to overall business processing.

Procedure

1. Navigate to `sys_properties.list`.
2. Locate the property named *`glide.ui.form.enforce_required_fields`* and make sure it is set to true.
3. Navigate to **System UI** > **Required Form Fields**.
4. Click **New**.
5. Select the table and field, and then select the **Required** check box.

   Example
   The following example sets the **Short description** field on the Incident form to be required.



If you decide later that you do not want to make the field required, clear the **Required** checkbox. This action is preferable to deleting the record.

6. Click **Submit**.

Result

If the table specified has extension tables, then the Required Form Field record applies to forms of all extended tables. For example, if an administrator specifies that the **Short description** field is required for the Task table, then this configuration applies to the Incident form, Change Request form, Problem form, and so on.

An extended table can override the Required Form Field rule of its base table. For example, if the **Short description** field is required for the Task table, but not required for the Incident table, it is required for all Task tables except Incident.

Control the label type for derived fields

You can configure the type of label that appears for derived fields.

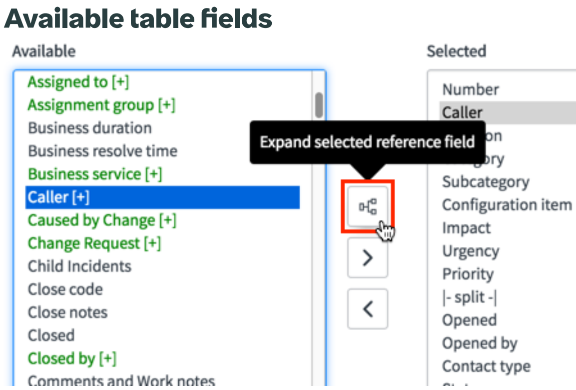
Before you begin

Role required: admin

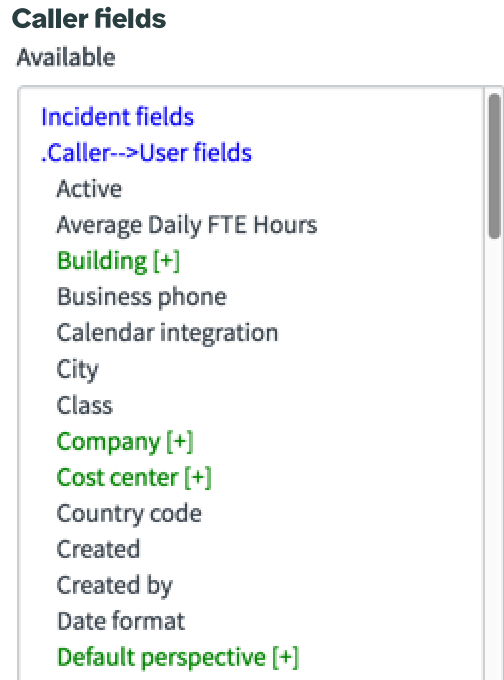
About this task

An example would be displaying the email address for the caller when looking at an incident record. The email address is not stored in the Incident table, but is obtained by following the caller reference from the incident to the User table. You control the label type by setting a system property. For example, the field label for an incident email address can be either of the following strings.

- **Caller Email**, which represents the complete label to uniquely identify this field as the email from the caller user record. If you display the email address for the person the ticket is assigned to, its label would be **Assigned to Email**.
- **Email** which is the label for the target field. This label is not unique on the form if, for example, you are also displaying the email address of the person assigned to the incident. However, usually the placement of the field on the form makes it clear what the field represents.



Choose the **Caller** field and click the expander icon.



Select the available fields associated with the **Calle**
field.

Procedure

1. Navigate to **All** > **System Properties** > **System**.
2. Locate the **Use short labels for all fields. For example, if a form contains the caller's email address, use the "Email" label rather than the full label of "Caller Email"** (*`glide.short.labels`*) property.
   The default value is **true**, meaning that the short label is displayed in all forms.
3. If you want to display the complete label in forms, clear the check box.
4. Click **Save**.

Field administration

The individual pieces of data in a record are called fields. You enter data in fields on the form or by using the list editor. Administrators can create new or modify existing fields.

You can enter data in fields by using the list editor or by using a form. In form view, fields appear as fields in the form, and in list view they appear as columns of data in the table. Administrators can create new fields or change the type of existing fields.

Field administration considerations

- If you edit a field on a child table that is present on the parent table, it's also changed in the parent table and all other child tables.
- Kanji characters aren't currently supported. If a table column identifier is created using Kanji characters, it's ignored in any update or insert operation from a form.
- When you create a custom field, use one of the supported field types described in Field types. Other field types, such as User Input, are for internal use only and aren't supported for custom fields.

- The Field Name and Table Name field types have a built-in dependency relationship. For example, Field Name fields don't exist independently; they require a Table Name field. Also, Field Name fields always contain a value, which is sys_id by default. You can't set the value for a Field Name field to None, even if you apply the attribute allow_null=true.
- If you need to change the data type for a field, create a new column using the new data type, copy the data from the old column to the new column via a background script, and then rename the original column label.
- Various conditions can cause a field to be read-only. For more information, see the Determining why a field is Read Only (grayed out and not editable) [KB0783470] article in the Now Support Knowledge Base.
- Fields may not display on forms as expected. For more information, see the Troubleshooting fields not appearing on forms [KB0547219] article in the Now Support Knowledge Base.

Field types

These field types are available to administrators when creating fields or changing the type of existing fields.

Field types

Field type	Platform name	Supported in configurable workspace	Description
approval_rules	Approval Rules	No	
audio	Audio	No	Audio field for uploading and embedding `.mp3` or `.ogg` audio files.
auto_increment	Auto Increment	Yes	
auto_number	Auto Number	Yes	
boolean	True/False	Yes	True/False field that holds a true or false value, typically displayed as a check box.
bootstrap_color	Bootstrap Color	No	
breakdown_element	Breakdown Element	No	
calendar_date_time	Calendar Date and Time	No	
catalogue_preview	Catalog Preview	No	
char	Char	Yes	
choice	Choice	Yes	Choice field that restricts values to a list of options, which is ideal for fields with a limited set of valid entries. For example, a priority field or a category field.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
collection	Collection	No	Collection field type that applies any changes made to the assigned field also to the entire table For example, changes such as attributes or the **Read only** check box that are applied to a table entry with this field type are applied to the table rather than a specific field. This entry is automatically created when a table is created. There shouldn't be more than one entry for a table of this type.
color	Color	No	String field that accepts CSS color declarations,including hex or RGB notation, and displays a preview. For more information on CSS color declarations, go to the Mozilla developer web docs. See the "<color>" article. https://developer.mozilla.org/en-US/docs/Web/CSS/color_value.
color_display	Color Display	No	
composite_field	Composite Field	Yes	
composite_name	Composite Name	No	
compressed	Compressed	No	Compressed field that stores large binary data in a compressed format, reducing database storage requirements. It's used for files like images or documents, automatically compressing and decompressing data to optimize performance. This field type helps maintain efficient storage and database performance, especially when handling large volumes of data.
condition_string	Condition String	Yes	Text field that accepts a plain JavaScript condition statement that is validated automatically for correctness before an update.
conditions	Conditions	Yes	Field that adds the condition builder to a form. You must specify a

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			dependent field that references the table name.
counter	Counter	No	
css	CSS	Yes	
currency	Currency	Yes	Decimal field with four digits after the decimal point. When displayed on a form, a **Currency** field also includes an additional list of choices for selecting the currency type. If there isn't a default value for the field, then empty **Currency** fields use the reference currency. Adding a value causes the field to use the session currency of the active user. See Change default currency decimal places for how to use two fraction digits. **Note:** After you assign this field type to a field, you can't change it to the **FX Currency** field type.
currency2	FX Currency	Yes	
data_array	Data Array	No	
data_object	Data Object	No	
data_structure	Data Structure	No	Data structure field where you can select one of the following data structures and enter values to organize particular information in the record: • String • Boolean • Integer • Decimal • Object • Array
date	Other date	Yes	Date field that displays a day, which can be selected with a calendar widget.

servicenow

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
datetime	Date/Time	No	Date/Time field that can be selected with a calendar widget. It's used for date-specific entries and is ideal for timestamps and scheduling.
day_of_week	Day of Week	No	
days_of_weeks	Days of Week	Yes	
decimal	Decimal	Yes	Number field with up to two digits after the decimal points. For example, 12.34.
document_id	Document ID	Yes	Document ID field that references a record on a table.
documentation_field	Documentation Field	Yes	Documentation field used by admins to add the label during table or field creation.
domain_id	Domain ID	Yes	Domain ID field that contains a reference to the domain.
domain_path	Domain Path	Yes	String field that contains a domain path, which is a series of three-character codes separated by a slash delimiter that uniquely identifies a domain. For more information on domain paths, see Domain Separation- Advanced Concepts and Configurations [KB0716268] article in the Now Support Knowledge Base.
due_date	Due Date	Yes	Date field that stores a date and time.
email	Email	Yes	
email_script	Email Script	No	Email script field that provides the ability to use field name notation **(${fieldname})**to represent the value of that field. This is a combination of text area and variable picker component and can be used to create text templates that have variables.
expression	Expression	No	
external_names	External Names	No	
field_list	Field List	Yes	
field_name	Field Name	Yes	Reference field for a field name in the table that is selected in a **Table Name**

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			field type. Make this field dependent on the **Table Name** field.
file_attachment	File Attachment	Yes	File attachment field that can hold one file. All file types are supported.
float	Floating Point Number	Yes	
formula	Formula	No	
geo_point	Geo Point	No	Geo point field for holding longitude and latitude coordinates.
glide_action_list	Action List	No	
glide_date	Date	Yes	
glide_date_time	Date/Time	Yes	
glide_duration	Duration	Yes	
glide_list	List	Yes	
glide_precise_time	Precise Time	No	
glide_time	Time	Yes	
glide_utc_time	UTC Time	Yes	
glide_var	Var	No	
glyphicon	Glyph Icon	No	
graphql_schema	GraphQL Schema	No	
GUID	Sys ID (GUID)	Yes	
html	HTML	Yes	String field with a built-in HTML editor. It supports formatted text with rich text editor and is useful for descriptions that need enhanced readability.
html_script	HTML script	Yes	HTML script field that provides the ability to add variables in the form of field name notation **(${fieldname})** via a variable picker within the HTML editor. This field is used to create rich text content that also has dynamic values.
html_template	HTML template	No	
icon	Icon	No	String field that provides the user access to an icon picker in a form. By default, the favorites icon set is used.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
image	Image	No	Image field used for uploading and embedding images.
index_name	Index Name	No	
insert_timestamp	Insert Timestamp	No	
int	Int	No	
integer	Integer	Yes	Number field with zero decimal points. **Note:** To search for an integer, input `=` followed by the integer in the search bar. For example, if you want to search for an Order of 100, input `=100`.
integer_date	Integer date	Yes	
integer_time	Integer time	No	
internal_type	Internal Type	No	
ip_addr	IP Address (Validated IPV4, IPV6)	Yes	
ip_address	IP address	Yes	Variable character field that stores IPv4 and IPv6 addresses. See IP address field type for more information.
journal	Journal	No	Journal field that accepts text entries and displays previous entries with a user name and timestamp.
journal_input	Journal Input	Yes	Journal input field that accepts text entries but doesn't display previous entries.
journal_list	Journal List	No	Journal list field that displays the contents of journal fields. You must specify the journal fields as the dependent fields. If a journal list field depends on more than one journal field, the entries are displayed chronologically.
json	JSON	Yes	
json_translations	JSON Translations	No	

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
language	Language	No	
long	Long	Yes	Long field that stores large whole numbers, which can be useful for high-value data. This field handles values that exceed standard integer limits, which is essential in high-volume contexts like serial numbers or counting operations. This field ensures that numeric data is stored accurately without overflow.
longint	Longint	Yes	Longint field that stores large whole numbers, which can be useful for high-value data. This field handles values that exceed standard integer limits, which is essential in high-volume contexts like serial numbers or counting operations. This field ensures that numeric data is stored accurately without overflow.
mask_code	Mask code	No	
metric_absolute	Metric Absolute	No	
metric_counter	Metric Counter	No	
metric_derive	Metric Derive	No	
metric_gauge	Metric Gauge	No	
mid_config	Mid Config	No	
month_of_year	Month of Year	No	
multi_small	Multi Small	Yes	Text area field that stores shorter texts like short descriptions and notes.
multi_two_lines	Two Line Text Area	Yes	
name_values	Name-Value Pairs	No	Name-value pairs field that maps text values. Each mapping is one-to-one, but a single **Name-Value Pairs** field can contain multiple mappings. Each mapping must use a unique name, and the name can't be empty. For example, you can use a **Name-Value Pairs** field to hold header information for a web service request. In this example, the name

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			of each mapping is the header such as `Content-Type` and the value is the header value, such as `Application/json`. For information on scripting **Name-Value Pairs** fields, see Name-value pairs field type.
nds_icon	NDS Icon	No	
nl_task_int1	NL Task Int1	No	
order_index	Order Index	Yes	Order index field that defines the display order of records in lists or hierarchies. By assigning a numeric value to each record, it enables admins to control the visual sequence, which is helpful for logically organizing tasks, categories, or items. This field type helps improve user experience by making the interface intuitive and orderly.
password	Password (1 Way Encrypted)	Yes	Text field that stores passwords with one-way encryption. One-way encryption stores the password as a secure hash value that can't be decrypted.
password2	Password (2 Way Encrypted)	Yes	Text field that stores passwords with two-way encryption. Two-way encryption stores the password as a secure encrypted value that can be decrypted programmatically within the instance. You can use Password 2 encryption with form variables. To encrypt text fields on forms, see Password2 encryption with KMF. The length for password2 field values must be at least 255 characters.
percent_complete	Percent Complete	Yes	Decimal field that renders a percent complete bar in lists. You can convert any existing **Decimal** field to a **Percent Complete** field.
ph_number	Phone Number	Yes	
phone_number	Phone Number (Unused)	Yes	

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
phone_number_e164	Phone number (E164)	Yes	String field that provides E164-compliant formatting and validation for telephone numbers.
price	Price	Yes	Currency field that enables control over conversions and display. See Price fields for more information.
properties	Properties	No	
radio	Radio	Yes	Radio field that displays mutually exclusive options as radio buttons, letting users select only one choice. It's suitable for simple, definitive decisions, like priority level or yes/no responses. This field type helps improve usability by presenting clear options for single-selection inputs.
records	Records	No	
reference	Reference	Yes	Query field that displays records from another table, which is crucial for relational data structures.
reference_name	Reference Name	No	
related_tags	Related Tags	No	
reminder_field_name	Reminder Field Name	No	
repeat_count	Repeat Count	No	
repeat_type	Repeat Type	No	
replication_payload	Replication Payload	No	
schedule_date_time	Schedule Date/Time	No	
schedule_interval_count	Schedule Interval Count	No	
script	Script	Yes	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. It also provides a list of fields and server APIs. You must specify a dependent field that references the table name for the list of fields.
script_client	Script Client	No	

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
script_plain	Script (Plain)	Yes	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting.
script_server	Script Server	No	
short_field_name	Short Field Name	No	
short_table_name	Short Table Name	Yes	Text field that stores a compact version of a table name, often used for efficiency in system configurations, URLs, or logs. It helps map the full table names to shorter identifiers, mainly for internal system use rather than direct user interaction.
simple_name_values	Name-Value Pairs	Yes	
slushbucket	Slushbucket	Yes	
snapshot_template_value	Snapshot Template Value	No	
source_id	Source ID	No	
source_name	Source Name	No	
source_table	Source Table	No	
string	String	Yes	String field that holds a string of characters. Strings of up to 255 characters appear in a single-line text box. Anything 256 characters or over appears as a multi-line text box. **Note:** The database may translate the value that you provide in the **Max length** field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100). For Oracle instances, users aren't able to increase the max length of a string field to a value greater than 4000 through the application UI. Changes greater than 4000 require

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			the CLOB data type in Oracle. If you require a field to be larger than 4000 characters, log an incident to request the change.
string_boolean	String Boolean	No	
string_full_utf8	String (Full UTF-8)	Yes	String field that contains UTF-8 character encoding. This field type is restricted to the same maximum length that can be defined within the application UI as the String data type. Emojis are supported in the String (Full UTF-8) field type.
structure	Structure	No	
sys_class_name	System Class Name	Yes	System field that holds the table name.
sys_class_path	System Class Path	No	
sysevent_name	System Event Name	No	
sysrule_field_name	System Rule Field Name	No	
table_name	Table Name	Yes	String field that lets you select a table. If you use the **Field Name** field type, add this field type and make the **Field Name** field dependent on the **Table Name** field. If you're in a scoped application, you can view only the tables of that scope.
template_value	Template Value	Yes	
time	Time	No	Time field that stores a time in the database as a **Date/Time** field, but only the time part of this field is used.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			Note: This field stores the date as 1970-01-01, which doesn't fall within the dates for Daylight Savings Time (DST). As a result, the time isn't adjusted automatically for DST. If a custom feature uses time as a start time, the feature must adjust for DST, if necessary.
timer	Timer	Yes	
translated	Translated	No	
translated_field	Translated Field	Yes	
translated_html	Translated HTML	Yes	HTML text field that displays translations based on the user's language.
translated_text	Translated Text	Yes	Text field that displays translations based on the user's language.
tree_code	Tree Code	No	
tree_path	Tree Path	No	
url	URL	Yes	String field that is a selectable URL field when locked. When configuring, there's an option to allow/disallow links with or without HTTPS. **Note:** In the mobile UI, this field appears as a multi-line text field. The field saves as a single line with the line breaks removed.
user_image	Image	Yes	
user_input	User Input	No	User input field that captures input provided by users, typically in the context of workflows, surveys, or other interactive processes. This field enables users to enter text, select options, or provide other types of input that can then be processed or stored for further use. The data collected through **User Input** fields is often used to guide

Field types (continued)

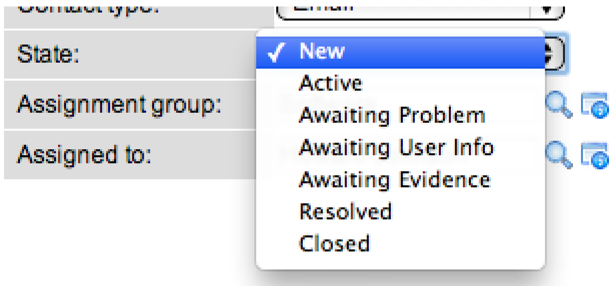
Field type	Platform name	Supported in configurable workspace	Description
			decision-making in workflows or to gather information for reporting and analysis. It's a flexible field type that can be customized to fit various use cases where user interaction is required.
user_roles	User Roles	Yes	
variable_conditions	Variable Conditions	No	
variable_template_value	Variable Template Value	No	
variables	Variables	No	
version	Version	Yes	
video	Video	No	Video field for uploading and embedding video.
week_of_month	Week of Month	No	
wide_text	Wide Text	Yes	
wiki_text	Wiki	Yes	String field with a built-in wiki text editor that accepts a simplified version of standard wiki text formatting.
wms_job	WMS Job	No	
workflow	Workflow	Yes	List field that displays a stage in a workflow.
workflow_conditions	Workflow Conditions	No	
xml	XML	Yes	

Choice list field type

A choice list is a type of field that lets the user select from a pre-defined set of choices.

Administrators can define the available choices and customize the behavior and appearance of choice lists.

Incident state choice list



Note:
Choice lists do not support a one to many relationship. Only one choice from a choice list can be selected at a time.

Choice list security

You can use the personalize_choices security role to enable non-administrators modify Choice elements options on all tables.

If more granular control is desired, you can also create a custom ACL (security rule) governing the personalize_choices operation either for a particular field or for all fields (.*) on a particular table. However, access to the personalize_choices operation on a particular field does not confer the ability to add new choices for that field.

To be able to create new choices for a particular field, an ACL that grants personalize_choices access for that field is required. For example, to give the hris_admin role the ability to personalize only the Category field for Human Resources KB articles, you need an ACL granting personalize_choices access to the hris_admin role on the Category field of the Knowledge (kb_knowledge) table.

There are predefined ACLs granting both types of access to the personalize_choices security role, for all fields on all tables. The personalize_choices security role also has read, write, and delete access to the sys_choices table. However, this additional access is not required when making just the Personalize Choices functionality available on a granular basis.

Values to associate with choice labels for scripting

When you write a script that references a choice list, you need to know the value that is associated with each choice.

For example, to check whether the incident_state field is active, you could not use the condition `current.incident_state == "active"` because the value associated with the choice labeled **Active** is the integer **2**. Instead, you would use the condition `current.incident_state == 2`.

The **Type** field on the choice list dictionary entry determines the data type of the values.

To determine the value associated with a choice, right-click the field label and select **Show Choice List**, and then locate the choice for which you need to know the value.

Show choices list values

		Table ▲	Element	Language	Value	Label	Inactive	Sequence
		incident	state	en	1	New	false	1
		incident	state	en	2	Active	false	2
		incident	state	en	3	Awaiting Problem	false	3
		incident	state	en	4	Awaiting User Info	false	4
		incident	state	en	5	Awaiting Evidence	false	5
		incident	state	en	6	Resolved	false	6
		incident	state	en	7	Closed	false	7

The **-- None --** option may not have a sys_choice record associated with it. A choice list field set to **-- None --** evaluates to these values, depending on the script context as listed below.

- For client-side scripts,such as client scripts: "" (empty string)
- For server-side scripts, such as business rules: "0" (string of the number zero)

System dictionary

Integer values for default choice lists

Choice provide four default values.

Some common choice lists use integer values that do not match the string labels. For example, the Problem table uses these default values for the **State** field.

State field default values

Value	Label
1	Open
2	Known Error
3	Pending Change
4	Closed/Resolved

These integer values are also used in several default business rules. For example, a business rule on the Incident table sets the active flag to false when the **State** field changes to **7**, which is the default value for the **Closed**. If you change the values of your Incident state options, this business rule may no longer behave as desired or expected.

On the Incident table, the **Active**, **State**, and **Incident state** fields are affected by the following default business rules.

Default business rules

Business rule	Description
mark_closed (incident)	If the incident_state changes to **7** (**Closed**), the **Active** field is set to false

Default business rules (continued)

Business rule	Description
incident reopen (incident)	If the incident_state is less than **7** (**Closed**) and the **Active** field is false, the **Active** field is set to true
mark closed (task)	If the state changes to either **3** (**Closed Complete**) or **4** (**Closed Incomplete**), the **Active** field is set to false
task closer (task)	If the **Active** flag changes from true to false and the state is neither **3** (**Closed Complete**) nor **4** (**Closed Incomplete**), the state is set to **3** (**Closed Complete**)
task reopener (task)	If the **Active** field changes from false to true and the state is either **3** (**Closed Complete**) or **4** (**Closed Incomplete**), the state is set to **1** (**Open**)

Note:
Notice that these business rules do not change incident_state based on a change to either the **Active** field or the **State** field. Changes to incident_state drive the other two fields, not the other way around.

Configure state field choice values

State fields are a subset of choice list fields. Keep the following information in mind when you configure choice values for the state field.

- Use a negative value to add a new active state field.
- Search for and study the business rules that use a state number filter on the **Script** and **Conditions** fields. You can use the Debug tool to trace the order of the business rule execution.
- New values representing inactive states should have a value above 8.

You can define any of the following attributes for a state field by configuring the dictionary. If the attributes are not defined, the system uses the default values. The TaskStateUtil API uses the following attributes. For more information on the TaskStateUtil API, see TaskStateUtil.

Related Attributes

Attribute	Definition
close_states	Semicolon delimited list of state values that are inactive, used to identify whether the task should be set to active or inactive. This is a required attribute to use the TaskStateUtil functionality.
default_close_state	Optional attribute to define the state value of the default close state if you want to define business rules that automatically close a task. Defaults to 3, typically Closed Complete if attribute is not defined.
default_work_state	Optional attribute to define the state value of the default working state if you want to define business rules that automatically set a task for working. Defaults to 2, typically Work in Progress if the attribute is not defined.

State modification examples

Follow these examples for modifying the states of incidents and change requests.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Choice Lists**.
2. At the top of the list, construct a list filter like the following:
   - **Table**: incident
   - **Element**: incident_state
3. Run the filter.

   Notice that the **Closed** state has a value of **7** and the **Resolved** state has a value of **6**. Any state greater than or equal to **7** is assumed to be inactive. Therefore, you should use a positive integer greater than **7** if you want to add a new inactive-type of state. Use a negative value like **-1** or **-2** if you wish to add a new active-type of state field, such as **Awaiting Vendor**.
4. Navigate again to **System Definition** > **Choice Lists**.
5. At the top of the list, construct a list filter like the following:
   - **Table**: change_request
   - **Element**: phase_state
6. Run the filter.

   Notice that the **Complete** state has a value of **8**. Any state greater than or equal to **8** is assumed to be inactive. Therefore, you should use a positive integer greater than **8** if you want to add a new inactive-type of state, such as **Cancelled**. Use a negative value like **-1** or **-2** if you wish to add a new active-type of state field, such as **Pending**.

Troubleshoot change states and business rules

Business rules in the system make assumptions about state values. You can troubleshoot business rules to see the order in which they run and see how it affects changes you make to **State** field values.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Business Rules**.
2. Construct a filter like this one to view the scripts and conditions that pertain to the Resolved incident_state of 6 or the Closed incident_state value of 7:

   The **Script** field contains 7 OR the **Condition** field contains 7 OR the **Script** field contains 6 OR the **Condition** field contains 6 AND the **Table** field is incident AND the **Active** field is true.

What to do next
See Debug Business Rule for information on how to trace the order of business rule execution. You can click **Debug All**, resolve an incident, and then check the trace at the bottom of form to watch the business rules execute. These two line examples show that the mark_closed business rule code is entered `==>` and then exited `<==`.

```
==> 'mark_closed' on incident
<== 'mark_closed' on incident
```

View choice list definitions

The Choice Set [sys_choice_set] table contains a record for every field that uses a choice list.

Before you begin

Role required: personalize_choices

Note:
The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

About this task

The choice set record is associated with an application file, which allows update sets and team development to track and transfer all choices for a field in a single update record.

Choice list values allow a maximum length of 40 characters. The range of allowable numerical values is [-999, 999].

Procedure

1. Right-click the choice list field label and select **Show Choice List**.
   To view other choice list values, modify the filter at the top of the list.

   Note:
   When you use an ACL to grant personalize_choices on a particular field, **Show Choice List** is not available. It is only available if you explicitly grant the role to the user. **Configure Choices** continues to appear regardless of whether it is an ACL or an explicitly granted user role.

2. Review the items in the list.

   Warning:
   Do not add new choices to the list. To add new choices to a choice list field, use the **Configure Choices** option.

Define an option for a choice list

You can personalize the options that are available in a choice list.

Before you begin

Role required: personalize_choices

Procedure

1. Navigate to a form where the field appears.
2. If the choice list is dependent on another field, enter the choice value that the options depend on.

   For example, on the incident table, the **Subcategory** is dependent on the **Category**. To customize which subcategory choices are available for the hardware category, select **Hardware** in the **Category** field.

3. Right-click the field label and select **Configure Choices**.
4. Use the slushbucket to rearrange the order, add, or remove items or to create new items.
5. Click **Save**.

To dynamically add items to a choice list, use the `addOption` GlideForm method .

Note:
Some business rules may be affected by changes to choice list options (for example, default Incident states).

Reuse a choice list

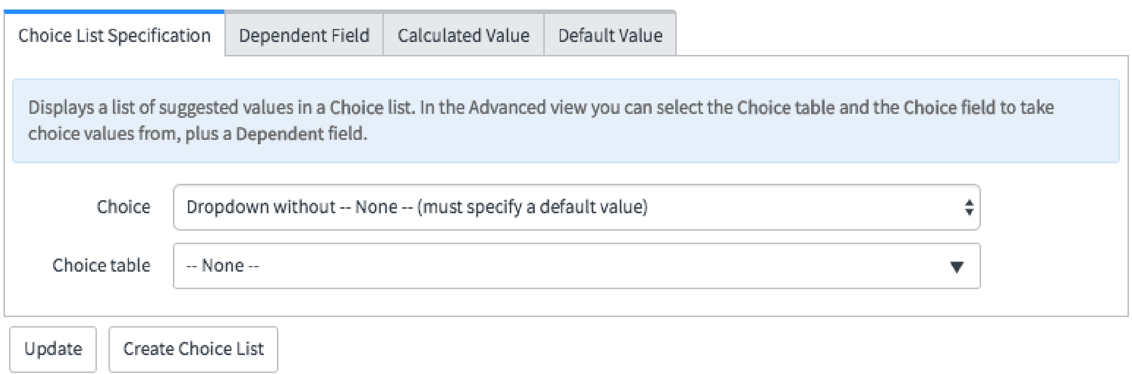
After defining a set of choice list values, you can reuse the values for another field in a different table.

Before you begin

Role required: personalize_choices

Procedure

1. Right-click an existing choice field (Field A) and select **Configure Choices**.
2. Add the desired choice list values in the **Choices** related list.
3. To reuse the choice list values for another field (Field B) in a different table, right-click the label for Field B and select **Configure Dictionary**.
4. In the **Choice table** field, select the table where Field A resides.
5. In the **Choice field** field, select Field A.



6. Click **Update**.

   The choice list values defined on Field A are displayed on Field B. When you add or remove choice list values on Field A, those changes are also reflected on Field B. After you specify a choice table and a choice field, the field no longer uses the defined choice list.

Remove the None option from a choice list

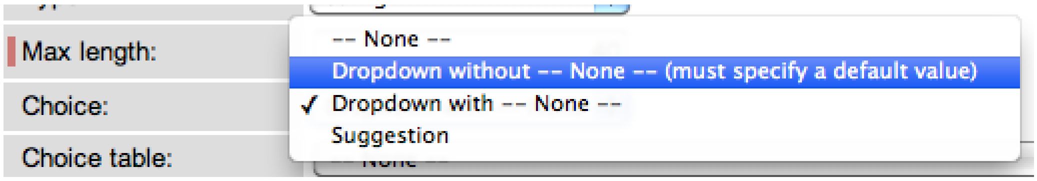
You can remove the **None** option from a choice list if it is not necessary.

Before you begin

Role required: personalize_dictionary

Procedure

1. Navigate to a form where the field appears.
2. Right-click the field label and select **Configure Dictionary**.
3. Change the **Choice** field value to **Dropdown without -- None -- (must specify a default value)**.



4. Ensure that the **Default** field is populated to determine which choice is displayed by default.

   Note:
   If the field is dependent on another field, the **-- None --** option remains available.

Change the None display value for a choice list

You can change the default display label of the **None** option for a choice field.

Before you begin

Role required: personalize_choices

Note:
The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

Procedure

1. Navigate to a form on which the field appears.
2. Right-click the field label and select **Show Choice List**.
3. Click **New**.
4. Complete the form.

Choice form fields

Field	Value
Table	Select the table.
Element	Leave the name of the field that is automatically populated.
Language	Enter ISO language code for the label.
Sequence	Leave empty. This field determines the order.
Inactive	Leave cleared.
Label	Enter the label to appear in the choice list. You can use JavaScript, including calls to script includes, to define the label. For example, the JavaScript label in the following example changes the **-- None --** value of the **Time zone** choice list in a user record to use the time zone value of the instance.

Field	Value
	Value	Enter `NULL_OVERRIDE`. **Note:** You must enter `NULL_OVERRIDE` as the value, or the new label appears in addition to the **-- None --** option.
Dependent value	Leave blank.
Hint	Leave blank. **Note:** When field type is set to **List (Glide List)** the hint won't display.

5. Click **Submit**.

Delete all choice list options

You can delete all choices for a choice field from the Choice Set record.

Before you begin

Role required: personalize

About this task

You may want to use this method when you are developing a new application and the business requirements change. If you are updating a choice list that is already in use, consider deactivating the options you no longer use to avoid conflicts with existing data or scripts that may rely on the previous options.

Procedure

1. In the navigation filter, enter `sys_choice_set.list` and press Enter.
2. Open the choice set record for the field.

   For example, to locate the choice set for the incident subcategory, filter by **[Table] [is] [incident] AND [Element] [is] [subcategory]**.

3. Check the box beside the choice set record to delete and select **Delete** from the Actions choice list below the list.

4. Click **Delete** in the confirmation window.
   All choices for the field are deleted.

Create a choice list for another field type

You can create a choice list for a field with another type, such as an integer, string, or reference field.

Before you begin
Role required: personalize_dictionary

About this task
You can use this configuration to standardize data entry and limit available options for a field while still maintaining the original field type.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary entry for the field.

   Note:
   Reference fields with a large number of records in the reference table cannot be converted to look like choice fields. A reference field with too many records reverts to looking like a reference field.

3. Change the **Choice** value to **Dropdown with --- None ---** or **Dropdown without --- None --- (must specify a default value)**.
4. Right-click the form header and select **Save**.
5. Click **Create Choice List**.

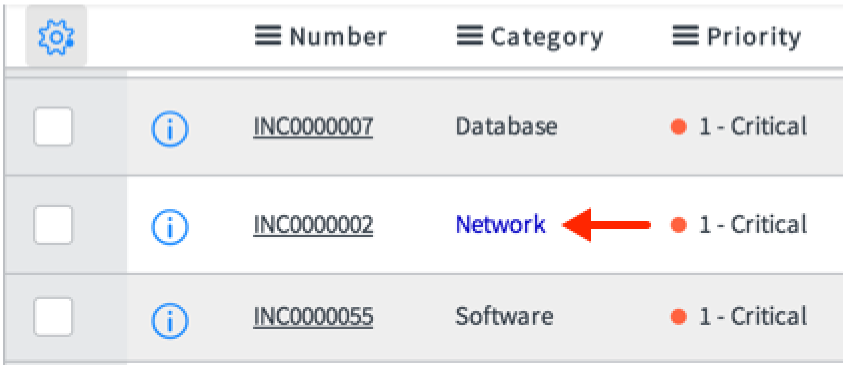
   - The **Choices** related list appears on the dictionary entry form.
   - If records on the table contains data for the field, a choice list value for each unique field value is created. For example, if three records exist on the table and each record has a unique value in the field, then three choices are created.
   - If no data exists in the field, a choice list value of **-- New choice --** is created.

Display invalid choice list values

By default, inactive or invalid choice list values appear in blue text instead of black. You can disable the color indicator for invalid choices.

Before you begin
Role required: admin

About this task
In the following example, the **Network** category has been deactivated, so it appears in blue for records that still contain the inactive value.



Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Clear the check box for the **Display missing choice list entries** property.

Add search option to a choice field

Add a search field to choice fields that have a long list of options.

Before you begin

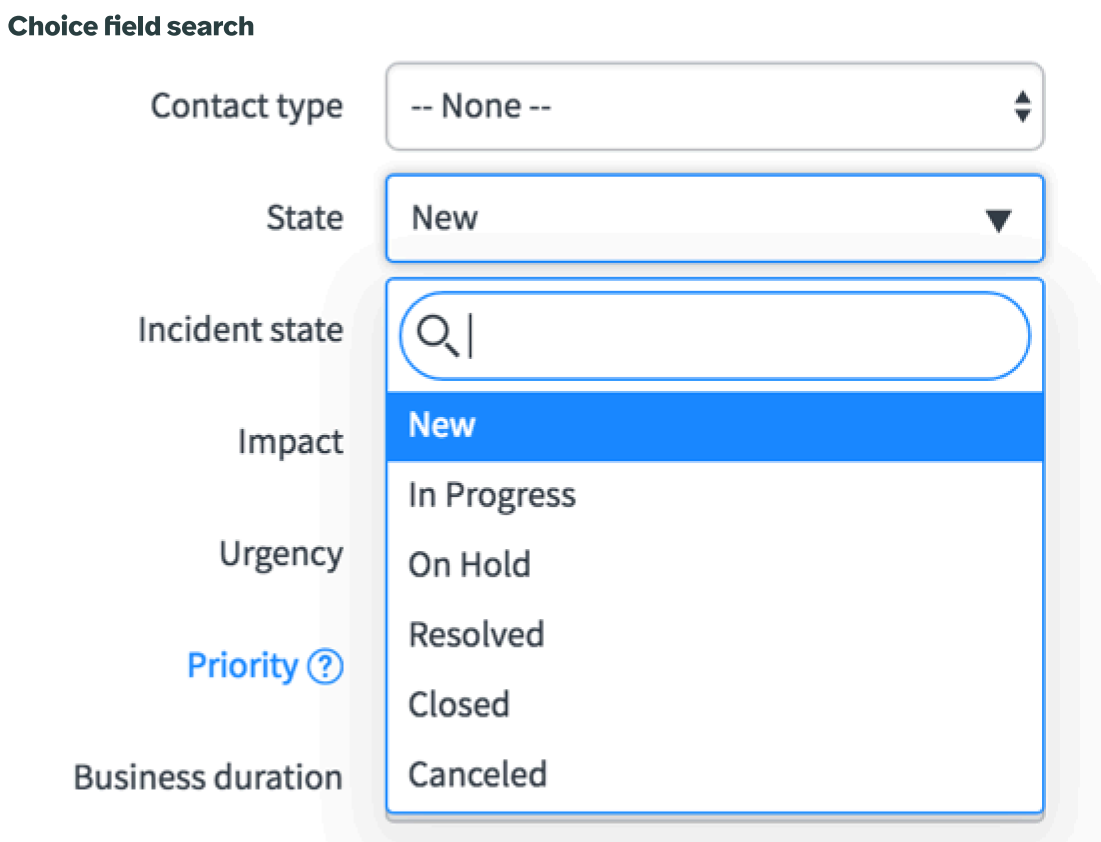
Role required: admin

Procedure

1. Navigate to a form that contains choice fields.
   For example, incident.
2. From a choice field on the form, for example State, right-click the field and select **Configure Dictionary**.
3. Switch to the advanced view for the dictionary entry form using the context menu by navigating to **View** > **Advanced**.
4. In the Attributes field, type `is_searchable_choice=true`.
   If there are other entries in the attributes field, use a comma to separate the entries.
5. Update the Dictionary Entry form and reload the page containing the choice list.

Result

The choice list contains a search field that users can use to filter the list of choices.



Condition field types

A condition field specifies when to run business logic such as a business rule or workflow.

There are two types of condition field.

Condition field types

Condition field type	Description
Condition string	A text field that accepts a plain JavaScript condition statement. The system validates the condition syntax for correctness before an update.
Conditions	A field that adds a condition builder to a form. Condition builders require specifying a dependent field whose values the system uses to display choice list options. Typically, the dependent field is the **Table** field.

The system evaluates both types of condition field to determine if the conditions are true or false. When true, the system runs the business logic. When false, the system ignores the business logic.

To find dictionary attributes that affect condition fields, see Altering tables and fields using dictionary attributes.

Add the condition count to a condition field

The condition count widget can be activated on condition fields to display a preview of the records that would meet the current set of conditions. For fields where the condition count is activated, the number of records that match the conditions will automatically display. The count

refreshes if the field the condition field depends on, such as Table, is changed. If the Table field is left blank, the widget is hidden.

Before you begin

Role required: personalize_dictionary

Procedure

1. Right-click the field label and select **Configure Dictionary**.
2. Add `show_condition_count=true` to the **Attributes** field.
3. Submit.

Result

In this example, a condition is run on the Incident table to look for incidents where **Category** is **Network**:

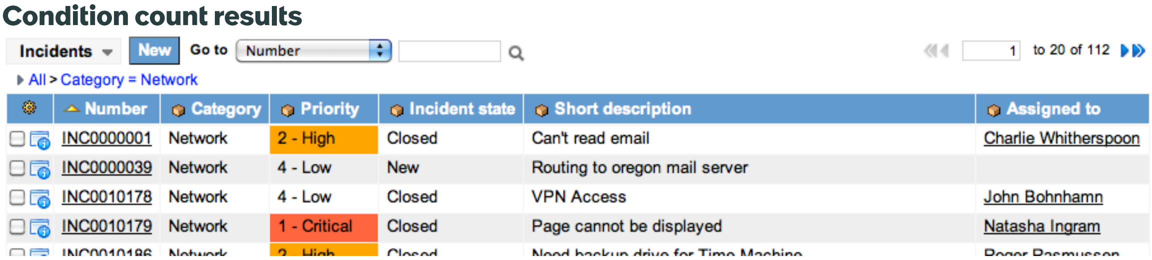
Condition count

The list shows that there are 112 records with **Network** as its category.

To refresh the preview, click the update count icon ( ).

To view details of the results, click the number of records to open the list view of the results:

Condition count results



Update a conditions field to use condition builder v2

In Core UI, you can update a conditions field to display the version 2 condition builder.

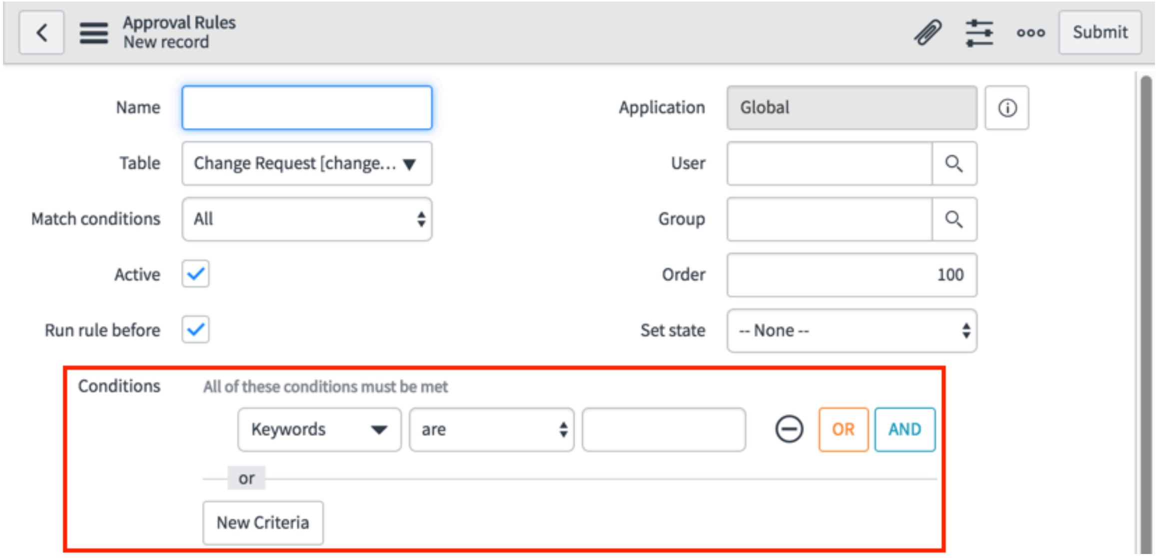
Before you begin

Role required: admin

About this task

You add a dictionary attribute to the Conditions field to enable condition builder version 2 (v2).

Condition builder v2 configured in Approval Rules form



Procedure

1. Open the form with the condition builder to configure.
2. Right-click the **Conditions** label and click **Configure Dictionary**.
3. In the **Attributes** field, enter `condition_builder=v2`.
   If attributes exist, add this string at the end separated by a comma.
4. Click **Update**.
   The form reloads with the v2 version of the condition builder.

Database field type

Several field types are available in the system.

This table shows field types and corresponding MySQL database types. Typically, it isn't necessary to perform any actions at the database level. To learn about changing a field type, see System dictionary.

Database field types

Field types	Options	Dictionary XML type	MySQL DB type
String	small	string	VARCHAR(40)
String	medium	string	VARCHAR(100)
String	large	string	MEDIUMTEXT
String	extralarge	string	MEDIUMTEXT
Decimal		decimal	Decimal (15,2) older instances may have (12,2)
Integer		integer	Integer
True-False		boolean	TINYINT(1)
Date		glide_date	DATE
Date-Time		glide_date_time	DATETIME

Database field types (continued)

Field types	Options	Dictionary XML type	MySQL DB type
Time		glide_time	DATETIME
Duration		glide_duration	DATETIME
Choice		string	VARCHAR(40)
Suggestion		string	VARCHAR(40)
Journal		journal	MEDIUMTEXT
Reference	<reference table>	reference	VARCHAR(32)
List		glide_list	MEDIUMTEXT
Url		url	MEDIUMTEXT
Image		user_image	VARCHAR(40)
Due-Date		due_date	DATETIME

Note:
An example of option types is as follows:

- A string field defined in the platform with a max length of 40 characters → VARCHAR(40).
- A string field defined in the platform with a max length of x, where x = 41-255 characters, inclusive → VARCHAR(x) [examples: String 42 is VARCHAR(42) and String 211 is VARCHAR(211)].
- A string field defined in the platform with a max length of 256 and upwards → MEDIUMTEXT.

Dictionary entry data types

You can only change a dictionary entry's data type when the change does not result in data loss. Use the following guidelines to change a dictionary entry's data type.

Valid data type changes

Condition	Restrictions
The field is empty in all table records.	None. You can convert an empty field from any data type to another without restriction.
The table contains existing data for the field.	You can only convert between logical data types that map to the same physical data type in the database. For example, you can convert a glide duration to a glide datetime since both logical data types map to the DATETIME physical data type in the database.
The field is a string field you are converting to another type of string field.	You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.
The field is a string field you are converting to a	You can only convert a string field to a GUID if all of the exiting data in the field are already **Sys ID** values.

Valid data type changes (continued)

Condition	Restrictions
globally unique ID (GUID).	
The field is a GUID field you are converting to a string field.	None. You can convert a GUID field to a string field without restriction.

Document ID field

You can create document ID fields to reference any record on any table.

Before you begin
Role required: personalize_dictionary

About this task
In comparison, a reference field references a record on a specific table. To reference records from any table, two fields need to work together—one to store the table reference and another to store the record reference.

You can select the document ID type when creating a new field.

Procedure
1. Navigate to the form view for the table.
2. Right-click the header and select **Configure** > **Form Layout**.
3. Create a field to store the table name and click **Add**.
   - **Name**: Any label (for example, `Model table`)
   - **Type**: String
4. Create a field to store the record reference and click **Add**.
   - **Name**: Label for your document ID field (for example, `Model ID`)
   - **Type**: Document ID
5. Click **Save**.
6. Right-click the form header and select **Configure** > **Dictionary**.
7. Open the dictionary entry for the document ID field.
8. Under **Related Links**, click **Advanced view**.
9. In the **Dependent** field, enter the column name of the table reference field (for example, `u_model_table`).
10. **Optional:** In **Attributes**, add the *`show_all_tables`* dictionary attribute to display system tables.
11. Click **Update**. When users click the reference lookup for the document ID field, a dialog appears that allows them to select the table and then the record. The sys_id of the selected record is stored in the document ID field and the table name is stored in the table reference field.

12. **Optional:** Configure the form to remove the table reference field.

Altering tables and fields using dictionary attributes

Function field

Create function fields and scripts in the ServiceNow AI Platform to perform common database transformations and calculations.

Regular fields store a value in the database. Instead of storing data, a function field displays the results of a database query. Function fields do not have an associated database column. Instead, function fields generate a value based on simple computations of other fields and constants. They can be used like any other fields in the system: in forms, lists, query conditions, reports, data visualizations, and so on.

> **Warning:**
> A function field that references another function field in the function will result in an error. Function fields don't hold data or evaluate in run-time.

Example: Use case

You want to identify all incidents with a probably useless short description of fewer than 10 characters.

Instead of querying all records to determine which record meets a given criteria, create a function field or function script that retrieves only the records that meet the criteria.

For a simple computation, it is better to use a function field or function script rather than store a computed value. The value is always calculated on retrieval. Another benefit of using function fields is that the database server performs the transformation rather than the application node.

Function fields versus calculated fields

The values of the calculated fields are stored in the database. The values of function fields or function scripts are not stored in the database, but are calculated at the time of retrieval. Function field values are always up to date.

Function fields versus business rules

Use function fields or scripts when business logic is based on a simple transformation of one or more existing fields. Function fields and scripts let you implement business logic without storing and maintaining the result of a transformation.

Function fields versus filters, query strings, and Rhino

Rather than calling Rhino to perform string transformations, you can use a function field or function script to perform the transformations for you. Function fields and function scripts are more efficient and result in up-to-date values that do not have to be stored or maintained.

Function field limitations

Because function field calculations are not stored in the database, some operations are not relevant.

- Function fields cannot be directly audited or indexed.

  Note:
  To index a function field as if it were a regular field, make sure the individual fields used by the function are indexed. Or for best performance, make sure that there is a composite index including all fields that are used in the function.

- Function fields cannot be encrypted, since a function field value is never stored in the database.
- Function fields cannot be converted to regular fields or vice versa.
- Function fields that you create in the Reporting UI do not support dot-walking. For more information, see Configure function fields in Reporting.
- Security is evaluated on the components of the function and on the calculated value of the field. When used in visualizations, sections that contain information that the user is not permitted to see are hidden from the user.
- Field function names must be unique.

Defining platform functions

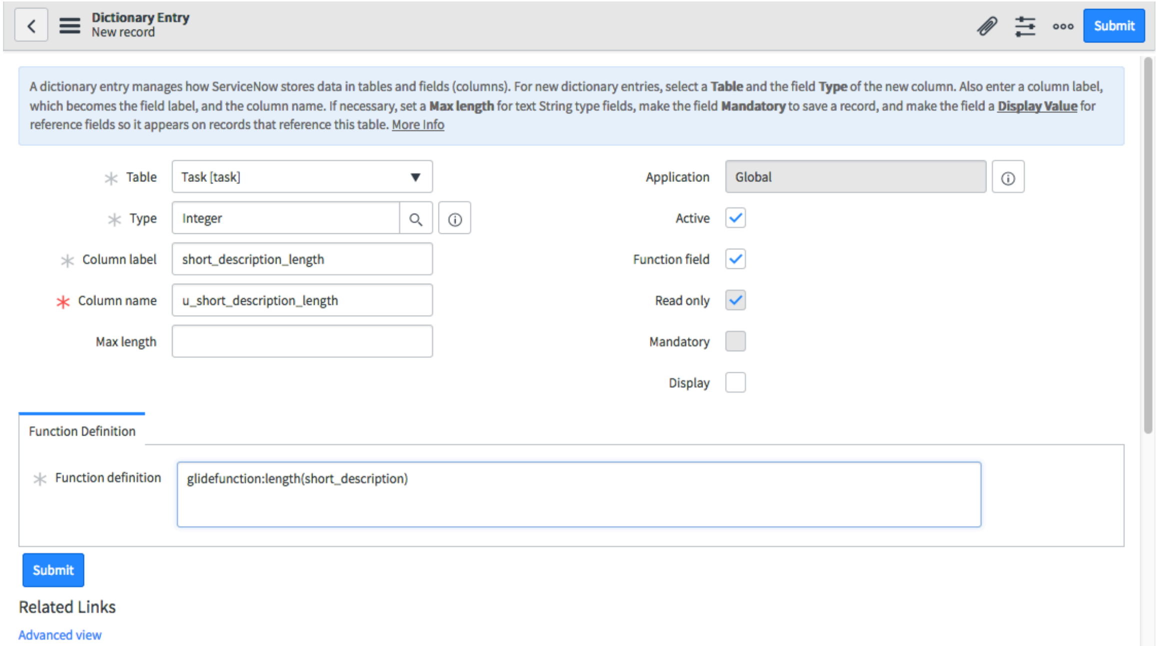
Platform functions can be defined in two ways:

1. Use the following application programming interfaces (APIs) to build and use functions in a script.

   Function APIs

APIs	Description
Scoped GlideDBFunctionBuilder	Construct the function to perform a SQL operation.
GlideRecord - addFunction(Object function)	Apply the function to a GlideRecord.
GlideDBFunctionCaseBuilder - Global	Build case statements.

2. Create a field that holds the function definition, as shown in the following example.



Select the **Function field** check box on the Dictionary Entry [sys_dictionary] form. This action specifies that the field runs a function rather than stores a value.

glidefunction operations

Function fields can perform the following operations using the `glidefunction:<operation>` syntax. When providing a field as an argument, you can dot-walk to related fields. For example, `cmdb_ci.name`.

Note:
The function field type must be compatible with the return type of the glide function. For example, integer, longint, string, and so on. If the returned type cannot be converted to the dictionary type, you get exceptions.

Function field operations

Operation	Description	Example
`add()`	Takes two number fields as input, adds them, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	*`glidefunction:add(child_incident`* *`parent_incident)`* Returns 6 if the incident has five child incidents and one parent incident. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`coalesce()`	Takes any number of comma-separated fields as input and returns the first non-empty value.	*`glidefunction:coalesce(closed_at`* *`resolved_at,`* *`sys_updated_on)`* If the value of closed_at is empty, the function returns

Function field operations (continued)

Operation	Description	Example
		the value of resolved_at. If the value of resolved_at is also empty, the function returns the value of sys_updated_on. Return type: Text
`concat()`	Takes any number of comma-separated fields and constants as input, concatenates the input, and returns a single string as a field value.	`glidefunction:concat(incident_nu '/', short_description)` Returns "INC0001 / My client needs a new laptop." if the value of the number field is 'INC0001' and the short_description is 'My client needs a new laptop'. Return type: Text
`datediff()`	Takes two date/time fields as input, calculates the difference between the dates in days, minutes, and seconds, and returns the results as a duration field value.	`glidefunction:datediff(closed_at sys_created_on)` Returns the duration of an incident from the creation date to the close date. Example result: 10 days, 8 hours 23 minutes 11 seconds Return type: Duration
`dayofweek()`	Takes two arguments: A date field and a constant of either `'1'` (week starts on Sunday) or `'2'` (week starts on Monday). Returns the results as an integer value that represents the day of the week. The `dayofweek()` function uses UTC dates, but adjusts comparison values based on the instance's time zone.	`glidefunction:dayofweek(resolved '1')`. If resolved_at occurs on a Wednesday, returns 4 if the integer is 1 and returns 3 if the integer is 2. Return type: Whole number
`distance_sphere()`	Takes two locations and returns the distance between them in meters.	• `glidefunction:distance_sphere( '51.473584', '80.206458', '25.767242')` Returns the distance between the two sets of longitude and latitude pairs.

Function field operations (continued)

Operation	Description	Example
		• `glidefunction:distance_sphere(u` `'80.206458',` `'25.767242')` Returns the distance between the u_location geo point field and the longitude and latitude coordinates. • `glidefunction:distance_sphere(l` `location2)` Returns the distance between the location1 and location2 geo point fields. • `glidefunction:divide(distance_s` `'-0.189937',` `'51.473584'),` `'1000')` Returns the distance between the location1 geo point field and London in kilometers. Return type: Decimal
`divide()`	Takes two number fields as input, divides the first by the second, and returns the result as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	`glidefunction:divide(u_num2,u_nu` Returns 5 if num2 = 10 and num1 = 2. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`greatest()`	Takes two or more values as input and returns the greatest value of the list of arguments.	`glidefunction:greatest(10,100,10` Returns 1000 Possible numeric return types: Decimal, Floating Point Number, Large Whole Number, Whole Number This function also works with date and string fields.
`least()`	Takes two or more values as input and returns the lowest value of the list of arguments.	`glidefunction:least(10,100,1000)` Returns 10

Function field operations (continued)

Operation	Description	Example
		Possible numeric return types: Decimal, Floating Point Number, Large Whole Number, Whole Number This function also works with date and string fields.
`length()`	Takes a string field as input, calculates the field length in characters, and returns the results as a field value.	`glidefunction:length(short_descr` Returns 37 if short_description = "This application is performing a test". Return type: Whole number
`multiply()`	Takes two number fields as input, performs the multiplication, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	`glidefunction:multiply(u_num1, u_num2)` Returns 48 if num1 = 8 and num_2 = 6. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`position()`	Takes two text fields or two text fields and a whole number as input. One or both of the text fields can also be strings. 1. Returns the position of the first occurrence of the string of the first text field in the second. 2. If a whole number is specified, this function returns the position of the second text field after the position of the whole number. Returns 0 if the first text field is not present in the second (after the position of the whole number if specified).	• `glidefunction:position('e',shor` If the value of the short_description field is "This computer is performing an upgrade", returns 12. • `glidefunction:position('e',shor` If the value of the short_description field is "This computer is performing an upgrade", returns 19. Return type: Whole number
`substring()`	Takes a text field and two whole numbers as input. Returns the first instance of a string that starts at the position of the first whole	`glidefunction:substring(short_de '7', '2')` If the value of the short_description field is

Function field operations (continued)

Operation	Description	Example
	number and is the length of the second.	'We're going to the store', returns 'go'. Return type: Text
subtract()	Takes two number fields as input, subtracts the second from the first, and returns the result as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	*glidefunction:subtract(u_num1, u_num2)* Returns 2 if num1 = 8 and num_2 = 6. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number

Create a function field to perform database functions

Create a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Test in a subproduction instance before deploying to a production instance.

Before you begin

Role required: personalize_dictionary or admin.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Click **New**.
3. Select **Function field**.
4. Fill in these fields on the form.

Fields for function fields

Field	Description
Table	Table to which the function field is added.
Type	Species the type of field: string, number, date, and so on.
Column label	Defines the label for the column.
Column name	Defines the name of the column. Created automatically based on **Column label**.
Max length	Defines the maximum length of the return value.
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation.

Field	Description
	Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Function definition	Defines the function that the field performs. Starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. For example, the following function definition creates a field that shows the short description, followed by a space, followed by the caller name: `glidefunction:concat(short_description, ' ', caller_id.name)` **Note:** Function parameters support dot-walking. See Dot-walking to data in related tables.

5. Click **Submit**.
   You return to the Dictionary Entry [sys_dictionary] table.
6. Navigate to the table to which you added the function field.
7. Add the function field to the list.
   See Configure items on forms or in lists using a list collector.

Result

Use the function field like any other field. For example, add it to a form, use it in a filter, or use it in the condition builder.
If the function definition is invalid, instead of the expected value you receive the message **Invalid function** if the function field is a string type field, or an empty value for other field types.

Geo point field type

The geo point data type stores longitude and latitude coordinates.

You can store longitude and latitude coordinates by adding a geo point data type field to any table. For example, you can define a geo point field to store a longitude and latitude pair to help technicians find the location of a part in a warehouse.

You can calculate the distance between geo points using distance_sphere() in a function field and use it to order records in a list based on how far away the warehouse is. For example:

```
glidefunction:distance_sphere(geopointField1, geopointField2)
```

See Function field.

Values for geo points are in longitude, latitude format where:

- Both longitude and latitude are restricted to 6 decimal places of precision. For example, “80.206458”, “25.767242”.
- The longitude range is [-180, 180].
- The latitude range is [-90, 90].
- Values entered outside the ranges for longitude or latitude are normalized to values inside their respective ranges.

HTML field type

The HTML editor provides WYSIWYG (what you see is what you get) functionality and HTML source mode editing. Administrators can customize some of the functionality associated with HTML fields.

The HTML editors available depend on your version of the UI.

UI support for available HTML editors

HTML editor	UI support
TinyMCE version 5	Core UI, UI15
htmlArea (legacy)	Basic support in Core UI

Knowledge articles, service catalog item descriptions, release documentation, and HTML content blocks are common examples of HTML fields.

Note:
The TinyMCE editor does not support converting Microsoft Word Shapes into HTML.

While HTML fields can be added to split forms, HTML fields are not intended for this use and can behave unexpectedly due to the limited available width in split pane forms.

If accessibility is enabled, a help icon appears with the HTML field. The help icon indicates how to use keys to access and escape the HTML field toolbar.

Configure a field editor for the HTML field

You can configure HTML fields to use TinyMCE or the legacy HtmlArea editor. This editor provides better stability and more editing functions than the legacy htmlArea editor.

Before you begin

Role required: admin

About this task

There are two options for HTML editors.

- TinyMCE: A What You See Is What You Get (WYSIWYG) field that displays text as readers would see it on the screen. TinyMCE is the default editor.
- htmlArea: The legacy editor, which offers a more basic WYSIWYG interface as well as a mode that shows only HTML markup.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property called **HTML field editor to use** (`glide.ui.html.editor`).

3. Select **TinyMCE** or **htmlArea**.
4. Click **Save**.

Configure the HTML toolbar

When HTML fields are configured to use the HTML editor, follow this procedure to configure which buttons are available on the toolbar.

Before you begin

Role required: admin

Procedure

1. Update the toolbar options for your preferred HTML field editor.

Option	Description
htmlArea toolbar	a. Navigate to the System properties [sys_properties] table by entering `sys_properties.list` in the application navigator. b. In the **Name** column, search for `glide.ui.html.toolbar`. c. Select the **glide.ui.html.toolbar** property.
TinyMCE	a. Navigate to the System properties [sys_properties] table by entering `sys_properties.list` in the application navigator. b. In the **Name** column, search for `glide.ui.html.editor.v5.toolbar`. c. Select the **glide.ui.html.editor.v5.toolbar** property.

2. In the **Value** field, enter or remove buttons for each toolbar as a comma-separated list without spaces.

   For the TinyMCE toolbar, use the following buttons. Use a vertical bar ("|") to add a section separator.

   TinyMCE button options

Button purpose	Accepted button names
Formatting	newdocument, bold, italic, underline, strikethrough, justifyleft, justifycenter, justifyright, justifyfull, formatselect, fontselect, fontsizeselect, bullist, numlist, outdent, indent, blockquote, forecolor, removeformat, backcolor, sub, sup
Table functions	tablecontrols
Editing	cut, copy, paste, pastetext, search, replace, undo, redo
Extended functions	link, unlink, cleanup, code, hr, visualaid, charmap, image, media, preview, fullscreen (not supported by Internet Explorer)

   For the htmlArea toolbar, use the following buttons. Use **separator** to add a section separator.

htmlArea button options

Button purpose	Accepted button names
Formatting	formatblock, fontname, fontsize, bold, italic, underline, justifyleft, justifycenter, justifyright, justifyfull, insertorderedlist, insertunorderedlist, outdent, indent, forecolor, hilitecolor
Editing	copy, paste, undo
Extended functions	createlink, inserthorizontalrule, insertimage, insertvideo, inserttable, htmlmode

3. Select **Update**.

TinyMCE toolbar

htmlArea toolbar

Configure TinyMCE to allow deprecated tags

You can set a dictionary attribute on a TinyMCE field to allow the use of deprecated HTML tags, such as <b> and <i>. By default, TinyMCE uses the <strong> and <em> tags for bold and italic formatting.

Before you begin

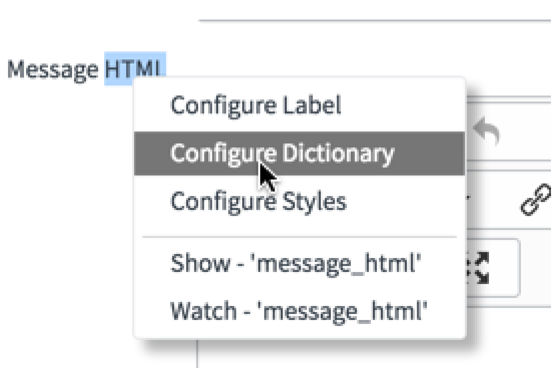
Role required: personalize_dictionary or admin

About this task

After you set the dictionary attribute, use code view to manually enter deprecated tags. The editor does not validate any tags you enter manually, for example, if you type an incorrect character.

Procedure

1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select **Configure dictionary**.



3. In the **Attributes** field, enter `tinymce_allow_all=true`, separated by a comma if needed.

   Dictionary entry attributes can only be added to when the dictionary entry form is in advanced view, as they are not shown in default view.

   
   If other attributes are already listed, use a comma as a separator.

4. Click **Update**.

Configure TinyMCE to allow JavaScript in URLs

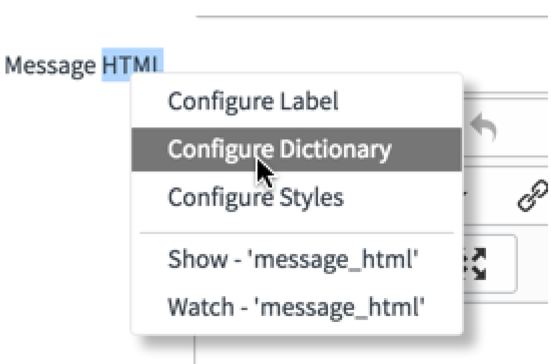
You can set a dictionary attribute on a TinyMCE field to allow the use of JavaScript in a URL.

Before you begin

Role required: personalize_dictionary or admin

Procedure

1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select **Configure dictionary**.

3. In the **Attributes** field, enter `tinymce_allow_script_urls=true`, separated by a comma if needed.

   Dictionary entry attributes can only be added to when the dictionary entry form is in advanced view, as they are not shown in default view.

   
   If other attributes are already listed, use a comma as a separator.

4. Select **Update**.

Formatting icons for the HTML field editors

The formatting table displays how to control the way text appears.

The following table displays icons that are available in the TinyMCE and the htmlArea editors. Names marked with an asterisk (*) are not available with the htmlArea editor.

Formatting table

htmlArea icon	TinyMCE icon	Name	Description
B	**B**	Bold	Applies bold formatting to the selected text or current word. Keyboard shortcut: CTRL + B
I	*I*	Italic	Applies italics formatting to the selected text or current word. Keyboard shortcut: CTRL + I
U	U	Underline	Applies underline formatting to the selected text or current word.

Formatting table (continued)

htmlArea icon	TinyMCE icon	Name	Description
			Keyboard shortcut: CTRL + U
		Align Right	Applies right alignment to the current paragraph. Code reference: `text-align:right`
		Align Center	Applies center alignment to the current paragraph. Code reference: `text-align:center`
		Align Left	Applies left alignment to the current paragraph. Code reference: `text-align:left`
		Justify	Applies justified alignment, which stretches the lines to equal width, to the current paragraph. Code reference: `text-align:justify`
Paragraph		Format	Applies a paragraph style to the current paragraph, such as Paragraph, Heading 1, and Preformatted.
Arial	Font Family	Font Family	Applies a font family to the selected text or current word.
3 (12pt)	Font Sizes	Font Size	Applies a font size to the selected text or current word.
		Insert/ Remove Bulleted List	Applies or removes unordered list tags for the selected paragraphs. Click the arrow beside the button to select a different bullet type.
		Insert/ Remove Numbered List	Applies or removes ordered list tags for the selected paragraphs. Click the arrow beside the button to select a different number type.
		Decrease Indent	Removes indentation from the current or selected paragraphs (removes 30px of left padding; padding cannot be less than 0). Code reference: `padding-left`
		Increase Indent	Applies indentation to the current or selected paragraphs (adds 30px of left padding). Code reference: `padding-left`

Formatting table (continued)

htmlArea icon	TinyMCE icon	Name	Description
		Select Text Color	Applies font color to the current word or selected text. Click the button to use the current color, or click the arrow next to the button to view more colors. Click **More Colors...** to view various color options and the hexadecimal codes.
		Select Background Color	Applies background color to the current word or selected text. Click the button to use the current color, or click the arrow next to the button to view more colors. Click **More Colors...** to view various color options and the hexadecimal codes.

Extended functions

The extended functions available for working with HTML content.

Extended functions

Icon	TinyMCE v4 Icon	Name	Description
		Insert/Edit Link	Configures a link for the selected text. Define the link URL, title (additional information that appears in the tooltip), and the target (same window or new window or tab). Code reference: `<a>`
		Remove link*	Removes the current hyperlink.
		Cleanup Messy Code*	Fixes standard HTML errors for the selected text, such as invalid tags. Clicking this button may change the layout of existing content. If you do not like the results, you can click **Undo** to revert this action.
HTML		Edit HTML Source	Opens HTML source code in a separate window. See Editing in HTML Source Mode.
		Insert Horizontal Line	Inserts a horizontal line at the current location.
		Toggle Invisible Elements*	Shows or hides invisible elements in the article, such as collapsed table borders.
		Insert Special Character*	Inserts a special character (symbol) at the current cursor location. Click the button to view a list of available characters. Point to a character to view the name and HTML code. Click a character to insert it.
		Insert/Edit Image	Inserts an image from the image library or an attachment. You can also add images to the image library with this feature. To learn more, see Embedding Images in HTML Fields.

Extended functions (continued)

Icon	TinyMCE v4 Icon	Name	Description
		Insert/Edit Embedded Media	Embeds a video from the video library or an attachment. You can also add videos to the video library with this feature. To learn more, see Embedding Video in HTML Fields.
		Spell Checker	Checks the spelling of text in the HTML field. Spellcheck is only available in the htmlArea editor.
		Preview*	Opens a preview of the HTML field in a separate window without saving changes.
		Toggle Full Screen Mode*	Expands the HTML field to use the full form view for easier editing. Click the button again to return to standard form view. This feature is only available for the htmlArea editor, and is not available for Internet Explorer.

*These options are not available with htmlArea.

Editing functions in TinyMCE

Several editing functions are built into TinyMCE.

You can add more edit functions to TinyMCE v5 using the `glide.ui.html.editor.v5.toolbar` and properties located on the **UI Properties** page. For more information on configuring the edit functions, see Configure the HTML toolbar.

Editing functions

Icon	TinyMCE v4 Icon	Name	Description
		Cut*	Cuts the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + X
		Copy*	Copies the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + C
		Paste*	Pastes the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + V
		Paste as Plain Text*	Enables paste as plain text without source formatting.

Editing functions (continued)

Icon	TinyMCE v4 Icon	Name	Description
		Paste from Word*	Opens a new window that allows you to copy and paste content from Microsoft Word into the HTML field.
		Find*	Allows you to locate text strings in the HTML field. Search above (up) or below (down) the cursor location.
		Find/ Replace*	Allows you to replace the next (Replace) or all (Replace All) occurrences of a text string in the HTML field. Keyboard shortcuts: CTRL + F, Cmd + F
		Undo*	Reverts the previous edit.
		Redo*	Reapplies the last reverted edit.

*These options are not available with htmlArea.

Table functions in TinyMCE

TinyMCE version 4 uses menus and menu selections to create and edit tables.

TinyMCE version 4

UI element	Action
Table menu  	Click the table icon ( ) to access the TinyMCE version 4 table menu. Use the table menu to: • Insert or delete a table • Modify table properties • Add, move, or delete rows and columns • Modify row and column properties • Split and merge cells

TinyMCE version 4 (continued)

UI element	Action
Table insert grid 	To insert a table in the HTML field, click **Insert table** and highlight squares in the grid to represent the desired number of rows and columns. Click the last highlighted square to insert the table. After you insert the table, you can modify the size by clicking and dragging the handles at the table edges.
Table properties 	From the table menu, click **Table properties** to open the Table properties dialog box. From this box you can take any of the following actions. • General tab: ◦ Set table width and height ◦ Set cell spacing and padding ◦ Enable borders and captions ◦ Set the table alignment • Advanced tab: ◦ Configure the table style ◦ Select the border color ◦ Select the background color
Cell properties 	With the cursor in the desired table cell, open the table menu and click **Cell properties**. From this box you can set the following properties for table cells. • General tab: ◦ Width and height ◦ Type and scope ◦ Horizontal and vertical alignment • Advanced tab

TinyMCE version 4 (continued)

UI element	Action
	◦ Configure the cell style ◦ Select the border color ◦ Select the background color
Row properties  	With the cursor in a table cell in the desired row, open the table menu and click **Row properties**. From this box you can set the following properties for rows. • ◦ Row type ◦ Alignment ◦ Height • Advanced tab ◦ Configure the row style ◦ Select the border color ◦ Select the background color

You can also paste tables into HTML fields from table-based editors.

Customize TinyMCE attributes

Change TinyMCE toolbars and the default height of HTML fields to customize your journal field experience.

Add or remove TinyMCE attributes from the default TinyMCE toolbar. The TinyMCE attributes are applied to TinyMCE toolbars in the platform and workspaces, or to specific plugins in a record or specific tables in a record. You can also apply an attribute to increase the height of HTML fields, enlarging the HTML field that agents work with.

Change the TinyMCE default toolbar

Set the toolbar items in your system properties to enable or disable throughout Workspace.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Update the **Configures the editing toolbar for HTML fields(TinyMCE v5)** (glide.ui.html.editor.v5.toolbar) property to add or remove buttons for the toolbar.

   Note:
   Use a vertical bar ("|") to add a section separator.

Type	Buttons
Default buttons	*bold italic underline undo redo | fontselect fontsizeselect table | forecolor backcolor link unlink | image media code | alignleft aligncenter alignright | bullist numlist fullscreen*
Valid buttons	*newdocument, bold, italic, underline, strikethrough, alignleft, aligncenter, alignright, alignjustify, formatselect, fontselect, fontsizeselect, table, cut, copy, paste, pastetext, searchreplace, bullist, numlist, outdent, indent, blockquote, undo, redo, link, unlink, code, forecolor, backcolor, removeformat, hr, visualblocks, subscript, superscript, charmap, image, media, fullscreen, anchor, toc, codesample, ltr, rtl, emoticons, insertdatetime, nonbreaking, pagebreak, print, visualblocks, visualchars, cut, copy*

3. Select **Save**.

Change the TinyMCE toolbar for a specific table

Set the attributes in the TinyMCE dictionary to determine which TinyMCE attributes show in a specific table.

Before you begin

Role required: admin

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, input `editor.toolbar=` followed by the desired toolbar buttons.
   For example, `editor.toolbar=formatselect|bold italic underline strikethrough blockquote subscript superscript removeformat|bullist numlist outdent indent|undo redo|table hr|link unlink|image media code|visualblocks preview fullscreen`.

Note:

- Include all the toolbar items that you want displayed, not just the toolbar items you want to add.
- The configurations made to a field's Attribute field on the associated Dictionary record overrides the value of the System Property glide.ui.html.editor.v5.toolbar.
- Multiple attributes, such as height, toolbar buttons, and toolbar plugins, can be combined within the Attributes field. For example, `editor.height=300,editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor toc codesample visualblocks visualchars compat3x autolink align_listitems,editor.toolbar= fontselect fontsizeselect | bold italic underline strikethrough forecolor backcolor pastetext removeformat | formatselect searchreplace undo redo | bullist numlist outdent indent alignleft aligncenter alignright | toc table link unlink image media codesample | code fullscreen`.

5. Select **Update**.

Change TinyMCE plugins for a specific table

Set the attributes in the TinyMCE dictionary to enable or disable plugins in a specific HTML field.

Before you begin

Role required: admin

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, input `editor.plugins=` followed by the desired plugins, separated with a space.

   For example, `editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor toc codesample visualblocks visualchars compat3x autolink align_listitems`.

Note:

- Include all the toolbar items that you want displayed, not just the toolbar items you want to add.
- The configurations made to a field's Attribute field on the associated Dictionary record overrides the value of the System Property glide.ui.html.editor.v5.toolbar.
- Allowed plugins include: advlist align_listitems anchor autolink autoresize bbcode charmap codemirror codesample colorpicker directionality emoticons fullscreen hr image insertdatetime link lists media nonbreaking pagebreak preview print readonlynoborder searchreplace table textcolor toc visualblocks visualchars wordcount
- Multiple attributes, such as height, toolbar buttons, and toolbar plugins, can be combined within the Attributes field. For example, `editor.height=300,editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor toc codesample visualblocks visualchars compat3x autolink align_listitems,editor.toolbar= fontselect fontsizeselect | bold italic underline strikethrough forecolor backcolor pastetext removeformat | formatselect searchreplace undo redo | bullist numlist outdent indent alignleft aligncenter alignright | toc table link unlink image media codesample | code fullscreen`.

5. Select **Update**.

Change the default height of an HTML field

Change the default height of a specific HTML field to expand the size of a journal field.

Before you begin

Role required: admin

About this task

HTML field height is configured per HTML field.

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, enter `editor.height=X`, where X is the desired height.
   For example, `editor.height=250`

   Note:

   HTML fields can range from 72 to 2000. HTML fields are by default 64.

5. Select **Update**.
6. To configure the height of form fields dynamically as the text line increases rather than providing a specific height, complete the following steps:

a. Navigate to **All** > **System Properties** > **All Properties**

b. In the search bar, enter `glide.ui.html.editor.v5.enabled_plugins` and select the property.

c. In the value field, add `autoresize`.

d. Select **Update**.
The autoresize plugin is active.

Change the default font size of an HTML field

Change the default font size of a specific HTML field to use a standard font size across forms.

Before you begin

Role required: admin

About this task

HTML font size is configured per HTML field.

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. Select the Default Value tab.
4. In the **Default value** field, enter `<p style="font-size:X;"></p>`, where X is the default value.
   For example:
   - To set the font to large, enter `<p style="font-size:large;"></p>`
   - To set the size to 10, enter `<p style="font-size:10pt;"></p>`
5. Select **Update**.

Highlight text in TinyMCE

On the bottom bar of TinyMCE, the path of HTML tags for the text at the cursor position is displayed.

Click a tag in the path to highlight the text affected by the tag.

Insert a line break in the HTML editor

When you use the `Enter` key, the editor creates a paragraph element (`<p>`) tag, which appears as a double space.

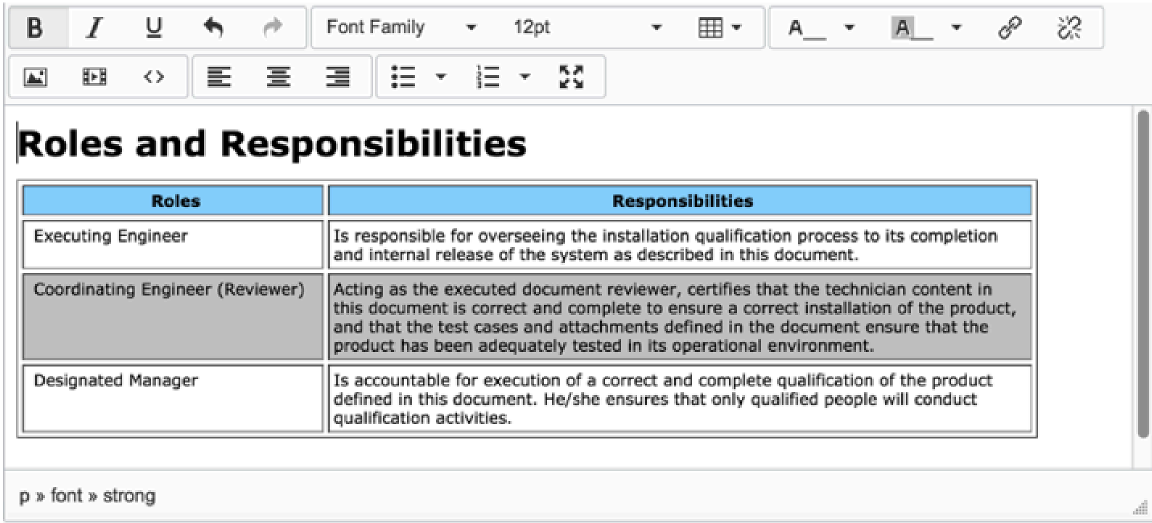
To enter a single-line space, use the `Shift` + `Enter` key combination, which inserts a line break (`<br>`) tag.

Add a table to the HTML field

This example uses HTML field controls to format a table in a knowledge article.

About this task

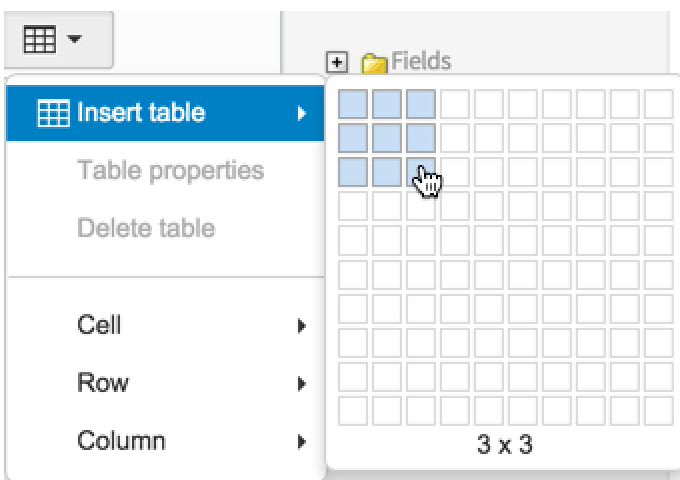
Table example html



To add the formatted table to a knowledge article:

Procedure

1. Navigate to **All** > **Knowledge** > **Edit** and select the article to edit.
2. In the HTML field, position the cursor in the location for the table.
3. Click the table icon, click **Insert table**, and then select the number of rows and columns.



4. Complete the following steps to edit the table properties.

   a. Position your cursor in the table, click the table icon, and select **Table properties**.

   b. Enter the following values on the **General** tab.

      - Width: 75%
      - Cell spacing: 3
      - Cell padding: 3

- Border: 1
- Alignment: Left

c. On the **Advanced** tab, click the text field next to **Border color** and enter `Gray`.
The color picker box to the right turns gray to indicate the color that you entered. You can also click the box and select the color in the palette.

d. Click **Ok**.

5. Complete the following steps to update the header table row.

a. Select the cells in the first table row, click the table icon, and select **Row** > **Row properties**.

b. Enter the following values on the **General** tab.

- Row type: Header
- Alignment: Center

c. On the **Advanced tab**, enter `#87cefa` in the text box beside **Background color** to set it to a light blue.

d. Click **Ok**.

6. To set cell properties, complete the following steps.

a. Select all table cells in the first column except those cells in the header row, click the table icon, and select **Cell** > **Cell properties**.

b. Enter the following values on the **General** tab.

- H Align: Left
- V Align: Top

c. Click **Ok**.

d. Repeat these steps for the table cells in the second column.

7. To set the background color of the middle row, complete the following steps.

a. Position your cursor in the middle table row, click the table icon, and select **Row** > **Row properties**.

b. On the **Advanced tab**, enter `Silver` in the text box beside **Background color** to set it to color #c0c0c0.

c. Click **Ok**.

Repeat this procedure for every other table row.

8. To set column width, complete the following steps.

a. Click the first column of the table, click the table icon, and select **Cell** > **Cell properties**.

b. On the **General** tab, enter `30%` in the **Width** text field.

c. Click **Ok**.

9. Right-click the form header and click **Save**.
10. Enter data in the table cells and then save the article.

Embed images in HTML fields

You can use the HTML field image picker to embed images into HTML fields, and to add images to the image library.

Before you begin

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed an image in it.

About this task

Note:
Administrators and users with the image_admin role manage the image library at **System UI** > **Images**. See Storing images in the database .

Procedure

1. Open the form that contains the HTML field.
2. Click the position where the image is to appear, or to modify an existing image, click the image.
3. Click the insert/edit image icon () on the HTML editor toolbar.
4. In the Insert/Modify image form, enter information in each field.

Insert/Modify Image form

Field	Description
Type	Select the image type. ◦ **Image Library**: Images stored in the db_image table. You can reuse images in the image library in multiple locations. ◦ **Attachment**: Available in the current record only
Image	Begin typing a file name and select an image from the list, or click the reference lookup icon and select an image. To upload a new image, click **New**, click **Choose File**, locate the image, and click **Upload**. If you chose the **Attachment** type, click **Choose File**, locate the image, and click **Attach**.
Tooltip	Enter alternate text that appears when a user points to the image.
Alt	Enter alternate text that can be used to improve accessibility. For example, it could be used with a screen reader. If this field is left blank, it defaults to the text entered in the **Tooltip** field.

Note:
To resize an embedded image, click the image. The sizing frame appears. Drag a sizing point until the image is the desired size. Corner points adjust the size proportionally. Depending on your browser, you may need to highlight the image before the sizing frame appears.

5. **Optional:** To provide additional control over the appearance of an image, click **Advanced options**.

Advanced options

Field	Description
Layout	Select the image **Alignment** (default is **Baseline**) and enter the **Border thickness**.
Spacing	Enter the number of **Horizontal** and **Vertical** pixels around the image.
Size	Enter the **Width** and **Height** of the image (in pixels).

6. Click **OK**.
7. **Optional:** Paste an image into the HTML editor.
   To edit the image, save the entry then select the image. Click the insert/edit image icon and complete the form using the same tables for adding an image.

   (Optional) Pasted images are saved in the system as attachments.

Link to a website in HTML fields

You can insert a link to a website in an HTML field.

Before you begin

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and link to a website in the article text.

Procedure

1. Move the cursor to the position where the link is to appear.
2. Click the insert/edit link icon () in the HTML toolbar.
3. Enter information in each field.

Insert/Edit Link form

Field	Description
URL	Enter the URL for the link. Copying and pasting is usually the easiest method.
Text	Enter the text you want to display for the link.
Target	Select the target window for the URL. For files, the **None (use implicit)** selection is generally the best choice. However, if you are linking to a complete web page, choose **New window (_blank)** so the browser opens the link in a new tab or window.

4. Click **OK** to insert the link into the field.

Embed videos in HTML fields

You can insert videos into HTML fields. You can also add videos to the video library using the HTML Insert/Modify Video form.

Before you begin

Note:
The Videos [db_video] table is a public table that does not have any security restrictions. Unauthenticated users have full access to videos uploaded to the db_video table.

Role required: The role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed a video in it.

About this task

The following file formats are supported in the base system.

- MPEG-4 video `.mp4`
- WebM Video `.webm`

The larger the file size, the longer it takes to download before the video starts. To reduce file size, you can reduce the bit rate, but doing so reduces the quality of the video. The following bit rates optimize download speed and video quality:

Video resolution	Recommended bitrate
Standard definition (480p)	1.5–2.5 megabits per second (mbps)
High definition (720p)	3–5 mbps
High definition (1080p)	6–8 mbps

Note:
For the best viewing experience the following specifications are suggested:

Optimal viewing settings

Type	Definition
Size	20MB
Bit rate	320KBPS
Resolution	480*320

Internet Explorer and Safari have difficulty streaming videos uploaded to the database. Attach a file rather than embedding if you intend to use one of these browsers or an unsupported file type. For more information on attaching files, see Add and manage attachments.

Note:
Administrators and users with the image_admin role can manage the video library at **System UI** > **Videos**.

Procedure

1. Open the form that contains the HTML field.
2. Click the position where the video is to appear, or to modify an existing video, click the video.
3. Click the insert/edit video icon ( ) on the HTML editor toolbar.
4. Enter information in each field.

Insert/Modify Video

Field	Description
Type	Select the video type. ○ **Video Library**: List of videos stored in the db_video table. You can reuse it. ○ **URL**: from an external source ○ **Attachment**: available in the current record only For an attachment or video library file, select a video from the list or click **New**. For an external URL, enter the URL.
Size	Enter the **Width** and **Height** of the video in pixels.

5. Click **OK**.

Define video file types for HTML fields

You can define the types of video files that can be added to HTML fields.

Before you begin

Role required: image_admin

About this task

Users can add videos to HTML fields. By default, users can add one of the following types of videos to HTML fields: `.mp4`, `.webm`, and `.swf` video file types. You can inactivate video types that you do not want to allow users to add, or add new video types. `.swf` files are only minimally supported. `.mp4` files might be limited by browser type.

Note:
By default, the HTML Sanitizer removes videos from HTML fields. To allow video file types, see Embed videos in HTML fields

Procedure

1. Navigate to **All** > **System UI** > **Embed Object Types**.
2. To deactivate a video type, set the **Active** field to **false**.
3. To add an additional video type, click **New** and complete the form.

   Note:
   If you specify values for the **Codebase** or **Pluginspage** fields, which instruct the browser where to get the plugin, point to `https` pages to avoid warnings from Internet Explorer about unsecure content on the page.

Disable user access to the image library

By default, users can use and upload images to the image library from an HTML field. You can disable access to the image library from HTML fields.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **UI Pages**.
2. Select **html_insert_image_dialog**.
3. Locate the following lines of code in the **HTML** field and comment them out.

```
<g:evaluate var="jvar_use_dbimage">
 var imageGR = new GlideRecord('db_image');
  if(imageGR.isValid())
  imageGR.canRead();
</g:evaluate>
```

   and

```
<j:if test= "${jvar_write_dbimage}">
    <j:set var = "jvar_default_insert_image_type" value =
 "dbimage" />
    <g:ui_select_option text = "${gs.getMessage('Image
 Library')}" value = "dbimage" selected =
 "${jvar_default_insert_image_type}" />
</j:if>
```

4. Click **Update**.

What to do next

To remove the **Upload from URL** option in the HTML editor, add a new property named *glide.ui.html.image.allow_url* and set the **Value** to **false**.

Related topics

Add a system property

Paste content into the HTML editor

Paste content from a desktop application to the HTML editor. Content might not paste the same from every application.

Before you begin

Role required: admin

Procedure

1. Navigate to an HTML field.
   For example, the **Text** field of a Knowledge article.
2. Paste in content from another application.
   Google Chrome and Mozilla Firefox do not support paste using the Paste icon. Use the command/control+V keyboard shortcut instead.
3. From the paste formatting options dialogue, choose to **Keep** or **Remove** the text formatting for the pasted content.

Result

The HTML editor has some pasting limitations:

- Pasting images: Pasting images and text from OneNote works in Microsoft browsers. Pasting from OneNote into Chrome or Firefox works but styles and images are not included. You can still select images individually and paste them into the HTML field. Pasting images and text from Microsoft Word into any browser works as expected.
- Pasting tables: Pasting tables into Safari does not always work correctly. Pasting tables into Internet Explorer only works from Excel.

Image field type

Image fields enable you to add images to forms.

Before you begin

Role required: personalize_form

About this task

For example, you can add portraits to the user records in your system. The image type must be `.gif`, `.jpg`/`.jpeg`, or `.png`.

Image resizing is defined by the CSS. Larger images are resized to 250 pixels. For most browsers, the larger of the height and width measurements is reduced to 250 pixels and the proportion of the image is maintained. For example, an image with a size of 1508 x 663 pixels is resized to 250 x 110 pixels. Some browsers resize both the height and width measurements to 250 pixels, resulting in a square image.

You can add a new image field.

Procedure

1. Open the desired form.
2. Create a new field with the **Type** set to **Image**.
   For instructions, see Add and customize a field in a table.
3. Add the new field to the form and save your customization.
   The form displays the new blank image field.
4. Click **Click to add** in the image field, select an image to upload, and click **OK**.
   The selected image is attached to the form and displayed in the image field.

Result

Configuring the form layout

IP address field type

The **IP Address (Validated IPV4, IPV6)** [ip_addr] field type stores valid IPv4 and IPv6 addresses.

Support for IPv4 and IPv6

Standard dot-decimal notation is supported for IPv4 and standard hex notation is supported for IPv6. For IPv6, you can use canonical notation to compress zeros. Familiarize yourself with IETF RFC5952 for examples and guidelines on text representation for IPv6 addresses.

The following are examples of valid IP addresses:

- **A standard IPv4 address in dot-decimal notation**:

  `10.34.51.20`

- **An expanded IPv4 address would be zero padded**:

  `10.1.10.210` would be represented as `010.001.010.210`

- **An IPv6 address in fully expanded notation**:

  `1507:f0d0:1002:0051:0000:0000:0000:0004`

- **The same IPv6 address above using the canonical notation**:

  `1507:f0d0:1002:51::4`

How IP addresses are stored in the database

The IP address `ip_addr` field is a Variable Character (VARCHAR) field with a length of 40 characters. The values are normally stored in standard (dot-decimal or canonical) notation for both IPv4 and IPv6 addresses regardless of the notation you use when you input values in the field.

For example, if you enter an IPv6 address in a non-canonical format (expanded or any other valid formats per IETF RFC5952), by default, the system will store it in canonical format unless an IP Data Control attribute value is defined on that column with a different address format. See the [ip_data_control] glide attribute section in Altering tables and fields using dictionary attributes for more details.

Support for data migration

Provide support in migrating IP addresses stored as string fields to the new **IP Address(Validated IPV4,IPV6)** type. The new IP address type accepts only a valid IP address. The existing data is formatted according to the ip_data_control attribute. The ip_data_control attriute can be set to exactly one of the following four values:

- *`canonical`*: Incoming IP addresses are validated and canonicalized before they are entered in the database. Invalid IP addresses are rejected.
- *`canonicalize_when_possible`*: Valid IP addresses are canonicalized before before being entered in to the database. Invalid IP addresses are also entered in to the database without being changed.

  Note:
  `canonicalize_when_possible` is the default value for the ip_data_control attribute, unless it's otherwise specified.

- *`expanded`*: The IP addresses are validated and stored in an expanded form to support efficient database range queries. Invalid IP addresses are rejected.
- *`none`*: No validation or normalization is performed in this value type. It is used only as an emergency mechanism as it essentially reverts this type to a plain string field.

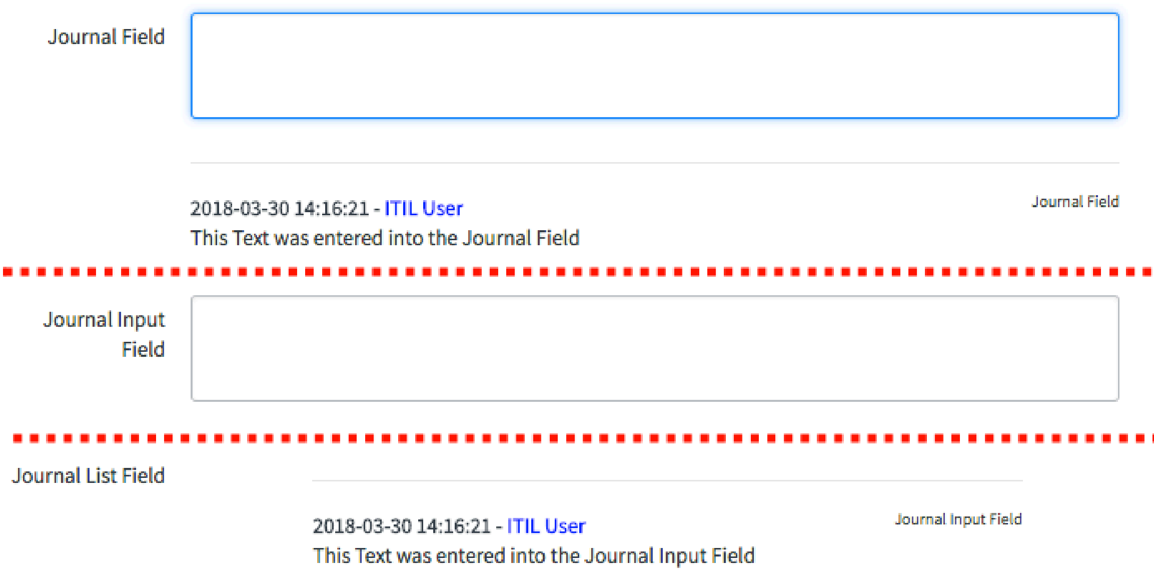
Journal field type

There are three types of journal field: journal, journal_list, and journal_input.

Journal field types

Journal field types	Description
journal	Allow and store input, and display the combined inputs below the input box. Journal fields display in the activity stream in the form and in the list view.
journal_input	Allow and store input, but do not display the combined inputs. Journal input fields only display with the record they are associated with, so they do not display in the activity stream on the list view.
journal_list	Do not allow or store input; they merely display the contents of other Journal fields upon which the journal_list field is dependent. If a journal_list field is dependent on more than one Journal field, it will chronologically interweave those fields' inputs. The journal_list field does not display content within the activity stream, but rather in a separate block.

Journal fields on a form



The example image contains the three available journal field types. The first is a journal field, with its inputs displayed below the field. The second is a journal input field, which does not show its previous inputs. The third is Journal list field, which is configured to show the input from the journal input field above it.

Restricting journal entries sent in a notification

Administrators can control the number of journal entries notifications include with the following system property.

Property	Label	Description
glide.email.journal.lines	Number of journal entries (Additional comments, Work notes, etc.) included	Specifies the number of entries from a journal field (such as **Additional comments** and **Work notes**) included in

Property	Label	Description
	in email notifications (-1 means all).	email notifications. A value of -1 includes all journal entries. • Type: integer • Default value: 3 • Location: System Properties > Email

Code for getting the contents of a journal field into an array

To put the contents of a journal field into an array so that you can iterate through each entry, you can use the code in this page.

```
var notes = current.work_notes.getJournalEntry(-1);
//gets all journal entries as a string where each entry is
 delimited by '\n\n'
var na = notes.split("\n\n");

//stores each entry into an array of strings
 for (var i = 0; i < na.length; i++)
  gs.print(na[i]);
```

Journal field script values

The *setValue()* method is not supported for journal fields. Instead, assign values in script as in the following example.

```
var now_GR = new GlideRecord('incident');

//query priority 1 incidents in the state of either 'new' or
 'active'.
gr.addQuery('priority', 1);
var gc = gr.addQuery('state', 1);
gc.addOrCondition('state', 2);
gr.query();

while(gr.next())
{

//print a list of the incident numbers updated
gs.print(gr.number);

//add an entry to the 'work notes' journal field for each
 incident
gr.work_notes = "This is a high-priority incident. Please
 prioritize.";
gr.update();
}
```

Render journal field entries as HTML

Journal fields can render text enclosed within code tags as HTML.

Before you begin

- Role required: any role that grants write access to a journal field
- System property: the glide.ui.security.allow_codetag is set to the default value of **true**

Note:

To learn more about this property, see Allow JavaScript tags in embedded HTML (instance security hardening) in Instance Security Hardening Settings.

About this task

By default, a High Security Setting escapes any HTML code you type in a journal field by replacing it with its equivalent HTML entity value. Escaping causes the system to display HTML code as text rather than forwarding it to the browser as rendering instructions.

Procedure

1. Enter `[code][/code]` tags around any code you want to render as HTML.

   Note:
   A single journal entry can contain multiple code tags as long as each code tag has a beginning and ending tag.

   Example
   For example, enter these lines:

   Results of entering HTML code

Code entered	Result
`[code]<a href="http://www.service-now.com">ServiceNow</a>[/code]`	The system renders a hyperlink to the ServiceNow web site.
`[code]<b>This text will be bold.</b>[/code]`	The system renders the sentence in bold.
`<b>This text will not be bold.</b>`	The system escapes the bold tags and renders them as text.
`[code]<script> gs.info(gs.getUserDisplayName());</script>[/code]`	The system escapes the content of the script tag. **Note:** By default, the HTML Sanitizer prevents the entry of <script> elements.

   For more examples of HTML formatting options, see the blog post Formatting within Journal fields using HTML & [code] by a ServiceNow Technical Support Engineer in the ServiceNow Community.

2. Click **Post**.

   Note:
   You cannot edit previous journal entries.

Result

The system renders the text within code tags as HTML.

[General security settings properties]

[HTML sanitizer]

Restrict the CODE tag in journal fields

You can prevent journal fields from rendering HTML code by disabling support for the `[code]` tag.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Clear the check box for **Allow support for embedding HTML code by using the [code] tag** (the `glide.ui.security.allow_codetag` property).

   Note:
   To learn more about this property, see Allow embedded HTML code (instance security hardening) in the Instance Security Hardening Settings.

3. Click **Save**.

Validate HTML in journal fields

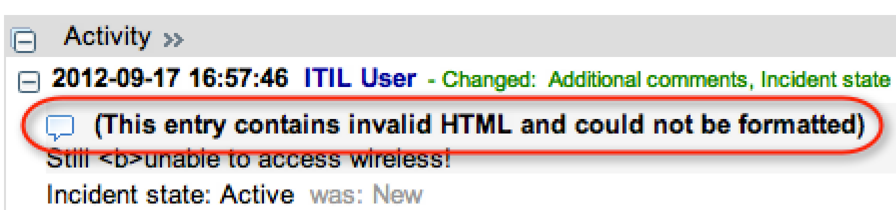
Prevent users from saving invalid HTML in a journal field.

Before you begin
Role required: admin

Procedure

1. Add the property `glide.ui.allow_deep_html_validation`.
   For instructions, see Add a system property.
2. Set the **Value** to **true**.
3. Click **Save**.

   Users now see a warning in the activity formatter when they enter invalid HTML code in a journal field.



Journal field display limits

Journal fields can greatly increase the size of task records because they allow users to enter very large string values.

Display limits prevent the instance from loading the entire journal field into memory. Administrators have the option to:

- Set the length at which journal fields stop displaying the entire field's contents and instead only display a portion (called a preview) of the field's contents. Users can still access the field's entire contents by clicking a **Show All** button.
- Set the size of the preview text the journal field displays.
- Set the maximum number of journal entries journal fields can display.

In Core UI, journal fields and the activity formatter must be in the same form section. You cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.

Note:
Journal field display limits are not supported in the legacy **Comments and Worknotes** field.

Set the maximum display size for journal fields

You can set the maximum display size for journal fields by adding a system property.

Before you begin

Role required: admin

About this task

When a journal field exceeds the length set in this property, the instance shows a preview of the journal field instead of the field's entire contents. The preview includes a **Show All** button to display the rest of the field's contents. A separate property determines the number of characters the preview displays.

Procedure

1. Add a system property with the following settings.

Property	Value
Name	glide.max_journal_list_size
Description	Size in megabytes when a journal field should display a preview rather than the field's entire contents.
Type	Integer
Value	10

2. Click **Submit**.

Set the journal preview size

Set the size of the *glide.max_journal_list_size* system property. When a journal field exceeds this size, the instance displays a preview rather than the field's entire contents. Users can click the **Show All** button to see the rest of the field's contents.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Select **New**.
3. Set the values for the property as listed in the table.

Property	Value
Name	glide.shortened_journal_length
Description	Number of characters to display as a preview of journal fields.
Type	Integer
Value	512000

4. Select **Submit**.

Set the maximum number of journal entries

To set the maximum number of entries the system shows in the activity formatter, edit the following system property. The activity formatter displays the entries starting with the most recent entry up to the maximum number.

Before you begin

Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Search for the property *`glide.history.max_entries`*.
3. Edit the **Value** of the property.

Property	Value
Name	glide.history.max_entries
Description	Maximum number of entries the system shows in the activity formatter. The default is 250.
Type	Integer
Value	250

4. Click **Update**.

Related topics

Activity formatter

Enable the text field character counter

By default, multi-line text fields have a 4000 character limit. To help users see how many characters remain before they reach the limit, you can enable the *`glide.ui.textarea.character_counter`* property.

Before you begin

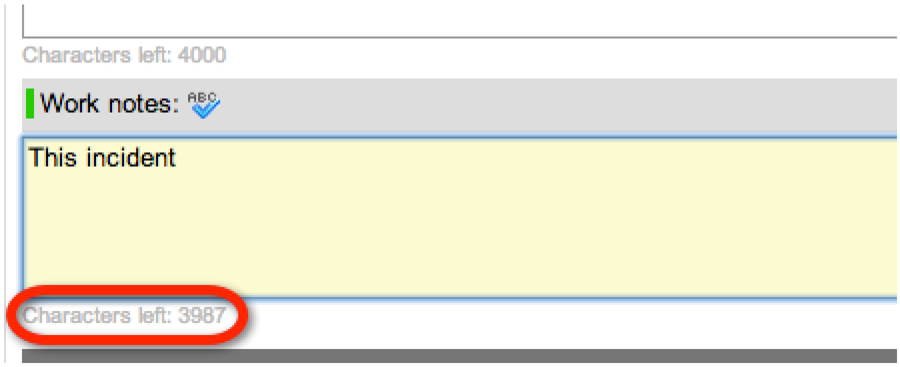
Role required: admin

About this task

This property adds a counter under text fields, such as the **Additional Comments** and **Work notes** fields. The counter is dynamically updated as users enter text.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Select the check box next to **Character counter for textarea (journal and multi line text fields)**.
3. Click **Save**.



Name-value pairs field type

You can access the values stored in a name-value pairs field in scripts using the name.

Sample script

The following example demonstrates how to add mappings to a name-value pairs field, and how to query existing values using the name.

```
// Script example demonstrating setting and getting values
var gr = new GlideRecord('u_nv_table');
gr.initialize();

gr.nv_field.name1 = "value1"; //add a name-value Pair mapping
 with the name "name1" and value "value1"
gr.nv_field.name2 = "value2"; //add another name-value Pair
 mapping with the name "name2" and value "value2"

// Access by dot notation
gs.print("name1 = " + gr.nv_field.name1); // Expected output:
 name1 = value1

// Iterate over each property and print name and value
for(var name in gr.nv_field) {
    gs.print(name + " = " + gr.nv_field[name]);
}

gs.print(gr.nv_field); // Expected output:
 {"name1":"value1","name2":"value2"}
```

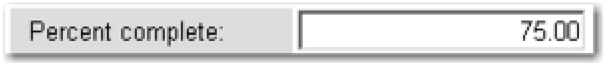
Percent complete field type

Administrators can create percent complete fields, which accept decimal input and appear as progress bars when displayed in lists.

For example, use a percent complete field to set the completion percentage for a task or project in a form and then see that percentage displayed as a progress bar in a list.

Administrators can also configure views that compare actual progress with a target value to determine if goals are being met and then apply color to provide visual alerts where progress does not meet expectations.

Form view of a percent complete field



List view of a percent complete field

Target threshold colors attribute

If the *target_field* attribute is configured, a second attribute called *target_threshold_colors* enables an administrator to define additional parameters.

The parameters are:

- Different thresholds at which the colored bar should change color
- A specific color for each threshold

The format of this attribute's value is **number1:color1;number2:color2** and so on. Use this attribute to apply warning colors to completion percentages that are lower than target percentages. These values are defined as the percentage of target accomplished. For example, a value of **0:red;50:yellow;90:green** displays a red bar if the progress to target pecentage is between 0-49. If the percent of target is between 50 and 89, the color is yellow. Percent of target 90 and above displays in green. Completion percentages that exceed target percentages also display in green. Order the color attributes from the smallest percentage to the largest.

If you do not specify a target_field, then a target of 100 is used, allowing you to use the color thresholds with a single field value.

```
target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen
```

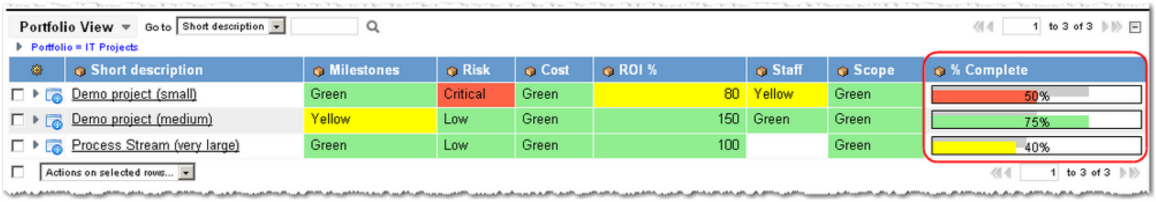
The following table lists examples of percent of target calculation using the colors defined above.

Target threshold colors attribute

Target percent	Percent field value	Percent of target calculation	Color
100	40	40%	tomato
65	59	90.7%	lightgreen
15	10	66.7%	khaki

servicenow.

Percent complete color example



Add a target field attribute

Add an optional attribute (*target_field*) to a percent complete field to compare the actual completion percentage of a task or project with a target percentage in a different decimal field that specifies where the task should be at this point.

Before you begin

Role required: personalize_dictionary

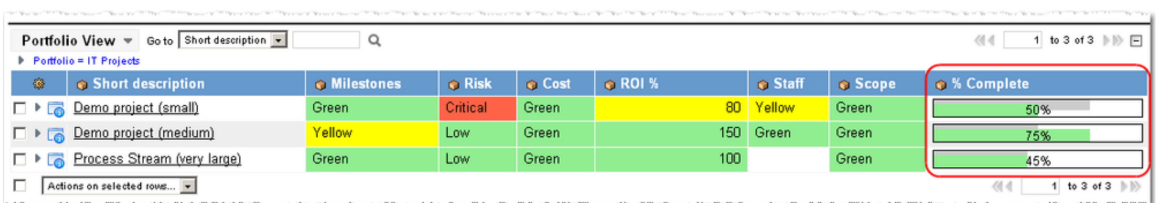
About this task

If a target field is not specified, the target of 100 is assumed.

Procedure

1. Right-click the **% Complete** field in a form.
2. Select **Configure Dictionary** from the pop-up menu.
3. In the Dictionary Entry form, add the following attribute:
   target_field=percent_complete_target
4. Update the dictionary record.

   In the list, a gray bar appears behind the colored bar to indicate the target value. The gray target bar appears only if you defined a target field.



Phone number field type

The E.164 phone number standard ensures that all necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network.

When a user enters a phone number, it is received and stored as a string of numbers. An E.164 phone number field automatically formats and validates the numbers so that they are E.164-compliant when displayed as local and international numbers. The E.164 phone number field type does not replace the phone field type.

An E.164 phone number field displays:

- [Optional] A choice list for the phone number territory.
- [Always] An input box for entering phone numbers.

- [By Default] A red underline when a phone number does not match the format for the selected phone territory and cannot be saved.
- [Optional] A green underline when a phone number does not match the format for the selected phone territory but can be saved with **Other / Unknown** as the territory.

Phone e164

Territories assigned

Territories are assigned to locations, and are not assigned directly to users.

A user's territory, and so the user's E.164-compliant phone functionality, is based on the user's location. For example, if a user has a location of **SHS quadra 5, Bloco E., Brasilia** defined in the User [sys_user] table, the parent record for Brazil in the location table defines the phone territory. The phone territory may be assigned at any level of the Map pages hierarchy, which is searched going up to the next parent until the territory is found or no parents remain.

Dependent fields

In the dictionary, you can specify a dependent field in the **User** or **Location** fields, which displays the appropriate territory in the selector choice list when a user enters a phone number.

For example, if you enter `caller_id` in the dependent field in the Incident table, the appropriate territory is added to the territory selector choice list when a user enters caller information.

Related topics

Make a field dependent

E.164 phone number field configuration

Administrators can use the phone number system properties and dictionary attributes to do certain things.

The system properties apply the configuration option to all phone number fields that do not have a comparable dictionary attribute. The dictionary attributes apply the configuration only to the phone number field it is added to. Since dictionary attributes take precedence over system properties, administrators can set a global configuration with a property and then apply exceptions on a field-by-field basis.

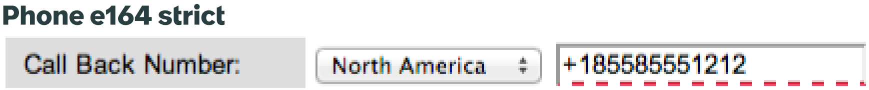
Note:
Alpha numeric characters are not allowed and is not considered as a valid phone number.

Requiring territory format validation

By default, phone number fields require that a phone number match the display format of the selected territory.

By default, phone number fields require that a phone number match the display format of the selected territory. If a phone number does not match this format, the input box displays a red line underneath the phone number or the whole box turns red, and users are prevented from saving it.

Phone e164 strict



Setting the *glide.phone_number_e164.strict* system property to **false** or adding the *pn_strict* dictionary attribute allows the phone number input box to display a green line underneath numbers that do not match the territory format listed for the selected territory or the whole box turns green. You can use the **Other / Unknown** territory to store otherwise invalid phone numbers.

Phone e164 not strict

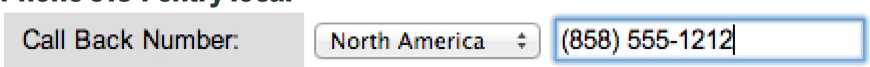
> **Warning:**
> Switching from optional territory format validation to required territory format validation may result in some phone numbers failing validation altogether. In such cases, the E.164 phone number field displays an error message.

Requiring entry of international format

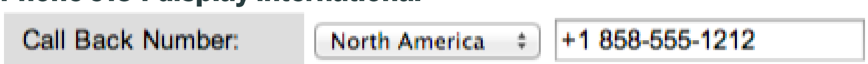
By default, users can enter phone numbers in their territory's local format and do not have to format the number for international dialing.

The phone number field automatically formats local phone numbers into E.164-compliant international phone numbers when the user finishes editing the field. As long as the phone number entered matches the territory's format for a local number, users can save the phone number.

Phone e164 entry local



Phone e164 display international



Changing the *glide.phone_number_e164.allow_national_entry* system property or adding the *pn_allow_national_entry* dictionary attribute requires users to enter a phone number in the territory's international format, which starts with the plus (+) character. Users cannot save a locally formatted phone number, and the phone number input box displays a red line underneath phone numbers without the proper international formatting.

Configure the display of the local format

By default, an E.164 phone number field always displays phone numbers in an international format.

Phone e164 display international

Change the E.164 phone number to use the local format in certain circumstances by adding the following system property:

Property	Description
glide.phone_number_e164.display_national	• **Type** : string • **Default value**: false • **Other possible values**:

(continued)

Property	Description
	○ **true or form**: displays phone numbers in a local format on forms, but displays an international format on lists. ○ **all**: always displays phone numbers in a local format. ○ **user**: only displays phone numbers in a local format when the phone number matches the local setting of the current user. ○ **false**: does not display phone numbers in local format.

Select one of the possible values to determine how the system handles the E.164 phone number.

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_national	Overrides the *glide.phone_number_e164.display_national* property setting for how an E.164 phone number field displays phone numbers. Available values are identical to those described for the *glide.phone_number_e164.display_national* property. • Type: string • Default value: false • Example:pn_display_national=all

Configure the phone territory selector choice list

By default, an E.164 phone number field always displays the phone territory associated with the phone number.

Changing the system property or adding the dictionary attribute hides the territory selector choice list. If the territory selector choice list is hidden, users can only enter a local or national number.

Phone e164 hide selector

Add the following system property to show or hide the territory selector choice list.

Property	Description
glide.phone_number_e164.display_territory_selector	Determines whether to display the territory selector choice list. Hiding the territory selector choice list restricts users to entering only local or national phone numbers. • **Type** : true | false • **Default value**: true

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_territory_selector	Overrides the *glide.phone_number_e164.display_territory_s* property setting that determines whether to display the territory selector choice list. Available values are identical to those described above for the *glide.phone_number_e164.display_territory_s* property. • Type: true | false • Default value: true • Example: pn_display_territory_selector=false

Configure the display of territory labels

A property controls how territory labels are displayed.

You can display territory labels to the right of the number in an E.164 phone number field by setting the system property or adding the dictionary attribute. This is useful if the territory selector choice list is turned off and you want the user to see the territory for the entered phone number.

Enabling territory labels also displays the phone territory in lists.

Add the following system property to display the territory label to the right of the number in an E.164 phone number.

Property	Description
glide.phone_number_e164.display_territory_text	Determines when an E.164 phone number field displays a territory label. • **Type** : string • **Default value**: read-only • **Other possible values**: ○ **all**: always displays the territory label. ○ **national**: displays the territory label only if the phone number is in local format. ○ **read-only**: displays the territory label in read-only mode, regardless of whether the number is in local or international format. ○ **read-only-national**: displays the territory label in read-only mode only if the number is in local format. ○ **list**: displays the territory label in a list. ○ **list-national**: displays the territory label in a list if the number is in national format. ○ **none**: does not display the territory label.

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_territory_text	Overrides the *glide.phone_number_e164.display_territory_t* property that defines when a phone number field displays a territory label. Available values are identical to those described above for the *glide.phone_number_e164.display_territory_t* property. • Type: string • Default value: read-only • Example:pn_display_territory_text=all

Configure the international direct dialing prefixes

A property is available to control the display of prefixes.

You can enable the display of the international direct dialing prefix, which appears between the territory selector choice list and the input box for an E.164 phone number field on forms, by setting the system property or adding the dictionary attribute.

E164 phone display idd

Add the following system property to display the international direct dialing prefix.

Property	Description
glide.phone_number_e164.display_users_idd	Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. • **Type** : true | false • **Default value**: false

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_users_idd	Overrides the *glide.phone_number_e164.display_users_idd* property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described above for the *glide.phone_number_e164.display_users_idd* property. • Type: true | false • Default value: false • Example:pn_display_users_idd=false

E.164 phone number field system properties

Several properties are available to configure E.164 phone number fields.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

e.164 phone number field system properties

Property	Description
glide.phone_number_e164.strict	Determines whether all phone number fields must match the display format for the selected territory.

e.164 phone number field system properties (continued)

Property	Description
	When the value is **true**, the phone number input box displays a red line underneath phone numbers that do not match the format for the selected territory. Users cannot save the phone number. When the value is **false**, the phone number input box displays a green line underneath phone numbers that do not match the format for the selected territory. Users can save the phone number. The territory selector choice list offers the option to select an **Other / Unknown** territory format. • **Type** : true | false • **Default value**: true • **Location**: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.allow_national_entry	Determines whether users can enter phone numbers in the local format or whether they must enter phone numbers in international format. When **true**, users can enter phone numbers in the local format for the selected territory. When **false**, users must enter phone numbers in the international format for the selected territory. • **Type** : true | false • **Default value**: true • **Location**: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.display_national	Determines whether to display E.164 phone numbers in local format. • **Type** : string • **Default value**: false • **Other possible values**: ◦ **true or form**: Displays phone numbers in a local format on forms, but displays an international format on lists.

e.164 phone number field system properties (continued)

Property	Description
	○ **all**: Always displays phone numbers in a local format. ○ **user**: Only displays phone numbers in a local format when the phone number matches the local setting of the current user. The local setting of the current user is determined by the location associated with the user record. ○ **false**: Does not display phone numbers in local format. • **Location**: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.display_territory_selector	Determines whether to display the territory selector choice list. Hiding the territory selector choice list restricts users to entering only local or national phone numbers. • **Type** : true | false • **Default value**: true • **Location**: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.display_territory_text	Determines when an E.164 phone number field displays a territory label. • **Type** : string • **Default value**: read-only • **Other possible values**: ○ **all**: Always displays the territory label. ○ **national**: Displays the territory label only if the phone number is in local format. ○ **read-only**: Displays the territory label in read-only mode, regardless of whether the number is in local or international format. ○ **read-only-national**: Displays the territory label in read-only mode only if the number is in local format. ○ **list**: Displays the territory label in a list.

e.164 phone number field system properties (continued)

Property	Description
	◦ **list-national**: Displays the territory label in a list if the number is in national format. ◦ **none**: Does not display the territory label. • **Location**: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.display_users_idd	Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. • **Type** : true | false • **Default value**: false • **Location**: Add to the System Properties [sys_properties] table.

E.164 phone number field dictionary attributes

You can override the global system property with certain dictionary attributes.

e.164 phone number field dictionary attributes

Dictionary attribute	Description
pn_strict	Overrides the *glide.phone_number_e164.strict* property setting that requires all phone number entries match the format for the selected territory. Available values are identical to those described for the *glide.phone_number_e164.strict* property. • Type: true | false • Default value: true • Example:pn_strict=false
pn_allow_national_entry	Overrides the *glide.phone_number_e164.allow_national_entry* property setting that determines whether users can enter phone numbers in the local format or whether they must enter phone numbers in international format. Available values are identical to those described for the *glide.phone_number_e164.allow_national_entry* property. • Type: true | false • Default value: true • Example:pn_allow_national_entry=false
pn_display_national	Overrides the *glide.phone_number_e164.display_national* property setting for how an E.164 phone number field displays phone

e.164 phone number field dictionary attributes (continued)

Dictionary attribute	Description
	numbers. Available values are identical to those described for the *glide.phone_number_e164.display_national* property. • Type: string • Default value: false • Example:pn_display_national=all
pn_display_territory_selector	Overrides the *glide.phone_number_e164.display_territory_selector* property setting that determines whether to display the territory selector choice list. Available values are identical to those described for the *glide.phone_number_e164.display_territory_selector* property. • Type: true | false • Default value: true • Example: pn_display_territory_selector=false
pn_display_territory_text	Overrides the *glide.phone_number_e164.display_territory_text* property that defines when a phone number field displays a territory label. Available values are identical to those described for the *glide.phone_number_e164.display_territory_text* property. • Type: string • Default value: read-only • Example:pn_display_territory_text=all
pn_display_users_idd	Overrides the *glide.phone_number_e164.display_users_idd* property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described for the *glide.phone_number_e164.display_users_idd* property. • Type: true | false • Default value: false • Example:pn_display_users_idd=false

Configure a territory phone display rule

The string of numbers that make up a phone number is automatically validated and formatted for a specific territory by applying a series of regular expressions.

Before you begin

Role required: admin

About this task

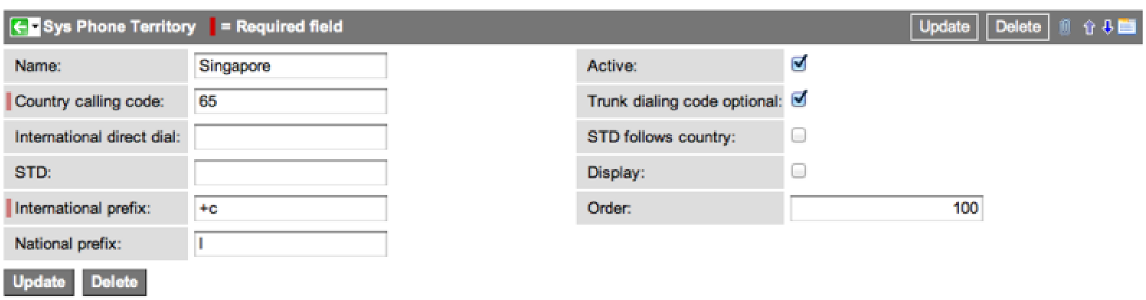
The number is first validated against the phone validations that have been defined for the territory, and in the order specified by the **Order** field. To be valid, the number must match the regular expression defined in the **Condition** field for at least one phone validation.

After a number has been validated, the **Condition** expression for each format defined for the territory is applied to the number in the order determined by the **Order** fields. The **Pattern** and **Format** regular expressions are applied to produce a phone number that is formatted correctly for the territory.

The Sys Phone Territory screen allows administrators to edit the display rules for a given territory. Administrators may want to modify the **Active**, **Display**, or **Order** fields. To edit the display rules for a territory:

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Telephone Display Rules**.
2. Click a territory **Name**.
3. Edit the fields, as appropriate (see table).
4. Click **Update**.



Territory phone display rules

Field	Description
Name	The unique name of the territory.
Country calling code	The country code for dialing numbers from outside the territory.
International direct dial	The prefix for calling internationally from the territory, such as 00 or 001.
STD	The subscriber trunk dialing code, also know as the direct distance dialing code, which is a sequence of numbers before the telephone number that indicate whether the call is to be routed outside of the local calling area.
International prefix	The prefix required to dial an international call, such as a plus sign (+).
National prefix	The prefix required to dial a local call.
Active	An indicator for whether the territory phone definition is active. If deactivated, this territory unavailable to users.
Trunk dialing code optional	An indicator for whether the STD code is optional.

Field	Description
STD follows country	An indicator for whether the STD code should be displayed to the right of the country calling code.
Display	An indicator for whether to display the territory in the choice list. Clearing this check box removes the territory from the choice list. If an international number is entered for a territory that is not displayed in the territory selector choice list, that territory is temporarily added to the selector choice list for that field only. For example, If the United Kingdom **Display** field is not selected, the United Kingdom does not appear in the territory selector choice list. However, if the user enters an international number beginning with +44, the United Kingdom is added to the list and the number is formatted and validated accordingly.
Order	The order in which a territory appears in a choice list. Territories are sorted numerically by the number assigned here. If more than one territory is assigned the same number, they are subsorted alphabetically. All territories are assigned a default value of 100. To display a territory at the top of the list, assign a value that is less than 100. To display a territory at the end of the list, assign a value that is greater than 100. For example, if a territory is assigned an order of 500, it is displayed at the end of the list, and if more than one territory is assigned an order of 500, they are listed alphabetically at the end of the list.

Phone validations

Phone validations are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

</table>

Actions on selected rows... 1 to 4 of 4

Reference field type

A reference field stores a reference to a field on another table. For example, the **Caller** field on the Incident table is a reference to the User [sys_user] table.

When you define a reference field, the system creates a relationship between the two tables. Adding a reference field to a form makes the other fields in the referenced table available to the form.

Note:
A reference field can refer only to records from one other table. To add a field that can refer to records on any table, use the Document ID element type.

Administrators can create new reference fields and configure several options for reference fields.

Reference field options

Option	Description
Display values	Each reference field stores a sys_id for each referenced record in the database, but the sys_id is not shown. The reference field shows the specified display value.
Decorations	A reference decoration is an icon that appears next to a reference field.
Reference styles	Reference styles are specialized field styles that control the appearance of reference fields.
Reference qualifiers	Reference qualifiers restrict the records that are available for reference fields.
Cascade delete rules	Cascade delete rules specify what should happen to records that reference a record that is deleted.
Auto-complete	By default, a reference field auto-completes as the user types in the field. Administrators can configure auto-complete settings.
Reference key	A reference key saves a field other than sys_id as the unique identifier for a reference field.
Enable dynamic creation	When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Tip:
For troubleshooting information, see the Reference field is not showing the expected display value when selected or it appears blank [KB0693859] article in the Now Support Knowledge Base.

Add a reference field

Add reference fields to a table using the same method as for any other field.

Before you begin

Role required: personalize_form

About this task

The related table also appears in the Available Tables list for future form customizations.

Procedure

1. Open the desired form.
2. Right-click the header and select **Configure** > **Form Layout**.
3. Use dot-walking to locate and select the field in the referenced table that you want to add.

Example
It appears as *`Table name.Field`*. For example, the caller's email address appears as *`Caller.Email`*.

4. Click **Save**.

Enable dynamic creation for reference fields

When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Before you begin

Role required: personalize_dictionary

About this task

By default, a user must enter a value in a reference field that matches an existing record in the table that the reference field refers to. For example, the **Caller** field in an Incident must have a value that is an existing user. You can enable dynamic creation to create a new record on the referenced table when a user enter a nonexistent value in a reference field instead of returning an error.

Procedure

1. Right-click the field label in the form and select **Configure Dictionary**.
2. Populate the following fields (you may need to configure the Dictionary form):
   - **dynamic_creation**: Select the check box.
   - **dynamic_creation_script**: Enter a script that dynamically creates the record.
3. Click **Update**.
   Examples:

   You could use the following `dynamic_creation_script` to create a record on the referenced table.

   ```
   current.name = value;
   current.insert();
   ```

   Note:
   The parent object can be used to access anything from the parent record.

   You could create a script include named *`MyUserReferenceCreator`* with the following contents:

   ```
   var MyUserReferenceCreator = Class.create();
   MyUserReferenceCreator.prototype = {
       initialize: function() {
       },

       create: function(current, value) {
           current.name=value;
           return current.insert();
       },

       type: 'MyUserReferenceCreator'
   }
   ```

When the script include is created, the following `dynamic_creation_script` generates a new location for an invalid reference field value:

```
new MyUserReferenceCreator().create(current, value);
```

Related topics

Configuring the form layout

Configure cascade delete rules

When a record is deleted, there are different options for how the deletion will affect records that reference the deleted record. You can configure what happens to records that reference a record when that record is deleted.

Before you begin

Role required: personalize_dictionary

About this task

For example, if you delete a user record that is referenced in the **Caller ID** field on several incident records, you can configure what happens to those incident records. By default, the references are cleared, so the incident records are maintained with an empty **Caller ID** field.

Procedure

1. Navigate to a reference field on a form.
2. Right-click the field label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
4. Locate the Reference Specification section.
5. In the **Reference cascade rule** field, select one of the following options.

   Note:
   The option for this field have no effect for tables with m2m relationships, meaning that in this example, if the tables have an m2m relationship, the user record is deleted.

6. Click **Update**.

Related topics

Modify dictionary entries

Define the reference key

By default, reference fields store the sys_id of the record in the database.

Before you begin

Role required: personalize_dictionary

About this task

By defining a reference key, you can identify a field other than sys_id to use as the unique identifier for the reference field. The value of the reference key field, instead of the sys_id, is stored in the database for that reference field.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the field record (for example, **resolved_by** on the Incident table).
3. In the **Reference key** field, enter a field name on the referenced table (for example, email on the sys_user table).

    Note:
    Always choose a field from the referenced table that is both required and unique.

4. Select **Update**.

Display a reference field as a choice list

You can display a reference field as a choice list instead of opening a lookup window.

Before you begin

Role required: personalize_dictionary

About this task

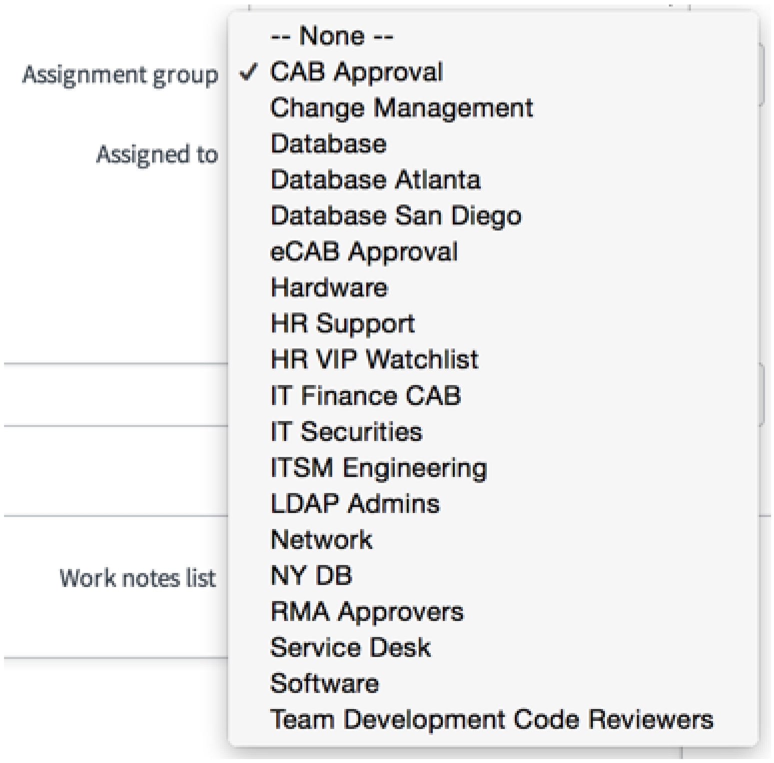
Note:
A choice reference field with a defined reference key won't function.

Procedure

1. In the form, right-click the label for the reference field and select **Configure Dictionary**.
2. In the Choice List Specification section, select one of the following options in the **Choice** field.
    - **Dropdown with --None--**
    - **Dropdown without --None--**
3. Right-click the form header and click **Save**.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, add the following attribute, separated from other attributes by a comma.

    ```
    ref_auto_completer=AJAXReferenceChoice
    ```

6. Click **Update**.
    The form reopens, with the reference field as a choice list.



Note:

The *glide.ui.max_ref_dropdown* system property determines whether a reference field is displayed as a choice list or a reference icon. When the number of available choices exceeds the value of this property, a reference icon displays instead of a choice list. The default value of this property is 25. This property affects the entire instance, however you can override this property on an individual field by using the *max_ref_dropdown* dictionary attribute. Modifying dictionary attributes requires the personalize_dictionary role. If the column is not defined on the same table, you should add these attributes as a dictionary attributes override.

The *glide.xmlhttp.max_choices* system property determines how many choices display on a choice list. This property has a value of 15 by default, however, when the property is not present on the instance, the instance uses a hard coded value of 10.

Related topics

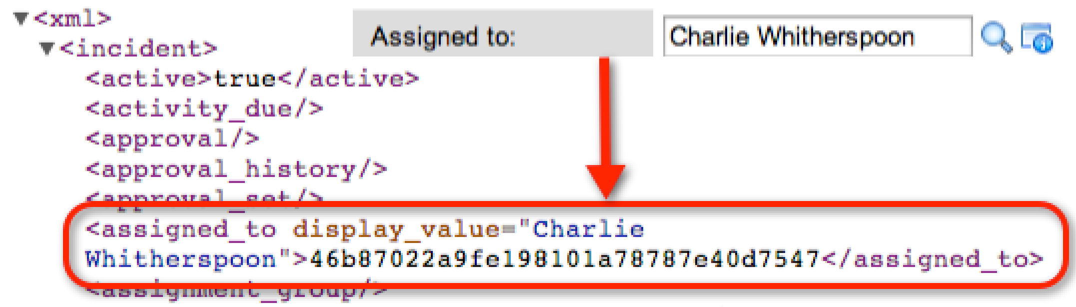
System dictionary

Display values

Reference fields store a sys_id for each referenced record in the database, but the sys_id is not shown.

The reference field shows the display value. For example, an incident's **Assigned to** field stores the sys_id of a particular user, but actually displays the user's name. The following example shows how **Charlie Witherspoon**, which is the display value of a user record, is shown in the **Assigned to** field.

Display value xml



Reference field

Reference field	Value stored in database	Display value field of source table	Value displayed in UI
Assigned to [task.assigned_to]	46b87022a9fe198101a78787e40d7547	Name [sys_user.name]	Charlie Whitherspoon

Reference fields show display values in:

- Lists
- Forms
- Reports
- Auto-complete suggestions
- Slushbuckets

Unique record identifier (sys_id)

Select a field as the table display value

Only one field can be defined as the display value for a table.

Before you begin

Role required: personalize_dictionary

About this task

When you set the **Display** value to **true**, a business rule sets the **Display** value to **false** for all other fields on the table. In previous versions, you must manually ensure that no other fields on the table have a value of **true** in the **Display** column.

Note:
Extended tables inherit the display value of the parent table. Setting a separate display value for the extended table overrides the parent table's display value.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Filter on **[Table] [is] [<name of the referenced table>]**.
3. Locate the desired field and set **Display** to **true**.

   For best results, choose a field that is required and unique in each record as the display value field.

> **Note:**
> If you make a field the display field for a table, be sure to translate all values for the field in the Translated Text [sys_translated_text] table into all the languages provided. Display field options left untranslated are not presented by the autocomplete (type ahead) feature.

Reference fields look for the display value in the following order:

a. A field with display=true in the system dictionary on the lowest sub-table for extended tables.
b. A field with display=true in the system dictionary on the parent table.
c. A field named **name** or **u_name** or **x_name**.
d. A field named **number** or **u_number** or **x_number**.
e. The field named in the Glide Property *`glide.record.display_value_default`*
f. The **Created on** field of the referenced record.

Decorations

Reference decorations are icons which appear next to the reference field.

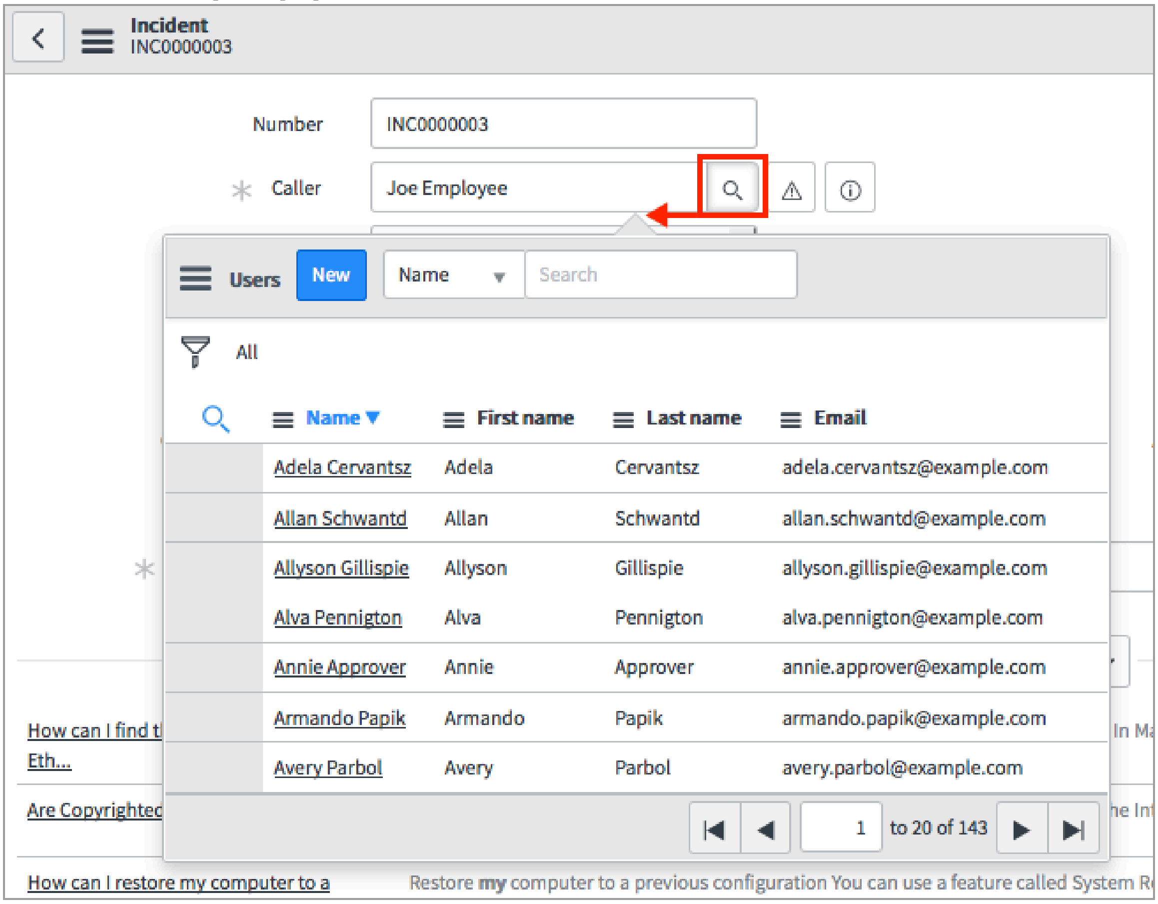
The reference lookup is always visible and is used to select a record to reference. Other reference decorations appear when a record is selected.

Reference lookup

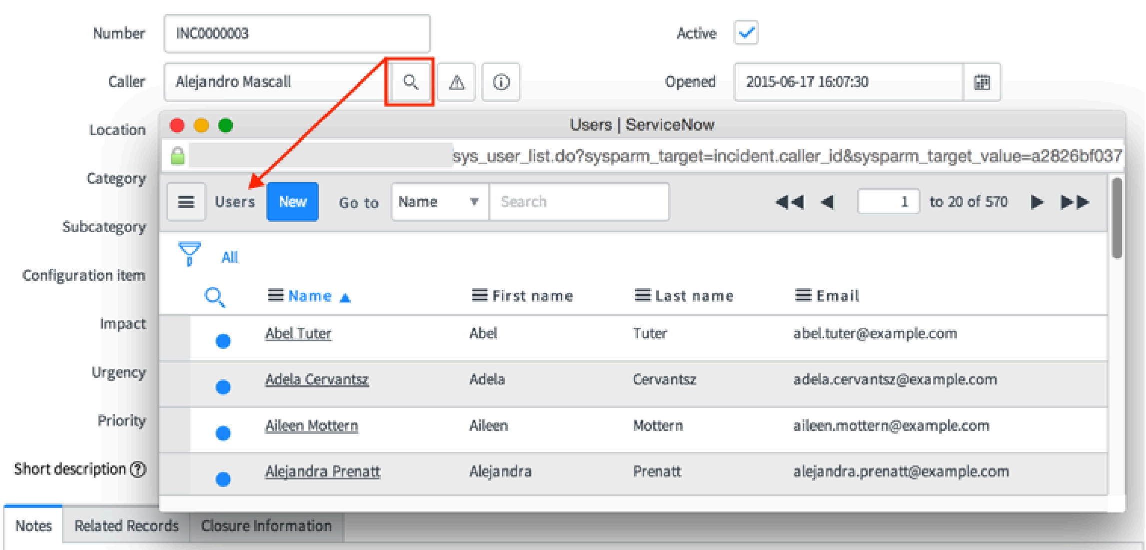
On forms, the reference lookup icon () appears by editable reference fields. Clicking the reference lookup icon displays a list of records on the referenced table.

When List v3 is enabled, the list appears in a popover. Otherwise, the list appears in a pop-up window.

Reference lookup list popover



Reference lookup list pop-up



Tree picker lookup

The reference lookup can be rendered in the tree picker format by modifying the dictionary and adding the attribute `tree_picker`.

You cannot customize the label names used in the tree picker. The label names are taken from the values in the table.

Note:
The tree display hierarchy does not appear in reference fields when using mobile applications.

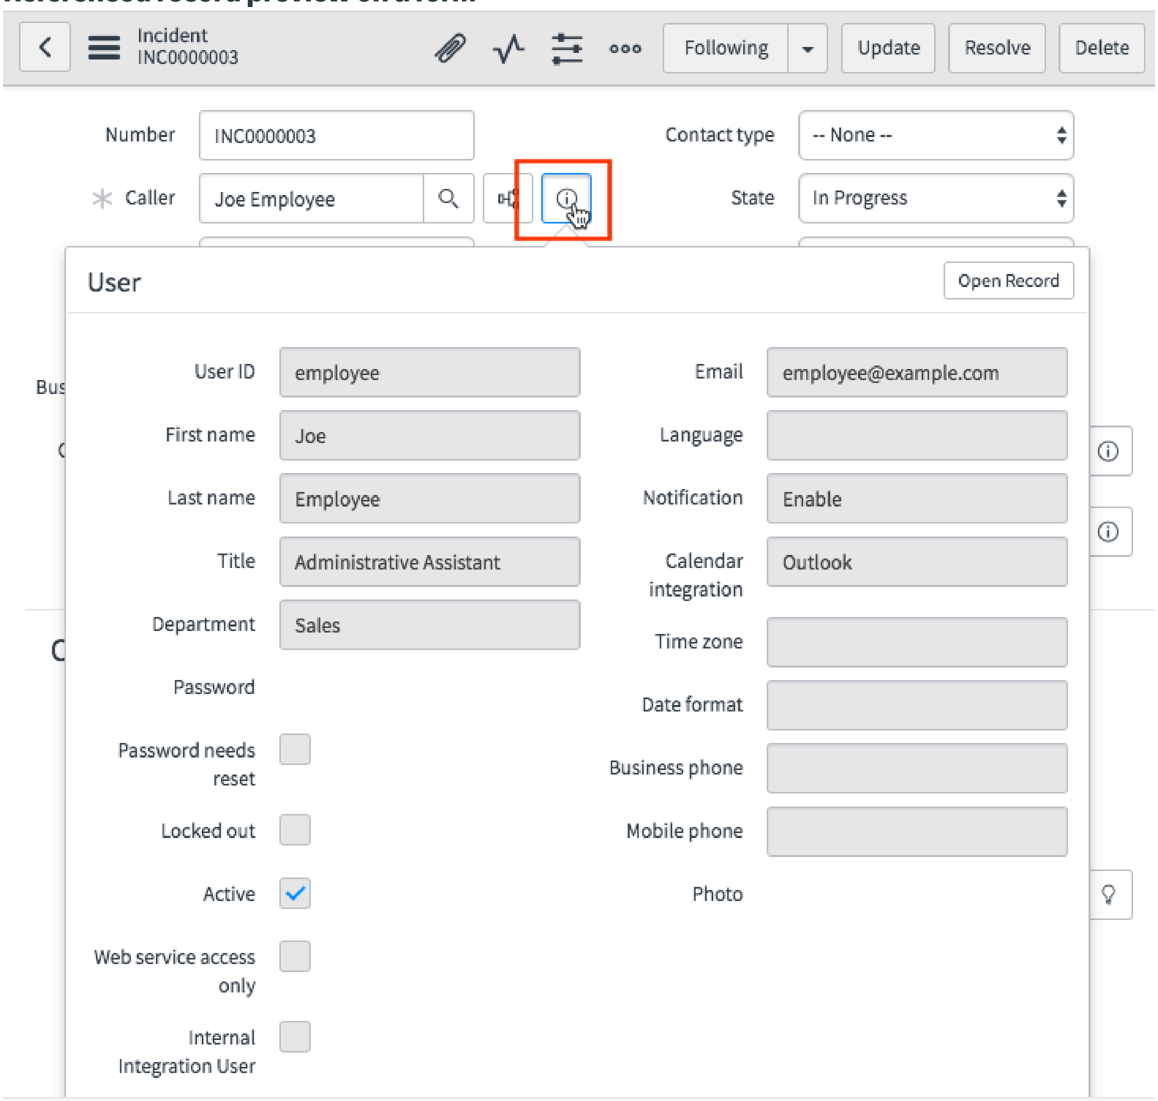
Related topics

[Tree picker](#)

Reference field icon

On forms, the reference icon ( ) appears by populated reference fields. Clicking the icon opens a read-only preview of the referenced record.

Referenced record preview on a form



The preview remains open until you click somewhere else on the form.

Click **Open Record** to navigate to the referenced record.

Note:
When using a reference icon in Service Portal, a form opens using the default view of the form rather than a popup view. Write permissions to this form are the same as opening the form in the default view in the standard UI.

Configure the reference icon view of fields

Use a table's sys_popup form view to configure the fields in the pop-up form that appear when pointing to a reference icon. If the table has no sys_popup view, the pop-up uses the default view.

Before you begin
Role required: personalize_form

About this task
The pop-up form displays in the top form section only.

Procedure

1. To configure a reference field popup form for a table using the default sys_popup view, navigate to the following URL format, substituting the instance name and table name:

```
<your instance name>.service-now.com/<table
 name>.do?sysparm_view=sys_popup
```

Note:
This URL format only shows a table and default sys_popup view. It does not work for records that use a different view.

Example
An example of an instance for Acme, the sys_user table, and the sys_popup default view:

```
acme.service-now.com/sys_user.do?sysparm_view=sys_popup
```

2. **Optional:** To configure a reference field popup form for a table using a non-default sys_popup view, navigate to the following URL format, substituting the instance name, table name, and name of view:

```
<your instance name>.service-now.com/<table
 name>.do?sysparm_view=sys_popup,<name_of_view>
```

Example
An example of an instance for Acme, the sys_user table, and the sys_popup ESS view:

```
acme.service-now.com/sys_user.do?sysparm_view=sys_popup,ess
```

3. Configure the form to add or remove fields as appropriate.

Configure pop-ups on read-only fields

Reference pop-ups and click-throughs are hidden by default when a client script, UI policy, variable, or ACL makes the field read-only. The ability to see or click through to the target record does not depend on whether the reference field is writable. You can change the read-only setting.

Before you begin
Role required: admin

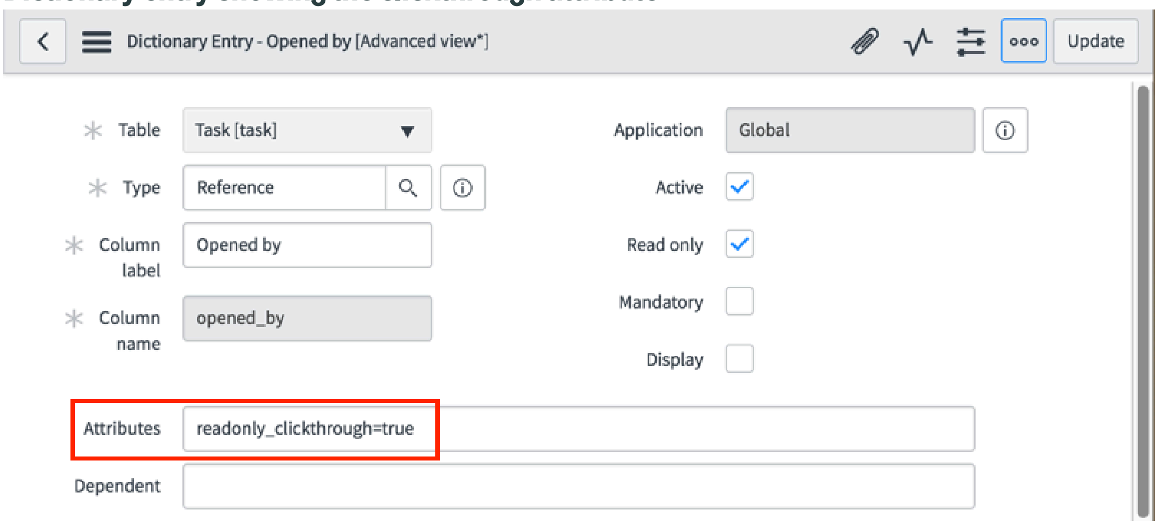
Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Change the value of the **Enable click-through of a reference field when the reference field is read-only.** (`glide.ui.reference.readonly.clickthrough`) property.
   If set to true, the pop-up appears for read-only fields and for variables.

What to do next

If this system value is set to **false**, you can override the setting for a specific read-only reference field. Configure the dictionary entry and add the `readonly_clickthrough=true` attribute.

Dictionary entry showing the clickthrough attribute



Configure the related incidents icon

You can configure an icon to appear beside a reference field in a form, such as the **Caller** field, to display related incidents.

Before you begin

Role required: admin

About this task

The show related incidents icon () displays other incidents related to the referenced record.

Procedure

1. In the form, right-click the label for the reference field and select **Configure Dictionary**.
2. Add the `ref_contributions=user_show_incidents` dictionary attribute in the **Attributes** field.
3. Click **Update**.
   The form reopens and the related incidents icon appears beside the field on the right.

Related topics

Altering tables and fields using dictionary attributes

Configure the show workflow icon

You can configure an icon to appear beside a workflow field to display the related workflow in the Workflow Editor.

Before you begin

Role required: admin

About this task

The show workflow icon ( ) opens the workflow in the Workflow Editor.

Procedure

1. In the form, right-click the label for the workflow field and select **Configure** > **Configure Dictionary**.
2. Add the *ref_contributions=show_workflow* dictionary attribute in the **Attributes** field.
3. Click **Update**.
   The form reopens and the show workflow icon appears beside the field on the right.

Related topics

Altering tables and fields using dictionary attributes

Reference qualifiers

Use reference qualifiers to filter the data that is returned for a reference field.

A reference field stores a link (reference) to a field on another table, making the records/fields in the referenced table available to the form containing the reference field.

For example, the **Assigned to** field on the Incident table is a reference to the User [sys_user] table. By default, all values for the field that is being referenced appear in the reference lookup and can be directly accessed through the reference field (type ahead). Expanding on the prior example, if a reference qualifier is not defined, all users in the User table appear in the reference lookup. Including those users that are inactive. Sometimes, this might be the desired functionality. In other cases however, only a subset of the available values may be desired. In this case, create a reference qualifier to filter the available data so that only the desired values are returned and made available to the form. Such as only the active users or users that have a specific role. Reference qualifiers are robust and can consist of simple AND/OR conditions, inline JavaScript, or complex script include.

You can modify the reference qualifier for a table, and any table based on that table (parent or extended), by defining a reference qualifier through the Dictionary Entry form. You can also modify the reference qualifier only on an extended table and its children (not the parent table), through a dictionary override. You can only define a single reference qualifier per field, per form/table. Reference qualifiers are not applicable to condition builders. For information on using filtering in condition builders, see Create a dynamic filter option.

Note:

- Creating reference qualifiers requires knowledge of the underlying ServiceNow data model (tables and fields) and knowledge of the Web services and Scripts.
- To restrict what data specific users can access, use ACLs not reference qualifiers.

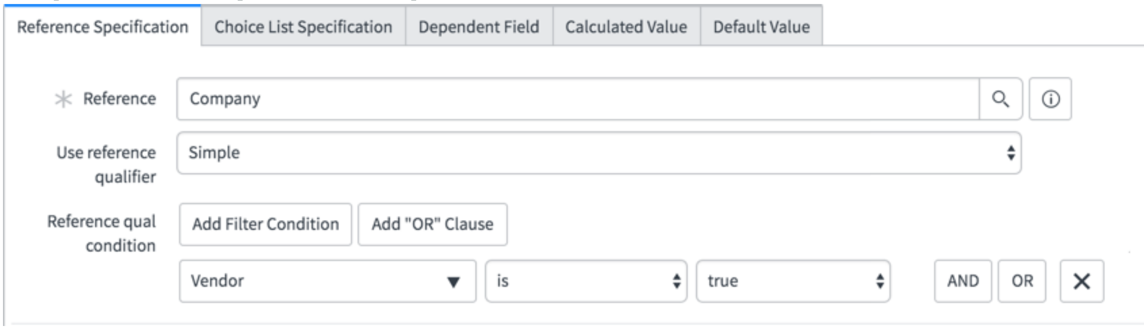
You can define a reference qualifier using one of the following methods.

Simple reference qualifier

Simple reference qualifiers use AND/OR statements (conditions) to create simple filters. Use simple reference qualifiers when filtering on conditions such as whether a company is active, a user has a specific role, and/or a caller is in a specific time zone. Simple reference qualifiers can

have a maximum of 13 reference qualifier conditions. For additional information on how to use condition builders, see Condition builder.

Simple reference qualifier example



Dynamic reference qualifiers

Dynamic reference qualifiers enable you to use a Create a dynamic filter option to run a query against a reference field to filter the returned data set. Dynamic filter options are stored filters that can contain Encoded query strings, JavaScript, or script includes, and can be used in multiple dynamic reference qualifiers. Changes made to a dynamic filter option automatically apply to all reference qualifiers that use the same dynamic filter option. Use this type of reference qualifier when you want to use the same filter on multiple forms or to provide filter functionality to "non-code savvy" implementers.

The base instance provides several OOB dynamic filter options. If a dynamic filter option that meets your needs does not exist, you can create a new dynamic filter option that is specific to your requirements. An example of an OOB dynamic filter option is the reference qualifier on the **Model ID** field on a configuration item form, such as the Computer form. The reference qualifier calls the **CI Model Qualifier** dynamic filter option, which in turn calls the *`ModelAndCategoryFilters`* script include. This script include filters the data set based on the class of the CI. The only options for the model ID are options that belong to the same class as the current CI. For example, only CIs that belong to the Computer class are available in the **Model ID** field on the Computer form.

To locate the available dynamic filter options, navigate to **System Definition** → **Dynamic Filter Options**. In the right-corner of the Dynamic Filter Options list, click the filter icon and create the filter condition `Available for ref qual is true`. All dynamic filter options that can be used in dynamic reference qualifiers appear.

Dynamic reference qualifier example

Advanced reference qualifier

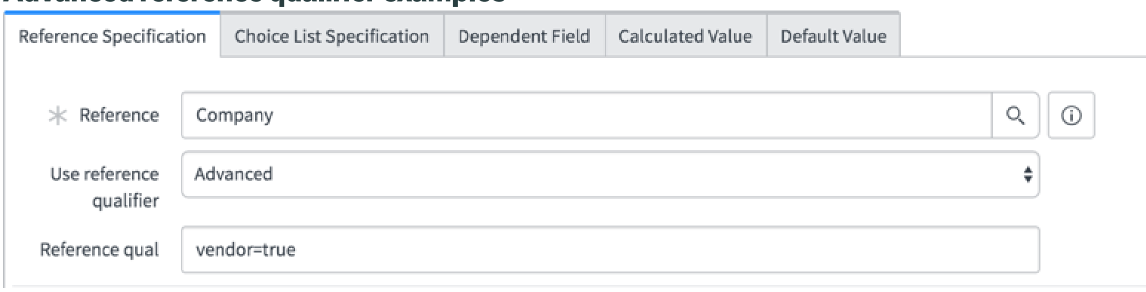
Advanced reference qualifiers enable you to define an inline encoded query string or JavaScript (actual code or the name of an existing script include or business rule) filter directly in the **Reference qual** field of the reference qualifier. Similar to the other reference qualifier types, when the form loads, the filter is executed, and only the records that match the filter appear in the reference field. Use this type of reference qualifier for implementations that only require

a simple, unique filter, that cannot be handled by a simple reference qualifier, and is not used across multiple reference fields.

Note:
As a good practice, make JavaScript calls to functions in a script include instead of a global business rule.

An example of an encoded query string is `vendor=true`, which returns all companies that are designated as vendors. Entering this string is the same as using the condition builder as shown in the example for the simple reference qualifier. For additional information on valid encoded query string syntax and examples, see Encoded query strings.

Advanced reference qualifier examples



An example of a JavaScript call is `javascript:new mySciptInclude().my_refqual()`. This code calls the function *`my_refqual()`* in the script include *`myScriptInclude()`*. The function must return a query string that can filter the options available on a reference field.

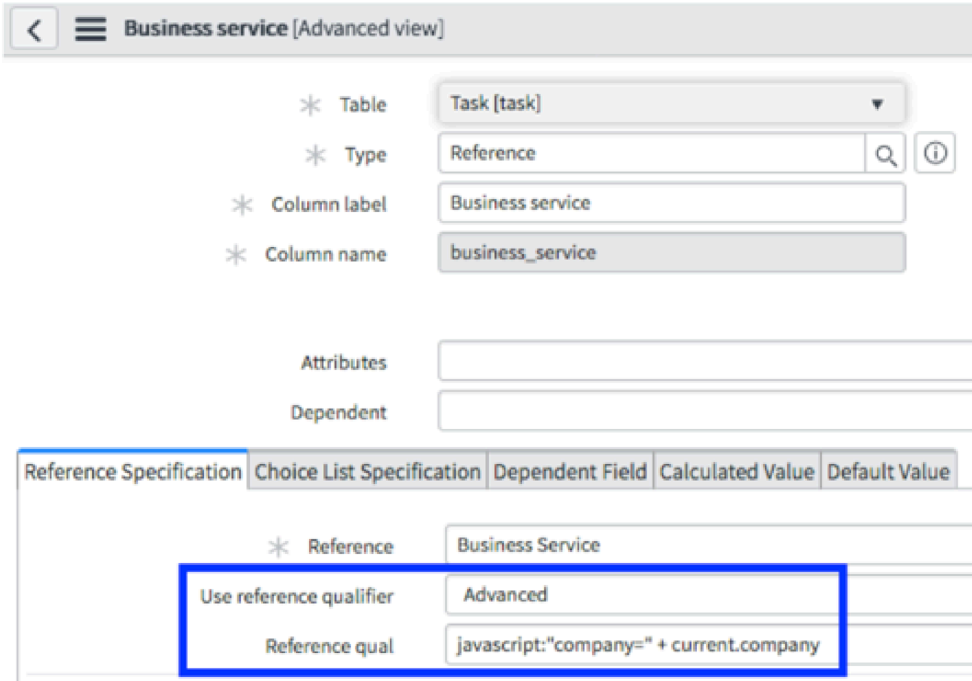
Note:
You can also use encoded JavaScript filters such as `javascript:'u_active=true^' + "u_hr_service="+current.hr_service` in reference qualifiers.

In another example, if you are trying to filter based on the current company, you don't have use a lookup script but can simply add this line to your dynamic qualifier:

```
return "company=" + current.company;
```

You can also simplify this and use an advanced reference qualifier instead of a dynamic one:

```
javascript:"company=" + current.company
```



For an additional example, configuring the reference field to show only users of a specific group, see the How to select only users of a specific group into a reference field [KB0831564] article in the Now Support Knowledge Base

.

Related lists and reference qualifiers

When a field appears on multiple Related lists on a single form view, it may be necessary to validate which related list is being referenced to properly build the reference qualifier for the field. In this situation, configure the list control for the related list and enter a unique tag in the **List edit tag** field. This tag value is available to filter scripts as a variable named *listEditRefQualTag*. The following script include code is an example of a function that uses this type of tag.

```
// Advanced reference qualifier on the CI Relationship Child
 field that takes into account
// the related list that we are editing the child field on, if
 the field is being edited
// from a tagged related list.

 cmdb_rel_ci_child_refQual:function(){

  if(listEditRefQualTag =="application") return "sys_class_name
 = cmdb_ci_appl";

  if(listEditRefQualTag =="database") return "sys_class_name =
 cmdb_ci_database"

  }
```

Using Javascript current syntax in reference qualifiers

`current` is a JavaScript object that contains the fields and field values of the active (current) record. For forms, this is the record that is displayed (loaded) in the form. Within advanced and dynamic reference qualifiers, you can use the JavaScript `current` object to define filters such as `javascript:"company=" + current.company`.

This JavaScript, within a reference qualifier, only returns the records from the referenced table that are equal to the company field value of the current record. So, if the value that appears in the **Company** field is Acme, the JavaScript returns all reference field records whose company value is equal to Acme (company="Acme"). If you then bring up a record whose company value is "ViewRite", the JavaScript resolves to company="ViewRite."

All fields within the currently loaded form (tables) are available for use with the `current` object. Use dot-walking to access values in a table, including the referenced table. For example, on the Incident form, the **Assigned To** field references the User table. To access the email address of the user, use the following syntax: `javascript:"emailAddress=" + current.assigned_to.email`.

Configure reference qualifiers

System administrators can configure reference qualifiers that enable filtering of the associated reference field.

About this task

This task walks you through creating a reference qualifier in the system dictionary. When creating a reference qualifier in the system dictionary, it not only applies to that table, but also to all the children of the table.

> **Note:**
> You can also create reference qualifiers on extended tables through dictionary overrides. Dictionary overrides only impact the extended table and any of its children, not the parent table.

Procedure

1. Navigate to the reference field on the form or table on which you want to define a reference qualifier.
2. Right-click the reference field label and select **Configure Dictionary**.
3. Under **Related Links**, select **Advanced view**.
   The simple reference qualifier is available in both the default view and the advanced view. The dynamic and advanced reference qualifiers are available only in the advanced view.
4. In the Reference Specification section, verify that the table in the **Reference** field contains the table that you want associated with the reference field, or select another table if necessary.
5. From the **Use reference qualifier** choice list, select the reference qualifier to implement.
6. Configure the qualifier based on the type of reference qualifier.

- **Simple**: Build the condition using the choice lists.
- **Dynamic**: Either select an existing dynamic filter option or Create a dynamic filter option.
- **Advanced**: In the **Reference qual** field, enter an Encoded query strings, JavaScript that returns a query string, or the name of a script include or business rule to run.

7. Complete the **Reference Specification — Additional Customization** section, as appropriate.

Field	Description
Reference key	Identifies a field other than sys_ID to use as the unique identifier for the reference field.
Reference cascade rule	Defines what happens to a record if the record it references is deleted. Possible options include: ◦ None ◦ Cascade ◦ Clear ◦ Delete ◦ Delete no workflow ◦ Restrict
Reference floats	Flag that determines whether to Configure the edit option for one-to-many relationships.
Dynamic creation	Flag that determines if the system should create a new record when a value for the reference field does not match an existing record. If you select this option, enter a script that specifies how to create the record in the **Dynamic creation script** field.

8. Click **Update**.

Constrain the assigned to field by role

This example shows how to use JavaScript and a business rule to restrict the incident **Assigned to** field choices to only the users with the itil_admin role.

Before you begin

Role required: personalize_dictionary or admin

About this task

You can also change itil_admin to any other role on a reference field that refers to the User [sys_user] table.

Procedure

1. Open an incident.
2. In the upper-left corner of the screen, click the form context menu, and then select **Configure** > **Dictionary**.
3. In the **Reference qual** field, enter `javascript:"sys_idIN"+getRoledUsers("itil_admin").join(",")`.
4. Save the record.

5. To see the base system business rule that this JavaScript code calls, navigate to **System Definition** > **Business Rules**.
6. Open **getRoledUsers**.
   The business rule uses the following JavaScript code.

```
// Return an array of sys_ids of the users that have at least
 one role
// optional parameters allow the exclusion (NOT IN) of some
 roles or
// look for specific roles (IN)
//
// optional: queryCondition - 'IN' or 'NOT IN'
// optional: roleList - a comma separated list of role names
//
function getRoledUsers(queryCondition, roleList) {
   var roleListIds;
   if (queryCondition && roleList) {
      roleListIds = getRoleListIds(roleList);
   }

   var users = {};
   var now_GR = new GlideRecord('sys_user_has_role');
   if (roleListIds) {
      now_GR.addQuery('role', queryCondition, roleListIds);
   }
   now_GR.query();
   while (now_GR.next()) {
      users[now_GR.user.toString()] = true;
   }

   var ids = [];
   for (var id in users)
      ids.push(id);

   return ids;
}

// get sys_id's for the named roles
function getRoleListIds(roleList) {
   var ids = [];
   var now_GR = new GlideRecord('sys_user_role');
   now_GR.addQuery('name','IN',roleList);
   now_GR.query();
   while (now_GR.next()) {
      ids.push(now_GR.sys_id.toString());
   }
   return ids;
}
```

Constrain the assignment group field

This example shows how to use an advanced reference qualifier with JavaScript and a script include to restrict the incident **Assignment group** choices to only the groups that contain the user specified in the **Assigned to** field.

Before you begin

Role required: personalize_dictionary or admin

servicenow

Procedure

1. Open an incident.
2. Right-click the **Assignment group** label and select **Configure Dictionary**.
3. If the form appears in **Default view**, under **Related Links**, click **Advanced view**.
4. In the **Use reference qualifier** field, ensure that the **Advanced** option is selected.
5. In the **Reference qual** field, enter `javascript:new ReferenceQualifierHelper().backfillAssignmentGroup()`.
6. Save the record.
7. Navigate to **System Definitions** > **Script Includes**.
8. Click **New**.
9. Name your script includes as `ReferenceQualifierHelper` to match the Javascript in the following step.
   This name ensures the API Name is generated correctly, based on the Name field.
10. Script includes with the following JavaScript code.
    Ensure that the **Accessible form** field is properly set for the environment.

```
var ReferenceQualifierHelper = Class.create();
ReferenceQualifierHelper.prototype = {

 backfillAssignmentGroup:function() {
  var assigneeGroupsQualifier = '';
  var assignee = current.assigned_to;

  //return if the assigned_to value is empty (this causes all
 groups to be returned)
  if(!assignee)
   return;

  //sys_user_grmember has the user to group relationship
  var grAssigneeGroups = new GlideRecord('sys_user_grmember');

  grAssigneeGroups.addQuery('user',assignee);
  grAssigneeGroups.query();

  while(grAssigneeGroups.next()) {
   if (assigneeGroupsQualifier.length == 0) {
    // Create the beginning of the qualifier and add the 1st
 group
    assigneeGroupsQualifier = 'sys_idIN' +
 grAssigneeGroups.getValue('group');
   }
   else {
    // build a comma separated string of groups if there is
 more than one
    assigneeGroupsQualifier += (',' + grAssigneeGroups.group);
   }
  }
  // return Groups where assigned to is in those groups we use
 IN for lists

  gs.log('DP: RefQual = ' + assigneeGroupsQualifier);
```

```
  return assigneeGroupsQualifier;
 },
 type: 'ReferenceQualifierHelper'
};
```

What to do next

To test, create an incident and select a user in the **Assigned to** field. Click the **Assignment group** lookup icon. Only the groups that contain the user you selected appear. For example, you assign an incident to Bob Smith, who belongs to the **Database** group and the **Networking** group. The only options that appear in the assignment group are **Database** and **Networking**.

The INSTANCEOF operator in reference qualifiers

You can use the INSTANCEOF operator in a reference qualifier to shorten or simplify a complex class qualifier.

For example, use the INSTANCEOF operator for a reference field to the cmdb_ci table to specify that all subclasses of a class are included in the results. The following reference qualifier returns all servers, including Linux, UNIX, Windows, and so on, because each of those subclasses extend the cmdb_ci_server class.

```
sys_class_nameINSTANCEOFcmdb_ci_server
```

In another example, you can simplify the following reference qualifier in a similar way.

```
 u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_name=cmdb_ci_computer
^ORsys_class_name=cmdb_ci_server
^ORsys_class_name=cmdb_ci_win_server
^ORsys_class_name=cmdb_ci_unix_server
^ORsys_class_name=cmdb_ci_linux_server
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Using the INSTANCEOF operator, the reference qualifier is rewritten as follows because the server subclasses extend the cmdb_ci_computer class.

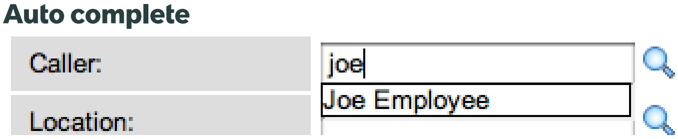
```
 u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_nameINSTANCEOFcmdb_ci_computer
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Auto-complete for reference fields

By default, a reference field auto-completes as the user types in the field.

Administrators can configure additional auto-complete options. A user must have table-level read permission on the referenced table for auto-complete to display any options.

Auto complete



Dictionary attributes for auto-completion of reference fields

There are dictionary attributes that are specific to reference fields and that determine auto-complete behavior.

Reference field auto-completion dictionary attributes

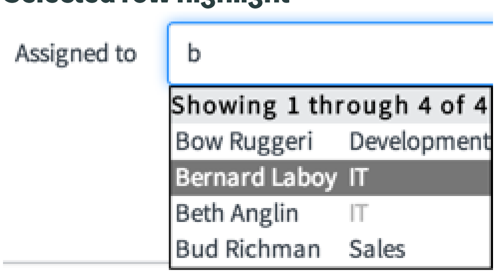
Attribute	Description
ref_auto_completer	Specifies the name of the client-side JavaScript class that creates the drop-down auto completion choices. Valid class values include: • *`AJAXReferenceCompleter`*: Displays matching auto-complete choices as a drop-down choice list. The list only displays the reference table's display value column. Reference fields automatically use this class if there is no other auto-completion class specified. • *`AJAXTableCompleter`*: Displays matching auto-complete choices as rows in a table. The table displays the reference table's display value column and any columns listed in the *`ref_ac_columns`* attribute. • *`AJAXReferenceChoice`*: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table's display value column. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.
ref_ac_columns	Specifies the list of reference table columns to display. Separate column names with a semi-colon. For example, *`ref_ac_columns=user_name;email;sys_created_on`* allows auto-complete to match text from the user_name, email, and sys_created_on columns.
ref_ac_order_by	Specifies the reference table column that sorts the auto-completion choices. For example, *`ref_ac_order_by=name`* sorts the auto-completion choices alphabetically by name.

Auto-complete UI features

The AJAX table completer class has a number of UI improvements.

- The table completer always displays the number of records the auto-complete query finds.
- The table completer highlights the entire selected row by changing the color of the background and text.
- The table completer lists a value for every column.
    - The first time a value appears in a column, the table completer displays it in black text.
    - The table completer displays subsequent duplicate values in grey text. Previously, the table completer displayed an empty cell in a column containing a duplicate value.

Selected row highlight



Set the *ref_auto_completer=AJAXTableCompleter* dictionary attribute to use these improvements.

Define auto-complete attributes for all references to a table

A field inherits and uses the reference table's auto-complete attributes unless the field has its own value for the same attributes. You can define the attributes for references to a table, and it affects every form that references that table.

Before you begin

Role required: personalize_dictionary

About this task

A field-level attribute overrides a table-level attribute of the same name. If a field uses different reference attributes from those that are defined for the reference table, then the field uses both sets of attributes.

Use these steps to define auto-complete attributes for all fields in a table that do not already have their own auto-complete attributes. This example describes how to define auto-complete attributes for all references to the User [sys_user] table.

Note:
A field's auto-complete attribute value supersedes a table's auto-complete attribute value. This means that any existing field-level value for an auto-complete attribute supersedes any value the administrator applies to the auto-complete attribute from the reference table.

Procedure

1. Navigate to a list of the target table, such as **All** > **User Administration** > **Users**.
2. Perform the appropriate action for your list version.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, enter a comma-separated list of auto-complete attributes you want to apply to all fields in the table.

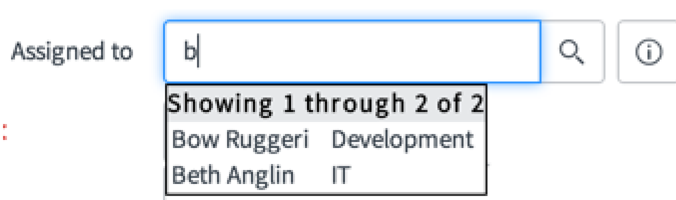
   Example
   For example, to display the user's department with all references to the sys_user table, enter:

   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department
   ,ref_ac_order_by=department
   ```

6. Click **Update**.

What to do next

To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now include both the user name and department.



Remove the display value column

You can remove the display value column from a reference field by setting the *ref_ac_display_value* attribute to false.

Before you begin

Role required: personalize_dictionary

About this task

This causes the reference field to remove the display value column and only display the columns listed in the *ref_ac_columns* attribute. This feature requires the use of the *AJAXTableCompleter* class and the *ref_ac_columns*, *ref_ac_columns_search*, and *ref_ac_display_value* attributes.

> **Note:**
> Auto-complete cannot match text from additional columns when the reference field is a product of the *ui_reference* UI macro. This means any auto-complete action against a selector, such as the Impersonate User list, can only match text against the display value.

This example describes how to remove the display value column from references to the User [sys_user] table and replace it with references to the first_name and last_name columns.

Procedure

1. Navigate to a list of the target table, such as **All** > **User Administration** > **Users**.
2. Perform the appropriate action for your list version.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, add the *ref_auto_completer*, *ref_ac_columns*,*ref_ac_columns_search* , and *ref_ac_display_value* attributes.

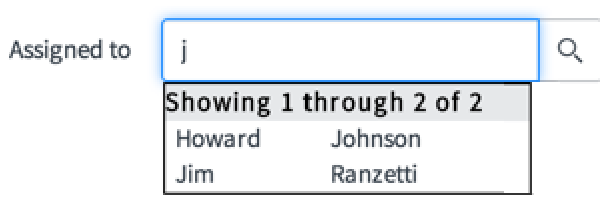
   Example

   For example, to hide the display value column and only display the user's first and last names enter the following.

   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=first_name
   ;last_name,ref_ac_columns_search=true,ref_ac_display_value=fa
   lse
   ```
6. Click **Update**.

What to do next

To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now hide the display value column (user_name) and only display the first_name and last_name columns.



Improve auto-complete queries

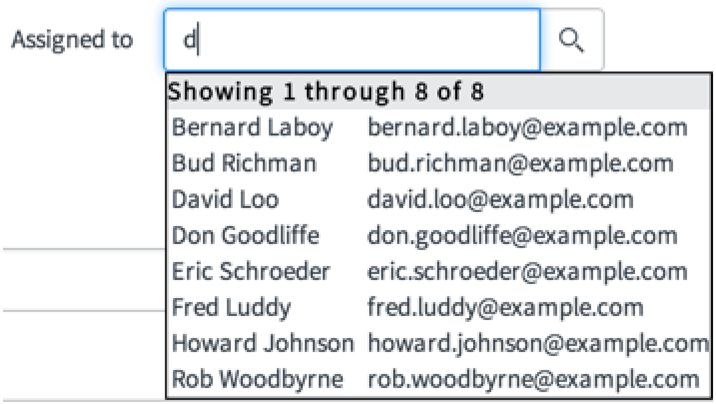
By default, all reference fields use a **starts with** query to search for matching text in the reference table. This prevents auto-complete from executing inefficient **contains** queries every time a user searches a reference field. You can require all reference fields to use a **starts with** query.

Before you begin

Role required: admin

About this task

The following example illustrates a **contains** query. Note that the letter "d" appears anywhere in the user's first or last name.



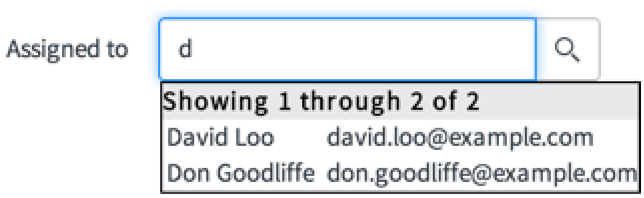
This procedure describes how to change the `glide.ui.ref_ac.startswith` system property to always use a `starts with` query.

Procedure

1. In the navigation filter, enter `sys_properties.list` and press the Enter key.
2. Select the `glide.ui.ref_ac.startswith` property.
   To search for the property, enter `*startswith` in the **Go to** search filter for the **Name** column.
3. In the **Value** field, replace **false** with **true**.

   Note:
   Setting the `glide.ui.ref_ac.startswith` system property to **true** overrides any existing `autocomplete.contains` settings in both user and system level preferences. This property changes the autocomplete query method for all users regardless of preferences.

4. Click **Update**.
5. Test the change by opening a record with a reference field and entering a character in it, as illustrated in the example below.



Configure auto-complete to match text from any reference field

By default, auto-complete only matches text in the display value column. You can configure a reference field to match text from any additional column the reference field displays.

Before you begin

Role required: personalize_dictionary

About this task

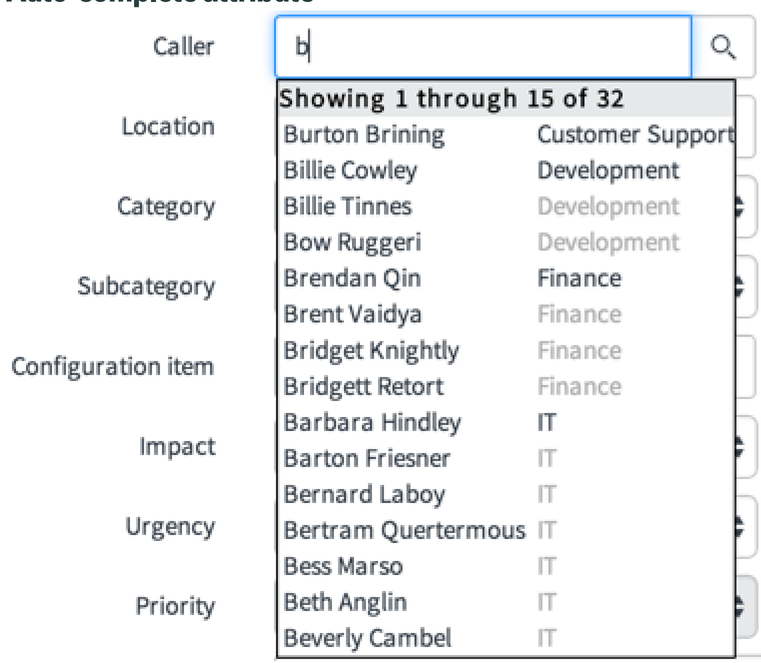
You can add the `ref_ac_columns_search` attribute to enable auto-complete to match text in any column listed in the `ref_ac_columns` attribute. Set the `ref_ac_columns_search` attribute to **true** to match text from all reference field columns. By default (or when this attribute is **false**) auto-complete only matches text in the display value column.

Procedure

1. Right-click the label of a reference field.
2. Select **Configure Dictionary** from the choice list.
3. Under **Related Links**, click **Advanced view**.
4. In the **Attributes** field, add the desired auto-completion attributes.
   For example, these attributes add the department field to the caller list and sort callers by their department:

```
ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department
,ref_ac_order_by=department,ref_ac_columns_search=true
```

Auto-complete attribute



5. Click **Update**.

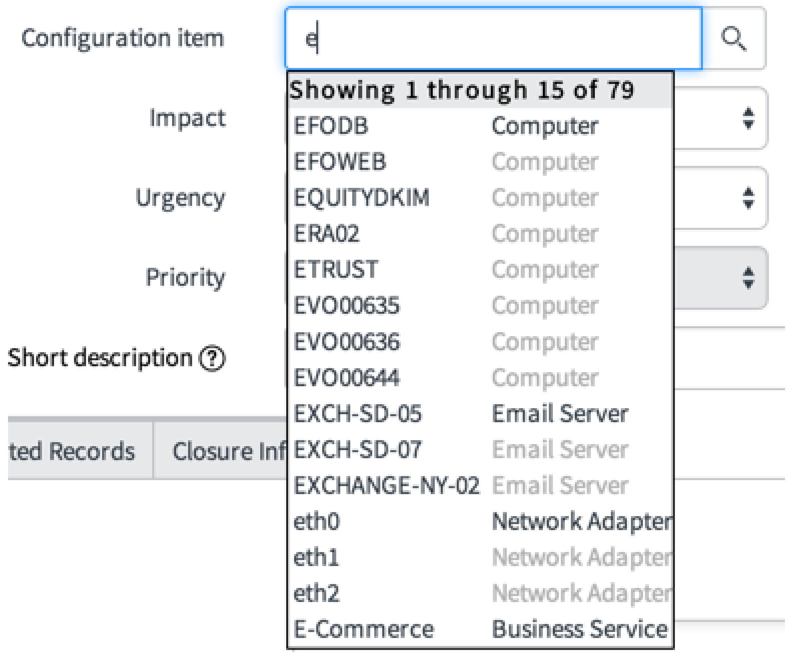
Example:

The following example describes how to set the **Configuration Item** field display the CI class names from auto-complete choices for the Configuration item [cmdb_ci] table.

```
ref_auto_completer=AJAXTableCompleter ,ref_ac_columns
 =sys_class_name ,ref_ac_order_by
```

```
=sys_class_name ,ref_contributions
=task_show_ci_map ;ci_show_incidents
```

Note:
The *ref_contributions* attribute controls the icons that appear next to the reference field.



Enable contains auto-complete searches

By default, the reference auto-complete uses a **starts with** search. A user preference can be created to implement a **contains** search.

Before you begin

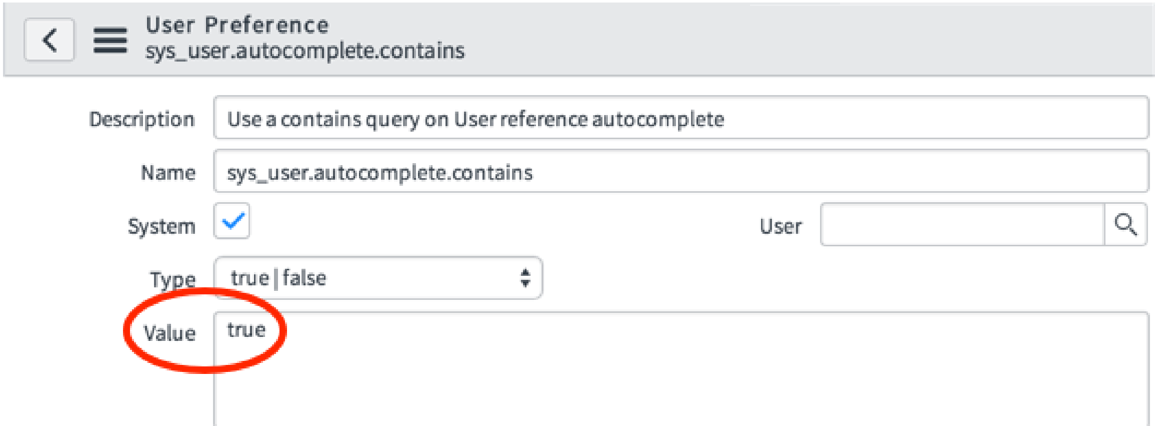
Role required: admin

Procedure

1. Disable the *glide.ui.ref_ac.startswith* system property.
   For more information, see Improve auto-complete queries.

   Note:
   Setting the *glide.ui.ref_ac.startswith* system property to **true** overrides any existing "autocomplete.contains" settings in both user and system level preferences. This property changes the auto-complete query method for all users regardless of preferences.

2. Navigate to **User Administration** > **User Preferences**.
3. Select the preference **"<referenced table>.autocomplete.contains"**.
4. Set the **value** field to **true**.



5. Click **Update**.

What to do next

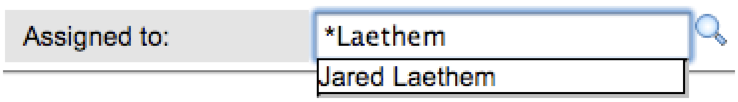
Log out and log back in to display the updated search.

Wildcards in reference auto-completes

Wildcard searches use the auto-complete functionality.

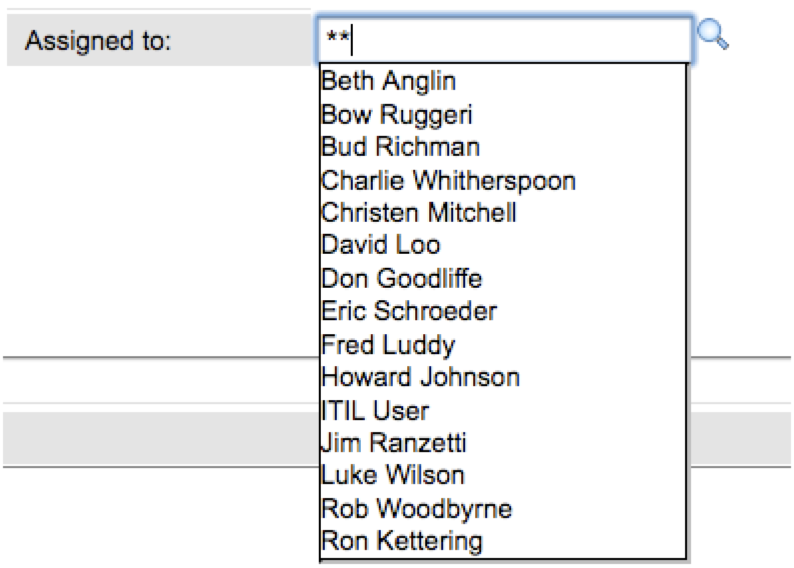
Use an asterisk in the reference field for wildcard searches.

One asterisk wildcard search



If two asterisks are entered, a list of available records display in the auto-complete suggestions.

Two asterisk wildcard search



Related topics

Wildcard characters allow searching for patterns and variations

Recent selections

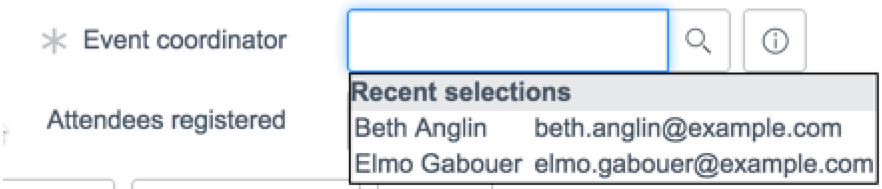
Reference fields store a list of each user's recent selections to enable you to quickly select past values when filling in a reference field.

By default, the system stores up to 15 selections from a reference field for each user in the Recent Selection [sys_ui_recent_selection] table. You can see the recent selections list by selecting an empty reference field.

Note:

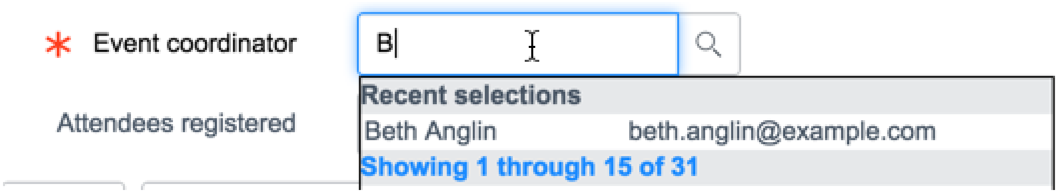
- The system doesn't store recent selections for Service Catalog reference variables.
- Recent selections aren't available in the Service Portal or mobile user interfaces.

Recent selections



The system uses auto-complete to filter the list of recent selections to match the values that you enter.

Recent selections filtered



The system adds a Recent Selection record whenever you insert or update a reference field value. Administrators can control the number of recent selections the system displays with the `glide.xmlhttp.max_choices` system property. Setting the property to zero disables recent selections.

Note:

- The `glide.xmlhttp.max_choices` property also controls the number of entries the system displays in lists.
- For information on clearing recent selections, see the How to clear out the "Recent Selections" that appears up on the reference fields. [KB0747334] article in the Now Support Knowledge Base.

Related topics

Available system properties

Suggestion field type

To help users find what they are looking for, you can add a suggestion field to any form.

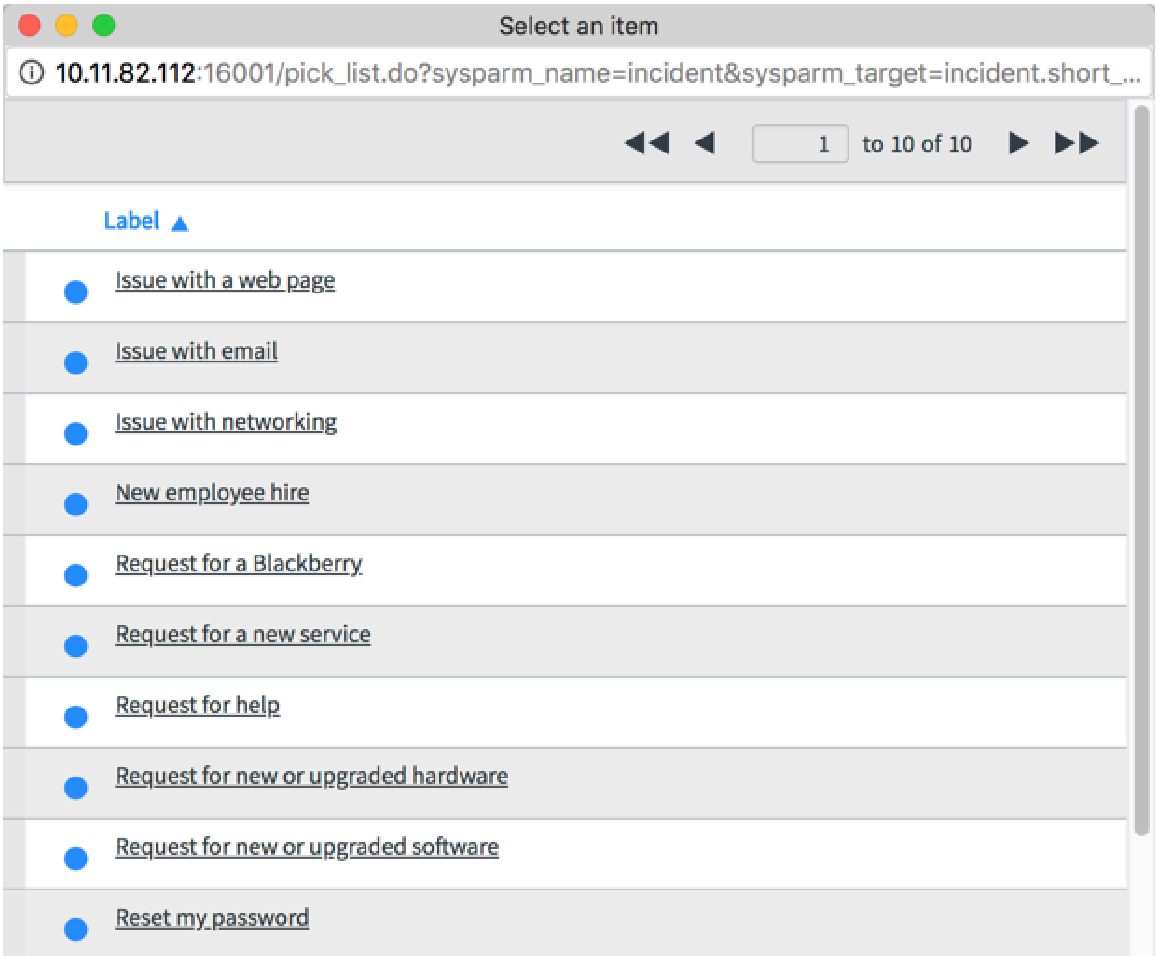
Before you begin

Role required: personalize_dictionary

Procedure

1. Open the form to which you are adding a suggestion field.
2. Add a new field or locate an existing field.
3. Right-click the field label and select **Configure Dictionary**.
4. In the **Choice** field, select **Suggestion**.
5. Click **Update**.

   Suggestions are presented to the user.



Configure suggested text for string fields

You can configure the suggested text options for string fields.

Before you begin

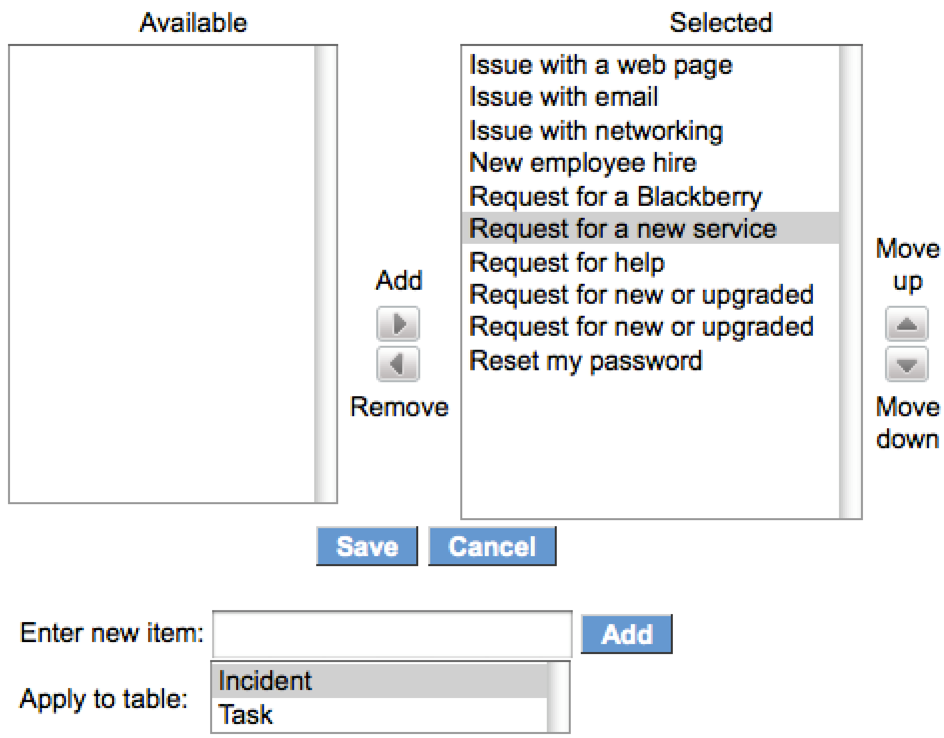
Role required: personalize_choices

Procedure

1. Right-click the field label and select **Configure Choices**.
2. Using the slushbucket, select options and the order in which you want them to appear.
   - To create a new option, enter the suggested text in the **Enter new item field** and click **Add**.
   - The **Apply to Table** field is available when the current table extends another table (for example, Incident extends Task). This field allows suggested text options to be configured for all tables that extend the parent or for only the current (child) table.

3. Click **Save**.
4. To edit existing options, right-click the field label and select **Show Choice List.**.

Example:



Configure suggested text for journal fields

You can configure the suggested text options for journal fields, such as work notes or the activity stream. Suggested text options for journal fields are unavailable in Core UI.

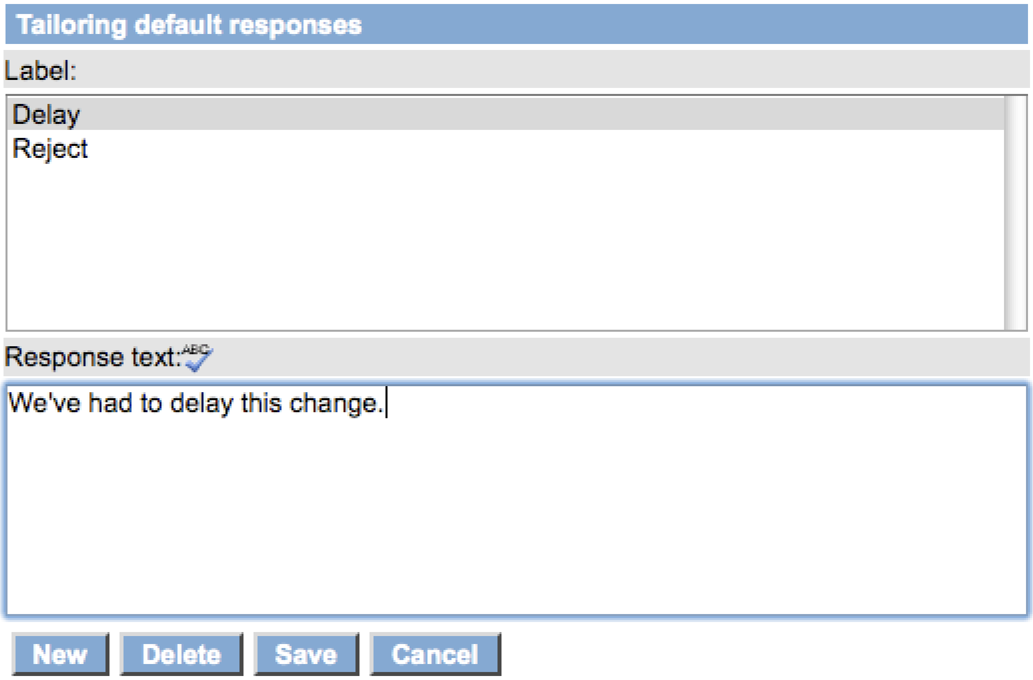
Before you begin

Role required: personalize_responses

Procedure

1. Right-click the field label and select **Configure Responses**.
2. Click **New**.
3. Enter a label, or brief description, for the option.
4. Enter the complete text in **Response text**.
5. Click **Save**.

Example:



Wiki field type

Wikitext fields use the basic wiki markup language and support links to external URLs and to sources within the system.

Some fields in the base system support Wikitext and administrators can add Wikitext fields on any form in the system.

Supported wiki tags

Basic tags are supported for Wikitext fields in the system.

Supported wiki tags

Format	Wiki tag
Headers	= Header 1 =, == Header 2 ==, etc.
Numbered step	#Step 1
Bullets (multi-level)	*Bullet 1, **Bullet 2
Indentation	:Level 1, ::Level 2
Line break	
Tables	Full table support, including cell spacing, padding, borders, background shading, and width measurements. For example: `{| class="wikitable"` `|-` `! Header 1`

Supported wiki tags (continued)

<table>
<tr><th>Format</th><th>Wiki tag</th></tr>
<tr><td></td><td><pre>! Header 2
|-
| row 1, cell 1
| row 1, cell 2
|-
| row 2, cell 1
| row 2, cell 2
|}</pre>
Note:
Sortable tables are not supported (class="sortable").</td></tr>
<tr><td>Code blocks</td><td><pre> Generic block </pre>

<javascript> Javascript Syntax </javascript>

<xml> XML Syntax </xml></td></tr>
<tr><td>Bold</td><td>'''text'''</td></tr>
<tr><td>Italics</td><td>''text''</td></tr>
<tr><td>Ignore Wiki and HTML formatting</td><td><nowiki> wikitext </nowiki></td></tr>
<tr><td>Web link</td><td>[http://community.service-now.com/ <link text>]</td></tr>
<tr><td>Placed images</td><td>[[Image:<image name>]] For more information on uploading images or files to the database, see Storing images in the database.</td></tr>
<tr><td>HTML</td><td>Most common HTML tags are supported

bold, strong, <i>italics</i>, <h1>header1</h1>, <h2>header2</h2>, <h3>header3</h3>, <p>paragraph</p>, _{sub}, ^{sup}, <center>center</center></td></tr>
</table>

Create a Wikitext field

You can create a Wikitext field on any form.

Before you begin

Role required: personalize_form

Procedure

1. Create a new field with the **Type** set to **Wiki**.
2. Click **Wikitext** to begin editing.

The Wikitext field appears on the form.

Related topics

Add and customize a field in a table

Extend the functionality of a Wikitext field

Configure the Wikitext field to link to other sources within the system.

Before you begin

Role required: personalize_dictionary

Procedure

1. Right-click in the header of the new Wikitext field.
2. Select **Configure Dictionary**
3. In the **Dependent** field of the dictionary form, enter the field you want to use for linking to other pages.

   For example, on the Incident table, you might choose the **number** field.

   
   This configuration enables you to link to any incident by using that incident's number. For example, to open INC0000002, you enter `[[INC0000002]]`.

   The following dictionary attributes are available for wiki_text fields.

   - *`preview_first=true`* - sets the preview mode to display on page load, otherwise editor will be displayed
   - *`preview_selector=true`* - enables the toggle button to switch between the editor and preview
   - *`dual_mode=true`* - enables displaying both the editor and the preview simultaneously during edit mode.

Add and customize a field in a table

Administrators can add new fields to a table to store and display data.

Before you begin

Role required: admin

About this task

Note:
Certain ServiceNow AI Platform subscriptions include custom table entitlements. You can create custom tables for any purpose, up to the entitlement limit in the subscription. To learn more about how your usage administrator maps the custom tables that you create to subscriptions, see Map custom tables to a product subscription in Subscription Management.

Be aware of these database limitations:

- The system can only have a maximum of 1000 columns per table. Although 1000 columns is a specified limit, this limit doesn't mean you can physically have 1000 columns within a table. The number of columns within a table is defined by the database used in the ServiceNow datacenter, not by the ServiceNow AI Platform.
- Every table, regardless of storage engine, has a maximum row size of 65,535 bytes. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.
- The system can't have more than 10 medium-length or longer **String** fields to a single table. Attempting to save a large number of characters in 11 or more String fields can result in the following error: Syntax Error or Access Rule Violation detected by database (Row size too large (> `8126`).
- When you create fields, the u_ prefix is automatically added to the column name. If the column label that you enter contains leading numeric characters, they are replaced by the u_ prefix.

For more information on database limitations and general questions on tables in your ServiceNow instance, see KB0749585.

Procedure

1. Navigate to any form.
2. Right-click the form header and select **Configure** > **Form Layout**.
3. In the **Create new field** section, fill in the following fields

Option	Description
Name	Enter the name of the field as you want it to appear on forms and lists.
Type	Select a field type.
Field length	Select a field length. This field is visible only for certain field types.

4. Click **Add**.
5. Use the slushbucket to place the field in the desired location on the form.
6. Click **Save**.
   The field now appears on the form in the designated location.

Make a field mandatory

Fields can be marked as mandatory, meaning they must contain a value before the record can be saved. Mandatory fields are marked with a field status indicator before the label.

Before you begin

Role required: personalize_dictionary

About this task

A mandatory field that is pre-populated by the platform with default data, such as a value from a client script, does not display the indicator. If you delete this value from the field, however, the indicator appears. The color of the indicator depends on the field state.

Using a dictionary entry to make a field mandatory does not work when using WebServices. You can use a data policy instead. For more information on data policies, see Data policy.

Procedure

1. Right-click the field's label in the form and select **Configure Dictionary**.
2. In the **Dictionary** form, select the **Mandatory** check box.
3. Click **Update**.

   The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory. If the mandatory field is pre-populated for any reason, the mandatory field indicator does not appear.

   Mandatory fields are global. The field is marked as mandatory everywhere it appears in a form.

   Making a **True/False** mandatory will have no effect. **True/False** fields are always considered to have a value. A selected check box has a value of true and an unselected check box has a value of false. Either of these values satisfies the requirement of a mandatory field.

   A form can be saved with an empty mandatory field if that field is a reference field, and if the parent field is also blank. However, if the mandatory reference field shows a value from the parent field, then the form cannot be saved if this value is deleted. If the value in the referenced field is changed, the value for that field is changed everywhere it appears.

4. **Optional:** Use *`dictionary override>override mandatory`* to make a field that is mandatory only in the child table and not the parent table.

Related topics

Set a CI field to be mandatory

Define a dictionary override

Change the field label or hint

You can change a field's label or the text that appears as a hint when you point your cursor to the field.

Before you begin

Role required: personalize_dictionary

Procedure

1. Navigate to the form the field appears on.
2. Right-click the field label and select **Configure Label**.
3. Update the form.

Changing the Field Label or Hint

Field	Description
Table	The table the label appears on.
Label	The label that the field displays. You can enter up to 80 characters for the label, but not all databases support this many characters. The recommended maximum is 30 or fewer characters. HTML in field labels is not supported.
Plural	The plural version of the field label.
Element	The dictionary name of the field.
Help	Helpful text stored in the record.
Hint	A short description of the field that displays when the user hovers over it.
URL	A URL link that displays on the label if this field is not blank.
URL target	A target attribute that determines where the URL will open. For information on the target attributes, see this W3Schools article.

4. Click **Update**.

Related topics

Add help to a field label on a form

Delete a field from a table

You can delete custom fields that you created. Custom fields begin with **u_**. It is recommended that you remove the field from forms and lists instead of deleting it.

Before you begin
Role required: admin

About this task
You cannot delete base system fields. In addition, any missing base system fields are recreated when the instance is upgraded.

Procedure

1. Navigate to a form that contains a custom field to delete.
2. Right-click the field label and select **Configure Dictionary**.
3. Click **Delete Column** in the form header, and then click **OK**.
4. To delete multiple custom fields, complete the following steps.
   a. Navigate to **System Definition** > **Dictionary**.
   b. Locate the custom fields to delete.

      Example
      For example, search for column names that start with `u_`.

   c. Check the boxes next to the fields to delete and select **Delete** from the action list below the list.

A confirmation dialog opens and reminds you that this may result in deletion of related records. If there are dependencies for the selected fields, they are listed.

d. To proceed, click **Delete**.

Add users to a watch list

Watch lists enable you and others to subscribe to notifications of a task.

Before you begin

Role required: none

Procedure

1. Navigate to a record that you want to add watchers to.

   Note:
   Not all records have watch lists. If you're unable to see a watch list, you may need to adjust your form view or ask your administrator to update the form to add a watch list.

2. Expand the watch list by selecting the lock icon ( ).
3. Select users with the list controls (see table).

Glide controls

Icon	Function
	Add yourself to the watchlist
	Remove the highlighted user
	Open the highlighted user's record (active only when a user record exists)
	Open the Edit Members window to add or remove multiple users (not available until a record has initially been saved)
	Indicates that the watch list is unlocked; select the icon to lock the watch list
	Open the Users list in a new window to select a single user
	Enter an email address for users who aren't in the User [sys_user] table or don't have an email address defined in their user record

Configure email notifications for watch lists

Watch lists (glide_list field type) allow multiple users to subscribe to notifications of a task. You can specify conditions in an email notification to send email notifications to the members when the conditions are met.

Before you begin

Role required: admin

About this task

To receive these notifications, users must define an email address in their user record or enter an email address into the watch list email field.

Important:
Administrators configure email notifications for watch lists (see Configure email notifications for watch lists).

An advanced configuration using watch lists involves placing two watch lists on a form, one for the general comments on a task and another for work notes or non-public comments. By configuring separate email notifications, separate users on each watch list can be notified about different information.

If users on a watch list are getting more than one email for each update to an incident, it can be because other recipients are replying all to an email notification. Recipients may be receiving email through their email system (Outlook, Groupwise, and so on) and through the base system. To stop this duplication, remove the names of other users from the email or the watch list.

Procedure

1. Open the notification to configure.
2. In the Who will receive section, select the icon beside **Users/groups in fields**.
3. Double-click **Watch list** in the **Available** column to move it to the **Selected** column.
4. Click **Update**.

Related topics

Configure email notifications for watch lists

Email and SMS notifications

Hide email addresses in a watch list

You can remove the email address text entry element from a watch list by modifying the dictionary.

Before you begin

Role required: admin

Procedure

1. Open a task record that displays the **Watch list** field.
2. Right-click the label and select **Configure Dictionary**.
3. In the **Attributes** related list, click **New**.
4. Enter or select the **no_email** attribute and enter `true` in the **Value** field.
5. Click **Submit**.

Result

The email entry field is hidden. Users can select users from the reference field to add to the watchlist.

Related topics

Altering tables and fields using dictionary attributes

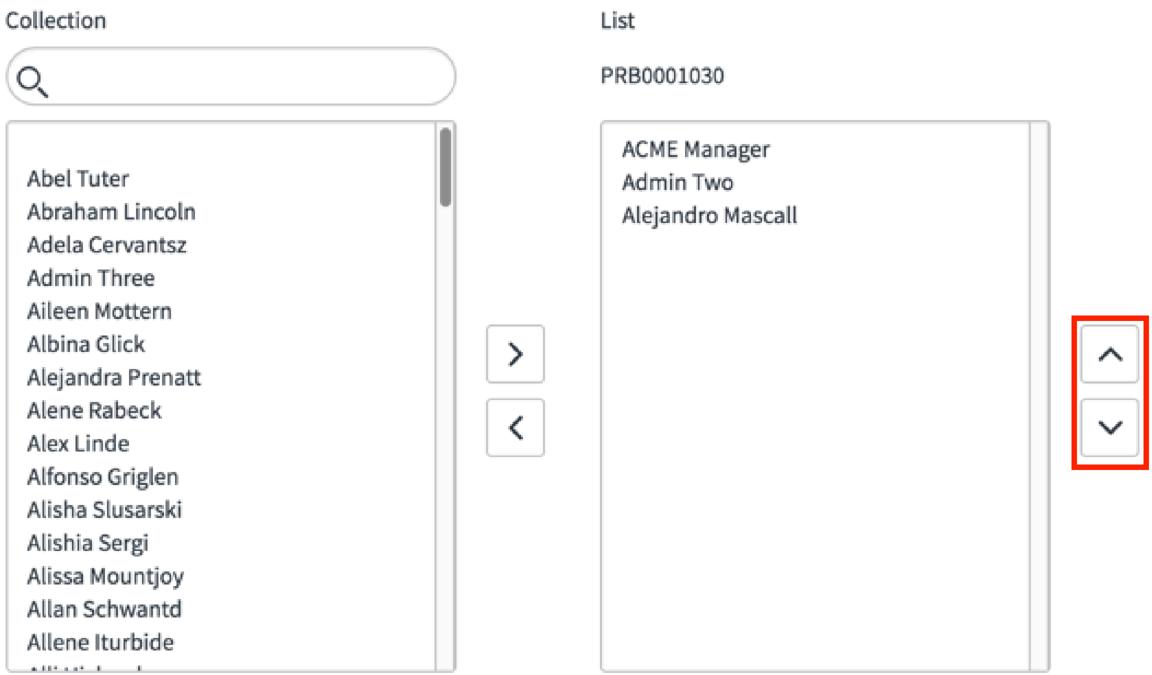
Configure order buttons on the watch list slushbucket

When you add multiple users to a glide_list, such as a watch list, the slushbucket does not display the order buttons for the list of selected members. You can set a dictionary attribute to display the order buttons.

Before you begin
Role required: admin

About this task
The slushbucket opens when the user clicks the add/remove multiple users icon.

By default the order buttons on the right are not displayed. Follow the procedure to display the order buttons.



Procedure

1. Open a task record that displays the **Watch list** field.
2. Right-click the label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
4. In the **Attributes** field, enter `maintain_order=true` separated by a comma if necessary.
5. Click **Update**.

Related topics

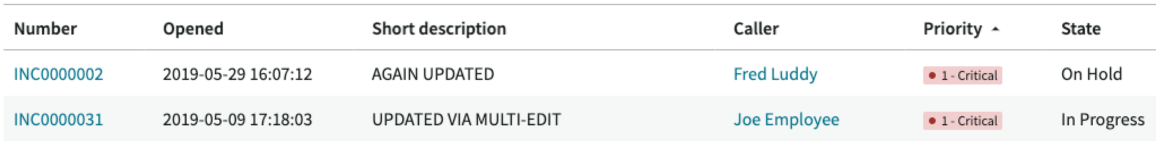
Altering tables and fields using dictionary attributes

Highlight list fields

Color fields in lists to call an agent's attention to them.

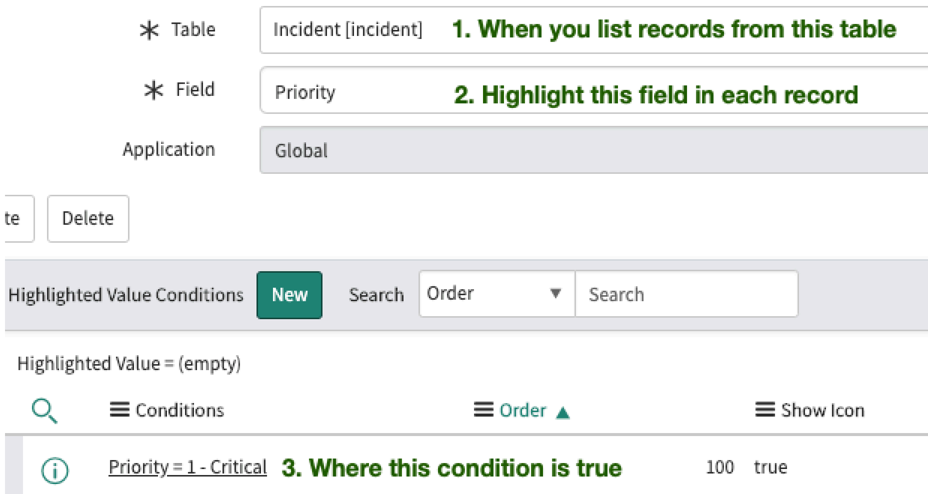
Before you begin
Role required: admin

About this task
Highlighted fields in lists appear colored and optionally, have a leading bullet.



Number	Opened	Short description	Caller	Priority	State
INC0000002	2019-05-29 16:07:12	AGAIN UPDATED	Fred Luddy	1 - Critical	On Hold
INC0000031	2019-05-09 17:18:03	UPDATED VIA MULTI-EDIT	Joe Employee	1 - Critical	In Progress

The set up involves specifying the fields that gets highlighted and the conditions that trigger the highlighting.



Available highlighting colors are:

You cannot highlight the following field types:

- Reference
- URL
- Document IDs

Procedure

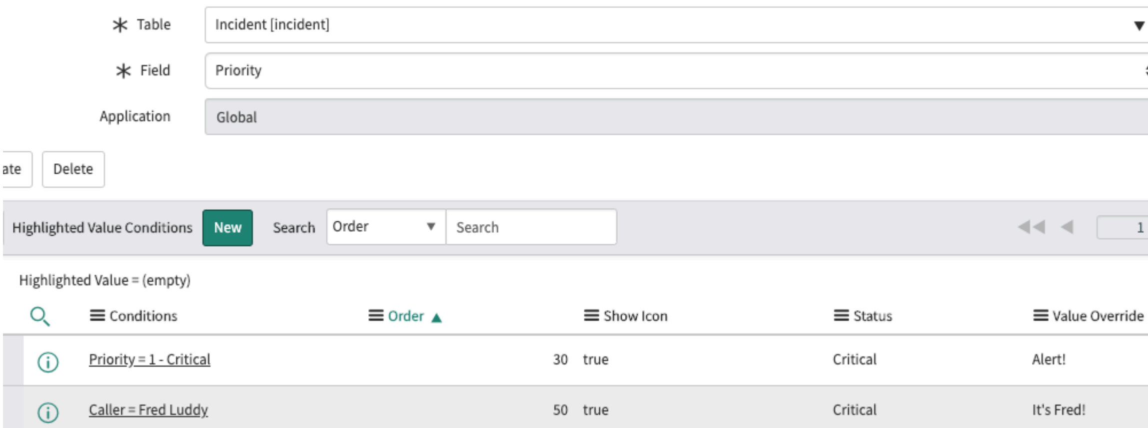
1. Navigate to **All** > **Workspace Experience** > **Administration** > **Highlighted Values** and click **New**.
2. On the form, fill in the fields.

Highlighted Value

Field	Definition
Table	Name of the table that contains the fields you want to highlight.

Field	Definition
Field	Name of the field you want to highlight if the triggering conditions are met.
Application	Scope of applications this highlighting pertains to.
Workspace	The workspace this highlighting applies to.

The **Field** value can be unrelated to the condition that triggers the highlighting. In the following example, if the **Caller** is Fred Luddy, Workspace highlights the **Priority** field, not the **Caller** field.



3. Right-click the header and click **Save**.
   You've specified the field where the highlights appear. Now, it's time to specify the conditions that trigger the highlighting.
4. In **Highlighted Value Conditions**, click **New**.
5. In the Highlighted Value Condition form, fill in the fields.

Field	Description
Conditions	Conditions that trigger the highlighting. The condition can be different from the field that gets highlighted. For example, you might highlight the **Priority** field in a record if the **Caller** in that record is Fred Luddy. A simpler example is highlighting the **Priority** field if the priority value is **critical**.
Status	The highlighting color.
Show Icon	Toggle to display (selected) or hide the leading bullet when highlighting.
Value Override	Text that replaces the field values from the table. If you don't supply a **Value Override**, Workspace highlights the field value from the table. If you supply a value, Workspace replaces the field value with your text and highlights that.
Application	Scope of applications this highlighting pertains to.
Order	The order in which to evaluate the conditions. When you have multiple conditions for highlighting the same field, they are evaluated in order from lowest to highest. If any of the conditions are True, Workspace highlights the field.

6. Click **Submit**.

   In the following example, the highlighting was triggered on the **Priority** field because the priority value was critical.

Number	Opened	Short description	Caller	Priority ▲	State
INC0000002	2019-05-29 16:07:12	AGAIN UPDATED	Fred Luddy	1 - Critical	On Hold
INC0000031	2019-05-09 17:18:03	UPDATED VIA MULTI-EDIT	Joe Employee	1 - Critical	In Progress

7. **Optional:** Click **New** on the **Highlighted Value Conditions** Related List and create another condition for highlighting the same field.
   For example, highlight the **Priority** field associated with the Incident table when the **Priority** value is "critical," or when the **Caller** value is "Fred Luddy." The conditions are ranked according to the **Order** value. Workspace evaluates the lowest value first.

Conditions	Order ▲	Show Icon	Status	Value Override
Priority = 1 - Critical	30	true	Critical	Alert!
Caller = Fred Luddy	50	true	Critical	It's Fred!

8. **Optional:** Remove all highlighting from a filtered list that would otherwise have highlighting.
   When setting up highlighting for a table, all filtered lists associated with the table display highlighted fields unless you disable highlighting for specific, filtered lists.

   a. Navigate to `sys_aw_list.list`.

   b. In the **Name** column, enter the name of the table with highlighted fields, for example, Incident.
      All filtered lists associated with the table appear.

   c. Click the filtered list you want to remove highlighting from.

   d. On the Workspace List form, if Global is the current application, click **here** in **To edit this record click here.**

   e. Select the **Ignore Highlight in List**check box and click **Update**.
      Now, regardless of the conditions, Workspace will not highlight any fields in the specified filtered list. This option does not work, however, for filtered lists in **My Lists**, which are the filtered lists agents create.

Modify string field length

You can modify the maximum character limit for a string field.

Before you begin

Role required: personalize_dictionary

About this task

The URL type field hides the Max Length field on the Dictionary form by default. Browsers support URL length up to 2,083 characters. The URL field is a String field.

Procedure

1. Navigate to a form that contains the field that you want to modify.
2. Right-click the field label in the form and select **Configure Dictionary**.
3. Change the **Max length** field to the desired length.

   Note:
   You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.

4. Click **Update**.
   The system cancels any length change that results in data loss due to truncation.

Related topics

Field types

Specify a default field value

A default value populates a value in a field when a new record is created.

Before you begin

Role required: personalize_dictionary

About this task

The default value populates the field on the blank form for a new record, and also subsequently when the new record is submitted if the field is empty. Default values can be specified as either a constant or generated through script.

Procedure

1. Right-click the field's label in the form and select **Configure Dictionary**.
2. Enter the default value in the **Default value** field.

   To set a constant value, type it into the **Default value** text box field. To assign a default value using a more complex formula, use JavaScript to output a default value.

   Note:
   The default value should be the underlying value that would be present in the field, not the label. For example, in a choice list field, use the **value** of the choice as the default value, not the choice's name.

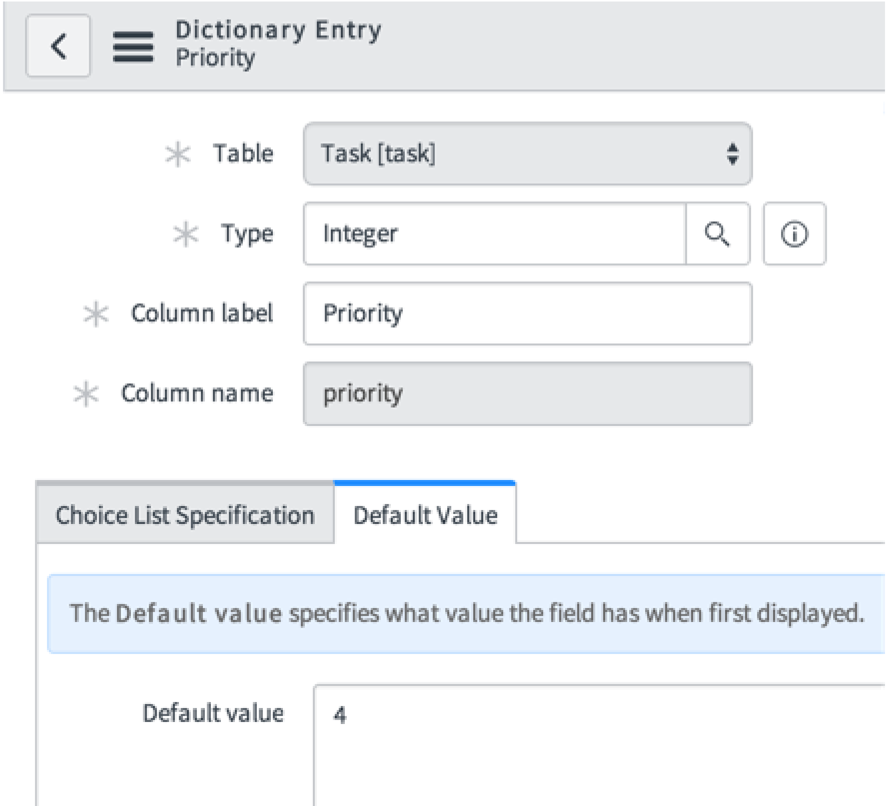
Default field value examples

Review the following examples about specifying default field values.

Example: Constant default values

Here is an example that sets a default value for the **Priority** field.

Default value constant



Example: Javascript default values

To view out-of-box examples of JavaScript default values, navigate to **System Definition** > **Dictionary** and enter this filter: **[Default value] [starts with] [javascript]**. Open some of the records and view the default value javascript entries.

Example: Set a default value for assignment_group

The following example sets a default value in a [sys_user_group] reference field by getting the ID from the name of a group.

```
javascript:GetIDValue('sys_user_group', 'Development');
```

Example: Set a default value for assigned_to if user has the itil role

This example for the Task [task] table describes how to configure the default value for the [assigned_to] user equal to the current user id if the user has a role of itil.

- Column label: **Assigned to**
- Column name: **[assigned_to]**
- Reference Specification section
  - Reference: **User** [sys_user]
  - Reference qual condition: **[Roles] [is] [itil]**
- Default value script:

```
javascript:if (gs.hasRole("itil"))current.assigned_to =
 gs.getUserID();
```

Example: Set a default value for a duration field

To set a default value for a duration field, use the following in the **Default value** field of the duration field's dictionary entry:

```
javascript:current.duration_field.setDisplayValue('3 04:30:14');
```

Avoid hard-coding a particular date-time. If the system date-time format changes, the value becomes invalid. Instead, select the **Use dynamic default** check box and assign a dynamic filter option. For more information on dynamic filters, see Create a dynamic filter option .

Make a field dependent

A choice or reference field can be declared dependent on another field on the same table to limit the values available to select based on the value of the dependent field.

Before you begin
Role required: personalize_dictionary or admin

About this task
If a required dependency does not function as expected, as might happen if there is a many-to-many relationship between the fields, consider using reference qualifiers to accomplish the goal.

Note:

- Fields cannot be made dependent on derived fields.
- When you create a dependency between reference fields (similar to assignment group and assigned to), you must add `_group` to the name of the field on which the other is dependent on to get the expected behavior. See KB0998861: Dependent field does not work as expected on task "Assigned to" field for more information.

Procedure

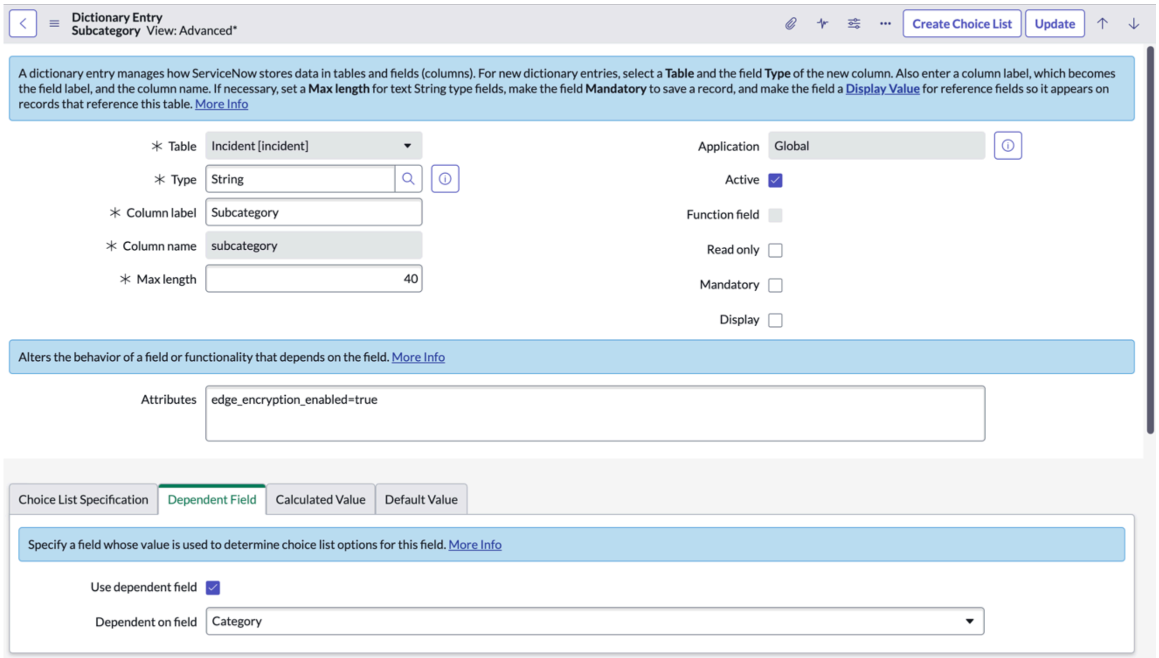
1. Navigate to a form that contains the field that you want to make dependent on another field.

   Example
   For example, to configure a field in the Incident [incident] table, navigate to **All** > **Incident** > **All** and select **New**.
2. Right-click the field label in the form and select **Configure** > **Dictionary**.
3. From the Dependent field tab, select **Use dependent field** and select the name of the field that this field will depend on.

   Note:
   For some field types, you may only need to enter the name of a field in the same table on which the field depends.
4. Select **Update**.

Example: Dependent field

In the example below, the Subcategory field is made dependent upon the Category field. On an incident form, the value selected for the Category field determines which options appear for the Subcategory field.



Related topics

Reference qualifiers

Require unique values for a field

The system allows you to require that a field's values be unique. When this is done, the system will not let two records have the same value for that field.

Before you begin

Role required: personalize_dictionary

About this task

By default, fields are created without this constraint. A field can have unique values only if there aren't already duplicate values in the database for that field. The system doesn't allow you to make a field unique while there are duplicate values in the table.

The system also doesn't allow you to add a unique index if a non-unique index already exists. In this scenario, you can't select the **Unique** check box on the form; instead, the system directs you to the **Tables & Columns** module, so you can drop the non-unique index, and then create the unique index.

Procedure

1. Verify that no records in the table for the field have values, or that they all have the same value.
2. Right-click the field label in the form and select **Configure Dictionary**.
3. Configure the form to add the **Unique** field if it does not already appear.
4. Select the **Unique** check box.
5. **Update**.

Related topics

Configuring the form layout

Define field styles

Field styles enable you to declare individual CSS styles for a field in a list or form.

Before you begin

Role required: personalize_styles or admin

About this task

The CSS lets you change the following attributes of a field.

- Change the color.
- Change the font attributes (bold, italics, underline).
- Change the padding and alignment of text.

You can define field styles for tables and database views that are in the same scope as the field style and for other tables that have at least one field in the same scope as the field style. Field styles defined for a table don't apply to database views that include the table. Create separate field styles for database views.

> **Note:**
> Field styles aren't applied to comments and work notes fields used with the activity formatter. Background color for these fields can be set using the `glide.ui.activity_stream.style.comments` and `glide.ui.activity_stream.style.work_notes` system properties located in the sys_properties table.

Procedure

1. Navigate to the list of styles for the field in one of the following ways.
   - Right-click the field label on the form and select **Configure Styles**.
   - Navigate to **System UI** > **Field Styles**, and locate the field to apply a style (admin only).
2. Select **New**, or select the style to modify.
3. Complete the form.

Field	Description
Table	Table that contains the field. **Note:** The list shows only tables and database views that meet the scope protections for field styles.
Field name	The field to which the style applies.
Value	The exact value or script-based-condition required to apply the style. **Note:** The value only affects list field styles when the field isn't read-only. The value affects both list and forms if the field is read-only. To apply field styles to forms only, leave the value field empty.
Style	The CSS style to apply. For example, to make the background of the Incident Category fields red in record lists, with a 24-px font size and white text color, enter the following code.

Field	Description
	`background-color:red; font-size:24px; color:white;`

You can use a script-based-condition with the syntax `javascript:<script>` in the **Value** field to determine whether the system should apply a style to a field in the list. If the evaluated script returns true, the system applies the style to the list item.

The script has access to the *current* script object, which enables you to build conditions based on the field values of the current record. For example, this script checks for overdue items based on a field value:

```
javascript:gs.dateDiff(gs.now(),
current.u_datefield.getDisplayValue(), true) < 0
```

Note:
In this example, `current.u_datefield` refers to the name of a custom date field.

The system only supports one `javascript:<script>` entry in a **Value** field. If you want to enter multiple JavaScript conditions, consolidate the conditions into one statement. For example, instead of this invalid entry:

```
javascript: current.state == "Completed" javascript:
 current.error_tables > 0
```

Consolidate the conditions into one statement such as:

```
javascript: current.state == "Completed" &&
 current.error_tables > 0
```

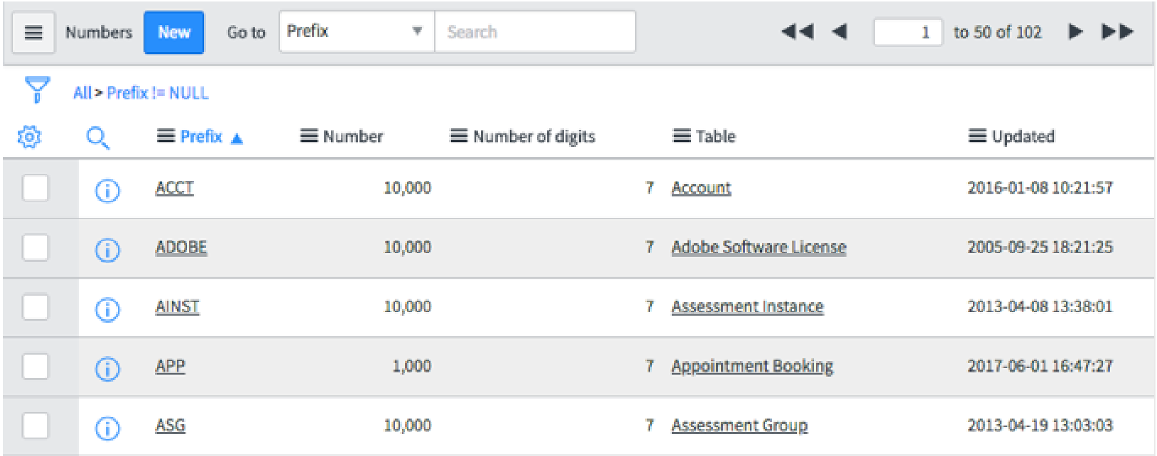
4. **Optional:** To add alternative text for a style, configure the form to add the alternative text field. For styles like the VIP style icon, you can add alternative text so that screen readers can differentiate between the style and the text.
5. Select **Submit** or **Update**.

Record numbering

In the base system, several tables are numbered, including Incident, Problem, Change Request, and Knowledge. You can also use these numbers anywhere that script is present, for example to generate watermarks for emails. Records in tables can be numbered automatically.

Administrators can manage record numbering by navigating to **System Definition** > **Number Maintenance**. The current number format for a table, including the prefix (such as **INC** for incidents or **CHG** for changes), is stored in a record on the Number [sys_number] table.

Number table



Prefix ▲	Number	Number of digits	Table	Updated
ACCT	10,000	7	Account	2016-01-08 10:21:57
ADOBE	10,000	7	Adobe Software License	2005-09-25 18:21:25
AINST	10,000	7	Assessment Instance	2013-04-08 13:38:01
APP	1,000	7	Appointment Booking	2017-06-01 16:47:27
ASG	10,000	7	Assessment Group	2013-04-19 13:03:03

You can renumber auto-incremented tables that extend the task table or manage numbering with a database field named **Number this field**.

Note:
If you reset numbering in Number Maintenance, it only renumbers new records. It leaves the numbering as-is for existing records in system tables.

Add auto-numbering records in a table

You can define one number format per table in the system.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Number Maintenance**.
2. Select a table name to view the number record for that table, or click **New**.
3. Define the number format by completing the fields (see table).
4. Select **Submit** or **Update**.

   If an auto-numbered field does not already exist, a new field is automatically created on the table with the following values:

   - Label: Number
   - Name: u_number
   - Default value:

   ```
   javascript:getNextObjNumberPadded();
   ```

   Note:
   This script renumbers records when the **Number of digits** is updated. To use a script that does not renumber records when the **Number of digits** is updated, open the dictionary entry for the **Number** field and enter the following script in the **Default value** field.

   ```
   javascript:getNextObjNumber();
   ```

Auto-numbering records in a table

Field	Description
Table	Select a table.
Prefix	Enter a prefix for every number in the table (for example, **INC** for Incident).
Number	Enter the base number for this table (default value is 1000). Record numbers are automatically incremented, and the next number is maintained in the Counter [sys_number_counter] table. If you set the base number to a value higher than the current counter, the next record number uses the new base number. Otherwise the next record number uses the current counter. The counter does not reset to a base number lower than itself. To see the current counter, click the **Show Counter** related link.
Number of digits	Enter the minimum number of digits to use after the prefix (default value is 7). ◦ Leading zeros are added to auto-numbers, if necessary. For example, **INC0001001** contains three leading zeros. ◦ The number of digits can exceed the minimum length. For example, if **Number of digits** is **2** and more than 99 records are created on the table, the numbers continue past 100 (such as **INC101**). **Warning:** Changing this field may update all number values for existing records on a table. Take care when changing this field on a production instance.

When moving some applications these records may not be automatically included. Take care to ensure that all necessary records are present when moving applications.

Note:
To change the default values for new number formats, change the **Default value** field on the system dictionary record for the **Number** or **Number of digits** field. These fields are on the Number table.

Prepare to left-pad number fields in custom tables

Before you configure left padding of number fields on a custom table or a table that does not extend the task table, you must prepare business rules and script includes.

Before you begin

Role required: admin

Procedure

1. Duplicate the base system business rule named *Pad Numbers*: Click **Insert and Stay**.
   If **Insert and Stay** is not available on your instance, create a new business rule and manually copy all field values from Pad Numbers.
2. Give the business rule a new name and change the script field to read as follows:

```
padCurrentCategory();
function padCurrentCategory() {
```

```
var target = new GlideRecord(current.category+"");
if (!target.isValidField("u_number") ||
 target.isValidField("number")) return;
var nm = new UNumberManager();
nm.padTableNumbers(current.category, current.maximum_digits);
};
```

3. Save the changes.
4. Duplicate the base system script include named *NumberManager*.
5. Change the following two lines as indicated:

```
105: currentNumber = records.u_number.toString();
117: records.u_number = prefix + currentNumber;
```

6. Name the new script include `UNumberManager` and save your changes.
   You can now continue with the process of configuring left-padding and renumbering records.

Configure left padding of a system number in a table

You can configure the left padding of the system numbers on a table. For example, pad the **Number** field on an Incident, Problem, or Change Request.

Before you begin

If you are configuring numbers on a custom table or a table that does not extend the task table, then, before performing the following procedure, you must prepare business rules and script includes. For more information, see Prepare to left-pad number fields in custom tables.

Role required: admin

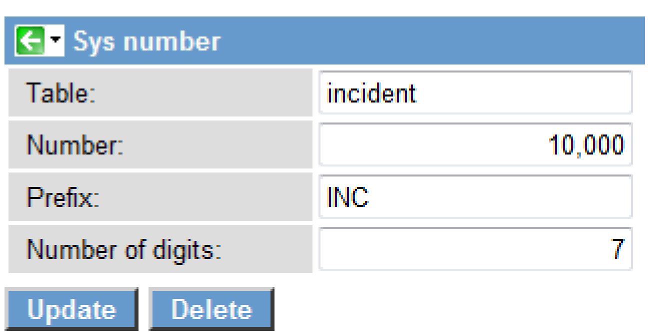
Procedure

1. Navigate to the form, then right-click the **Number** field and select **Configure Dictionary**.
2. Enter the following script in the **Default value** field and click **Update**.

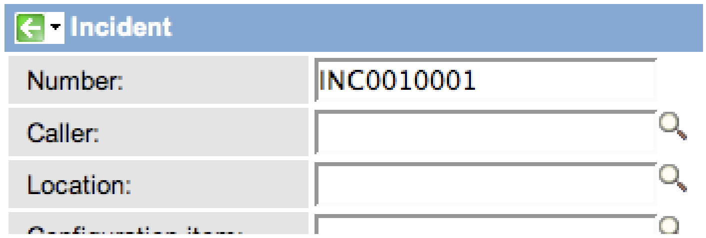
```
javascript:getNextObjNumberPadded();
```

3. Navigate to **System Definition** > **Number Maintenance**.
4. Open the table record.
5. Enter a value in the **Number of digits** field.
6. Click **Update**.

   Number padding is applied to both existing and new records.



The result of the configuration in the image is an Incident number that is left padded.



Prevent numbering gaps

By default, numbers are generated every time a new record is created.

Before you begin

Role required: admin

About this task

When records are created but not saved, a gap in the numbering is created. You can prevent these numbering gaps by generating numbers only when records are saved.

Procedure

1. Navigate to **All** > **System Properties** > **System**.
2. Set the property **Assign a task number only upon insert (prevents unused numbers)**, *`glide.itil.assign.number.on.insert`*, to **true**.
3. Click **Save**.

Enforcing unique numbering

Although duplicate numbers are rare, numbering does not enforce uniqueness, by default.

To enforce uniqueness, you can:

- Create a before business rule on insert only to check for duplicate values and replace duplicates with the next available number.
- Enable a unique index on the table. For more information, see Create a table index.

> **Note:**
> While unique indexes ensure data integrity they also prevent any insert involving a duplicate number. This may cause unexpected errors during data entry.

Sample business rule

This sample script can be used as part of a before business rule on insert only to check for duplicate numbers and replace them with the next available number. The following script references a script created in Configure left padding of a system number in a table.

```
var curNum = current.number + '';

if(curNum) {

  var recordClass = current.getRecordClassName();
  var now_GR = new GlideRecord(recordClass);
  now_GR.addQuery('number', curNum);
  now_GR.setLimit(1);
  now_GR.query();
```

```
  if(now_GR.getRowCount() > 0) {
    var newNum = getNextObjNumberPadded();
    gs.addInfoMessage("The number " + current.number + " was already used
by another " +
      recordClass + ". The " + recordClass + " number has been changed to " +
 newNum);
    current.number = newNum;
  }
}
```

Field normalization and transformation

Field Normalization includes normalization and transformation, which are two different ways to alter field values for increased data integrity and reduced duplication.

Normalization

Normalization searches for variations of the same field value and converts them into a single preferred value. By consolidating multiple variations of the same value into a single simple recognizable value, the system eliminates duplicate records and provides better search results. When a process or a user enters a value in a normalized field, the system determines whether to replace it with a normal value. Normalization also automatically adjusts queries to return normalized results and normalizes values in scripts.

While normalization is available for every field in the platform, it works best for descriptive values such as names or standard units of measurement. For example, you might create normalization rules to:

- Set the CPU type of a computer CI to a standard model name such as Xeon.
- Set the suffix used for the names of corporations to a standard format such as ServiceNow, Inc..

Transformation

Transformation converts raw field input values into standardized values that are more meaningful to an organization. Administrators control when transformation happens by defining rules and conditions for specific fields. For example, you might create transformation rules to:

- Remove suffixes from user names such as Jr. and II.
- Round computer CI RAM sizes to the nearest whole number such as rounding 4112 MB to 4000 MB.

Transform records make up the rules that define how a field transformation is executed. Order values determine the order in which each rule is evaluated. A check box on each transform enables an administrator to determine where processing stops when a rule evaluates to true.

Enabling normalization and transformation by field type

Field type records specify which data types are available for normalization and transformation. By default, the system supports normalization and transformation for these field types.

Field type	Use to normalize	Use to transform
Decimal	false	true
Float	false	true
Integer	false	true
Numeric	false	true
String	true	true
URL	true	true

A field type entry applies to all fields whose dictionary entry data type matches the field type entry. Administrators can create additional field type records for other data types as needed.

Warning:
Avoid creating field type records for fields that store a Sys ID value such as a reference field, field name field, or a table name field. Directly altering a Sys ID value is more likely to produce data corruption and broken references than to produce meaningful standard values. Instead, normalize or transform the display value associated with the Sys ID. For example, normalize the user name instead of the Sys ID of a specific user.

Identifying normalized fields

The system displays the normalization icon on fields with an associated normalization or transformation record. Users with the normalizer role can click the icon to access the associated normalization or transformation record. Users without the normalizer role instead see a help page. Administrators can configure who sees the normalization icon with a preference called `Restrict to roles`.

Activate Field Normalization

Activate the Field Normalization [com.snc.field_normalization] plugin to install demo data and activate related plugins if they are not already active.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with field normalization

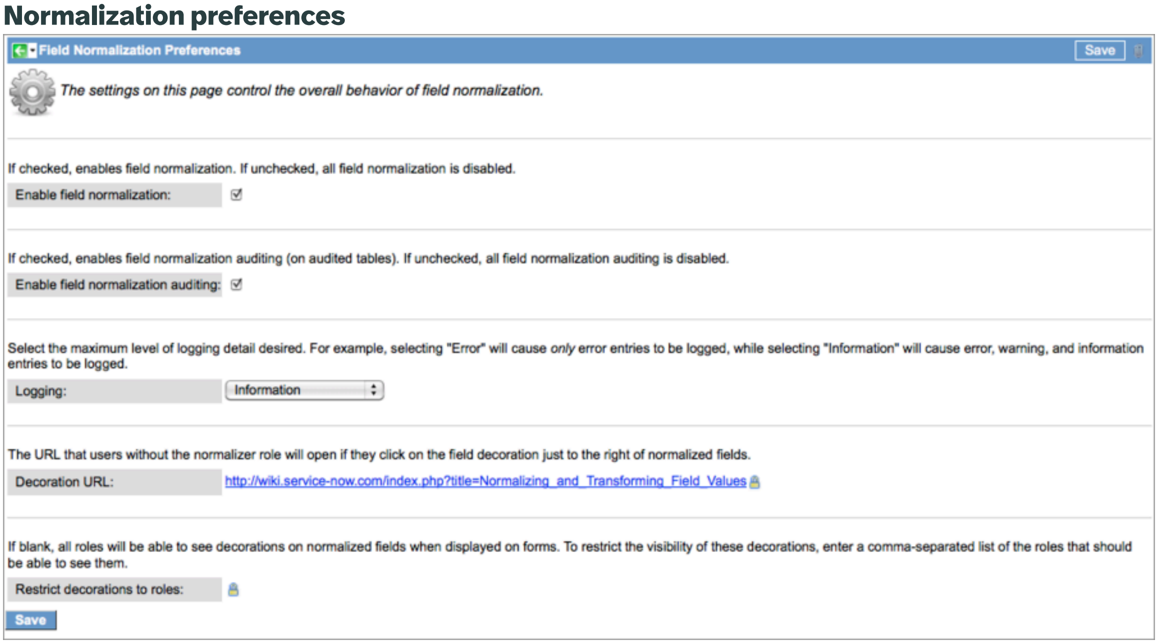
Several components are installed with Field Normalization.

The following preferences (**Field Normalization** > **Administration** > **Preferences**) control features for normalization and transformation:

Field Normalization preferences

Preference	Description
Enable field normalization	This preference enables or disables the Field Normalization functionality, including transformations.
Enable field normalization auditing	This preference enables or disables auditing of field normalization tables.
Logging	Select the maximum level of logging detail desired. For example, select Error to log only errors and Information to log errors, warnings, and information.
Decoration URL	Enter the URL for the help/information link associated with the Field Normalization decoration. This link opens the page presented to users who do not have rights to see the normalization or transformation record. The default link opens a ServiceNow Wiki page with a general explanation of Field Normalization. The purpose of this page is to explain to normal users why a field value they entered was changed automatically.
Restrict decorations to roles	Use this preference to define the user roles that can view the reference icon (decoration) adjacent to a normalized field. This decoration displays transformation and normalization records to users with the normalizer role. For all other users, it opens the URL specified in the Decoration URL preference. If this preference does not specify any roles, then all roles can see the decoration.

Normalization preferences



Field Normalization business rules

The following business rules were created for this plugin:

- Ensure Rules Application Job
- Ensure Transform Application Job
- Ensure Rules and Alias Jobs
- Ensure Transform Application Job
- Ensure Decoration Attribute
- Cleanup on field or table change
- Prevent duplicates in class hierarchy
- Handle potential duplicates
- Run job
- Ensure Pending Value Collection Job
- Ensure name changer job
- Flush forms when activating

Field Normalization script includes

Name	Description
FieldNormalizationAjax	Provides AJAX services for the Field Normalization plugin.
FNEnsureJob	Ensures that a job record exists for a particular extant data job target.
FNExtantDataJobChoices	Generates a list of tables for use in document_id field of the fn_extant_data_normalization table.
FNExtantDataJobUtil	Determines whether an extant data job is allowed to run.
FNFields	Returns valid fields for normalization.
FNTransformChooserUtil	Provides support for the fn_transform_chooser UI page.
Position	Finds a position within a given string.
Round	Rounds numbers with various rounding modes and intervals.

Field Normalization UI pages

Name	Description
aliases	Creates the slushbucket with pending values for choosing aliases for a normal value.
fn_transform_chooser	Displays available transforms. Invoked by the New button on the fn_transform related list.

Field Normalization roles

Role	Description
normalizer	Person authorized to manage field normalization and transformation.
normalization_tester	Person authorized to create test records for normalizations and transformations. Only records opened by users with this role are available for testing normalization and transformation rules in Test mode.

Enable a field type for normalization or transformation

Create or modify a normalization field type record to enable a specific field data type for use with normalization or transformation.

About this task

To normalize or transform a value in a reference field, apply the processing to the field in the target table.

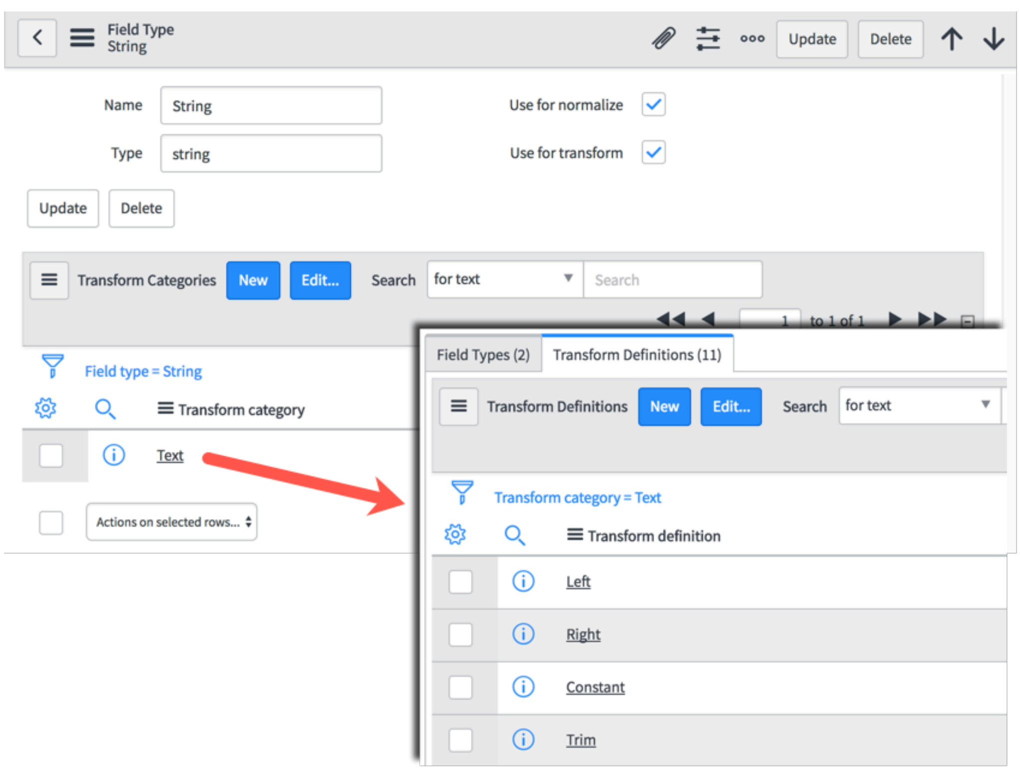
Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Normalization Field Types**.
2. Click **New** in the record list.
3. Enter a **Name** for the field type that clearly describes the type in the dictionary.
   This value is for reference only and is not used in any processing. For example, you might enter **IP Address** for the field type of `ip_address`.
4. Enter the **Type** from the dictionary.
5. Select the appropriate check box to use this field type to normalize or transform fields.
   In the base system, only the **String** field type is used for normalization.
6. Right-click in the header bar and select **Save** from the choice list.
   The **Transform Categories** Related List appears.
7. If this field type is being used for transforms, click **Edit** to associate an existing Transform Category with this field type.

   Note:
   If you create a custom field type that is used for normalizations only, a link to a transform category is not necessary.

   The relationship of a field type to a category, and the category to a list of transformation definitions, is completely configurable.

   The String field type is associated with the Text Transform Category, which contains these transform definitions. Any of these associations are configurable.

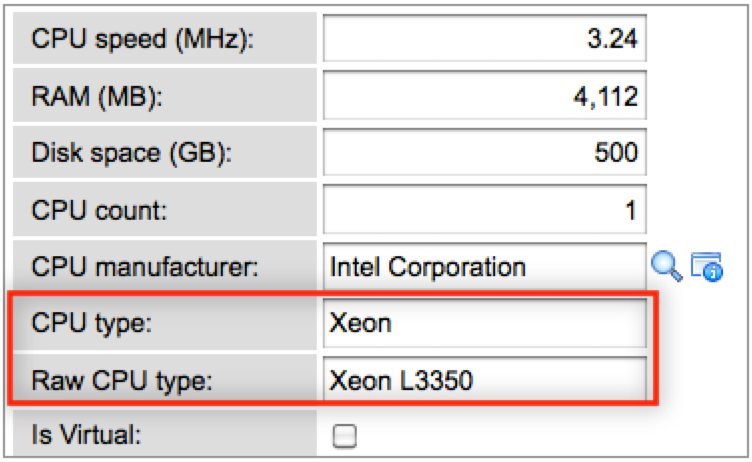


Create a raw field

A raw field is a custom field created by an administrator to show the original (raw) input in a field on a form after it has been normalized or transformed.

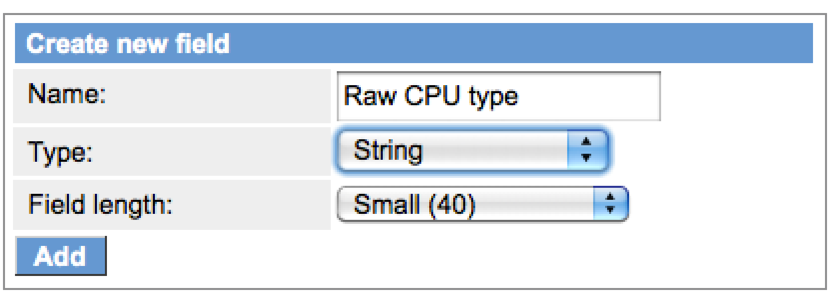
About this task

An administrator might add a custom field to a form to show the original, or raw, value of a normalized field.
This is a read-only field that might be called something like **Raw CPU type** or **Original Name**. In the following example, the **CPU type** field was normalized to **Xeon** from an original, raw value of **Xeon L3350**.



Procedure

1. In the form containing the field that is being normalized or transformed, right-click in the header bar.
2. Select **Personalize** > **Form Layout**.
3. Complete the Create new field form at the bottom of the page, and then click **Add**.
   - **Name**: Type the field label. In this case, use Raw + <field label>.
   - **Type**: Select a data type from the list for this field.
   - **Field length**: Select the character limit for this field. The default is 40.
4. Move the new field adjacent to the normalized field using the direction arrows in the slushbucket.
5. Click **Save**.



Normalization and transformation data jobs

The system uses data jobs to change field values during normalization and transformation.

Administrators must manually start data jobs that apply field changes. All transformation records open in Test mode by default, which blocks administrators from running manual data jobs that

apply changes to existing data. Most data jobs have a roll back option to revert changes after the job completes. By default, the system provides these data jobs.

Note:

If the Field Normalization plugin is active, the normalization engine executes on insert of records into a table according to normalization rules. To learn more about this plugin, see Activate Field Normalization.

If the Field Normalization plugin is not active, a data job runs to normalize the values. The data job saves the previous values in the rolled back fields to revert them if necessary.

Name	Used for	Description
Pending value collection	Normalization	The system runs this job to collect field values that will change during the next field normalization run. The system runs this job whenever you insert or update a field normalization record. Since this data job does not change any field values, there is no roll back option.
Normal value change	Normalization	Run this job to rerun field normalization and update field values when you change a normal value. The system creates this job whenever you change a normal value. Roll back the data job to revert the normalized fields to the previous normal value.
Alias application	Normalization	Run this job to normalize all field values that match an alias. The system creates this job whenever you create or update an alias. Roll back the data job to revert normalized fields to their previous values.
Rule application	Normalization	Run this job to normalize all field values that match a rule. The system creates this job whenever you create or update a rule. Roll back the data job to revert normalized fields to their previous values.
Coalesce too normal	Normalization	Run this job to normalize the reference field values by replacing references to multiple duplicate records with one reference to a normalized record. The system creates this job whenever you change a normal value that applies to a reference field. Roll back the data job to restore the duplicate records as valid options. The rollback does not restore references to the previous records.
Transform application	Transformation	Run this job to transform all field values that match the transformation

Name	Used for	Description
		conditions. You cannot start this job while the Transformation record is in **Test** mode. The system creates this job whenever you create or update a transformation record. Roll back the data job to revert transformed fields to their previous values.

Run a single data job

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run a single data job.

Procedure

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Open the Transformation record and switch the **Mode** to **Active**.
3. Select the **Data Jobs** Related List.
4. Run the data job using one of the following methods.

   - In the list of data jobs, select the check box of the jobs you want to run, and then select **Start** from the **Actions** menu.

   - Click the link in the Created column to open the data job, and then click the **Start** Related Link.

   The **State** of the jobs turns to **Queued** as it runs and to **Completed** when it finishes successfully.

Run multiple data jobs

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run data jobs for multiple field transformations.

Procedure

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Navigate to **Field Normalization** > **Data Jobs** > **All**.
3. Select the check boxes for the jobs you want to start.

   Note:
   These jobs must have the **Mode** set to **Active**.

4. Select **Start** from the **Actions** menu.

   Note:
   The platform only runs data jobs from Active transformations. The Action menu indicates the number of Active data jobs that can run. For example, the menu might display Start (3 of 4).

Rollback a data job

Use rollback to revert changes made by a normalization or transformation data job.

Before you begin
Role required: admin or normalizer

About this task
You can only rollback completed data jobs.

Procedure

1. Navigate to **Field Normalization** > **Data Jobs** > **All**.
2. Select the completed data job to rollback.
   The system displays the data normalization job record.
3. From **Related Links**, select **Rollback**.
   The values in the **Pending Values** Related List are removed and the data job **State** indicates that it was rolled back.

Normal values

A normal value replaces similar but ambiguous field values with one standard value.

Field value variations

Records values can come from multiple sources such as:

- Automated entries made by Discovery.
- Automated entries made by importing records from external systems or files.
- Manual entries made by users.

Each of these sources may describe the same field value in several different forms. For example, the **CPU Type** field on a computer CI form might display any of the following similar values:

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Without normalization, these variant field values results in:

- Duplicate CPU types
- Poor search results
- Complex queries and conditions to apply business logic

Creating a normal value record solves these issues by consolidating on one standard value such as `Xeon`.

Identifying variations with aliases and rules

Each Normal value record specifies how to identify variations of a normal value using a combination of aliases and rules.

Aliases

Aliases are known variations of an input value that normalization converts to the normal value. Use aliases when there is a short list of variant values.

For example, you could create a normal value `Xeon` that has these aliases.

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Whenever a normalization data job or normalized query sees a field value matching an alias, it automatically replaces the field value with the normal value. Normalization data jobs and queries process aliases before rules.

Note:
Aliases are logically equivalent to rules using the **[is]** operator in a condition where **[Field name][is][Alias value]**. For example, the sample aliases are equivalent to these rules: **[CPU Type][is][E3350 (Intel) 4.5.2234] OR [CPU Type][is][Intel Xeon 5.4.554] OR [CPU Type][is][Xeon L3350] OR [CPU Type][is][L3350]**

Rules

Rules specify the conditions under which normalization replaces an input value with the normal value. Use rules when there are a large number of possible variant values, or when you must create complex conditions.

For example, the normal value `Xeon` could have this rule.

[CPU Type][matches regex][.*\bxeon\b.*]

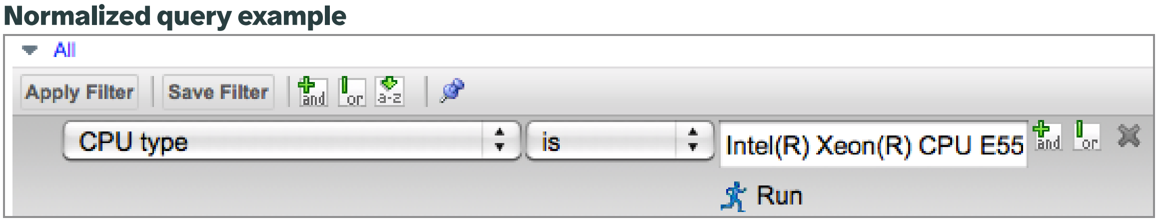
Whenever a normalization data job or normalized query sees a field value matching a rule, it automatically replaces the field value with the normal value. Normalization data jobs and queries process rules after aliases.

Rules and aliases can be combined to normalize a field. Make sure to test your normalization methods before applying them to all the existing records in the database.

Normalized queries

An administrator can configure normalization to apply to queries issued against normalized fields in lists. Select the **Normalize query** check box on the Normalization form to enable this functionality. In a list containing normalized values, Filters and breadcrumbs using the original (raw) value for the normalized field in the query condition.

Normalized query example



The filtered list returns records with the normal value substituted for the raw value. However, the breadcrumbs for the filter display the original query conditions.

Scripting and normalization

Scripts that update or insert records into the database (GlideRecord) are normalized automatically when field normalization is applied. For example, if a script to insert a CI record contains a CPU type of **Xeon L3350**, the script is normalized to insert the CI with a CPU type of **Xeon** instead. Scripts that query the database for normalized field values (using the conditions of equals or not equals) can be configured to return the normal value (such as **Xeon**) rather than the original (raw) value.

Related topics

GlideRecord

Create the normalization record

Regardless of the normalization method selected, all field normalization requires a list of existing variants and a normal value that is configured to replace these variants in forms and in queries.

About this task

Normalize a field by selecting aliases for a normal field value or by creating rules that use condition statements to match field variants with a normal value.

Note:
Users must have the normalizer role to create and manage normalization records.

Special Cases

- Reference fields cannot be normalized. To normalize values appearing in reference fields, normalize the field in the target table. Examples of this would be normalized values for the **Name** fields in the Company [core_company] and Location [cmn_location] tables, which are referenced by other tables in the platform. The normalized names are available to all fields that reference these tables.
- Fields in a choice list can be normalized if they are of a type **string**.

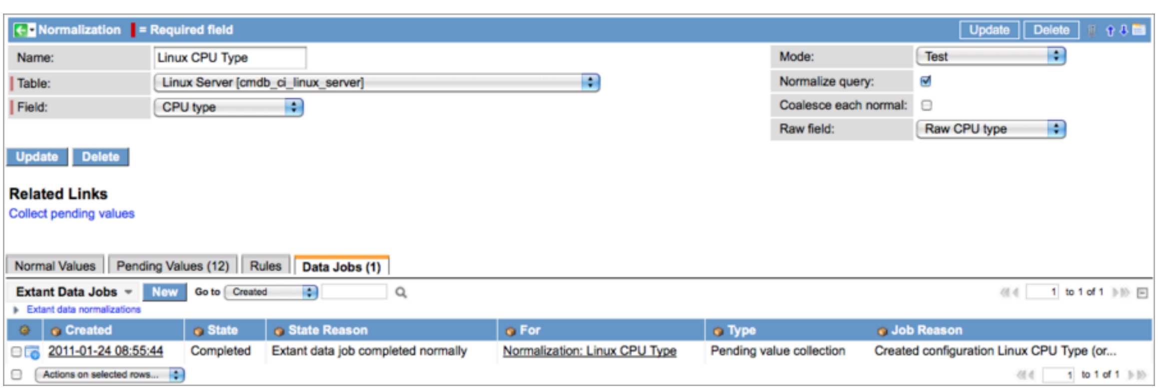
Procedure

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization** > **Configurations** > **Normalizations**.
3. Click **New**.
4. Create a normalization record.

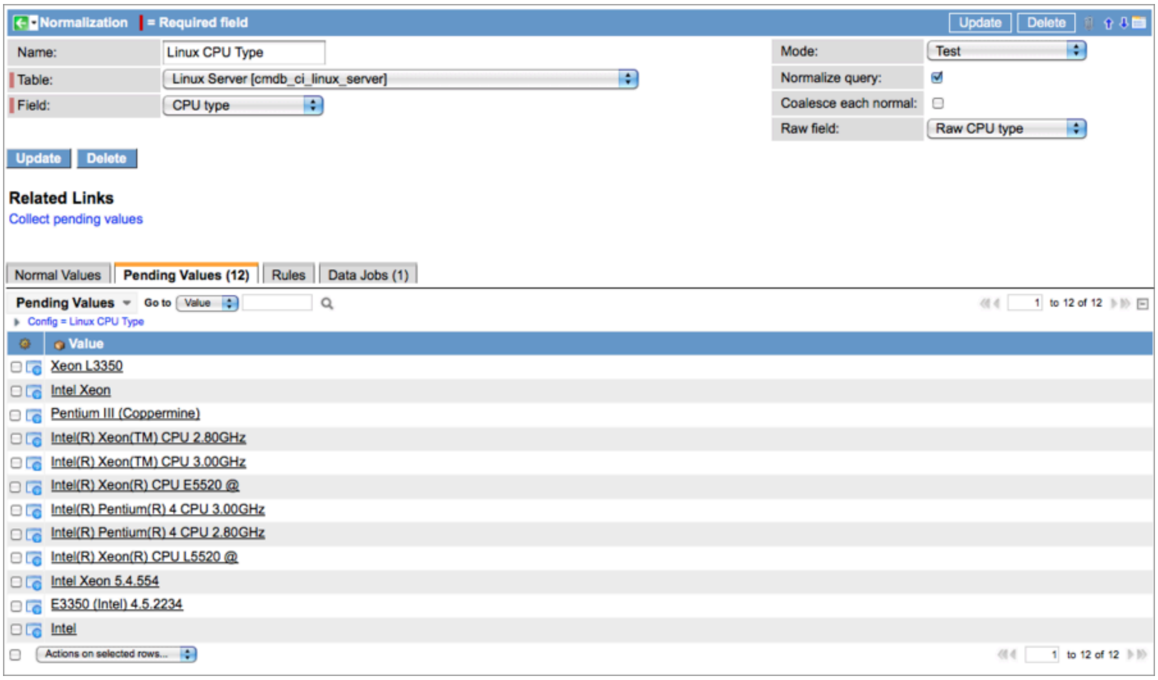
Normalization record fields

Field	Input value
Name	Unique name for this normalization record. This value is for reference only and is not used in any processing.
Table	Select the ServiceNow table for the field being normalized.
Field	Select the field to normalize.
Mode	The three available modes are Off, Test, and Active. All normalization records are created in the test mode by default. If you are planning to select aliases for your normal values, change the Mode to Active. If you intend to normalize the field using rules, be sure to leave this record in the Test mode. To disable this normalization, switch the mode to Off.
Normalize query	Select this check box to apply the field value normalized by this record to all queries involving this field. Queries formed with the raw (original) field value return records displaying the normal value. Queries issued by a script using the conditions equals or not equals return normalized values. See Normalized Queries for details.
Coalesce each normal	Select this check box to normalize reference field values. This option resets all references to records containing an alias field value to the record using the normal value. See Coalesce Normal Values for details.
Raw field	Select the field to use to display the original (non-normalized) input values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Creating a Raw Field.

After the normalization record is submitted, the platform runs the Pending value collection job in the **Data Jobs** related list automatically to gather all the current values (Pending Values) for the field being normalized.



Click the **Pending Values** related list to view values for the normalized field that have been entered manually, imported into the platform, or created by Discovery.



Create a normal value

A normal value is a simplified, generic value for a field that replaces all the possible variants of that value that exist in the database.

Before you begin

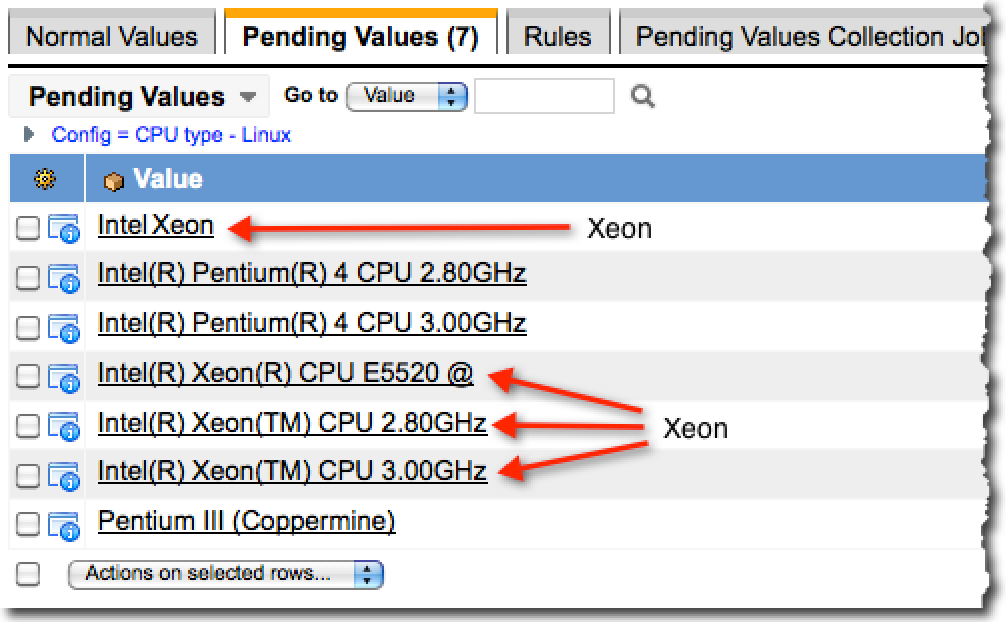
Role required: admin or normalizer

About this task

Normal values should be clear and unambiguous.

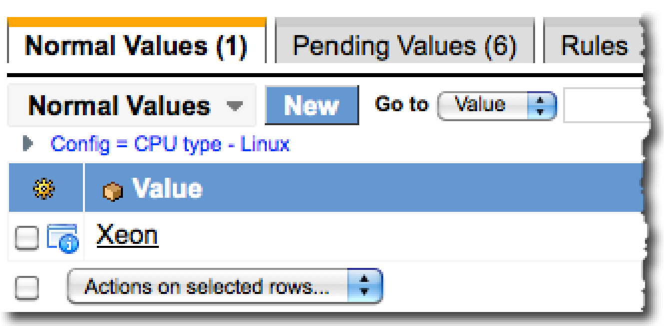
After the platform runs the data job, the **Pending Values** related list on the Data normalization jobs form is populated with all the unique values for the field in the database. Examine the values in the list and decide which normalizing method is best for the existing data. For example, define an alias for a small pool of values and a rule for a large pool of values. The following screenshot shows the pending values for CPU types in Linux servers in a network. The list contains several choices for Intel Xeon CPUs, which might be normalized as **Xeon**.

Normalization pending values 2



Procedure

1. Navigate to **All** > **Field Normalization** > **Normalizations**.
2. Open the appropriate normalization record.
3. Click the **Normal Values** related list.
4. Click **New**.
5. In the Normal Value form, create normal values for the variants in the **Pending Values** related list.
   These are the values the platform uses to replace the variants configured as aliases.



Create aliases

Aliases are the variants of a field value in the instance that will be replaced by the normal value.

Before you begin

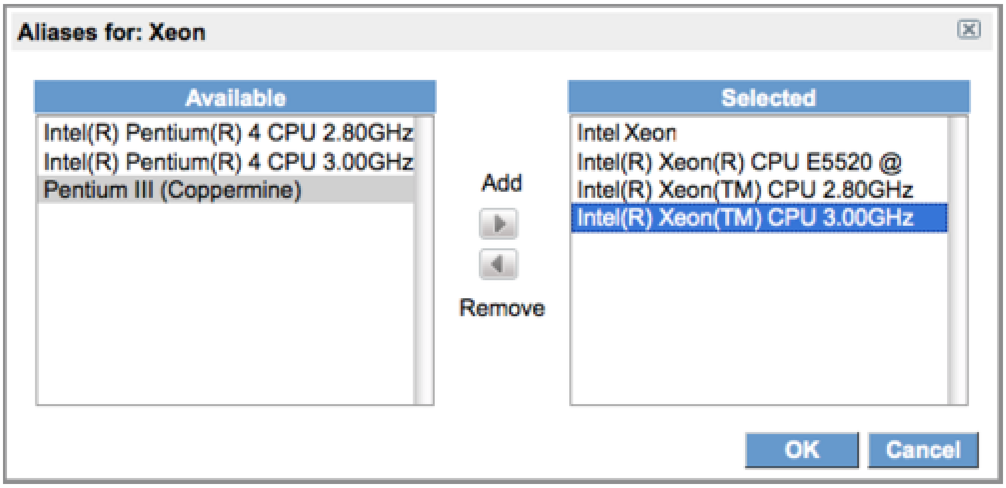
Role required: admin or normalizer

About this task

The list of potential aliases is the contents of the **Pending Values** related list. After creating a normal value, assign aliases to this value if the pool of pending values is small. A normalized field can have a combination of aliases and rules.

Procedure

1. Navigate to **All** > **Field Normalization** > **Configurations** > **Normalizations**.
2. Open a normalization record.
3. Click the **Normal Values** related list.
4. Select one of the values.
5. In the normal value record, click the **Aliases** related link.
6. Select aliases for this normal value from the available (pending) values that appear in the slushbucket, and then click **OK**.



The aliases for this normal value now appear in the **Aliases** related list.

What to do next

Apply the aliases by running the associated data jobs.

Apply aliases

After testing, aliases can be normalized in all new records or in existing records when they are updated.

About this task

Each time an alias is created for a normal value, a data job is created. The alias is not applied to values in the entire database until its data job is started manually. Run each job separately or run the jobs together to apply all aliases at once.

Procedure

1. In a normalization record, ensure that the Mode is set to **Active**.

   Data jobs cannot run in the **Test** mode.

2. Click the **Normal value** related list.
3. Select a value from list.
4. In the Normal Value record, select the **Data Jobs** related list.

   A data job is listed for each alias configured for this normal value.

5. Run the extant data jobs to replace the aliases with the normal value in all existing records in the database.

a. Select the check box next to a job, and then select **Start** from the Actions menu.

b. To run all data jobs at once, select all the check boxes, and then select the **Start** action.

c. Refresh the list to check the progress of the data jobs to ensure that they complete normally.

Create rules

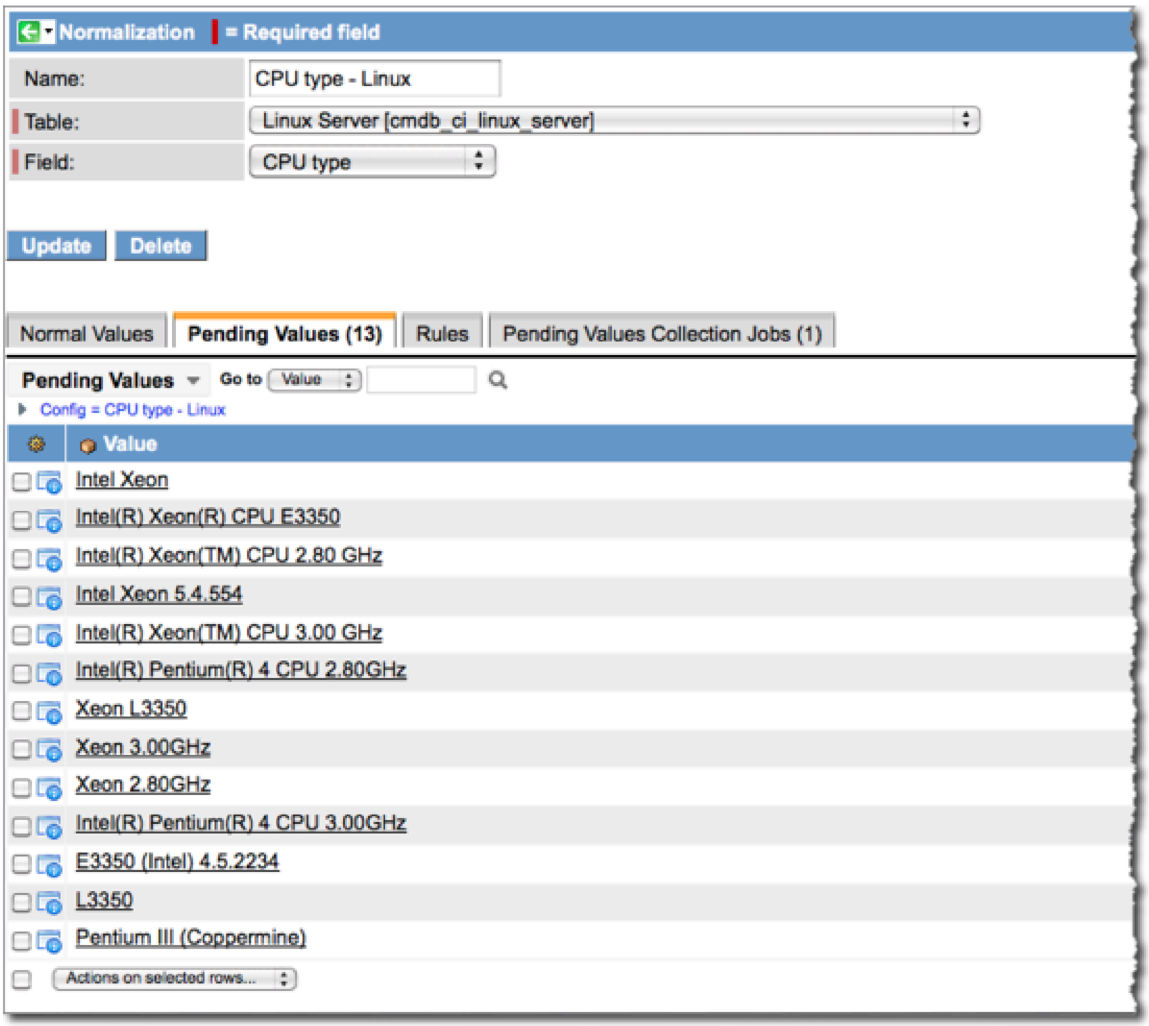
The use of rules to normalize a field is intended for large lists of variant field values.

About this task

Always test your rules before applying them to all the existing records in the database. Prior to creating the rule, make sure to generate the list of Pending Values and create a normal value for the field. A normalized field can have a combination of aliases and rules.

The rules in this example are based on the following Pending Values:

Normalization rules 3



Procedure

1. In a Normalization record, open the **Normal Values** related list.
2. Open a Normal Value record.
3. Open the **Rules** related list in the Normal Value form, and then click **New**.

   The Field Normalization Rule form provides the following fields:

Field normalization rule fields

Field	Description
Name	Unique name for this rule. For example, this name might be Xeon CPU Type.
Order	Order in which this rule should be evaluated. The platform parses the rules in the order configured until it finds one that evaluates to true.
Active	Enables or disables this rule. By default, new rules are active (true)
Make alias	If this check box is selected, and the rule evaluates to true, the rule makes an alias automatically from a pending value. If this check box is not selected, and the rule evaluates to true, the platform automatically changes the value for the named field in the record to the normal value, but does not create an alias.
Case sensitive	All pending values for the named field must match the case of the same value in a rule to be normalized.
Rule	Use the ServiceNow rule builder to construct the rules for normalizing fields. Rules automate the transformation of large numbers of pending field values into aliases.

4. Create a set of rules to incorporate all the possible variants of the pending values.

   For this example, the rules might be:

   - **Intel Xeon**: CPU type matches pattern *Intel*Xeon*. This rule normalizes all variants in which **Intel** precedes **Xeon**, including **Intel Xeon**, **Intel(R) Xeon(TM) CPU 2.80GHz**, and **Intel(R) Xeon(TM) CPU 3.00GHz**.
   - **Xeon**: CPU type contains Xeon
   - **L3350**: CPU type contains L3350
   - **E3350**: CPU type contains E3350

   For every rule that is created, the platform generates a **Rule applier** data job. In the testing mode, the **Start** controls are not available, and the job cannot be run until the mode is changed to **Active**.

5. Test all the rules before making the normalization record **Active**.

   Testing Rules

   > **Note:**
   > Users must have the normalization_tester role to create test records.

   Field normalization records are created in the **Test** mode by default, enabling administrators to test normalization rules thoroughly before applying them to the existing records in the database. In the testing mode, the **Start** controls are not available for the **Rule applier** data job. The job can be run only when testing is complete and the **Mode** has been changed to **Active**. In the testing mode, only records that have been created or updated by a user with the normalization_tester role are normalized. The normalizer and normalization_tester roles can be combined for a single user or granted separately.

Coalesce records on a normal value

Coalescence enables an administrator to redirect references to multiple records containing variants of the same field value to point to a single record, based on a normal value.

Before you begin
Role required: admin

About this task
An example of this is the Company table that might have multiple variants of a company name, such as Hewlett-Packard, Hewlett-Packard, Inc., Hewlett-Packard Incorporated, HP, and so on. Potentially, thousands of records might reference each of these duplicate company records. Using the variants of the Hewlett-Packard name as aliases, coalescence unifies all these references into a single record that normalizes the **Name** field in the Company record to a normal value such as **HP**.

Note:
Coalescing normal values changes the record values permanently. If a rollback is performed, records will be returned to the table, but the normalized values will not be rolled back to the original variants.

When the references are fixed, all table fields directly corresponding to sys_dictionary get fixed. The secondary references are not fixed. If you have filter conditions that has the old, pre coelesced company names, they aren't fixed either.

Procedure

1. Navigate to **All** > **Field Normalization** > **Configuration** > **Normalizations**
2. Select a normalization record.
3. Enable **Coalesce each normal**.
   The system adds the **Coalesce to** field to the Normal Value form.
4. Create one or more normal value records for this normalization record.
   Create related aliases and rules as needed.
5. For each normal value record, set **Coalesce to** by selecting the record that contains the normal value.

   Example
   For example, suppose your Company table contains several variations of the name ServiceNow. When you create the Normal Value record, you select the Company record for ServiceNow, Inc.. During normalization, the system updates any references to variant records to instead refer to the normal record.
   The system updates any references to records that match aliases and rules to instead point to the normal record. The system also deletes the duplicate records from the table.
6. Start all the **Alias application** data jobs to replace the aliases with the normal value in existing records in the database.
   The system starts the **Coalesce to normal** data jobs for each alias.

Transforms

Transforms update field values by applying a transformation definition to the field contents such as replace text, change case, or round value.

Transform definitions

Transform definitions define the transformation actions available for a given field type. Administrators select a definition when they transform a field, and then provide the definition with the specific parameters that are applied to the transformation. For example, a definition can round up an integer or insert a value at a defined position in a string.

The system provides a number of definitions that are designed to meet the needs of most organizations, but administrators can create new definitions as needed. Transform definitions can be associated with existing Transform Categories or to new categories.

Transform categories

Transform categories are used to group the transform definitions together appropriately to present to users when creating new field transforms. You can create new categories for existing definitions or change the default associations of categories to definitions.

Transform categories are associated with normalization field types to present the correct definition option list for the field being transformed. The base system provides two transform categories: Text and Numeric.

Text

Definitions in the Text category transform string type field values. Included in the Text category are:

- Left
- Right
- Constant
- Trim
- Prefix
- Suffix
- Change Case
- Delete
- Insert
- Substring
- Replace

Numeric

Definitions in the Numeric category arithmetically manipulate integer type field values. Included in the Numeric category are:

- Limit
- Round
- Constant

Transformation testing mode

Transformation is a powerful tool that can cause data issues if used incautiously. Test all transformations before committing the changes to the CMDB.

All transformation records open in **Test** mode by default, which blocks administrators from running manual data jobs that apply changes to existing data. Only users with the normalization_tester role can transform data when a record is in the **Test** mode. This is limited to new records opened by the tester or records in which the transformed field is updated by the tester.

To apply transformations to the CMDB after testing, change the mode to **Active** in the transformation record and run the appropriate data job. For information on testing transforms, see Test a transform.

Transform a field

Transform the contents of field using a set of rules and conditions.

Before you begin

Role required: admin or normalizer

Procedure

1. Create a transformation record.
2. Create one or more related transform records.
3. Test the transform.
4. Runs data jobs.

What to do next

If you want to also show what the original (raw) input value was prior to transformation, create a raw field to store this value.

Create a transformation record

Creating a transformation record is the first step in transforming a field.

Procedure

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization** > **Configurations** > **Transformations**.
3. Click **New**.
4. Create a transformation record.

Transformation record fields

Field	Description
Name	Unique name for this transformation record. This value is for reference only and is not used in any processing.
Table	Select the ServiceNow table containing the field being transformed. It is important to understand the table hierarchy when setting up a field transform. For example, if you configure transformation for a field in the Computer [cmdb_ci_computer] table, that field will be transformed for all workstation machines, Windows servers, Linux servers, and UNIX servers.
Field	Select the field to transform. The list presented contains only those field types (integer and string) from the table selected that can be transformed.

Field	Description
	Note: The sys_user record that initiates the transform process must have its date format set to the default format of "yyyy-MM-dd." Any other date format causes an error during transformation. This problem is only specific to transforming **TO TARGET** fields of type Date/Time. This problem is not an issue if the target field type is of type String or if the field mapping for the date field is changed to the same date format as the transformation process.
Mode	The three available modes are **Off**, **Test**, and **Active**. All transformation records are created in the test mode by default. Do not change the mode until you have thoroughly tested the transformation. When testing is complete, change the mode to **Active**. To disable this transformation, switch the mode to **Off**.
Normalize query	Select this check box to apply the field value transformed by this record to all queries involving this field. Queries issued with the raw (original) field value will be edited to use the transformation value.
Raw field	Select the field to use to display the original input (non-normalized) values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Create a raw field.

5. Click **Submit**.

   The **Transforms** and **Data Jobs** Related Lists appear on the form.

Create one or more related transform records

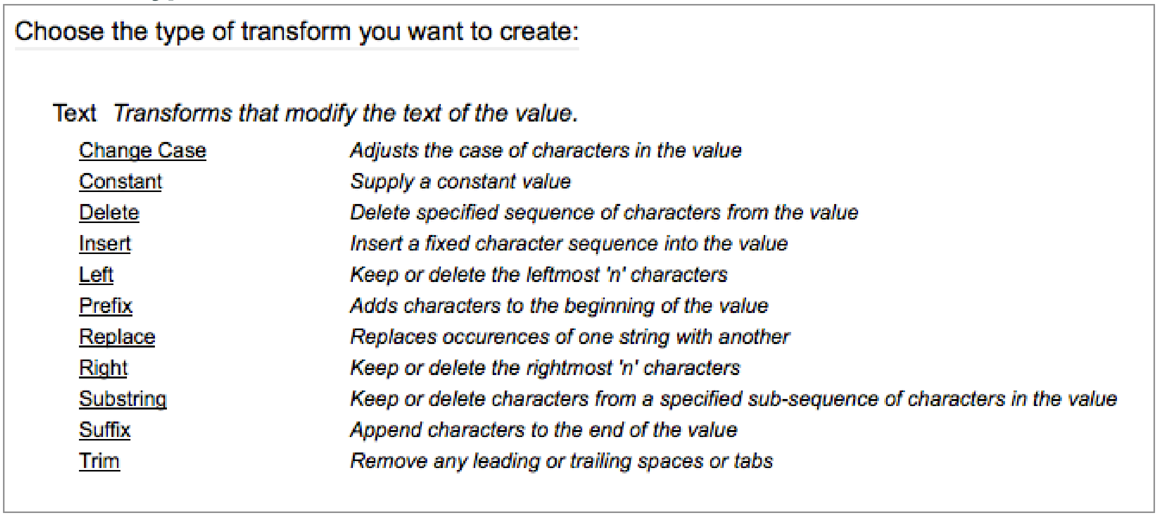
Each related transform record performs a specific transformation type such as adding characters to the beginning of the value or replacing one string for another. You may need to create multiple related transform records to generate a preferred output field value.

Procedure

1. In the Transformation record, select the **Transforms** Related List.
2. Click **New**.

   A selection list of transform types appears, displaying only those transformations appropriate for the field type selected.

Transform types



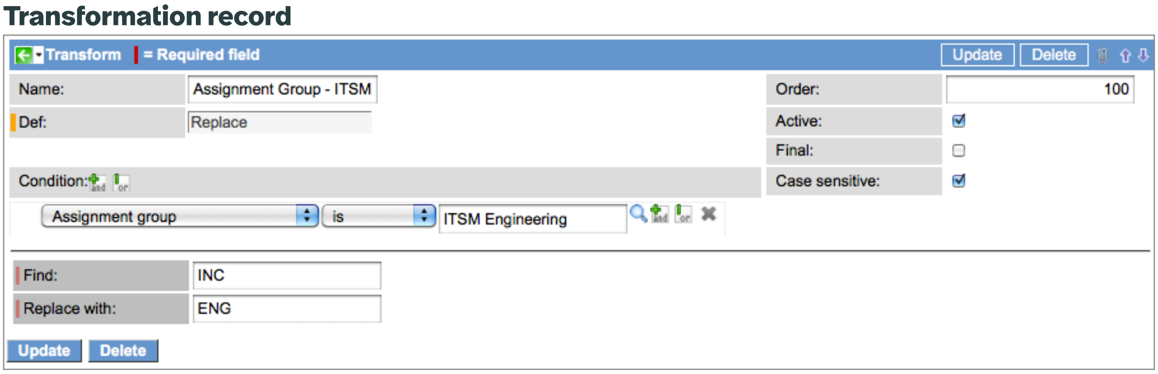
3. Select a transform type and provide the appropriate parameters.
4. Select an **Order** number for this transform.

   Note:
   The conditions for the transforms are executed according to the order numbers assigned.

5. Select the **Final** check box to stop processing with this transform if the condition evaluates to true.
6. Select the **Case sensitive** check box to force case sensitivity in the condition statement.

   The following transform example replaces the *INC* at the beginning of an incident number with the string *ENG* if the assignment group is *ITSM Engineering*.

Transformation record



7. Click **Submit**.

   The new Transform appears in the Related List of the Transformation record.

   When the Transform is created, a Transformation application data job is also created. This data job applies this transform to appropriate records in the entire database and should not be run until testing is complete.

8. **Optional:** Repeat steps 2 through 8 until the output value meets your desired criteria.

Test a transform

Verify the transform changes the field value as desired before applying them to existing records in the database.

About this task

Note:
Users must have the normalization_tester role to create test records.

New transformation records open in the **Test** mode by default, enabling administrators to test transforms thoroughly before applying them to the existing records in the database. In the test mode, the **Start** controls are not available for the **Transform application** data job. There are two methods, listed below, for testing transforms before committing the transformations to existing data.

Procedure

- Manually create or update test records.

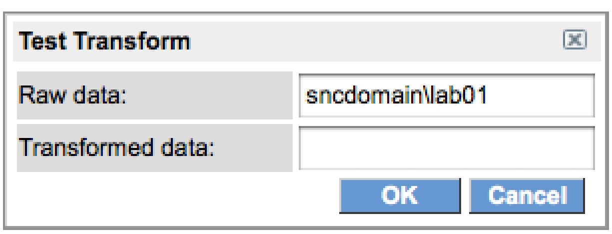
  In the test mode, only records that have been created or updated by a user with the normalization_tester role are transformed. Grant the normalizer and normalization_tester roles to the same user or grant them to separate users.

- Use the Test transforms utility to enter a raw value and see the resulting transformed value.

  This feature enables a normalization tester to transform field values on the fly without opening or updating records. This utility tests all the transforms configured for this field.

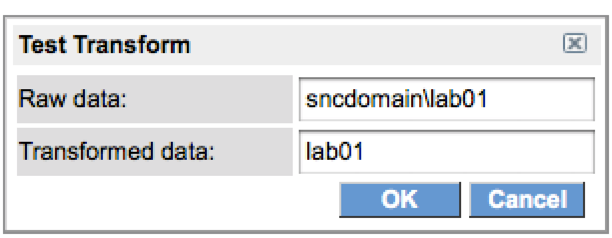
1. Open a Transformation record.
2. Click the **Test transforms** Related Link.

   A dialog box appears for testing field values.
3. Enter a value to transform in the **Raw data** field.

4. Click **OK**.

   The platform transforms the raw value in the **Transformed data** field.

5. Enter new raw data to test other transforms.

6. Click **Cancel** to end the test.
7. When testing is complete, change the **Mode** to **Active** and run the data job.

Default Transform Definitions

The system offers default transform definitions for fields containing text, text numeric, and numeric values.

Transform Definitions

Transform Type	Category	Description	Parameters
Change case	Text	Changes the case of the characters in the field value.	*Mode*: Select one of the following modes: • *Upper*: Converts the value to all upper case characters • *Lower*: Converts the value to all lower case characters • *Proper*: Converts the value to title case, with the first character in each string in upper case, and the remaining characters of the string in lower case. • *Formal*: Converts the value to a string in which only the first letter of the first word is in upper case.
Constant	Text Numeric	Converts the value in this field to a constant.	*Constant*: The constant with which to replace the value in this field.
Delete	Text	Delete a specified sequence of characters from a field value.	• *Starting position*: Specifies the first character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details. • *Ending position*: Specifies the final character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details.
Insert	Text	Insert a fixed character sequence into a field value.	• *Position*: The character position at which to insert the new value. See the discussion of

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			position modes at the beginning of this section for details. • *Insert*: The value to insert into this field.
Left	Text	Deletes or keeps a specified number of characters from the left side of this field value.	• *Position*: Specifies the number of characters to keep or delete from the left side of the value. See the discussion of position modes at the beginning of this section for details. • *Mode*: Select the mode for this transform: *Keep* or *Delete*.
Prefix	Text	Adds characters to the beginning of a field value.	*Prefix*: Defines the characters to add to the beginning of the transformed field value.
Replace	Text	Replaces occurrences of one string with another string. The special characters backslash (\) and dollar sign ($) in the replacement string can cause the transform to be different than if the replacement string were being treated as a literal replacement string. Use a regular expression to replace a string or parts of a string.	• *Find*: Enter the string or regular expression to replace. • *Replace with*: Enter the replacement string.
Right	Text	Retains or deletes a specified number of characters from the right	• *Position*: The number of characters to delete or keep from the right side of this transformed field. See the discussion of

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
		side of a field value.	position modes at the beginning of this section for details. • *Mode*: Select the mode for this transform: *Keep* or *Delete*.
Round	Numeric	Rounds integers to a configured rounding interval using specific criteria. The interval must be appropriate to the value being transformed, such as an interval of 12 for a value expressed in dozens or 0.01 for decimal values expressed in hundredths.	• *Interval*: Select the rounding interval that is appropriate to the units of the field value. For example. an interval of 256 is appropriate for expressing RAM values in megabytes, but does not work for Disk space expressed in gigabytes. The rounding interval for the examples below is 1 • *Mode*: Criteria for applying the rounding interval. ○ *Half up*: Always round up a value that is exactly half way between two intervals. For example, 3.5 is always rounded up to 4, and -3.5 is always rounded up to -3. ○ *Half down*: Always round down a value that is exactly half way between two intervals. For example, 3.5 is always rounded down to 3, and -3.5 is always rounded down to -4. ○ *Half away from zero*: Always round an integer that is half way between the specified interval away from zero. For example, 3.5 is always rounded to 4, and -3.5 is always rounded to -4. ○ *Half toward zero*: Always round an integer that is half way between the specified interval toward zero. For example, 3.5 is always rounded to 3, and -3.5 is always rounded to -3. ○ *Half to even*: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is even. For example, 3.5 is always rounded

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			to 4, and 4.5 is always rounded to 4. ◦ *Half to odd*: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is odd. For example, 3.5 is always rounded to 3, and 4.5 is always rounded to 5. ◦ *Up*: Always round an integer up by the specified rounding interval. For example, 3.4 is always rounded to 4 by a rounding interval of 1.0. ◦ *Down*: Always round an integer down by the specified rounding interval. For example, 4.6 is always rounded to 4 by a rounding interval of 1.0. ◦ *Away from zero*: Always round an integer away from zero by the specified rounding interval. For example, 3.3 is always rounded to 4, and -3.3 is always rounded to -4 by a rounding interval of 1.0. ◦ *Toward zero*: Always round an integer toward zero by the specified rounding interval. For example, 3.3 is always rounded to 3, and -3.3 is always rounded to -3 by a rounding interval of 1.0.
Substring	Text	Keep or delete characters from a specified sub-sequence of characters in the field value.	• *Starting position*: Specifies the first character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details. • *Ending position*: Specifies the final character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details.

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			• *Mode*: Select whether to `Delete` the sub-sequence selected or `Keep` only those characters defined.
Suffix	Text	Appends characters to the end of a field value.	*Suffix*: Defines the suffix to add to the end of the field value.
Trim	Text Numeric	Removes blank spaces from the field value.	No parameters

Create a transform definition

The following example describes the procedure for creating a new transform definition. In this example, we create a definition that transforms a number field to an odd or even integer. The transform category is **Numeric** and the normalization field type is **Integer**.

Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Transform Definitions**.
2. Click **New** in the record list.
3. Enter a name for this definition.

   Note:
   In this example, we enter `Odd/Even`.

4. Enter a brief description of the action, such as, `Transforms an integer to an odd or even value`.

   This information appears in the definition choice list when a user selects a new transform.

5. Right-click in the header bar and select **Save** in the context menu.

   Two Related Lists appear in the form.

   - Transform Categories: Click **Edit** and select **Numeric** as the category to which this definition belongs. Currently, field transformation supports two categories: **Numeric** and **Text**. The **Integer** normalization field type is already associated with this category.
   - Transform Variables: Define any variables required by this transform definition to perform an action on a field value. Variables are not necessary if a script can perform the action alone.

Create a transform variable for a transform definition

Transform variables enable an administrator to apply the same definition to different fields in different ways.

About this task

Transform variables contain values used by a script to perform a field transformation. Scripts and variables can be created in either order, but the script must use the transform variables. Transform variables are populated with values when a user configures a transform type.

Procedure

1. In the Transform Definition record, click **New** in the **Transform Variables** Related List.
2. Complete the form.
   Important considerations for completing a form:
   - The Column name is an entry in the fn_transform_var table for this variable. This becomes the variable in the script, in the form of variables.<variable name>. For example, `odd_even`.
   - The value in the Label field appears as the variable field label in the Transform form. For example, `Odd/Even`.
   - The field Type defines the field type of the variable value. Because the values for the variables used are **even** and **odd**, this is a type of string.
   - The Order of the variables controls the order in which they are displayed in lists and records.
   - This variable has a choice list with two options: **Even** and **Odd**. Select **Dropdown without - None** as the format for the list in the Choice field and define a Default value of **even** when the list is displayed.
   - Create a Hint that becomes a tooltip for the variable in the Transform record.
3. Right-click in the header bar and select **Save** from the context menu.

   The **Variables Choice List** Related List appears.
4. Click **New** in the Variables Choice List and define the list options.
5. Create records for **Even** and **Odd**.

   Note:
   The **Element** value is the same as the **Column** name in both selections for the choice list.
6. Save the choice list variables and return to the transform definition form to create the script.

Create a script for a transform definition

Create the script at any time during the configuration of a definition.

About this task

The script can perform a transform action without using a variable, but the action of the definition will be the same for all fields. Variables create more flexibility for the definition, enabling an administrator to use the same definition in different ways in different places. If a variable is defined, the script must reference the variable using the correct format.

There are three arguments in the script:

- Variables: Contains the variables using the format variables.<variable name>.
- Value: Contains the un-transformed value
- Parameters: Special objects that set debug messages.

All position parameters (such as Starting position and Ending position) have three modes that apply to all the transform types that use this variable.

Position parameters

Positive positions	If the position is expressed as a positive integer, the platform calculates the starting position beginning from the left side of the field value. For example, in the string ABCDE, a position of 3 places the starting point of the action after C.

Position parameters (continued)

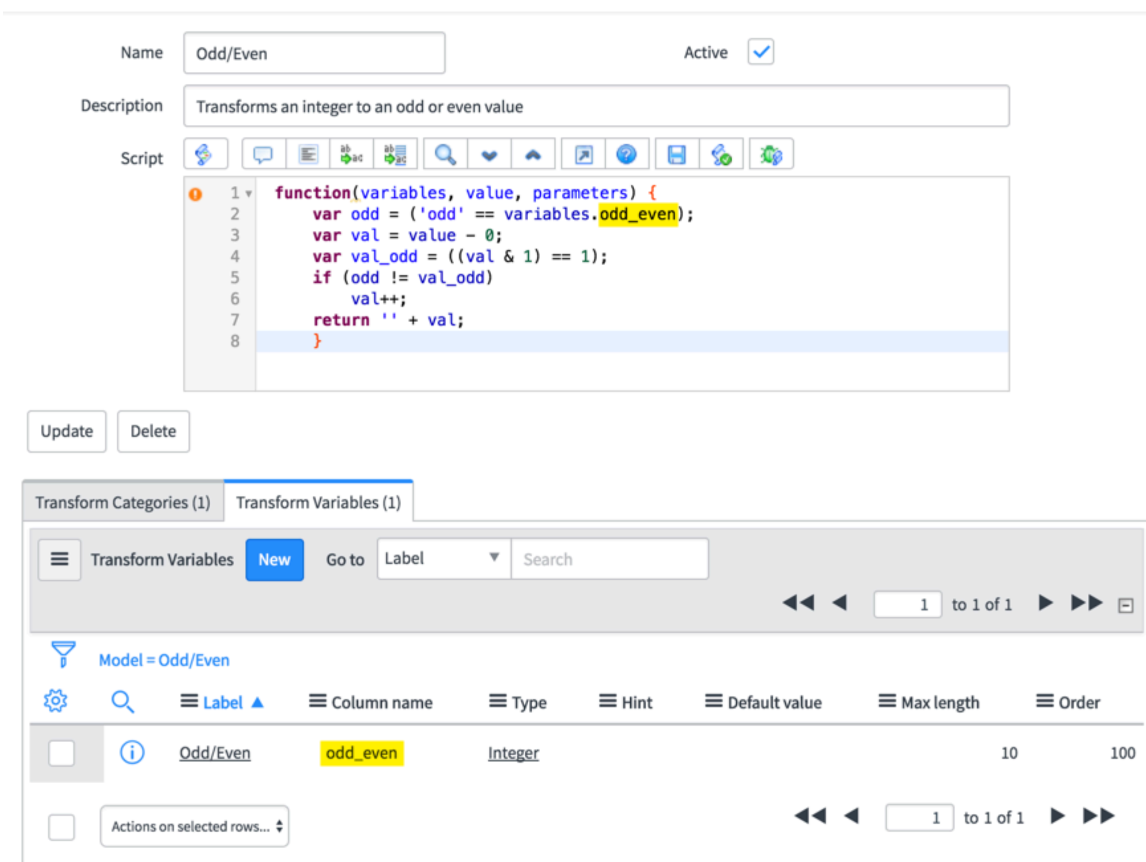
Negative positions	If the position is expressed as a negative integer, the platform calculates the position beginning from the right side of the field value. For example, in the string ABCDE, a position of -3 places the starting point of the action before C.
Regex	If the position value starts with /regex/, everything after that is a regular expression that is used to calculate the starting position. For example, in the string ABCDE, a position of /regex/B.*D places the starting point of the action after C (B and all the characters between B and D).

Procedure

1. Open the **Odd/Even** record in the Transform Definitions module.
2. Enter the following script to pass values with the odd_even variable.

```
function(variables, value, parameters) {
 var odd = ('odd' == variables.odd_even);
 var val = value - 0;
 var val_odd = ((val & 1) == 1);
 if (odd != val_odd)
  val++;
 return '' + val;
 }
```

The script references the variable in the form variables.odd_even.



3. Update the record to complete the configuration.

   The Odd/Even transform definition is now ready to use in a field transformation.

Create a transform category

Create a transform category to group the transform definitions together.

Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Transform Categories**.
2. Click **New** in the **Transform Categories Related List**.
3. Enter the **Name** of this category and a description.
4. Select an **Order** for this category and save the record.
   The order determines the display order of categories in lists and forms. Two Related lists appear:

   - **Field Types**: Click **Edit** to select an existing field type for this category or click **New** to create a new field type. The normalization field types provided are:

     - Decimal
     - Float
     - Integer
     - Numeric
     - String
     - URL

   - **Transform Definitions**: Click **Edit** to select the transform definitions that are included in this category.

Regular expressions and patterns in field normalization rules

Field Transformation definitions support the use of regular expressions (referred to in the platform as **regex**) and pattern matching for determining the position of characters in a string.

After identifying the target characters, field transformation can replace or delete the identified characters or insert other characters at that position.

Regex

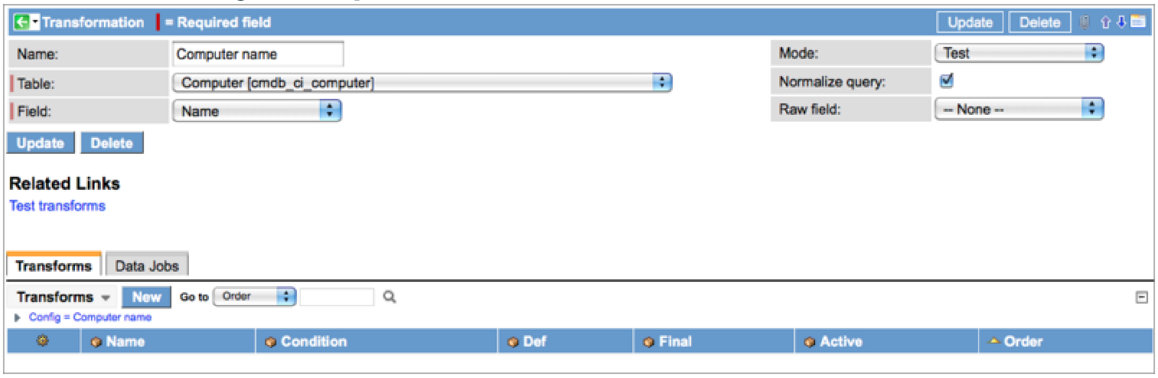
Regular expressions can be used in transform parameters and in condition statements to determine which characters in a field value are transformed.

Regular expressions used as parameters to locate characters in transformed field values must begin with `/regex/`. Everything after that is a regular expression that is used to calculate character position.

Example

The computer names in an organization's Windows network are expressed as domain\machine name, such as **development\devlab01**. The network administrator wants to simplify these names by removing the domain name and backslash. He creates a transformation record for the Computer [cmdb_ci_computer] table and selects the **Name** field to transform.

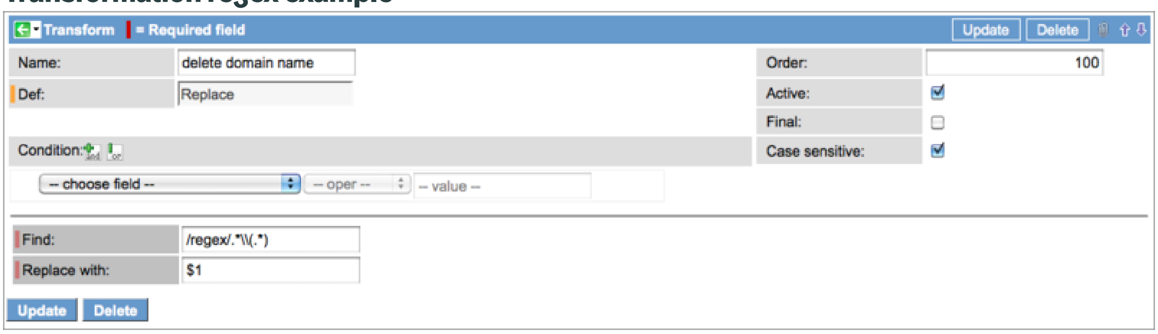
Transformation regex example



The network contains several domains, and each domain contains numerous computers. The only character common to each name is the backslash. To delete the domain name, the administrator decides to use a regular expression to replace the entire raw value in the field with the characters that appear after the backslash (the actual machine name). He creates a new Transform using **Replace** as the Transform Type and enters the following values:

- Find:**/regex/.*\\(.*)**
- Replace with:**$1**

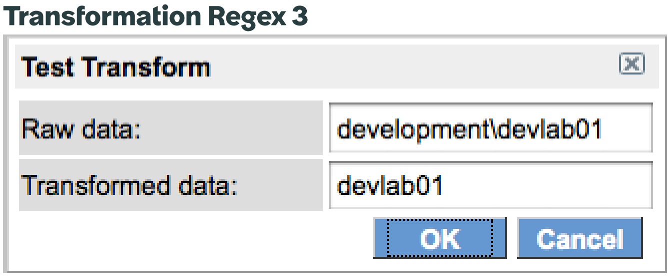
Transformation regex example



The regular expression **.*\\(.*)** represents the entire raw value in the **Name** field - in this example **development\devlab01**. The first part of the expression, **.***, represents everything before the backslash (the **development** domain name). The backslash by itself is the escape character in regular expressions and requires special syntax to retain its function in the computer name. The administrator must escape it by using another backslash (\\ means \). The part of the expression after the backslash, **(.*)**, represents the computer name (**devlab01**) and is grouped within parentheses for reference. The value in the **Replace with** field, **$1**, references this group and replaces the entire raw value of the field with the contents of the group, **devlab01**.

The administrator clicks **Test transforms** in the transformation record and enters `development\devlab01` in the **Raw data** field. He then clicks **OK** to apply the transform to the test value. The transform replaces **development\devlab01** with **devlab01**.

Transformation Regex 3



When the transforms for this field are tested successfully, the administrator changes the **Mode** in the transformation record to **Active** and runs the Transformation application data job to apply this transformation to existing records in the database.

Pattern matching

Pattern matching in Field Normalization uses special characters differently from regular expressions to create patterns that the platform recognizes when transforming field values.

Pattern matching can be used only in condition statements. When using pattern matching characters in a condition statement, make sure to select the **matches pattern** operator.

Use the following special characters to create patterns for searches.

- The asterisk in a search string (*) matches any number (including zero) of any character.
- The question mark (?) in a search string matches one of any character.
- Everything else in a search string matches itself.

Examples

- **the story** matches **the story** but not **that story**.
- ***story** matches **the story** and **that story**, but not **that story is the best**.
- **st?ry** matches **story** and **stxry**, but not **my story** or **stairy**.
- ***b?gus*** matches **bogus**, **my bogus story**, and **His bagus machine**, but not **my bgus story** or **my baigus story**.

Domain separation and Field Normalization

Domain separation is unsupported in Field Normalization. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Data policy

Data policies enable you to enforce data consistency by setting mandatory and read-only states for fields.

Data policies are similar to UI policies, but UI policies only apply to data entered on a form through the standard browser. Data policies can apply rules to all data entered into the system, including data brought in through import sets or web services and data entered through the mobile UI.

For example, suppose that you are configuring a web service that allows users from outside the platform to update problems on the ServiceNow instance. Since these problems are not updated through the instance UI, they are not subject to the UI policies on the problem form. To ensure that the **Close notes** field is completed before a problem is marked **Closed/Resolved**, you can create a data policy that applies to server-side imports. Data that does not comply with this data

policy produces an error. You can also apply the policy on the browser by selecting the **Use as UI Policy on client** check box in the data policy record.

Since UI policies can also manage the visibility of fields on a form, you may want to augment UI policies with data policies rather than replace them.

By default, data policies are applied to all GlideRecord operations including those used in Scripted REST APIs, and the REST Table API. You can opt out of applying the data policy to:

- Target records of SOAP web services
- Import sets
- Client-side UI policies

The admin role is required to edit data policies.

Note:
Defining a data policy enforces the policy when a record is submitted from the UI. This behavior cannot be changed.

Installed with data policy

Data policy includes several components that are installed on the instance.

Tables

Table label	Table name
Data Policy	sys_data_policy2
Data Policy Rule	sys_data_policy_rule

Data Policy Module

The **System Policy** > **Data Policies** module displays a list of all data polices and where they apply.

Roles

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Data Policy Administrator [data_policy_admin]

Access and maintain data policies to specific users. Grant this role access to the System Policy application

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

Create a data policy

You can create a new data policy to define data rules for a table.

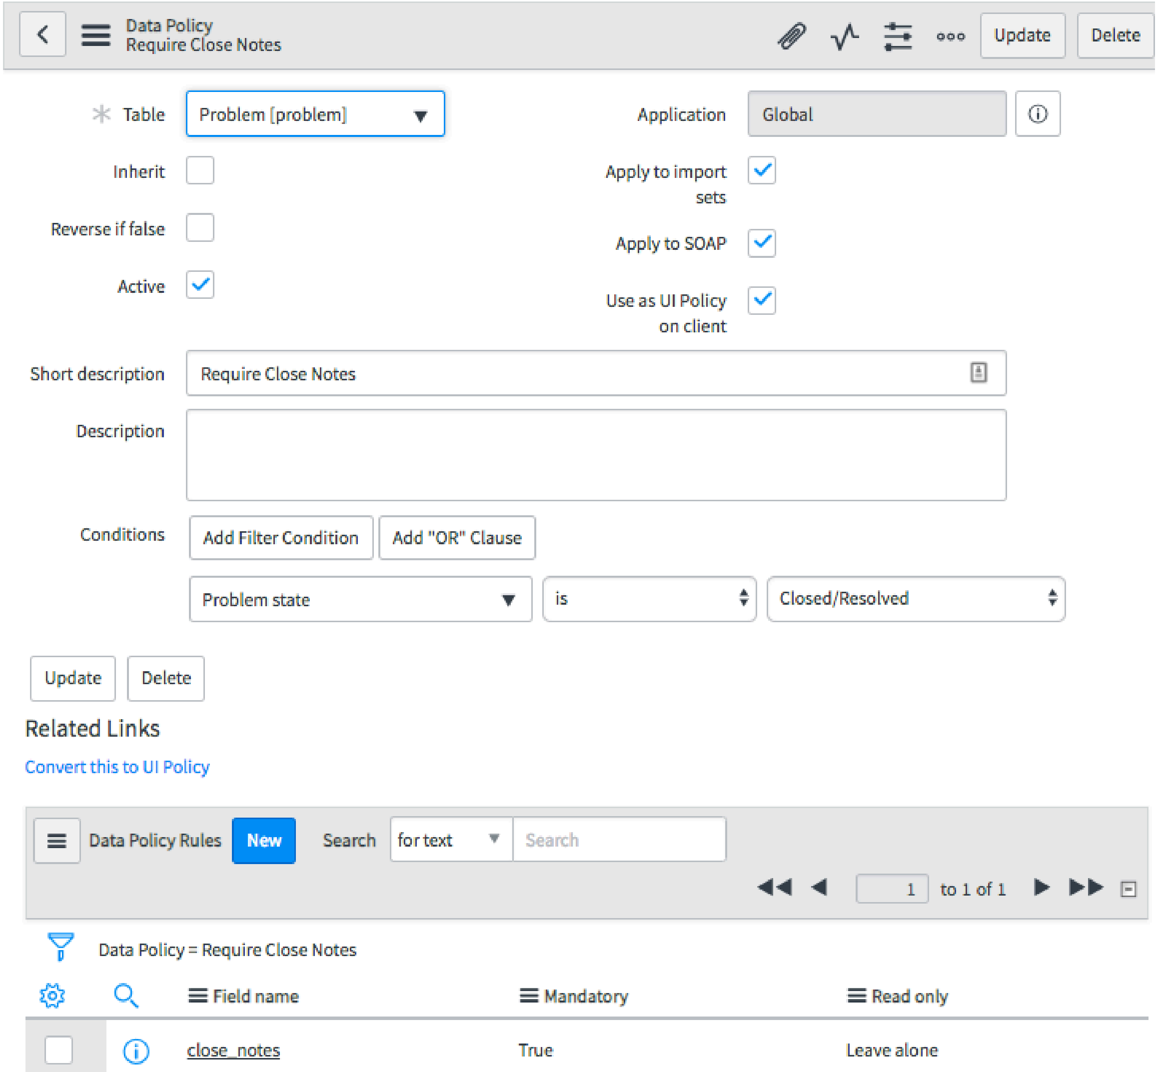
About this task

Create data policies to enforce consistency. You can create data policies only for tables and database views that are in the same scope as the data policy and for other tables that have at least one field in the same scope as the data policy. For tables that are in a different scope from the data policy record, you can create data policy rules only for fields in the same scope as the data policy and you cannot make a field mandatory.

Procedure

1. Navigate to **Data Policies** by completing one of the following actions.
   - Navigate to **System Policy** > **Rules** > **Data Policies**.
   - From any form header, right-click the header bar and select **Configure** > **Data Policies**.
   - In List v2, open any column context menu and select **Configure** > **Data Policies**.
   - In List v3, open the list title menu and select **Configure** > **Data Policies**.
2. Click **New**.
3. Select any options for the data policy.
4. Create the condition that must exist for the platform to apply this policy.
   For example, your conditions might include **[Problem state] [is] [Closed/Resolved]**
5. Right-click the header and select **Save**.
   The **Data Policy Rules** related list appears.
6. Click **New** in the related list and create the record that identifies the field and the policy to apply.

   
   It is possible to have multiple rules on a single field, but it is not recommended.
7. Click **Submit**.



8. Optional: Add more rules by repeating steps 6 and 7.

Data policy fields

These fields appear on the Data Policy form and related forms.

Data policy fields

Field	Description
Table	The table to which this policy applies. **Note:** The list shows only tables and database views that are in the same scope as the data policy.
Application	Application that contains this data policy.
Inherit	If selected, applies this data policy to tables that extend the specified table. For example, incident, problem, and change tables all extend the task table, therefore selecting Inherit on a data policy defined for task would apply the data policy to them as well.

Data policy fields (continued)

Field	Description
Reverse if false	If selected, the data policy action is reversed when the conditions evaluate to false. For example, when the conditions are true, then actions are taken and when they change to false, the actions are reversed.
Active	If selected, the data policy is used.
Short description	A short description that identifies the policy.
Description	A detailed description of the policy.
Apply to import sets	If selected, the data policy applies to data brought into the system from import sets. This option also applies to web service import sets.
Apply to SOAP	If selected, the data policy applies to data brought into the system from a SOAP web service. Scripted SOAP web services are not affected. This field does not affect data policy interaction with REST web services.
Use as UI Policy on client	If selected, enforces the data policy on the UI using the UI policy engine.

Data policy rule fields

Field	Description
Table	The table on which the data policy action applies.
Field name	The field from the specified table to which the data policy will apply.
Read Only	How the data policy affects the read only state of the field. Choices are: • Leave alone • True • False
Mandatory	How the data policy affects the mandatory state of the field. Choices are: • Leave alone • True • False **Note:** For tables that are in a different scope than the data policy record, you cannot make a field mandatory.

Convert a UI policy to a data policy

To make a UI policy the default setting, convert the UI policy to a data policy.

Before you begin

Role required: ui_policy_admin

About this task

You can also apply a UI policy to import sets or to data imported by SOAP web services when you convert it to a data policy. Converting a UI policy to a data policy deactivates the UI policy. To retain the policy in the UI, ensure that the **Use as UI Policy on client** check box is selected on the data policy record.

For a UI policy to be eligible for conversion to a data policy, the following conditions must be met on the UI Policy form.

- The **Run scripts** check box must be cleared.
- The **Global** check box must be selected.
- None of the UI policy actions can have **Visible** set to **True** or set to **False**. **Visible** must be set to **Leave Alone**.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Open an existing UI policy.
3. Under **Related Links**, click **Convert this to Data Policy**.
   A new data policy record is created.
4. Edit the fields on the data policy record as necessary.

Related topics

Data policy

Convert a data policy to a UI policy

Convert a data policy to a UI policy if a data policy already exists but needs to apply only to records created or updated in the browser.

Before you begin

Role required: admin

About this task

Converting deactivates the data policy. The new UI policy is applied only at the UI layer only and not to import sets or data imported from SOAP web services.

Note:
An alternative to converting from a data policy to a UI policy is to select the **Use as UI Policy on client** checkbox on the data policy record. This field extends the data policy to the UI. The main difference between converting and using the **Use as UI Policy on client** checkbox is that converting provides the Visible field on the UI policy record. Use the **Visible** field to select how the UI policy affects the visible state of the field.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Data Policies** and click an existing data policy.
2. Under **Related Links**, click **Convert this to UI Policy**.

   A new UI policy record appears.
3. Edit the fields on the UI policy record as necessary.
   For details about the fields, see Create a UI Policy.

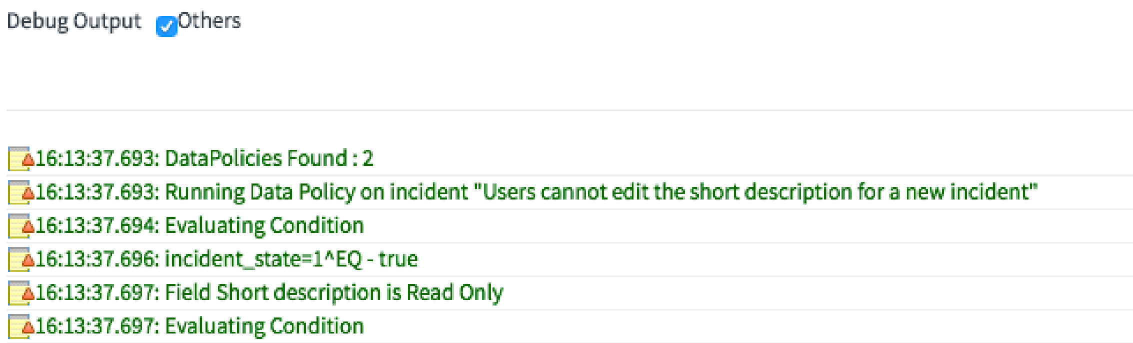
Data policy debugging

Debug messages can help administrators identify and resolve data policy problems.

Debug messages can help you identify and resolve data policy problems. To view data policy debugging messages at the bottom of the screen, navigate to **System Diagnostics** > **Session Debug** > **Debug Data Policies**.

In the example, a data policy is in place to prevent the short description on an incident from being changed when the incident state is set to Open. A user edited the short description while the incident was open and tried to save the changes, but the data policy was enforced.

Data policy debug messages



Data lookup and record matching support

The data lookup and record matching feature enables administrators to define rules that automatically set one or more field values when certain conditions are met.

Data lookup rules allow administrators to specify the conditions and fields where they want data lookups to occur. For example, on Incident forms, there are priority lookup rules for the sample data that automatically set the incident **Priority** based on the incident **Impact** and **Urgency** values.

> **Note:**
> Activating the Data Lookup and Record Matching Support plugin replaces the `calculatePriority` business rule with a priority data lookup definition, but does not transfer any custom logic. If you manually activate the plugin, you must recreate any custom business logic that uses the priority lookup rules.

The following codes will be removed by manually activating the `com.glide.data_lookup` plugin:

- sys_script_18105ab0c61122750127a49c9055d29f
- sys_script_client_2bbac34da9fe1561000d89c04779a30c
- sys_script_client_2bc0bf4fa9fe15610019c5c8a8461647
- sys_script_client_ac0081210f030000b12e6903cfe012ac
- ys_script_d1b7d4af4655e7c2001be4c18b99215a
- sys_script_include_9e1904840a0a0b7d00d5ee8d0e2d89ef

Create custom data lookups

Creating custom data lookups involves adding a lookup value, creating the definition, and activating data lookup.

Create a custom data lookup table

Create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules `[dl_matcher]` table.
For example, this custom lookup table stores information about VIP callers and incident assignments.

Custom data lookup table

Field	Sample value
Label	VIP Caller Lookup
Table name	u_vip_caller_lookup
Extends base table	dl_matcher
Create new module	True
Add module to menu	System Policy

Add a data lookup value to the data lookup table

The columns of a data lookup table contain both matcher and setter field data.

About this task

Each data lookup is a query that searches for a row containing values that match the matcher fields. The data lookup then returns the value listed in the setter fields. For example, this Priority Data Lookup [dl_u_priority] table lists the combinations of impact and urgency (matcher fields) that produce a particular priority value (setter field).

Lookup table

Matcher fields		Setter field
Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

Procedure

1. In the navigation filter, enter the name of the new custom lookup table.
   For example, u_vip_caller_lookup.list.
2. Configure the list and create new fields.

   For this example, create the new fields in the following table.

New fields

Name	Type	Field length or Table to reference
Caller	Reference	User [sys_user]
Priority	Integer	
Assignment Group	Reference	Group [sys_user_group]

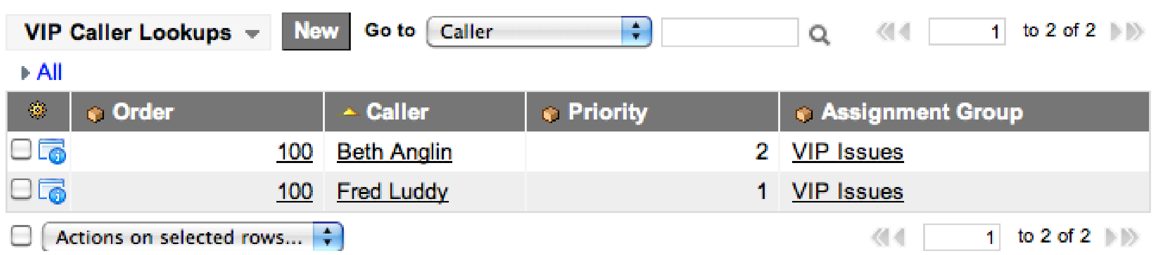
For more information, see List configuration.

3. From the table list, click **New** and enter appropriate matcher and setter field values.

   For example:

New matcher and setter field values

Matcher field	Setter fields	
Caller	Priority	Assignment Group
Beth Anglin	2	VIP Issues
Fred Luddy	1	VIP Issues



Note:
Each row in a data lookup table must be unique.

Create a data lookup definition record

Data lookup requires a definition record that specifies how to set one or more field values when specified conditions are met.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Data Lookup Definitions**.
2. Select **New**.
3. Select **Data Lookup Rule**.
4. Complete the Data Lookup Rule form using the following table.

Data lookup definitions fields

Field	Description
Name	Enter a unique name to identify the definition record.
Source Table	Select the table containing the fields you want to automatically update with lookup values. Data Lookup Definitions are not inherited by extension tables. For example,

Field	Description
	a Data Lookup Definition on the Task table cannot match values on the Incident incident table.
Matcher Table	Select the table containing the lookup values. This table should always start with a u_ prefix. This table can be any table within the current scope containing the lookup values. **Note:** The list shows only tables and database views that are in the same scope as the catalog data lookup definition.
Active	Select this check box to run this data lookup rule. Clear the check box to ignore this data lookup rule.
Run on form change	Select this check box to automatically look up values whenever a user or onChange client script changes a field value on a source table form. **Note:** This does not include changes automatically made by other data lookup rules, such as the Priority Lookup Rules.
Run on insert	Select this check box to automatically look up values whenever a user creates a new record.
Run on update	Select this check box to automatically look up values whenever a user saves or updates a record.

5. Right-click the form header and select **Save**.
6. From the **Matcher Field Definitions** related list, click **New**.
7. Complete the Matcher Field Definitions using the following table.

   A data lookup only occurs on fields with matcher field definitions. The data lookup uses the values of the source table fields to look up one or more values from the matcher table. Note that data lookup does not work with **Journal** type fields.

Matcher field definitions fields

Field	Description
Data Lookup	Displays the name of the parent data lookup definition record.
Source table field	Select the field from the source table that contains the data to match.
Matcher table field	Select the field from the matcher table that contains the data to match. This table can be any table within the current scope containing the lookup values.
Exact lookup match	Select this check box to require the matcher table to contain a matching row for every possible combination of values (including blank values). Clearing this check box means that any blank values in the matcher table match any value. For example, suppose the Priority field is blank in the matcher table. When this check box is selected, there is a match only when the Priority value is blank in the source

Field	Description
	table row. When this check box is cleared, the blank matcher field value matches any value in the source table field. **Note:** If the lookup does not require an exact match, matcher table rows containing blank values are treated as wild cards, matching all values.

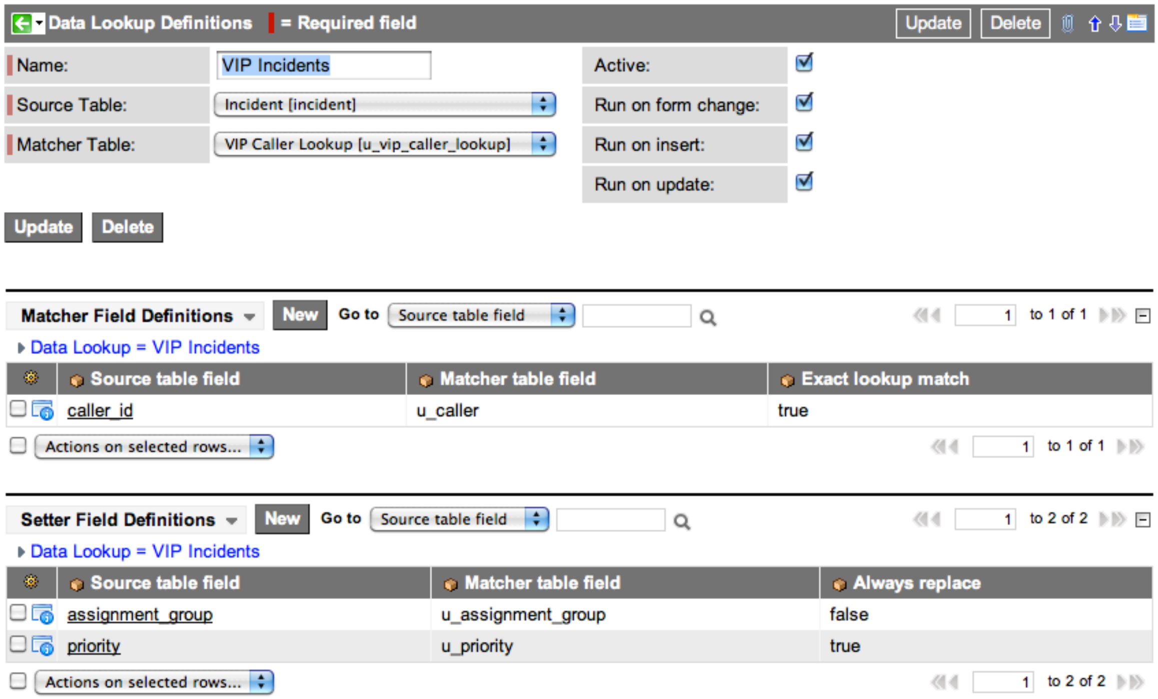
8. Select **Submit**.
9. From the **Setter Field Definitions** related list, click **New**.
10. Complete the Setter Field Definitions form using the following table.

Setter field definitions fields

Field	Description
Data Lookup	Displays the name of the parent data lookup definitions record.
Source table field	Select the field from the source table that the data lookup updates.
Matcher table field	Select the field from the matcher table that provides the new value for the update.
Always replace	Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.

11. Select **Submit**.
12. Select **Update**.

For example, the following data lookup definition assigns incidents to the VIP Issues group based on the **Caller** field. In addition, the incidents are set to critical or high priority based on the caller.



Create a data lookup module

You can create a module for data lookup so it appears in the instance application navigator.

Procedure

1. Navigate to **All** > **System Definition** > **Application Menus**, then select an application to add the module to.
2. In the Modules related list, click **New**.
3. Configure a module for the data lookup table you created using the following properties.

   Module properties

Property	Required value
Table	Select the data lookup table you created in Step 2. For example u_vip_caller_lookup.
Link type	List of Records

4. Click **Submit**.

Troubleshooting data lookup

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

- Verify that the data lookup definition is set to run on the appropriate events.
- Verify that the matcher field is not read-only. Since users cannot change read-only fields, user interactions cannot trigger an on form change event for read-only fields.
- Verify a client script is not changing a field value. Client scripts can trigger `Run on form change` events even on read-only fields.
- Verify that the data in the matcher table is correct.
- If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if cannot find a matching value.
- Verify that you have not created a recursive rule, such as:

  If Field A = 1, then Field B =2. If Field B = 2, then Field A = 2

List administration

Administrators control the data presented to end users in a list, the controls that appear, and the behavior of the controls.

> **Note:**
> For information about using lists, see Lists.

List configuration

Users with the appropriate roles can configure various aspects of lists. Configuration changes apply to all users.

With list configuration, you can add, remove, and reorder list columns. You can configure calculations to appear under columns. You can also hide controls and define access conditions by role for existing list controls. Configuring lists is called personalizing lists in versions prior to the Fuji release.

> **Note:**
> Configuring a list in this way modifies the list for all users. To make changes to a list that are visible to you only, see Personal lists.

Configure the list layout

You can configure a list to choose which columns appear in a list, create list views, and create fields on the table.

Before you begin
Role required: personalize_list

About this task
Configure the list layout

Procedure

1. Navigate to the list you want to configure.
2. Open the **List controls** menu and select **View** > **(view name)**to select the view you want to

   configure.
3. Right-click any column heading and select **Configure** > **List Layout**.
4. Add, remove, or reorder fields to configure the columns displayed and their order of appearance.
   The first non-reference field automatically links to the form view of the record. For this reason, consider using the record number as the first column in the list layout.
5. Select **Save**.

   Note:

   - If you use Personal lists and then configure the list view differently, the changes do not appear until you reset your personal list to column defaults.
   - Inactive fields display in admin-configured lists until an admin updates the list layout to remove them.

Trouble?

If a reference field in a list displays as (empty) instead of the expected value, it is due to another field in the list containing an incorrect reference to either an orphaned record or a sys_id that does not exist in the referenced table. The solution is to remove the incorrect reference data from any reference fields in that table.

Add an extended field to a base table list

Administrators can configure a property that determines whether fields on extended tables can be added to a parent table list. For example, when this feature is enabled, you can view and filter on the **Caller** field, from the Incident table, on a Task table list.

Before you begin

Role required: admin

Note:
Enabling this property does not show the extended table fields in the personalize list.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property **Allow base table lists (task, cmdb_ci, etc.) to include extended table fields (incident_state, os_version, etc.), and allow filtering on extended table fields** (`glide.ui.list.allow_extended_fields`).
3. Select the check box to enable extended fields on parent table lists, or clear the check box to disable the feature.
4. Select **Save**.

Configure list calculations

You can configure list calculations for columns, which calculate column totals, minimums, maximums, and averages.

Before you begin

Role required: personalize_list.

About this task

You can configure list calculations for multiple columns in the same list. List calculations apply only to the view of the list in which they are configured. All users can see configured list calculations.

Note:

- List calculations are also available in list reports.
- List calculations for a calculated field can only operate on the *current values stored in the database for each record and not the values as calculated fresh when the list is rendered.

Procedure

1. In a list of records, right-click the header of a numeric column you want to evaluate with list calculations.
2. Select **Configure** > **List Calculations**.
3. Select one or more of the following list calculation options:
   - Total value (not available for string, date, or date/time fields)
   - Minimum value
   - Maximum value
   - Average value (not available for string, date, or date/time fields)
4. Select **OK**.
   The calculations appear below the last record in the column. If the list is grouped, in addition to the overall calculations at the bottom of the list, group calculations appear below the last record in each group.

Omit record count in a list

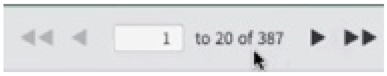
Speed up how fast lists load by removing the calculation of the total number of records in a list.

Before you begin

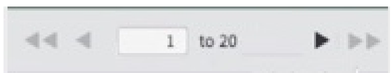
Role required: workspace_admin

About this task

Calculating the total number of records included in a list that's filtered from large tables can take a long time. Platform displays the total number of records in the list.



To load lists faster, you can remove the page calculation for all or only specified filtered lists. When you remove the calculation, the total record count is not displayed and the double arrow icon ( ) is grayed out.



Procedure

1. Open a list, for example navigate to **Incident** > **All**.
2. Right-click a header in the list and navigate to **Configure** > **List Control**.
3. Select **Remove pagination count**.
4. **Optional:** To omit the record count only in specific view:
   a. Select **Remove pagination count for specific views**.
   b. Beside Specific list of views prevented from getting full record count, click the lock icon ( ).
   c. Select the search icon ( ) and select the view where platform omits the page count.
   d. Repeat the previous step for as many views as necessary.
5. Select **Update**.

Configure list controls

You can configure list controls, such as buttons and filters.

Before you begin

Role required: personalize_control.

Procedure

1. Open a list.
2. Right-click any column heading and select **Configure** > **List Control**.
3. Complete the form.

   Note:
   The list control fields that are available for embedded lists are more limited. Unless otherwise noted, the list control fields in the following table are available for both standard and embedded lists.

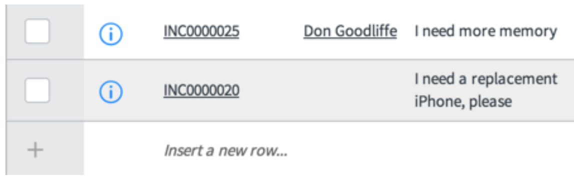
List Control form

Field	Description
Table	Name of the table for the list or related list. For example, **Change Request [change_request]**. The system automatically sets this value.

Field	Description
Related list	Name of the table and field that define the related list. For example,**sysapproval_approver.sysapproval**. The system automatically sets this value.
Label	Label to display for this list. Allows an admin to customize the label for a related list or list. If not supplied, the default plural label for the file is used. For example, the label for the Incident table would be **Incidents**.
Omit new button	Option to prevent the **New** button from displaying on this list. Clear the check box to display the **New** button or to control the **New** button with roles (**New roles** field). This field is available for standard lists only.
Omit edit button	Option to prevent the **Edit** button from displaying on this list. Clear this check box to display the **Edit** button or to control the **Edit** button with roles (**New roles** field). The **Edit** button does not apply to all lists. This field is available for standard lists only.
Omit if empty	Option to omit the **Related List** from the form entirely (no header) if there are no entries for the **Related List**.
Omit columns if empty	Option for a top-level list to omit the column headers AND filters/breadcrumbs for an empty column.
Omit filters	Option to hide filters or breadcrumbs for this list. Clear this check box if you always want filters or breadcrumbs or to control filters/breadcrumbs with roles (**Filter roles** field). This field is available for standard lists only.
Omit links	Option to hide links for fields that reference other files in this list. Leave this button unchecked to generate links or to control the use of links with roles (**Link roles** field).
Omit drill-down link	Option to disable the link to the record from the first column in list view. Users can still select the reference icon to access the record. This field is available for standard lists only.
Hierarchical lists	See Enable a hierarchical list. Hierarchical list inserted into a record list. Hierarchical lists enable a user to view the contents of a record's related lists without leaving the record list form. This field is available for standard lists only.
List edit type	Ability for the user to edit values directly in individual cells in a list. The options are: ◦ **Save immediately (cell edit mode):** enables cell editing. The entire row is saved when the user enters a new value. ◦ **Save data by rows:** enables cell editing. The row is saved only when the user navigates away from the row or selects the **Save** icon ( ). This mode allows the user to modify multiple values before saving a record. ◦ **Disable list editing:** prevents users from editing cells in the list.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>This field is available for standard lists only.</td></tr>
<tr><td>List edit tag</td><td>Unique tag that is sent to a reference qualifier as the script variable <code>listEditRefQualTag</code>. Enter an arbitrary string of letters or numbers.</td></tr>
<tr><td>List edit insert row</td><td>

Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list.



This field is available for standard lists only.

</td></tr>
<tr><td>Remove pagination count</td><td>Option to remove pagination count from the list.</td></tr>
<tr><td>Disable Natural Language Query (NLQ)</td><td>

Option to disable the NLQ filter in specific lists when NLQ on lists is enabled in the instance. The NLQ filter enables you to use natural language to filter lists instead of using the condition builder. For more information on NLQ filters, see Natural Language Query.

Note:
When the system property (<code>com.snc.listv2.nlq.lists.enabled</code>(com.snc.listv2.nlq.lists.enabled) is set to **false**, the query destructs. Text entered in the search replaces existing conditions.

</td></tr>
<tr><td>Application</td><td>Scope of this setting's applicability. Global means that all workspaces can use this setting.</td></tr>
<tr><td>New roles</td><td>User roles that can access the New button on this list. Leave the field blank to enable all users to access the New button. This option does not apply to embedded lists, which do not contain New buttons.</td></tr>
<tr><td>Filter roles</td><td>User roles required to have the filter appear in the list.

This field is available for standard lists only.</td></tr>
<tr><td>Link roles</td><td>User roles required to have links generated for fields that reference other files.</td></tr>
</table>

Example of configuring list controls

The following example shows how to configure a list of related incidents in a problem record to suit specific business needs.

Before you begin

Role required: personalize_control

About this task

In this example, a related list label is configured to say `Child Incidents`, not just `Incidents`. The related list is also configured to remove the **New** button to prevent users from creating incidents from the Problem form.

Procedure

1. Navigate to a problem record.
2. Open the list context menu in the **Incidents** related list and select **Configure** > **List Control**.
3. On the List Control form, change the **Label** field to `Child Incidents`.
4. Select the **Omit new button** check box.
5. Select **Submit** to save your changes and return to the previous record, in this case, the problem record.
   In the problem record, the label for the embedded incident list has changed and the **New** button is no longer available.

Advanced list control with scripts

You can write scripts to specify which list elements, such as links, filters, and buttons, are present.

These scripts can react to the record that is being displayed. For related list controls, the global variable **parent** identifies the parent record. For primary lists, there is no parent record.

Configure the List Control form and add the script field that you need:

- **Omit Columns Condition:** If there are no conditions, omit column headings.
- **Omit Edit Condition:** Omit the **Edit** button.
- **Omit Empty Condition:** If there are no conditions, omit the list header.
- **Omit Filter Condition:** Omit the list filter.
- **Omit Links Condition:** Omit related links.
- **Omit New Condition:** Omit the **New** button.

In these script fields, if the script evaluates to **true**, the item is omitted. The following script is an example that you can use on the **Affected CIs** related list to show only the **Edit** button if the parent task is active. This script is placed in the **Omit Edit Condition** script field.

```
var answer;
 if (parent.active == true ) {
 //Do not remove the 'Edit' button
  answer = false;
}
else {
 //Remove the 'Edit' button
  answer = true;
}
answer;
```

Configure a list UI action

You can create a UI action that opens the slushbucket interface to customize lists in the list view.

Before you begin

Role required: ui_action_admin

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Click **New**.

3. In the **Table** field, select the **List [sys_ui_list]** table.
4. Select the **List context menu** check box.
5. Ensure the **Active** check box is selected.
6. Paste the following script in the **Script** field:

```
var url  = "slushbucket.do?sysparm_form=list&sysparm_list=" +
 current. name + "&sysparm_view=" + current. view. name ;
url  += "&sysparm_collection=" + current. parent +
 "&sysparm_collection_relationship=" + current. relationship ;
url  += "&sysparm_referring_url=sys_ui_view.do?sys_id=" +
 current. view. toString ( ) ;
action. setRedirectURL (url ) ;
```

7. Click **Submit**.

Show/hide filter controls

The Show/hide filter used in the list configuration, lists the fields to configure in the filter conditions.

The fields mentioned in the Show/hide filter are sorted in an alphabetical order.

> **Note:**
> If the name of the fields start with an accented character, those fields are placed at the end of the list.

You can enable the *guide.ui.condition_builder.sort_labels_by_locale* sys property to sort the fields of the Show/hide filter as per the locale-based language. The sys property is set to **False**, by default. If you have a customized script that's based on alphabetical sorting of the fields, the locale-based language setting might break your script. So, you can enable the sys property only when you need the filter to be locale-based language.

> **Note:**
> If the sys property is not enabled, the fields are sorted in an alphabetical order. The fields starting with an accented character are placed at the end of the list.

Controlling the sort sequence used to display lists

All lists have a default sort sequence based on the type of fields present in the list.

When a user displays a list for the first time, it is sorted by one of the following items.

- The **ORDERBY** arguments found the URL. (See the following section on sort order control.)
- The **<table>.db.order** and **<table>.db.order.direction** user preferences.
- The **isOrder** dictionary attribute.
- The **Order** field if one is present in the table.
- The **Number** field if one is present in the table.
- The **Name** field if one is present in the table.
- The field specified as the display field for the table.

> **Note:**
> The task table is an exception to the preceding sequence. Task and tables extended from task use the **Number** field when no URL arguments or user preferences are found.

Setting default order with user preferences

The **<table>.db.order** and **<table>.db.order.direction** user preferences determine the field and sort direction seen by the user. A default sort can be created by creating user preference records with no value in the **User** field and checking the **System** check box. This preference is applied to any users who do not have their own preference.

Setting the default sort order in the system dictionary

An administrator can set the sort order of records displayed for a table in the system dictionary when there is no other sort specified. This is done by adding an attribute called **isOrder** with a value of **true** to the dictionary entry of the desired field. This sort is the sort order presented to all users initially. Once a user sorts a list, that user preference is saved, and the list is always sorted for that user based on the previous sorting preference.

Note:
isOrder can define which field is used for list sorting, but cannot control the sort direction.

Related topics

- System dictionary
- User preferences
- Altering tables and fields using dictionary attributes

Sort order control

For any list, if the user has clicked a column header to sort by that column, then that action is remembered. The next time that list is displayed, the same field is used to order the list.

This remembered sort field can be overridden by adding a `sysparm_order` specification to the definition of the module. For example, if each time **News** is displayed, you want the new items listed in order of importance, then the **News** module can be updated accordingly.

Set module sort order to the Importance field value

The actual order (ascending or descending) can be specified by adding a `sysparm_order_direction` specification. Here are two examples of sorting a list by the **sys_created_on** field, one ascending and one descending:

```
&sysparm_order=sys_created_on &sysparm_order_direction=desc
&sysparm_order=sys_created_on &sysparm_order_direction=asc
```

Sort by multiple fields

To sort a list by multiple fields, remove everything from the filter field and place it in the arguments field. For example, if the filter specifies **[Active] [is] [true]** and you want to sort by category and subcategory, remove the condition and put the following in the module arguments:

```
active=true^ORDERBYcategory^ORDERBYsubcategory
```

This argument first orders by the category and then orders by the subcategory. If you want any field to be a descending sort, then change *ORDERBY* to be *ORDERBYDESC*.

List editor administration

The list editor allows users to edit field values directly from a list without navigating to a form.

Administrators can manage this feature by using the following options. Some of the options are not supported in List v3.

- Configure global properties
- Configure list control settings for a table
- Configure contextual security rules
- Manage user preferences (List v2 only)

Warning:
In List v2, the list editor does not enforce client scripts or UI policies. In List v3, the list editor enforces UI policies and mandatory dictionary attributes, but not client scripts. Allowing list editing with client scripts running on fields in a form can result in incorrect data being saved to the record. For systems in which client scripts or UI policies apply to forms, consider disabling list editing or creating appropriate business rules or access control to control the setting of values in the list editor. See Use business rules and client scripts to control field values for information on managing form and list editing.

Warning:
You cannot edit state fields that are extended from the Task [task] table from a list of task records. Examples include:

- problem_state
- incident_state
- phase_state
- request_state

While these fields are visible from the task list, they must be edited from the extended table.

Related topics

Use the list editor

Configure list editor properties

Configure list editor properties that control whether lists can be edited and, in List v2, which field types cannot be edited.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. To disable list editing, set the **Enable list editing** (`glide.ui.list_edit`) property to **No** by clearing the check box.
   This property is enabled by default, and it globally enables list editing. When you disable it, the list editor is disabled globally.
3. To configure the field types that cannot be edited for v2 lists, complete the following steps.

a. Locate the **List of element types (comma-separated) that cannot be edited in the list editor** (*glide.ui.list_edit_ignore_ types*) property, which contains several element types that cannot be edited by default.

Note:
This property does not impact v3 lists. There is no equivalent property for List v3.

The following field types are not editable from the list editor by default.

- Conditions [conditions]
- Currency [currency]
- Document ID [document_id]
- Field List [field_list]
- HTML [html]
- Image [user_image]
- List [glide_list]
- Price [price]
- Template Value [template_value]
- Time [glide_time]
- User Roles [user_roles]
- Video [video]
- Array [array]

b. Add any other field types you want to disable to the end of the list, separated by a comma.

4. Select **Save**.

Configure list control settings for the list editor

You can configure the list control settings that affect the list editor.

Before you begin
Role required: personalize_control

About this task
List control settings customize the behavior of list functions for a table.

Procedure

1. Navigate to a list view for the desired table.
2. Right-click any column heading and select **Configure** > **List Control**.
3. On the List Control form, select the desired settings.

List control settings for the list editor

Field	Description
List edit type	Ability for the user to edit values directly in individual cells in a list. The options are:

Field	Description
	○ **Save immediately (cell edit mode):** enables cell editing. The entire row is saved when the user enters a new value. ○ **Save data by rows:** enables cell editing. The row is saved only when the user navigates away from the row or selects the **Save** icon ( ). This mode allows the user to modify multiple values before saving a record. ○ **Disable list editing:** prevents users from editing cells in the list. This field is available for standard lists only.
List edit insert row	Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list.  This field is available for standard lists only.

4. Click **Update**.

Configuring contextual security for the list editor

The list editor enforces existing access control rules (ACLs) and additional security controls to restrict editing from a list.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

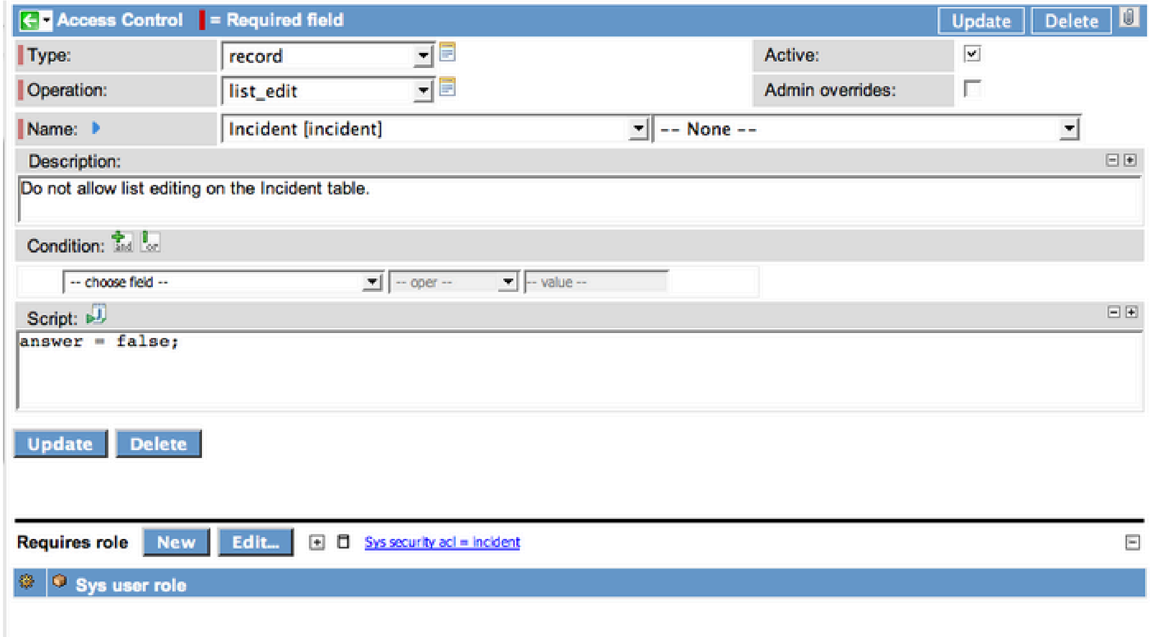
- write and list_edit access to the field
- write and list_edit access to any dependent fields of the field
- write and list_edit access to any fields that depend on the field being edited

To configure access controls, navigate to **System Security** > **Access Controls**. The following examples use the list_edit security operation to restrict list editing in certain contexts.

Example - Restrict a table

This access control prevents everyone from editing all fields in the Incident table in a list.

Restrict the Incident Table

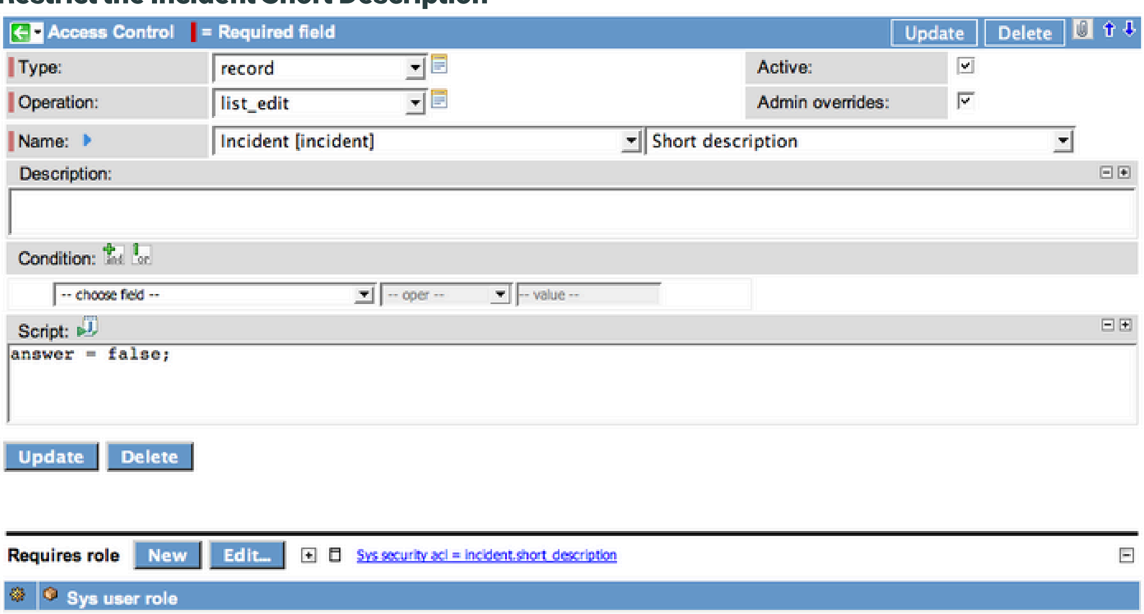


- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Script:** `answer = false;`

Example - Restrict a field

This access control prevents everyone except an administrator from editing the Short Description field of an incident record in a list.

Restrict the Incident Short Description

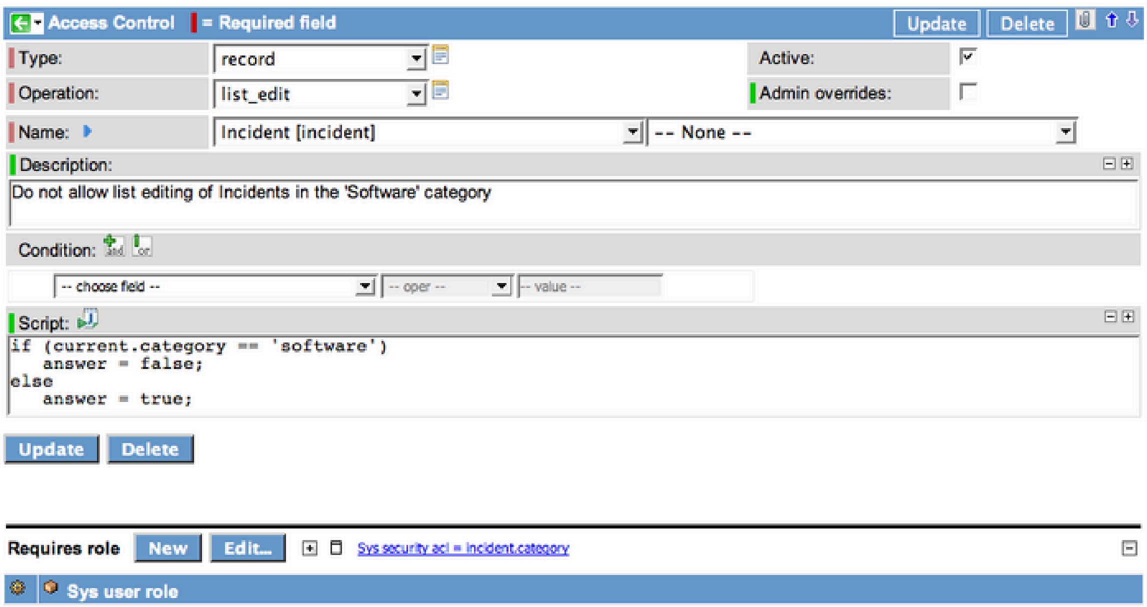


- **Type:** record
- **Operation:** list_edit
- **Name:** Incident [incident], Short Description
- **Admin overrides:** Select the check box.
- **Script:** `answer = false;`

Example - Restrict a field with a script

This access control prevents everyone from editing an incident with a category of Software in a list. It is defined by a script.

Restrict Software Incidents



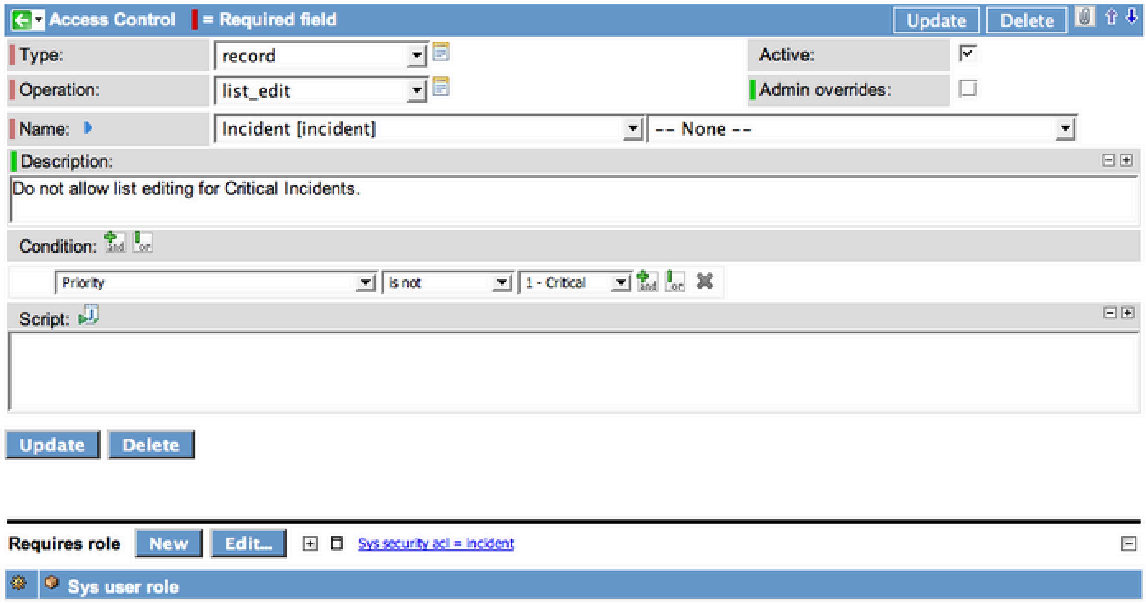
- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Script:**

```
if (current.category == 'software')
answer = false;
else
answer = true;
```

Example - Restrict a field with a condition

This access control prevents everyone from editing a Critical Incident in a list. It is defined by a condition.

Restrict Critical Incidents



- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Condition:** Priority is not 1 - Critical

User preferences for list editing

Users can set user preferences for list editing by personalizing a list (available when the list mechanic is activated).

To view and manage list editor user preferences, navigate to **User Administration** > **User Preferences**.

User preferences for list editing

User preference name	Description
list_edit_enable	Set the value to **true** to enable or **false** to disable list editing. Default value is **true**.
list_edit_double	Set the value to **true** for double-click or **false** for single-click. Default value is **true**.

Related topics

Personal list administration

Personal list administration

Users can customize the layout for any list view by personalizing a list. Administrators can configure options related to list personalization.

In List v2, administrators can also disable or restrict access to list personalization. This functionality is not supported in List v3.

Enable or disable personal lists

You can enable or disable personal lists through the UI Macros module.

Before you begin

Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Activate (or deactivate) the *list_mechanic2* UI macro.

Control which roles can personalize lists

You can control who can create personal lists.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property labeled **List of roles (comma-separated) that can use Personal Lists. If blank, all can use** (*glide.ui.list_mechanic.roles*).
3. Enter the roles for which personal lists are available, separated by commas, or leave the field blank to allow access for all users (default).

Manage personal lists

Administrators can manage personal lists.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Lists**.
2. Personal lists have a user value in the **User** field.

Related topics

Personal lists

Administer detail rows

Detail rows provide additional information about records in a list.

Before you begin

Role required: admin

About this task

To display detail rows, an administrator must enable them globally and add them to lists.

> **Note:**
> Detail rows are not supported in List v3.

Procedure

1. To enable detail rows, add a new system property with the following field values.

Name	glide.ui.list.detail_row
Type	true | false
Value	true

2. To add detail rows to a list, complete the following steps.

   a. Add the *detail_row* dictionary attribute to the table.
   Specify the name of the field to display in the following format:
   `detail_row=short_description`

   b. Use the *all_tables* element descriptor with the *detail_row* attribute to display detail rows for all child tables that contain the designated field.

   Example
   For example, *all_tables.detail_row=short_description* is on the Task [task] table by default, so the short description detail row appears in lists for Incident [incident], Problem [problem], and other child tables unless you set *detail_row* to a different field for each one.

Lists

Altering tables and fields using dictionary attributes

Restrict filters and breadcrumbs with fixed queries

The record list view allows users to navigate to different subsets of a table using breadcrumbs and filters. You can limit access to parts of the table by restricting active links in breadcrumbs or by suppressing breadcrumbs and filters for specific roles.

Before you begin

Role required: admin

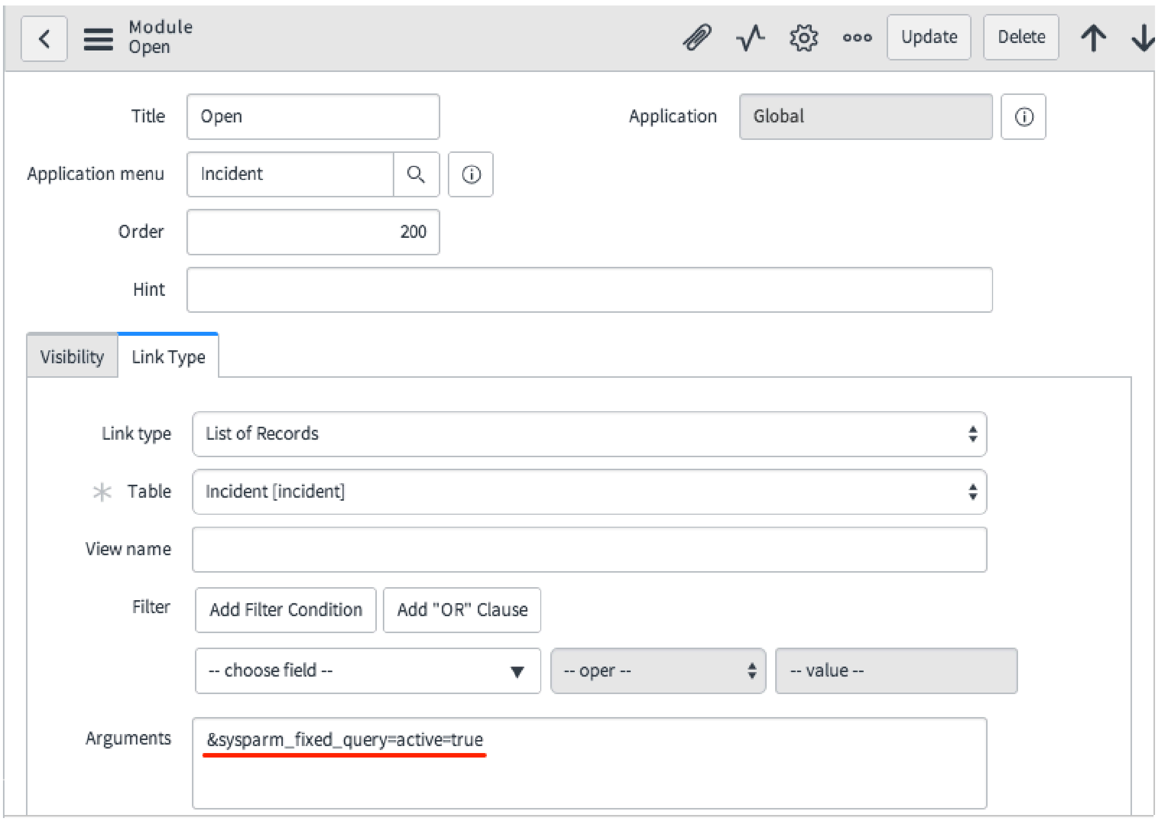
About this task

A breadcrumb option enables an administrator to control the base view of a record list presented to users. By adding a fixed query to the argument for a module, an administrator can prevent users from expanding their view past a specified starting point. The argument for this fixed query is written as *&sysparm_fixed_query=active=true*. A use case for this query is to prevent users from using the breadcrumbs to switch a list of open incidents to a list of all incidents. When users select **Incident** > **Open**, they are limited to viewing and filtering a list of open (active=true) incidents.

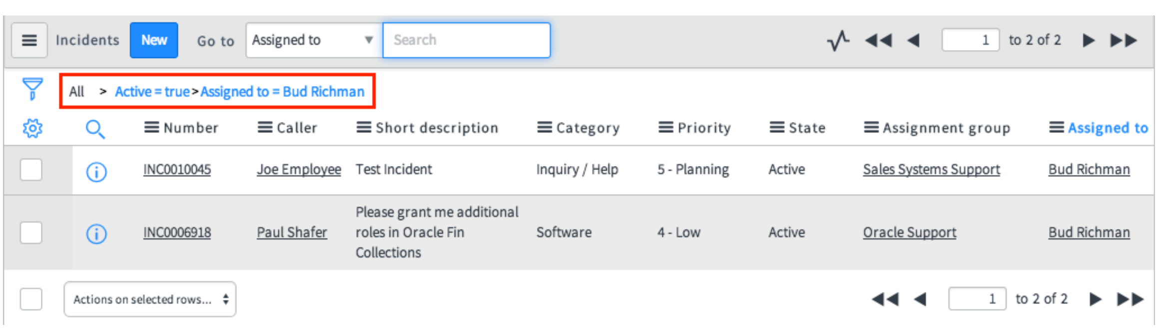
Note:
A new Create ACL allows all users to save filters by default. This overrides any custom ACLs in place if administrators are restricting filter access. The new ACL gives all users access to the User field by default, and access to the Group field only if users have the filter_group role and are in the currently selected group.

Procedure

1. Point to the application menu that contains the module to edit and click the edit application (pencil) icon.
   To open the module directly, point to the module and click the edit module (pencil) icon.
2. Select the module to edit.
   For example, select **Open**.
3. In the **Link Type** section of the Module form, select **List of Records** for the **Link type**.
4. Delete the **Active is true** filter, if present.
5. Add *&sysparm_fixed_query=active=true* to the **Arguments** field and update the record.



6. Navigate to **Incidents** > **Open** and examine the breadcrumbs.
   The **Active=true** link is the widest view permitted in the list of Open incidents shown. The breadcrumb for **All** is not a link because of the fixed query.



Suppress filters and breadcrumbs with list controls

Use list controls to suppress filters and breadcrumbs on defined tables for users with specific roles.

Before you begin

Role required: personalize_control

Procedure

1. Navigate to the list view of the table to restrict breadcrumbs.
2. Open list control by performing the appropriate action for the list version.
   You can also navigate to **System UI** > **List Control**.
3. On the List Control form, select the **Omit Filters** check box, or clear the check box to include filters.
   The **Filter Roles** field allows an administrator to specify certain roles that can see the filters.

Use script includes to suppress filters and breadcrumbs

You can use a script to restrict filters and breadcrumbs to specific roles, either on a per-table or global basis. Using a script is an advanced option that offers additional flexibility compared to using list control.

Before you begin

Using a script include requires knowledge of JavaScript.
Role required: script_include_admin

About this task

The examples shown must be modified for your environment.

Procedure

1. Create a script include with the name `<tablename>DisplayFilter.`
   The script section contains one function with the same name as the script include.
2. Use your function to set the global variable *answer* to either true (show the filters and breadcrumbs) or false (hide them.)

   Example
   The following example restricts filters and breadcrumbs on the Incident table to users with any role. Be sure that the name of the script matches the function name exactly, including case.

   ```
   function incidentDisplayFilter() {
       if (gs.getUser().hasRoles()) {
           answer = "true";
       } else {
           answer = "false";
       }

       return answer;
   }
   ```

3. **Optional:** To exclude a specific role from having access to filters and breadcrumbs, make the following change.

   ```
   function incidentDisplayFilter() {
       if (gs.getUser().hasRoles()
    && !gs.getUser().hasRoles('newrole')) {
   ```

```
            answer = "true";
        } else {
            answer = "false";
        }

        return answer;
}
```

Users with the role `newRole` do not have access to filters and breadcrumbs.

4. **Optional:** To let all users use filters and breadcrumbs on the Incident table, make the following change to your script.

```
function incidentDisplayFilter() {
    var answer = true;

    return answer;
}
```

5. **Optional:** To modify filter and breadcrumb access for another table, create a script include using the name of that table instead of Incident.

Increase the allowed number of breadcrumb entries

You can add a property to allow for a larger number of breadcrumb entries in the filter.

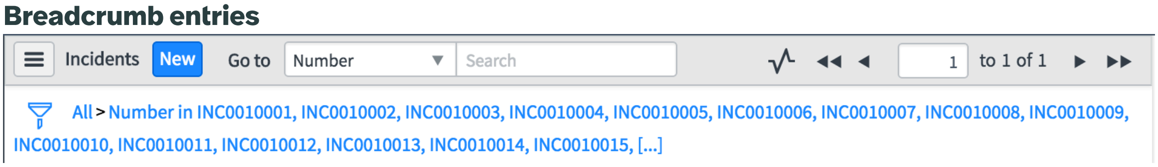
Before you begin
Role required: admin

Procedure

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for *`glide.ui.breadcrumb_max_entries`*.
3. Click **New**.
4. Complete the form.

5. To verify this property, go to any table and use the filter modifier **is one of** to search for any number of items.
   The number of entries you entered in the Value field displays before ending in a [...].

Breadcrumb entries



Enable a hierarchical list

You can enable hierarchical lists to make data from related lists directly accessible from within a v2 list.

Before you begin
Role required: personalize_control

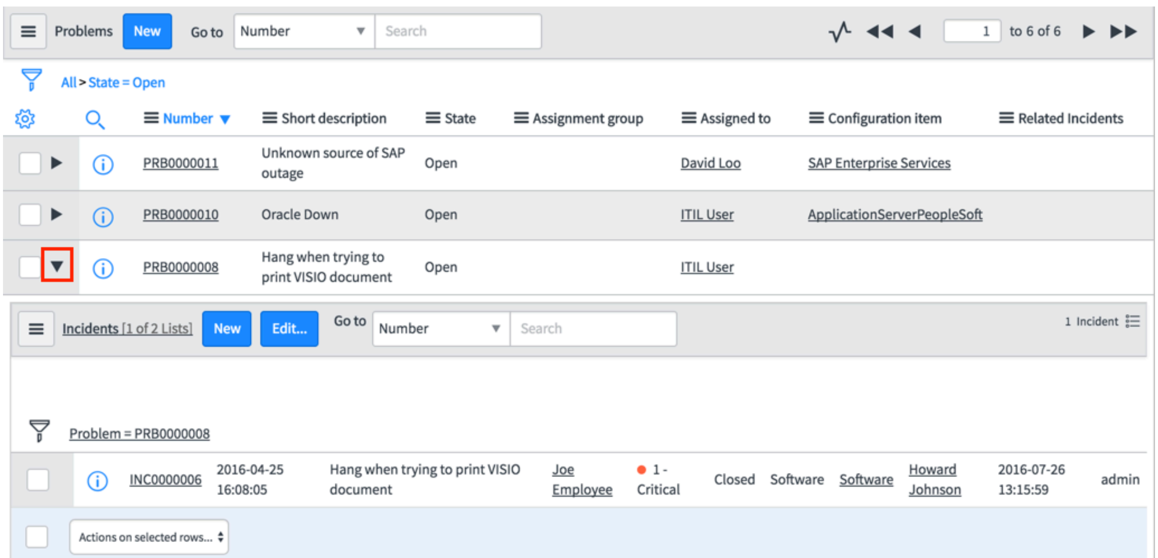
About this task

Hierarchical lists enable a user to view the contents of the related lists of a record without leaving the record list form.

> **Note:**
> You cannot enable a hierarchical list view for an embedded list. Hierarchical lists are not supported in List v3, even if they are enabled.

Procedure

1. Right-click any column header, and select **Configure** > **List Control** from the context menu.
2. Select the **Hierarchical lists** check box in the List Control dialog box and then click **Submit** or **Update**.
3. Click the arrow for a record number to display the related lists for the record.



Use list controls in hierarchical lists

By default, no related list tabs are visible in a hierarchical list and only a single related list is displayed at a time. The column headers are hidden by default.

Before you begin

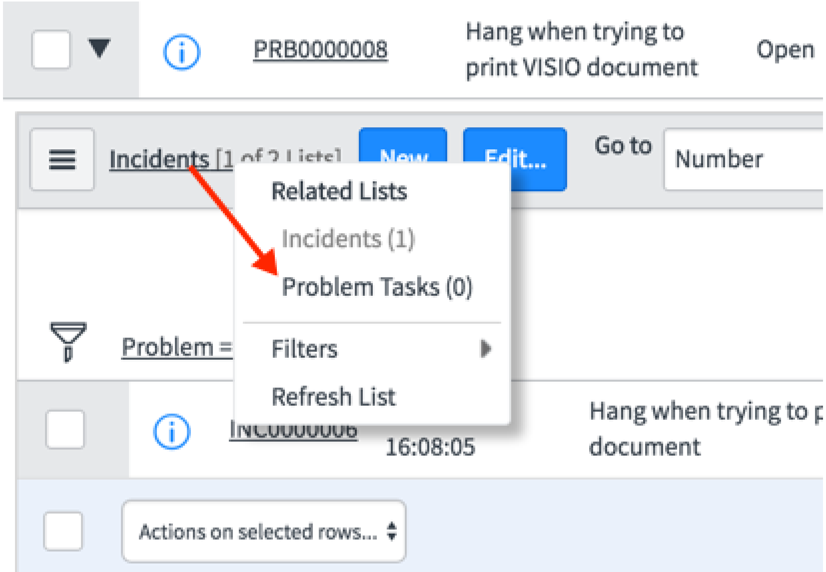
Role required: none

About this task

> **Note:**
> Hierarchical lists are not supported in List v3.

Procedure

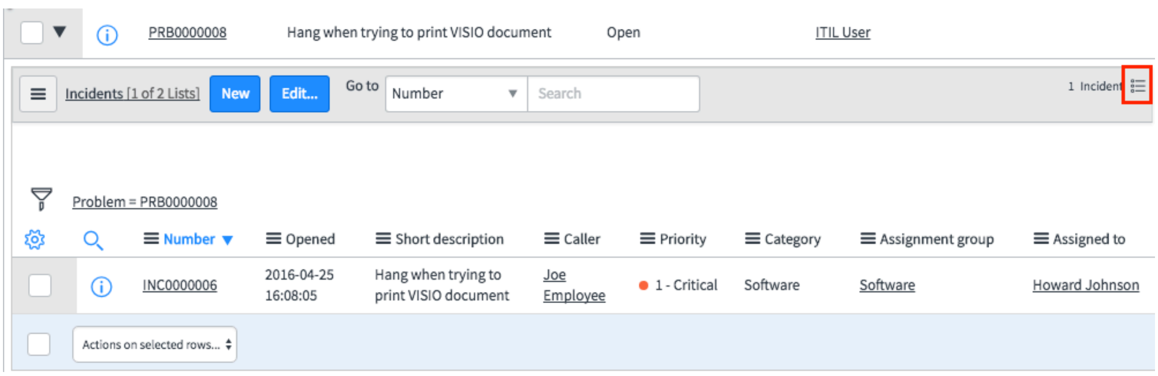
1. To select a different related list, click the link in the list title.
2. Select a list from the menu.



If the related list is empty, the hierarchical list indicates that there are no records to display.

The platform remembers this preference and displays the last selected related list for each table when you open another hierarchical list within that table.

3. To display column headers in the related list, click the show/hide headers icon in the upper right corner of the hierarchical list.



The platform remembers this preference and opens all hierarchical lists with column headers enabled until the headers are hidden.

Context ranking

Context ranking allows a user to sort a collection of records preferentially, that is, independently of the attributes of those records.

For example, a Customer Support manager can organize a list of incidents in the order in which a technician should work on the tasks. Creating such an arbitrary list with a list filter is not possible.

Activate context ranking

If you have the admin role, you can activate the Context Ranking plugin (com.glide.sorting). This plugin activates related plugins if they are not already active.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Context Ranking plugin (com.glide.sorting) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a ranking definition

Enable context ranking for a related list by creating a ranking definition.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Ranking Definitions**.
2. Click **New**.
3. Enter a **Name** for the ranking definition.
4. In the **Record table** field, select the table for which ranking is enabled.
   This is the table of the records in the ranked related list. For example, to enable ranking for a related list of incidents in the Problem form, select the Incident [incident] table.
5. In the **Context column** field, select the reference column providing the context in which ranking is to be performed.
   The context in this case is the form in which the related list appears and not a table name. For example, a related list with a **Record table** of Incident [incident] can have several contexts, including the **Problem** form or a **Configuration item** form.
6. Complete the relationship-based fields if the ranking is to be performed on a related list that is defined by a relationship.
   - **Relationship table:** select the table forming the other side of the relationship. In the case of the ranking definition for Product stories in scrum, you might use the Product Model [cmdb_model] table.
   - **Relationship column:** select the column from the relationship table to compare with the context column. To avoid adding a related list of user stories to the Product Model [cmdb_model] table, you might use the **Sys ID** column, which defines a subclass of the Product Model table (cmdb_model.sys_id).
7. In the **Attributes** field, enter attributes to change and restrict the contents of the Rank dialog box, as appropriate.

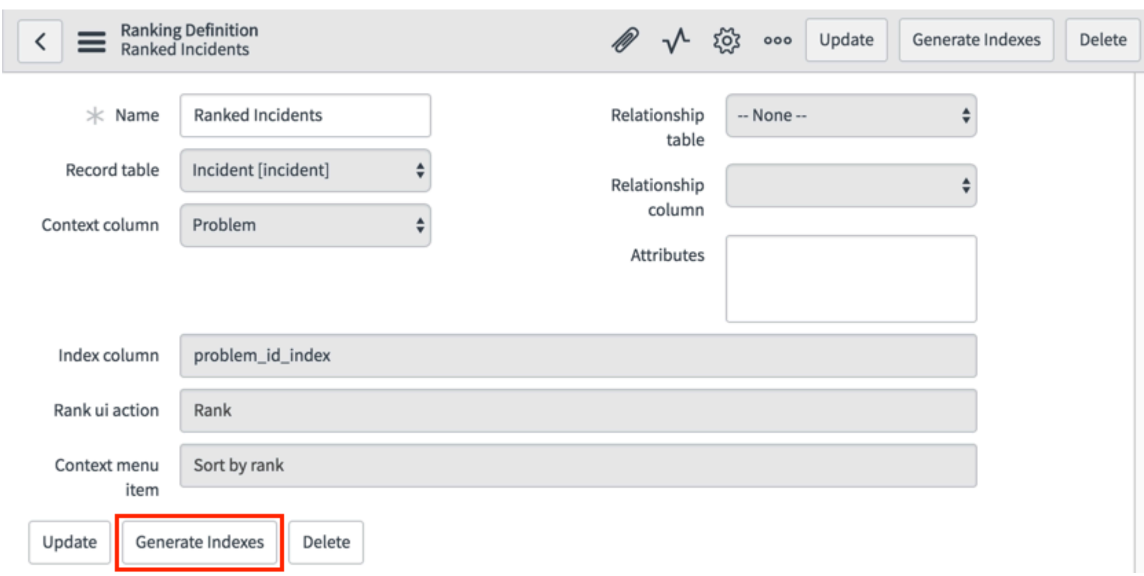
- *`visible_columns`*: a semi-colon separated list of columns to be displayed in the Rank dialog box. If not specified, the Rank dialog box uses the default view of the related list you selected in the **Record table** field.
- *`extra_conditions`*: an encoded query to restrict the records shown in the Rank dialog box. For example, the query `extra_conditions=^state!=7` displays all incidents whose state is not **Closed**. If not specified, the Rank dialog box shows all records for the relationship.

8. Click **Submit**.
   The index is generated automatically. The system completes these read-only fields:
   - Index column
   - Rank ui action
   - Context menu item

   Note:
   After you submit a ranking definition, only the **Attributes** field can be edited. If additional changes are required, delete the record and create a new one with the revised settings.

What to do next

The system does not generate indexes for ranking definitions inserted into the database by an update set. To use a ranking definition inserted by an update set, you must generate the indexes manually. To generate indexes, open the Ranking Definition form, and click **Generate Indexes**.



Rank a list

After you create a ranking definition for a table, related lists based on that table and context include options for ranking the list and displaying the list by rank.

Before you begin

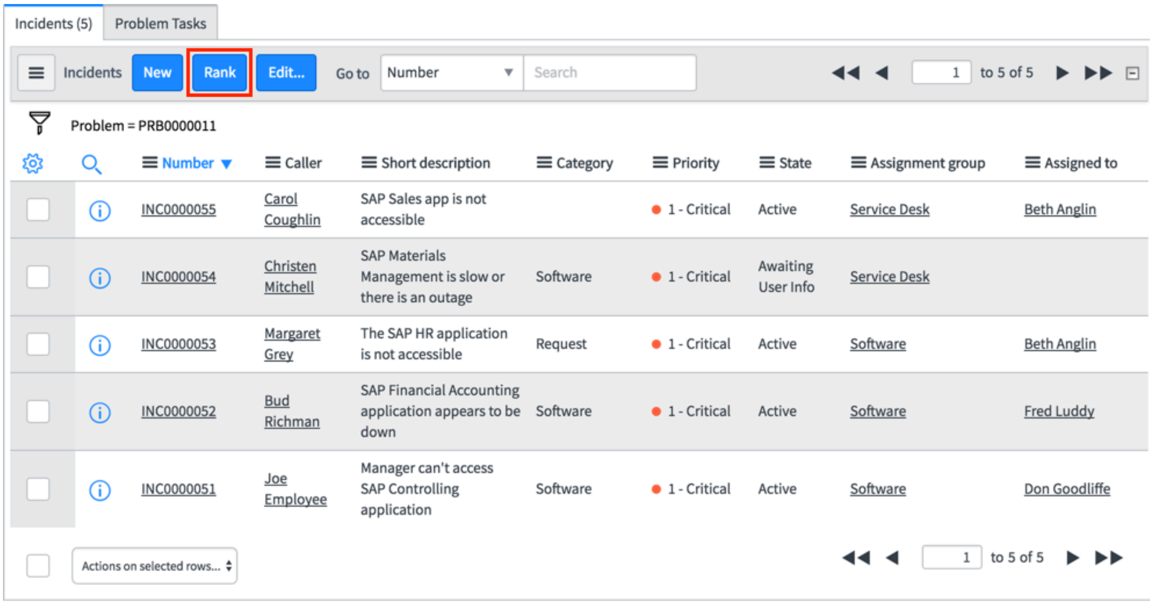
Role required: none

About this task

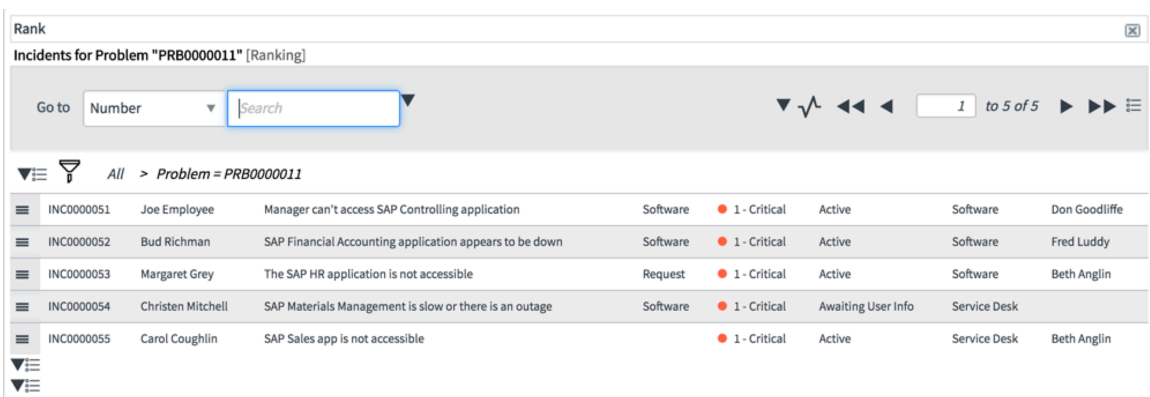
You can set the preferential order of records.

Procedure

1. Click the **Rank** button in the related list to reorder the records.



The Rank dialog box appears, allowing you to sort the records in any order.



2. Click and drag the move icon ( ) to change the position of a record.

> **Note:**
> Administrators can define which columns appear in the Rank dialog box in the **Attributes** field of the Ranking Definition form.

Apply a new sort order to a list

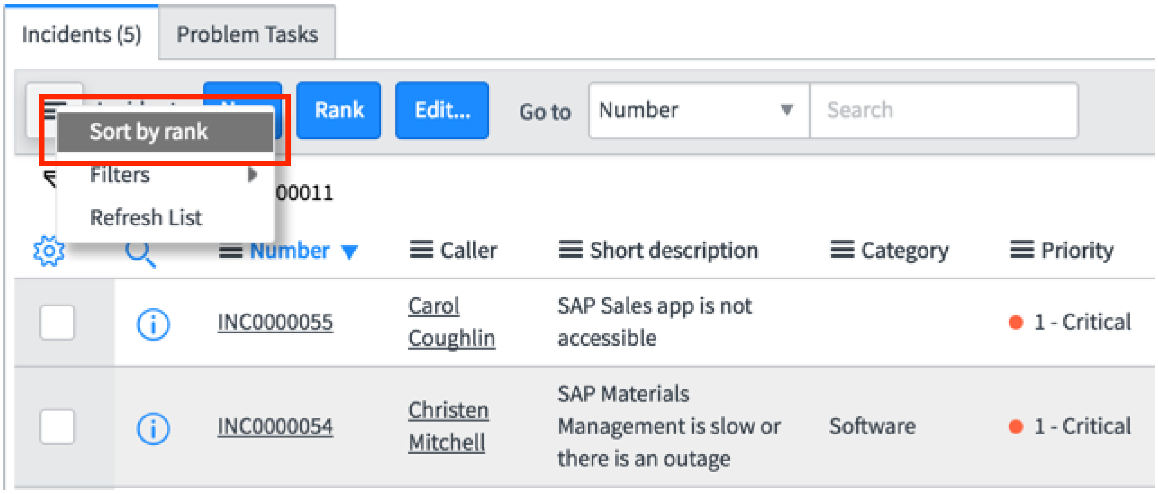
You can apply a new sort order to the records in a list.

Before you begin

Role required: none

Procedure

1. Open the context menu from the list title and select **Sort by rank**.



2. To remove the ranking and return to the original order of the list, click the label in any column that contains data.

Scrum ranking definitions

Ranking definitions for user stories are part of the SDLC (scrum process) application.

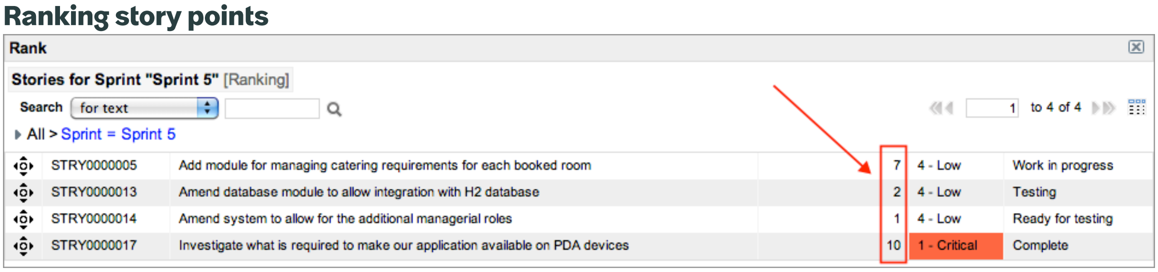
These ranking definitions enable scrum users with the proper roles to rank related lists of stories in these tables:

- Product stories: Application Model [cmdb_application_product_model] table
- Release stories: Release [rm_release] table
- Sprint stories: Sprint [rm_sprint] table

Users can rank stories in the scrum planning board by priority. Story lists ranked in the planning board appear in the new order in product, release, and sprint forms. Stories ranked in one of these scrum forms changes the order in the planning board.

Story points for each story are listed in a ranked view, which is useful for prioritizing stories.

Ranking story points



Related topics

Agile Development

Rank stories in a related list

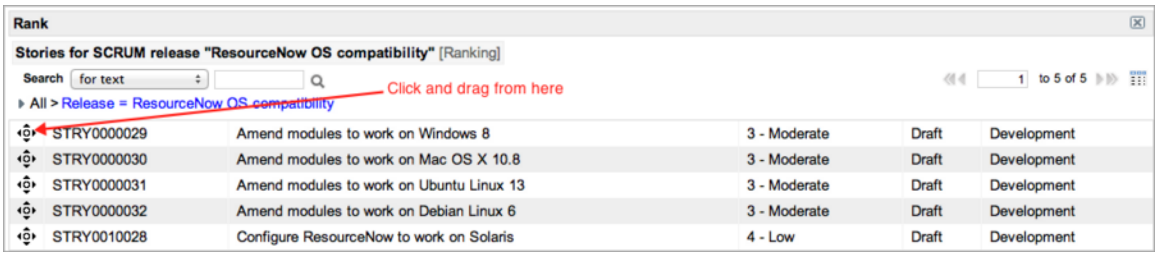
The Context Ranking feature enables all scrum users to manually sort a related list of stories by priority.

About this task

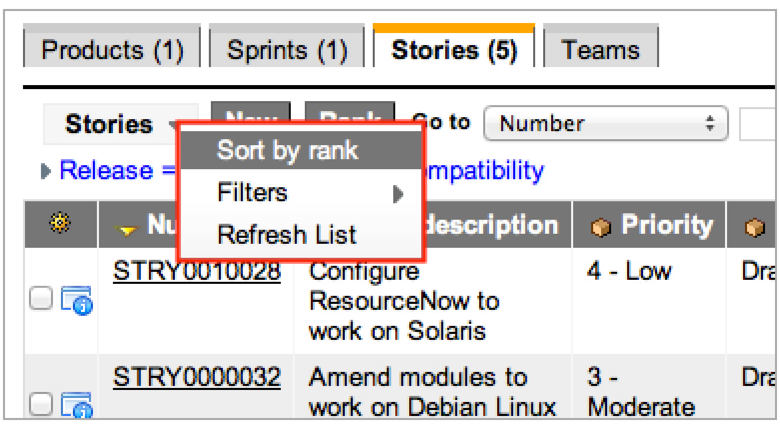
A product owner or release planner uses this tool to establish the order in which to work the stories. Stories ranked in a related list (in the Product, Release, and Sprint forms) appear in the same order in the planning board when the appropriate backlog is displayed. Conversely, stories ranked in the planning board appear in that order when viewed in the related list in the form. Users can switch the view in a Stories related list from ranked to any sort order without changing the ranking in the planning board.

Procedure

1. In the **Stories** related list, click **Rank**.
   A dialog box appears, allowing you to arrange the stories in any order, such as by priority.
2. Click and drag each story into position using the move icon to the left of the story number.



3. When you are done, click the **X** in the upper right corner to close the list.
   The **Stories** related list is not sorted by your ranking initially.
4. To view the related list in its ranked order, open the context menu from the related list and select **Sort by rank**.



5. To return the sort order of the list to an unranked state, click once in the heading of any column that contains data.
   The system uses this ranked list to display the appropriate backlog in the planning board. For example, if you rank stories in the **Stories** related list in the Release form, the release backlog in the planning board uses the same ranking to display the stories. Conversely, scrum masters, product owners, and release planners can create a new ranking order for the **Stories** related list by rearranging the list of stories in the planning board.

Customize list context menus

You can customize the content and behavior of list context menus.

Before you begin

Role required: admin

About this task

For example, you might add an option to the list column heading menu for a specific table. You might also want to change the roles required to access a global context menu option.

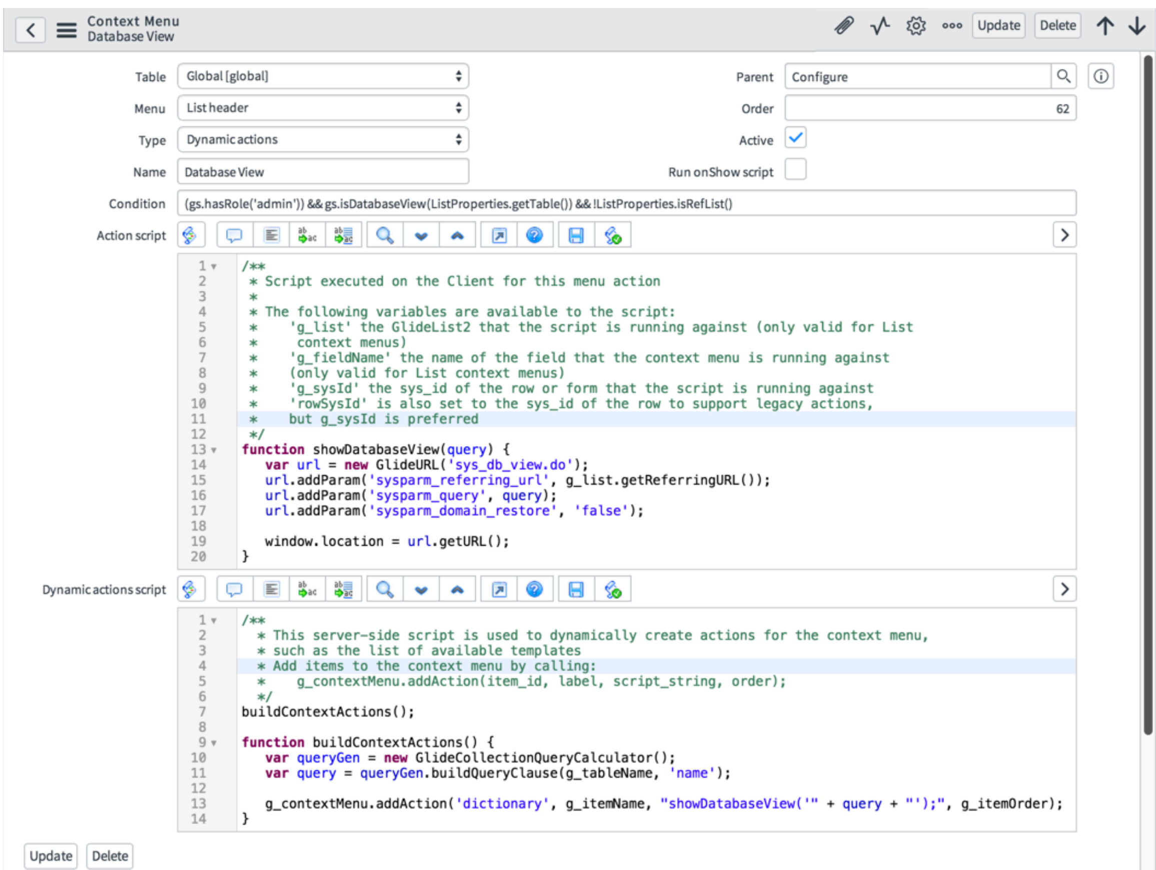
Procedure

1. Navigate to **All** > **System UI** > **UI Context Menus**.
2. Click **New**.
3. Complete the form.

Context menu form fields

Field	Description
Table	Select the table to which this context menu option is attached. The base system menu items are attached to the Global [global] table, which applies the context menu option to all lists for all tables. If you specify a particular table, the option is available only on context menus in lists from that table. **Note:** The list shows only tables and database views that are in the same scope as the context menu.
Menu	Select the list context menu in which this option appears. ◦ List title ◦ List header ◦ List row
Type	Select the type of menu option to create: ◦ **Action**: A menu option that performs an immediate action. ◦ **Menu**: Creates a parent menu that can display a submenu. ◦ **Separator**: Draws a line between groups of options on a menu. Menus do not display separator lines next to one another or at the bottom of a menu. If a condition that removes options for a role forces two separators together, one of the separators is removed from the view. ◦ **Label**: Create an unlinked label for a menu or section of a menu. ◦ **Dynamic actions**: Menu options dynamically created, such as the available views or user filters that can only be generated at the time the list is displayed.
Name	Enter the label for the action as it will appear in the menu.
Parent	If this action is part of a submenu, type the name of the parent menu item. For example, in the base system, **Configure** is a parent.
Order	Assign an order number to this item, menu, or separator to specify where in the menu it appears.
Active	Enable or disable this context menu item. Only active items are shown in the context menu.

Field	Description
Run onShow script	Select this check box to display the **onShow script** field.
Condition	Create the conditions under which this menu option appears. For example, define the role that has permission to see this item.
Action script	The action script runs when someone selects the context menu option. For more information, see Action script for list context menus.
Dynamic actions script	The dynamic actions script populates the context menu with dynamic options, such as filters or views. For more information, see Dynamic actions script for list context menus.
onShow script	The onShow script runs before the context menu is displayed, to determine which options appear in the context menu. For more information, see onShow script for list context menus.



4. Click **Submit**.

Action script for list context menus

The **Action script** field, on the Context Menu form, defines a script. The script runs when someone selects the context menu option.

This script is client-side and runs in the user's browser. The following JavaScript variables are available to the Action script when it is executed.

Action script variables

Variable	Description
g_list	GlideList2 against which the script runs.
g_fieldName	Name of the field against which the context menu runs.
g_fieldLabel	Label of the field against which the context menu runs.
g_sysId	The sys_id of the row or form against which the script runs.

The base system uses the following code in an action script to refresh the platform view.

```
g_list.refresh(1);
```

Another example is the use of these variables in a list header menu to sort a list by the selected field in descending order (z to a).

```
g_list.sortDescending(g_fieldName);
```

Dynamic actions script for list context menus

The **Dynamic actions script** field, on the Context Menu form, defines a script. The script populates a list context menu with dynamic options, such as filters or views.

The following JavaScript variables are available to the dynamic actions script when it is executed.

Dynamic actions script variables

Variable	Description
g_tableName	Name of the current table.
g_listId	ID of the list for which the context menu is built.
g_itemName	Name defined in the UI context menu record.
g_itemOrder	Order defined in the UI context menu record. Use this variable to pass the value of the **Order** field to the dynamic actions script.
g_contextMenu.addAction(item_id, label, script_string, order)	Add options to the context menu and select the order in which they appear.

The following example displays a list title menu item that controls the number of records per page in the list view.

```
g_contextMenu.addAction('50', g_itemName,
 'showRowsPerPage("50");', g_itemOrder);
```

Note:
The action script for this item must define the `showRowsPerPage` function so that when selecting this menu item, that function is called with an argument of 50.

onShow script for list context menus

The **onShow script** field defines a script that runs before the context menu is displayed to determine which options appear in the context menu.

Use this script to change the menu items on the list header menu based on the current field column. The following JavaScript variables are available to the *onShow* script when it is executed:

onShow script variables

Variable	Description
g_menu	Context menu to be displayed.
g_item	Current context menu item.
g_list	GlideList2 against which the script runs.
g_fieldName	Name of the field against which the context menu runs.
g_fieldLabel	Label of the field against which the context menu runs.
g_sysId	The sys_id of the row or form against which the script runs.

An example of an *onShow* script is one that determines when to enable or disable the **Ungroup** option in a list column heading menu based on whether the list is grouped or not.

```
if (g_list.getGroupBy()) {
   // list is grouped so enable to Ungroup menu item
   g_menu.setEnabled(g_item);
} else {
   // list is not grouped, so disable the Ungroup menu item
   g_menu.setDisabled(g_item);
}
```

Search administration

The ServiceNow AI Platform® includes multiple search engines and interfaces to help users easily and quickly find the information they need.

Search engines

The ServiceNow AI Platform includes two search engines:

AI Search

AI Search is the default search engine for the ServiceNow AI Platform. It provides consumer-grade search capabilities for Customer Service Management, Now Mobile, Service Portal, and Virtual Agent .

Zing text indexing and search engine

Zing is a legacy search engine which provides fast results and emphasizes relevancy scoring.

Search plugins

These search plugins offer specialized search experiences for particular search contexts.

Contextual Search

The Contextual Search plugin enables search that focuses on query context and user intent to fetch the most relevant set of results. Contextual search displays related results within a form or record producer based on the text you enter in a field.

Intelligent Search for CMDB

Intelligent Search for CMDB enables users to query for a set of Configuration Items in the CMDB. Complex queries open in CMDB Query Builder, where you can refine them or run them.

Search interfaces and widgets

These are search fields and widgets offered in the ServiceNow AI Platform UI or in ServiceNow AI Platform applications.

Global search

Global search in the Next Experience UI allows you to search multiple tables from a single search field.

Service Portal

The Service Portal framework displays search data within a widget on the search page.

Service Portal search widgets

Service Portal includes widgets for multiple forms of search.

Now Mobile app

The Now® Mobile app provides global search, voice search, and photo search.

Mobile Agent

The Mobile Agent app enables service desk agents to promptly manage and resolve end user issues from their mobile devices.

Virtual Agent

The Virtual Agent platform uses search to help parse user statements and intents in chats.

Agent assist

The Agent assist feature in Workspace automatically displays possible solutions for records that agents open.

Machine learning solutions for Search administration

Machine learning in Search administration helps to enhance business scalability and improve business operations for organizations.

Businesses face a challenge with growing volumes of data, in extracting meaningful information from a huge set of raw data, and in deriving meaningful business insights. Machine learning can serve as a solution to a variety of business complexities as its algorithm is built using historical data. It helps avoid duplicate and inaccurate data being entered into the database and enables businesses to compute and process information much faster.

Predictive Intelligence for Contextual Search

The Predictive Intelligence for Contextual Search capability uses machine-learning algorithms to search for Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents.

Predictive Intelligence suggests related results to help you solve an issue or resolve a question.

The sources such as Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents are available only when the Predictive Intelligence plugin (com.glide.platform_ml) and the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) are active.

For more information, see Predictive Intelligence.

Features of Search administration

Enable and configure Search administration features.

Feature	Description	Top tasks	Status
Zing text indexing and search engine	Index and search record data by table.	• Configure a table for indexing and searching • Zing can expand search results with synonyms • Zing can include attachments in search results	Active
Contextual search	Display search results on forms and record producers when users enter text in a field.	Define a search context	Active

Search Suggestions

The Search Suggestions application uses saved user search data to create auto-complete suggestions for AI Search applications and search suggestions for Zing. These suggestions appear as you enter terms into an application's search field. You can refine your search or jump to a relevant search result by selecting an applicable suggestion.

Exploring Search Suggestions

Learn how Search Suggestions displays suggestions to users in AI Search applications and the Zing text indexing and search engine. Review the rules that dictate which suggestions are offered in each search application and context.

Search Suggestions overview

The Search Suggestions application makes it possible for search applications to display suggested search completions or results to users as they enter terms into a search field.

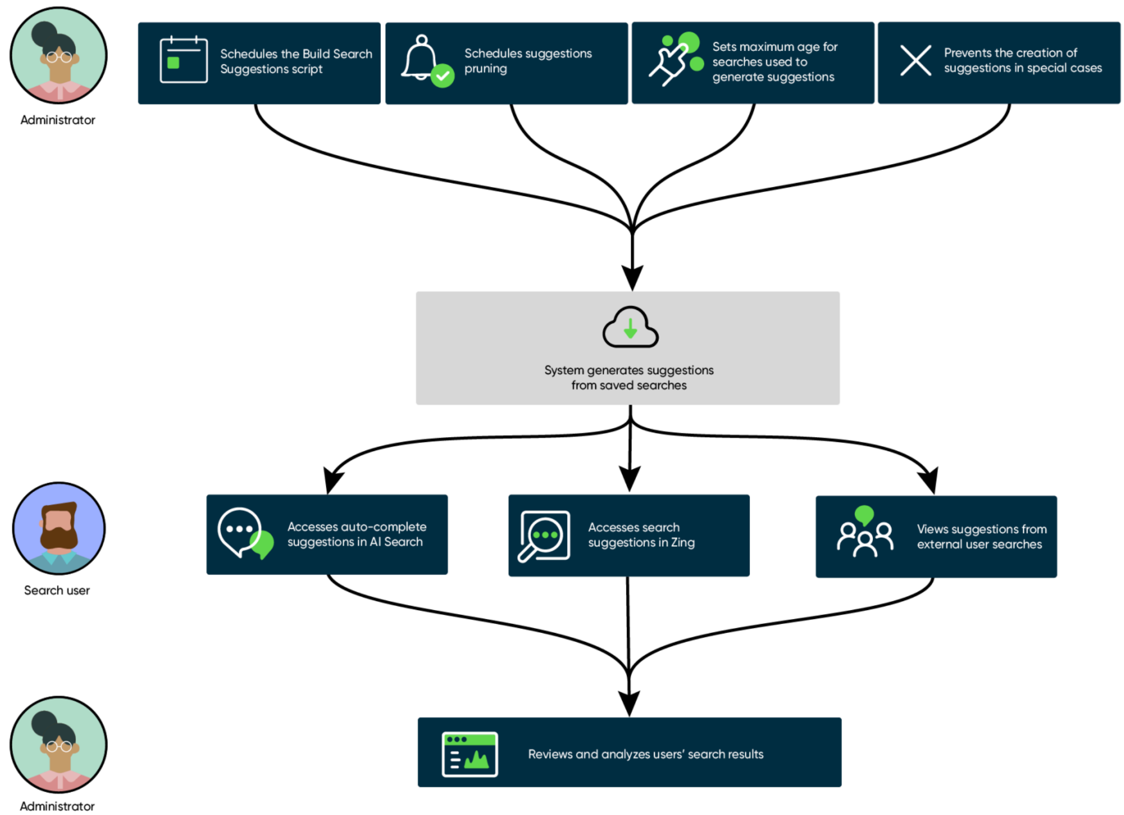
Search Suggestions saves query terms and results from user searches. A Build Search Suggestions script runs against this saved data periodically to generate auto-complete suggestions for AI Search and search suggestions for Zing text search. The Prune Search Suggestions script runs periodically to remove low-relevancy suggestions.

Administrators can limit the age of saved search data used to generate suggestions. They can also configure specific suggestions to prevent them from being displayed to search application users.

Search Suggestions workflow

In this infographic, see a sample workflow of how different users in an organization configure and use auto-complete suggestions and search suggestions with the Search Suggestions application.

Configuring and using Search Suggestions



In this Search Suggestions workflow:

1.
   - Administrators configure Search Suggestions settings, including scheduling of scripts and restrictions on which saved search results the system uses to create auto-complete suggestions and search suggestions.
   - The system saves users' search results and uses them to generate new auto-complete suggestions and search suggestions.
2.
   - Search users view and select generated auto-complete suggestions in AI Search applications.
   - Search users view and select generated search suggestions in Zing.
   - Non-authenticated guest users access and review the list of generated suggestions created from searches by external users.
3. Administrators review and analyze saved search results to improve understanding of how users interact with generated suggestions, allowing for more effective tuning of Search Suggestions settings.

Search Suggestions benefits

Benefit	Feature	Users
View and select relevant auto-complete suggestions when searching in AI Search applications.	Auto-complete suggestions in AI Search applications	AI Search users

Benefit	Feature	Users
View and select relevant search suggestions when searching with the Zing text search engine.	Zing displays search suggestions as users enter search terms	Zing search users
See the list of auto-complete suggestions and search suggestions created from searches by external users.	Use the GraphQL REST API to view suggestions created from external user searches	Non-authenticated guest user
Control suggestion generation time by configuring how often the system builds auto-complete suggestions and search suggestions from user search strings.	Schedule the Build Search Suggestions script	Administrator
Improve suggestion relevancy by configuring how often the system prunes the least relevant auto-complete suggestions and search suggestions from the Search Suggestion [sys_search_suggestion] table.	Schedule suggestion pruning	Administrator
Increase suggestion freshness by using only the most recent search event records to create auto-complete suggestions and search suggestions.	Set maximum age for searches used in suggestion generation	Administrator
Prevent creation of unwanted auto-complete suggestions and search suggestions.	Prevent the creation of suggestions in special cases	Administrator
Understand how users interact with search by analyzing data from the Search Suggestions tables.	Analyze search relevancy	Administrator

Configuring Search Suggestions

You can configure Search Suggestions settings to control the creation of auto-complete suggestions and search suggestions on your instance.

Configuration overview

Task	Description
Schedule the Build Search Suggestions script	Specify how often and at what time the system generates auto-complete suggestions and search suggestions from stored search strings. By default, this task runs daily.
Schedule suggestion pruning	Specify how often and at what time the system prunes the lowest-rated suggestions to limit the Search Suggestion [sys_search_suggestion] table to 500,000 suggestions. By default, this task runs weekly.
Set maximum age for searches used in suggestion generation	Specify the maximum age of search strings the system considers when creating auto-complete suggestions and search suggestions. By default, the system only

Task	Description
	generates suggestions using search strings from the last 180 days.
Prevent the creation of suggestions in special cases	Disable generation of suggestions from specific search strings to keep unhelpful terms from appearing in suggestions or to prevent disclosure of personal or secure information. As part of this task, you may want to test regular expression patterns in your Search Suggestion Exclusion List Rule entries.

Schedule the Build Search Suggestions script

Specify when to run the script that builds auto-complete suggestions and search suggestions from user search strings.

Before you begin

Role required: admin

About this task

Search Suggestions stores search strings entered by users in the Search Event [sys_search_event] table. The `Build Search Suggestions` script turns those search strings into auto-complete suggestions and search suggestions and stores them in the Search Suggestion [sys_search_suggestion] table.

By default, this script runs daily. You can customize how often and at what time the script runs. How often you run the script depends on how frequently you want to update suggestions for users. When you run the script might depend on performance considerations.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs** and select **Build Search Suggestions**.
2. In the Scheduled Search Execution form, edit how often the script runs in the **Run** field.
3. Edit the time of day the script runs in the **Time** field.
4. Select **Update**.
5. **Optional:** Select **Execute Now** to run the script immediately.

Schedule suggestion pruning

Search Suggestions limits the number of auto-complete suggestions and search suggestions stored in the Search Suggestion [sys_search_suggestion] table to 500,000. A periodic pruning job removes the least relevant suggestions and increases the overall relevancy of suggestions.

Before you begin

Role required: admin

About this task

By default, the pruning job runs once a week and limits the Search Suggestion [sys_search_suggestion] table to 500,000 suggestions. Once the table reaches that limit, the pruning job removes the lowest-rated auto-complete suggestions and search suggestions to keep the maximum number of suggestions at 500,000. Pruning the least relevant suggestions improves the relevancy of the suggestions.

How often you run the pruning job might depend on how frequently you generate suggestions from the Search Suggestion table, and how quickly the table exceeds 500,000 suggestions.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the **Prune Search Suggestions** job.
3. On the Scheduled Script Execution form, edit the following fields.

Field	Description
Run	Frequency of execution for the pruning job. To execute the job manually, select **On Demand** and select **Execute Now**.
Day	Day of the week to run the pruning job.
Time zone	Time zone to use when interpreting the **Time** field value.
Time	Time of day to run the pruning job. Specify hours (00–23), minutes (00–59), and seconds (00–59).
Repeat interval	Interval between executions of the pruning job when **Run** is set to `Periodically`. Specify days (01–07, where 01 is Sunday), hours (00–23), minutes (00–59), and seconds (00–59).
Conditional	Script to run when executing the pruning job.

Note:
The fields on the form change with the choice of the **Run** value.

4. Select **Update**.

Set maximum age for searches used in suggestion generation

Set the Auto Flush parameter to limit the age of search strings used to create auto-complete suggestions and search suggestions.

Before you begin

Role required: admin

About this task

The Search Event [sys_search_event] table contains all of the strings used in searches. Scripts use this table to generate search analytics, search suggestions, and auto-complete suggestions. A system property sets the maximum age for records preserved in the table. The default is 180 days, but you can change this number to preserve search events for a shorter or longer duration. Longer durations increase the size of the table and its disk consumption.

Procedure

1. Navigate to the Auto Flush [sys_auto_flush] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_auto_flush.list`.
   c. Press Enter.
2. Search on `*search` and open the **sys_search_event** record.
3. On the Auto Flush form, edit the **Age in seconds** value.
   The default is 15,552,000 seconds, which is 180 days.

Prevent the creation of suggestions in special cases

Disable generation of suggestions from specific search strings to keep unhelpful terms from appearing in suggestions or to prevent disclosure of personal or secure information.

Before you begin

Make sure you're familiar with Java's regular expression pattern syntax. To learn about regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Role required: admin

About this task

Search Suggestions generates auto-complete suggestions and search suggestions from the search strings that users enter. You may not want to create suggestions from all search strings. You can prevent the generation of suggestions using one of the following approaches:

- Exclude words or regular expression patterns from auto-complete suggestions and search suggestions.

  For example, a user might search on `KB2938272`. This search string is too opaque to provide a meaningful suggestion. Or, someone might enter a social security number or phone number as search strings which shouldn't be surfaced as suggestions to anyone else. So, you might exclude all search strings that contain multiple numbers. Likewise, if someone uses an expletive in a search string, you may not want to surface that word in suggestions. The Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table contains the list of excluded words and regular expression patterns.

  Note:
  In the base system, the Search Suggestion Exclusion List table contains excluded words for English and language-independent regular expression patterns. Search Suggestions inserts additional language-specific excluded words into this table when you activate any of the following languages: Chinese, Czech, Dutch, Finnish, French, German, Hebrew, Hungarian, Italian, Japanese, Norwegian, Polish, Portuguese, Russian, Spanish, Swedish, Thai, or Turkish.

- Assign roles to users that prevent the generation of suggestions from their search strings.

  There may be individuals whose searches shouldn't appear in search or auto-complete suggestions for privacy or security reasons. To prevent their searches from generating suggestions, assign them the suggestion_exempt role. This role is unnecessary in most situations. Search Suggestions never shows who performed the initial search. To prevent people from seeing auto-complete suggestions and search suggestions, assign them the cannot_read_suggestions role.

Procedure

1. Navigate to the Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_search_suggestion_blacklist.list`.
   c. Press Enter.
2. To make a word or regular expression pattern active or inactive:
   a. Select the term in the list that you want to activate or deactivate.
   b. In the Search Suggestion Exclusion List form that appears, select or clear the **Active** option.
3. To add a new excluded word or regular expression pattern:
   a. Select **New**.
   b. On the Search Suggestion Exclusion List form, fill in the fields.

Search Suggestion Exclusion List form

Field	Description
Phrase	Word or regular expression pattern to exclude.
Language	The language that the excluded word is in. Use the ISO 639-1 code for the language, such as "en" for English. Because regular expression patterns work for all languages, search suggestions ignores this field for regular expression patterns.
Description	Explanation of why you excluded the word or regular expression pattern if it's not obvious. This field is especially important for regular expression patterns.
Active	Option to remove the excluded word or regular expression pattern from suggestions.
Type	Option that specifies whether the **Phrase** field represents one word or a regular expression pattern.

Note:
If you use regular expression patterns, you should verify that they exclude the words you want. For more information, see Test regular expression patterns in Search Suggestion Exclusion List Rule entries.

4. To assign someone a role that prevents them from seeing auto-complete suggestions and search suggestions, or to prevent their search strings from becoming suggestions:
   a. Navigate to **All** > **User Administration** > **Users** and select the name of a user.
   b. In the Roles related list, select **Edit**.
   c. To prevent a user from seeing auto-complete suggestions and search suggestions, move **cannot_read_suggestions** from the Collections column to the Roles List column and select **Save**.
   d. To prevent a user's search strings from generating auto-complete suggestions and search suggestions, move **suggestion_exempt** from the Collections column to the Roles List column and select **Save**.

Test regular expression patterns in Search Suggestion Exclusion List Rule entries

Regular expression patterns are powerful and often require editing to get the correct behavior. When using regular expression patterns to exclude search strings, test the patterns thoroughly so as not to have unintended results.

Before you begin

Make sure you're familiar with Java's regular expression pattern syntax. To learn about regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Role required: admin

About this task

The Exclusion List Rule and Search Suggestion Relations [m2m_blacklist_search_suggestion] table lists the suggestions eliminated from the Search Suggestion [sys_search_suggestion] table by entries in the Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table.

Procedure

1. In your browser, navigate to `https://<instance name>.service-now.com/m2m_blacklist_search_suggestion_list`.
   A list of words excluded from search suggestions appears in the Exclusion List Rule and Search Suggestion Relations table. The Suggestion column shows the search string that was eliminated in the creation of suggestions.
2. Add a regular expression pattern to the exclusion list table.
   For more information, see Preventing suggestions in special cases.
3. In a search field, for example, on the ServiceNow® Service Portal, enter words that satisfy the regular expression pattern.
4. Run the script that builds the search suggestions.
   For more information, see Schedule the Build Search Suggestions script. Select **Execute Now** to run the script immediately.
5. In the m2m_blacklist_search_suggestion_list table, select the menu icon (≡) for the Exclusion List column heading, then select **Group By Exclusion List** to see the regular expression patterns and what they eliminated.
6. Review the suggestions in the table to see if the regular expression patterns removed the suggestions they should have and no more.
7. In the sys_search_suggestion_blacklist table, set an excluded regular expression pattern's **Active** field to **false**, then run the Build Search Suggestions script again to make sure that only excluded suggestions were removed.
8. Revise the regular expression patterns if necessary and repeat the procedure.

Using Search Suggestions

Search applications display auto-complete suggestions and search suggestions as you type in their search fields. Administrators can analyze data from Search Suggestions tables to learn how users interact with search. Guest users can view suggestions created from self-registered external user searches.

Using Search Suggestions in AI Search

AI Search applications display auto-complete suggestions created by the Build Search Suggestions script. Auto-complete suggestions appear as you enter terms into the application's search field. You can select an auto-complete suggestion to accept it as your search query.

To learn more about auto-complete suggestion usage and configuration in AI Search applications, see Auto-complete suggestions in AI Search applications.

Using Search Suggestions in Zing text indexing and search engine

Zing displays search suggestions created by the Build Search Suggestions script. Search suggestions appear as you enter terms into the Zing search field. You can select a search suggestion to accept it as your search.

For more details on how search suggestions appear in Zing, see Zing displays search suggestions as users enter search terms.

Analyze search relevancy

Analyze data from the Search Suggestions tables to understand how your users interact with search.

Before you begin

Role required: admin

About this task

Search Suggestions uses the following tables:

- Search Event [sys_search_event]: Stores all search strings and search results.
- Search Source Event [sys_search_source_event]: Stores search strings and search results and ties them to a data source, for example, the suggestion came from the knowledge base table rather than the catalog table.
- Search Suggestion [sys_search_suggestion]: Stores suggestions for searches.

For details on the Search Suggestions tables, see Search Suggestions tables.

Procedure

1. Display the Search Event [sys_search_event] table by navigating in your browser to `https://<instance name>.service-now.com/sys_search_event_list.do`.
2. Find search queries with **Has results** column values of **false**.
   A value of false means that someone searched but didn't get any search results. You can choose to create information, such as a Knowledge article, to provide search results in the future, create synonyms for the search words that would surface a search result, or not provide information if the question is irrelevant.
3. Average the numbers in the **Click rank** column.
   Click rank shows which search result you selected. If you click the first result in the list of search results, the click rank value is 1. If you click the 6th result listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first result, return to the search page and click the 6th result, return to the search page and click the 4th result and find an answer, the click rank is 6 (not 4). A click rank of 0 means that you didn't select any search result, or that you selected a Genius Result answer card in AI Search. Lower positive click rank values indicate that the top search results are the most relevant, so the goal is to reduce the average value for this field.
4. Determine the click-through rate by dividing the number of records where the click rank isn't zero by the total number of records.

   Higher click-through rate numbers are better. Click-through rate is a good indicator of how often users find relevant results, but it doesn't reveal how much effort it took to find those results. That's where click rank comes in. Click rank describes how much effort it took the user to find what they perceived to be a relevant result.

5. Average the numbers in the **Refinements** column.
   Refinement is the number of actions a user took to reduce the number of search results. Actions include sorting and filtering. More refinements means more effort to find relevant search results, so lower numbers are better.
6. Display the Search Source Event [sys_search_source_event] table by navigating in your browser to `https://<instance name>.service-now.com/sys_search_source_event_list.do`.
7. Find search queries with **Has results** column values of **false**.
   False means that someone searched but didn't get any search results from a particular source table, for example, the Knowledge Base table. You can choose to create information, such as a Knowledge article, on the source to provide search results in the future, create synonyms for the search words that would surface a search result in that source table, or not provide information if the question is irrelevant.

Use the GraphQL REST API to view suggestions created from external user searches

Submit a request to the GraphQL REST API endpoint to retrieve search suggestions created from searches by self-registered external users. This endpoint allows access by non-authenticated guest users.

Before you begin

Ensure that the following conditions are met in your instance:

- The Domain Separation plugin isn't activated. For details on this plugin, see Domain separation plugin.
- The Explicit Roles plugin (com.glide.explicit_roles) is activated. To learn more about this plugin, see Explicit Roles.
- External users with the snc_external role have submitted searches in search applications that generate search suggestions, such as ServiceNow® Service Portal, Now Mobile, or ServiceNow® Virtual Agent.
- The *`glide.search.suggestions.allow_guest_user`* system property is set to **true**. For details on setting a system property value, see Add a system property.

Obtain the sys_id of the search application that you want to retrieve external user search suggestions for.

Note:
Users with the search_application_admin, agent_workspace_user, or workspace_user roles can obtain this sys_id by copying it from the search application record in the Search Application Configuration [sys_search_context_config] table.

Download a third-party GraphQL client, such as the GraphiQL, Insomnia, or Postman client.

Role required: none

About this task

Search Suggestions creates suggestions for searches performed by self-registered external users. When the *`glide.search.suggestions.allow_guest_user`* system property is set to **true**, non-authenticated guest users can access the GraphQL REST API endpoint for your instance to retrieve external user search suggestions for a search application.

No authentication is required or enforced for this GraphQL REST API endpoint.

servicenow

Note:
Non-authenticated guest users can only retrieve search suggestions from the Global domain. If domain separation is enabled in your instance, guest users can't retrieve any search suggestions.

Procedure

1. In your third-party GraphQL client, configure a new request that uses the HTTP POST method.
2. Set the endpoint for the request to the GraphQL REST API endpoint for your instance, `https://<instance name>.service-now.com/api/now/graphql`.
3. Set the request body to the following GraphQL query, replacing `<search_application_sys_id>` with the sys_id of the search application that you want to retrieve external user search suggestions for:

```
{
  GlideSearch_Query {
    suggestions(searchContextConfigId:
 "<search_application_sys_id>", searchTerm: "") {
      term
      data {
        name
        records {
          type
          columns {
            label
            fieldName
            value
            displayValue
          }
        }
      }
    }
  }
}
```

Result

The system returns search suggestions from application searches by self-registered external users as a JSON object, as shown in this example:

```
{
  "data": {
    "GlideSearch_Query": {
      "suggestions": {
        "term": "",
        "data": [
          {
            "records": [
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "automatic replies",
                    "value": "automatic replies",
                    "fieldName": "name"
                  }
```

```
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "contact group",
                    "value": "contact group",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "tablet",
                    "value": "tablet",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "laptop",
                    "value": "laptop",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "new email account",
                    "value": "new email account",
                    "fieldName": "name"
                  }
                ]
              }
            ],
            "name": "Popular searches"
          }
        ]
      }
    }
  }
}
```

Search Suggestions reference

Reference topics provide additional information about components and domain separation behavior for Search Suggestions.

Installed with Search Suggestions

Several types of components are installed with activation of the Search Suggestions plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description	Contains roles
Search Suggestions blocked searcher [cannot_read_suggestions]	Doesn't see search or auto-complete suggestions displayed when searching.	None
Search Suggestions exempt searcher [suggestion_exempt]	Submits searches that the system ignores when generating search or auto-complete suggestions.	None

For more details on restricting generation of search suggestions, see Prevent the creation of suggestions in special cases.

Scheduled jobs installed

Scheduled job	Description
Build Search Suggestions	Converts searches stored in the Search Event [sys_search_event] table into auto-complete suggestions and search suggestions stored in the Search Suggestion [sys_search_suggestion] table.
Prune Search Suggestions	Removes the lowest-rated auto-complete suggestions and search suggestions from the Search Suggestion [sys_search_suggestion] table to keep the maximum number of suggestions at 500,000.

Tables installed

Table	Description
Search Event [sys_search_event]	Search strings and details about their associated results, including the search user, application, UI source, session, and language, and any user-specified click rank and refinements.
Search Event per source table	Correlations between search strings with search results from a specific table (data source). A search that queries multiple tables produces multiple Search Event per source records.

Table	Description
[sys_search_source_event]	
Search Suggestion [sys_search_suggestion]	auto-complete suggestions and search suggestions generated from user searches by the Build Search Suggestions scheduled job. The Prune Search Suggestions scheduled job removes the lowest-rated auto-complete suggestions and search suggestions from this table to keep its maximum size at 500,000 suggestion records.

To learn about individual columns on these tables, see Search Suggestions tables.

Search Suggestions tables

Search Suggestions uses tables to generate and track relevant search suggestions. You can review data from these tables to gain insight into search suggestions offered in your system.

Note:
Because the Search Suggestions tables are system tables, they are excluded from the Reporting module by default. To learn about enabling reporting on system tables, see Reporting on system tables.

Search Event table

The Search Event [sys_search_event] table stores search strings and their search results.

sys_search_event table

Column	Description
Search query	Search string that the user entered.
Has results	Boolean value that specifies whether the search did (true) or didn't (false) return results. For all false values, consider adding information so that the same search would return suggestions in the future.
Click rank	Click rank shows which search result you selected. If you click the first result in the list of search results, the click rank value is 1. If you click the 6th result listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first result, return to the search page and click the 6th result, return to the search page and click the 4th result and find an answer, the click rank is 6 (not 4). A click rank of 0 means that you didn't select any search result, or that you selected a Genius Result answer card in AI Search. Lower positive click rank values indicate that the top search results are the most relevant, so the goal is to reduce the average value for this field.
User	User who performed the search.
Application ID	Application where the search feature was used, for example, you did a search in the Service Portal. See **UI source**.
Language	Language of the query. Search only returns results that are in the same language as the search query.
Refinements	Number of actions that you took to reduce the number of search results. Actions include sorting and filtering. The goal is to reduce this number.
UI source	Specific page (mobile) or page (portal) where the search query came from. See **Application ID**.

sys_search_event table (continued)

Column	Description
Session	ID of the session, which specifies when the search happened.
AI Search Profile	Name of the search profile used for the search. Only applicable for searches made with the AI Search engine.
GR Configurations Executed	Shows the list of Genius Result configurations that the system evaluated for the search. Genius Result configurations in this list may or may not have displayed answer cards for the search. Only applicable for searches made with the AI Search engine.
Genius Result Displayed	Shows whether or not any Genius Result answer cards were displayed for the search. Only applicable for searches made with the AI Search engine.
GR Configurations with Result Displayed	Shows the list of evaluated Genius Result configurations that displayed answer cards for the search. A Genius Result configuration can appear multiple times in this list if it displayed multiple answer cards for the search. Only applicable for searches made with the AI Search engine.
Last Clicked Genius Result Position	Shows which Genius Result answer card you selected an action from. If you select an action from the first displayed Genius Result answer card, the position value is 1. If you select an action from the third answer card, the value is 3. A value of 0 means that you didn't select actions from any Genius Result answer card. Only applicable for searches made with the AI Search engine.
Genius Result Events	JSON document showing details of actions you selected from Genius Result answer cards displayed for the search. Only applicable for searches made with the AI Search engine.

Search Event per source table

The Search Event per source [sys_search_source_event] table stores records correlating search strings with results from a specific table, here called a data source. A search can query multiple tables. The sys_search_event table lists one record for the entire search, while the sys_search_source_event table lists one record for each data source (table) queried.

sys_search_source_event

Column	Description
Search query	Search string that you entered.
Source	System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal wouldn't be used as a suggestion in Now Mobile.
Has results	Boolean value that specifies whether the source did (true) or didn't (false) supply search results. For all false values, consider adding information so that the same search query would return suggestions in the future.
Created	Time stamp of the search query.

Search Suggestion table

The Search Suggestion [sys_search_suggestion] table stores auto-complete suggestions and search suggestions. A scheduled job uses the sys_search_event table to build the content of the suggestion table. This job segregates generated suggestions by source. Suggestions generated from searches on the Service Portal, for example, are only returned for other Service Portal searches. These suggestions aren't returned for Now Mobile queries.

sys_search_suggestion

Column	Description
Application ID	Application where the search feature was used, for example, you did a search in the Service Portal.
User group	Specifies whether an internal or external user generated the search query. Suggestions for internal users aren't shared with external users and vice versa.
Language	Language of the query. Search only returns suggestions that are in the same language as the search query.
Score	Suggestion rank. The higher the score, the more relevant the suggestion. Once all suggestions are returned for a search query, the suggestions are sorted by **Score**, the highest listed first. Scores reflect how often you selected a suggestion. A popular suggestion implies that it answers the query.
Source	System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal wouldn't be used as a suggestion in Now Mobile.

Domain separation and Search Suggestions

Domain separation is unsupported in the Search Suggestions application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Search Suggestions domain separation overview

Domain separation provides complete data isolation for domain-specific users.

How domain separation works with Search Suggestions

By default, Search Suggestions results are limited to the specific domain of the logged-in user. Search and auto-complete suggestions aren't shared in parent or child domains.

Related topics

Domain separation

Search signals

Search stores signal data from user searches. The aggregated signal data helps improve search result relevancy in your system.

Signals record details of user searches, search refinements, and interactions with search results.

AI Search machine learning relevancy analyzes aggregated signal data and automatically tunes search relevancy scoring to reflect user behavior patterns. This tuning helps improve result relevancy for search users.

To learn more about AI Search machine learning relevancy, see Machine learning relevancy in AI Search.

Search signal tables

Search uses tables to store details from user searches, search refinements, and interactions with search results. These details are called search signals. Data from the search signal tables helps improve the relevancy of search results in your system.

Search signals refer to user, query, and similar data stored in columns on search suggestion tables. For a guide to search suggestion tables and their columns, see Search Suggestions tables.

Note:
Because the search signal tables are system tables, they are excluded from the Reporting module by default. To learn about enabling reporting on system tables, see Reporting on system tables.

Search Signal Event table

The Search Signal Event [sys_search_signal_event] table stores signal data produced when users submit a search.

sys_search_signal_event

Column	Description
Search event	Reference to the record for the search event on the Search Event [sys_search_event] table.
Browser	User browser agent string.
Latitude	Latitude coordinate of the user location in decimal degrees.
Longitude	Longitude coordinate of the user location in decimal degrees.
Matched Query Intents	List of query intents matched in the user search query.
First page results	JSON array of objects in which each node represents a single result returned in the first page of results for the search. The result order is preserved. Each object includes the unique record identifier (sys_id) of a result and the table where the result is located.

sys_search_signal_event (continued)

Column	Description
	Note: The first page results aren't updated when you refine a search.
Search Response Time(ms)	Time taken by the search, in milliseconds.
User Query Language	Language of the user search query.

Search Signal Result Event table

The Search Signal Result Event [sys_search_signal_result_event] table stores signal data for search results that users select.

sys_search_signal_result_event

Column	Description
Search query	Search query that led to the search result selection.
User	User that selected the search result.
Result DocID	Source table and record names for the selected search result.
Description	Short description for the selected search result.
Source Table	Source table for the selected search result.
AIS DocID	Source table name and record sys_id for the selected search result.
Result Type	Type of search result selected. For example, *REGULAR* for a regular search result or *GENIUS* for a Genius Result answer card.
Search Signal Event	Reference to the record for the search on the Search Signal Event [sys_search_signal_event] table.
Number	Record number for the selected search result.
Domain	Domain to which the selected search result belongs.
Use for Suggestions	Option indicating whether AI Search uses this result selection when computing auto-complete suggestions. For more details, see Auto-complete suggestions in AI Search applications
Source URL	URL for the selected search result.
Action Data	JSON array of objects representing the search result selection action.

Search Signal Result Event Action table

The Search Signal Result Event Action [sys_search_signal_result_event_action] table stores signal data for user interactions with search results.

sys_search_signal_result_event_action

Column	Description
Signal Type	The type of user interaction signal recorded for the search result. For example, `CLICK` indicates that the user selected a search result.
Signal Value	The value for the user interaction signal. For example, when the signal type is `CLICK`, the signal value is the numeric index for the search result that the user selected.
Search Signal Result Event	Reference to the record for the search result on the Search Signal Result Event [sys_search_signal_result_event] table.

Search Autocomplete Query Event table

The Search Autocomplete Query Event [sys_search_autocomplete_query_event] table stores signal data for auto-complete suggestions that users select from the search input field.

sys_search_autocomplete_query_event

Column	Description
Selected Query	The auto-complete suggested query that the user selected in the search input field.
Click Index	The numeric index of the auto-complete suggestion that the user selected in the search input field.
Latitude	Latitude coordinate of the user location in decimal degrees.
Longitude	Longitude coordinate of the user location in decimal degrees.
Search Profile	Reference to the search profile used for the search query.

Genius Result Event Action table

The Genius Result Event Action [sys_search_genius_result_event_action] table stores signal data for user interactions with Genius Result answer cards.

sys_search_genius_result_event_action

Column	Description
Action Id	The identifier for this Genius Result event action signal.

sys_search_genius_result_event_action (continued)

Column	Description
Action Type	The type of action taken from the Genius Result answer card.
Action Value	The value, if any, for the action taken from the Genius Result answer card.
Matched Genius Result Intents	List of NLU model intents matched by the action taken from the Genius Result answer card. **Note:** This field is only populated for Genius Result configurations with NLU triggers.
Card Type	The type of Genius Result answer card that the user interacted with.
Search Signal Result Event	Reference to the record for the Genius Result answer card on the Search Signal Result Event [sys_search_signal_result_event] table.

Zing text indexing and search engine

Index and search record data by table.

The ServiceNow® Zing text indexing and search engine is the default search engine used to search ServiceNow AI Platform® record data. Its engine is created entirely with ServiceNow code and implemented within the relational model.

The Zing text search index is split into multiple database shards for parallel querying. Its search engine logic yields fast results and emphasizes relevancy scoring. Relevancy scores include frequency and proximity weighting. Scores also include weighting for specific indexed fields such as title, short description, and metadata.

Zing provides type-ahead search suggestions and **Did you mean:** global search suggestions.

Administrators and users with the ts_admin role can configure the following Zing text search settings:

- match relevance
- relevancy field weights for each indexed table
- global stop words
- stop words for each index
- synonym dictionaries for each table
- tables with attachment indexing

Explore	Set up	Administer

• Washington DC • Features of Search administration • Features of Zing text indexing and search engine	• Set global text search properties • Zing can include attachments in search results • Zing can expand search results with synonyms	• Zing indexes words • Global search finds records from multiple tables • List search finds records from the current table
Use	Develop	Troubleshoot and get help
• Boolean operators allow conditional search results • Quotation marks allow exact phrase searches • Wildcard characters allow searching for patterns and variations	• Developer training • Developer documentation • Create synonym dictionaries	• Ask or answer questions in the Platform forum • Search the Known Error Portal for known error articles • Contact Customer Service and Support

Features of Zing text indexing and search engine

Enable and configure Zing text indexing and search engine features.

Feature	Description	Top tasks	State
Zing indexes words	Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages.	• Configure a table for indexing and searching • Regenerate a text index for a table • Configure tables to use the Japanese tokenizer	Active
Zing computes document scores using three components	Compute document scores based on the frequency, sequence, and weight of search terms in the document.	• Score search terms by inverse document frequency (IDF) • Set the relative weight of a field	Active

Feature	Description	Top tasks	State
Global search finds records from multiple tables	Search multiple record types from a single search field.	• Add a search group for Core UI • Configure a table for indexing and searching	Active
Search results page in Core UI and UI15	Display global text search results for each table as Zing generates them.	• Add a search group for Core UI • Revert to the legacy global search UI	Active
List search finds records from the current table	Search records from a table list view.	• Configure a table for indexing and searching • Regenerate a text index for a table	Active
Zing can include attachments in search results	Search content from attachments on indexed tables. Display attachments for search results from the Knowledge [kb_knowledge] table.	• Index attachments on a table • Configure a table for indexing and searching	Active
Zing removes stop words from queries	Remove common words from search queries that don't produce meaningful results.	• Configure a global stop word • Configure a table-specific stop word	Active

Feature	Description	Top tasks	State
Zing matches derived words with stemming	Convert any multiple-character search keyword to its stem form to find derived versions of the word.	• System Localization properties • Activate a language	Active
Zing can expand search results with synonyms	Expand search results to include additional search terms. Requires configuration before use	• Enable search synonyms • Create synonym dictionaries	Inactive

Available search options

Zing offers users several search interfaces and search operators to conduct text searches.

Available search interfaces

Search interface	Description
Global search	Find records in multiple tables using the global search field in the Next Experience Unified Navigation.
Search a list	Find records in a list; search in a specific field (Go to), all fields (Search), or in a specific column.
Knowledge Base	Find knowledge articles.
Live feed	Filter, search, or sort messages in live feed.
UI pages	Create a custom UI page to search for records in a table.

Available search operators

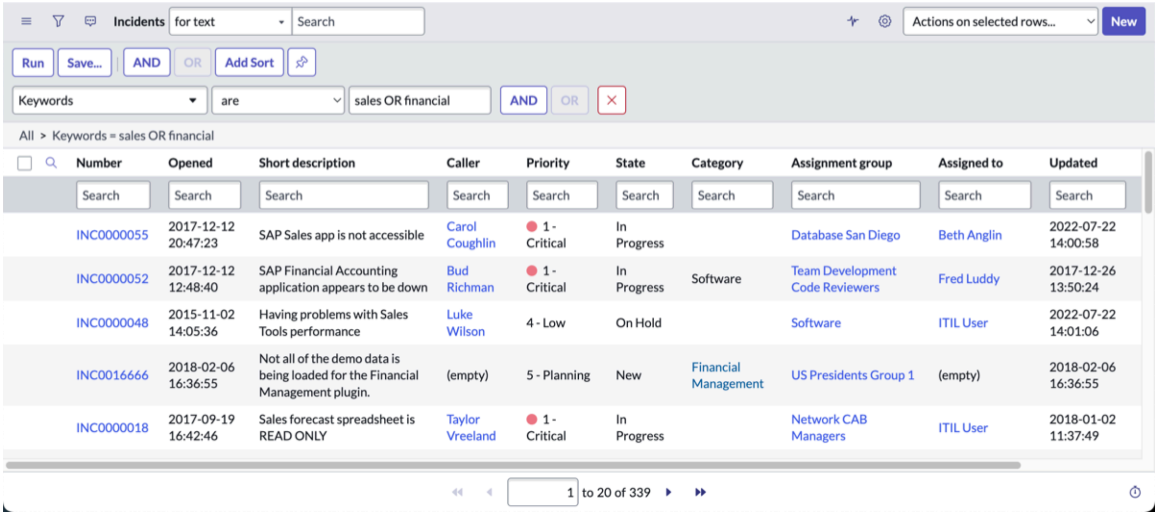
Search operator	Description
Boolean operators	Construct complex searches using Boolean AND, OR, and NOT operators in global text searches.
Quotation marks	Wrap search terms in quotation marks to search for an exact phrase consisting of one or more words.
Wildcard characters	Expand search results to match any non-space character. Zing supports both single-character and multiple-character wildcards.

List search finds records from the current table

Search records from a table list view.

Indexed tables display the *for text* option in the list title bar, which searches all records for matching field values.

List search



The list search field accepts Boolean operators (AND, OR, and NOT) in search queries. When a user adds a Boolean operator to a search query, the system only returns records that match all search conditions of the query.

The system also converts any search query into an equivalent keyword condition in the list breadcrumbs and filter. For example, searching for the text "Oracle OR SAP" produces the condition **[Keywords] [are] [Oracle OR SAP]**. The standard list controls can modify or remove these breadcrumbs and conditions.

Boolean operators allow conditional search results

Construct complex searches using Boolean AND, OR, and NOT operators in global text searches.

You can use Boolean operators in all global text search interfaces:

- Global text search field
- Knowledge Base search
- List search for text

Note:
Boolean operators are case-sensitive. As an example, the system recognizes OR as a Boolean operator, but treats `Or` and `or` as regular search terms.

Boolean operators

Operator	Description
OR or vertical bar symbol (|)	Finds a match if any of the search terms exist in a document (a union of sets). For example, to find documents that contain either `email password` or just `email`, you can search for `"email password" OR email` or `"email password"|email`. Using the `.or.` operator, which the system uses when you create OR condition groups for fields other than Keywords with the condition builder, can produce different results. For example, this filter searches for records with short

Boolean operators (continued)

Operator	Description
	descriptions containing SSO and then searches separately for records with short descriptions containing SAML: **Searching with the filter choice lists**  **Note:** By design, you can only have one Keywords filter condition per condition set. If you select the Keywords field in a filter choice list, the OR button for that filter condition becomes unavailable. Similarly, if you construct an OR filter condition, the Keywords field becomes unavailable in the filter choice lists.
AND	Finds a match if all search terms exist in a document (an intersection of sets). For example, to find documents that contain both "CPU load" and "10 minutes", search for `"CPU load" AND "10 minutes"` By default, Zing applies an AND operator between all search terms not separated by OR or NOT operators. For example, if you enter `email server down` as your search terms, the system searches for `email AND server AND down`. **Note:** For Knowledge Base searches, if the default AND search returns poor results, the search is automatically re-run with the OR operator. Administrators can configure the knowledge base search to always use OR by modifying the *`glide.knowman.search.operator`* system property.
NOT, minus (-), or exclamation point (!)	Excludes documents that contain the search term after the NOT operator (a difference of sets). For example, to find documents that contain "CPU load" but not "10 minutes", you can search for `"CPU load" NOT "10 minutes"` or `"CPU load" -"10 minutes"` or `"CPU load" !"10 minutes"`. NOT must be a stand-alone term in your search. For example, `atom NOT ion` excludes the term `ion`, but NOTION searches for the term `notion`. The minus and exclamation point symbols must immediately precede the search term that you want to exclude. For example, a search for `email !Joe` excludes `Joe` but a search for `email ! Joe` includes `Joe`. You can't use the NOT operator to exclude all terms in your search. For example, the following search returns no results: NOT `"10 minutes"`.

Related topics

Knowledge properties

Quotation marks allow exact phrase searches

Wrap search terms in quotation marks to search for an exact phrase consisting of one or more words.

Search terms in quotation marks are treated as exact phrase searches. When you search for an exact phrase, Zing only matches documents that contain the quoted words in the exact order you specify.

As an example, searching for `email password` returns search results that include `email` and `password` in any order, including records with these text strings:

- `enter your email password`
- `your email account password`

If you search for the quoted phrase `"email password"`, Zing returns search results with text `enter your email password` because they contain `email password` as an exact phrase. It doesn't return results with text `your email account password` because the search terms don't occur in the exact order specified in your search phrase.

Exact phrase searches ignore:

- stop words
- punctuation marks
- wildcard characters

Note:
Wildcard characters are ignored as punctuation.

For example, searching for the phrase `"email password"` returns the same search results as these phrases:

- `"email the password"` because the stop word `the` is ignored.
- `"email password?"` because the punctuation mark ? is ignored.
- `"email password*"` because the wildcard character `*` is ignored as punctuation.

Wildcard characters allow searching for patterns and variations

Expand search results to match any non-space character. Zing supports both single-character and multiple-character wildcards.

The following searches support Zing wildcard characters.

- Global text search
- Knowledge Base

  Note:
  Users with the admin role can enable wildcard search in the Knowledge context by navigating to **All** > **Contextual Search** > **Search Contexts**, editing the **Knowledge Base Search** record, and selecting the **Enable wildcard searches** check box.

- Search a list

  Note:
  To perform a wildcard text search of a list, you must select **for text** as the search field. If you select a list field instead of **for text**, wildcard characters in search terms will be interpreted as list search wildcards (for non-reference fields) or as auto-complete wildcards (for reference fields).

To perform a single-character wildcard search, use the percent sign (%) character. This wildcard finds words that contain any one character in place of the percent-sign-character. For example, to find words such as **text** or **test**, search for `te%t`.

To perform a multiple-character wildcard search, use the asterisk (`*`) character. This wildcard finds words that contain zero or more characters in place of the asterisk-character. For example, to find words such as **planned** or **placed**, search for `pl*d`.

You can use wildcard characters anywhere in a search string, and can include multiple wildcards in the same word. For example, to find words including **affordable**, **effort**, and **offering**, search for `%ff%r*`.

If a wildcard search returns too many hits, the system displays a message asking you to refine the search. Administrators can set a global text search property to change the limit for wildcard search results.

Note:
Wildcard text searches are only effective with multiple character words. A wildcard within a sequence of pictogram characters returns too many options for an efficient search. Wildcards are best used with letter-based words.

Wildcard characters and synonym matching

Zing doesn't expand the `%` and `*` wildcard characters when looking for synonyms that match your search term. These characters are treated as literal characters when finding matching synonyms. As an example, if you search for `issu*`, Zing doesn't find synonyms for `issue`, but it does find synonyms for `issu*`.

Enable or disable the Zing junk filter

When its junk filter is enabled, Zing doesn't index or search for 2-digit numbers or single-character words (unless they are Chinese or Japanese characters). You can enable or disable the junk filter for individual tables.

Before you begin

Role required: admin

About this task

For example, to disable matches for search terms like `a` or `40` in the Knowledge Base, turn on junk filtering for the kb_knowledge table.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary entry for the table.
3. In the Attributes related list, set the value of the **Text index filter junk** attribute:
   a. If you want Zing to include 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to `false`.
   b. If you want Zing to ignore 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to `true`.
4. Select the additional actions icon (≡) in the Dictionary Entry form header, then select **Save**.

5. Select the **Generate Text Index** related link and select **OK**.

Note:

- To have the desired effect, you may also need to reconfigure the automatic stop words. For example, if a specific 2-digit number appears in all of your problem numbers (92-0001, 92-0002, and so on), the automatic stop word threshold is quickly exceeded and the word is no longer found in searches. To find that 2-digit number in the problem table, you must disable both junk filtering and automatic stop words.
- Disabling the junk filter results in a larger table index. For optimal performance, don't apply this attribute unless it's required.

Debug Zing

Debugging messages create a log of search processes as they occur. These messages may help administrators configure optimal performance settings.

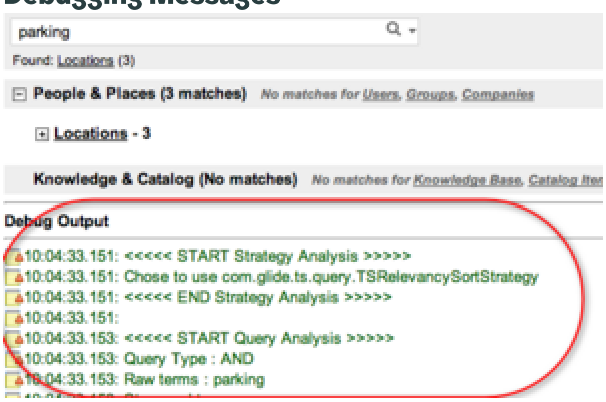
Before you begin

Role required: admin

About this task

- To view debugging messages, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Text Search**. The search log messages appear at the bottom of the results page for the remainder of your session.

Debugging Messages



- To debug text indexing problems, you may want to view text_index events in the system log.
- In rare cases, you may need to reset the text search caches after regenerating a text index. If text search fails for known words, diagnose and fix this problem:

Procedure

1. Enable text search debugging messages.
2. In any table with search problems, search for the problem text.
3. In the debug output, note the numbers used for the Stemmed terms.
4. Navigate to the Ts Word [ts_word] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `ts_word.list`.
   c. Press Enter.

5. Locate the stemmed terms and compare the numbers in the list to the debug output from step 3.
   If the numbers are different, the UI node's cache is stale.
6. Navigate to **All** > **System Definition** > **Text Indexes**.
7. Select the **Reset Text Search Caches** related link and select **OK**.

Global search finds records from multiple tables

Search multiple record types from a single search field.

To perform a global search, perform one of the following actions based on your UI version.

UI version	Action
Next Experience UI	Enter your search terms in the Unified Navigation search field, then select **View results** or press Enter.
Core UI	Select the search icon in the banner on the upper right of the System settings for the user interface (UI) , then enter your search terms and press Enter.

All UI versions also have a global search keyboard shortcut. The `ui_global_text_search` UI Macro provides the global search field.

For a list of search source tables that the system searches by default, along with steps for adding new search source tables, see Default global search sources for Next Experience UI and Default global text search groups for Core UI.

Global search supports Boolean operators, quoted phrases, and wildcard characters. For details on these search features, see Boolean operators allow conditional search results, Quotation marks allow exact phrase searches, and Wildcard characters allow searching for patterns and variations.

Keyboard shortcuts

Global search displays a page of matching results

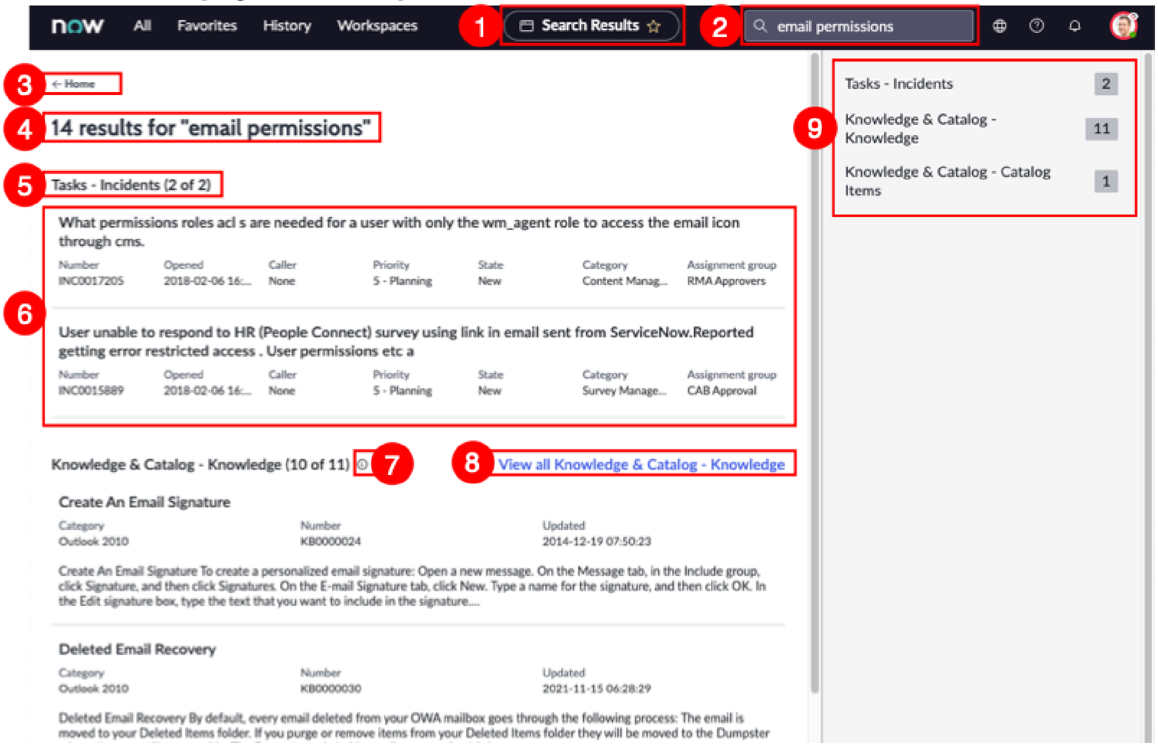
Global search displays a page of results that match your search, grouped by table.

The elements included on the search results page differ by UI, as described in the following sections.

Search results page in Next Experience UI

Global search displays a Search Results page containing results that match your search terms, grouped by search source. Results appear when the search is complete.

Search Results page in Next Experience UI



Zing displays global search results in a dedicated page consisting of these elements.

Elements of the global search results page in Next Experience UI

UI element	Description
1. Search Results page title	Contextual app pill for the search results page.
2. Global search field	Field displaying your current search terms. If you edit these terms, refresh the results page by selecting the **View results** link that appears in a panel below the search field.
3. Contextual return link	Link to return to the page you were on when you performed the search. The title of this link depends on which page you searched from.
4. Total result count	Total number of records matching your search.
5. Search source table name and result count	Name of a search source table and the number of previewed and total matching records in that table. Users with the admin or ui_builder_admin roles can hide the per-table counts of matching records. For details on making this change, see Hide per-table search result counts in Next Experience UI.
6. Preview of matching records for table	Partial list of matching records for the specified table, with maximum count controlled by the preview limit. By default, the system displays up to 10 matching records per table, sorted from highest to lowest document score. The system displays a separate list for each table in the search source.

Elements of the global search results page in Next Experience UI (continued)

UI element	Description
	By default, the system displays fields from the table's text_search list view for each search result. If this view doesn't exist for the table, it instead displays fields from the default list view. For more details on the text_search list view and the format of individual result listings, see Text search views control format of global search results for tables. Users with the admin role can override the preview results limit for a search application by modifying the application's record in the Workspace Global Search Configuration [sys_aw_global_search_config] table. For more details on this procedure, see Set the preview limit for global or workspace search in Next Experience UI. Administrators can also modify the search results table list view by modifying the value of the `glide.ui.text_search.view` system property. For details on changing this value, see Set global text search properties.
7. Table filter	Icon indicating that a filter was applied to results from this search source table. Pointing to the information icon displays a pop-up containing the search filter applied.
8. Link to all table results	Link to all matching records from the searched table. Select the link to launch a filtered list view based on the query. This link only displays when the total number of matching records in the table exceeds the preview limit.
9. Results summary	List of search source tables, showing the number of matching search results per table. Select the search source table name to display the associated preview list results. Search source tables with no matching results don't appear in this list. Users with the admin or ui_builder_admin roles can hide the per-table counts of matching records. For details on making this change, see Hide per-table search result counts in Next Experience UI.

View and open search results using workspace applications in Next Experience Unified Navigation

Use the search context menu to view and open results for your current search in workspace applications.

Before you begin

You must be using Next Experience UI.

Role required: none

About this task

In addition to global search, you may have access to workspace search applications, such as CSM/FSM Configurable Workspace. If you have access to multiple search applications, the search field's drop-down search context menu displays all available search applications, with the current application preselected. To view and open search results in another application, select it from the search context menu.

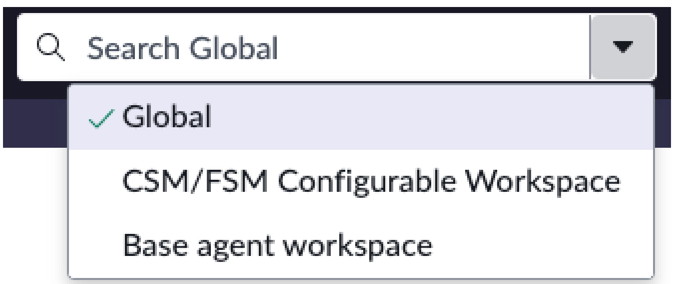
Users with the administrator role can add workspace applications to the search context menu. For details on this procedure, see Add a workspace application to the Unified Navigation search context menu.

Procedure

1. Use the search field to perform a search and view search results.
2. To open the search context menu, select the **Choose search context** icon ( ) in the search field.

   Note:
   If the **Choose search context** icon isn't displayed in the search field, the current search applications is the only one available. You can't switch search applications.

   A drop-down menu of available search applications displays, with the current search applications preselected.

3. Select an alternate search application from the drop-down menu.
   The drop-down menu disappears and the **View results** link appears.
4. To view search results in the selected application, select **View results** or press Enter.

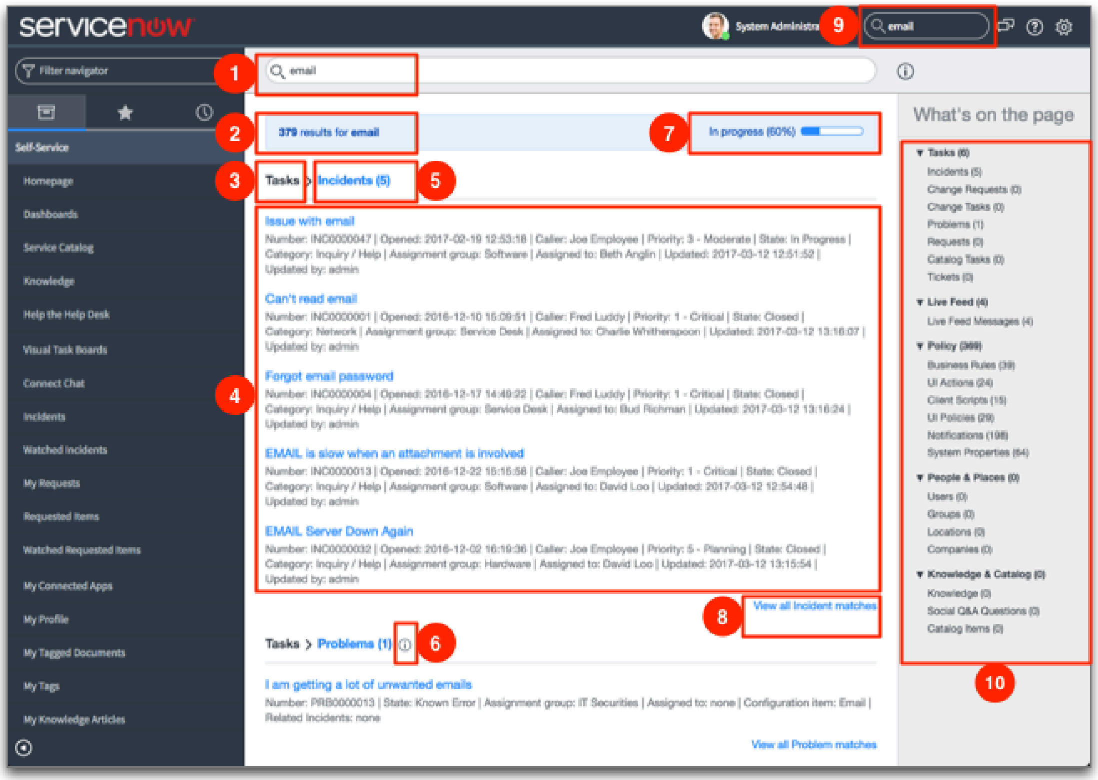
Result

The page reloads and displays results for your current search from the selected search application. If you select a previewed matching record, it opens in the selected search application.

Search results page in Core UI and UI15

Global text search displays a page of results that match your search terms. Search results appear dynamically on this page as Zing generates them.

Global text search results page in Core UI



Zing displays global text search results in a dedicated page consisting of these elements.

Elements of the global text search results page in Core UI and UI15

UI element	Description
1. Search terms	Field displaying your current search terms. If you edit these terms, refresh the results page by selecting the search icon ( ) or pressing Enter. **Note:** If you delete your search terms and select the search icon or press Enter, the search results page doesn't refresh. To refresh the page, enter search terms, then select the search icon or press Enter.
2. Total results	Total number of records matching your search.
3. Search group name	Name of the search group that includes the table with matching records.
4. Preview of matching records	Partial list of matching records for the specified table, with maximum count controlled by the preview limit. By default, the system displays up to 10 matching records per table, sorted from highest to lowest document score. The system displays a separate list for each table in the search group.

Elements of the global text search results page in Core UI and UI15 (continued)

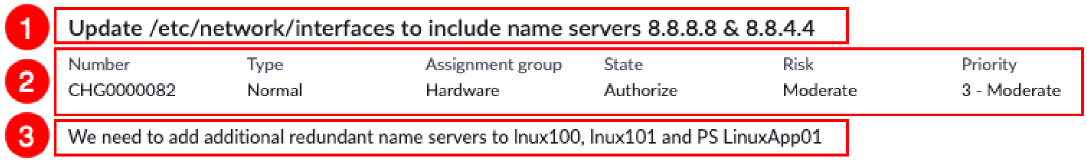
UI element	Description
	By default, the system uses the table's text_search list view if available. Otherwise, it displays fields with the default list view. Users with the admin role can modify the default preview results limit and search results table list view by changing the values of the *glide.ui.text_search.rowcount* and *glide.ui.text_search.view* system properties. For more details on these properties, see Set global text search properties.
5. Table name	Name of the search group table and the number of matching records in the table. Click the link to launch a filtered list view based on the query. Users with the admin role can hide matching record counts by setting the *sn_global_searchui.hide_results_count* property to **true** in the System Property table.
6. Table filter	Current filter applied to search results from this table. Pointing to the information icon displays a pop-up containing the search filter applied. For information on applying a table filter to a search group, see Add a search group for Core UI.
7. Progress bar	Current percentage of tables searched. The system hides this element after the search is complete.
8. Link to all table results	Link to see all matching records from the search group table. Click the link to launch a filtered list view based on the query.
9. Global search field	Global search field. **Note:** If you delete your search terms and select the search icon or press Enter, the search results page refreshes, displaying zero search results.
10. Results summary	List of search groups and tables with the number of search results per group and table. Select the table name to display the associated preview list results.

Text search views control format of global search results for tables

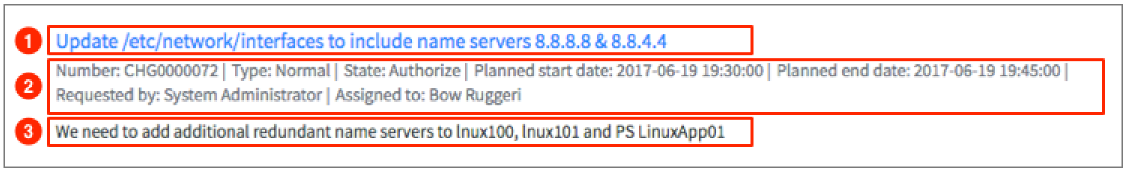
The text_search view for a table determines how global search displays results from that table.

Results displayed by global search include multiple elements. For each search result, the system populates these elements with values of fields included in the table's text_search list view.

Sample search result listing in Next Experience UI



Sample search result listing in Core UI



Search result elements

Element	Description	Matching criteria
1. Title	The title is the first line of the search result block. It links to the matching record of the search result.	Global search uses the first string field in the table's text_search list view that is not the number field. If there is no matching string field or the contents of the field is empty, the system displays the text "No title" in the session language. For example, in the default text_search view for the Incident table, the short description field satisfies the title criteria. Global search uses this field as the search result title.
2. Field list	The field list is the second line of the search results. It displays field name-value pairs, separated by the pipe character, for up to 10 fields.	Global search uses the first 10 fields in the table's text_search list view that don't match the title or description criteria. For example, in the default text_search view for the Incident table, the number, opened, caller, priority, state, category, and assignment group fields satisfy the field list criteria. Global search displays the names and values for these fields in the search result field list.
3. Description	The description is the third line of the search results. This line is optional and may not appear for all search results.	Global search uses the first string field in the table's text_search list view that is not the title and is over 100 characters in length. If no field matches these criteria, the search results omit this line. For example, in the default text_search view for the Incident table, the description field satisfies the description criteria. Global search uses this field as the search result description.

By default, the system uses the text_search list view for a table to format global text search results for that table. If a text_search view doesn't exist for the table, the system instead formats search results using the table's default form view. Implementers can

specify which view the system uses to format search results by modifying the value of the *glide.ui.text_search.view* system property.

Create and delete views

Default display fields for global search tables

This table lists the tables enabled for global search in the base system. For each table, it shows the fields included in the table's default text_search list view. The system uses fields from this view to format global search results from these tables.

Table	Display fields
Catalog Item [sc_cat_item]	Short description, Description, Category, Price
Catalog Task [sc_task]	Short description, Description, Number, Priority, State, Assignment group, Request item
Change [change_request]	Short description, Description, Number, Type, Assignment group, State, Risk, Priority
Change Task [change_task]	Short description, Description, Number, Type, State, Assignment group
Company [core_company]	Name, Street, City, Zip / Postal code, Phone
Group [sys_user_group]	Name, Description, Type
Incident [incident]	Short description, Description, Number, Opened, Caller, Priority, State, Category, Assignment group
Knowledge [kb_knowledge]	Short description, Article body, Category, Number, Updated
Problem [problem]	Problem statement, Description, Number, State, Resolution code, Assignment group, Configuration item, Related Incidents
Request [sc_request]	Short description, Number, Requested for, State, Opened by
Requested Item [sc_req_item]	Number, Item, Stage, State, Requested for, Opened by, Opened
User [sys_user]	Name, Email, Company, Department, Title

Search settings filter and group global search results by table

Global search filters and groups matching results by table. You can configure search sources (in Next Experience UI) or search groups to define tables and groups for global search.

The configuration settings for table-based filtering and grouping of global search results differ by UI, as described in the following sections.

Search sources filter global search results by table in Next Experience UI

Global search in Next Experience UI displays search results broken out by search source. A search source is a collection of global search settings for a ServiceNow AI Platform® table.

A user must have read access to a table to see search results for it.

Default global search sources for Next Experience UI

The base system includes these default search sources for global search in Next Experience UI.

When Next Experience UI is activated, the following search sources are defined for global search. These search sources appear in the Application Search Sources related list for the **Now Experience Search Configuration** record in the Search Application Configuration [sys_search_context_config] table.

Search source	Table searched
Tasks - Incidents	Incident [incident]
Tasks - Change Requests	Change Request [change_request]
Tasks - Change Tasks	Change Task [change_task]
Tasks - Problems	Problem [problem]
Tasks - Requests	Request [sc_request]
Tasks - Catalog Tasks	Catalog Task [sc_task]
People & Places - Users	User [sys_user]
Tasks - Requested Items	Requested Item [sc_req_item]
People & Places - Groups	Group [sys_user_group]
Knowledge & Catalog - Knowledge	Knowledge [kb_knowledge]
People & Places - Companies	Company [core_company]
Knowledge & Catalog - Catalog Items	Catalog Item [sc_cat_item]

Note:
Search sources only affect filtering of global search results in Next Experience UI. In Core UI, global text search filters results based on settings defined in text search groups. For details on these settings, see Search groups filter global text search results by table in Core UI.

Add a search source for Next Experience UI

Add a new search source to make a table searchable by global search or workspace search in Next Experience UI.

Before you begin

You must be using Next Experience UI.

Note:
You can configure tables for global text search in Core UI by adding new text search groups. For more details, see Add a search group for Core UI.

The tables you want to include in the search group must have text indexing enabled. To enable text indexing for a table, see Configure a table for indexing and searching.

Role required: search_application_admin or workspace_admin

About this task

A search source defines a table that is searchable by global or workspace search in Next Experience UI. Define new search sources to add to the default set of tables configured for global search or your workspace search. For the list of global search sources included in the base system, see Default global search sources for Next Experience UI.

Procedure

1. Define the new search source in the Search Source [sys_search_source] table.

   a. Select **All**.

   b. In the **Filter** field, enter `sys_search_source.list`.

   c. Press Enter.

   d. Select **New**.

   e. On the Search Source form, fill in the fields.

Field	Description
Name	Name to display for the search source in the global search results page.
Table	Table to make searchable for global search.
Conditions	Filter conditions that table records must satisfy to be searchable.
Application	Application scope for the search source. This field is automatically set.

   f. Select **Submit**.

2. Link the new search source to the record for the global or workspace search application in the Search Application Configurations [m2m_search_context_config_search_source] table.

   a. Select **All**.

   b. In the **Filter** field, enter `m2m_search_context_config_search_source.list`.

   c. Press Enter.

   d. Select **New**.

   e. Select the additional actions icon (≡), then select **Configure** > **Form Layout**.

   f. Use the slushbucket to add the Search context config field to the selected field list, then select **Save**.

   g. On the Application Search Sources form, fill in the fields.

Field	Description
Source	Name to display for the search source in the global search results page.

Field	Description
Order	Order of appearance for the search source in the search application configuration context.
Application	Application scope for the search source. This field is automatically set.
Search context config	Record for the global or workspace search application in the Search Application Configuration [sys_search_context_config] table. To add the search source for global search, select the **Now Experience Search Configuration** record. To add the search source for a workspace application, select the record for that application. For example, to add a search source for Agent Workspace, select the **Agent Workspace Search Config** record.

h. Select **Submit**.

3. **Optional:** Reorder search sources for the global or workspace search application.

   a. Navigate to **All** > `AI Search` > **Search Experience** > **Search Applications**.

   b. Open the record for the search application.

   Note:
   For global search, open the **Now Experience Search Configuration** record. For a workspace application, open the record for that application, such as the **Agent Workspace Search Config** record for Agent Workspace.

   c. In the Application Search Sources related list, edit the **Order** values for search source records to alter the display order for table filters on the application's search results page.

Result
The new search source appears in global or workspace search results.

Search groups filter global text search results by table in Core UI

Global text search in Core UI displays search results broken out by search group. A search group is a collection of related searchable tables.

Within each search group, the system divides search results by table. A user must have read access to a table to see search results for it.

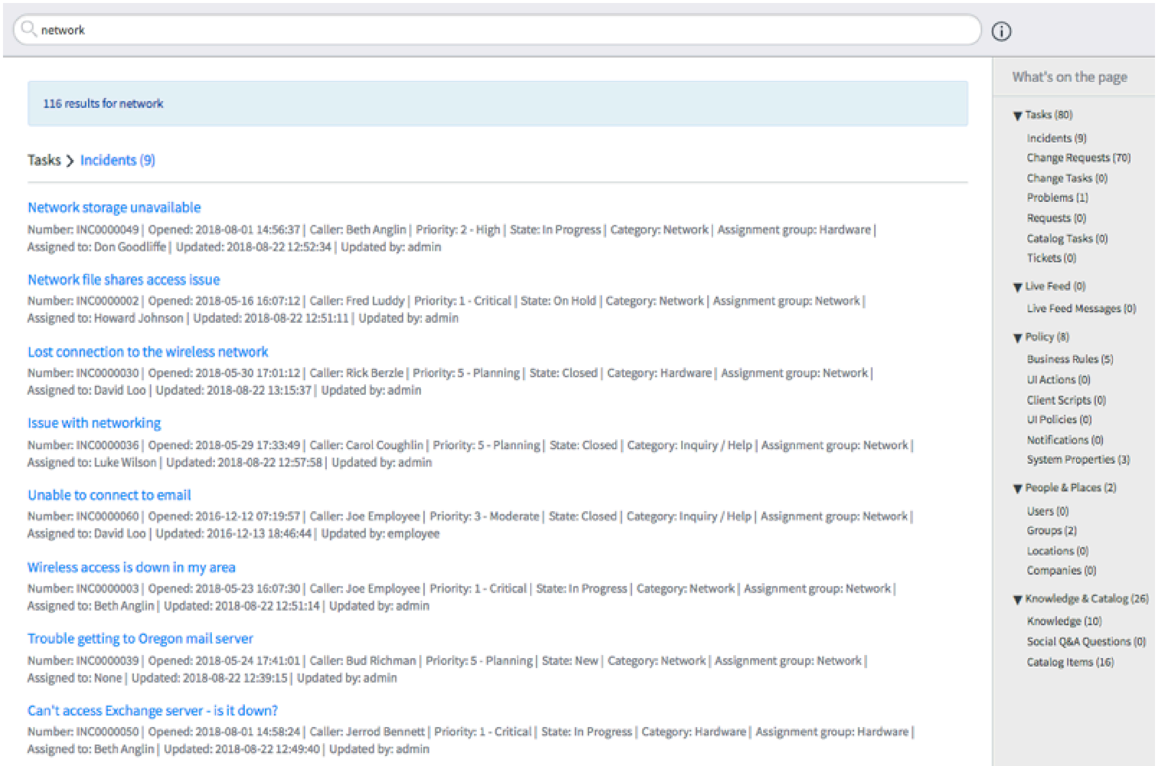
Displaying search results by group

The system displays knowledge and service catalog search results within their respective search results pages. The system displays other results in list format.

For exact match searches, the system only returns records from the Task (task) and Knowledge (kb_knowledge) tables.

Note:
The system filters global search results to display only knowledge articles that are in the same language as the preferred language setting.

Example global text search results



Options for administrators

Administrators can customize these search group settings for all users:

- Specifying which tables are part of the group.
- Specifying whether the search group is available for use.
- Specifying whether searches include results from this search group by default.
- Creating new search groups.

Enabling a search group allows users to see records from the search group's tables. Disabling a search group hides records from the search group's tables.

Default global text search groups for Core UI

The base system includes these default text search groups for global text search in Core UI.

Search group	Tables searched
Tasks	• Incident [incident] • Change Request [change_request] • Change Task [change_task] • Problem [problem]

Search group	Tables searched
	• Request [sc_request] • Catalog Task [sc_task] • Requested Item [sc_req_item]
People & Places	• User [sys_user] • Group [sys_user_group] • Company [core_company]
Knowledge & Catalog	• Knowledge [kb_knowledge] • Catalog Item [sc_cat_item]

Note:
Text search groups only affect filtering of global text search results in Core UI and UI15. In Next Experience UI, global search filters results based on search sources linked to the **Now Experience Search Configuration** record in the Search Application Configuration [sys_search_context_config] table. For details on the search sources included in the base system, see Default global search sources for Next Experience UI.

Add a search group for Core UI

Add a new text search group to filter global text search results by table in Core UI.

Before you begin

You must be using Core UI.

Note:
You can configure tables for global search in Next Experience UI by adding new search sources. For more details, see Add a search source for Next Experience UI.

The tables you want to include in the search group must have text indexing enabled. To enable text indexing for a table, see Configure a table for indexing and searching.

Role required: text_search_admin

About this task

A text search group defines a set of tables to use as filters for global text search results in Core UI. Define new search groups to add to the default set of text search groups configured for global text search.

For the list of text search groups included in the base system, see Default global text search groups for Core UI.

Procedure

1. Navigate to **All** > **System Definition** > **Search Groups**.
2. Select **New**.
3. On the Text Search Groups form, fill in the fields.

Field	Description
Name	Enter a name for the search group.
Roles	Select one or more user roles if you want to restrict access to the search group to those roles.
User group	Select a user group if you want to restrict access to the search group to users in that user group.
Description	Enter text to display as a tooltip for the search group.
Active	Ensure the check box is selected to make the search group available.
Searched	Clear the check box if you want to exclude results from this search group.
Order	Enter a number to determine the order in which this search group is listed relative to other search groups.

4. Select the additional actions icon (≡), then select **Save**.
5. For each table that you want to add to the search group, perform the following steps.

   a. In the search group record's Text Search Tables related list, select **New**.

   b. On the Text Search Table form, fill in the fields.

   Text search table

Field	Description
Search group	The search group that you want to add a table to.
Table	Select the table to include in the search group. **Note:** You can select any table not excluded by the `glide.ui.no_text_search` system property, but global search only displays search results for tables that have text indexing enabled.
Application	Application scope for the text search table record. This field is automatically set.
Active	Option to search the table as part of the search group.
Searched	If you want to exclude results from this table by default, clear this option. A user can manually choose to show results from this table on the search results page.
Order	Order in which this table is listed relative to other tables in the search group.
Conditions	Select one or more conditions to determine which records on the selected **Table** are searched.

   c. Select **Submit**.

Global search displays exact matching records

When your search exactly matches the **Number** field value for a record, global search takes you directly to that record, bypassing the search results page.

As an example, if you search for `INC0038278`, global search shows Incident record INC0038278 in form view instead of showing the search results page.

> **Note:**
> Exact match respects security settings. If you don't have permission to view the record that matches your search, global search won't show you that record.

If more than one record has a **Number** field value that exactly matches your search, global search displays the first exact match. An informational message reports the total number of exact matches and provides links to the other exact matches.

Exact match configuration settings

Exact match only returns matches for Number values that contain prefixes defined in the Numbers [sys_number] table. To view prefixes and their matching tables, navigate to **All** > **System Definition** > **Number Maintenance**.

Search behavior for exact match is controlled by the *`com.snc.agent_workspace.global_search.typeahead.exact_match_request_criterio`* system property. This property's value is a Java regular expression pattern. Only search queries that match the regular expression pattern are evaluated as possible exact record matches. For details on Java regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Exact search matches in Next Experience UI

When your search in Next Experience UI exactly matches a searchable record, the Unified Navigation search field displays a preview of that record. Selecting the preview takes you directly to that record and bypasses the search results page.

Exact search match in Next Experience

The preview of the matching record appears below the Unified Navigation search field with an **Exact Match** tag. Select this tag or press Enter to navigate directly to the record.

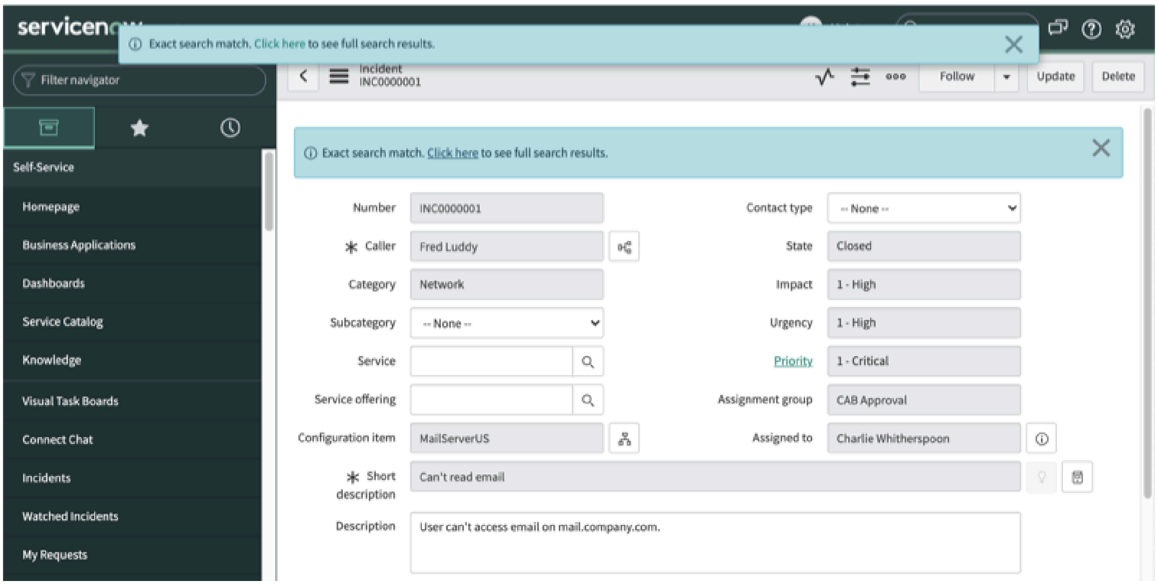
To see the full search results page for your search, select **View results**. For details on the elements that make up the search results page, see Search results page in Next Experience UI.

Note:
You may need to wait a few seconds after entering your record number into the search field for the system to process your search request and display the preview. Once the preview appears, you can press Enter to go directly to the matched record. If you press Enter before the preview appears, the system shows you the full search results page for your search instead.

Exact search matches in Core UI

When your search in Core UI exactly matches a searchable record, global search takes you directly to that record, bypassing the search results page.

Exact search match in Core UI



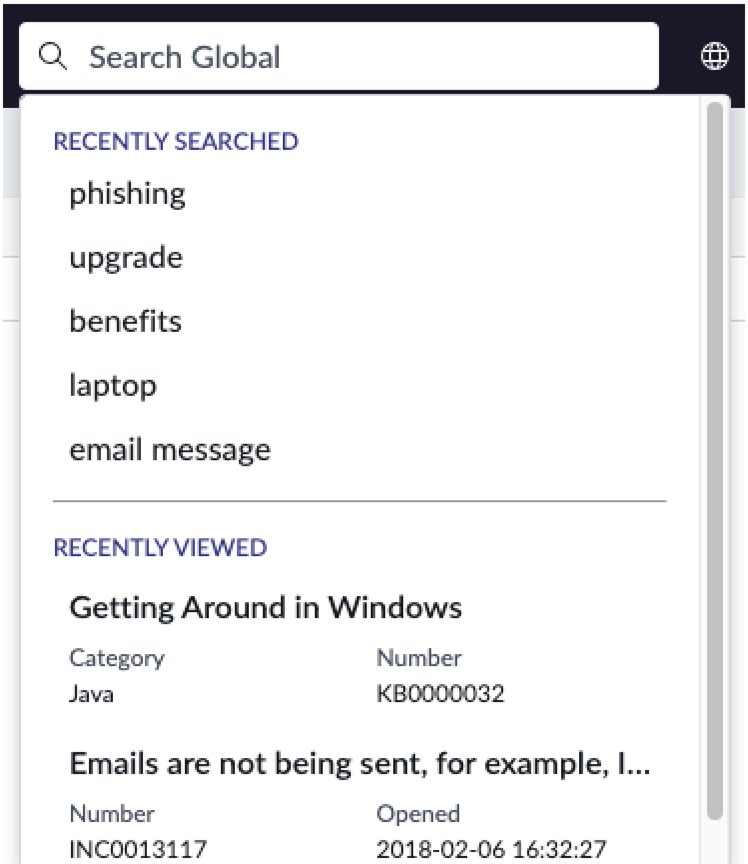
The system displays the matching record with an informational message indicating that your search produced an exact search match.

To see the full search results page for your search, select the link in the informational message. For details on the elements that make up the search results page, see Search results page in Core UI and UI15.

Global search displays your most recent search queries and results in Next Experience UI

When you select the empty Unified Navigation search field, the system displays lists showing your most recent search queries and your most recently viewed search results. Select a **Recently Searched** query to repeat it, or select a **Recently Viewed** search result record to navigate to it.

The **Recently Searched** and **Recently Viewed** lists appear below the Unified Navigation search field.



The **Recently Searched** list shows the most recent search queries from your personal search history. This list only appears when your search history includes previous search queries.

The **Recently Viewed** list shows the most recently viewed search results from your personal search history. This list only appears when your search history includes previously viewed search results.

Set global text search properties

Administrators can control how global text search behaves with system properties.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **Global Text Search**.
2. Review the values for the following global text search properties and change them as needed.

UI properties for global text search

Property	Description
Enable Global Text Search (`glide.ui.text_search.enable`)	Option to enable global search in Core UI and UI15. ◦ Type: Boolean ◦ Default value: `true` ◦ Supported values:

servicenow

Property	Description
	▪ *true*: Global search is enabled in Core UI. ▪ *false*: Global search is disabled in Core UI. **Note:** When Next Experience is enabled, this system property has no effect. To enable or disable the Unified Navigation search field in Next Experience, set the *glide.ui.polaris.global_search* system property described in Next Experience system properties.
List of roles (comma-separated) that can use the Global Text Search capability (*glide.ui.can_search*)	Comma-separated list of user roles that allow access to global search. To enable global search for users with a role, add the role to this list. ○ Type: String ○ Default value: *itil, text_search_admin, admin*
List of tables (comma-separated) that won't appear as options when setting up Global Text Search tables (*glide.ui.no_text_search*)	Comma-separated list of tables that don't appear as options when defining text search groups for Core UI. Examples are system or maintenance tables. ○ Type: String ○ Default value: *sys_audit, sys_event, ecc_queue, ecc_event, syslog, syslog_transaction, sys_journal_field, sys_audit_relation, ecc_agent_log, ecc_mi_result, sysrule_escalate_history, sys_user_token, sys_time_dimension, sys_attachment_doc, sys_audit_delete*
Number of Global Text Search matches returned per table (*glide.ui.text_search.rowcount*)	Maximum number of matching records previewed for each table on the global text search results page. Users can select a table to see all matching results for that table. ○ Type: Integer ○ Default value: 10 **Note:** This system property only controls the global text search preview limit in Core UI. In Next Experience UI, you can set the global search preview limit by editing the **Now Experience Search Configuration** record in the Workspace Global Search Configurations [sys_aw_global_search_config] table.
Global Text Search background color for Knowledge Base results (*css.textsearch.kb.background.color*)	Background color for Knowledge article global text search results. This property only affects display of results on the legacy global search results page. ○ Type: String ○ Default value: *#f0f7f9*

Property	Description
Global Text Search background color for Catalog results (*css.textsearch.catalog.background.color*)	Background color for Catalog global text search results. This property only affects display of results on the legacy global search results page. ◦ Type: String ◦ Default value: *#ffffdd*
Form view to use for Global Text Search exact match - blank means Default view (*glide.ui.text_search.match_view*)	Name of the form view that global text search uses to display exact match results. If no value is specified, global text search uses the default form view. For information on creating and managing views, see View management. ◦ Type: String ◦ Default value: (empty)
List and form view to use for Global Text Search results. Blank means default view (*glide.ui.text_search.view*)	Name of the list view that global text search uses to format results for each searched table. If no value is specified, global text search uses the default list view. For information on creating and managing views, see View management. ◦ Type: String ◦ Default value: *text_search*
Query method for global text search. Run a query for each table, for each base class (parent table), against a single index regardless of table (requires text index regeneration), or let GlideRecord handle the query (simple). With the Zing text search engine, the preferred value is "simple" (*glide.ir.query_method*)	Query method to use for global text search. **Note:** The *base*, *single*, and *table* values aren't supported. Leave this system property set to its default *simple* value. ◦ Type: Choice list ◦ Default value: *simple* ◦ Available values: ▪ *base*: Run a search query for each base class. This value is no longer supported. ▪ *simple*: Let GlideRecord handle the search query. ▪ *single*: Run a search query against a single text search index. To use this method, you must regenerate text search indexes. This value is no longer supported. ▪ *table*: Run a search query for each searchable table. This value is no longer supported.
The maximum number of results that will be returned during a text index search. This limits	Maximum number of results that global text search will return when searching a text search index.

Property	Description
the number of records that will be extracted from the text index and displayed (*glide.lucene.base_result_max*)	**Note:** When the query method is set to *simple*, this property is ignored. ◦ Type: Integer ◦ Default value: 100
The maximum number of entries that will be retrieved from the text index. Only the table that is involved will be returned from the text index for all entries that are between the value specified for maximum results and this value. This is done so that it can be indicated that more results exists for any given table that are going to be displayed (*glide.lucene.base_hits_max*)	Maximum number of entries that global text search will retrieve from a text search index. **Note:** When the query method is set to *simple*, this property is ignored. ◦ Type: Integer ◦ Default value: 500
Number of simultaneous processes (1 to 16) used when searching though multiple groups in a global search (*glide.ts.global_search.parallelism*)	Number of concurrent threads global text search uses when searching multiple search groups. Each search group requires one thread. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits. ◦ Type: Integer ◦ Default value: 4

3. Select **Save**.
   The business rule **Text Search Property Change Rationally** validates the new values and aborts the update if they are outside its acceptable ranges.
4. To set the maximum number of matches to display for a wildcard search term, follow these steps.

   a. Open the System Properties table and search for the property **glide.ts.max_wildcard_expansion**.

Field	Description
Name	glide.ts.max_wildcard_expansion
Description	Maximum number of matches for a wildcard search term that are allowed as unambiguous.
Type	Integer

Field	Description
Default value	500

b. Edit the **Value**.
If a wildcard search matches more words than this value, the system displays a message asking the user to refine the search.

c. Select **Update**.

5. To set the Zing text search stemming language, follow these steps.

a. Install the internationalization (i18n) plugin for the language you want to stem text search terms in.

b. Add a new system property, *glide.ts.stemming_language*:

Field	Description
Name	glide.ts.stemming_language
Description	Language to use for text search stemming. For details on stemming, see Zing matches derived words with stemming.
Type	String
Values supported	▪ English ▪ French ▪ German
Default value	English

c. To make tables use the new stemming language for text search, manually regenerate their text search indexes.
For details on this procedure, see Regenerate a text index for a table.

6. **Optional:** To enable and configure fallback number search for exact matches, follow these steps.

Note:
Fallback number search is disabled by default. When it's enabled, if a global text search finds no exact match for a record number, the system searches a list of specified tables for matches. This additional search can make global text searches take longer, so enable fallback number search only if you need it.

a. To enable fallback number search, add a new system property, *glide.ui.text_search.enable_fallback_number_search*:

Field	Description
Name	glide.ui.text_search.enable_fallback_number_search

Field	Description
Description	Option to enable fallback number search for use when global text search finds no exact matches for a record number. **Note:** Fallback number search can make global text searches take longer. Enable the option only if you need it.
Type	Boolean
Default value	false

b. To configure the list of tables searched by fallback number search, add a new system property, *glide.ui.text_search.fallback_table_list*:

Field	Description
Name	glide.ui.text_search.fallback_table_list
Description	(Optional) Comma-separated list of names of tables to search when performing fallback number search. Use the special value *all* to search all tables that have prefixes defined in the Number [sys_number] table. **Note:** Increasing the number of tables to search may increase the time required for fallback number search. Test any changes to this system property before putting them into production.
Type	String
Default value	task,kb_knowledge

Configure parallel processing of search groups

To improve performance, only activate search groups and tables that are necessary to meet business needs.

Before you begin

Role required: admin

About this task

For example, if you don't need Change Task results, deactivate that table in the Tasks search group. If only one group of users needs Change Task results, set up a separate search group that includes Change Tasks. Other users search using a group that doesn't contain Change Tasks.

Global text search can render results in parallel to improve performance. To configure the number of parallel processes:

Procedure

1. Navigate to **All** > **System Properties** > **Global Text Search**.
2. Locate the property called **Number of simultaneous processes(1 to 16) used when searching though multiple groups in a global search**.
3. Enter the number of processes to run in parallel.
   Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.
4. Select **Save**.

Revert to the legacy global search UI

Disable the dynamic global search UI to preserve customizations you made to the legacy global search UI.

Before you begin

You must have Next Experience disabled on your instance. The legacy global search UI is only available in Core UI.

Role required: admin

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Select **New**.
3. Enter these field values.

Field	Value
Name	glide.ui.use_legacy_global_search
Type	true | false
Value	true

4. Select **Submit**.

Result

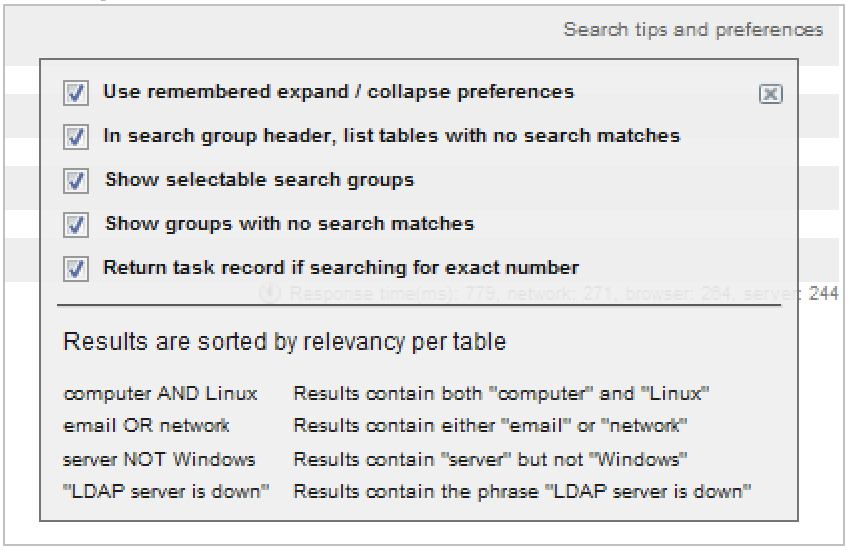
The system displays the global search UI and uses the legacy display logic.

Legacy global search user preferences

The global text search results page allows users to set several user preferences for global text search.

The following search preferences are available from the **Search tips and preferences** link.

Search preferences



Search preferences

User preference	Description
Label Use remembered expand / collapse preferences **Preference** ts.remember.expanded	Specifies whether you want the collapse state of any search groups/tables remembered for your next search. If selected and you collapse the search results for the People & Places search group for example, that group will be collapsed on your next search. If cleared, all groups and tables are expanded for every search.
Label Show list of tables with no search matches **Preference** ts.show_negative_result_info	Specifies whether or not you want to see a summary of tables that had no search matches. For example: No matches for Requests, Catalog Tasks, Tickets.
Label Show selectable search groups **Preference** ts.show_search_groups	Shows or hides the search group check box row.
Label Show groups with no search matches **Preference** ts.show_empty_groups	Shows or hides a search group if it returns no matches. If selected, the search results display a placeholder row stating there were no matches for that group.
Label Return task record if searching for exact number **Preference**	Shows or hides the full search results page if the search term matches a task record number. When selected, an exact match to a record number causes the system to hide

Search preferences (continued)

User preference	Description
ts.match	the full search results and instead display the record with an exact match message. Exact search matches ignore most additional search conditions normally applied to the record such as the currently selected search groups or the knowledge article published state. For example, an exact search match for a knowledge article returns the article in any state as long as the current user has read access to it. **Note:** The system filters exact search results to display only knowledge records that are in the same language as the preferred language setting. **Sample exact match search query**  In this sample search, the **Knowledge & Catalog** search filter is cleared, which would normally prevent returning any knowledge articles. **Sample exact match search results**  In this sample exact match, the system displays the matching article and an information message in the form header reading `Exact search match. Click here to see full search results.`

User preferences

Set the preview limit for global or workspace search in Next Experience UI

Override the default limit of 5 preview results per search source on the Next Experience UI search results page for global or workspace search.

Before you begin

You must be using Next Experience UI.

Role required: workspace_admin

About this task

The preview limit for a search application specifies how many preview results can appear for each search source on the search results page. By default, the system displays up to 5 preview results per search source. Workspace administrators can override this default limit separately for global search and for all workspace searches.

Procedure

1. Navigate to the Workspace Global Search Configuration [sys_aw_global_search_config] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_aw_global_search_config.list`.
   c. Press Enter.
2. Open the configuration record for the search application that you want to modify the preview limit for:
   - To modify the preview limit for global search, open the **Now Experience Search Configuration** record.
   - To modify the preview limit for a workspace application, open the **Workspace search settings** record.
3. On the Workspace Global Search Configuration form, enter your desired preview limit into the **Tab overview items per section** field, then select **Update**.

Result

The search results page for global or workspace search displays preview results up to the new limit for each search source.

Hide per-table search result counts in Next Experience UI

Suppress display of per-table search result counts in the Next Experience UI search results page.

Before you begin

You must be using Next Experience UI.

Role required: ui_builder_admin or admin

About this task

By default, the search results page displays the total number of search results along with per-table result counts for each searchable table that contains matching records. You can hide the per-table result counts for search users by following this procedure.

Procedure

1. Navigate to **All** > *Next Experience* **Framework** > *UI Builder*.
   UI Builder opens in a new browser tab.
2. In the list of available experiences, open the *Unified Navigation* **App** record.
3. In the Pages and variants listing, open the **Search Results** > **search Default** record.
   UI Builder reloads and displays settings for the Search Results (search Default) page.
4. In the Content pane, select the **Body (Grid)** > **Search Result Wrapper 1** component.
   Properties, styles, and events for the selected component appear in the configuration panel.
5. If a `Different application scope` informational message appears, select **Edit in original scope**.
   The system displays an informational message indicating that you are editing in the application scope.
6. On the configuration panel's Config tab, enable the **Hide search results count** option.
7. Select **Save**.

Result

Per-table search result counts no longer display on the search results page.

Add a workspace application to the Unified Navigation search context menu

Enable users to view results for their Unified Navigation searches in workspace applications as well as in global search.

Before you begin

You must be using Next Experience UI.

The workspace application that you want to add to the search context menu must be installed. A search application configuration record must exist for the workspace, with AI Search specified as the search engine. If you need to create a new search application configuration record for the workspace, see Create a search application configuration for AI Search.

Role required: admin

About this task

You can add a workspace application, such as CSM/FSM Configurable Workspace, to the Unified Navigation search context menu. Adding the workspace application to the search context menu enables users to switch between global search results and search results from the specified workspace.

Procedure

1. Copy the sys_id of the record for the search application configuration for the chosen workspace:
   a. Navigate to **All** > `AI Search` > **Search Experience** > **Search Applications**.
   b. Open the record for the chosen workspace's search application configuration.
      As an example, for Agent Workspace, open the **Agent Workspace Search Config** record.
   c. Select the Additional actions icon (≡), then select **Copy sys_id**.
2. Define a globalSearchDataConfigId UX page property to map the search application configuration record to the workspace's UX application:
   a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.
   b. Select **New**.
   c. On the UX Page Property form, fill in the fields as follows:

Field	Description
Page	Use the Lookup using list icon (🔍) to select the UX Application record for your workspace.
Name	Enter `globalSearchDataConfigId`.
Type	Select **string**.

Field	Description
Value	Enter the search application configuration record sys_id that you copied in step 1.c.

d. Select **Submit**.

3. Copy the sys_id of the record for the Workspace Global Search Configuration that you want workspace search to use:

   a. Navigate to the Workspace Global Search Configuration [sys_aw_global_search_config] table's list view by selecting **All**, entering `sys_aw_global_search_config.list` in the navigation filter, and pressing Enter.

   b. Open the record for the Workspace Global Search Configuration that you want workspace search to use.
   If you have a custom Workspace Global Search Configuration record that you want to use, open that record. Otherwise, open the Workspace search settings record.

   c. Select the Additional actions icon ( ), then select **Copy sys_id**.

4. Define a global_search_configurations UX page property to configure the workspace's search settings:

   a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.

   b. Select **New**.

   c. On the UX Page Property form, fill in the fields as follows:

Field	Description
Page	Use the Lookup using list icon ( ) to select the UX Application record for your workspace.
Name	Enter `global_search_configurations`.
Type	Select **json**.
Value	Enter the following JSON: `{ "globalSearchViewConfigId": "00000000000000000000000000000000", "globalSearchRoute": "search" }` Replace the `globalSearchViewConfigId` value of 00000000000000000000000000000000 with the Workspace Global Search

Field	Description
	Configuration record sys_id that you copied in step 3.c. For example, if you selected the Workspace search settings record, replace the value with `97a574ea53c0130084acddeeff7b12a6`.

d. Select **Submit**.

5. Enable Unified Navigation search for the chosen workspace:

a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.

b. Look for a UX Page Property record with name **chrome_header** and page matching the chosen workspace.
As an example, for CMDB Workspace, look for a record with name **chrome_header** and page *CMDB* **Workspace**.

c. If a **chrome_header** record exists for the workspace, edit it and change the **searchEnabled** JSON element to true in its **Value** field, then select **Update**.

d. If no **chrome_header** record exists for the workspace, select **New** and fill in the UX Page Property form fields as follows, then select **Submit**.

Field	Description
Page	Use the Lookup using list icon ( ) to select the UX Application record for your workspace.
Name	Enter `chrome_header`.
Type	Select **json**.
Value	Enter the following JSON: `{ "privatePage": { "searchEnabled": true } }`

6. Refresh your browser tab to reload the ServiceNow AI Platform®.

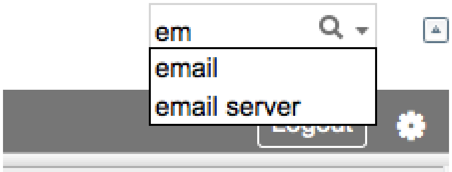
Result
The chosen workspace appears as an option in the Unified Navigation search context menu for users who have it assigned. Users can switch to the workspace's search context. For more details on using the search context menu to switch application contexts, see View and open search results using workspace applications in Next Experience Unified Navigation.

Global text search suggestions

Global text search offers two types of search suggestions.

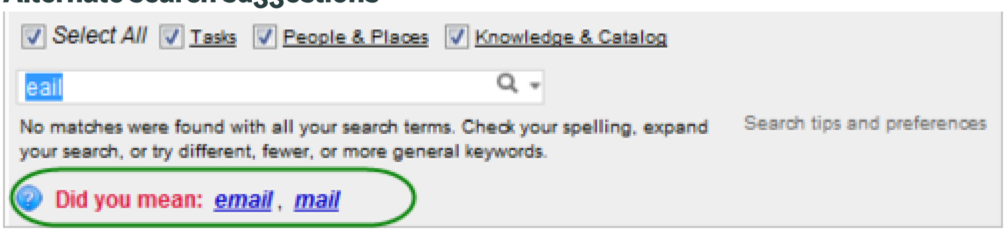
The knowledge base and global text searches provide suggestions as you type. Type-ahead suggestions appear under the search box. Suggestions are based on similar searches that begin with the same characters.

Type-ahead search suggestions



The knowledge base and global text searches also provide suggestions for alternate search terms. Suggestions appear if your original search doesn't return any results and an alternate spelling or similar recent search does. For example, if you misspell a search term (such as eail), the correct spelling (email) may appear as an alternate search suggestion. Suggestions appear beneath the search box on the results page.

Alternate search suggestions



Note:
The type-ahead search suggestions feature is only available in the UI15 interface.

Update a type-ahead suggestion

The knowledge base and global text searches provide suggestions as you type. These type-ahead suggestions are compiled on a nightly basis by a scheduled job.

Before you begin

The type-ahead search suggestions feature is only available in the UI15 interface.

Role required: admin

About this task

Use the following procedure if you need to refresh the type-ahead suggestions list before the next run of the scheduled job.

Note:
Type-ahead suggestions aren't configurable. For more about how suggestions are generated and maintained, see the blog post Global Text Search Suggestions by a ServiceNow Technical Support Engineer in the ServiceNow Community.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. Open **TS Search Stats**.
3. Run the scheduled job.

Configure "Did you mean?" suggestions

The Knowledge Base and global text searches can provide "Did you mean?" suggestions. Suggestions appear if a search doesn't return any results and an alternate spelling or similar recent search does. This feature is disabled by default.

Before you begin

Role required: admin

About this task

Set system properties to enable "Did you mean?" suggestions in the Knowledge Base and legacy global search tools.

Procedure

1. Navigate to **All** > **System Properties** > **Text Search**.
2. Select any of the following check boxes:
   - **Suggest alternate search spellings for knowledge or global search** (the *glide.ts.dym.enable_spell_correct* property).
   - **Suggest related searches for knowledge or global search** (the *glide.ts.dym.enable_chain_suggest* property); uses search chains, which generate suggestions by tracking occurrences of similar searches, in order, over time.

   Note:
   The global search references in these check boxes only apply to the legacy global search functionality. They don't apply to the global search functionality introduced in the New York release, because the "Did you mean?" functionality isn't available.
3. Select **Save**.

Zing generates search results in four phases

Generate search results by dividing documents among shards, searching shard documents, scoring shard documents, and merging scores into an index.

Zing generates search results in four phases:

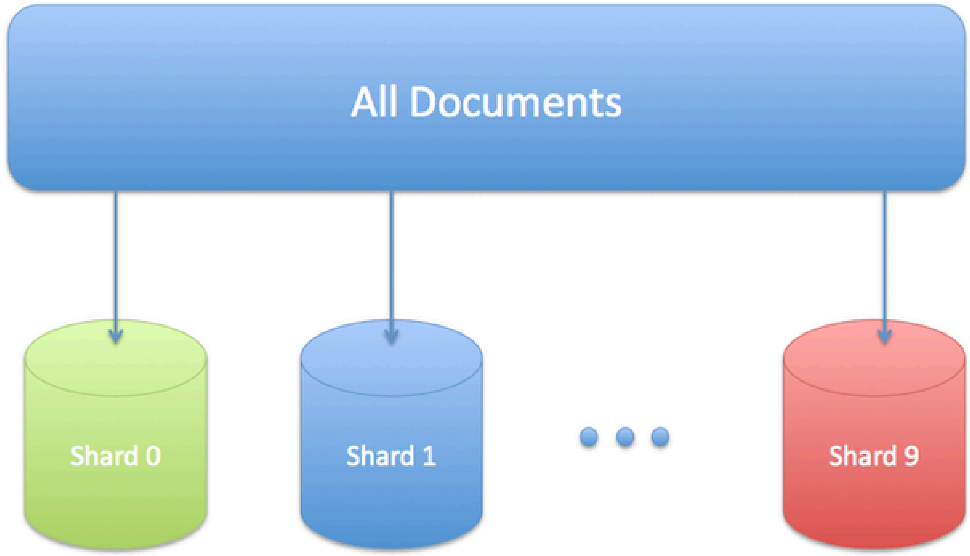
1. Divide searchable documents among index shards.
2. Search and filter shard documents.
3. Score shard documents.
4. Merge shard document scores into an index.

Phase 1: Divide searchable documents among index shards

When a search is executed, the system equally divides all searchable documents among 10 index shards. Each shard has a unique list of documents.

To maximize search efficiency, the system creates 10 query threads to simultaneously search each index shard.

Divide documents among index shards



Phase 2: Search and filter shard documents

Each query thread searches through its list of shard documents to identify documents that match the search criteria. For example, if you search for "`wifi network`," the system returns all documents containing both "`wifi`" and "`network`" in no particular order.

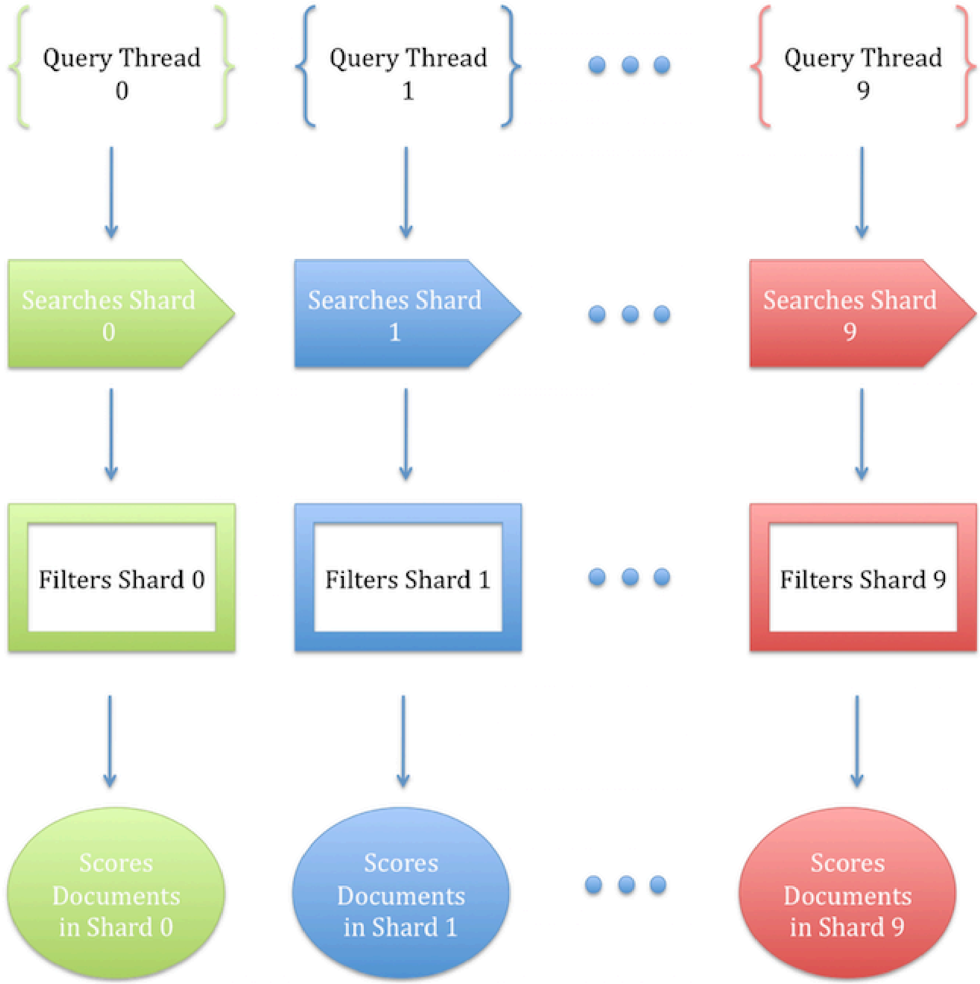
Note:
A multiple word search is equivalent to multiple single word searches connected by an AND operator. For example, **[contains][wifi][AND][contains][network]**.

The query thread assigns each matching document a numeric value (a document ID) to uniquely identify it. All other documents are ignored.

Phase 3: Score shard documents

The query thread scores each matching shard document.

Query threads search, filter, and score shard documents



Phase 4: Merge and sort shard document scores

The system merges the document scores into a single index and sorts the documents from highest to lowest document score. The documents with the highest document score are most relevant to the search query.

Merge and sort shard document scores

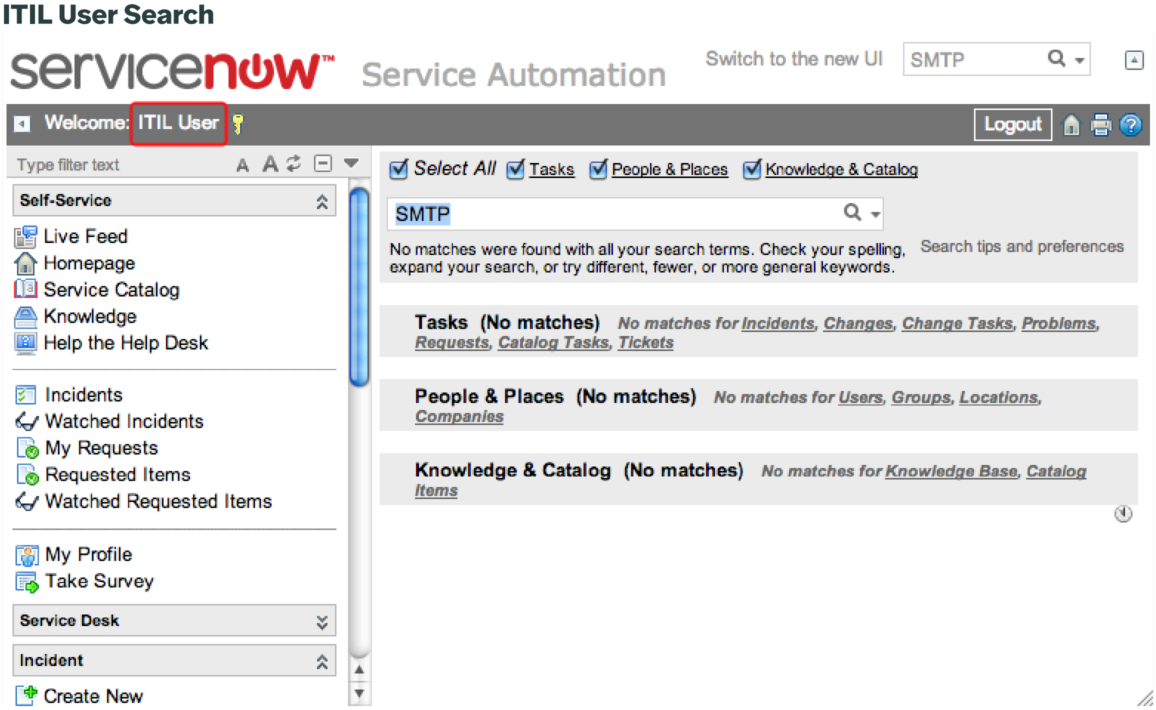
Zing filters search results with access controls

Zing filters search results to only display records the user can access.

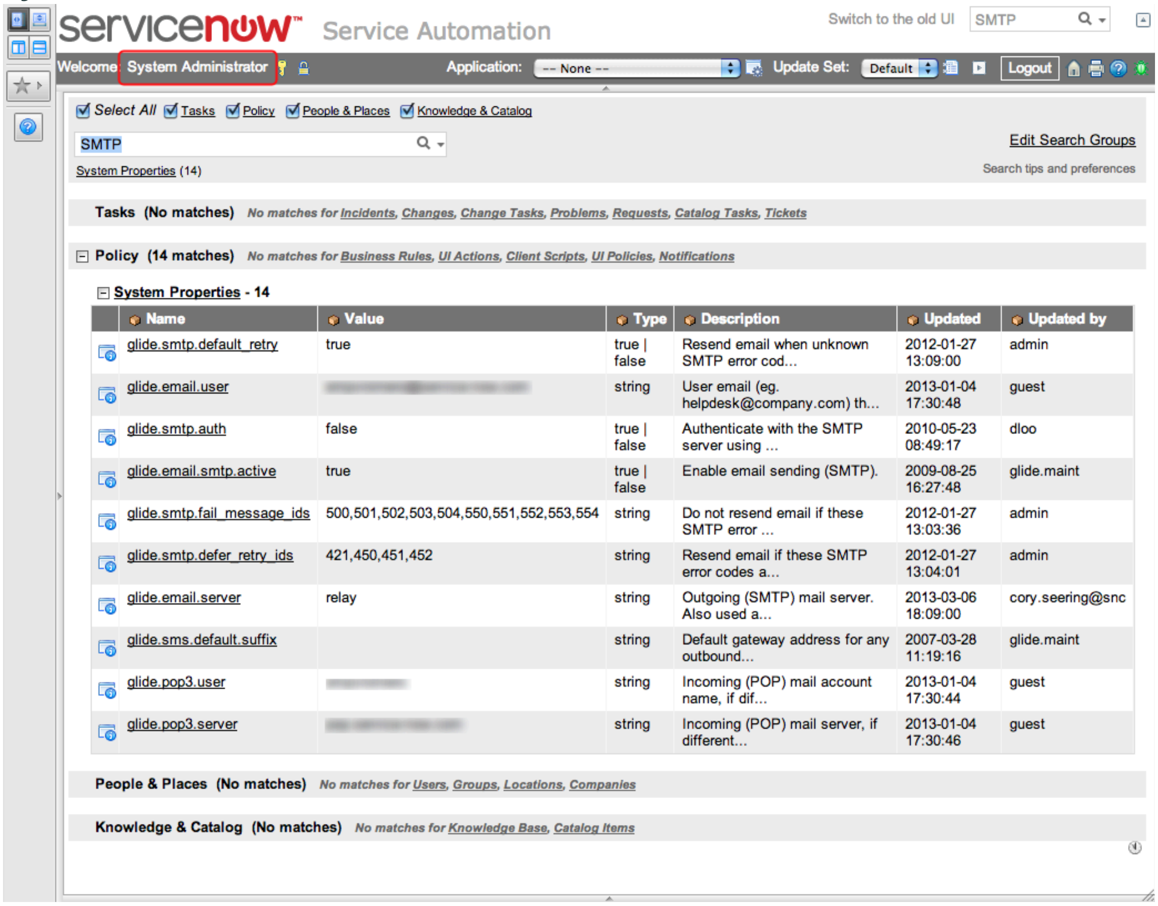
For example, suppose you index the System Property [sys_properties] table. When the ITIL user searches for a term in the System Property table, Zing returns no search results because the ITIL user doesn't meet the ACL rule requirements.

ITIL User Search



When a system administrator searches for the same property, Zing returns search results from the System Property table because the administrator meets the ACL rule requirements.

System Administrator Search



Zing computes document scores using three components

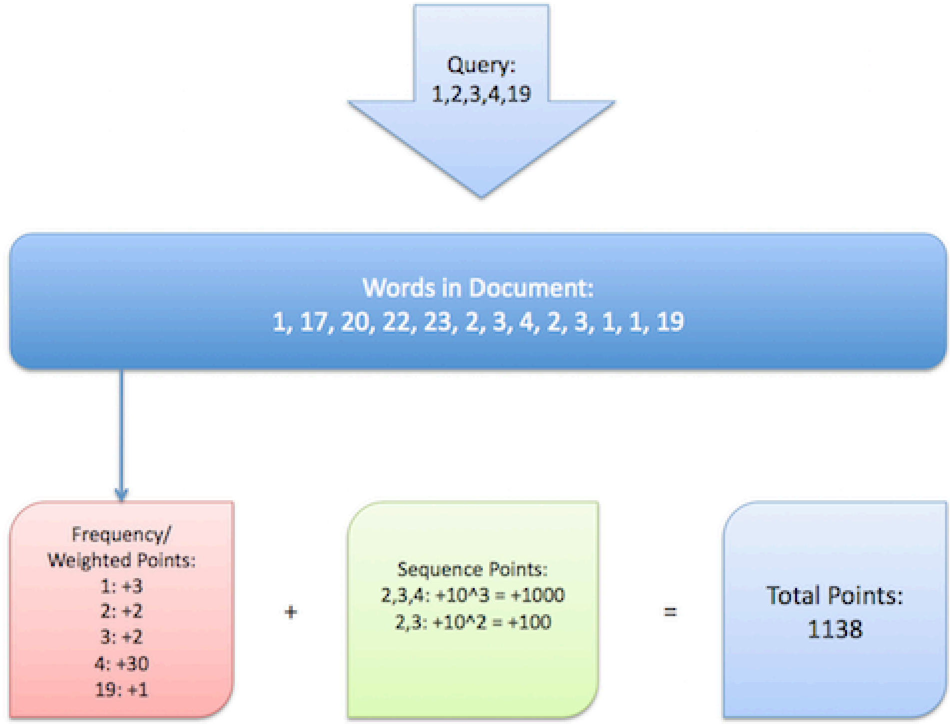
The Zing search engine computes document scores based on the frequency, sequence, and weight of search terms in the document.

Document scores

The components of a document score for a search query are:

- Frequency: how often the search terms appear in the document.
- Sequence: how often the search terms appear in the same order as the search query.
- Weight: how heavily weighted the source field is in which the search terms appear.

Sample document score computation



Frequency points

Zing awards one point whenever a search term appears anywhere in the document. For example, when searching for `distributed database server`, a document that contains `distributed` three times, `database` five times, and `server` 17 times would have 25 frequency points.

To increase search result scores of search terms that appear more frequently in a document, but less frequently in a document set, you can Score search terms by inverse document frequency (IDF). When TF-IDF is enabled, search term scores are calculated by multiplying the term frequency score by the inverse document frequency score. Because enabling TF-IDF increases the weight of less common search terms, search results for that table are more likely to be relevant. For example, when searching for `distributed database server`, the term `distributed` might receive a higher score than `server` if it appears frequently in one document but less frequently in the document set as a whole.

Zing applies a multiplier to frequency points based on the value of the *`ts_weight`* attribute for the field in which the search term appears. A field with a text search scoring weight of 30 (*`ts_weight=30`*) would add 30 points for each inclusion of a search term.

Sequence points

Zing awards a document more points when it contains the search terms in the same order in which they were typed. The more search terms in sequence there are, the exponentially higher the score becomes. Zing awards sequence points as 10^x, where x is the number of search terms that appear in sequence.

In the `distributed database server` search example, Zing awards a document 100 (10^2) sequence points for each time it includes the two-term string `database server`.

Likewise, Zing awards a document 1000 (10^3) sequence points each time it includes the three-term string `distributed database server`.

Zing applies a multiplier to sequence points based on the value of the *`ts_weight`* attribute for the field in which the sequence appears. The sequence points use the calculation (10^x * field *`ts_weight`* attribute).

Field scoring weights

The system elevates the default scoring weight of Knowledge record numbers, Knowledge short descriptions and metadata, task record numbers, and task short descriptions. Default *`ts_weight`* attributes for these fields are as follows:

- *`kb_knowledge.number = 50`*
- *`kb_knowledge.short_description = 10`*
- *`kb_knowledge.meta = 10`*
- *`task.number = 50`*
- *`task.short_description = 10`*

All other fields have a default *`ts_weight`* attribute of 1. The maximum possible weight value is 255.

Score search terms by inverse document frequency (IDF)

Enable term frequency–inverse document frequency (TF-IDF) to increase the search result scores of search terms that appear more frequently in a document, but less frequently in the whole collection of searchable documents.

Before you begin

To enable TF-IDF scoring, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

Administrators can enable TF-IDF scoring on a table to improve search results. The Knowledge table [kb_knowledge] has TF-IDF scoring enabled by default.

Note:
This task requires that you regenerate an index and therefore should be done with system performance in mind. Regenerating an index may take a while to complete depending on table size and other factors. You may notice performance degradation or incomplete search results while the system regenerates the index.

Procedure

1. Navigate to the system dictionary and open the entry for the desired table.
2. In the **Attributes** related list, select **New**.
3. In the **Attributes** field, select **Text search Enable IDF**.
4. Select **Submit**.
   The **Enable IDF Score** check box in the table's text index record can now be configured.
5. Navigate to **All** > **System Definition** > **Text Indexes**.
6. Open the text index created for the table.

7. Select **Enable IDF Score**.
8. Under **Related Links**, select **Regenerate Document Frequency**.
   Regenerating document frequency is a one-time task. Regenerate document frequency when TF-IDF scoring is first enabled for a table.
9. Configure the desired notification and select **OK**.

Set the relative weight of a field

To improve search results, the Zing search engine assigns to each potential match a numeric score that represents its relevancy to the query.

Before you begin

Text indexing must be enabled for the table containing the fields you want to modify the relative weight for. To learn about enabling text indexing for a table, see Configure a table for indexing and searching.

Role required: admin

About this task

Administrators can control the relative importance of a match for each field in a table with the ts_weight attribute. The majority of fiends have no ts_weight attribute. Zing treats these fields as having weight 1 when scoring search matches.

The following fields have ts_weight attribute values by default:

- kb_knowledge.number = 50
- kb_knowledge.short_description = 10
- kb_knowledge.meta = 10
- task.number = 50
- task.short_description = 10

When scoring records, Zing compares the relative weights of fields that produced search term matches. For example, if the **Title** field has `ts_weight=50` and the **Description** field has `ts_weight=10`, then a match in **Title** is 5 times as relevant as a match in **Description** and 50 times as relevant as a field without the ts_weight attribute.

Note:
To view the complete scoring system, see Document Scoring.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the system dictionary record for the field's table and column.
   For example, to modify the ts_weight for the kb_knowledge.number field, open the dictionary record with **Table** "kb_knowledge" and **Column name** "number".
3. In the Dictionary Entry form's **Attributes** field, perform one of the following steps:
   - If a ts_weight attribute appears in the list of attributes, change its integer value to the relative weight you want to set for the field.
   - If no ts_weight attribute appears in the list, add a new `ts_weight=<value>` comma-separated list entry, where <value> is the relative weight you want to set for the field.
4. Select **Update**.
5. Refresh the table's text index:

a. Open the system dictionary record for the field's table.
The table's system dictionary record is the one with the table name as its **Table** value, an empty **Column name** field, and "Collection" as its **Type** value.

b. On the Dictionary Entry form, select the **Generate Text Index** link in the Related Links section.

Result
Once Zing finishes regenerating the text index for the table, search result scoring uses your new relative weights for fields.

Zing indexes words

Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages.

Zing uses spaces to define the basic unit of word separation. Zing uses the following rules to index words.

Zing word indexing rules

Rule	Behavior
Punctuation	Zing indexes some punctuation marks as part of some words to improve search results for common search terms. Zing converts any non-indexed punctuation characters to spaces. See Zing indexes punctuation as part of some words.
Pictograms	Zing supports the full range of Unicode pictogram characters. Each Chinese or Japanese pictogram is indexed as a separate word as if it were a single Latin-1 character surrounded by spaces.
Letter	Zing treats Latin-1, Arabic, and Pinyin characters as individual letters of space-separated-words. Sequences of letters define indexable words.

Zing indexes punctuation as part of some words

Zing indexes some punctuation marks as part of some words to improve search results for common search terms.

Punctuation indexed as part of a word

Punctuation	Indexed to find	Search behavior
Ampersands [&]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `H&R Block` locates exact matches to the search term.
Apostrophes [']	Proper names	Zing ignores trailing possessives and retains most others to find company names. For example, a search for `O'Reilly's` locates matches to O'Reilly and O'Reilly's.

Punctuation indexed as part of a word (continued)

Punctuation	Indexed to find	Search behavior
Hyphens [-]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `Coca-Cola` locates exact matches to the search term.
	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD-10-987` locates exact matches to the search term.
Numbers [123]	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD10987` locates exact matches to the search term.
	Record numbers	Zing locates record numbers that follow a typical pattern. To meet this pattern, search terms must start with a recognized record number prefix. For example, a search for `INT1234567` locates exact matches to the Incident record.
Periods [.]	Acronyms	Zing locates acronyms whether they are separated by periods or not. For example, a search for `u.s.a.` locates matches to usa or u.s.a.. Note that wildcard searches may affect acronym handling. In another example, a search for `u.s.*` may yield better results than a search for `u.s*`.
	Host names	Zing locates sequences of letters and numbers separated only by periods. For example, a search for `en.myhost123.com` locates exact matches to the search term.
	IP addresses	Zing locates numbers that follow a typical IPv4 address pattern.

Punctuation indexed as part of a word (continued)

Punctuation	Indexed to find	Search behavior
		For example, a search for `10.0.0.1` locates exact matches to the search term.
	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD.10.987` locates exact matches to the search term.
Plus signs [+]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `Google+` locates exact matches to the search term.
Underscores [_]	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD_10_987` locates exact matches to the search term.

Note:
The punctuation handling described here doesn't affect wildcard and boolean operators. These operators provide separate Zing functions.

Zing indexes some HTML elements

Zing indexes the contents of certain HTML elements to improve document search results. This indexing is addition to the normal indexing by word.

Indexed HTML elements

HTML element	Description
Title attribute	Zing indexes the contents of the *`title`* attribute of any HTML element. This is separate from the *`title`* element, which Zing already indexes when identifying the words of the document.
Anchor link target	Zing indexes the target URL specified in the *`href`* attribute of any anchor element.

Indexed HTML elements (continued)

HTML element	Description
Alt text for an image	Zing indexes the alternative text of any image element.

Configure a table for indexing and searching

Enable Zing text indexing for a table to allow users to search its records for string values. Configure the table's text indexing attributes, stop words, and synonym dictionaries to control search behavior.

Before you begin

Role required: ts_admin or admin

About this task

Enabling text indexing for a table allows users to search for string values in records on that table. You can configure attributes, stop words, and synonym dictionaries to control indexing and search behavior for an indexed table.

By default, the system creates text indexes for the tables with a Text index record (**All** > **System Definition** > **Text Indexes**). For example:

- Knowledge-related tables
- Core-data-related tables
- Connect-related tables
- Task table
- User table

Enabling text indexing for a table also enables it for all child tables. If you want to disable text indexing for a child table, see Remove the text index for a child table.

> **Note:**
> Whenever you create an index table, the system also creates Access Control Roles (ACLs) for new tables.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical text indexing statistics.

> **Note:**
>
> New tables created by update set transfers have text indexing disabled, even if it's enabled for the tables included in the update set.
>
> To enable users to search tables created by update set transfers, you must manually enable text indexing for those tables.

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Configurations** and select **New**.
2. In **Applies to**, select **Table**.
3. In **Table**, select the table that you want to configure text indexing for.

4. **Optional:** If you intend to use the table in multi-table searches or if you want to use the BM25 scoring algorithm on the table, upgrade its indexing format to V4.

   a. If the value in **Format** isn't grayed out, select **v4**, then select **Submit** and skip to step 5.

   b. If the value in **Format** is grayed out, select **Submit**.
   The grayed-out value means that the table has already been indexed and needs its indexing upgraded to V4.

   c. Navigate to **All** > **System Definition** > **Text Index Configurations** and select the table you submitted.

   d. Under **Related Links**, select **Show index name record**.

   e. Under **Related Links**, select **Upgrade to V4** and select **Submit**.
   The specified table's indexing is upgraded from V3 to V4. Now, this table can be part of multiple-table indexing and BM25 is used to score the table's relevance score. Optionally, select **Show Configuration** under **Related Links**to show the table indexing format on the **Text Index Configuration** page.

5. Configure indexing and search attributes on the selected table.

   a. Navigate to **All** > **System Definition** > **Text Index Configurations** and select the table you configured.

   b. In the Text Index Table Attribute Maps related list, select **New**.
   Attributes pertain to the way Zing indexes documents and ranks documents returned in search results.

   c. On the Text Index Table Attribute Maps form, fill in the fields.

Field	Description
Table	Table to define attributes for.
Attribute name	Search engine attribute. For a list of the attributes and valid values, see Zing index and search attributes.
Value	Value for attribute.

   d. Repeat this procedure to define additional attributes for the table.

   e. In the Related Links section, select **Generate Text Index**.

6. Configure column-level attributes.

   a. Navigate to **All** > **System Definition** > **Text Index Configurations** and select a table.

   b. In the Text Index Column Attribute Maps related list, select **New**.

   c. On the Text Index Column Attribute Map form, fill in the fields.

Field	Description
Table	Table that contains the column you want to define attributes for. Only tables in the index group and their child tables display.
Attribute name	Attribute. For a list of the attributes and valid values, see Zing index and search attributes.
Column	The name of the column in the selected table you want to apply the search attribute to.
Value	Value for attribute.

d. Select **Submit**.

e. Repeat this procedure to define additional search engine parameters for table columns in the index group.

f. In the Related Links section, select **Generate Text Index**.

7. **Optional:** Add stop words.
Stop words are words that you don't want to index, such as `the`, `a`, or `an`. There is a global list of common stop words, so you only have to add stop words specific to your situation. To see the global list of stop words, navigate in your browser to `https://<instance name>.service-now.com/ts_stop_list.do`.
   a. On the **Index Stop Words** tab, select **New**.
   b. In **Index**, select the index to add the stop word to.
   c. In **Word**, enter a single word you don't want to index and select **Submit**.
8. **Optional:** Add a synonym dictionary.
Specifying a synonym dictionary searches on the search term as well as synonyms of the search term, such as car, and its synonym, auto. Zing provides a default synonym dictionary.
   a. On the **Index synonym Dictionaries** tab, select **New**.
   b. In **Index**, select the index to add the stop words to.
   c. In **Synonym dictionary**, select the synonym dictionary to use on the specified table.
   To add a dictionary, select **New** and follow the procedure in Create synonym dictionaries.

Result

The list search *for text* option appears on the list views for the table and its child tables.

What to do next

You can search records on the indexed table using list search in form view. To learn more about using list search, see List search finds records from the current table.

You can also query the indexed table for string matches using the `GlideRecord.addQuery(name, value)` or `GlideRecord.addEncodedQuery(name, value)` methods with the `123TEXTQUERY321` reserved name. For more information about querying for string matches, see Querying tables in script.

Fields excluded from text indexing

Text indexing excludes fields that meet certain name, type, attribute, or encryption conditions. User searches don't match or return values from excluded fields.

Text indexing excludes a field if it meets any of the conditions in the following table.

Category	Description
Field name	Text indexing includes the **sys_class_name** and **sys_tags** fields but excludes all other fields whose names begin with **sys_**.
Field type	Text indexing excludes fields of these types: • Date • Date/Time • Duration • True/False • Workflow For more information on these types, see Field types.
Field attributes	Text indexing excludes fields that have the **no_text_index** attribute set to true. For more information on this attribute, see Remove an index for a specific field.
Field encryption	Text indexing excludes fields configured for Edge Encryption. For more information on configuring fields with Edge Encryption, see Encrypt fields using encryption configurations.

Configure a text index group to search across multiple tables

Update tables to the V4 indexing format and include them in a text index group to facilitate searching across multiple tables.

Before you begin

Role required: ts_admin or admin

About this task

Text index groups enable you to index and search across multiple tables.

Performing searches across multiple tables requires normalizing the tables first so the relevance scores mean the same thing for all tables. V4 indexing provides that normalization. Zing uses the Okapi BM25 ranking function to calculate the relevancy score of search results.

The V4 table indexing format is optimized for documentation, such as knowledge base articles. You don't need to reindex tables that use this format when you change the value of an indexing

attribute, such as the weight of a field. If you want to use the BM25 ranking function on a single table, you can convert it to the V4 format.

To enable search across multiple tables, you:

1. Configure all of your chosen tables to use the V4 index format if they don't already use it.

   Note:
   In new instances, the Catalog Item [sc_cat_item], Knowledge [kb_knowledge], Social Q&A Questions [kb_social_qa_question], and User [sys_user] tables use the V4 index format. If you upgrade your instance from a previous release, the indexing format of these tables remains the same as it was in the older release.

2. Add the tables to a text index group so they can be indexed and searched together.

   Note:
   You can't add the Task [task] table or any tables that extend it to a text index group.

Procedure

1. Configure the tables that you want to include in multiple table searches to use the V4 index format.

   Note:
   Upgrading from V3 to V4 is easy. Downgrading from V4 to V3 is more difficult and discouraged.

   a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

   b. Open the record for the table that you want to upgrade to the V4 index format.

   c. If **Format** isn't disabled, select **V4**, select **Submit**, and then skip to step 2.
   You can choose index formatting in this step because no index exists for the table.

   d. If **Format** is disabled, select the **Show index name record** related link.
   The disabled field means that an index already exists for the table and you must explicitly update the index format.
   The Text Index page displays.

   e. Select the **Upgrade to V4** related link, then select **OK**.
   The system schedules a task to upgrade the text index from V3 to V4, enabling this table to participate in multiple-table indexing.

2. Create a text index group that specifies the tables you want to index together so you can search them together.

   a. Navigate to **All** > **System Definition** > **Text Index Groups**.

   b. Select **New**.

   c. Enter the following field values:

Field	Value
Label	Name for the group of tables that you want to index and search together.
Tables	List of tables that you want to include in the text index group.

You can add tables formatted with V3 and V4 to text index groups. If you add V3 tables, the text index group remains inactive.

d. Select **Submit**.

3. Configure the indexing and search attributes on tables in a text index group.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Select **New**.
The Text Index configuration form displays. If you already have a text index group in the list, skip to step 3.d.

c. In **Applies to**, select **Index Group**.

d. In **Index group**, select the magnifying glass and select the text index group you created, then select **Submit**.
The only text index groups that display are the ones you have already created.
The Text Index Configuration table displays.

e. Open the record for your text index group.

f. On the **Text Index Table Attribute Maps** tab, select **New**.
The Text Index Table Attribute Map form displays. Attributes pertain to the way Zing indexes or searches individual tables in the text index group.

g. In **Table**, select a table to define attributes for.
Only tables in the specified text index group and their child tables display.

h. In **Attribute name**, select the magnifying glass and select an attribute.
To see the list of attributes, enter `ts_configuration_attribute.list` in the application navigator. For attribute definitions, see Zing index and search attributes.

i. In **Value** enter a value and select **Submit**.
Valid values depend on the attribute. For information on valid values, see Zing index and search attributes.

j. Repeat this procedure to define additional search engine parameters for other tables in the text index group.

k. Under **Related Links**, select **Generate Text Index**.

4. Configure search parameters on individual table columns in the text index group.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Open the record for your text index group.

c. On the **Text Index Column Attribute Maps** tab, select **New**.
The Text Index Column Attribute Map form displays. Attributes pertain to the way Zing indexes or searches individual table columns in the text index group.

d. In **Table**, select a table to define attributes for.
Only tables in the text index group and their child tables display.

e. In **Attribute name**, select a search engine parameter, enter a value for that parameter in **Value**, and select **Submit**.
To see the list of attributes, enter `ts_configuration_attribute.list` in the application navigator. For attribute definitions, see Zing index and search attributes.

f. In **Column**, specify the name of the column in the selected table you want to apply the search attribute to.

g. In **Value**, specify the attribute's value that governs the search.

h. Select **Submit**.

i. Repeat this procedure to define additional search engine parameters for table columns in the text index group.

j. Under **Related Links**, select **Generate Text Index**.

5. **Optional:** Add a synonym dictionary.
Specifying a dictionary enables searches on the search term and synonyms of the search term, such as `car` and its synonym `auto`. Zing provides a default synonym dictionary.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Open the record for your text index group.

c. On the **Index synonym Dictionaries** tab, select **New**.

d. In **Index**, select the table index to add the stop words to.

e. In **Synonym dictionary**, select the dictionary to use.
To add a dictionary, select **New** and follow the procedure in Create synonym dictionaries.

f. Select **Submit**.

g. Under **Related Links**, select **Generate Text Index**.

6. Select **Update**.

What to do next

You can query the tables in the text index group for string matches using the `GlideRecord.addQuery(name, value)` or `GlideRecord.addEncodedQuery(name, value)` methods with the `123TEXTINDEXGROUP321` reserved name. For more information about querying text index groups for string matches, see Querying tables in script.

Zing index and search dictionary attributes

The following dictionary attributes either affect the way Zing indexes tables or ranks search results.

Index and search dictionary attributes

Zing uses dictionary attributes set at the table or field level to configure the following settings:

- indexing behavior
- ranking of search results
- the BM25 relevancy ranking algorithm

Zing index and search dictionary attributes

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
attachment_index	boolean	Table	Both	If true, attachments on the table are indexed for search purposes.	Attachment Index	TRUE	FALSE
no_text_index	boolean	Both	Both	This attribute on a field prevents the field from being included in a text index.	No Text Index	TRUE	FALSE
text_index_attachment_body_weight	float	Table	V4	Specifies how much consideration (weight, a float value) to give a search term found in the body of an attachment. For more	Text Index Attachment Body Weight	FALSE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				information on how weight value affect search result relevancy, see Zing computes document scores using three components.			
text_index_attachment_displayed	boolean	Table	Both	Displays attachments in text search results.	Text Index Attachment Displayed	FALSE	FALSE
text_index_attachment_title_weight	float	Table	V4	Specifies how much consideration (weight, a float value) to give a search term found in the title of an attachment. For more information on how weight value affect search result relevancy, see Zing computes document scores using three components.	Text Index Attachment Title Weight	FALSE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
text_index_auto_stop	boolean	Table	Both	Automatically identifies stop words and doesn't index them. Based on the threshold specified in text_index_auto_stop_threshold.	Text Index Auto Stop	TRUE	TRUE
text_index_auto_stop_threshold	int	Table	Both	Threshold (integer, number of occurrences) for a word to become a stop word automatically. See text_index_auto_stop.	Text Index Auto Stop Threshold	TRUE	TRUE
text_index_default_partial_matching_rule	String	Table	Both	String for partial matching rule configuration. Input should be based on Change the query mode of an indexed table.	Text Index Default Partial Matching Rule	FALSE	TRUE
text_index_default_query_mode	String	Table	Both	String for query mode configuration. Input should be based on Change the query mode of an	Text Index Default Query Mode	FALSE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				indexed table			
text_index_disable_synonym	boolean	Table	Both	TRUE disables searching on synonyms as well as the search term.	Text Index Disable Synonym	FALSE	TRUE
text_index_enable_idf	boolean	Table	V3	TRUE enables TF-IDF scoring.	Text Index Enable IDF	FALSE	TRUE
text_index_filter_junk	boolean	Table	Both	TRUE by default, FALSE disables the junk filter for a table. By default, Zing doesn't index or search for 2-digit numbers and single character words (unless they are Chinese or Japanese characters). Regenerate the index after disabling the junk filter. This attribute results in a larger table index. For optimal	Text Index Filter Junk	TRUE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				performance, don't apply it unless it's required.			
text_index_filter_query	An encodedQuery on the table	Table	Both	Use this attribute when you want to index the rows matching specific filter conditions. The attribute value must be an encodedQuery on the table.	Index Filter	TRUE	FALSE
text_index_filterable	boolean	Column	Both	If a field with this attribute set to true, is changed, the row is evaluated for re-indexing (even if the field itself isn't indexable).	Index Filterable	TRUE	FALSE
text_index_include_stop_word	boolean	Table	Both	if you need to index stop words in this table, set this attribute to true.	Text Index Include Stop Word	TRUE	TRUE
text_index_scorer_bm25_b	float	Table	V4	This attribute is the b parameter	bm25_b	FALSE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				used in the BM25 algorithm. See text_index_scorer_bm25_b.			
text_index_scorer_bm25_k1	Float	Table	V4	This attribute is the K1 parameter used in the BM25 algorithm. See text_index_scorer_bm25_k1.	bm25_k1	FALSE	TRUE
text_index_tags	String	Table	Both	Should be set to specific String: empty/ everyone_only/ all_shared, depending on type of tags that wants to be indexed.	Text Index Tags	TRUE	FALSE
text_index_tokenizer_language	String	Table	Both	Put "ja" (without double quote) when there is need to support tokenization in Japanese.	Text Index Tokenizer Language	TRUE	TRUE
text_index_translations	Boolean	Table	Both	If present or true, forces indexes to be recalculated when translated strings are added. Requires	Text Index Translations	TRUE	FALSE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				sys-admin role to modify. Automatically set for indexed fields that are translated, and to fields that have a translation and are being indexed. The glide.i18n.force_index system property, which defaults to true, overrides this attribute.			
text_search_and_or_limit	int	Table	Both	Add table level custom attribute text_search_and_or_limit that overrides the global property.	Text Search And Or Limit	FALSE	FALSE
ts_language	String	Column	Both	Added to allow for text indexing of only specific languages.	Text Search Language	TRUE	FALSE
ts_multi_value_field_splitter	String	Column	Both	If one field is a multi-value field, add the splitter in the field in this	Text Search Multi-value Field Splitter	TRUE	TRUE

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				attribute to spread out index positions of the values. For example, to separate multi:value, put : for this attribute.			
ts_weight	int	Column	Both	Controls the relative importance of a match in the field for text search. For more information on how weight value affect search result relevancy, see Zing computes document scores using three components. To learn how to set text search weight for a field, see Set the relative weight of a field.	Text Search Weight	FALSE	FALSE

no_text_index

For Customer Service and Support guidelines on setting the **no_text_index** option for different field types, see KB0859922 on the Now Support site.

text_index_scorer_bm25_b

This dictionary attribute is part of the BM25 algorithm. The attribute impacts the importance of the length of a document in search results. If this attribute is 0, the length has no bearing. In this case, a document of two words would be valued equally as a document with 1000 words. Very short documents are often weighted lower than longer documents. The default is 0.75.

text_index_scorer_bm25_k1

This dictionary attribute is part of the BM25 algorithm. The attribute helps determine term frequency saturation characteristics, that is, having the search term appear in a document increases the relevancy of the document, but the increase is less impactful as the numbers climb. For example, a search term occurring 10 times in a document makes it more relevant than a document that has only one occurrence. However, a document that has 100 occurrences of the search term may not be ten times more impactful than a document that has 10 occurrences. The relevance approaches a maximum effect asymptote. The higher the attribute value, the lower the maximum effect of multiple occurrences. Typical values are between 1.25 - 2.0.

Regenerate a text index for a table

You can regenerate a table text index when you change table stop words or display values.

Before you begin

The table that you want to regenerate the text index for must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

By default, the system maintains text indexes on a daily schedule. Typically, you only need to manually regenerate a text index when you change these values.

- You change the list of table-specific stop words.
- You change the display value of a record such as changing a user or group name. Until you regenerate the index, text searches for old display values will still produce results and searches for the new display value won't show results.

You can also regenerate a text index if you observe incorrect search results for the indexed table. This is rare and usually only occurs if text indexing was interrupted.

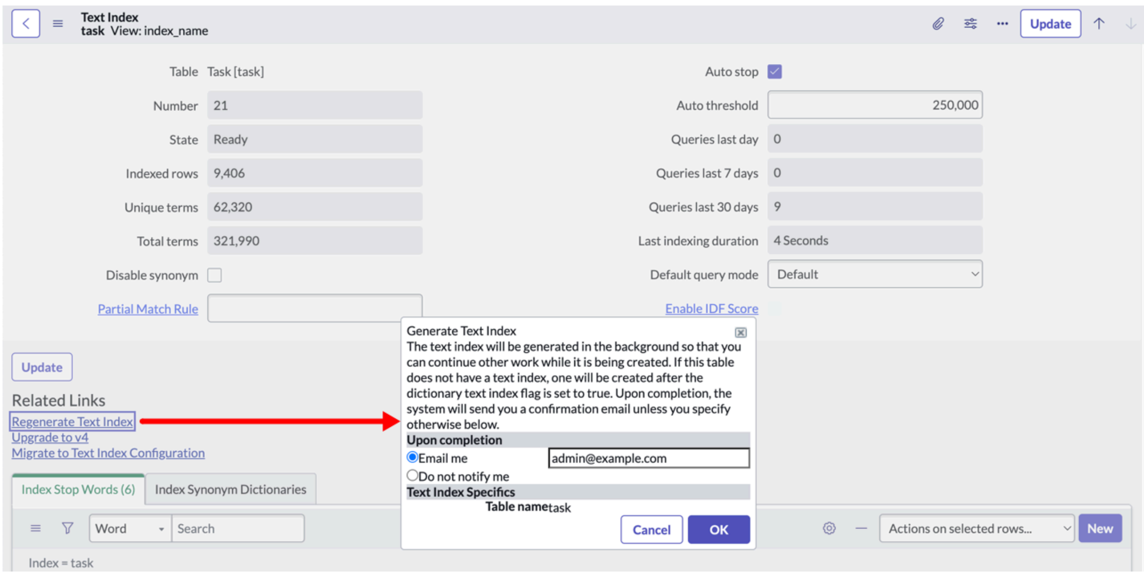
Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

Note:
This index regeneration process purges the existing text search index for the table before it regenerates it. While it's processing, no search results are returned if you perform a text search before the regeneration is complete. An alternate method is available that doesn't impact use of text searches for the table while the regeneration is in process. See Reindex a table without impacting text search results.

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index for the table.

   Example
   For example, select **task**.
   The system displays the Text Index record for the table.
3. Select the **Regenerate Text Index** related link, then select **OK**.



Result

The system schedules the selected table for text indexing.

Reindex a table without impacting text search results

Rebuild text search indexes without adversely impacting search results. You can continue to perform text searches on a table while the index regeneration takes place.

Before you begin

The table that you want to rebuild the index for must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: admin

Note:
If the `glide.script_processor.admin` system property's value has been changed from the default value, you need the role specified by that property value. For details on this property value and its effects, see Restrict access to background script [Updated in Security Center 1.3].

About this task

This reindexing method doesn't purge the entire text search index before the rebuild takes place. It rebuilds the text search table index one record at a time, and reindexes the target table hierarchy only. For example, if you select the sc_cat_item table, only the sc_cat_item table is reindexed.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.

   Note:
   If the *glide.script_processor.admin* system property's value is set to security_admin, you must elevate to that privileged role to access this module. For more information on elevating privileges, see Elevated privilege roles.

2. In the **Run script (JavaScript executed on server)** text field, enter the following background script, being sure to enclose both arguments in quotes as shown:

   ```
   new GlideTextIndexEvent ( ).indexUpdate('TABLE_NAME',
    'EMAIL_ADDRESS');
   ```

   Where:

   - `TABLE_NAME` is the name of the table you want to reindex.

     Note:
     Only the specified table and its child tables are reindexed.

   - `EMAIL_ADDRESS` is the address to which an email notification should be sent when the table reindex completes. Type `null` for no email notification.

   Example
   For example, to regenerate the kb_knowledge table text search index, and specify that no email notification is required after the rebuild completes, create the following background script:

   ```
   new GlideTextIndexEvent ( ).indexUpdate('kb_knowledge',
    'null');
   ```

   The script creates an event that the index handler processes, so the script completes without blocking on completion of the reindexing job.

3. Select **Run script**.

Result

The system reindexes the text search for the specified table. For large tables, such as sys_metadata, reindexing can take a couple of hours, but you can still perform text searches on the table while the script is running.

Regenerate the text index for a single record

Update the text search index for a single record. Use this approach to quickly verify whether text indexing is the cause of a search issue without rebuilding the full text index for an entire table.

Before you begin

Identify the following:

- A search term that doesn't return the expected results
- A record containing the identified search term that isn't returned when searching for the term
- The table that includes the identified record

The identified table must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: admin

Note:
If the *glide.script_processor.admin* system property's value has been changed from the default value, you need the role specified by that property value. For details on this property value and its effects, see Restrict access to background script [Updated in Security Center 1.3].

About this task

This reindexing method rebuilds the text search index for a single record. It takes less time than rebuilding the text index for all records in a table.

You can use this method to quickly determine whether text indexing is the cause of a search issue. Doing so avoids the delay associated with rebuilding the entire table's text search index.

Procedure

1. Copy the sys_id for the identified record by selecting **Copy sys_id** from its context menu.
2. Navigate to **All** > **System Definition** > **Scripts - Background**.

   Note:
   If the *glide.script_processor.admin* system property's value is set to security_admin, you must elevate to that privileged role to access this module. For more information on elevating privileges, see Elevated privilege roles.

3. In the **Run script (JavaScript executed on server)** text field, enter the following script, replacing `TABLE_NAME` with the name of the table containing the identified record and `SYS_ID` with the record's sys_id that you copied in step 1:

   ```
   var gr = new GlideRecord('TABLE_NAME');
   gr.get('SYS_ID');
   gs.eventQueue("text_index", gr,
    '[TABLE_NAME]','update','text_index');
   ```

4. Select **Run script**.
   The script creates a text_index update event for the specified table in the text_index queue.
5. Navigate to **All** > **System Policy** > **Events** > **Event Log** and wait for the new text_index update event's state to change to **processed**.
   To find the new event, you can apply a **[Name][contains][text_index]** filter and sort the Event list view by **Created** date/time in descending (z to a) order.

Result

The system updates the text index for the specified record in the specified table.

What to do next

Repeat your sample search. If this search returns the identified record, you may want to update the text index for the entire table that contains that record. For details, see Regenerate a text index for a table.

Remove an index

You can remove the index for a table if you no longer want the search engine to return results for that table. This procedure also removes the index for all tables that extend the specified table.

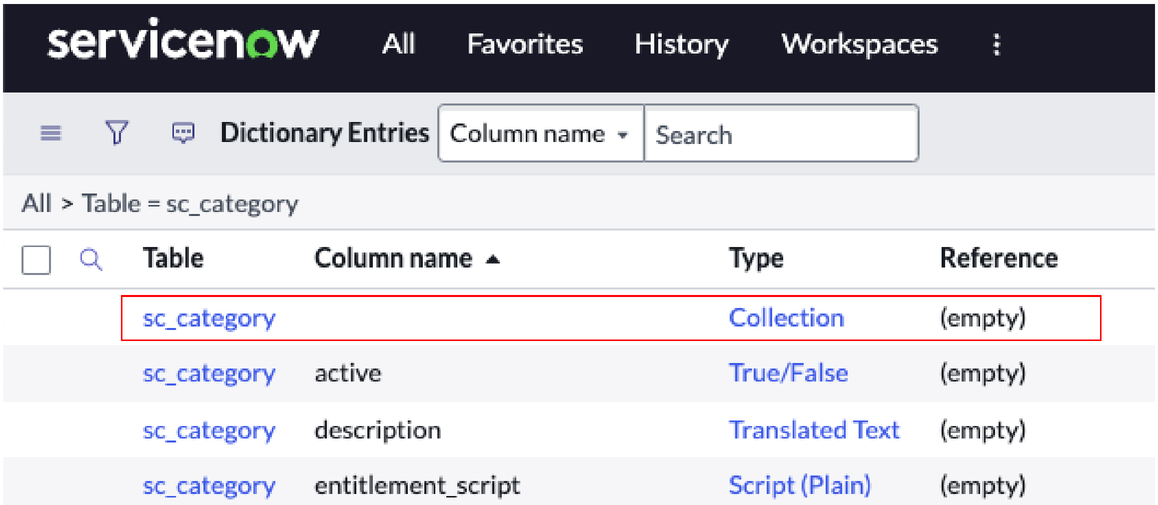
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the table.

   The dictionary record for a table is the record with **Table** matching the table's name, an empty column name, and a **Type** value of **Collection**, as shown in the following example image.

3. **Optional:** If the **Text index** option field is hidden, configure the form layout to show it.
   For details on showing and hiding fields on a form, see Configuring the form layout.
4. Clear the record's **Text index** option, then select **Update**.

Result

The system no longer indexes text from the specified table or queries it for text search results. This change also disables text indexing and search for all tables that extend the specified table.

Remove an index for a specific field

You can remove the index for a specific field in a table if you no longer want the search engine to return results for that field.

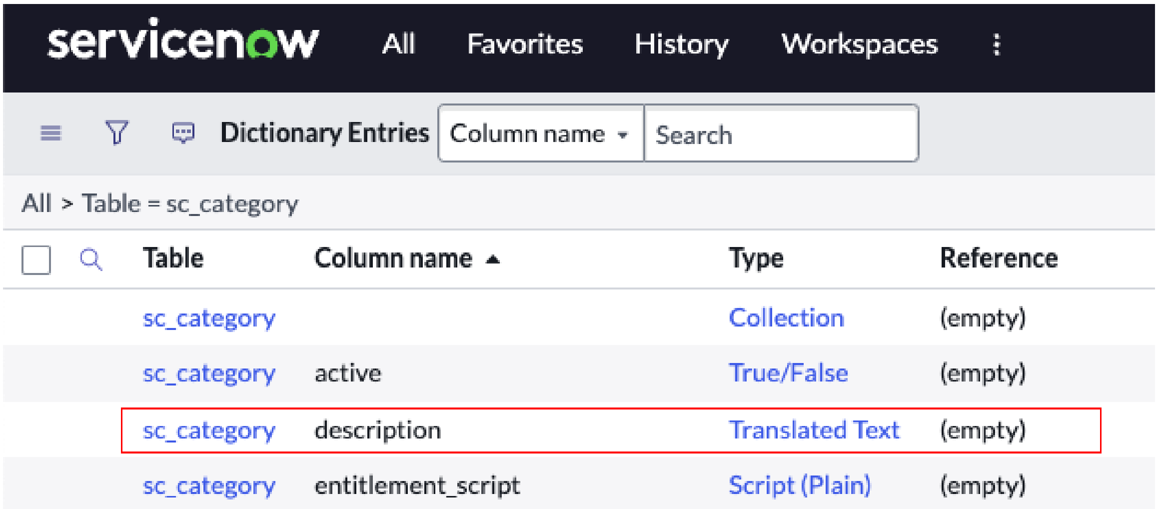
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the table field.

   The dictionary record for a table field is the record with **Table** matching the table's name and **Column name** matching the field's name, as shown in the following example image.



3. In the Attributes related list, select **New**.
4. On the Dictionary Attribute form, fill in the fields.

Field	Value
Attribute	No text index
Value	true

5. Select **Submit**.
6. Select **Update**.

Result

The system no longer indexes text from the specified table field or queries it for text search results. This change also disables text indexing and search for the specified field in all tables that extend the specified table.

Remove the text index for a child table

You can remove the text index for a child table if you no longer want the search engine to return results for that child table.

Before you begin

Role required: admin

About this task

The **Text index** option for a table is inherited by all of that table's child tables. Clearing this option for an individual child table has no effect.

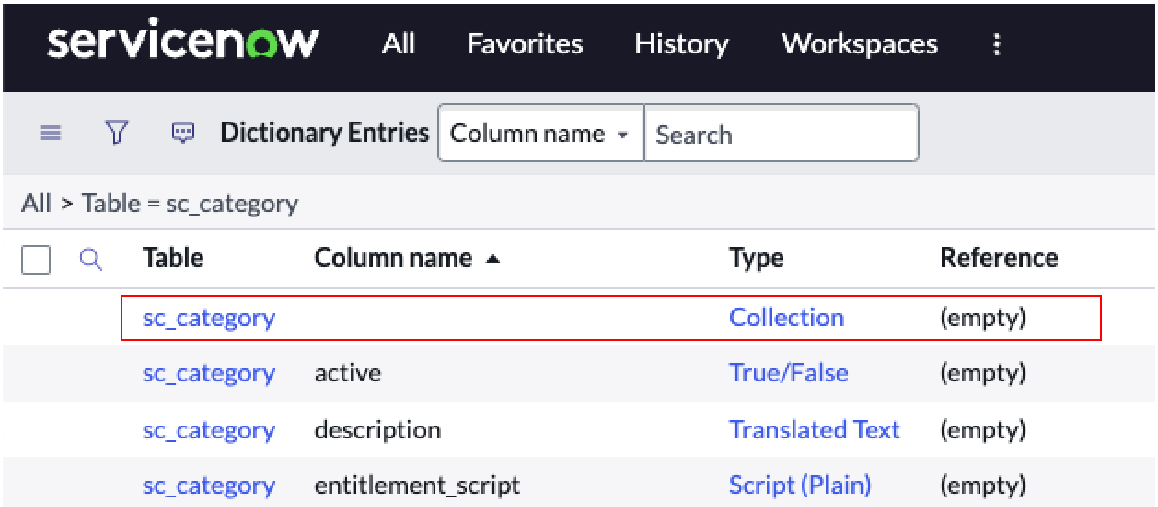
For example, **Text index** is selected for the Task table in the base system. This setting enables text indexing for the Task table. All tables that extend Task, such as Catalog Task, Incident, and Request, inherit this option. Clearing the **Text index** option in the Incident child table doesn't disable text indexing for Incident records.

To disable text indexing for a specific child table, set that table's *`No text index`* attribute. This attribute overrides the table's inherited **Text index** option without affecting indexing behavior for other tables in its hierarchy.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the child table.

   The dictionary record for a table is the record with an empty column name and a **Type** value of **Collection**, as shown in the following example image.

3. In the Attributes related list, select **New**.
4. On the Dictionary Attribute form, fill in the fields:

Field	Value
Attribute	No text index
Value	true

5. Select **Submit**.
6. Select **Update**.

Result

The system no longer indexes or queries the child table for text search results. Indexing continues for other tables in the table's hierarchy.

Change the query mode of an indexed table

Set the query mode to specify whether searches on an indexed table must match all or only some of the search terms.

Before you begin

To change the query mode of an indexed table, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

Once a table is indexed, the data within the table can be searched through the global search bar. Change the query mode for the indexed table to allow global search to match all or only some of

the searched terms. Enable a partial match rule to return results that partially match the searched terms.

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table you want to configure from the list of indexed tables.
3. Use the combo box to select a **Default query mode**.

Option	Description
Default	The default query mode for a table is an AND query.
AND	Matches all search terms.
OR	Matches one or more search terms.
AND_OR	Matches all search terms. If no results are found, matches one or more search terms.

4. To enable partial matching of search terms, configure the partial match rule in the **Partial Match Rule** field.
Partial match rules return results that partially match the search terms. Use a partial match rule if queries often include many keywords (if, for example, users cut and paste phrases into the global search bar).

Partial match rules

Input type	Example	Description
Integer	3	Indicates the minimum number of search terms to be matched.
Negative integer	-2	Indicates that the number of search terms, minus this number, should be matched.
Percentage	75%	Indicates the minimum percentage of search terms to be matched. The minimum number of search terms is the number computed from the percentage rounded down.
Negative percentage	-25%	Indicates that the number of search terms, minus this percentage, should be matched. The minimum number of search terms is the number computed from the percentage rounded down and subtracted from the total number of search terms.
Combination	3<70%	A positive integer, followed by a less than symbol, followed by any of the previously mentioned input types. Indicates that if the number of search terms is equal to or less than the integer, all search terms are required. If the number of search terms is greater than the integer, the specification applies. In this example: if there are 1–3 search terms, all are required. If there are 4 or more search terms, only 70% are required.

Input type	Example	Description
Multiple combinations	3<-25%, 9<-5	Multiple conditional specifications separated by commas. In this example: if there are 1–3 search terms, all are required. If there are 4–9 search terms, all but 25% are required. If there are more than 9 search terms, all but 5 are required.

Enable indexing of text in multi-row variable sets

Make text from multi-row Service Catalog variable sets searchable in global search.

Before you begin

Role required: admin

About this task

By default, Zing doesn't index text from multi-row Service Catalog variable sets. Global search doesn't return results for text in these variable sets.

Administrators can override this default behavior by adding the *glide.ts.index.variableset* system property and setting its value to **true**. With this value set, Zing indexes text in multi-row variable sets, and global search returns results for that text.

To learn more about variable sets, see Service catalog variable sets.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search the table for a system property with name *glide.ts.index.variableset*.
   - If the property already exists, change its value to **true** and skip the following steps.
   - If the property doesn't exist, go on to the following steps.
3. Select **New**.
4. On the System Property form, fill in the fields.

Field	Value
Name	glide.ts.index.variableset
Type	true | false
Value	true

5. Select **Submit**.

Result

Zing indexes text from multi-row Service Catalog variable sets so that you can find it using global search.

What to do next

To see text from multi-row variable sets immediately in global searches, regenerate the text indexes for the affected tables. For details on this procedure, see Regenerate a text index for a table.

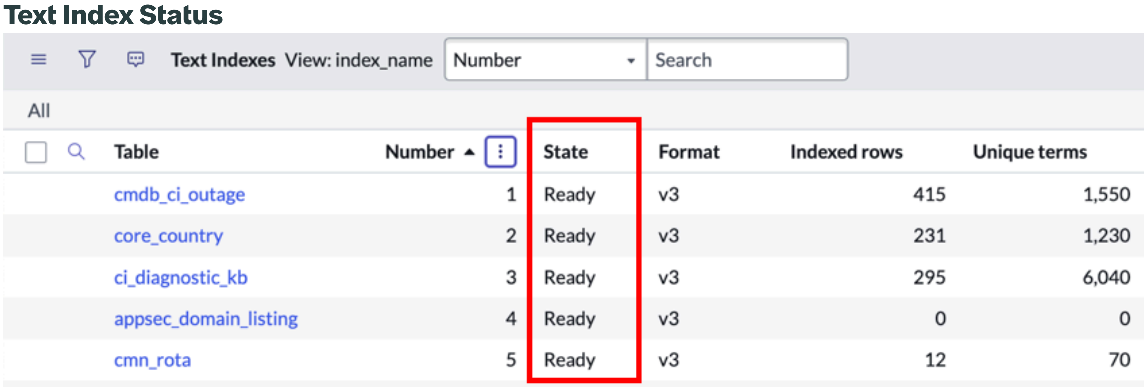
If you don't regenerate the text indexes for the affected tables, records on those tables will be reindexed as they are updated or added. Global searches will only return text from multi-row variable sets on reindexed records.

Text indexing statistics and status

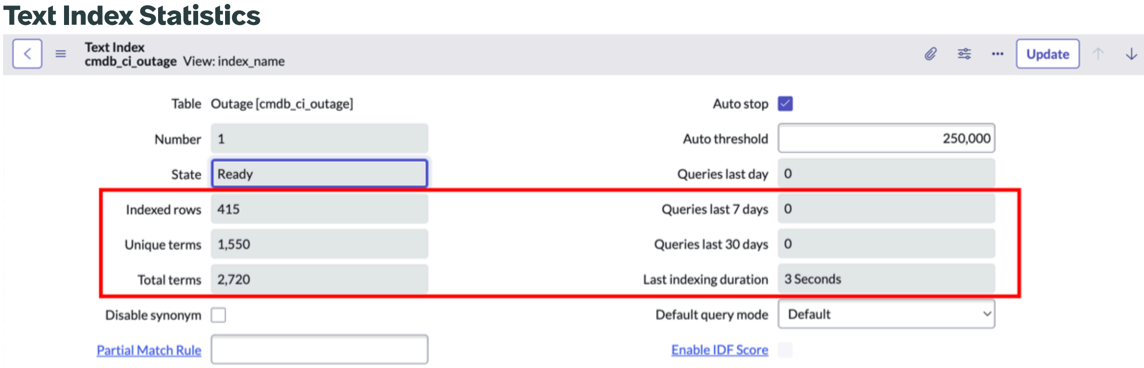
To view text indexing statistics and status, navigate to **All** > **System Definition** > **Text Indexes**.

- If text indexing is in progress, view the status of each index in the **State** field. Refresh the list to view updates. Tables are indexed one at a time.
- To see how long it takes to index a specific table, view the **Last indexing duration** field for the table entry. Although each process varies based on activity and data, historical data can provide a good estimate.
- View statistics (such as the number of indexed rows, terms, and queries in the past week) in the list or on the form for a specific table.

Text Index Status



Text Index Statistics



Configure tables to use the Japanese tokenizer

Improve search results in Japanese language searches by configuring individual tables to use the Japanese tokenizer.

Before you begin

Role required: admin

About this task

Japanese language searches use the Kuromoji Japanese tokenizer in Zing. The Japanese tokenizer attribute is active by default, but you must configure individual tables to use it and then regenerate the text index.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Search for the table name.
3. In the search results, open the table, which is the list item that has an empty **Column name** and a **Type** of **Collection**.
4. Scroll down the page and select the **Attributes** tab, and then select **New**.
5. Fill in the fields on the form.

   Attributes fields

Field	Description
Attribute	Enter **Text index tokenizer language**.
Dictionary entry	Defaults to the name of the table.
Value	Enter **ja** for the Japanese tokenizer.

6. Select **Submit**.
7. Regenerate a text index for a table.

   Note:
   Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

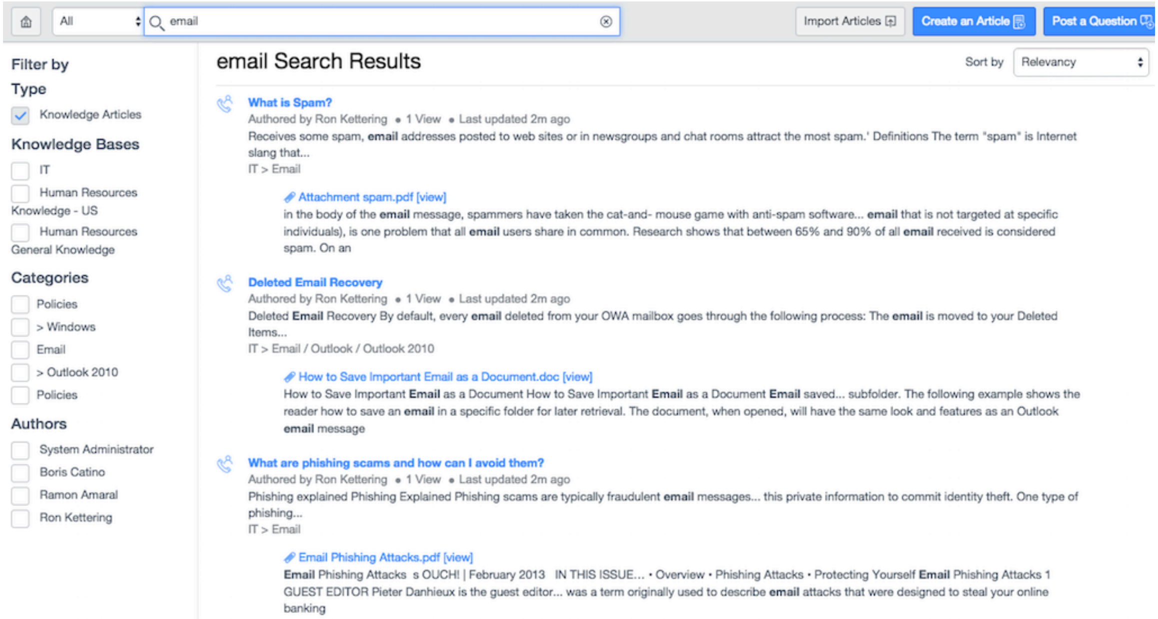
Result

When the text index is generated and you go to the table you configured, the table now uses the Japanese tokenizer.

Zing can include attachments in search results

Search content from attachments on indexed tables. Display attachments for search results from the Knowledge [kb_knowledge] table.

Sample Knowledge search showing attachments with matching content

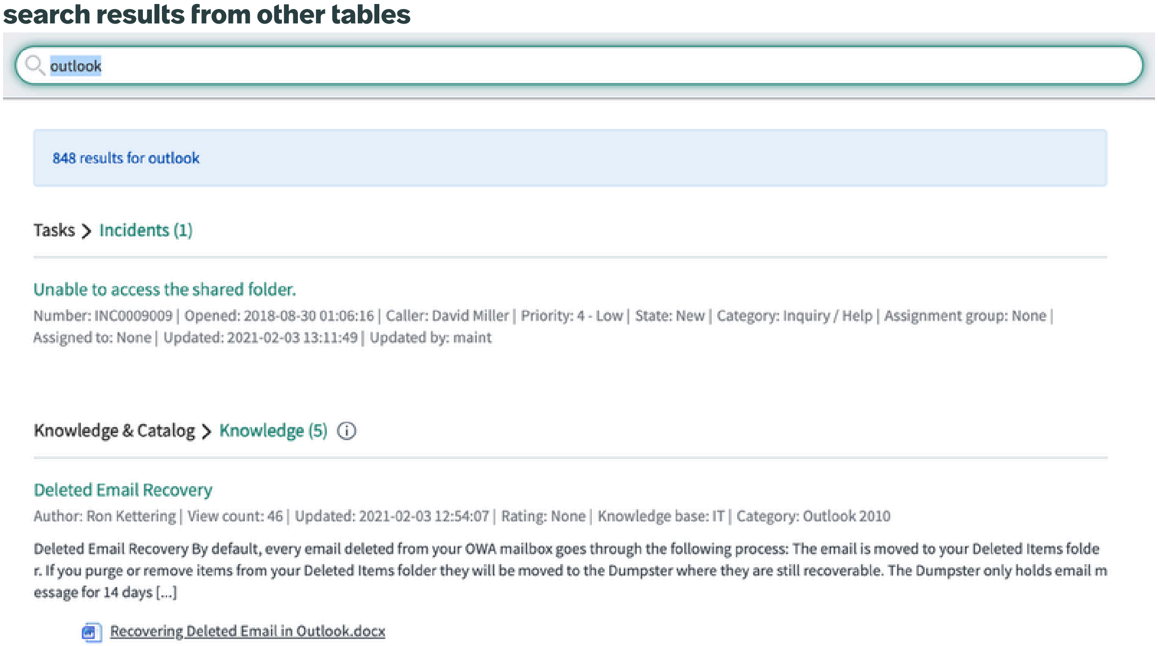


By default, search only matches content from attachments on Knowledge [kb_knowledge] records. Administrators can enable search for attachments on other tables, but doing so causes the system to re-index the selected table, its parent table, and any children of the parent table.

> **Warning:**
> For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

The search results page only displays attachments for search results from the Knowledge [kb_knowledge] table, even if other tables have attachment search enabled.

Global search displays attachments for Knowledge search results but not for search results from other tables



Zing supports indexing and searching these attachment file types.

- .doc

Index attachments on a table

Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

Before you begin

Role required: admin

About this task

By default, attachment indexing is enabled for the Knowledge Base. You can enable attachment indexing for other tables. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

Procedure

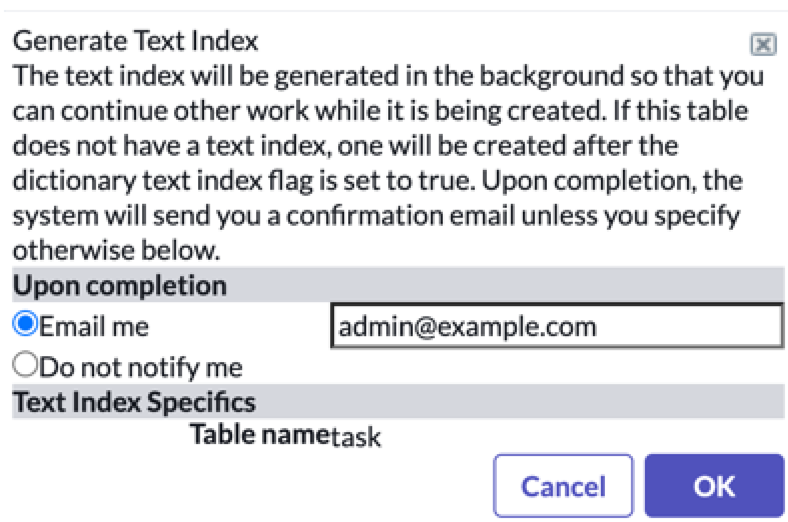
1. Navigate to **All** > **System Definition** > **Text Index Configurations**.
2. Edit the record for the table that you want to enable attachment indexing for.
3. In the Text Index Table Attribute Maps related list, select **New**.
4. On the Text Index Table Attribute Map form, fill in the fields.

Field	Value
Table	<table name>

Field	Value
Attribute name	Attachment index
Value	true

Note:
The attachment index attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, enabling indexing of attachments on the Task table does not enable indexing of attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

5. Select **Submit**.
   A message appears indicating that the attachment index attribute change will not take effect until you reindex the selected table.
6. Dismiss the reindexing message by selecting **OK**.
7. On the Text Index Configuration form, select the **Generate Text Index** related link.
8. In the confirmation window, perform one of these two steps:
   - To receive an email notification from the system when text indexing for the table is complete, enter your email address and select **OK**.
   - If you do not want to receive an email notification, select **Do not notify me**, then select **OK**.



9. Dismiss the confirmation message by selecting **OK**.

Result

The system begins text indexing for the table. When it is complete, attachments can be searched on that table.

Zing removes stop words from queries

Remove common words from search queries that don't produce meaningful results.

Stop words are common words that aren't indexed because they aren't meaningful in search results. Articles, conjunctions, personal pronouns, and prepositions are examples of stop words that aren't used in keyword searches. Administrators can configure stop words for all indexed tables and for specific tables.

By default, the system maintains two types of stop words.

Types of stop words

Stop word type	Description
System-wide text index stop words	The system always ignores system-wide text index stop words when generating text indexes. Any search for a system-wide stop word returns no search results.
Table-specific stop words	The system uses the table-specific Text Index record to determine whether to index the stop word or to just remove it from keyword search queries against the table.

By default, the system has stops words for common English words. Search administrators typically create stop words from search terms that produce too many search results such as articles, conjunctions, personal pronouns, and prepositions.

Configure a global stop word

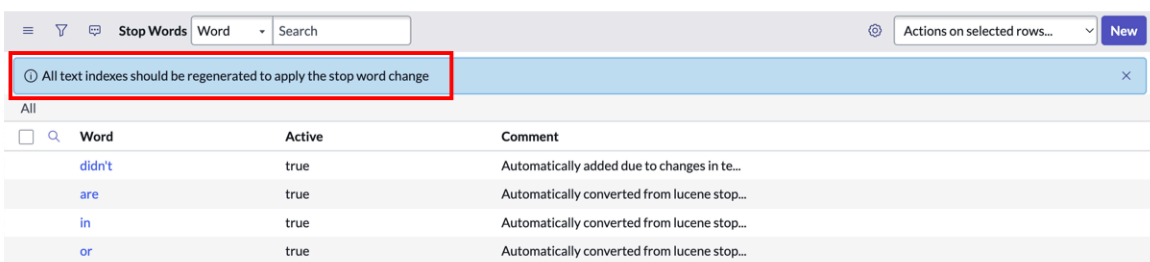
Configure stop words that shouldn't be indexed by the search.

Before you begin

Role required: ts_admin or admin

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Stop Words**.
2. Add or remove stop words from the list.
3. If a message appears at the top of the list, contact Technical Support to regenerate all indexes.
   You must regenerate indexes whenever words may be missing from an index. For example, if you delete, inactivate, or change an active global stop word, the word may be missing from the index. An after business rule checks these conditions and generates the notification message when index regeneration is necessary.



Configure a table-specific stop word

You can configure stop words for a specific table.

Before you begin

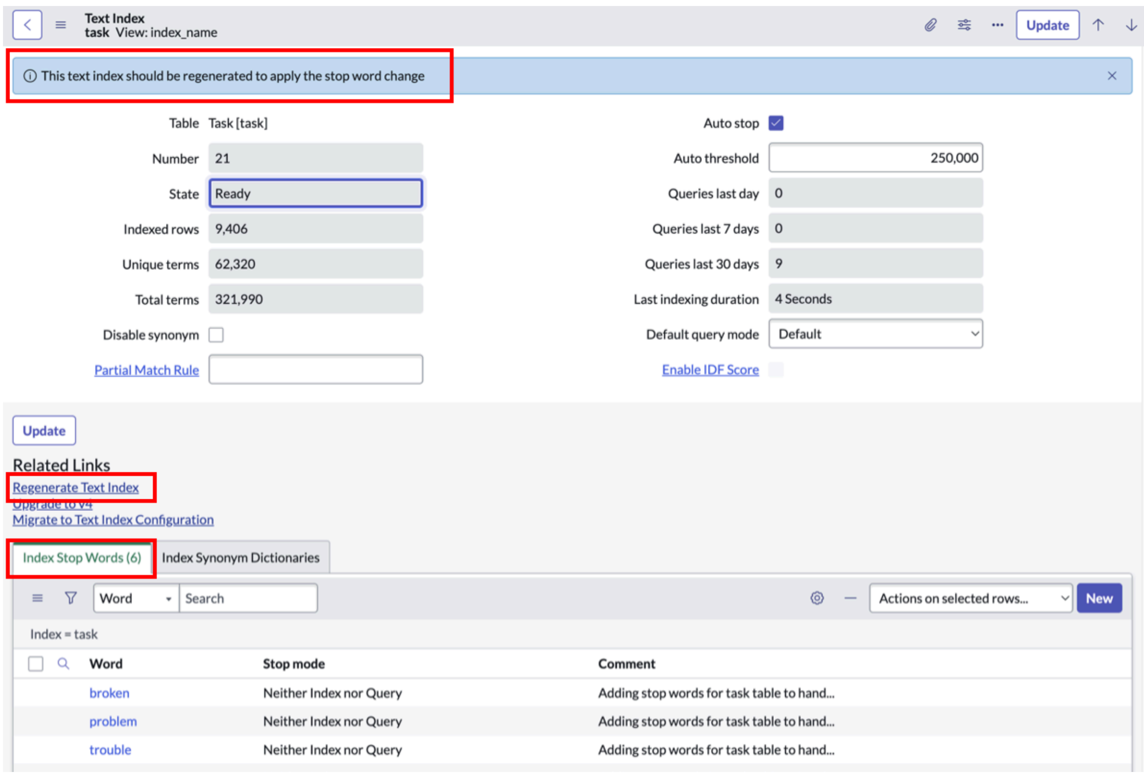
Role required: ts_admin or admin

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index entry for the table.
3. Add or remove stop words from the **Index Stop Words** related list.
   For each word, select the desired **Stop mode** (Not a Stop Word (inactivates the stop word), Neither Index nor Query, or Index but do not Query).
4. If a message appears at the top of the form, select **Regenerate Text Index**, then select **OK**.

You must regenerate indexes whenever words may be missing from an index. For example, if you delete or change a stop word for which the mode was Neither Index nor Query, the word may be missing from the index. An after Business rules checks these conditions and generates the notification message when index regeneration is necessary.

Note:
Text search uses the global list plus the table-specific list of stop words when indexing the table.



Enable automatic stop words for a table

The system can identify and generate stop words when a search term exceeds an occurrence threshold.

Before you begin

Enable text indexing for the table.

Role required: ts_admin or admin

About this task

By default, the TS Index Stats scheduled job identifies and creates stop words for tables with text indexes on a nightly basis. Automatically adding stop words improves your search results by removing search terms that return too many search results.

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index entry for the table.
3. Select the **Auto stop** check box.
4. In **Auto threshold**, enter the maximum number of occurrences a search term can have in search results.

When a search term generates more search results than the threshold, the system automatically creates a stop word for the search term.

Example
For example, to create stop words for the task table, see the blog post Configuring auto stop words and regenerating text indexes from a ServiceNow employee on the ServiceNow Community.

5. Select **Update**.

Result

The job identifies and creates stop words for the table with a **Stop mode** value of `Index but do not Query` and inserts a **Comment** to indicate that the stop word was generated automatically.

Disable a stop word in Zing

Configure Zing to return results for text search terms that match a stop word's stemmed form.

Before you begin

Role required: admin

About this task

Zing's stemming feature can cause search to return no results for an acronym or short word if its stemmed form is defined as a stop word.

Indications that a search term may be stemmed to a stop word include:

- Text search returns no results for the affected term.
- The system displays an informational message: `Your text query contained only common words or ambiguous wildcards, please refine your search and try again.`

As an example, imagine that a user searches for the acronym `AMS`. Zing stems this search term to `am`. Because `am` is defined as a stop word, Zing ignores the search term. The user's `AMS` search returns no results, and the system displays the informational message.

To enable correct search results for an affected term, administrators can disable the relevant stop word in the global and table-specific stop word lists.

Note:
Disabling a stop word can impact search performance and relevancy. Text search will return matching results for the disabled stop word as well as for its stemmed forms.

For more details on stemming in Zing, see Zing matches derived words with stemming.

Procedure

1. To disable a stop word in the global stop word list, perform the following steps:
    a. Navigate to **All** > **System Definition** > **Text Index Stop Words**.
    b. Open the record for the stop word you want to disable.
    c. On the Stop Word form, clear the **Active** option, then select **Update**.
2. To disable a stop word in table-specific stop word lists, perform the following steps for each table that includes the stop word:

a. Navigate to **All** > **System Definition** > **Text Indexes**.

b. Open the table's text index record.

c. In the Index Stop Words related list, open the record for the stop word.

Note:
If the Index Stop Words related list isn't visible, open the form context menu and select **View** > **Default view**.

d. On the Index Stop Word form, set the stop word's stop mode to **Not a Stop Word** and select **Update**.

e. On the Text Index form, select the **Regenerate Text Index** related link.

Result
Zing no longer ignores the disabled stop word and its stemmed forms in text searches.

Zing matches derived words with stemming

Convert any multiple-character search keyword to its stem form to find derived versions of the word.

Stemming removes a variety of common word inflections, such as plurals and past tense forms. Zing treats all words with a common stem as synonyms of the original search term. Stemming doesn't apply to searches involving single-character words such as Chinese and Japanese pictograms.

Zing uses the Porter Stemming Algorithm, which is most effective for English text, but supports stemming in these languages.

- English
- French
- German

The stemming language determines how the system generates indexes of record data. The system only supports one stemming language at a time regardless of how many languages the instance supports. When you change the stemming language, the system creates any new index entries based on the new language stemming rules, but doesn't regenerate any existing index records. You must manually regenerate indexes for tables you want to use the new stemming language.

Zing can expand search results with synonyms

Expand search results to include additional search terms.

By default, Zing includes a sample synonym dictionary consisting of a list of synonym sets (synsets). Zing supports two types of synonym sets.

Synonym set types

Synonym set type	Description	Example
Synonym list	A synonym list is a list of words separated by commas. When a search uses any word	Cyber,Internet,Cybercafe

Synonym set types (continued)

Synonym set type	Description	Example
	from the list, Zing expands the search to include all words in the list.	
Synonym map	A synonym map is two word lists separated by the equal and greater than characters => . When a search uses any word from the list on the left, Zing expands the search to include all words from the list on the right. When a search uses a word from the list on the right, Zing doesn't expand the search to include terms from the list on the left.	IOT,Internet of Things=>Chip,Nest thermostat,RFID,IOT

Search results, synonym expansion and weighting

In search results, documents containing the original search keywords have a higher score than documents containing the search synonyms. For example, documents with the search keyword `IOT` have a higher score than documents with the synonym `Internet of Things`.

- One-way synonym expansion to/from multiple terms `(blork, cork => malork, elastic)` works as expected. `Blork` and `cork` both expand to `malork` and `elastic`.
- Multi-level one-way expansion `(blork => cork => malork)` doesn't work transitively. Neither `blork` nor `cork` expands to `malork`.
- Multi-level one-way expansion split between multiple synonym set records `(blork => cork)` `(cork => malork)` doesn't work transitively. Only `cork` expands to `malork`, `blork` only expands to `cork` but not `malork`.

By default, synonyms don't use the same weight as regular search terms. Synonyms are only weighted at 10% of the default search weight. Additionally, multiple instances of a synonym in a single doc/field don't increase the search weight. The weight of synonyms is controlled by the property *`glide.ts.synonym.expanded.boost`*. When this property value = 1, synonyms are weighted equally to normal search terms. 0.5 = 50% weight etc.

Wildcard characters and synonym matching

Zing doesn't expand the `%` and `*` wildcard characters when looking for synonyms that match your search term. These characters are treated as literal characters when finding matching synonyms. As an example, if you search for `issu*`, Zing doesn't find synonyms for `issue`, but it does find synonyms for `issu*`.

Enable search synonyms

Enabling text index synonyms allows Zing to expand text searches with additional search keywords.

Before you begin
Role required: ts_admin or admin

About this task
By default, text searches don't use text index synonyms.

Procedure

1. Navigate to **All** > **System Properties** > **Text Search**.
2. Scroll down to **Enable Synonym**, and select **Yes**.

Result

Text searches use active synonym dictionaries to expand keyword searches.

Create synonym dictionaries

You can create synonym dictionaries to expand Zing text searches with additional search keywords.

Before you begin

Role required: ts_admin or admin

About this task

By default, the system provides a sample Zing synonym dictionary called **Example synonym dictionary**. You can add synonyms to this dictionary or create your own synonym dictionaries.

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Synonym Dictionaries**.
2. Select **New**.
3. On the Synonym Dictionary form, fill in the fields.

   Synonym Dictionary form

Field	Description
Name	Unique name for the synonym dictionary.
Active	Option to make the synonym dictionary active. Zing only uses active synonym dictionaries when expanding searches.
Global	Option to use the synonym dictionary for searches against all tables that have not been individually configured.
State	Publication state for the synonym dictionary. This field is read-only.
Order	Order of evaluation for the synonym dictionary. Zing evaluates synonym dictionaries with lower `Order` values before dictionaries with higher values.
Description	Description of the synonym dictionary.

4. For each set of synonyms you want to add to the synonym dictionary, insert a new Synonym Set row and fill in the fields.

   Synonym set fields

Field	Description
Synset	Comma-separated set of synonym expansions. Zing expands searches

Field	Description
	containing any one of these terms to include all of these terms. As an example, if you define the synonym set `medicalise,médicalisé` and search for `medicalise`, Zing expands your search to match records containing either `medicalise` or `médicalisé`.
Active	Option to make this synonym set active. Zing only uses active synonym sets when expanding searches.
Description	Description of the synonym set.

5. Select **Submit**.
6. Select the **Publish All Dictionaries** related link.
   A message indicates that publication of your synonym dictionaries has been scheduled. Refresh the page to see whether publication is complete. The dictionary is published when its state changes from **Draft** to **Published**.

Select synonym dictionaries for a table

Search administrators can specify one or more synonym dictionaries available to a particular table.

Before you begin

Role required: ts_admin or admin

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table for which you want to change search behavior.
   The system displays the Text index record for the table.
3. Select the **Index Synonym Dictionaries** tab.
4. Select **New**.
5. Select a synonym dictionary in the **Synonym Dictionary** field on the **Index Synonym Dictionary** form.
6. Select **Submit**.

Result

Text searches on this table use the selected synonym dictionaries.

Disable synonyms for a table

By default, Zing uses all active synonym dictionaries when a user performs a text search. Search administrators can disable synonym dictionary usage on a per-table basis.

Before you begin

Role required: ts_admin or admin

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table for which you want to change search behavior.

The system displays the Text index record for the table.

3. Select **Disable synonym**, so the check appears.
4. Select **Update**.

Debug synonym searches

You can view debug messages to determine if synonym searches are working as expected.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Text Search**.
2. Perform a search using a term in a synonym dictionary.
3. View the session debug output.

   Note:
   You can only view the debug output on a table view (_list.do). You can't view it on a UI page itself.

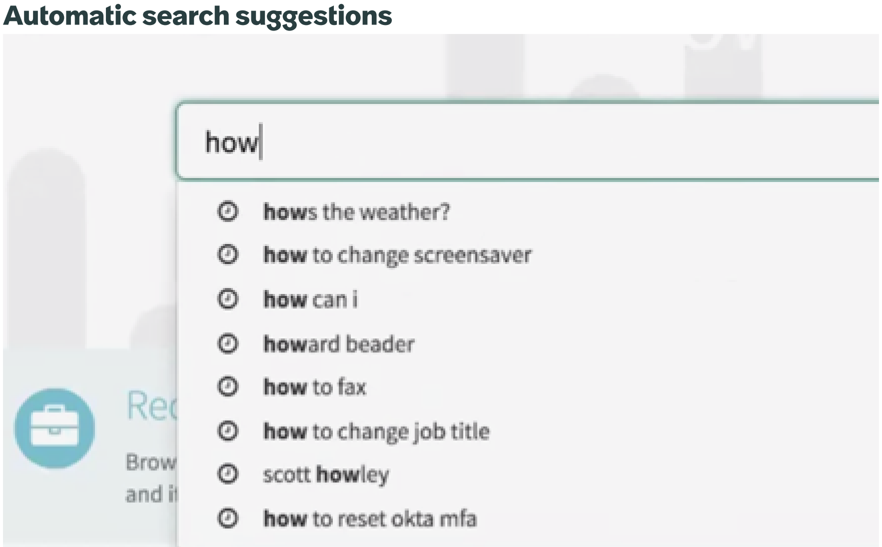
Zing displays search suggestions as users enter search terms

Display possible search query completions as users enter search terms.

To use the Search Suggestions application, activate the com.glide.search.suggestions plugin if it's not already installed. For information, see Request a plugin and Activate a plugin.

Once you enable Search Suggestions, suggestions appear automatically when users enter text into Zing search fields in the Service Portal or Now Mobile.

Automatic search suggestions



If there are any matching suggestions from the user's own previous searches, those suggestions appear first, with a clock icon. The remaining suggestions are those suggestions coming from the searches of other users.

In the Service Portal, you can use Search Suggestions or type-ahead functionality, but not both at the same time. In Now Mobile, only Search Suggestions is available. By default, new ServiceNow instances use Search Suggestions in the Service Portal. Upgraded instances use

whatever was previously enabled. You can easily enable Search Suggestions on upgraded instances. To learn more, see Enable and disable Search Suggestions in Zing.

For full details on configuration and use of the Search Suggestions application, see Search Suggestions.

Enable and disable Search Suggestions in Zing

Enable the Search Suggestions application to improve the Zing search user experience.

Before you begin

ServiceNow personnel installed and activated the com.glide.search.suggestions plugin.

Role required: admin

About this task

The Search Suggestions application is available on new instances by default. On upgraded instances, Search Suggestions is enabled for Now Mobile and disabled for Service Portal by default.

The following system properties enable and disable Search Suggestions:

- *`glide.search.suggestions.enabled`*: Set to **true** (default) to enable Search Suggestions in Zing, or set to **false** to disable Search Suggestions in Zing.
- *`glide.service_portal.search_as_you_type_behavior`*: Select **Suggestions** or **Typeahead** functionality in the Service Portal.

On new instances, the first parameter is set to **true** and the second is set to **Suggestions**. In upgraded instances, the parameters are set to whatever was previously enabled.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. To switch between Search Suggestions and type-ahead functionality in Service Portal, follow these steps.
   a. In the **Name** search column, enter *`glide.service_portal.search_as_you_type_behavior`*.
   b. On the System Property page, in the **Value** field, enter `Suggestions` to enable Search Suggestions, or `Typeahead` to enable type-ahead functionality.
      You can only enter one of these options.
3. To turn Search Suggestions on or off globally, follow these steps.
   a. In the **Name** search column, enter *`glide.search.suggestions.enabled`*.
   b. In the **Value** field, double-click the value and select **true** to enable suggestions, or **false** to disable Search Suggestions globally.

Set the maximum number of search suggestions Zing displays

Set the maximum number of search suggestions Zing displays when users enter search strings in search applications.

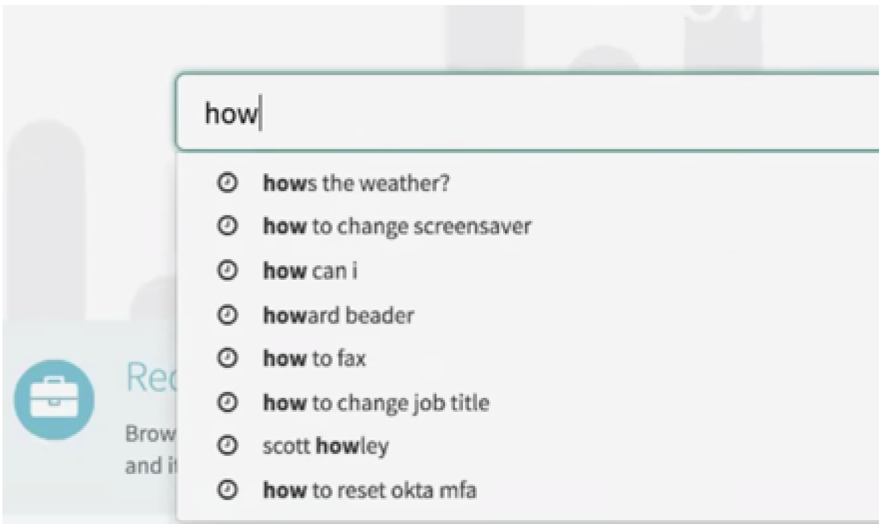
Before you begin

You must be using a search application that has Zing specified as its Search Engine in its search application configuration record. For details on search application configuration record fields, see Search Application Configuration form.

Role required: admin

About this task

Zing displays suggestions generated by the Search Suggestions application when users enter text in a search field in a supported search application. You can control the number of suggested search strings displayed by editing the search application configuration records for your search applications that use Zing.



Note:
You can also configure a search suggestion limit for Knowledge and System Status searches in Service Portal by editing the instance options for the Typeahead Search widget. For details on these instance options, including the Limit option, see Typeahead Search widget. To learn how to configure instances of the Typeahead Search widget for the Knowledge and System Status portal pages, see Configure widget instances.

Procedure

Set the maximum number of search strings displayed in a search application that uses Zing.

a. Navigate to the Search Application Configurations [sys_search_context_config] table's list view by selecting **All**, entering `sys_search_context_config.list` in the navigation filter, and pressing Enter.
b. Open the Search Application Configuration record for your Zing search application.
c. If a warning message about the current application scope appears, select the link in the message to switch to the correct application scope for the record.
d. In the **Suggestions Limit** field, enter the new maximum number of search suggestions you want the application to display.
e. Select **Update**.

Installed with Zing

Several types of components are installed with Zing.

Tables installed with Zing

Table	Description
Text Index [ts_index_name]	Stores the tables the system indexes.
Index Stop Word [ts_index_stop]	Stores the stop words for a specific table.
Stop Word [ts_stop]	Stores the global stop words.
Text Search Groups [ts_group]	Stores search groups for global text search.
• ts_attachment • ts_chain_summary • ts_chain • ts_deleted_doc • ts_document • ts_index_stats • ts_phrase • ts_search_stats • ts_search_summary • ts_word_roots • ts_word	System tables that support Zing. Extending or modifying these tables isn't recommended.

Business rules installed with Zing

Business Rule	Description
Text Search Property Change Rationally	Ensures that valid values are entered for Zing text search properties.
Text Index Stop Reminder	Warns the user of stop word changes that require the index to be rebuilt (table-specific). The warning is issued if record is deleted that had a stop mode "neither index nor query", if record's stop mode is updated to something else and was "neither index nor query", and if record's word is updated to something else and stop mode is "neither index nor query".
Stop Word Reminder	Warns the user of stop word changes that require the index to be rebuilt (global). The warning is issued if record is deleted and it was active, if record is inactivated, and if record's word is changed and was active.

Scheduled jobs installed with Zing

Scheduled job	Description
TS Search Stats	Compiles type-ahead suggestions each night. See Update A Type-Ahead Suggestion.
TS Index Stats	Collects statistics and performs maintenance for text search and indexing. Runs nightly.
text index events process	Collects statistics and performs maintenance for text search and indexing. Runs every 30 seconds.
TS Chain Summary	Compiles search chain statistics each hour.

UI action installed with Zing

UI action	Description
Regenerate Text Index	Displays the **Regenerate Text Index** link on Text Index forms.
